EXHIBIT "C" (Stormwater Pollution Prevention Plan)

TYPICAL PROTECTION FOR INLET ON SUMP

TYPICAL PROTECTION FOR INLET ON GRADE

NOTES:

1. Intended for short-term use.
2. Use to inhibit non-storm water flow.
3. Allow for proper maintenance and cleanup.
4. Bags must be removed after adjacent operation is completed
5. Not applicable in areas with high silts and clays without filter fabric.
6. Protection can be effective even if it is not immediately adjacent to the inlet provided that the inlet is protected from potential sources of pollution.

Description and Purpose

Active Treatment Systems (ATS) reduce turbidity of construction site runoff by introducing chemicals to stormwater through direct dosing or an electrical current to enhance flocculation, coagulation, and settling of the suspended sediment. Coagulants and flocculants are used to enhance settling and removal of suspended sediments and generally include inorganic salts and polymers (USACE, 2001). The increased flocculation aids in sedimentation and ability to remove fine suspended sediments, thus reducing stormwater runoff turbidity and improving water quality.

Suitable Applications

ATS can reliably provide exceptional reductions of turbidity and associated pollutants and should be considered where turbid discharges to sediment and turbidity sensitive waters cannot be avoided using traditional BMPs. Additionally, it may be appropriate to use an ATS when site constraints inhibit the ability to construct a correctly sized sediment basin, when clay and/or highly erosive soils are present, or when the site has very steep or long slope lengths.

Limitations

Dischargers choosing to utilize chemical treatment in an ATS must follow all guidelines of the Construction General Permit Attachment F – Active Treatment System Requirements. General limitations are as follows:

- Numeric Effluent Limit (NEL) for all discharges (10 NTU daily flow-weighted average)
- Limited availability of chemical residual testing procedures that meet permit requirements for flow-through treatment
- Specific field and classroom ATS training required to operate equipment
- Batch treatment requires extensive toxicity testing of effluent
- Batch treatment requires large footprint to accommodate treatment cells
- Requires additional filtration to remove residual floc and treatment chemicals prior to discharge
- Petroleum based polymers should not be used
- Requires site-specific design and equipment
- Limited discharge rates depending on receiving water body
- Labor intensive operation and maintenance
- ATS costs are higher on a unit basis for smaller sites that would be expected to have a lower volume of treated runoff
- ATS costs are seasonably variable due to increases or decreases in rainfall volumes

Implementation

Turbidity is difficult to control once fine particles are suspended in stormwater runoff from a construction site. Sedimentation ponds are effective at removing larger particulate matter by gravity settling but are ineffective at removing smaller particulates such as clay and fine silt. Sediment ponds are typically designed to remove sediment no smaller than medium silt (0.02 mm). ATS may be used to reduce the turbidity of stormwater runoff. With an ATS, very high turbidities can be reduced to levels comparable to what is found in streams during dry weather.

Criteria for ATS Product Use

Chemically treated stormwater discharged from construction sites must be non-toxic to aquatic organisms. The following protocol should be used to evaluate chemicals proposed for stormwater treatment at construction sites. Authorization to use a chemical in the field based on this protocol does not relieve the applicant from responsibility for meeting all discharge and receiving water criteria applicable to a site.

- An ATS Plan, which includes an Operation and Maintenance component, a Monitoring, Sampling and Reporting component, a Health and Safety component, and a Spill Prevention component must be prepared and submitted to the Regional Water Quality Control Board (RWQCB).

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

- Treatment chemicals should be approved by EPA for potable water use or otherwise be demonstrated to be protective of human health and the environment. Chemical residual or whole effluent toxicity testing is required.
- Prior to field use of chemical treatment, jar tests are to be conducted to demonstrate that turbidity reduction necessary to meet the NELs and receiving water criteria can be achieved. Test conditions, including but not limited to raw water quality and jar test procedures, should be indicative of field conditions. Although these small-scale tests cannot be expected to reproduce performance under field conditions, they are indicative of treatment capability. A minimum of six site-specific jar tests must be conducted per chemical.
- The proposed maximum dosage should be at least a factor of five lower than the no observed effects concentration (NOEC).
- Effluent discharge from an ATS to a receiving water is conditional upon the favorable results of full-scale whole effluent bioassay/toxicity testing for batch treatment systems and upon chemical residuals testing for flow-through systems.
- Contact the RWQCB for a list of treatment chemicals that may be pre-approved for use.

Active Treatment System Design Considerations

The design and operation of an ATS should take into consideration the factors that determine optimum, cost-effective performance. While site characteristics will influence system design, it is important to recognize the following overriding considerations:

- The right chemical must be used at the right dosage. A dosage that is either too low or too high will not produce the lowest turbidity. There is an optimum dosage rate. This is a situation where the adage “adding more is always better” is not the case.
- The coagulant must be mixed rapidly into the water to insure proper dispersion.
- The mixing system for batch treatment must be sized to provide adequate mixing for the design storage volume. Lack of adequate mixing during the flocculation phase results in flocs that are too small and/or insufficiently dense. Too much mixing can rapidly destroy floc as it is formed.
- Care must be taken in the design of the withdrawal system to minimize outflow velocities and to prevent floc discharge. The discharge should be directed through a filtration system such as sand, bag, or cartridge filter that would catch any unintended floc discharge.
- ATS is also regulated for pH of the discharge. A pH-adjusting chemical should be added into the treated water to control pH if the selected coagulant requires alteration of the pH of the discharge outside of the acceptable range.

Active Treatment System Design

ATS can be designed as batch treatment systems using either ponds or portable trailer-mounted tanks, or as flow-through systems using any number of proprietary designed systems.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

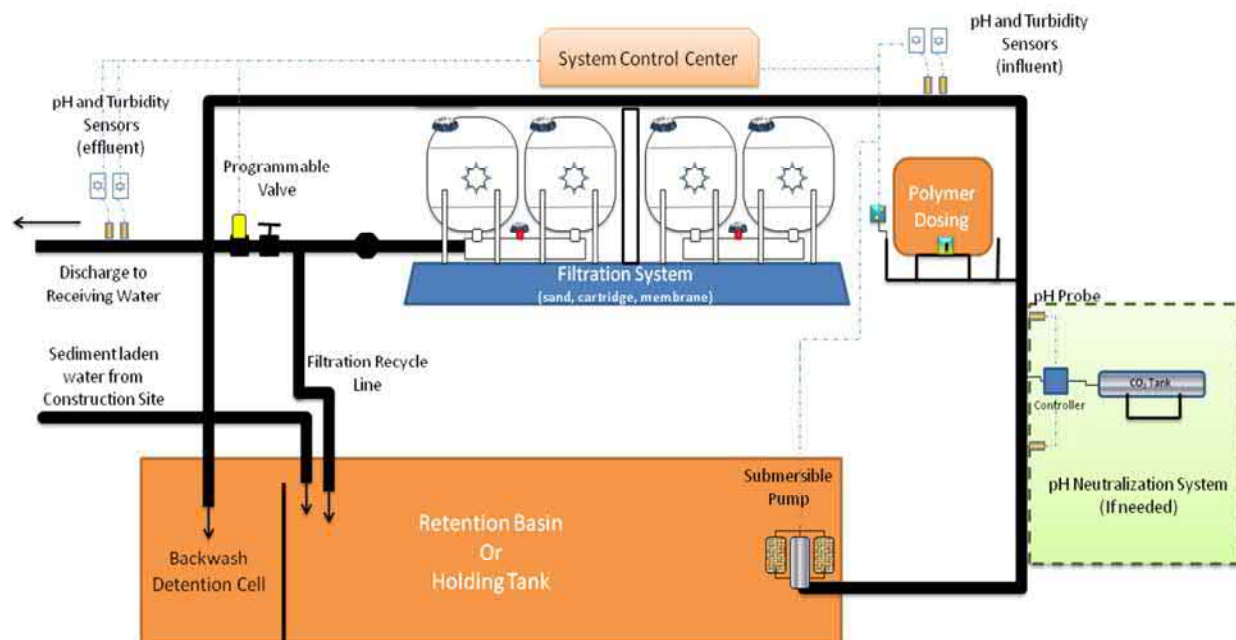

Figure has been adapted from Port of Seattle response to Washington Dept. of Ecology Action Order 2948

Batch Treatment

Batch Treatment systems consist of the stormwater collection system (either temporary diversion or the permanent site drainage system); a sediment basin, trap or holding tanks; pumps; a chemical feed system; treatment cells; and, interconnecting piping.

Batch treatment systems should use a minimum of two lined treatment cells. Multiple treatment cells allow for clarification of treated water while other cells are being filled or emptied. Treatment cells may be basins, traps, or tanks. Portable tanks may also be suitable for some sites.

The following equipment should be located in a secured, covered location:

- The chemical injector
- Secondary containment for acid, caustic, buffering compound, and treatment chemical
- Emergency shower and eyewash
- Monitoring equipment which consists of a pH meter and a turbidimeter (if not already within the instrumentation panel of the chemical injector)

Flow-through Treatment

At a minimum, a flow-through ATS system consists of the stormwater collection system (either temporary diversion or the permanent site drainage system), an untreated stormwater storage pond or holding tank, and a chemically enhanced filtration system.

Stormwater is collected at interception point(s) on the site and is diverted by gravity or by pumping to an untreated stormwater storage pond or other untreated stormwater holding area.

EXHIBIT C (Stormwater Pollution Prevention Plan)

The stormwater is stored until treatment occurs. It is important that the holding pond be large enough to provide adequate storage.

Stormwater is then pumped from the untreated stormwater storage pond to the chemically enhanced filtration system where polymer is added. Adjustments to pH may be necessary before chemical addition. The filtration system continually monitors the stormwater for turbidity and pH. If the discharge water is out of the acceptable turbidity or pH range, the water is recycled to the untreated stormwater pond (or holding tank) where it can be retreated. Flow through systems must ensure that:

- Cumulative flow volume shall be recorded daily. The data recording system shall have the capacity to record a minimum of seven days of continuous data.
- Instrumentation systems are interfaced with system control to provide auto shutoff or recirculation in the event that effluent measurements exceed turbidity or pH.
- Upon system upset, power failure, or other catastrophic event, the ATS will default to a recirculation mode or safe shut down.
- The instrumentation system provides a method for controlling coagulant dose, to prevent potential overdosing.

Sizing Criteria

An ATS shall be designed and approved by a Certified Professional in Erosion and Sediment Control (CPESC), a Certified Professional in Storm Water Quality (CPSWQ); a California registered civil engineer; or any other California registered engineer.

ATS must be designed to capture and treat (within 72 hours) runoff from the 10-year 24-hour storm event. The runoff volume of the watershed area to be treated from this size storm event is required to be calculated using the Rational Method with a runoff coefficient of 1.

If sediment basins are used to capture flow-through or batch treatment, see SE-2, Sediment Basin, for design criteria. Bypass should be provided around the ATS to accommodate extreme storm events. Primary settling should be encouraged in the sediment basin/storage pond. A forebay with access for maintenance may be beneficial.

The permissible discharge rate governed by potential downstream effect should be used to calculate the recommended size of the treatment cells. Local requirements related to Phase I or Phase II NPDES permit thresholds should be considered in developing maximum discharge rates the ATS Plan.

Costs

Costs for ATS may be significant due to equipment rental requirements and cost of chemicals. ATS cost is lower on a treated unit-basis for large construction sites with large volumes of runoff.

Inspection and Maintenance

ATS must be operated and maintained by individuals with experience in their use and trained in accordance with training requirements below. ATS should be monitored continuously while in

use. A designated responsible person shall be on site daily at all times during treatment operations. Daily on-site visual monitoring of the system for proper performance shall be conducted and recorded in the project data log. The name, phone number, and training documentation of the person responsible for system operation and monitoring shall be included in the project data log.

The following monitoring requirements and results should be recorded in the data log:

Operational and Compliance Monitoring

- Effluent flow rate and volume shall be continuously monitored and recorded at 15- minute or less intervals.
- Influent and effluent pH must be continuously monitored and recorded at 15-minute or less intervals.
- Influent and effluent turbidity (expressed in NTU) must be continuously monitored and recorded at 15-minute or less intervals.
- The type and amount of chemical used for pH adjustment, if any, shall be monitored and recorded.
- Dose rate of chemical used in the ATS system (expressed in mg/L) shall be monitored and reported 15-minutes after startup and every 8 hours of operation.
- Laboratory duplicates – monthly laboratory duplicates for residual coagulant analysis must be performed and records shall be maintained onsite.
- Effluent shall be monitored and recorded for residual chemical/additive levels.
- If a residual chemical/additive test does not exist and the ATS is operating in a batch treatment mode of operation refer to the toxicity monitoring requirements below.

Toxicity Monitoring

Batch Treatment

Toxicity testing for systems operated in batch treatment mode should be made in accordance with the following:

- Acute toxicity testing on effluent samples representing effluent from each batch prior to discharge shall be undertaken. All bioassays shall be sent to a laboratory certified by the Department of Health Services (DHS) Environmental Laboratory Accreditation Program (ELAP). The required field of testing number for Whole Effluent Toxicity (WET) testing is E113.
- Acute toxicity tests shall be conducted with the following species and protocols. The methods to be used in the acute toxicity testing shall be those outlined for a 96-hour acute test in “Methods for Measuring the Acute Toxicity of Effluents and Receiving Water to Freshwater and Marine Organisms, USEPA-841-R-02-012” for Fathead minnow, *Pimephales promelas*. Rainbow trout, *Oncorhynchus mykiss*, may be used as a substitute for fathead minnow.

All toxicity tests shall meet quality assurance criteria and test acceptability criteria in the most recent versions of the EPA test method for WET testing.

Flow-through Treatment

Toxicity testing for systems operated in flow-through treatment mode should be made in accordance with the following:

- A residual chemical test method shall be used that has a method detection limit (MDL) of 10% or less than the maximum allowable threshold concentration (MATC) for the specific coagulant in use and for the most sensitive species of the chemical used. The MATC is equal to the geometric mean of the No Observed Effect Concentration (NOEC) and Lowest Observed Effect Concentration (LOEC) Acute and Chronic toxicity results for most sensitive species determined for the specific coagulant.
- The residual chemical test method shall produce a result within one hour of sampling.
- A California State certified laboratory shall validate the selected residual chemical test. Specifically, the lab will review the test protocol, test parameters, and the detection limit of the coagulant. The discharger shall electronically submit this documentation as part of the ATS Plan.

Numeric Effluent Limit (NEL) Compliance:

All chemically treated stormwater must be sampled and tested for compliance with pH and turbidity limits. These limits have been established by the Construction General Permit. Sampling and testing for other pollutants may also be necessary at some sites. Turbidity limits have been set as 10 NTU as a daily flow-weighted average or 20 NTU from a single sample. pH must be within the range of 6.0 to 9.0 standard units. It is often possible to discharge treated stormwater that has a lower turbidity than the receiving water and that matches the pH.

Treated stormwater samples and measurements should be taken from the discharge pipe or another location representative of the nature of the treated stormwater discharge. Samples used for determining compliance with the water quality standards in the receiving water should not be taken from the treatment pond prior to decanting. Compliance with the water quality standards is determined in the receiving water.

Operator Training:

Operators shall have training specific to using an ATS and liquid coagulants for stormwater discharges in California. The training shall be in the form of a formal class with a certificate and requirements for testing and certificate renewal. Training shall include a minimum of eight hours classroom and 32 hours field training.

Standard BMPs:

Erosion and sediment control BMPs should be implemented throughout the site to prevent erosion and discharge of sediment to the ATS. Some types of chemical coagulation and flocculation are only achievable in water below a certain turbidity; therefore, minimizing the amount of sediment reaching the system will increase the likelihood of meeting effluent limits and will potentially lower costs of chemical dosing.

Sediment Removal and Disposal

- Sediment shall be removed from the storage or treatment cells as necessary to ensure that the cells maintain their required water storage (i.e., volume) capability.
- Handling and disposal of all solids generated during ATS operations shall be done in accordance with all local, state, and federal laws and regulations.
- If sediment is determined to be non-toxic, it may be incorporated into the site away from drainages.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

Manufactured Linear Sediment Controls (MLSC) SE-12

Description and Purpose

Manufactured linear sediment controls (MLSC) are pre-manufactured devices that are typically specified and installed for drainage and sediment control on the perimeter of disturbed sites or stockpiles and as check dams within channels. Typically, MLSCs can be reused.

This fact sheet is intended to provide guidance on BMP selection and implementation of proprietary or vendor-supplied products, for sediment control. Products should be evaluated for project-specific implementation and used if determined to be appropriate by the SWPPP Preparer.

Suitable Applications

MLSCs are generally used in areas as a substitute for fiber rolls and silt fences in sediment control applications to slow down runoff water, divert drainage or contain fines and sediment. MLSCs are a linear control and application suitability varies based on the specific product type. They may be suitable:

- On paved surfaces for perimeter protection.
- As check structures in channels.
- Along the perimeter of disturbed sites in lieu of silt fence.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

Manufactured Linear Sediment Controls (MLSC)

SE-12

- At operational storm drains as a form of inlet protection.
- Around temporary stockpiles or material/equipment storage areas.
- At the interface between graveled driveways and pavement.
- Along the toe of exposed and erodible slopes.

Limitations

- Limitations vary by product. Product manufacturer's printed product use instructions should be reviewed by the SWPPP Preparer to determine the project-specific applicability of MLSCs.

Implementation

General

When appropriately placed, MLSCs intercept and slow sheet flow runoff, causing temporary ponding. The temporary ponding provides quiescent conditions allowing sediment to settle. The device is porous, which allows the ponded runoff to flow slowly through the device, releasing the runoff as sheet flows. Generally, MLSCs should be used in conjunction with temporary soil stabilization controls up-slope to provide an effective combination of erosion and sediment control.

Design and Layout

- MLSCs used on soil should be trenched or attached to the ground per manufacturer specifications in a manner that precludes runoff or ponded water from flowing around or under the device.
- MLSCs designed for use on asphalt or concrete may be attached using a variety of methods, including nailing the device to the pavement, or using a high strength adhesive.
- Follow manufacturer written specifications when installing MLSCs.
- Allow sufficient space up-slope from the silt dike to allow ponding, and to provide room for sediment storage.
- For installation near the toe of the slope, MLSCs should be set back 3 feet from the slope toe to facilitate cleaning. Where site conditions do not allow set back, the sediment control may be constructed on the toe of the slope. To prevent flows behind the barrier, sand or gravel bags can be placed perpendicular and between the sediment control and slope to serve as a barrier to parallel flow.
- Drainage area should not exceed 5 acres.

Materials

- Several manufactured products are available. The following search terms or combination of terms can be used with an internet search engine to find manufactured linear sediment controls:

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

Manufactured Linear Sediment Controls (MLSC)

SE-12

- “silt barrier”
- “reusable silt fence”
- “silt fence alternative” or
- “perimeter sediment control”

Costs

Manufacturers should be contacted directly for current pricing.

Inspection and Maintenance

- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Reshape or replace sections of damaged MLSCs as needed.
- Repair washouts or other damage as needed.
- Sediment that accumulates behind the BMP should be periodically removed in order to maintain BMP effectiveness. Sediment should be removed when the sediment accumulation reaches one-third of the barrier height.
- Remove MLSCs when no longer needed. Remove sediment accumulation and clean, re-grade, and stabilize the area. Removed sediment should be incorporated in the project or disposed of properly.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

Description and Purpose

Compost socks and berms act as three-dimensional biodegradable filtering structures to intercept runoff where sheet flow occurs and are generally placed at the site perimeter or at intervals on sloped areas. Compost socks are generally a mesh sock containing compost and a compost berm is a dike of compost, trapezoidal in cross section. When employed to intercept sheet flow, both BMPs are placed perpendicular to the flow of runoff, allowing filtered runoff to pass through the compost and retaining sediment (and potentially other pollutants). A compost sock can be assembled on site by filling a mesh sock (e.g. with a pneumatic blower). The compost berm should be constructed using a backhoe or equivalent and/or a pneumatic delivery (blower) system and should be properly compacted. Compost socks and berms act as filters, reduce runoff velocities, and in some cases, aid in establishing vegetation.

Compost is organic, biodegradable, and renewable. Compost provides soil structure that allows water to infiltrate the compost medium which helps prevent rill erosion and the retained moisture promotes seed germination and vegetation growth, in addition to providing organic matter and nutrients important for fostering vegetation. Compost improves soil quality and productivity, as well as erosion and sediment control.

Potential Alternatives

- SE-1 Silt Fence
- SE-5 Fiber Roll
- SE-6 Gravel Bag Berm
- SE-8 Sandbag Barrier
- SE-14 Biofilter Bags

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

The compost of the compost sock or berm can be selected that targets site specific objectives in capturing sediment and other pollutants, supporting vegetation, or additional erosion control.

Compost is typically derived from combinations of feedstocks, biosolids, leaf and yard trimmings, manure, wood, or mixed solid waste. Many types of compost are products of municipal recycle or "Green waste" programs. Compost is organic and biodegradable and can be left onsite. There are many types of compost with a variety of properties with specific functions, and accordingly compost selection is an important design consideration in the application of this type of erosion and sediment control.

Suitable Applications

- Along the toe, top, face, and at grade breaks of exposed and erodible slopes to shorten slope length and spread runoff as sheet flow (compost berms should only be used at the top of slopes or on slopes 4:1 (H:V) or flatter, all other slope applications should use compost socks)
- Along the perimeter of a project
- As check dams in unlined ditches (compost socks only)
- Down-slope of exposed soil areas
- At operational storm drains as a form of inlet protection (compost socks only)
- Around temporary stockpiles

Compost socks and berms do not require special trenching or BMP removal compared to other sediment control methods (e.g. silt fence or fiber rolls). Compost socks and berms can remain in place after earth disturbing activities are completed or the compost components can be spread over the site providing nutrients for plant growth and augmenting soil structure. BMPs that remain in place are particularly advantageous below embankments, especially adjacent streams, by limiting re-entry and the disturbance to sensitive areas.

Compost can be pre-seeded prior to application (recommended by the EPA for construction site stormwater runoff control and required for compost socks) or seeded after installation (for compost berms only). The compost medium can also remove pollutants in stormwater including heavy metals; oil and grease; and hydrocarbons.

Limitations

- Compost can potentially leach nutrients (dissolved phosphorus and nitrogen) into runoff and potentially impact water quality. Compost should not be used directly upstream from nutrient impaired waterbodies (Adams et. al, 2008).
- Compost may also contain other undesirable constituents that are detrimental to water quality. Compost should be obtained from a supplier certified by the California Integrated Waste Management Board or compost should otherwise meet the environmental health standards of Title 14, California Code of Regulations, Division 7, Chapter 3.1, Article 7. Carefully consider the qualifications and experience of any compost producer/supplier.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

- Application by hand is more time intensive and potentially costly. Using a pneumatic blower truck is the recommended cost-effective method of assembly.
- Compost socks and berms should not be employed at the base of slopes greater than 2:1 (H:V). They can be employed with other erosion control methods for steeper slopes.
- Difficult to move once saturated.
- Compost berms should not be applied in areas of concentrated flows.
- Compost socks and berms are easy to fix; however, they are susceptible to damage by frequent traffic. Compost socks can be used around heavy machinery, but regular disturbance decreases sock performance.

Implementation

Compost Materials

- California Compost Regulations (Title 14, California Code of Regulations, Division 7, Chapter 3.1, Article 7, Section 17868.3) define and require a quality of compost for application. Compost should comply with all physical and chemical requirements. Specific requirements are provided in **Table 1**, taken from Caltrans *Standard Specifications* (2015).
- The Caltrans SSP, Section 21-2.02Q, *Compost Socks*, states that the sock used to retain the compost must be composed of natural, biodegradable products, such as cotton, jute, sisal, burlap or coir.
- The compost producer should be fully permitted as specified under the California Integrated Waste Management Board, Local Enforcement Agencies and any other State and Local Agencies that regulate Solid Waste Facilities. If exempt from State permitting requirements, the composting facility should certify that it follows guidelines and procedures for production of compost meeting the environmental health standards of Title 14, California Code of Regulations, Division 7, Chapter 3.1, Article 7.
- The compost producer should be a participant in United States Composting Council's Seal of Testing Assurance program.
- Compost medium parameter specifications for compost socks and berms have been developed to assist in compost selection, such as those provided by the American Association of State Highway Transportation Officials (AASHTO).
- Particle size is important parameter for selecting compost. Well consolidated, coarser grades of compost (e.g., small and large pieces) perform better for filtration objectives, while finer grades better support vegetation. Particle size of the compost should be selected based on site conditions, such as expected precipitation, and filtration goals and / or long-term plant nutrients.
- Compost moisture should be considered for composition quality and application purposes. A range of 30-50% is typical. Compost that is too dry is hard to apply and compost that is too wet is more difficult (and more expensive) to transport. For arid or semi-arid areas, or for application during the dry season, use compost with greater moisture content than areas with wetter climates. For wetter or more humid climates or for application during the wet

season, drier composts can be used as the compost will absorb moisture from the ambient air.

- If vegetation establishment is a desired function of the compost, a compost sample should be inspected by a qualified individual. Vegetation has different nutrient and moisture needs.
- Organic content of the compost is also important and should range from 30 to 65% depending on site conditions.
- Compost should not be derived from mixed municipal solid waste and should be reasonably free of visible contaminants.
- Compost should not contain paint, petroleum products, pesticides or any other chemical residues harmful to animal life or plant growth. Metal concentrations in compost should not exceed the maximum metal concentrations listed under Title 14, California Code of Regulations, Division 7, Chapter 3.1, Section 17868.2.
- Compost should not possess objectionable odors.
- Compost should be weed free.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

Physical Contaminants (% dry weight) Sharps	TMECC 02.02-C	None Detected

*TMECC refers to "Test Methods for the Examination of Composting and Compost," published by the United States Department of Agriculture and the United States Compost Council (USCC).

Installation

- Prior to application, prepare locations for socks and berms by removing brush and thick vegetation. The compost of the sock and/or berm should be allowed to come in full contact with the ground surface.
- Select method to apply the compost sock or berm. A pneumatic blower is most cost effective and most adaptive in applying compost to steep, rough terrain, and hard to reach locations.
- The compost of the berm should be distributed evenly to the surface, compacted, and shaped trapezoidal in cross section. Berm design is generally consisting of a base two times the height. AASHTO specification MP 9-03 provides compost berm dimensions based on anticipated site precipitation (AASHTO, 2003 and USEPA, 2009). State agencies, such as Oregon Department of Environmental Quality (ODEQ) have developed berm dimension based on slope steepness and length (ODEQ, 2004).

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

- Compost socks can be assembled on site by filling mesh socks with the selected compost. Mesh socks can be tied at one end, filled, and then tied at the other end. The ends of socks can be interlocked until the desired length is achieved. The sock diameter is a function of slope steepness and length. Again, ASSHTO provides specifications for various parameters. Compost socks range from 8" to 18" but are typically 12" to 18" in diameter.
- Compost socks are typically placed in contours perpendicular to sheet flow. They can also be placed in V formation on a slope. Compost socks need to be anchored, typically stakes, through the center of the sock. To prevent water flowing around them, the ends of compost socks should be placed upslope.
- Locate compost socks and berms on level contours spaced as follows:
 - Slope inclination of 4:1 (H:V) or flatter: Socks and/or berms should be placed at a maximum interval of 20 ft.
 - Slope inclination between 4:1 and 2:1 (H:V): Socks should be placed at a maximum interval of 15 ft. (a closer spacing is more effective).
 - Slope inclination 2:1 (H:V) or greater: Socks should be placed at a maximum interval of 10 ft. (a closer spacing is more effective).
- Place perimeter socks and berms using a j-hook installation. Use of vegetation will also provide additional anchoring.
- Compost socks and berms can be placed around the perimeter of an affected area, like a silt fence, if the area is flat or on a contour. Do not place these socks and berms where ponded water could become an issue.
- If used at the toe of slopes, the compost sock or berm should be at a minimum of 5 to 10 feet away.
- Use additional anchoring and erosion control BMPs in conjunction of the compost socks and berms as needed.
- Consider using compost berms or socks as necessary at the top and/or bottom of the slope for additional erosion control performance.
- Compost socks and berms can also be effective over rocky and frozen ground if installed properly.
- It is recommended that the drainage areas of these compost BMPs do not exceed 0.25 acre per 100 feet placement interval and runoff does not exceed 1 cubic foot per second.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

Costs

Recently obtained vendor costs indicated \$4.50 per linear foot for compost berm application and \$2.50 per linear foot for 8" socks and \$3.20 per linear foot for 12" socks (Adjusted for inflation, 2016 dollars, by Tetra Tech, Inc.). Costs do not include final compost sock or berm functions at the end of construction activities, including spreading or removal, if required. ODEQ estimates that compost berms cost 30 percent less than silt fences to install.

Inspection and Maintenance

- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Once damage is identified, mend or reapply the sock or berm as needed. Washed out areas should be replaced. If the sock or berm height is breached during a storm, an additional sock can be stacked to increase the sock height and similarly the berm dimensions can be increased, as applicable. An additional sock or berm may be installed upslope, as needed. It may be necessary to apply an additional type of stormwater BMP, such as a compost blanket.
- Sediment contained by the sock or berm should be removed prior reaching 1/3 of the exposed height of the BMP. The sediment can be stabilized with the compost sock or berm with vegetation at the end of construction activities.
- Care should be exercised to minimize the damage to protected areas while making repairs, as any area damaged will require reapplication of BMPs.
- Limit traffic to minimize damage to BMPs or impede vegetation establishment.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

Description and Purpose

Biofilter bags, or bio-bags, are a multi-purpose sediment control BMP consisting of a plastic mesh bag filled with 100% recycled wood product waste. Biofilter bags come in a variety of sizes (30" x 18" and 30" x 9" being common) and generally have between 1-2 cubic yards of recycled wood waste (or wood chips). Biofilter bags work by detaining flow and allowing a slow rate of discharge through the wood media. This action removes suspended sediment through gravity settling of the detained water and filtration within the bag.

Suitable Applications

Biofilter bags are a short-term BMP that can be rapidly deployed, maintained, and replaced. Biofilter bags can be an effective short-term solution to place in developed rills to prevent further erosion until permanent measures can be established. Suitable short-term applications include:

- As a linear sediment control measure:
 - Below the toe of slopes and erodible slopes
 - Below other small cleared areas
 - Along the perimeter of a site (with low-expected flow)
 - Down slope of exposed soil areas
 - Around temporary stockpiles and spoil areas

Parallel to a roadway to keep sediment off paved areas

- SE-6 Gravel Bag Berm
- SE-8 Sandbag Barrier
- SE-10 Storm Drain Inlet Protection

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

- Along streams and channels
- As linear erosion control measure:
 - Along the face and at grade breaks of exposed and erodible slopes to shorten slope length and spread runoff as sheet flow
 - At the top of slopes to divert runoff away from disturbed slopes
 - As check dams across mildly sloped construction roads
- Inlet Protection (See SE-10)
- Supplement to silt fences or other sediment control devices

Limitations

- Short life-span (maximum usefulness of 2-3 months and should be replaced more frequently if needed); regular maintenance and replacement required to ensure effectiveness. Bags will rapidly fill with sediment and reduce permeability.
- Easily damaged by construction vehicles.
- If not properly staked, will fail on slope applications.
- If improperly installed can allow undercutting or side-cutting flow.
- Not effective where water velocities or volumes are high.
- Potentially buoyant and easily displaced if not properly installed.

Implementation

General

Biofilter bags are a relatively low cost temporary BMP that are easily deployed and have a simple installation that can be performed by hand. Without proper installation, however, biofilter bags can fail due to their light weight, potential displacement, and multiple joint locations. One of the benefits of utilizing biofilter bags is that the media (wood-product) can be recycled or used onsite when no longer needed (where acceptable).

Design and Layout – Linear control

- Locate biofilter bags on level contours.
 - Slopes between 20:1 and 4:1 (H:V): Biofilter bags should be placed at a maximum interval of 20 ft, with the first row near the slope toe.
 - Slopes between 4:1 and 2:1 (H:V): Biofilter bags should be placed at a maximum interval of 15 ft, with the first row near the slope toe.
 - Slopes 2:1 (H:V) or steeper: Biofilter bags should be placed at a maximum interval of 10 ft, with the first row placed the slope toe.

- Turn the ends of the biofilter bag barriers up slope to prevent runoff from going around the berm.
- Allow sufficient space up slope from the biofilter bag berm to allow ponding, and to provide room for sediment storage.
- Stake biofilter bags into a 1 to 2 in. deep trench with a width equal to the bag.
 - Drive one stake at each end of the bag.
 - Use wood stakes with a nominal classification of 0.75 by 0.75 in. and minimum length of 24 in.
- Biofilter bags should be overlapped (6 in.), not abutted.

Costs

Pre-filled biofilter bags cost approximately \$3.20-\$4.50 per bag, dependent upon size (Adjusted for inflation, 2016 dollars, by Tetra Tech, Inc.).

Inspection and Maintenance

- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Biofilter bags exposed to sunlight will need to be replaced every two to three months due to degrading of the bags.
- Reshape or replace biofilter bags as needed.
- Repair washouts or other damage as needed.
- Sediment that is retained by the BMP should be periodically removed in order to maintain BMP effectiveness. Sediment should be removed when the sediment accumulation reaches one-third of the barrier height.
- Remove biofilter bag berms when no longer needed. Remove sediment accumulation and clean, re-grade, and stabilize the area. Biofilter media may be used on-site, if allowed.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

Description and Purpose

Wind erosion or dust control consists of applying water or other chemical dust suppressants as necessary to prevent or alleviate dust nuisance generated by construction activities. Covering small stockpiles or areas is an alternative to applying water or other dust palliatives.

California's Mediterranean climate, with a short "wet" season and a typically long, hot "dry" season, allows the soils to thoroughly dry out. During the dry season, construction activities are at their peak, and disturbed and exposed areas are increasingly subject to wind erosion, sediment tracking, and dust generated by construction equipment. Site conditions and climate can make dust control more of an erosion problem than water-based erosion. Additionally, many local agencies, including Air Quality Management Districts, require dust control and/or dust control permits in order to comply with local nuisance laws, opacity laws (visibility impairment) and the requirements of the Clean Air Act. Wind erosion control is required to be implemented at all construction sites greater than 1 acre by the General Permit.

Suitable Applications

Most BMPs that provide protection against water-based erosion will also protect against wind-based erosion and dust control requirements required by other agencies will generally meet wind erosion control requirements for water quality protection. Wind erosion control BMPs are suitable during the following construction activities:

Categories

EC	Erosion Control	
SE	Sediment Control	<input checked="" type="checkbox"/>
TC	Tracking Control	
WE	Wind Erosion Control	<input checked="" type="checkbox"/>
NS	Non-Stormwater Management Control	
WM	Waste Management and Materials Pollution Control

Bacteria	
Oil and Grease	
Organics	

Potential Alternatives

EC-5 Soil Binders

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

- Construction vehicle traffic on unpaved roads
- Drilling and blasting activities
- Soils and debris storage piles
- Batch drop from front-end loaders
- Areas with unstabilized soil
- Final grading/site stabilization

Limitations

- Watering prevents dust only for a short period (generally less than a few hours) and should be applied daily (or more often) to be effective.
- Over watering may cause erosion and track-out.
- Oil or oil-treated subgrade should not be used for dust control because the oil may migrate into drainageways and/or seep into the soil.
- Chemical dust suppression agents may have potential environmental impacts. Selected chemical dust control agents should be environmentally benign.
- Effectiveness of controls depends on soil, temperature, humidity, wind velocity and traffic.
- Chemical dust suppression agents should not be used within 100 feet of wetlands or water bodies.
- Chemically treated subgrades may make the soil water repellent, interfering with long-term infiltration and the vegetation/re-vegetation of the site. Some chemical dust suppressants may be subject to freezing and may contain solvents and should be handled properly.
- In compacted areas, watering and other liquid dust control measures may wash sediment or other constituents into the drainage system.
- If the soil surface has minimal natural moisture, the affected area may need to be pre-wetted so that chemical dust control agents can uniformly penetrate the soil surface.

Implementation

Dust Control Practices

Dust control BMPs generally stabilize exposed surfaces and minimize activities that suspend or track dust particles. The following table presents dust control practices that can be applied to varying site conditions that could potentially cause dust. For heavily traveled and disturbed areas, wet suppression (watering), chemical dust suppression, gravel asphalt surfacing, temporary gravel construction entrances, equipment wash-out areas, and haul truck covers can be employed as dust control applications. Permanent or temporary vegetation and mulching can be employed for areas of occasional or no construction traffic. Preventive measures include minimizing surface areas to be disturbed, limiting onsite vehicle traffic to 15 mph or less, and controlling the number and activity of vehicles on a site at any given time.

Chemical dust suppressants include: mulch and fiber based dust palliatives (e.g. paper mulch with gypsum binder), salts and brines (e.g. calcium chloride, magnesium chloride), non-petroleum based organics (e.g. vegetable oil, lignosulfonate), petroleum based organics (e.g. asphalt emulsion, dust oils, petroleum resins), synthetic polymers (e.g. polyvinyl acetate, vinyl, acrylic), clay additives (e.g. bentonite, montmorillonite) and electrochemical products (e.g. enzymes, ionic products).

Site Condition	Dust Control Practices							
	Permanent Vegetation	Mulching	Wet Suppression (Watering)	Chemical Dust Suppression	Gravel or Asphalt	Temporary Gravel Construction Entrances/Equipment Wash Down	Synthetic Covers	Minimize Extent of Disturbed Area
Disturbed Areas not Subject to Traffic	X	X	X	X	X			X
Disturbed Areas Subject to Traffic			X	X	X	X		X
Material Stockpiles		X	X	X			X	X
Demolition			X			X	X	
Clearing/Excavation			X	X				X
Truck Traffic on Unpaved Roads			X	X	X	X	X	
Tracking					X	X		

Additional preventive measures include:

- Schedule construction activities to minimize exposed area (see EC-1, Scheduling).
- Quickly treat exposed soils using water, mulching, chemical dust suppressants, or stone/gravel layering.
- Identify and stabilize key access points prior to commencement of construction.
- Minimize the impact of dust by anticipating the direction of prevailing winds.
- Restrict construction traffic to stabilized roadways within the project site, as practicable.
- Water should be applied by means of pressure-type distributors or pipelines equipped with a spray system or hoses and nozzles that will ensure even distribution.
- All distribution equipment should be equipped with a positive means of shutoff.
- Unless water is applied by means of pipelines, at least one mobile unit should be available at all times to apply water or dust palliative to the project.
- If reclaimed waste water is used, the sources and discharge must meet California Department of Health Services water reclamation criteria and the Regional Water Quality

Control Board (RWQCB) requirements. Non-potable water should not be conveyed in tanks or drain pipes that will be used to convey potable water and there should be no connection between potable and non-potable supplies. Non-potable tanks, pipes, and other conveyances should be marked, "NON-POTABLE WATER - DO NOT DRINK."

- Pave or chemically stabilize access points where unpaved traffic surfaces adjoin paved roads.
- Provide covers for haul trucks transporting materials that contribute to dust.
- Provide for rapid clean up of sediments deposited on paved roads. Furnish stabilized construction road entrances and wheel wash areas.
- Stabilize inactive areas of construction sites using temporary vegetation or chemical stabilization methods.

For chemical stabilization, there are many products available for chemically stabilizing gravel roadways and stockpiles. If chemical stabilization is used, the chemicals should not create any adverse effects on stormwater, plant life, or groundwater and should meet all applicable regulatory requirements.

Costs

Installation costs for water and chemical dust suppression vary based on the method used and the length of effectiveness. Annual costs may be high since some of these measures are effective for only a few hours to a few days.

Inspection and Maintenance

- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities.
- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Check areas protected to ensure coverage.
- Most water-based dust control measures require frequent application, often daily or even multiple times per day. Obtain vendor or independent information on longevity of chemical dust suppressants.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

Stabilized Construction Entrance/Exit TC-1

Description and Purpose

A stabilized construction access is defined by a point of entrance/exit to a construction site that is stabilized to reduce the tracking of mud and dirt onto public roads by construction vehicles.

Suitable Applications

Use at construction sites:

- Where dirt or mud can be tracked onto public roads.
- Adjacent to water bodies.
- Where poor soils are encountered.
- Where dust is a problem during dry weather conditions.

Limitations

- Entrances and exits require periodic top dressing with additional stones.
- This BMP should be used in conjunction with street sweeping on adjacent public right of way.
- Entrances and exits should be constructed on level ground only.
- Stabilized construction entrances are rather expensive to construct and when a wash rack is included, a sediment trap of some kind must also be provided to collect wash water runoff.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

Stabilized Construction Entrance/Exit TC-1

Implementation

General

A stabilized construction entrance is a pad of aggregate underlain with filter cloth located at any point where traffic will be entering or leaving a construction site to or from a public right of way, street, alley, sidewalk, or parking area. The purpose of a stabilized construction entrance is to reduce or eliminate the tracking of sediment onto public rights of way or streets. Reducing tracking of sediments and other pollutants onto paved roads helps prevent deposition of sediments into local storm drains and production of airborne dust.

Where traffic will be entering or leaving the construction site, a stabilized construction entrance should be used. NPDES permits require that appropriate measures be implemented to prevent tracking of sediments onto paved roadways, where a significant source of sediments is derived from mud and dirt carried out from unpaved roads and construction sites.

Stabilized construction entrances are moderately effective in removing sediment from equipment leaving a construction site. The entrance should be built on level ground. Advantages of the Stabilized Construction Entrance/Exit is that it does remove some sediment from equipment and serves to channel construction traffic in and out of the site at specified locations. Efficiency is greatly increased when a washing rack is included as part of a stabilized construction entrance/exit.

Design and Layout

- Construct on level ground where possible.
- Select 3 to 6 in. diameter stones.
- Use minimum depth of stones of 12 in. or as recommended by soils engineer.
- Construct length of 50 ft or maximum site will allow, and 10 ft minimum width or to accommodate traffic.
- Rumble racks constructed of steel panels with ridges and installed in the stabilized entrance/exit will help remove additional sediment and to keep adjacent streets clean.
- Provide ample turning radii as part of the entrance.
- Limit the points of entrance/exit to the construction site.
- Limit speed of vehicles to control dust.
- Properly grade each construction entrance/exit to prevent runoff from leaving the construction site.
- Route runoff from stabilized entrances/exits through a sediment trapping device before discharge.
- Design stabilized entrance/exit to support heaviest vehicles and equipment that will use it.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

Stabilized Construction Entrance/Exit TC-1

- Select construction access stabilization (aggregate, asphaltic concrete, concrete) based on longevity, required performance, and site conditions. Do not use asphalt concrete (AC) grindings for stabilized construction access/roadway.
- If aggregate is selected, place crushed aggregate over geotextile fabric to at least 12 in. depth, or place aggregate to a depth recommended by a geotechnical engineer. A crushed aggregate greater than 3 in. but smaller than 6 in. should be used.
- Designate combination or single purpose entrances and exits to the construction site.
- Require that all employees, subcontractors, and suppliers utilize the stabilized construction access.
- Implement SE-7, Street Sweeping and Vacuuming, as needed.
- All exit locations intended to be used for more than a two-week period should have stabilized construction entrance/exit BMPs.

Inspection and Maintenance

- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities. While activities associated with the BMPs are under way, inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Inspect local roads adjacent to the site daily. Sweep or vacuum to remove visible accumulated sediment.
- Remove aggregate, separate and dispose of sediment if construction entrance/exit is clogged with sediment.
- Keep all temporary roadway ditches clear.
- Check for damage and repair as needed.
- Replace gravel material when surface voids are visible.
- Remove all sediment deposited on paved roadways within 24 hours.
- Remove gravel and filter fabric at completion of construction

Costs

Average annual cost for installation and maintenance may vary from \$1,500 to \$6,100 each, averaging \$3,100 per entrance. Costs will increase with addition of washing rack and sediment trap. With wash rack, costs range from \$1,500 - \$7,700 each, averaging \$4,600 per entrance (All costs adjusted for inflation, 2016 dollars, by Tetra Tech Inc.

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

Access roads, subdivision roads, parking areas, and other onsite vehicle transportation routes should be stabilized immediately after grading, and frequently maintained to prevent erosion and control dust.

Suitable Applications

This BMP should be applied for the following conditions:

- Temporary Construction Traffic:
 - Phased construction projects and offsite road access
 - Construction during wet weather
- Construction roadways and detour roads:
 - Where mud tracking is a problem during wet weather
 - Where dust is a problem during dry weather
 - Adjacent to water bodies
 - Where poor soils are encountered

Limitations

- The roadway must be removed or paved when construction is complete.

- Certain chemical stabilization methods may cause stormwater or soil pollution and should not be used. See WE-1, Wind Erosion Control.
- Management of construction traffic is subject to air quality control measures. Contact the local air quality management agency.
- Materials will likely need to be removed prior to final project grading and stabilization.
- Use of this BMP may not be applicable to very short duration projects.

Implementation

General

Areas that are graded for construction vehicle transport and parking purposes are especially susceptible to erosion and dust. The exposed soil surface is continually disturbed, leaving no opportunity for vegetative stabilization. Such areas also tend to collect and transport runoff waters along their surfaces. During wet weather, they often become muddy quagmires that generate significant quantities of sediment that may pollute nearby streams or be transported offsite on the wheels of construction vehicles. Dirt roads can become so unstable during wet weather that they are virtually unusable.

Efficient construction road stabilization not only reduces onsite erosion but also can significantly speed onsite work, avoid instances of immobilized machinery and delivery vehicles, and generally improve site efficiency and working conditions during adverse weather

Installation/Application Criteria

Permanent roads and parking areas should be paved as soon as possible after grading. As an alternative where construction will be phased, the early application of gravel or chemical stabilization may solve potential erosion and stability problems. Temporary gravel roadway should be considered during the rainy season and on slopes greater than 5%.

Temporary roads should follow the contour of the natural terrain to the maximum extent possible. Slope should not exceed 15%. Roadways should be carefully graded to drain transversely. Provide drainage swales on each side of the roadway in the case of a crowned section or one side in the case of a super elevated section. Simple gravel berms without a trench can also be used.

Installed inlets should be protected to prevent sediment laden water from entering the storm sewer system (SE-10, Storm Drain Inlet Protection). In addition, the following criteria should be considered.

- Road should follow topographic contours to reduce erosion of the roadway.
- The roadway slope should not exceed 15%.
- Chemical stabilizers or water are usually required on gravel or dirt roads to prevent dust (WE-1, Wind Erosion Control).
- Properly grade roadway to prevent runoff from leaving the construction site.
- Design stabilized access to support heaviest vehicles and equipment that will use it.

- Stabilize roadway using aggregate, asphalt concrete, or concrete based on longevity, required performance, and site conditions. The use of cold mix asphalt or asphalt concrete (AC) grindings for stabilized construction roadway is not allowed.
- Coordinate materials with those used for stabilized construction entrance/exit points.
- If aggregate is selected, place crushed aggregate over geotextile fabric to at least 12 in. depth. A crushed aggregate greater than 3 in. but smaller than 6 in. should be used.

Inspection and Maintenance

- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities. While activities associated with the BMP are under way, inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Keep all temporary roadway ditches clear.
- When no longer required, remove stabilized construction roadway and re-grade and repair slopes.
- Periodically apply additional aggregate on gravel roads.
- Active dirt construction roads are commonly watered three or more times per day during the dry season.

Costs

Gravel construction roads are moderately expensive, but cost is often balanced by reductions in construction delay. No additional costs for dust control on construction roads should be required above that needed to meet local air quality requirements.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

Description and Purpose

A tire wash is an area located at stabilized construction access points to remove sediment from tires and undercarriages and to prevent sediment from being transported onto public roadways.

Suitable Applications

Tire washes may be used on construction sites where dirt and mud tracking onto public roads by construction vehicles may occur.

Limitations

- The tire wash requires a supply of wash water.
- A turnout or doublewide exit is required to avoid having entering vehicles drive through the wash area.
- Do not use where wet tire trucks leaving the site leave the road dangerously slick.

Implementation

- Incorporate with a stabilized construction entrance/exit. See TC-1, Stabilized Construction Entrance/Exit.
- Construct on level ground when possible, on a pad of coarse aggregate greater than 3 in. but smaller than 6 in. A geotextile fabric should be placed below the aggregate.
- Wash rack should be designed and constructed/manufactured for anticipated traffic loads.

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

- Provide a drainage ditch that will convey the runoff from the wash area to a sediment trapping device. The drainage ditch should be of sufficient grade, width, and depth to carry the wash runoff.
- Use hoses with automatic shutoff nozzles to prevent hoses from being left on.
- Require that all employees, subcontractors, and others that leave the site with mud caked tires and undercarriages to use the wash facility.
- Implement SC-7, Street Sweeping and Vacuuming, as needed.

Costs

Costs are low for installation of wash rack.

Inspection and Maintenance

- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities. While activities associated with the BMP are under way, inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Inspect BMPs subject to non-stormwater discharge daily while non-stormwater discharges occur.
- Remove accumulated sediment in wash rack and/or sediment trap to maintain system performance.
- Inspect routinely for damage and repair as needed.

Section 4 Non-Stormwater Management and Material Management BMPs

4.1 Non-Stormwater Management BMPs

The [discharge](#) of materials other than [stormwater](#) and authorized [non-stormwater discharges](#) is prohibited by NPDES regulations as well as other local codes and ordinances. It is recognized that certain authorized non-stormwater discharges may be necessary for the completion of construction projects. Such discharges include, but are not limited to, irrigation of vegetative [erosion control](#) measures, and pipe flushing and testing.

Non-stormwater management [BMPs](#) are [source control BMPs](#) that prevent pollution by limiting or reducing potential [pollutants](#) at their source or eliminating off-site discharge. These practices involve day-to-day operations of the construction site and are usually under the control of the contractor. These BMPs are also referred to as “good housekeeping practices,” which involve keeping a clean, orderly construction site.

Non-stormwater management BMPs also include procedures and practices designed to minimize or eliminate the discharge of pollutants from vehicle and equipment cleaning, fueling, and maintenance operations to stormwater drainage systems or to watercourses.

Table 4-1 of this handbook lists the non-stormwater management BMPs. All these BMPs must be implemented depending on the conditions and applicability of deployment described as part of the BMP. The key to implementing these BMPs is to maintain a clean site and keep water, runoff, and run-on away from potential pollutants, including bare soil. In general, conduct construction activities so that: potential pollutants are not discharged directly to drainage systems; generation of potential pollutants is limited; and pollutants that are generated are contained and cleaned up immediately and are therefore not available for later discharge. These BMPs are fundamental to water quality protection and all sites must implement non-stormwater BMPs appropriate for the construction activities being performed.

Table 4-1 Non-Stormwater Management BMPs

BMP#	BMP Name

NS-16	Temporary Batch Plants ^{1,3}
1) BMP fact sheet updated in 2009	
2) BMP fact sheet updated in 2011	
3) BMP fact sheet updated in 2012	

It is recommended that owners and contractors be vigilant regarding implementation of these BMPs, including making their implementation a condition of continued employment, and part of all prime and subcontract agreements. By doing so, the chance of inadvertent violation by an uncaring individual can be prevented, potentially saving thousands of dollars in fines and project delays. Also, if procedures are not properly implemented and/or if BMPs are compromised then the discharge may be subject to additional sampling and analysis requirements for non-visible pollutants contained in the [General Permit](#). (See Section 2.5.4.2. of this handbook)

4.2 Waste Management and Materials Pollution Control BMPs

[Waste management](#) and materials pollution control BMPs, like non-stormwater management BMPs, are source control BMPs that prevent pollution by limiting or reducing potential pollutants at their source before they come in contact with stormwater. These BMPs also involve day-to-day operations of the construction site, and are under the control of the contractor, and are additional “good housekeeping practices,” which involve keeping a clean, orderly construction site. These BMPs are fundamental to water quality protection and all sites must implement waste management and/or materials pollution control non-stormwater BMPs appropriate for the construction activities being performed.

Waste management consists of implementing procedural and structural BMPs for handling, storing, and disposing of wastes generated by a construction project to prevent the release of waste materials into stormwater runoff or discharges through proper management of the following types of wastes:

- Solid
- Sanitary
- Concrete
- Hazardous
- Equipment-related wastes

Materials pollution control (also called materials handling) consists of implementing procedural and structural BMPs in the handling of, storing, and the using of construction materials. The BMPs are intended to prevent the release of pollutants during stormwater and non-stormwater

Table 4-2 Waste Management and Materials Pollution Control BMPs

BMP#	BMP Name

discharges. The objective is to prevent or reduce the opportunity for contamination of stormwater runoff from construction materials by covering and/or providing [secondary containment](#) of storage areas and/or by taking adequate precautions when handling materials. These controls must be implemented for all applicable activities, material usage, and site conditions. The discharge of construction materials or wastes from a site is prohibited.

Table 4-2 of this handbook lists the waste management and materials pollution control BMPs. It is important to note that these BMPs should be implemented depending on the conditions/applicability of deployment described as part of the BMP.

4.3 Fact Sheet Format

A BMP fact sheet is a short document that presents detailed information about a particular BMP. Typically, each fact sheet contains the information outlined in Figure 4-1 of this handbook. Completed fact sheets for each of the above activities are provided in Section 4.4 of this handbook.

The fact sheets also contain side bar presentations with information on BMP categories, targeted constituents, removal effectiveness, and potential alternatives.

4.4 BMP Fact Sheets

BMP fact sheets for non-stormwater management and waste management and materials pollution control follow. The BMP fact sheets are individually page numbered and are suitable for inclusions in SWPPPs. Copies of the fact sheets can be individually downloaded from the CASQA Online BMP Handbook at <http://www.casqa.org>.

BMP fact sheets are guidance and intended to provide a range of information about the BMPs. The BMP fact sheets should not be interpreted as General Permit requirements. CASQA recognizes that there may be alternative public domain and/or proprietary practices performing similar function. Alternative products should be evaluated for project-specific implementation and used if determined to be appropriate by the QSD. Fact sheets do not address site-specific implementation application needs and modifications. The QSD should provide site specific implementation requirements in the SWPPP.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

Description and Purpose

Water conservation practices are activities that use water during the construction of a project in a manner that avoids causing erosion and the transport of pollutants offsite. These practices can reduce or eliminate non-stormwater discharges.

Suitable Applications

Water conservation practices are suitable for all construction sites where water is used, including piped water, metered water, trucked water, and water from a reservoir.

Limitations

- None identified.

Implementation

- Keep water equipment in good working condition.
- Stabilize water truck filling area.
- Repair water leaks promptly.
- Washing of vehicles and equipment on the construction site is discouraged.
- Avoid using water to clean construction areas. If water must be used for cleaning or surface preparation, surface should be swept and vacuumed first to remove dirt. This will minimize amount of water required.

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

- Direct construction water runoff to areas where it can soak into the ground or be collected and used.
- Authorized non-stormwater discharges to the storm drain system, channels, or receiving waters are acceptable with the implementation of appropriate BMPs.
- Lock water tank valves to prevent unauthorized use.

Costs

The cost is small to none compared to the benefits of conserving water.

Inspection and Maintenance

- Inspect and verify that activity based BMPs are in place prior to the commencement of authorized non-stormwater discharges.
- Inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Inspect BMPs subject to non-stormwater discharges daily while non-stormwater discharges are occurring.
- Repair water equipment as needed to prevent unintended discharges.
 - Water trucks
 - Water reservoirs (water buffalos)
 - Irrigation systems
 - Hydrant connections

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

Dewatering operations are practices that manage the discharge of pollutants when non-stormwater and accumulated precipitation (stormwater) must be removed from a work location to proceed with construction work or to provide vector control.

The General Permit incorporates Numeric Action Levels (NAL) for turbidity (see Section 2 of this handbook to determine your project's risk level and if you are subject to these requirements).

Discharges from dewatering operations can contain high levels of fine sediment that, if not properly treated, could lead to exceedances of the General Permit requirements or Basin Plan standards.

The dewatering operations described in this fact sheet are not Active Treatment Systems (ATS) and do not include the use of chemical coagulations, chemical flocculation or electrocoagulation.

Suitable Applications

These practices are implemented for discharges of non-stormwater from construction sites. Non-stormwaters include, but are not limited to, groundwater, water from cofferdams, water diversions, and waters used during construction activities that must be removed from a work area to facilitate construction.

Practices identified in this section are also appropriate for implementation when managing the removal of accumulated

precipitation (stormwater) from depressed areas at a construction site.

Stormwater mixed with non-stormwater should be managed as non-stormwater.

Limitations

- Dewatering operations will require and should comply with applicable local and project-specific permits and regulations. In some areas, all dewatering activities, regardless of the discharge volume, require a dewatering permit.
- Site conditions will dictate design and use of dewatering operations.
- The controls discussed in this fact sheet primarily address sediment. Other secondary pollutant removal benefits are discussed where applicable.
- The controls detailed in this fact sheet only allow for minimal settling time for sediment particles. Use only when site conditions restrict the use of the other control methods.
- Avoid dewatering discharges where possible by using the water for dust control.

Implementation

- A Construction Site Monitoring Plan (CSMP) should be included in the project Stormwater Pollution Prevention Plan (SWPPP).
- Regional Water Quality Control Board (RWQCB) Regions may require notification and approval prior to any discharge of water from construction sites.
- The destination of discharge from dewatering activities will typically determine the type of permit required for the discharge. For example, when discharging to a water of the U.S., a dewatering permit may be required through the site's governing RWQCB. When discharging to a sanitary sewer or Municipal Separate Storm Sewer System (MS4), a permit may need to be obtained from the owner of the sanitary sewer or MS4 in addition to obtaining an RWQCB dewatering permit. Additional permits or permissions from other agencies may be required for dewatering cofferdams or diversions.
- Dewatering discharges should not cause erosion at the discharge point. Appropriate BMPs should be implemented to maintain compliance with all applicable permits.
- Maintain dewatering records in accordance with all local and project-specific permits and regulations.

Sediment Treatment

A variety of methods can be used to treat water during dewatering operations. Several devices are presented below and provide options to achieve sediment removal. The sediment particle size and permit or receiving water limitations on sediment or turbidity are key considerations for selecting sediment treatment option(s); in some cases, the use of multiple devices may be appropriate. Use of other enhanced treatment methods (i.e., introduction of chemicals or electric current to enhance flocculation and removal of sediment) must comply with: 1) for storm drain or surface water discharges, the requirements for Active Treatment Systems (see SE-11); or 2) for sanitary sewer discharges, the requirements of applicable sanitary sewer discharge permits.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

Sediment Basin (see also SE-2)

Description:

- A sediment basin is a temporary basin with a controlled release structure that is formed by excavation or construction of an embankment to detain sediment-laden runoff and allow sediment to settle out before discharging. Sediment basins are generally larger than Sediment Traps (SE-3) and have a designed outlet structure.

Appropriate Applications:

- Effective for the removal of trash, gravel, sand, silt, some metals that settle out with the sediment.

Implementation:

- Excavation and construction of related facilities is required.
- Temporary sediment basins should be fenced if safety is a concern.
- Outlet protection is required to prevent erosion at the outfall location.

Maintenance:

- Maintenance is required for safety fencing, vegetation, embankment, inlet and outlet, as well as other features.
- Removal of sediment is required when the storage volume is reduced by one-third.

Sediment Trap (See also SE-3)

Description:

- A sediment trap is a temporary basin formed by excavation and/or construction of an earthen embankment across a waterway or low drainage area to detain sediment-laden runoff and allow sediment to settle out before discharging. Sediment traps are generally smaller than Sediment Basins (SE-2) and do not have a designed outlet (but do have a spillway or overflow).

Appropriate Applications:

Effective for the removal of large and medium sized particles (sand and gravel) and some metals that settle out with the sediment.

Implementation:

- Excavation and construction of related facilities is required.
- Trap inlets should be located to maximize the travel distance to the trap outlet.
- Use rock or vegetation to protect the trap outlets against erosion.

Maintenance:

- Maintenance is required for vegetation, embankment, inlet and outfall structures, as well as other features.
- Removal of sediment is required when the storage volume is reduced by one-third.

Weir Tanks

Description:

- A weir tank separates water and waste by using weirs. The configuration of the weirs (over and under weirs) maximizes the residence time in the tank and determines the waste to be removed from the water, such as oil, grease, and sediments.

Appropriate Applications:

- The tank removes trash, some settleable solids (gravel, sand, and silt), some visible oil and grease, and some metals (removed with sediment). To achieve high levels of flow, multiple tanks can be used in parallel. If additional treatment is desired, the tanks can be placed in series or as pre-treatment for other methods.

Implementation:

- Tanks are delivered to the site by the vendor, who can provide assistance with set-up and operation.
- Tank size will depend on flow volume, constituents of concern, and residency period required. Vendors should be consulted to appropriately size tank.
- Treatment capacity (i.e., volume and number of tanks) should provide at a minimum the required volume for discrete particle settling for treatment design flows.

Maintenance:

- Periodic cleaning is required based on visual inspection or reduced flow.
- Oil and grease disposal should be conducted by a licensed waste disposal company.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

Dewatering Tanks

Description:

- A dewatering tank removes debris and sediment. Flow enters the tank through the top, passes through a fabric filter, and is discharged through the bottom of the tank. The filter separates the solids from the liquids.

Appropriate Applications:

- The tank removes trash, gravel, sand, and silt, some visible oil and grease, and some metals (removed with sediment). To achieve high levels of flow, multiple tanks can be used in parallel. If additional treatment is desired, the tanks can be placed in series or as pre-treatment for other methods.

Implementation:

- Tanks are delivered to the site by the vendor, who can provide assistance with set-up and operation.
- Tank size will depend on flow volume, constituents of concern, and residency period required. Vendors should be consulted to appropriately size tank.

Maintenance:

- Periodic cleaning is required based on visual inspection or reduced flow.
- Oil and grease disposal should be conducted by licensed waste disposal company.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

Gravity Bag Filter

Description:

- A gravity bag filter, also referred to as a dewatering bag, is a square or rectangular bag made of non-woven geotextile fabric that collects gravel, sand, silt, and fines.

Appropriate Applications:

- Effective for the removal of sediments (gravel, sand, silt, and fines). Some metals are removed with the sediment.

Implementation:

- Water is pumped into one side of the bag and seeps through the top, bottom, and sides of the bag.
- Place filter bag on pavement or a gravel bed or paved surface. Avoid placing a dewatering bag on unprotected bare soil. If placing the bag on bare soil is unavoidable, a secondary barrier should be used, such as a rock filter bed placed beneath and beyond the edges of the bag to, prevent erosion and capture sediments that escape the bag.
- Perimeter control around the downstream end of the bag should be implemented. Secondary sediment controls are important especially in the initial stages of discharge, which tend to allow fines to pass through the bag.

Maintenance:

- Inspection of the flow conditions, bag condition, bag capacity, and the secondary barrier (as applicable) is required.
- Replace the bag when it no longer filters sediment or passes water at a reasonable rate.
- Caution should be taken when removing and disposing of the bag, to prevent the release of captured sediment
- Properly dispose of the bag offsite. If sediment is removed from the bag prior to disposal (bags can potentially be reused depending upon their condition), dispose of sediment in accordance with the general maintenance procedures described at the end of this BMP Fact Sheet.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

Sand Media Particulate Filter

Description:

- Water is treated by passing it through canisters filled with sand media. Generally, sand filters provide a final level of treatment. They are often used as a secondary or higher level of treatment after a significant amount of sediment and other pollutants have been removed using other methods.

Appropriate Applications:

- Effective for the removal of trash, gravel, sand, and silt and some metals, as well as the reduction of biochemical oxygen demand (BOD) and turbidity.
- Sand filters can be used for stand-alone treatment or in conjunction with bag and cartridge filtration if further treatment is required.
- Sand filters can also be used to provide additional treatment to water treated via settling or basic filtration.

Implementation:

- The filters require delivery to the site and initial set up. The vendor can provide assistance with installation and operation.

Maintenance:

- The filters require regular service to monitor and maintain the level of the sand media. If subjected to high loading rates, filters can plug quickly.
- Venders generally provide data on maximum head loss through the filter. The filter should be monitored daily while in use and cleaned when head loss reaches target levels.
- If cleaned by backwashing, the backwash water may need to be hauled away for disposal or returned to the upper end of the treatment train for another pass through the series of dewatering BMPs.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

Pressurized Bag Filter

Description:

- A pressurized bag filter is a unit composed of single filter bags made from polyester felt material. The water filters through the unit and is discharged through a header. Vendors provide bag filters in a variety of configurations. Some units include a combination of bag filters and cartridge filters for enhanced contaminant removal.

Appropriate Applications:

- Effective for the removal of sediment (sand and silt) and some metals, as well as the reduction of BOD, turbidity, and hydrocarbons. Oil absorbent bags are available for hydrocarbon removal.
- Filters can be used to provide secondary treatment to water treated via settling or basic filtration.

Implementation:

- The filters require delivery to the site and initial set up. The vendor can provide assistance with installation and operation.

Maintenance:

- The filter bags require replacement when the pressure differential equals or exceeds the manufacturer's recommendation.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

Cartridge Filter

Description:

- Cartridge filters provide a high degree of pollutant removal by utilizing a number of individual cartridges as part of a larger filtering unit. They are often used as a secondary or higher (polishing) level of treatment after a significant amount of sediment and other pollutants are removed. Units come with various cartridge configurations (for use in series with bag filters) or with a larger single cartridge filtration unit (with multiple filters within).

Appropriate Applications:

- Effective for the removal of sediment (sand, silt, and some clays) and metals, as well as the reduction of BOD, turbidity, and hydrocarbons. Hydrocarbons can effectively be removed with special resin cartridges.
- Filters can be used to provide secondary treatment to water treated via settling or basic filtration.

Implementation:

- The filters require delivery to the site and initial set up. The vendor can provide assistance.

Maintenance:

- The cartridges require replacement when the pressure differential equals or exceeds the manufacturer's recommendation.

Costs

- Sediment control costs vary considerably depending on the dewatering and sediment treatment system that is selected. Pressurized filters tend to be more expensive than gravity settling but are often more effective. Simple tanks are generally rented on a long-term basis (one or more months) and can range from \$460 per month for a 1,000-gallon tank to \$3,400 per month for a 10,000-gallon tank (adjusted for inflation, 2016 dollars, by Tetra Tech Inc.). Mobilization and demobilization costs vary considerably.

Inspection and Maintenance

- Inspect and verify that dewatering BMPs are in place and functioning prior to the commencement of activities requiring dewatering.
- Inspect dewatering BMPs daily while dewatering activities are being conducted.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

- Inspect all equipment before use. Monitor dewatering operations to ensure they do not cause offsite discharge or erosion.
- Sample dewatering discharges as required by the General Permit.
- Unit-specific maintenance requirements are included with the description of each unit.
- Sediment removed during the maintenance of a dewatering device may be either spread onsite and stabilized or disposed of at a disposal site as approved by the owner.
- Sediment that is commingled with other pollutants should be disposed of in accordance with all applicable laws and regulations and as approved by the owner.

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

Prevent or reduce the discharge of pollutants from paving operations, using measures to prevent runoff and runoff pollution, properly disposing of wastes, and training employees and subcontractors.

The General Permit incorporates Numeric Action Levels (NAL) for pH and turbidity (see Section 2 of this handbook to determine your project’s risk level and if you are subject to these requirements).

Many types of construction materials associated with paving and grinding operations, including mortar, concrete, and cement and their associated wastes have basic chemical properties that can raise pH levels outside of the permitted range. Additional care should be taken when managing these materials to prevent them from coming into contact with stormwater flows, which could lead to exceedances of the General Permit requirements.

Suitable Applications

These procedures are implemented where paving, surfacing, resurfacing, or sawcutting, may pollute stormwater runoff or discharge to the storm drain system or watercourses.

Limitations

- Paving opportunities may be limited during wet weather.

Discharges of freshly paved surfaces may raise pH to environmentally harmful levels and trigger permit violations.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

Implementation

General

- Avoid paving during the wet season when feasible.
- Reschedule paving and grinding activities if rain is forecasted.
- Train employees and sub-contractors in pollution prevention and reduction.
- Store materials away from drainage courses to prevent stormwater runoff (see WM-1, Material Delivery and Storage).
- Protect drainage courses, particularly in areas with a grade, by employing BMPs to divert runoff or to trap and filter sediment.
- Stockpile material removed from roadways away from drain inlets, drainage ditches, and watercourses. These materials should be stored consistent with WM-3, Stockpile Management.
- Disposal of PCC (Portland cement concrete) and AC (asphalt concrete) waste should be in conformance with WM-8, Concrete Waste Management.

Saw Cutting, Grinding, and Pavement Removal

- Shovel or vacuum saw-cut slurry and remove from site. Cover or barricade storm drains during saw cutting to contain slurry.
- When paving involves AC, the following steps should be implemented to prevent the discharge of grinding residue, uncompacted or loose AC, tack coats, equipment cleaners, or unrelated paving materials:
 - AC grindings, pieces, or chunks used in embankments or shoulder backing should not be allowed to enter any storm drains or watercourses. Install inlet protection and perimeter controls until area is stabilized (i.e. cutting, grinding or other removal activities are complete and loose material has been properly removed and disposed of) or permanent controls are in place. Examples of temporary perimeter controls can be found in EC-9, Earth Dikes and Drainage Swales; SE-1, Silt Fence; SE-5, Fiber Rolls, or SE-13 Compost Socks and Berms
 - Collect and remove all broken asphalt and recycle when practical. Old or spilled asphalt should be recycled or disposed of properly.
- Do not allow saw-cut slurry to enter storm drains or watercourses. Residue from grinding operations should be picked up by a vacuum attachment to the grinding machine, or by sweeping, should not be allowed to flow across the pavement, and should not be left on the surface of the pavement. See also WM-8, Concrete Waste Management, and WM-10, Liquid Waste Management.
- Pavement removal activities should not be conducted in the rain.
- Collect removed pavement material by mechanical or manual methods. This material may be recycled for use as shoulder backing or base material.

- If removed pavement material cannot be recycled, transport the material back to an approved storage site.

Asphaltic Concrete Paving

- If paving involves asphaltic cement concrete, follow these steps:
 - Do not allow sand or gravel placed over new asphalt to wash into storm drains, streets, or creeks. Vacuum or sweep loose sand and gravel and properly dispose of this waste by referring to WM-5, Solid Waste Management.
 - Old asphalt should be disposed of properly. Collect and remove all broken asphalt from the site and recycle whenever possible.

Portland Cement Concrete Paving

- Do not wash sweepings from exposed aggregate concrete into a storm drain system. Collect waste materials by dry methods, such as sweeping or shoveling, and return to aggregate base stockpile or dispose of properly. Allow aggregate rinse to settle. Then, either allow rinse water to dry in a temporary pit as described in WM-8, Concrete Waste Management, or pump the water to the sanitary sewer if authorized by the local wastewater authority.

Sealing Operations

- During chip seal application and sweeping operations, petroleum or petroleum covered aggregate should not be allowed to enter any storm drain or water courses. Apply temporary perimeter controls until structure is stabilized (i.e. all sealing operations are complete and cured and loose materials have been properly removed and disposed).
- Inlet protection (SE-10, Storm Drain Inlet Protection) should be used during application of seal coat, tack coat, slurry seal, and fog seal.
- Seal coat, tack coat, slurry seal, or fog seal should not be applied if rainfall is predicted to occur during the application or curing period.

Paving Equipment

- Leaks and spills from paving equipment can contain toxic levels of heavy metals and oil and grease. Place drip pans or absorbent materials under paving equipment when not in use. Clean up spills with absorbent materials and dispose of in accordance with the applicable regulations. See NS-10, Vehicle and Equipment Maintenance, WM-4, Spill Prevention and Control, and WM-10, Liquid Waste Management.
- Substances used to coat asphalt transport trucks and asphalt spreading equipment should not contain soap and should be non-foaming and non-toxic.
- Paving equipment parked onsite should be parked over plastic to prevent soil contamination.
- Clean asphalt coated equipment offsite whenever possible. When cleaning dry, hardened asphalt from equipment, manage hardened asphalt debris as described in WM-5, Solid Waste Management. Any cleaning onsite should follow NS-8, Vehicle and Equipment Cleaning.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

Thermoplastic Striping

- Thermoplastic striper and pre-heater equipment shutoff valves should be inspected to ensure that they are working properly to prevent leaking thermoplastic from entering drain inlets, the stormwater drainage system, or watercourses.
- Pre-heaters should be filled carefully to prevent splashing or spilling of hot thermoplastic. Leave six inches of space at the top of the pre-heater container when filling thermoplastic to allow room for material to move.
- Do not pre-heat, transfer, or load thermoplastic near drain inlets or watercourses.
- Clean truck beds daily of loose debris and melted thermoplastic. When possible, recycle thermoplastic material.

Raised/Recessed Pavement Marker Application and Removal

- Do not transfer or load bituminous material near drain inlets, the stormwater drainage system, or watercourses.
- Melting tanks should be loaded with care and not filled to beyond six inches from the top to leave room for splashing.
- When servicing or filling melting tanks, ensure all pressure is released before removing lids to avoid spills.
- On large-scale projects, use mechanical or manual methods to collect excess bituminous material from the roadway after removal of markers.

Costs

- All of the above are low cost measures.

Inspection and Maintenance

- Inspect and verify that activity-based BMPs are in place prior to the commencement of paving and grinding operations.
- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Sample stormwater runoff required by the General Permit.
- Keep ample supplies of drip pans or absorbent materials onsite.
- Inspect and maintain machinery regularly to minimize leaks and drips.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

Description and Purpose

A temporary stream crossing is a temporary culvert, ford or bridge placed across a waterway to provide access for construction purposes for a period of less than one year. Temporary access crossings are not intended to maintain traffic for the public. The temporary access will eliminate erosion and downstream sedimentation caused by vehicles.

Suitable Applications

Temporary stream crossings should be installed at all designated crossings of perennial and intermittent streams on the construction site, as well as for dry channels that may be significantly eroded by construction traffic.

Temporary streams crossings are installed at sites:

- Where appropriate permits have been secured (404 Permits, and 401 Certifications)
- Where construction equipment or vehicles need to frequently cross a waterway
- When alternate access routes impose significant constraints
- When crossing perennial streams or waterways causes significant erosion
- Where construction activities will not last longer than one year

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

- Where appropriate permits have been obtained for the stream crossing

Limitations

The following limitations may apply:

- Installation and removal will usually disturb the waterway.
- Installation may require Regional Water Quality Control Board (RWQCB) 401 Certification, U.S. Army Corps of Engineers 404 permit and approval by California Department of Fish and Game. If numerical-based water quality standards are mentioned in any of these and other related permits, testing and sampling may be required.
- Installation may require dewatering or temporary diversion of the stream. See NS-2, Dewatering Operations and NS-5, Clear Water Diversion.
- Installation may cause a constriction in the waterway, which can obstruct flood flow and cause flow backups or washouts. If improperly designed, flow backups can increase the pollutant load through washouts and scouring.
- Use of natural or other gravel in the stream for construction of Cellular Confinement System (CCS) ford crossing will be contingent upon approval by fisheries agencies.
- Ford crossings may degrade water quality due to contact with vehicles and equipment.
- May be expensive for a temporary improvement.
- Requires other BMPs to minimize soil disturbance during installation and removal.
- Fords should only be used in dry weather.

Implementation

General

The purpose of this BMP is to provide a safe, erosion-free access across a stream for construction equipment. Minimum standards and specifications for the design, construction, maintenance, and removal of the structure should be established by an engineer registered in California. Temporary stream crossings may be necessary to prevent construction equipment from causing erosion of the stream and tracking sediment and other pollutants into the stream.

Temporary stream crossings are used as access points to construction sites when other detour routes may be too long or burdensome for the construction equipment. Often heavy construction equipment must cross streams or creeks, and detour routes may impose too many constraints such as being too narrow or poor soil strength for the equipment loadings. Additionally, the contractor may find a temporary stream crossing more economical for light-duty vehicles to use for frequent crossings and may have less environmental impact than construction of a temporary access road.

Location of the temporary stream crossing should address:

- Site selection where erosion potential is low.

- Areas where the side slopes from site runoff will not spill into the side slopes of the crossing.

The following types of temporary stream crossings should be considered:

- **Culverts** – A temporary culvert is effective in controlling erosion but will cause erosion during installation and removal. A temporary culvert can be easily constructed and allows for heavy equipment loads.
- **Fords** - Appropriate during the dry season in arid areas. Used on dry washes and ephemeral streams, and low-flow perennial streams. CCS, a type of ford crossing, is also appropriate for use in streams that would benefit from an influx of gravels. A temporary ford provides little sediment and erosion control and is ineffective in controlling erosion in the stream channel. A temporary ford is the least expensive stream crossing and allows for maximum load limits. It also offers very low maintenance. Fords are more appropriate during the dry ice season and in arid areas of California.
- **Bridges** - Appropriate for streams with high flow velocities, steep gradients and where temporary restrictions in the channel are not allowed.

Design

During the long summer construction season in much of California, rainfall is infrequent, and many streams are dry. Under these conditions, a temporary ford may be sufficient. A ford is not appropriate if construction will continue through the winter rainy season, if summer thunderstorms are likely, or if the stream flows during most of the year. Temporary culverts and bridges should then be considered and, if used, should be sized to pass a significant design storm (i.e., at least a 10-year storm). The temporary stream crossing should be protected against erosion, both to prevent excessive sedimentation in the stream and to prevent washout of the crossing.

Design and installation requires knowledge of stream flows and soil strength. Designs should be prepared under direction of, and approved by, a registered civil engineer and for bridges, a registered structural engineer. Both hydraulic and construction loading requirements should be considered with the following:

- Comply with any special requirements for culvert and bridge crossings, particularly if the temporary stream crossing will remain through the rainy season.
- Provide stability in the crossing and adjacent areas to withstand the design flow. The design flow and safety factor should be selected based on careful evaluation of the risks due to over topping, flow backups, or washout.
- Install sediment traps immediately downstream of crossings to capture sediments. See SE-3, Sediment Trap.
- Avoid oil or other potentially hazardous materials for surface treatment.
- Culverts are relatively easy to construct and able to support heavy equipment loads.
- Fords are the least expensive of the crossings, with maximum load limits.

- CCS crossing structures consist of clean, washed gravel and cellular confinement system blocks. CCS are appropriate for streams that would benefit from an influx of gravel; for example, salmonid streams, streams or rivers below reservoirs, and urban, channelized streams. Many urban stream systems are gravel-deprived due to human influences, such as dams, gravel mines, and concrete channels.
- CCS allow designers to use either angular or naturally occurring rounded gravel, because the cells provide the necessary structure and stability. In fact, natural gravel is optimal for this technique, because of the habitat improvement it will provide after removal of the CCS.
- A gravel depth of 6 to 12 in. for a CCS structure is sufficient to support most construction equipment.
- An advantage of a CCS crossing structure is that relatively little rock or gravel is needed, because the CCS provides the stability.
- Bridges are generally more expensive to design and construct but provide the least disturbance of the streambed and constriction of the waterway flows.

Construction and Use

- Stabilize construction roadways, adjacent work area, and stream bottom against erosion.
- Construct during dry periods to minimize stream disturbance and reduce costs.
- Construct at or near the natural elevation of the streambed to prevent potential flooding upstream of the crossing.
- Install temporary erosion control BMPs in accordance with erosion control BMP fact sheets to minimize erosion of embankment into flow lines.
- Any temporary artificial obstruction placed within flowing water should only be built from material, such as clean gravel or sandbags, that will not introduce sediment or silt into the watercourse.
- Temporary water body crossings and encroachments should be constructed to minimize scour. Cobbles used for temporary water body crossings or encroachments should be clean, rounded river cobble.
- Vehicles and equipment should not be driven, operated, fueled, cleaned, maintained, or stored in the wet or dry portions of a water body where wetland vegetation, riparian vegetation, or aquatic organisms may be destroyed.
- The exterior of vehicles and equipment that will encroach on the water body within the project should be maintained free of grease, oil, fuel, and residues.
- Drip pans should be placed under all vehicles and equipment placed on docks, barges, or other structures over water bodies when the vehicle or equipment is planned to be idle for more than one hour.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

- Disturbance or removal of vegetation should not exceed the minimum necessary to complete operations. Precautions should be taken to avoid damage to vegetation by people or equipment. Disturbed vegetation should be replaced with the appropriate soil stabilization measures.
- Riparian vegetation, when removed pursuant to the provisions of the work, should be cut off no lower than ground level to promote rapid re-growth. Access roads and work areas built over riparian vegetation should be covered by a sufficient layer of clean river run cobble to prevent damage to the underlying soil and root structure. The cobble must be removed upon completion of project activities.
- Conceptual temporary stream crossings are shown in the attached figures.

Costs

Caltrans Construction Cost index for temporary bridge crossings is \$58-\$122/ft² (costs adjusted for inflation, 2016 dollars, by Tetra Tech Inc.).

Inspection and Maintenance

- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities. While activities associated with the BMP are under way, inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Check for blockage in the channel, sediment buildup or trapped debris in culverts, blockage behind fords or under bridges.
- Check for erosion of abutments, channel scour, riprap displacement, or piping in the soil.
- Check for structural weakening of the temporary crossings, such as cracks, and undermining of foundations and abutments.
- Remove sediment that collects behind fords, in culverts, and under bridges periodically.
- Replace lost or displaced aggregate from inlets and outlets of culverts and cellular confinement systems.
- Remove temporary crossing promptly when it is no longer needed.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

Description and Purpose

Clear water diversion consists of a system of structures and measures that intercept clear surface water runoff upstream of a project, transport it around the work area, and discharge it downstream with minimal water quality degradation from either the project construction operations or the construction of the diversion. Clear water diversions are used in a waterway to enclose a construction area and reduce sediment pollution from construction work occurring in or adjacent to water. Structures commonly used as part of this system include diversion ditches, berms, dikes, slope drains, rock, gravel bags, wood, aqua barriers, cofferdams, filter fabric or turbidity curtains, drainage and interceptor swales, pipes, or flumes.

Suitable Applications

A clear water diversion is typically implemented where appropriate permits (1601 Agreement) have been secured and work must be performed in a flowing stream or water body.

- Clear water diversions are appropriate for isolating construction activities occurring within or near a water body such as streambank stabilization, or culvert, bridge, pier or abutment installation. They may also be used in combination with other methods, such as clear water bypasses and/or pumps.
- Pumped diversions are suitable for intermittent and low flow streams.
- Excavation of a temporary bypass channel or passing the flow through a heavy pipe (called a "flume") with a trench

excavated under it, is appropriate for the diversion of streams less than 20 ft wide, with flow rates less than 100 cfs.

- Clear water diversions incorporating clean washed gravel may be appropriate for use in salmonid spawning streams.

Limitations

- Diversion and encroachment activities will usually disturb the waterway during installation and removal of diversion structures.
- Installation may require Regional Water Quality Control Board (RWQCB) 401 Certification, U.S. Army Corps of Engineers 404 permit and approval by California Department of Fish and Game. If numerical-based water quality standards are mentioned in any of these and other related permits, testing and sampling may be required.
- Diversion and encroachment activities may constrict the waterway, which can obstruct flood flows and cause flooding or washouts. Diversion structures should not be installed without identifying potential impacts to the stream channel.
- Diversion or isolation activities are not appropriate in channels where there is insufficient stream flow to support aquatic species in the area dewatered as a result of the diversion.
- Diversion or isolation activities are inappropriate in deep water unless designed or reviewed by an engineer registered in California.
- Diversion or isolation activities should not completely dam stream flow.
- Dewatering and removal may require additional sediment control or water treatment. See NS-2, Dewatering Operations.
- Not appropriate if installation, maintenance, and removal of the structures will disturb sensitive aquatic species of concern.

Implementation

General

- Implement guidelines presented in EC-12, Streambank Stabilization to minimize impacts to streambanks.
- Where working areas encroach on flowing streams, barriers adequate to prevent the flow of muddy water into streams should be constructed and maintained between working areas and streams. During construction of the barriers, muddying of streams should be held to a minimum.
- Diversion structures must be adequately designed to accommodate fluctuations in water depth or flow volume due to tides, storms, flash floods, etc.
- Heavy equipment driven in wet portions of a water body to accomplish work should be completely clean of petroleum residue, and water levels should be below the fuel tanks, gearboxes, and axles of the equipment unless lubricants and fuels are sealed such that inundation by water will not result in discharges of fuels, oils, greases, or hydraulic fluids.

- Excavation equipment buckets may reach out into the water for the purpose of removing or placing fill materials. Only the bucket of the crane/ excavator/backhoe may operate in a water body. The main body of the crane/excavator/backhoe should not enter the water body except as necessary to cross the stream to access the work site.
- Stationary equipment such as motors and pumps located within or adjacent to a water body, should be positioned over drip pans.
- When any artificial obstruction is being constructed, maintained, or placed in operation, sufficient water should, at all times, be allowed to pass downstream to maintain aquatic life.
- Equipment should not be parked below the high-water mark unless allowed by a permit.
- Disturbance or removal of vegetation should not exceed the minimum necessary to complete operations. Precautions should be taken to avoid damage to vegetation by people or equipment. Disturbed vegetation should be replaced with the appropriate erosion control measures.
- Riparian vegetation approved for trimming as part of the project should be cut off no lower than ground level to promote rapid re-growth. Access roads and work areas built over riparian vegetation should be covered by a sufficient layer of clean river run cobble to prevent damage to the underlying soil and root structure. The cobble should be removed upon completion of project activities.
- Drip pans should be placed under all vehicles and equipment placed on docks, barges, or other structures over water bodies when the vehicle or equipment is planned to be idle for more than 1 hour.
- Where possible, avoid or minimize diversion and encroachment impacts by scheduling construction during periods of low flow or when the stream is dry. Scheduling should also consider seasonal releases of water from dams, fish migration and spawning seasons, and water demands due to crop irrigation.
- Construct diversion structures with materials free of potential pollutants such as soil, silt, sand, clay, grease, or oil.

Temporary Diversions and Encroachments

- Construct diversion channels in accordance with EC-9, Earth Dikes and Drainage Swales.
- In high flow velocity areas, stabilize slopes of embankments and diversion ditches using an appropriate liner, in accordance with EC-7, Geotextiles and Mats, or use rock slope protection.
- Where appropriate, use natural streambed materials such as large cobbles and boulders for temporary embankment and slope protection, or other temporary soil stabilization methods.
- Provide for velocity dissipation at transitions in the diversion, such as the point where the stream is diverted to the channel and the point where the diverted stream is returned to its natural channel. See also EC-10, Velocity Dissipation Devices.

Temporary Dry Construction Areas

- When dewatering behind temporary structures to create a temporary dry construction area, such as cofferdams, pass pumped water through a sediment-settling device, such as a portable tank or settling basin, before returning water to the water body. See also NS-2, Dewatering Operations.
- Any substance used to assemble or maintain diversion structures, such as form oil, should be non-toxic and non-hazardous.
- Any material used to minimize seepage underneath diversion structures, such as grout, should be non-toxic, non-hazardous, and as close to a neutral pH as possible.

Comparison of Diversion and Isolation Techniques:

- Gravel bags are relatively inexpensive, but installation and removal can be labor intensive. It is also difficult to dewater the isolated area. Sandbags should not be used for this technique in rivers or streams, as sand should never be put into or adjacent to a stream, even if encapsulated in geotextile.
- Gravel Bag Berms (SE-6) used in conjunction with an impermeable membrane are cost effective and can be dewatered relatively easily. If spawning gravel is used, the impermeable membrane can be removed from the stream, and the gravel can be spread out and left as salmonid spawning habitat if approved in the permit. Only clean, washed gravel should be used for both the gravel bag and gravel berm techniques.
- Cofferdams are relatively expensive, but frequently allow full dewatering. Also, many options now available are relatively easy to install.
- Sheet pile enclosures are a much more expensive solution but do allow full dewatering. This technique is not well suited to small streams, but can be effective on large rivers or lakes, and where staging and heavy equipment access areas are available.
- K-rails are an isolation method that does not allow full dewatering, but can be used in small to large watercourses, and in fast-water situations.
- A relatively inexpensive isolation method is filter fabric isolation. This method involves placement of gravel bags or continuous berms to 'key-in' the fabric, and subsequently staking the fabric in place. This method should be used in relatively calm water and can be used in smaller streams. Note that this is not a dewatering method, but rather a sediment isolation method.
- Turbidity curtains should be used where sediment discharge to a stream is unavoidable. They can also be used for in-stream construction, when dewatering an area is not required.
- When used in watercourses or streams, cofferdams must be used in accordance with permit requirements.
- Manufactured diversion structures should be installed following manufacturer's specifications.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

- Filter fabric and turbidity curtain isolation installation methods can be found in the specific technique descriptions that follow.

Filter Fabric Isolation Technique

Definition and Purpose

A filter fabric isolation structure is a temporary structure built into a waterway to enclose a construction area and reduce sediment pollution from construction work in or adjacent to water. This structure is composed of filter fabric, gravel bags, and steel t-posts.

Appropriate Applications

- Filter fabric may be used for construction activities such as streambank stabilization, or culvert, bridge, pier or abutment installation. It may also be used in combination with other methods, such as clean water bypasses and/or pumps.
- Filter fabric isolation is relatively inexpensive. This method involves placement of gravel bags or continuous berms to 'key-in' the fabric, and subsequently staking the fabric in place.
- If spawning gravel is used, all other components of the isolation can be removed from the stream, and the gravel may be spread out and left as salmonid spawning habitat if approved in the permit. Whether spawning gravel or other types of gravel are used, only clean washed gravel should be used as infill for the gravel bags or continuous berm.
- This method should be used in relatively calm water and can be used in smaller streams. This is not a dewatering method, but rather a sediment isolation method.
- Water levels inside and outside the fabric curtain must be about the same, as differential heads will cause the curtain to collapse.

Limitations

- Do not use if the installation, maintenance and removal of the structures will disturb sensitive aquatic species of concern.
- Filter fabrics are not appropriate for projects where dewatering is necessary.
- Filter fabrics are not appropriate to completely dam stream flow.

Design and Installation

- For the filter fabric isolation method, a non-woven or heavy-duty fabric is recommended over standard silt fence. Using rolled geotextiles allows non-standard widths to be used.
- Anchor filter fabric with gravel bags filled with clean, washed gravel. Do not use sand. If a bag should split open, the gravel can be left in the stream, where it can provide aquatic habitat benefits. If a sandbag splits open in a watercourse, the sand could cause a decrease in water quality, and could bury sensitive aquatic habitat.
- Another anchor alternative is a continuous berm, made with the Continuous Berm Machine. This is a gravel-filled bag that can be made in very long segments. The length of the berms is usually limited to 18 ft for ease of handling (otherwise, it gets too heavy to move).

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

- Place the fabric on the bottom of the stream, and place either a bag of clean, washed gravel or a continuous berm over the bottom of the silt fence fabric, such that a bag-width of fabric lies on the stream bottom. The bag should be placed on what will be the outside of the isolation area.
- Pull the fabric up and place a metal t-post immediately behind the fabric, on the inside of the isolation area; attach the silt fence to the post with three diagonal nylon ties.
- Continue placing fabric as described above until the entire work area has been isolated, staking the fabric at least every 6 ft.

Inspection and Maintenance

- Immediately repair any gaps, holes or scour.
- Remove and properly dispose of sediment buildup.
- Remove BMP upon completion of construction activity. Recycle or reuse if applicable.
- Revegetate areas disturbed by BMP removal if needed.

Turbidity Curtain Isolation Technique

Definition and Purpose

A turbidity curtain is a fabric barrier used to isolate the near shore work area. The barriers are intended to confine the suspended sediment. The curtain is a floating barrier, and thus does not prevent water from entering the isolated area; rather, it prevents suspended sediment from getting out.

Appropriate Applications

Turbidity curtains should be used where sediment discharge to a stream is unavoidable. They are used when construction activities adjoin quiescent waters, such as lakes, ponds, and slow flowing rivers. The curtains are designed to deflect and contain sediment within a limited area and provide sufficient retention time so that the sediment particles will fall out of suspension.

Limitations

- Turbidity curtains should not be used in flowing water; they are best suited for use in ponds, lakes, and very slow-moving rivers.
- Turbidity curtains should not be placed across the width of a channel.
- Removing sediment that has been deflected and settled out by the curtain may create a discharge problem through the resuspension of particles and by accidental dumping by the removal equipment.

Design and Installation

- Turbidity curtains should be oriented parallel to the direction of flow.
- The curtain should extend the entire depth of the watercourse in calm-water situations.
- In wave conditions, the curtain should extend to within 1 ft of the bottom of the watercourse, such that the curtain does not stir up sediment by hitting the bottom repeatedly. If it is

desirable for the curtain to reach the bottom in an active-water situation, a pervious filter fabric may be used for the bottom 1 ft.

- The top of the curtain should consist of flexible flotation buoys, and the bottom should be held down by a load line incorporated into the curtain fabric. The fabric should be a brightly colored impervious mesh.
- The curtain should be held in place by anchors placed at least every 100 ft.
- First, place the anchors, then tow the fabric out in a furled condition, and connect to the anchors. The anchors should be connected to the flotation devices, and not to the bottom of the curtain. Once in place, cut the furling lines, and allow the bottom of the curtain to sink.
- Consideration must be given to the probable outcome of the removal procedure. It must be determined if it will create more of a sediment problem through re-suspension of the particles or by accidental dumping of material during removal. It is recommended that the soil particles trapped by the turbidity curtain only be removed if there has been a significant change in the original contours of the affected area in the watercourse.
- Particles should always be allowed to settle for a minimum of 6 to 12 hours prior to their removal or prior to removal of the turbidity curtain.

Maintenance and Inspection:

- The curtain should be inspected for holes or other problems, and any repairs needed should be made promptly.
- Allow sediment to settle for 6 to 12 hours prior to removal of sediment or curtain. This means that after removing sediment, wait an additional 6 to 12 hours before removing the curtain.
- To remove, install furling lines along the curtain, detach from anchors, and tow out of the water.

K-rail River Isolation

Definition and Purpose

This temporary sediment control or stream isolation method uses K-rails to form the sediment deposition area, or to isolate the in-stream or near-bank construction area.

Barriers are placed end-to-end in a pre-designed configuration and gravel-filled bags are used at the toe of the barrier and at their abutting ends to seal and prevent movement of sediment beneath or through the barrier walls.

Appropriate Applications

The K-rail isolation can be used in streams with higher water velocities than many other isolation techniques.

- This technique is also useful at the toe of embankments and cut or fill slopes.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

Limitations

- The K-rail method should not be used to dewater a project site, as the barrier is not watertight.

Design and Installation

- To create a floor for the K-rail, move large rocks and obstructions. Place washed gravel and gravel-filled bags to create a level surface for K-rails to sit. Washed gravel should always be used.
- Place the bottom two K-rails adjacent to each other, and parallel to the direction of flow; fill the center portion with gravel bags. Then place the third K-rail on top of the bottom two. There should be sufficient gravel bags between the bottom K-rails such that the top rail is supported by the gravel. Place plastic sheeting around the K-rails, and secure at the bottom with gravel bags.
- Further support can be added by pinning and cabling the K-rails together. Also, large riprap and boulders can be used to support either side of the K-rail, especially where there is strong current.

Inspection and Maintenance:

- The barrier should be inspected, and any leaks, holes, or other problems should be addressed immediately.
- Sediment should be allowed to settle for at least 6 to 12 hours prior to removal of sediment, and for 6 to 12 hours prior to removal of the barrier.

Stream Diversions

The selection of which stream diversion technique to use will depend upon the type of work involved, physical characteristics of the site, and the volume of water flowing through the project.

Advantages of a Pumped Diversion

- Downstream sediment transport can be nearly eliminated.
- Dewatering of the work area is possible.
- Pipes can be moved around to allow construction operations.
- The dams can serve as temporary access to the site.
- Increased flows can be managed by adding more pumping capacity.

Disadvantages of a Pumped Diversion

- Flow volume is limited by pump capacity.
- A pumped diversion requires 24-hour monitoring of pumps.
- Sudden rain could overtop dams.
- Erosion at the outlet.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

- Minor in-stream disturbance is required to install and remove dams.

Advantages of Excavated Channels and Flumes

- Excavated channels isolate work from water flow and allow dewatering.
- Excavated channels can handle larger flows than pumps.

Disadvantages of Excavated Channels and Flumes

- Bypass channel or flume must be sized to handle flows, including possible floods.
- Channels must be protected from erosion.
- Flow diversion and re-direction with small dams involves in-stream disturbance and mobilization of sediment.

Design and Installation

- Installation guidelines will vary based on existing site conditions and type of diversion used.
- Pump capacity must be sufficient for design flow.
- A standby pump is required in case a primary pump fails.
- Dam materials used to create dams upstream and downstream of diversion should be erosion resistant; materials such as steel plate, sheet pile, sandbags, continuous berms, inflatable water bladders, etc., would be acceptable.

When constructing a diversion channel, begin excavation of the channel at the proposed downstream end, and work upstream. Once the watercourse to be diverted is reached and the excavated channel is stable, breach the upstream end and allow water to flow down the new channel. Once flow has been established in the diversion channel, install the diversion weir in the main channel; this will force all water to be diverted from the main channel.

Inspection and Maintenance

- Pumped diversions require 24-hour monitoring of pumps.
- Inspect embankments and diversion channels for damage to the linings, accumulating debris, sediment buildup, and adequacy of the slope protection. Remove debris and repair linings and slope protection as required. Remove holes, gaps, or scour.
- Upon completion of work, the diversion or isolation structure should be removed, and flow should be redirected through the new culvert or back into the original stream channel. Recycle or reuse if applicable.
- Revegetate areas disturbed by BMP removal if needed.

Costs

Costs of clear water diversion vary considerably and can be very high.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

Inspection and Maintenance

- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities. While activities associated with the BMP are under way, inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Inspect BMPs subject to non-stormwater discharges daily while non-stormwater discharges occur.
- Refer to BMP-specific inspection and maintenance requirements.

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

Procedures and practices designed for construction contractors to recognize illicit connections or illegally dumped or discharged materials on a construction site and report incidents.

Suitable Applications

This best management practice (BMP) applies to all construction projects. Illicit connection/discharge and reporting is applicable anytime an illicit connection or discharge is discovered, or illegally dumped material is found on the construction site.

Limitations

Illicit connections and illegal discharges or dumping, for the purposes of this BMP, refer to discharges and dumping caused by parties other than the contractor. If pre-existing hazardous materials or wastes are known to exist onsite, they should be identified in the SWPPP and handled as set forth in the SWPPP.

Implementation

Planning

- Review the SWPPP. Pre-existing areas of contamination should be identified and documented in the SWPPP.
- Inspect site before beginning the job for evidence of illicit connections, illegal dumping or discharges. Document any pre-existing conditions and notify the owner.

- Inspect site regularly during project execution for evidence of illicit connections, illegal dumping or discharges.
- Observe site perimeter for evidence for potential of illicitly discharged or illegally dumped material, which may enter the job site.

Identification of Illicit Connections and Illegal Dumping or Discharges

- **General** – unlabeled and unidentifiable material should be treated as hazardous.
- **Solids** - Look for debris, or rubbish piles. Solid waste dumping often occurs on roadways with light traffic loads or in areas not easily visible from the traveled way.
- **Liquids** - signs of illegal liquid dumping or discharge can include:
 - Visible signs of staining or unusual colors to the pavement or surrounding adjacent soils
 - Pungent odors coming from the drainage systems
 - Discoloration or oily substances in the water or stains and residues detained within ditches, channels or drain boxes
 - Abnormal water flow during the dry weather season
- **Urban Areas** - Evidence of illicit connections or illegal discharges is typically detected at storm drain outfall locations or at manholes. Signs of an illicit connection or illegal discharge can include:
 - Abnormal water flow during the dry weather season
 - Unusual flows in sub drain systems used for dewatering
 - Pungent odors coming from the drainage systems
 - Discoloration or oily substances in the water or stains and residues detained within ditches, channels or drain boxes
 - Excessive sediment deposits, particularly adjacent to or near active offsite construction projects
- **Rural Areas** - Illicit connections or illegal discharges involving irrigation drainage ditches are detected by visual inspections. Signs of an illicit discharge can include:
 - Abnormal water flow during the non-irrigation season
 - Non-standard junction structures
 - Broken concrete or other disturbances at or near junction structures

Reporting

Notify the owner of any illicit connections and illegal dumping or discharge incidents at the time of discovery. For illicit connections or discharges to the storm drain system, notify the local stormwater management agency. For illegal dumping, notify the local law enforcement agency.

Cleanup and Removal

The responsibility for cleanup and removal of illicit or illegal dumping or discharges will vary by location. Contact the local stormwater management agency for further information.

Costs

Costs to look for and report illicit connections and illegal discharges and dumping are low. The best way to avoid costs associated with illicit connections and illegal discharges and dumping is to keep the project perimeters secure to prevent access to the site, to observe the site for vehicles that should not be there, and to document any waste or hazardous materials that exist onsite before taking possession of the site.

Inspection and Maintenance

- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities. While activities associated with the BMP are under way, inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Inspect the site regularly to check for any illegal dumping or discharge.
- Prohibit employees and subcontractors from disposing of non-job-related debris or materials at the construction site.
- Notify the owner of any illicit connections and illegal dumping or discharge incidents at the time of discovery.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

Description and Purpose

Potable Water/Irrigation consists of practices and procedures to manage the discharge of potential pollutants generated during discharges from irrigation water lines, landscape irrigation, lawn or garden watering, planned and unplanned discharges from potable water sources, water line flushing, and hydrant flushing.

Suitable Applications

Implement this BMP whenever potable water or irrigation water discharges occur at or enter a construction site.

Limitations

None identified.

Implementation

- Direct water from offsite sources around or through a construction site, where feasible, in a way that minimizes contact with the construction site.
- Discharges from water line flushing should be reused for landscaping purposes where feasible.
- Shut off the water source to broken lines, sprinklers, or valves as soon as possible to prevent excess water flow.
- Protect downstream stormwater drainage systems and watercourses from water pumped or bailed from trenches excavated to repair water lines.

Oil and Grease	
Organics	<input checked="" type="checkbox"/>

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

- Inspect irrigated areas within the construction limits for excess watering. Adjust watering times and schedules to ensure that the appropriate amount of water is being used and to minimize runoff. Consider factors such as soil structure, grade, time of year, and type of plant material in determining the proper amounts of water for a specific area.

Costs

Cost to manage potable water and irrigation are low and generally considered to be a normal part of related activities.

Inspection and Maintenance

- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities. While activities associated with the BMP are under way, inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Inspect BMPs subject to non-stormwater discharges daily while non-stormwater discharges occur.
- Repair broken water lines as soon as possible.
- Inspect irrigated areas regularly for signs of erosion and/or discharge.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

Description and Purpose

Vehicle and equipment cleaning procedures and practices eliminate or reduce the discharge of pollutants to stormwater from vehicle and equipment cleaning operations. Procedures and practices include but are not limited to: using offsite facilities; washing in designated, contained areas only; eliminating discharges to the storm drain by infiltrating the wash water; and training employees and subcontractors in proper cleaning procedures.

Suitable Applications

These procedures are suitable on all construction sites where vehicle and equipment cleaning is performed.

Limitations

Even phosphate-free, biodegradable soaps have been shown to be toxic to fish before the soap degrades. Sending vehicles/equipment offsite should be done in conjunction with TC-1, Stabilized Construction Entrance/Exit.

Implementation

Other options to washing equipment onsite include contracting with either an offsite or mobile commercial washing business. These businesses may be better equipped to handle and dispose of the wash waters properly. Performing this work offsite can also be economical by eliminating the need for a separate washing operation onsite.

If washing operations are to take place onsite, then:

- Secondary Objective

Targeted Constituents

Sediment	<input checked="" type="checkbox"/>
Nutrients	<input checked="" type="checkbox"/>
Trash	
Metals	
Bacteria	
Oil and Grease	<input checked="" type="checkbox"/>
Organics	<input checked="" type="checkbox"/>

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

- Use phosphate-free, biodegradable soaps.
- Educate employees and subcontractors on pollution prevention measures.
- Do not permit steam cleaning onsite. Steam cleaning can generate significant pollutant concentrates.
- Cleaning of vehicles and equipment with soap, solvents or steam should not occur on the project site unless resulting wastes are fully contained and disposed of. Resulting wastes should not be discharged or buried and must be captured and recycled or disposed according to the requirements of WM-10, Liquid Waste Management or WM-6, Hazardous Waste Management, depending on the waste characteristics. Minimize use of solvents. Use of diesel for vehicle and equipment cleaning is prohibited.
- All vehicles and equipment that regularly enter and leave the construction site must be cleaned offsite.
- When vehicle and equipment washing and cleaning must occur onsite, and the operation cannot be located within a structure or building equipped with appropriate disposal facilities, the outside cleaning area should have the following characteristics:
 - Located away from storm drain inlets, drainage facilities, or watercourses
 - Paved with concrete or asphalt and bermed to contain wash waters and to prevent runoff and runoff
 - Configured with a sump to allow collection and disposal of wash water
 - No discharge of wash waters to storm drains or watercourses
 - Used only when necessary
- When cleaning vehicles and equipment with water:
 - Use as little water as possible. High-pressure sprayers may use less water than a hose and should be considered
 - Use positive shutoff valve to minimize water usage
 - Facility wash racks should discharge to a sanitary sewer, recycle system or other approved discharge system and must not discharge to the storm drainage system, watercourses, or to groundwater

Costs

Cleaning vehicles and equipment at an offsite facility may reduce overall costs for vehicle and equipment cleaning by eliminating the need to provide similar services onsite. When onsite cleaning is needed, the cost to establish appropriate facilities is relatively low on larger, long-duration projects, and moderate to high on small, short-duration projects.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

Inspection and Maintenance

- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities. While activities associated with the BMP are under way, inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Inspect BMPs subject to non-stormwater discharges daily while non-stormwater discharges occur.
- Inspection and maintenance is minimal, although some berm repair may be necessary.
- Monitor employees and subcontractors throughout the duration of the construction project to ensure appropriate practices are being implemented.
- Inspect sump regularly and remove liquids and sediment as needed.
- Prohibit employees and subcontractors from washing personal vehicles and equipment on the construction site.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

Description and Purpose

Vehicle equipment fueling procedures and practices are designed to prevent fuel spills and leaks and reduce or eliminate contamination of stormwater. This can be accomplished by using offsite facilities, fueling in designated areas only, enclosing or covering stored fuel, implementing spill controls, and training employees and subcontractors in proper fueling procedures.

Suitable Applications

These procedures are suitable on all construction sites where vehicle and equipment fueling takes place.

Limitations

Onsite vehicle and equipment fueling should only be used where it is impractical to send vehicles and equipment offsite for fueling. Sending vehicles and equipment offsite should be done in conjunction with TC-1, Stabilized Construction Entrance/ Exit.

Implementation

- Use offsite fueling stations as much as possible. These businesses are better equipped to handle fuel and spills properly. Performing this work offsite can also be economical by eliminating the need for a separate fueling area at a site.
- Discourage “topping-off” of fuel tanks.

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

- Absorbent spill cleanup materials and spill kits should be available in fueling areas and on fueling trucks and should be disposed of properly after use.
- Drip pans or absorbent pads should be used during vehicle and equipment fueling, unless the fueling is performed over an impermeable surface in a dedicated fueling area.
- Use absorbent materials on small spills. Do not hose down or bury the spill. Remove the adsorbent materials promptly and dispose of properly.
- Avoid mobile fueling of mobile construction equipment around the site; rather, transport the equipment to designated fueling areas. With the exception of tracked equipment such as bulldozers and large excavators, most vehicles should be able to travel to a designated area with little lost time.
- Train employees and subcontractors in proper fueling and cleanup procedures.
- When fueling must take place onsite, designate an area away from drainage courses to be used. Fueling areas should be identified in the SWPPP.
- Dedicated fueling areas should be protected from stormwater runoff and should be located at least 50 ft away from downstream drainage facilities and watercourses. Fueling must be performed on level-grade areas.
- Protect fueling areas with berms and dikes to prevent runoff, and to contain spills.
- Nozzles used in vehicle and equipment fueling should be equipped with an automatic shutoff to control drips. Fueling operations should not be left unattended.
- Use vapor recovery nozzles to help control drips as well as air pollution where required by Air Quality Management Districts (AQMD).
- Federal, state, and local requirements should be observed for any stationary above ground storage tanks.

Costs

- All of the above measures are low cost except for the capital costs of above ground tanks that meet all local environmental, zoning, and fire codes.

Inspection and Maintenance

- Inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Vehicles and equipment should be inspected each day of use for leaks. Leaks should be repaired immediately, or problem vehicles or equipment should be removed from the project site.
- Keep ample supplies of spill cleanup materials onsite.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

- Immediately clean up spills and properly dispose of contaminated soil and cleanup materials.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

Vehicle & Equipment Maintenance NS-10

Description and Purpose

Prevent or reduce the contamination of stormwater resulting from vehicle and equipment maintenance by running a “dry and clean site”. The best option would be to perform maintenance activities at an offsite facility. If this option is not available then work should be performed in designated areas only, while providing cover for materials stored outside, checking for leaks and spills, and containing and cleaning up spills immediately. Employees and subcontractors must be trained in proper procedures.

Suitable Applications

These procedures are suitable on all construction projects where an onsite yard area is necessary for storage and maintenance of heavy equipment and vehicles.

Limitations

Onsite vehicle and equipment maintenance should only be used where it is impractical to send vehicles and equipment offsite for maintenance and repair. Sending vehicles/equipment offsite should be done in conjunction with TC-1, Stabilized Construction Entrance/Exit.

Outdoor vehicle or equipment maintenance is a potentially significant source of stormwater pollution. Activities that can contaminate stormwater include engine repair and service, changing or replacement of fluids, and outdoor equipment storage and parking (engine fluid leaks). For further information on vehicle or equipment servicing, see NS-8,

Vehicle & Equipment Maintenance NS-10

Vehicle and Equipment Cleaning, and NS-9, Vehicle and Equipment Fueling.

Implementation

- Use offsite repair shops as much as possible. These businesses are better equipped to handle vehicle fluids and spills properly. Performing this work offsite can also be economical by eliminating the need for a separate maintenance area.
- If maintenance must occur onsite, use designated areas, located away from drainage courses. Dedicated maintenance areas should be protected from stormwater runoff and should be located at least 50 ft from downstream drainage facilities and watercourses.
- Drip pans or absorbent pads should be used during vehicle and equipment maintenance work that involves fluids, unless the maintenance work is performed over an impermeable surface in a dedicated maintenance area.
- Place a stockpile of spill cleanup materials where it will be readily accessible.
- All fueling trucks and fueling areas are required to have spill kits and/or use other spill protection devices.
- Use adsorbent materials on small spills. Remove the absorbent materials promptly and dispose of properly.
- Inspect onsite vehicles and equipment daily at startup for leaks, and repair immediately.
- Keep vehicles and equipment clean; do not allow excessive build-up of oil and grease.
- Segregate and recycle wastes, such as greases, used oil or oil filters, antifreeze, cleaning solutions, automotive batteries, hydraulic and transmission fluids. Provide secondary containment and covers for these materials if stored onsite.
- Train employees and subcontractors in proper maintenance and spill cleanup procedures.
- Drip pans or plastic sheeting should be placed under all vehicles and equipment placed on docks, barges, or other structures over water bodies when the vehicle or equipment is planned to be idle for more than 1 hour.
- For long-term projects, consider using portable tents or covers over maintenance areas if maintenance cannot be performed offsite.
- Consider use of new, alternative greases and lubricants, such as adhesive greases, for chassis lubrication and fifth-wheel lubrication.
- Properly dispose of used oils, fluids, lubricants, and spill cleanup materials.
- Do not place used oil in a dumpster or pour into a storm drain or watercourse.
- Properly dispose of or recycle used batteries.
- Do not bury used tires.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

Vehicle & Equipment Maintenance NS-10

- Repair leaks of fluids and oil immediately.

Listed below is further information if you must perform vehicle or equipment maintenance onsite.

Safer Alternative Products

- Consider products that are less toxic or hazardous than regular products. These products are often sold under an “environmentally friendly” label.
- Consider use of grease substitutes for lubrication of truck fifth-wheels. Follow manufacturers label for details on specific uses.
- Consider use of plastic friction plates on truck fifth-wheels in lieu of grease. Follow manufacturers label for details on specific uses.

Waste Reduction

Parts are often cleaned using solvents such as trichloroethylene, trichloroethane, or methylene chloride. Many of these cleaners are listed in California Toxic Rule as priority pollutants. These materials are harmful and must not contaminate stormwater. They must be disposed of as a hazardous waste. Reducing the number of solvents makes recycling easier and reduces hazardous waste management costs. Often, one solvent can perform a job as well as two different solvents. Also, if possible, eliminate or reduce the amount of hazardous materials and waste by substituting non-hazardous or less hazardous materials. For example, replace chlorinated organic solvents with non-chlorinated solvents. Non-chlorinated solvents like kerosene or mineral spirits are less toxic and less expensive to dispose of properly. Check the list of active ingredients to see whether it contains chlorinated solvents. The “chlor” term indicates that the solvent is chlorinated. Also, try substituting a wire brush for solvents to clean parts.

Recycling and Disposal

Separating wastes allows for easier recycling and may reduce disposal costs. Keep hazardous wastes separate, do not mix used oil solvents, and keep chlorinated solvents (like, -trichloroethane) separate from non-chlorinated solvents (like kerosene and mineral spirits). Promptly transfer used fluids to the proper waste or recycling drums. Don't leave full drip pans or other open containers lying around. Provide cover and secondary containment until these materials can be removed from the site.

Oil filters can be recycled. Ask your oil supplier or recycler about recycling oil filters.

Do not dispose of extra paints and coatings by dumping liquid onto the ground or throwing it into dumpsters. Allow coatings to dry or harden before disposal into covered dumpsters.

Store cracked batteries in a non-leaking secondary container. Do this with all cracked batteries, even if you think all the acid has drained out. If you drop a battery, treat it as if it is cracked. Put it into the containment area until you are sure it is not leaking.

Costs

All of the above are low cost measures. Higher costs are incurred to setup and maintain onsite maintenance areas.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

Vehicle & Equipment Maintenance NS-10

Inspection and Maintenance

- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities. While activities associated with the BMP are under way, inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Inspect BMPs subject to non-stormwater discharges daily while non-stormwater discharges occur.
- Keep ample supplies of spill cleanup materials onsite.
- Maintain waste fluid containers in leak proof condition.
- Vehicles and equipment should be inspected on each day of use. Leaks should be repaired immediately, or the problem vehicle(s) or equipment should be removed from the project site.
- Inspect equipment for damaged hoses and leaky gaskets routinely. Repair or replace as needed.

Blueprint for a Clean Bay: Best Management Practices to Prevent Stormwater Pollution from Construction Related Activities; Santa Clara Valley Nonpoint Source Pollution Control Program, 1995.

Coastal Nonpoint Pollution Control Program; Program Development and Approval Guidance, Working Group, Working Paper; USEPA, April 1992.

Stormwater Quality Handbooks - Construction Site Best Management Practices (BMPs) Manual, State of California Department of Transportation (Caltrans), November 2000.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

Description and Purpose

The construction and retrofit of bridges and retaining walls often include driving piles for foundation support and shoring operations. Driven piles are typically constructed of precast concrete, steel, or timber. Driven sheet piles are also used for shoring and cofferdam construction. Proper control and use of equipment, materials, and waste products from pile driving operations will reduce or eliminate the discharge of potential pollutants to the storm drain system, watercourses, and waters of the United States.

Suitable Applications

These procedures apply to all construction sites near or adjacent to a watercourse or groundwater where permanent and temporary pile driving (impact and vibratory) takes place, including operations using pile shells as well as construction of cast-in-steel-shell and cast-in-drilled-hole piles.

Limitations

None identified.

Implementation

- Use drip pans or absorbent pads during vehicle and equipment operation, maintenance, cleaning, fueling, and storage. Refer to NS-8, Vehicle and Equipment Cleaning, NS-9, Vehicle and Equipment Fueling, and NS-10, Vehicle and Equipment Maintenance.

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

- Have spill kits and cleanup materials available at all locations of pile driving. Refer to WM-4, Spill Prevention and Control.
- Equipment that is stored or in use in streambeds, or on docks, barges, or other structures over water bodies should be kept leak free.
- Park equipment over plastic sheeting or equivalent where possible. Plastic is not a substitute for drip pans or absorbent pads. The storage or use of equipment in streambeds or other bodies of water must comply with all applicable permits.
- Implement other BMPs as applicable, such as NS-2, Dewatering Operations, WM-5, Solid Waste Management, WM-6, Hazardous Waste Management, and WM-10, Liquid Waste Management.
- When not in use, store pile-driving equipment away from concentrated flows of stormwater, drainage courses, and inlets. Protect hammers and other hydraulic attachments from runoff and runoff by placing them on plywood and covering them with plastic or a comparable material prior to the onset of rain.
- Use less hazardous products, e.g., vegetable oil, when practicable.

Costs

All of the above measures can be low cost.

Inspection and Maintenance

- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities. While activities associated with the BMP are under way, inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Inspect BMPs subject to non-stormwater discharges daily while non-stormwater discharges occur.
- Inspect equipment every day at startup and repair equipment as needed (i.e., worn or damaged hoses, fittings, and gaskets). Recheck equipment at shift changes or at the end of the day and scheduled repairs as needed.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

Description and Purpose

Concrete curing is used in the construction of structures such as bridges, retaining walls, pump houses, large slabs, and structured foundations. Concrete curing includes the use of both chemical and water methods.

Concrete and its associated curing materials have basic chemical properties that can raise the pH of water to levels outside of the permitted range. Discharges of stormwater and non-stormwater exposed to concrete during curing may have a high pH and may contain chemicals, metals, and fines. The General Permit incorporates Numeric Action Levels (NAL) for pH (see Section 2 of this handbook to determine your project's risk level and if you are subject to these requirements).

Proper procedures and care should be taken when managing concrete curing materials to prevent them from coming into contact with stormwater flows, which could result in a high pH discharge.

Suitable Applications

Suitable applications include all projects where Portland Cement Concrete (PCC) and concrete curing chemicals are placed where they can be exposed to rainfall, runoff from other areas, or where runoff from the PCC will leave the site.

Limitations

- Runoff contact with concrete waste can raise pH levels in the water to environmentally harmful levels and trigger permit violations.

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Implementation

Chemical Curing

- Avoid over spray of curing compounds.
- Minimize the drift by applying the curing compound close to the concrete surface. Apply an amount of compound that covers the surface but does not allow any runoff of the compound.
- Use proper storage and handling techniques for concrete curing compounds. Refer to WM-1, Material Delivery and Storage.
- Protect drain inlets prior to the application of curing compounds.
- Refer to WM-4, Spill Prevention and Control.

Water Curing for Bridge Decks, Retaining Walls, and other Structures

- Direct cure water away from inlets and watercourses to collection areas for evaporation or other means of removal in accordance with all applicable permits. See WM-8 Concrete Waste Management.
- Collect cure water at the top of slopes and transport to a concrete waste management area in a non-erosive manner. See EC-9 Earth Dikes and Drainage Swales, EC-10, Velocity Dissipation Devices, and EC-11, Slope Drains.
- Utilize wet blankets or a similar method that maintains moisture while minimizing the use and possible discharge of water.

Education

- Educate employees, subcontractors, and suppliers on proper concrete curing techniques to prevent contact with discharge as described herein.
- Arrange for the QSP or the appropriately trained contractor's superintendent or representative to oversee and enforce concrete curing procedures.

Costs

All of the above measures are generally low cost.

Inspection and Maintenance

- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities.
- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Inspect BMPs subject to non-stormwater discharges daily while non-stormwater discharges occur.

- Sample non-stormwater discharges and stormwater runoff that contacts uncured and partially cured concrete as required by the General Permit.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

- Ensure that employees and subcontractors implement appropriate measures for storage, handling, and use of curing compounds.
- Inspect cure containers and spraying equipment for leaks.

Description and Purpose

Concrete finishing methods are used for bridge deck rehabilitation, paint removal, curing compound removal, and final surface finish appearances. Methods include sand blasting, shot blasting, grinding, or high-pressure water blasting. Stormwater and non-stormwater exposed to concrete finishing by-products may have a high pH and may contain chemicals, metals, and fines. Proper procedures and implementation of appropriate BMPs can minimize the impact that concrete-finishing methods may have on stormwater and non-stormwater discharges.

The General Permit incorporates Numeric Action Levels (NAL) for pH (see Section 2 of this handbook to determine your project's risk level and if you are subject to these requirements).

Concrete and its associated curing materials have basic chemical properties that can raise pH levels outside of the permitted range. Additional care should be taken when managing these materials to prevent them from coming into contact with stormwater flows, which could lead to exceedances of the General Permit requirements.

Suitable Applications

These procedures apply to all construction locations where concrete finishing operations are performed.

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Limitations

- Runoff contact with concrete waste can raise pH levels in the water to environmentally harmful levels and trigger permit violations.

Implementation

- Collect and properly dispose of water from high-pressure water blasting operations.
- Collect contaminated water from blasting operations at the top of slopes. Transport or dispose of contaminated water while using BMPs such as those for erosion control. Refer to EC-9, Earth Dikes and Drainage Swales, EC-10, Velocity Dissipation Devices, and EC-11, Slope Drains.
- Direct water from blasting operations away from inlets and watercourses to collection areas for infiltration or other means of removal (dewatering). Refer to NS-2 Dewatering Operations.
- Protect inlets during sandblasting operations. Refer to SE-10, Storm Drain Inlet Protection.
- Refer to WM-8, Concrete Waste Management for disposal of concrete debris.
- Minimize the drift of dust and blast material as much as possible by keeping the blasting nozzle close to the surface.
- When blast residue contains a potentially hazardous waste, refer to WM-6, Hazardous Waste Management.

Education

- Educate employees, subcontractors, and suppliers on proper concrete finishing techniques to prevent contact with discharge as described herein.
- Arrange for the QSP or the appropriately trained contractor's superintendent or representative to oversee and enforce concrete finishing procedures.

Costs

These measures are generally of low cost.

Inspection and Maintenance

- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities.
- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Inspect BMPs subject to non-stormwater discharges daily while non-stormwater discharges occur.
- Sample non-stormwater discharges and stormwater runoff that contacts concrete dust and debris as required by the General Permit.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

- Sweep or vacuum up debris from sandblasting at the end of each shift.
- At the end of each work shift, remove and contain liquid and solid waste from containment structures, if any, and from the general work area.
- Inspect containment structures for damage prior to use and prior to onset of forecasted rain.

Stormwater Management for Construction Activities, Developing Pollution Prevention Plans and Best Management Practices, EPA 832-R-92005; USEPA, April 1992.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

Description and Purpose

Procedures for the proper use, storage, and disposal of materials and equipment on barges, boats, temporary construction pads, or similar locations that minimize or eliminate the discharge of potential pollutants to a watercourse.

Suitable Applications

Applies where materials and equipment are used on barges, boats, docks, and other platforms over or adjacent to a watercourse including waters of the United States. These procedures should be implemented for construction materials and wastes (solid and liquid), soil or dredging materials, or any other materials that may cause or contribute to exceedances of water quality standards.

Limitations

Dredge and fill activities are regulated by the US Army Corps of Engineers and Regional Boards under Section 404/401 of the Clean Water Act.

Implementation

- Refer to WM-1, Material Delivery and Storage and WM-4, Spill Prevention and Control.
- Use drip pans and absorbent materials for equipment and vehicles and ensure that an adequate supply of spill clean up materials is available.
- Drip pans should be placed under all vehicles and equipment placed on (docks, barges, or other structures over

water bodies when the vehicle or equipment is expected to be idle for more than 1 hour.

- Maintain equipment in accordance with NS-10, Vehicle and Equipment Maintenance. If a leaking line cannot be repaired, remove equipment from over the water.
- Provide watertight curbs or toe boards to contain spills and prevent materials, tools, and debris from leaving the barge, platform, dock, etc.
- Secure all materials to prevent discharges to receiving waters via wind.
- Identify types of spill control measures to be employed, including the storage of such materials and equipment. Ensure that staff is trained regarding the use of the materials, deployment and access of control measures, and reporting measures.
- In case of spills, contact the local Regional Board as soon as possible but within 48 hours.
- Refer to WM-5, Solid Waste Management (non-hazardous) and WM-6, Hazardous Waste Management. Ensure the timely and proper removal of accumulated wastes
- Comply with all necessary permits required for construction within or near the watercourse, such as Regional Water Quality Control Board, U.S. Army Corps of Engineers, Department of Fish and Game or and other local permitting.
- Discharges to waterways should be reported to the Regional Water Quality Control Board immediately upon discovery. A written discharge notification must follow within 7 days. Follow the spill reporting procedures contained in SWPPP.

Costs

These measures are generally of low to moderate cost. Exceptions are areas for temporary storage of materials, engine fluids, or wastewater pump out.

Inspection and Maintenance

- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities. While activities associated with the BMP are under way, inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Inspect BMPs subject to non-stormwater discharge daily while non-stormwater discharges occur.
- Ensure that employees and subcontractors implement the appropriate measures for storage and use of materials and equipment.
- Inspect and maintain all associated BMPs and perimeter controls to ensure continuous protection of the water courses, including waters of the United States.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

Description and Purpose

Procedures to protect water bodies from debris and wastes associated with structure demolition or removal over or adjacent to watercourses.

Suitable Applications

Full bridge demolition and removal, partial bridge removal (barrier rail, edge of deck) associated with bridge widening projects, concrete channel removal, or any other structure removal that could potentially affect water quality.

Limitations

None identified.

Implementation

- Refer to NS-5, Clear Water Diversion, to direct water away from work areas.
- Use attachments on construction equipment such as backhoes to catch debris from small demolition operations.
- Use covers or platforms to collect debris.
- Platforms and covers are to be approved by the owner.
- Stockpile accumulated debris and waste generated during demolition away from watercourses and in accordance with WM-3, Stockpile Management.
- Ensure safe passage of wildlife, as necessary.

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

- Discharges to waterways shall be reported to the Regional Water Quality Control Board immediately upon discovery. A written discharge notification must follow within 7 days. Follow the spill reporting procedures in the SWPPP.
- For structures containing hazardous materials, i.e., lead paint or asbestos, refer to BMP WM-6, Hazardous Waste Management. For demolition work involving soil excavation around lead-painted structures, refer to WM-7, Contaminated Soil Management.

Costs

Cost may vary according to the combination of practices implemented.

Inspection and Maintenance

- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities. While activities associated with the BMP are under way, inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Inspect BMPs subject to non-stormwater discharge daily while non-stormwater discharges occur.
- Any debris-catching devices shall be emptied regularly. Collected debris shall be removed and stored away from the watercourse and protected from runoff.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

Description and Purpose

The construction of roads, bridges, retaining walls, and other large structures in remote areas, often requires temporary batch plant facilities to manufacture Portland Cement Concrete (PCC) or asphalt cement (AC). Temporary batch plant facilities typically consist of silos containing fly ash, lime, and cement; heated tanks of liquid asphalt; sand and gravel material storage areas; mixing equipment; above ground storage tanks containing concrete additives and water; and designated areas for sand and gravel truck unloading, concrete truck loading, and concrete truck washout. Proper control and use of equipment, materials, and waste products from temporary batch plant facilities will reduce the discharge of potential pollutants to the storm drain system or watercourses, reduce air emissions, and mitigate noise impacts.

The General Permit draft incorporates Numeric Action Levels (NAL) for pH (see Section 2 of this handbook to determine your project's risk level and if you are subject to these requirements). Many types of batch plant materials, including mortar, concrete, cement and block and their associated wastes have basic chemical properties that can raise pH levels outside of the permitted range. Additional care should be taken when managing these materials to prevent them from coming into contact with stormwater flows which may cause an exceedance of the General Permit requirements.

Suitable Applications

These procedures typically apply to construction sites where temporary batch plant facilities are used; however, some of the

Organics	

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

practices described are applicable to construction sites with general concrete use.

Limitations

The General Permit for discharges of stormwater associated with industrial activities (General Industrial Permit) may be applicable to temporary batch plants.

Specific permit requirements or mitigation measures such as Air Resources Board (ARB), Air Quality Management District (AQMD), Air Pollution Control District (APCD, Regional Water Quality Control Board (RWQCB), county ordinances and city ordinances may require alternative mitigation measures for temporary batch plants. Contact the local regulatory agencies to determine if a permit is required.

Implementation

Planning

- Temporary batch plants may be subject to the General Industrial Permit. To obtain a copy of this permit and the application forms, visit <http://www.waterboards.ca.gov> or contact the State Water Resources Control Board.
- Proper planning, design, and construction of temporary batch plants should be implemented to minimize potential water quality, air pollution, and noise impacts associated with temporary batch plants.
- BMPs and a Construction Site Monitoring Plan (CSMP) should be included in the project Stormwater Pollution Prevention Plan (SWPPP). BMPs should be implemented, inspected, and maintained in accordance with these plans.
- Temporary batch plants should be managed to comply with AQMD Statewide Registration Program and/or local AQMD Portable Equipment Registration requirements.
- Construct temporary batch plants downwind of existing developments whenever possible.
- Placement of access roads should be planned to mitigate water and air quality impacts.

Layout and Design

- Temporary batch plants should be properly located and designed to mitigate water quality impacts to receiving water bodies. Batch plants should be located away from watercourses, drainage courses, and drain inlets. Batch plants should be located to minimize the potential for stormwater runoff onto the site.
- Temporary batch plant facilities (including associated stationary equipment and stockpiles) should be located at least 300 ft from any recreational area, school, residence, or other structure not associated with the construction project.
- Construct continuous interior AC or PCC berms around batch plant equipment (mixing equipment, silos, concrete drop points, conveyor belts, admixture tanks, etc.) to facilitate proper containment and cleanup of releases. Rollover or flip top curbs or dikes should be placed at ingress and egress points (SE-12, Temporary Silt Dike).
- Direct runoff from the paved or unpaved portion of the batch plant into a sump and pipe to a lined washout area or dewatering tank.

- Direct stormwater and non-stormwater runoff from unpaved portions of batch plant facility to catchment ponds or tanks.
- Construct and remove concrete washout facilities in accordance with WM-8, Concrete Waste Management.
- Layout of a typical batch plant and associated BMP is located at the end of this BMP fact sheet.

Operational Procedures

- Washout of concrete trucks should be conducted in a designated area in accordance with WM-8, Concrete Waste Management.
- Do not dispose of concrete into drain inlets, the stormwater drainage system, or watercourses.
- Washing of concrete mixing and transport equipment (including concrete truck washout) should occur in a designated area in accordance with WM-8, Concrete Waste Management.
- Washing equipment, tools, or vehicles to remove PCC should be conducted in accordance with NS-7, Potable Water/Irrigation, NS-8, Vehicle and Equipment Cleaning, and WM-8, Concrete Waste Management.
- All dry material transfer points should be ducted through a fabric or cartridge type filter unless there are no visible emissions from the transfer point.
- Equip all bulk storage silos, including auxiliary bulk storage trailers, with fabric or cartridge type filter(s).
- Maintain silo vent filters in proper operating condition.
- Equip silos and auxiliary bulk storage trailers with dust-tight service hatches.
- Fabric dust collection system should be capable of controlling particulate matter in accordance with the California Air Resources Control Board and local Air Pollution Control District Regulations.
- Fabric dust collectors (except for vent filters) should be equipped with an operational pressure differential gauge to measure the pressure drop across the filters.
- All transfer points should be equipped with a wet suppression system to control fugitive particulate emissions unless there are no visible emissions.
- All conveyors should be covered, unless the material being transferred results in no visible emissions.
- There should be no visible emissions beyond the property line, while the equipment is being operated.
- Collect dust emissions from the loading of open-bodied trucks, at the drip point of dry batch plants, or dust emissions from the drum feed for central mix plants.

- Equip silos and auxiliary bulk storage trailers with a visible and/or audible warning mechanism to warn operators that the silo or trailer is full.
- All open-bodied vehicles transporting material should be loaded with a final layer of wet sand and the truck should be covered with a tarp to reduce emissions.

Tracking Control

- Plant roads (batch truck and material delivery truck roads) and areas between stockpiles and conveyor hoppers should be stabilized (TC-2, Stabilized Construction Roadway), watered, treated with dust-suppressant chemicals (WE-1, Wind Erosion Control), or paved with a cohesive hard surface that can be repeatedly swept, maintained intact, and cleaned as necessary to control dust emissions.
- Trucks should not track PCC from plants onto public roads. Use appropriate practices from TC-1, Stabilized Construction Entrance/Exit, to prevent tracking.

Materials Storage

- WM-1, Material Delivery and Storage, should be implemented at all batch plants using concrete components or compounds. An effective strategy is to cover and contain materials.
- WM-2, Material Use should be conducted in a way to minimize or eliminate the discharge of materials to storm drain system or watercourse.
- Ensure that finer materials are not dispersed into the air during operations, such as unloading of cement delivery trucks.
- Stockpiles should be covered and enclosed with perimeter sediment barriers per WM-3, Stockpile Management. Uncovered stockpiles should be sprayed with water and/or dust-suppressant chemicals as necessary to control dust emissions, unless the stockpiled material results in no visible emissions. An operable stockpile watering system should be onsite at all times.
- Store bagged and boxed materials on pallets and cover or store in a completely enclosed storage area on non-working days and prior to rain.
- Minimize stockpiles of demolished PCC by recycling them in a timely manner.
- Provide secondary containment for liquid materials (WM-1, Material Delivery and Storage, WM-10, Liquid Waste Management). Containment should provide sufficient volume to contain precipitation from a 25-year storm plus 10% of the aggregate volume of all containers or plus 100% of the largest container, whichever is greater.
- Handle solid and liquid waste in accordance with WM-5, Solid Waste Management, WM-10, Liquid Waste Management, and WM-8, Concrete Waste Management.
- Maintain adequate supplies of spill cleanup materials and train staff to respond to spills per WM-4, Spill Prevention and Control.

- Immediately contain and clean up spilled cement and fly ash and contain.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

Equipment Maintenance

- Equipment should be maintained to prevent fluid leaks and spills per NS-9, Vehicle and Equipment Fueling, and NS-10, Vehicle and Equipment Maintenance.
- Maintain adequate supplies of spill cleanup materials and train staff to respond to spills per WM-4, Spill Prevention and Control.
- Incorporate other BMPs such as WM-5, Solid Waste Management, WM-6, Hazardous Waste Management, and WM-10, Liquid Waste Management.

Costs

Costs will vary depending on the size of the facility and combination of BMPs implemented.

Inspection and Maintenance

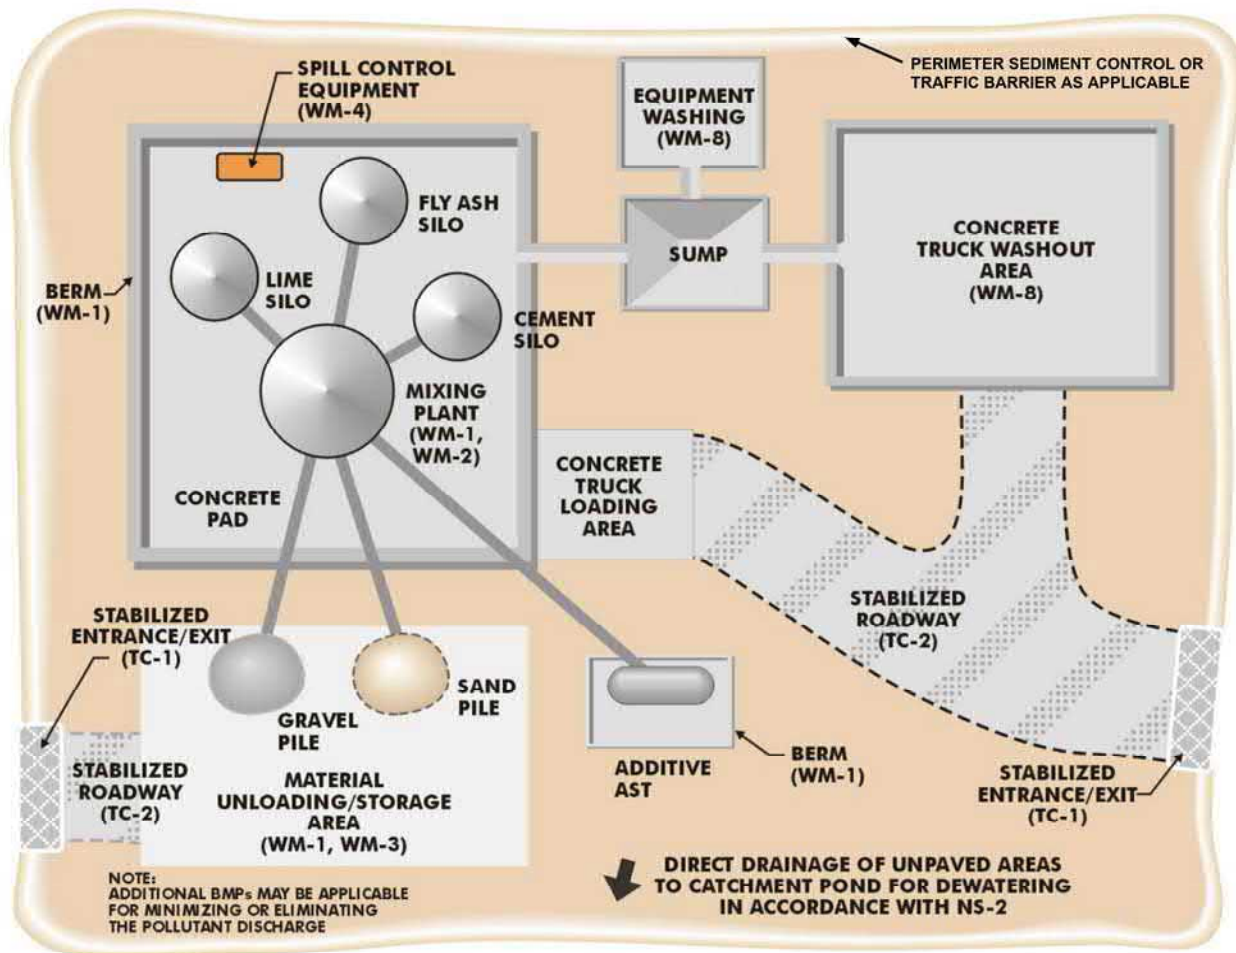

- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities.
- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Inspect BMPs subject to non-stormwater discharge daily while non-stormwater discharges occur.
- Sample non-stormwater discharges and stormwater runoff that contacts cementitious materials or fly ash as required by the General Permit.
- Inspect and repair equipment (for damaged hoses, fittings, and gaskets).
- Inspect and maintain a Stabilized Construction Entrance/Exit (TC-1) as needed.
- Inspect and maintain stabilized haul roads as needed (TC-2, Stabilized Construction Roadway).
- Inspect and maintain materials and waste storage areas as needed.

TC	Tracking Control	
WE	Wind Erosion Control	
NS	Non-Stormwater Management Control	
WM	Waste Management and Materials Pollution Control	<input checked="" type="checkbox"/>

Legend:

- Primary Category
- Secondary Category

Description and Purpose

Prevent, reduce, or eliminate the discharge of pollutants from material delivery and storage to the stormwater system or watercourses by minimizing the storage of hazardous materials onsite, storing materials in watertight containers and/or a completely enclosed designated area, installing secondary containment, conducting regular inspections, and training employees and subcontractors.

This best management practice covers only material delivery and storage. For other information on materials, see WM-2, Material Use, or WM-4, Spill Prevention and Control. For information on wastes, see the waste management BMPs in this section.

Suitable Applications

These procedures are suitable for use at all construction sites with delivery and storage of the following materials:

- Soil stabilizers and binders
- Pesticides and herbicides
- Fertilizers
- Detergents
- Plaster
- Petroleum products such as fuel, oil, and grease

Targeted Constituents

Sediment	<input checked="" type="checkbox"/>
Nutrients	<input checked="" type="checkbox"/>
Trash	<input checked="" type="checkbox"/>
Metals	<input checked="" type="checkbox"/>
Bacteria	
Oil and Grease	<input checked="" type="checkbox"/>
Organics	<input checked="" type="checkbox"/>

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

- Asphalt and concrete components
- Hazardous chemicals such as acids, lime, glues, adhesives, paints, solvents, and curing compounds
- Concrete compounds
- Other materials that may be detrimental if released to the environment

Limitations

- Space limitation may preclude indoor storage.
- Storage sheds often must meet building and fire code requirements.

Implementation

The following steps should be taken to minimize risk:

- Chemicals must be stored in water tight containers with appropriate secondary containment or in a storage shed.
- When a material storage area is located on bare soil, the area should be lined and bermed.
- Use containment pallets or other practical and available solutions, such as storing materials within newly constructed buildings or garages, to meet material storage requirements.
- Stack erodible landscape material on pallets and cover when not in use.
- Contain all fertilizers and other landscape materials when not in use.
- Temporary storage areas should be located away from vehicular traffic.
- Material Safety Data Sheets (MSDS) should be available on-site for all materials stored that have the potential to effect water quality.
- Construction site areas should be designated for material delivery and storage.
- Material delivery and storage areas should be located away from waterways, if possible.
 - Avoid transport near drainage paths or waterways.
 - Surround with earth berms or other appropriate containment BMP. See EC-9, Earth Dikes and Drainage Swales.
 - Place in an area that will be paved.
- Storage of reactive, ignitable, or flammable liquids must comply with the fire codes of your area. Contact the local Fire Marshal to review site materials, quantities, and proposed storage area to determine specific requirements. See the Flammable and Combustible Liquid Code, NFPA30.
- An up to date inventory of materials delivered and stored onsite should be kept.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

- Hazardous materials storage onsite should be minimized.
- Hazardous materials should be handled as infrequently as possible.
- Keep ample spill cleanup supplies appropriate for the materials being stored. Ensure that cleanup supplies are in a conspicuous, labeled area.
- Employees and subcontractors should be trained on the proper material delivery and storage practices.
- Employees trained in emergency spill cleanup procedures must be present when dangerous materials or liquid chemicals are unloaded.
- If significant residual materials remain on the ground after construction is complete, properly remove and dispose of materials and any contaminated soil. See WM-7, Contaminated Soil Management. If the area is to be paved, pave as soon as materials are removed to stabilize the soil.

Material Storage Areas and Practices

- Liquids, petroleum products, and substances listed in 40 CFR Parts 110, 117, or 302 should be stored in approved containers and drums and should not be overfilled. Containers and drums should be placed in temporary containment facilities for storage.
- A temporary containment facility should provide for a spill containment volume able to contain precipitation from a 25-year storm event, plus the greater of 10% of the aggregate volume of all containers or 100% of the capacity of the largest container within its boundary, whichever is greater.
- A temporary containment facility should be impervious to the materials stored therein for a minimum contact time of 72 hours.
- A temporary containment facility should be maintained free of accumulated rainwater and spills. In the event of spills or leaks, accumulated rainwater and spills should be collected and placed into drums. These liquids should be handled as a hazardous waste unless testing determines them to be non-hazardous. All collected liquids or non-hazardous liquids should be sent to an approved disposal site.
- Sufficient separation should be provided between stored containers to allow for spill cleanup and emergency response access.
- Incompatible materials, such as chlorine and ammonia, should not be stored in the same temporary containment facility.
- Materials should be covered prior to, and during rain events.
- Materials should be stored in their original containers and the original product labels should be maintained in place in a legible condition. Damaged or otherwise illegible labels should be replaced immediately.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

- Bagged and boxed materials should be stored on pallets and should not be allowed to accumulate on the ground. To provide protection from wind and rain throughout the rainy season, bagged and boxed materials should be covered during non-working days and prior to and during rain events.
- Stockpiles should be protected in accordance with WM-3, Stockpile Management.
- Materials should be stored indoors within existing structures or completely enclosed storage sheds when available.
- Proper storage instructions should be posted at all times in an open and conspicuous location.
- An ample supply of appropriate spill clean up material should be kept near storage areas.
- Also see WM-6, Hazardous Waste Management, for storing of hazardous wastes.

Material Delivery Practices

- Keep an accurate, up-to-date inventory of material delivered and stored onsite.
- Arrange for employees trained in emergency spill cleanup procedures to be present when dangerous materials or liquid chemicals are unloaded.

Spill Cleanup

- Contain and clean up any spill immediately.
- Properly remove and dispose of any hazardous materials or contaminated soil if significant residual materials remain on the ground after construction is complete. See WM-7, Contaminated Soil Management.
- See WM-4, Spill Prevention and Control, for spills of chemicals and/or hazardous materials.
- If spills or leaks of materials occur that are not contained and could discharge to surface waters, non-visible sampling of site discharge may be required. Refer to the General Permit or to your project specific Construction Site Monitoring Plan to determine if and where sampling is required.

Cost

- The largest cost of implementation may be in the construction of a materials storage area that is covered and provides secondary containment.

Inspection and Maintenance

- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Keep storage areas clean and well organized, including a current list of all materials onsite.
- Inspect labels on containers for legibility and accuracy.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

- Repair or replace perimeter controls, containment structures, covers, and liners as needed to maintain proper function.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

Description and Purpose

Prevent or reduce the discharge of pollutants to the storm drain system or watercourses from material use by using alternative products, minimizing hazardous material use onsite, and training employees and subcontractors.

Suitable Applications

This BMP is suitable for use at all construction projects. These procedures apply when the following materials are used or prepared onsite:

- Pesticides and herbicides
- Fertilizers
- Detergents
- Petroleum products such as fuel, oil, and grease
- Asphalt and other concrete components
- Other hazardous chemicals such as acids, lime, glues, adhesives, paints, solvents, and curing compounds
- Other materials that may be detrimental if released to the environment

Oil and Grease	<input checked="" type="checkbox"/>
Organics	<input checked="" type="checkbox"/>

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Limitations

Safer alternative building and construction products may not be available or suitable in every instance.

Implementation

The following steps should be taken to minimize risk:

- Minimize use of hazardous materials onsite.
- Follow manufacturer instructions regarding uses, protective equipment, ventilation, flammability, and mixing of chemicals.
- Train personnel who use pesticides. The California Department of Pesticide Regulation and county agricultural commissioners license pesticide dealers, certify pesticide applicators, and conduct onsite inspections.
- The preferred method of termiticide application is soil injection near the existing or proposed structure foundation/slab; however, if not feasible, soil drench application of termiticides should follow EPA label guidelines and the following recommendations (most of which are applicable to most pesticide applications):
 - Do not treat soil that is water-saturated or frozen.
 - Application shall not commence within 24-hours of a predicted precipitation event with a 40% or greater probability. Weather tracking must be performed on a daily basis prior to termiticide application and during the period of termiticide application.
 - Do not allow treatment chemicals to runoff from the target area. Apply proper quantity to prevent excess runoff. Provide containment for and divert stormwater from application areas using berms or diversion ditches during application.
 - Dry season: Do not apply within 10 feet of storm drains. Do not apply within 25 feet of aquatic habitats (such as, but not limited to, lakes; reservoirs; rivers; permanent streams; marshes or ponds; estuaries; and commercial fish farm ponds).
 - Wet season: Do not apply within 50 feet of storm drains or aquatic habitats (such as, but not limited to, lakes; reservoirs; rivers; permanent streams; marshes or ponds; estuaries; and commercial fish farm ponds) unless a vegetative buffer is present (if so, refer to dry season requirements).
 - Do not make on-grade applications when sustained wind speeds are above 10 mph (at application site) at nozzle end height.
 - Cover treatment site prior to a rain event in order to prevent run-off of the pesticide into non-target areas. The treated area should be limited to a size that can be backfilled and/or covered by the end of the work shift. Backfilling or covering of the treated area shall be done by the end of the same work shift in which the application is made.
- The applicator must either cover the soil him/herself or provide written notification of the above requirement to the contractor on site and to the person commissioning the

application (if different than the contractor). If notice is provided to the contractor or the person commissioning the application, then they are responsible under the Federal Insecticide Fungicide, and Rodenticide Act (FIFRA) to ensure that: 1) if the concrete slab cannot be poured over the treated soil within 24 hours of application, the treated soil is covered with a waterproof covering (such as polyethylene sheeting), and 2) the treated soil is covered if precipitation is predicted to occur before the concrete slab is scheduled to be poured.

- Do not over-apply fertilizers, herbicides, and pesticides. Prepare only the amount needed. Follow the recommended usage instructions. Over-application is expensive and environmentally harmful. Unless on steep slopes, till fertilizers into the soil rather than hydraulic application. Apply surface dressings in several smaller applications, as opposed to one large application, to allow time for infiltration and to avoid excess material being carried offsite by runoff. Do not apply these chemicals before predicted rainfall.
- Train employees and subcontractors in proper material use.
- Supply Material Safety Data Sheets (MSDS) for all materials.
- Dispose of latex paint and paint cans, used brushes, rags, absorbent materials, and drop cloths, when thoroughly dry and are no longer hazardous, with other construction debris.
- Do not remove the original product label; it contains important safety and disposal information. Use the entire product before disposing of the container.
- Mix paint indoors or in a containment area. Never clean paintbrushes or rinse paint containers into a street, gutter, storm drain, or watercourse. Dispose of any paint thinners, residue, and sludge(s) that cannot be recycled, as hazardous waste.
- For water-based paint, clean brushes to the extent practicable, and rinse to a drain leading to a sanitary sewer where permitted or contain for proper disposal off site. For oil-based paints, clean brushes to the extent practicable, and filter and reuse thinners and solvents.
- Use recycled and less hazardous products when practical. Recycle residual paints, solvents, non-treated lumber, and other materials.
- Use materials only where and when needed to complete the construction activity. Use safer alternative materials as much as possible. Reduce or eliminate use of hazardous materials onsite when practical.
- Document the location, time, chemicals applied, and applicator's name and qualifications.
- Keep an ample supply of spill clean up material near use areas. Train employees in spill clean up procedures.
- Avoid exposing applied materials to rainfall and runoff unless sufficient time has been allowed for them to dry.
- Discontinue use of erodible landscape material within 2 days prior to a forecasted rain event and materials should be covered and/or bermed.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

- Provide containment for material use areas such as masons' areas or paint mixing/preparation areas to prevent materials/pollutants from entering stormwater.

Costs

All of the above are low cost measures.

Inspection and Maintenance

- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities.
- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Ensure employees and subcontractors throughout the job are using appropriate practices.

Stormwater Management for Construction Activities; Developing Pollution Prevention Plans and Best Management Practice, EPA 832-R-92005; USEPA, April 1992.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

Description and Purpose

Stockpile management procedures and practices are designed to reduce or eliminate air and stormwater pollution from stockpiles of soil, soil amendments, sand, paving materials such as Portland cement concrete (PCC) rubble, asphalt concrete (AC), asphalt concrete rubble, aggregate base, aggregate sub base or pre-mixed aggregate, asphalt minder (so called “cold mix” asphalt), and pressure treated wood.

Suitable Applications

Implement in all projects that stockpile soil and other loose materials.

Limitations

- Plastic sheeting as a stockpile protection is temporary and hard to manage in windy conditions. Where plastic is used, consider use of plastic tarps with nylon reinforcement which may be more durable than standard sheeting.
- Plastic sheeting can increase runoff volume due to lack of infiltration and potentially cause perimeter control failure.
- Plastic sheeting breaks down faster in sunlight.
- The use of Plastic materials and photodegradable plastics should be avoided.

Implementation

Protection of stockpiles is a year-round requirement. To properly manage stockpiles:

Treat Categories

- Secondary Category

Targeted Constituents

Sediment	<input checked="" type="checkbox"/>
Nutrients	<input checked="" type="checkbox"/>
Trash	<input checked="" type="checkbox"/>
Metals	<input checked="" type="checkbox"/>
Bacteria	
Oil and Grease	<input checked="" type="checkbox"/>
Organics	<input checked="" type="checkbox"/>

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

- On larger sites, a minimum of 50 ft separation from concentrated flows of stormwater, drainage courses, and inlets is recommended.
- After 14 days of inactivity, a stockpile is non-active and requires further protection described below. All stockpiles are required to be protected as non-active stockpiles immediately if they are not scheduled to be used within 14 days.
- Protect all stockpiles from stormwater run-on using temporary perimeter sediment barriers such as compost berms (SE-13), temporary silt dikes (SE-12), fiber rolls (SE-5), silt fences (SE-1), sandbags (SE-8), gravel bags (SE-6), or biofilter bags (SE-14). Refer to the individual fact sheet for each of these controls for installation information.
- Implement wind erosion control practices as appropriate on all stockpiled material. For specific information, see WE-1, Wind Erosion Control.
- Manage stockpiles of contaminated soil in accordance with WM-7, Contaminated Soil Management.
- Place bagged materials on pallets and under cover.
- Ensure that stockpile coverings are installed securely to protect from wind and rain.
- Some plastic covers withstand weather and sunlight better than others. Select cover materials or methods based on anticipated duration of use.

Protection of Non-Active Stockpiles

A stockpile is considered non-active if it either is not used for 14 days or if it is scheduled not to be used for 14 days or more. Stockpiles need to be protected immediately if they are not scheduled to be used within 14 days. Non-active stockpiles of the identified materials should be protected as follows:

Soil stockpiles

- Soil stockpiles should be covered or protected with soil stabilization measures and a temporary perimeter sediment barrier at all times.
- Temporary vegetation should be considered for topsoil piles that will be stockpiled for extended periods.

Stockpiles of Portland cement concrete rubble, asphalt concrete, asphalt concrete rubble, aggregate base, or aggregate sub base

- Stockpiles should be covered and protected with a temporary perimeter sediment barrier at all times.

Stockpiles of “cold mix”

- Cold mix stockpiles should be placed on and covered with plastic sheeting or comparable material at all times and surrounded by a berm.

Stockpiles of fly ash, stucco, hydrated lime

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

- Stockpiles of materials that may raise the pH of runoff (i.e., basic materials) should be covered with plastic and surrounded by a berm.

Stockpiles/Storage of treated wood

- Treated wood should be covered with plastic sheeting or comparable material at all times and surrounded by a berm.

Protection of Active Stockpiles

A stockpile is active when it is being used or is scheduled to be used within 14 days of the previous use. Active stockpiles of the identified materials should be protected as follows:

- All stockpiles should be covered and protected with a temporary linear sediment barrier prior to the onset of precipitation.
- Stockpiles of “cold mix” and treated wood, and basic materials should be placed on and covered with plastic sheeting or comparable material and surrounded by a berm prior to the onset of precipitation.
- The downstream perimeter of an active stockpile should be protected with a linear sediment barrier or berm and runoff should be diverted around or away from the stockpile on the upstream perimeter.

Costs

For cost information associated with stockpile protection refer to the individual erosion or sediment control BMP fact sheet considered for implementation (For example, refer to SE-1 Silt Fence for installation of silt fence around the perimeter of a stockpile.)

Inspection and Maintenance

- Stockpiles must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- It may be necessary to inspect stockpiles covered with plastic sheeting more frequently during certain conditions (for example, high winds or extreme heat).
- Repair and/or replace perimeter controls and covers as needed to keep them functioning properly.
- Sediment shall be removed when it reaches one-third of the barrier height.

Stormwater Quality Handbooks - Construction Site Best Management Practices (BMPs) Manual, State of California Department of Transportation (Caltrans), March 2003.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

Description and Purpose

Prevent or reduce the discharge of pollutants to drainage systems or watercourses from leaks and spills by reducing the chance for spills, stopping the source of spills, containing and cleaning up spills, properly disposing of spill materials, and training employees.

This best management practice covers only spill prevention and control. However, WM-1, Materials Delivery and Storage, and WM-2, Material Use, also contain useful information, particularly on spill prevention. For information on wastes, see the waste management BMPs in this section.

Suitable Applications

This BMP is suitable for all construction projects. Spill control procedures are implemented anytime chemicals or hazardous substances are stored on the construction site, including the following materials:

- Soil stabilizers/binders
- Dust palliatives
- Herbicides
- Growth inhibitors
- Fertilizers
- Deicing/anti-icing chemicals

Organics	<input checked="" type="checkbox"/>

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

- Fuels
- Lubricants
- Other petroleum distillates

Limitations

- In some cases, it may be necessary to use a private spill cleanup company.
- This BMP applies to spills caused by the contractor and subcontractors.
- Procedures and practices presented in this BMP are general. Contractor should identify appropriate practices for the specific materials used or stored onsite

Implementation

The following steps will help reduce the stormwater impacts of leaks and spills:

Education

- Be aware that different materials pollute in different amounts. Make sure that each employee knows what a “significant spill” is for each material they use, and what is the appropriate response for “significant” and “insignificant” spills.
- Educate employees and subcontractors on potential dangers to humans and the environment from spills and leaks.
- Hold regular meetings to discuss and reinforce appropriate disposal procedures (incorporate into regular safety meetings).
- Establish a continuing education program to indoctrinate new employees.
- Have contractor’s superintendent or representative oversee and enforce proper spill prevention and control measures.

General Measures

- To the extent that the work can be accomplished safely, spills of oil, petroleum products, substances listed under 40 CFR parts 110,117, and 302, and sanitary and septic wastes should be contained and cleaned up immediately.
- Store hazardous materials and wastes in covered containers and protect from vandalism.
- Place a stockpile of spill cleanup materials where it will be readily accessible.
- Train employees in spill prevention and cleanup.
- Designate responsible individuals to oversee and enforce control measures.
- Spills should be covered and protected from stormwater runoff during rainfall to the extent that it doesn’t compromise clean up activities.

- Do not bury or wash spills with water.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

- Store and dispose of used clean up materials, contaminated materials, and recovered spill material that is no longer suitable for the intended purpose in conformance with the provisions in applicable BMPs.
- Do not allow water used for cleaning and decontamination to enter storm drains or watercourses. Collect and dispose of contaminated water in accordance with WM-10, Liquid Waste Management.
- Contain water overflow or minor water spillage and do not allow it to discharge into drainage facilities or watercourses.
- Place proper storage, cleanup, and spill reporting instructions for hazardous materials stored or used on the project site in an open, conspicuous, and accessible location.
- Keep waste storage areas clean, well organized, and equipped with ample cleanup supplies as appropriate for the materials being stored. Perimeter controls, containment structures, covers, and liners should be repaired or replaced as needed to maintain proper function.

Cleanup

- Clean up leaks and spills immediately.
- Use a rag for small spills on paved surfaces, a damp mop for general cleanup, and absorbent material for larger spills. If the spilled material is hazardous, then the used cleanup materials are also hazardous and must be sent to either a certified laundry (rags) or disposed of as hazardous waste.
- Never hose down or bury dry material spills. Clean up as much of the material as possible and dispose of properly. See the waste management BMPs in this section for specific information.

Minor Spills

- Minor spills typically involve small quantities of oil, gasoline, paint, etc. which can be controlled by the first responder at the discovery of the spill.
- Use absorbent materials on small spills rather than hosing down or burying the spill.
- Absorbent materials should be promptly removed and disposed of properly.
- Follow the practice below for a minor spill:
 - Contain the spread of the spill.
 - Recover spilled materials.
 - Clean the contaminated area and properly dispose of contaminated materials.

Semi-Significant Spills

- Semi-significant spills still can be controlled by the first responder along with the aid of other personnel such as laborers and the foreman, etc. This response may require the cessation of all other activities.

- Spills should be cleaned up immediately:
 - Contain spread of the spill.
 - Notify the project foreman immediately.
 - If the spill occurs on paved or impermeable surfaces, clean up using "dry" methods (absorbent materials, cat litter and/or rags). Contain the spill by encircling with absorbent materials and do not let the spill spread widely.
 - If the spill occurs in dirt areas, immediately contain the spill by constructing an earthen dike. Dig up and properly dispose of contaminated soil.
 - If the spill occurs during rain, cover spill with tarps or other material to prevent contaminating runoff.

Significant/Hazardous Spills

- For significant or hazardous spills that cannot be controlled by personnel in the immediate vicinity, the following steps should be taken:
 - Notify the local emergency response by dialing 911. In addition to 911, the contractor will notify the proper county officials. It is the contractor's responsibility to have all emergency phone numbers at the construction site.
 - Notify the Governor's Office of Emergency Services Warning Center, (916) 845-8911.
 - For spills of federal reportable quantities, in conformance with the requirements in 40 CFR parts 110,119, and 302, the contractor should notify the National Response Center at (800) 424-8802.
 - Notification should first be made by telephone and followed up with a written report.
 - The services of a spill's contractor or a Haz-Mat team should be obtained immediately. Construction personnel should not attempt to clean up until the appropriate and qualified staffs have arrived at the job site.
 - Other agencies which may need to be consulted include, but are not limited to, the Fire Department, the Public Works Department, the Coast Guard, the Highway Patrol, the City/County Police Department, Department of Toxic Substances, California Division of Oil and Gas, Cal/OSHA, etc.

Reporting

- Report significant spills to local agencies, such as the Fire Department; they can assist in cleanup.
- Federal regulations require that any significant oil spill into a water body or onto an adjoining shoreline be reported to the National Response Center (NRC) at 800-424-8802 (24 hours).

Use the following measures related to specific activities:

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

Vehicle and Equipment Maintenance

- If maintenance must occur onsite, use a designated area and a secondary containment, located away from drainage courses, to prevent the runoff of stormwater and the runoff of spills.
- Regularly inspect onsite vehicles and equipment for leaks and repair immediately
- Check incoming vehicles and equipment (including delivery trucks, and employee and subcontractor vehicles) for leaking oil and fluids. Do not allow leaking vehicles or equipment onsite.
- Always use secondary containment, such as a drain pan or drop cloth, to catch spills or leaks when removing or changing fluids.
- Place drip pans or absorbent materials under paving equipment when not in use.
- Use absorbent materials on small spills rather than hosing down or burying the spill. Remove the absorbent materials promptly and dispose of properly.
- Promptly transfer used fluids to the proper waste or recycling drums. Don't leave full drip pans or other open containers lying around
- Oil filters disposed of in trashcans or dumpsters can leak oil and pollute stormwater. Place the oil filter in a funnel over a waste oil-recycling drum to drain excess oil before disposal. Oil filters can also be recycled. Ask the oil supplier or recycler about recycling oil filters.
- Store cracked batteries in a non-leaking secondary container. Do this with all cracked batteries even if you think all the acid has drained out. If you drop a battery, treat it as if it is cracked. Put it into the containment area until you are sure it is not leaking.

Vehicle and Equipment Fueling

- If fueling must occur onsite, use designate areas, located away from drainage courses, to prevent the runoff of stormwater and the runoff of spills.
- Discourage "topping off" of fuel tanks.
- Always use secondary containment, such as a drain pan, when fueling to catch spills/ leaks.

Costs

Prevention of leaks and spills is inexpensive. Treatment and/ or disposal of contaminated soil or water can be quite expensive.

Inspection and Maintenance

- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities. While activities associated with the BMP are under way, inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

- Inspect BMPs subject to non-stormwater discharge daily while non-stormwater discharges occur.
- Keep ample supplies of spill control and cleanup materials onsite, near storage, unloading, and maintenance areas.
- Update your spill prevention and control plan and stock cleanup materials as changes occur in the types of chemicals onsite.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

Description and Purpose

Solid waste management procedures and practices are designed to prevent or reduce the discharge of pollutants to stormwater from solid or construction waste by providing designated waste collection areas and containers, arranging for regular disposal, and training employees and subcontractors.

Suitable Applications

This BMP is suitable for construction sites where the following wastes are generated or stored:

- Solid waste generated from trees and shrubs removed during land clearing, demolition of existing structures (rubble), and building construction
- Packaging materials including wood, paper, and plastic
- Scrap or surplus building materials including scrap metals, rubber, plastic, glass pieces, and masonry products
- Domestic wastes including food containers such as beverage cans, coffee cups, paper bags, plastic wrappers, and cigarettes
- Construction wastes including brick, mortar, timber, steel and metal scraps, pipe and electrical cuttings, non-hazardous equipment parts, styrofoam and other materials used to transport and package construction materials

Nutrients	<input checked="" type="checkbox"/>
Trash	<input checked="" type="checkbox"/>
Metals	<input checked="" type="checkbox"/>
Bacteria	
Oil and Grease	<input checked="" type="checkbox"/>
Organics	<input checked="" type="checkbox"/>

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

- Highway planting wastes, including vegetative material, plant containers, and packaging materials

Limitations

Temporary stockpiling of certain construction wastes may not necessitate stringent drainage related controls during the non-rainy season or in desert areas with low rainfall.

Implementation

The following steps will help keep a clean site and reduce stormwater pollution:

- Select designated waste collection areas onsite.
- Inform trash-hauling contractors that you will accept only watertight dumpsters for onsite use. Inspect dumpsters for leaks and repair any dumpster that is not watertight.
- Locate containers in a covered area or in a secondary containment.
- Provide an adequate number of containers with lids or covers that can be placed over the container to keep rain out or to prevent loss of wastes when it is windy.
- Cover waste containers at the end of each work day and when it is raining.
- Plan for additional containers and more frequent pickup during the demolition phase of construction.
- Collect site trash daily, especially during rainy and windy conditions.
- Remove this solid waste promptly since erosion and sediment control devices tend to collect litter.
- Make sure that toxic liquid wastes (used oils, solvents, and paints) and chemicals (acids, pesticides, additives, curing compounds) are not disposed of in dumpsters designated for construction debris.
- Do not hose out dumpsters on the construction site. Leave dumpster cleaning to the trash hauling contractor.
- Arrange for regular waste collection before containers overflow.
- Clean up immediately if a container does spill.
- Make sure that construction waste is collected, removed, and disposed of only at authorized disposal areas.

Education

- Have the contractor's superintendent or representative oversee and enforce proper solid waste management procedures and practices.
- Instruct employees and subcontractors on identification of solid waste and hazardous waste.
- Educate employees and subcontractors on solid waste storage and disposal procedures.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

- Hold regular meetings to discuss and reinforce disposal procedures (incorporate into regular safety meetings).
- Require that employees and subcontractors follow solid waste handling and storage procedures.
- Prohibit littering by employees, subcontractors, and visitors.
- Minimize production of solid waste materials wherever possible.

Collection, Storage, and Disposal

- Littering on the project site should be prohibited.
- To prevent clogging of the storm drainage system, litter and debris removal from drainage grates, trash racks, and ditch lines should be a priority.
- Trash receptacles should be provided in the contractor's yard, field trailer areas, and at locations where workers congregate for lunch and break periods.
- Litter from work areas within the construction limits of the project site should be collected and placed in watertight dumpsters at least weekly, regardless of whether the litter was generated by the contractor, the public, or others. Collected litter and debris should not be placed in or next to drain inlets, stormwater drainage systems, or watercourses.
- Dumpsters of sufficient size and number should be provided to contain the solid waste generated by the project.
- Full dumpsters should be removed from the project site and the contents should be disposed of by the trash hauling contractor.
- Construction debris and waste should be removed from the site biweekly or more frequently as needed.
- Construction material visible to the public should be stored or stacked in an orderly manner.
- Stormwater runoff should be prevented from contacting stored solid waste through the use of berms, dikes, or other temporary diversion structures or through the use of measures to elevate waste from site surfaces.
- Solid waste storage areas should be located at least 50 ft from drainage facilities and watercourses and should not be located in areas prone to flooding or ponding.
- Except during fair weather, construction and highway planting waste not stored in watertight dumpsters should be securely covered from wind and rain by covering the waste with tarps or plastic.
- Segregate potentially hazardous waste from non-hazardous construction site waste.
- Make sure that toxic liquid wastes (used oils, solvents, and paints) and chemicals (acids, pesticides, additives, curing compounds) are not disposed of in dumpsters designated for construction debris.

- For disposal of hazardous waste, see WM-6, Hazardous Waste Management. Have hazardous waste hauled to an appropriate disposal and/or recycling facility.
- Salvage or recycle useful vegetation debris, packaging and surplus building materials when practical. For example, trees and shrubs from land clearing can be used as a brush barrier, or converted into wood chips, then used as mulch on graded areas. Wood pallets, cardboard boxes, and construction scraps can also be recycled.

Costs

All of the above are low cost measures.

Inspection and Maintenance

- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities. While activities associated with the BMP are under way, inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Inspect BMPs subject to non-stormwater discharge daily while non-stormwater discharges occur
- Inspect construction waste area regularly.
- Arrange for regular waste collection.

Organics	<input checked="" type="checkbox"/>

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

Prevent or reduce the discharge of pollutants to stormwater from hazardous waste through proper material use, waste disposal, and training of employees and subcontractors.

Suitable Applications

This best management practice (BMP) applies to all construction projects. Hazardous waste management practices are implemented on construction projects that generate waste from the use of:

- Petroleum Products
- Concrete Curing Compounds
- Palliatives
- Septic Wastes
- Stains
- Wood Preservatives
- Any materials deemed a hazardous waste in California, Title 22 Division 4.5, or listed in 40 CFR Parts 110, 117, 261, or 302
- Asphalt Products
- Pesticides
- Acids
- Paints
- Solvents
- Roofing Tar

In addition, sites with existing structures may contain wastes, which must be disposed of in accordance with federal, state, and local regulations. These wastes include:

- Sandblasting grit mixed with lead-, cadmium-, or chromium-based paints
- Asbestos
- PCBs (particularly in older transformers)

Limitations

- Hazardous waste that cannot be reused or recycled must be disposed of by a licensed hazardous waste hauler.
- Nothing in this BMP relieves the contractor from responsibility for compliance with federal, state, and local laws regarding storage, handling, transportation, and disposal of hazardous wastes.
- This BMP does not cover aerially deposited lead (ADL) soils. For ADL soils refer to WM-7, Contaminated Soil Management.

Implementation

The following steps will help reduce stormwater pollution from hazardous wastes:

Material Use

- Wastes should be stored in sealed containers constructed of a suitable material and should be labeled as required by Title 22 CCR, Division 4.5 and 49 CFR Parts 172, 173, 178, and 179.
- All hazardous waste should be stored, transported, and disposed as required in Title 22 CCR, Division 4.5 and 49 CFR 261-263.
- Waste containers should be stored in temporary containment facilities that should comply with the following requirements:
 - Temporary containment facility should provide for a spill containment volume equal to 1.5 times the volume of all containers able to contain precipitation from a 25-year storm event, plus the greater of 10% of the aggregate volume of all containers or 100% of the capacity of the largest tank within its boundary, whichever is greater.
 - Temporary containment facility should be impervious to the materials stored there for a minimum contact time of 72 hours.
 - Temporary containment facilities should be maintained free of accumulated rainwater and spills. In the event of spills or leaks, accumulated rainwater and spills should be placed into drums after each rainfall. These liquids should be handled as a hazardous waste unless testing determines them to be non-hazardous. Non-hazardous liquids should be sent to an approved disposal site.
 - Sufficient separation should be provided between stored containers to allow for spill cleanup and emergency response access.

- Incompatible materials, such as chlorine and ammonia, should not be stored in the same temporary containment facility.
- Throughout the rainy season, temporary containment facilities should be covered during non-working days, and prior to rain events. Covered facilities may include use of plastic tarps for small facilities or constructed roofs with overhangs.
- Drums should not be overfilled, and wastes should not be mixed.
- Unless watertight, containers of dry waste should be stored on pallets.
- Do not over-apply herbicides and pesticides. Prepare only the amount needed. Follow the recommended usage instructions. Over application is expensive and environmentally harmful. Apply surface dressings in several smaller applications, as opposed to one large application. Allow time for infiltration and avoid excess material being carried offsite by runoff. Do not apply these chemicals just before it rains. People applying pesticides must be certified in accordance with federal and state regulations.
- Paint brushes and equipment for water and oil-based paints should be cleaned within a contained area and should not be allowed to contaminate site soils, watercourses, or drainage systems. Waste paints, thinners, solvents, residues, and sludges that cannot be recycled or reused should be disposed of as hazardous waste. When thoroughly dry, latex paint and paint cans, used brushes, rags, absorbent materials, and drop cloths should be disposed of as solid waste.
- Do not clean out brushes or rinse paint containers into the dirt, street, gutter, storm drain, or stream. "Paint out" brushes as much as possible. Rinse water-based paints to the sanitary sewer. Filter and reuse thinners and solvents. Dispose of excess oil-based paints and sludge as hazardous waste.
- The following actions should be taken with respect to temporary contaminant:
 - Ensure that adequate hazardous waste storage volume is available.
 - Ensure that hazardous waste collection containers are conveniently located.
 - Designate hazardous waste storage areas onsite away from storm drains or watercourses and away from moving vehicles and equipment to prevent accidental spills.
 - Minimize production or generation of hazardous materials and hazardous waste on the job site.
 - Use containment berms in fueling and maintenance areas and where the potential for spills is high.
 - Segregate potentially hazardous waste from non-hazardous construction site debris.
 - Keep liquid or semi-liquid hazardous waste in appropriate containers (closed drums or similar) and under cover.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

- Clearly label all hazardous waste containers with the waste being stored and the date of accumulation.
- Place hazardous waste containers in secondary containment.
- Do not allow potentially hazardous waste materials to accumulate on the ground.
- Do not mix wastes.
- Use all of the product before disposing of the container.
- Do not remove the original product label; it contains important safety and disposal information.

Waste Recycling Disposal

- Select designated hazardous waste collection areas onsite.
- Hazardous materials and wastes should be stored in covered containers and protected from vandalism.
- Place hazardous waste containers in secondary containment.
- Do not mix wastes, this can cause chemical reactions, making recycling impossible and complicating disposal.
- Recycle any useful materials such as used oil or water-based paint.
- Make sure that toxic liquid wastes (used oils, solvents, and paints) and chemicals (acids, pesticides, additives, curing compounds) are not disposed of in dumpsters designated for construction debris.
- Arrange for regular waste collection before containers overflow.
- Make sure that hazardous waste (e.g., excess oil-based paint and sludge) is collected, removed, and disposed of only at authorized disposal areas.

Disposal Procedures

- Waste should be disposed of by a licensed hazardous waste transporter at an authorized and licensed disposal facility or recycling facility utilizing properly completed Uniform Hazardous Waste Manifest forms.
- A Department of Health Services certified laboratory should sample waste to determine the appropriate disposal facility.
- Properly dispose of rainwater in secondary containment that may have mixed with hazardous waste.
- Attention is directed to "Hazardous Material", "Contaminated Material", and "Aerially Deposited Lead" of the contract documents regarding the handling and disposal of hazardous materials.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

Education

- Educate employees and subcontractors on hazardous waste storage and disposal procedures.
- Educate employees and subcontractors on potential dangers to humans and the environment from hazardous wastes.
- Instruct employees and subcontractors on safety procedures for common construction site hazardous wastes.
- Instruct employees and subcontractors in identification of hazardous and solid waste.
- Hold regular meetings to discuss and reinforce hazardous waste management procedures (incorporate into regular safety meetings).
- The contractor's superintendent or representative should oversee and enforce proper hazardous waste management procedures and practices.
- Make sure that hazardous waste is collected, removed, and disposed of only at authorized disposal areas.
- Warning signs should be placed in areas recently treated with chemicals.
- Place a stockpile of spill cleanup materials where it will be readily accessible.
- If a container does spill, clean up immediately.

Costs

All of the above are low cost measures.

Inspection and Maintenance

- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities. While activities associated with the BMP are under way, inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Inspect BMPs subject to non-stormwater discharge daily while non-stormwater discharges occur
- Hazardous waste should be regularly collected.
- A foreman or construction supervisor should monitor onsite hazardous waste storage and disposal procedures.
- Waste storage areas should be kept clean, well organized, and equipped with ample cleanup supplies as appropriate for the materials being stored.
- Perimeter controls, containment structures, covers, and liners should be repaired or replaced as needed to maintain proper function.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

- Hazardous spills should be cleaned up and reported in conformance with the applicable Material Safety Data Sheet (MSDS) and the instructions posted at the project site.
- The National Response Center, at (800) 424-8802, should be notified of spills of federal reportable quantities in conformance with the requirements in 40 CFR parts 110, 117, and 302. Also notify the Governors Office of Emergency Services Warning Center at (916) 845-8911.
- A copy of the hazardous waste manifests should be provided.

TC	Tracking Control	
WE	Wind Erosion Control	
NS	Non-Stormwater Management Control	
WM	Waste Management and Materials Pollution Control	<input checked="" type="checkbox"/>

Legend:

- Primary Objective
- Secondary Objective

Description and Purpose

Prevent or reduce the discharge of pollutants to stormwater from contaminated soil and highly acidic or alkaline soils by conducting pre-construction surveys, inspecting excavations regularly, and remediating contaminated soil promptly.

Suitable Applications

Contaminated soil management is implemented on construction projects in highly urbanized or industrial areas where soil contamination may have occurred due to spills, illicit discharges, aerial deposition, past use and leaks from underground storage tanks.

Limitations

Contaminated soils that cannot be treated onsite must be disposed of offsite by a licensed hazardous waste hauler. The presence of contaminated soil may indicate contaminated water as well. See NS-2, Dewatering Operations, for more information.

The procedures and practices presented in this BMP are general. The contractor should identify appropriate practices and procedures for the specific contaminants known to exist or discovered onsite.

Implementation

Most owners and developers conduct pre-construction environmental assessments as a matter of routine. Contaminated soils are often identified during project planning and development with known locations identified in the plans, specifications and in the SWPPP. The contractor should review applicable reports and investigate appropriate call-outs in the

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

plans, specifications, and SWPPP. Recent court rulings holding contractors liable for cleanup costs when they unknowingly move contaminated soil highlight the need for contractors to confirm a site assessment is completed before earth moving begins.

The following steps will help reduce stormwater pollution from contaminated soil:

- Conduct thorough, pre-construction inspections of the site and review documents related to the site. If inspection or reviews indicated presence of contaminated soils, develop a plan before starting work.
- Look for contaminated soil as evidenced by discoloration, odors, differences in soil properties, abandoned underground tanks or pipes, or buried debris.
- Prevent leaks and spills. Contaminated soil can be expensive to treat and dispose of properly. However, addressing the problem before construction is much less expensive than after the structures are in place.
- The contractor may further identify contaminated soils by investigating:
 - Past site uses and activities
 - Detected or undetected spills and leaks
 - Acid or alkaline solutions from exposed soil or rock formations high in acid or alkaline forming elements
 - Contaminated soil as evidenced by discoloration, odors, differences in soil properties, abandoned underground tanks or pipes, or buried debris.
 - Suspected soils should be tested at a certified laboratory.

Education

- Have employees and subcontractors complete a safety training program which meets 29 CFR 1910.120 and 8 CCR 5192 covering the potential hazards as identified, prior to performing any excavation work at the locations containing material classified as hazardous.
- Educate employees and subcontractors in identification of contaminated soil and on contaminated soil handling and disposal procedures.
- Hold regular meetings to discuss and reinforce disposal procedures (incorporate into regular safety meetings).

Handling Procedures for Material with Aerially Deposited Lead (ADL)

- Materials from areas designated as containing (ADL) may, if allowed by the contract special provisions, be excavated, transported, and used in the construction of embankments and/or backfill.
- Excavation, transportation, and placement operations should result in no visible dust.
- Caution should be exercised to prevent spillage of lead containing material during transport.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

- Quality should be monitored during excavation of soils contaminated with lead.

Handling Procedures for Contaminated Soils

- Minimize onsite storage. Contaminated soil should be disposed of properly in accordance with all applicable regulations. All hazardous waste storage will comply with the requirements in Title 22, CCR, Sections 66265.250 to 66265.260.
- Test suspected soils at an approved certified laboratory.
- Work with the local regulatory agencies to develop options for treatment or disposal if the soil is contaminated.
- Avoid temporary stockpiling of contaminated soils or hazardous material.
- Take the following precautions if temporary stockpiling is necessary:
 - Cover the stockpile with plastic sheeting or tarps.
 - Install a berm around the stockpile to prevent runoff from leaving the area.
 - Do not stockpile in or near storm drains or watercourses.
- Remove contaminated material and hazardous material on exteriors of transport vehicles and place either into the current transport vehicle or into the excavation prior to the vehicle leaving the exclusion zone.
- Monitor the air quality continuously during excavation operations at all locations containing hazardous material.
- Procure all permits and licenses, pay all charges and fees, and give all notices necessary and incident to the due and lawful prosecution of the work, including registration for transporting vehicles carrying the contaminated material and the hazardous material.
- Collect water from decontamination procedures and treat or dispose of it at an appropriate disposal site.
- Collect non-reusable protective equipment, once used by any personnel, and dispose of at an appropriate disposal site.
- Install temporary security fence to surround and secure the exclusion zone. Remove fencing when no longer needed.
- Excavate, transport, and dispose of contaminated material and hazardous material in accordance with the rules and regulations of the following agencies (the specifications of these agencies supersede the procedures outlined in this BMP):
 - United States Department of Transportation (USDOT)
 - United States Environmental Protection Agency (USEPA)
 - California Environmental Protection Agency (CAL-EPA)

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

- California Division of Occupation Safety and Health Administration (CAL-OSHA)
- Local regulatory agencies

Procedures for Underground Storage Tank Removals

- Prior to commencing tank removal operations, obtain the required underground storage tank removal permits and approval from the federal, state, and local agencies that have jurisdiction over such work.
- To determine if it contains hazardous substances, arrange to have tested, any liquid or sludge found in the underground tank prior to its removal.
- Following the tank removal, take soil samples beneath the excavated tank and perform analysis as required by the local agency representative(s).
- The underground storage tank, any liquid or sludge found within the tank, and all contaminated substances and hazardous substances removed during the tank removal and transported to disposal facilities permitted to accept such waste.

Water Control

- All necessary precautions and preventive measures should be taken to prevent the flow of water, including ground water, from mixing with hazardous substances or underground storage tank excavations. Such preventative measures may consist of, but are not limited to, berms, cofferdams, grout curtains, freeze walls, and seal course concrete or any combination thereof.
- If water does enter an excavation and becomes contaminated, such water, when necessary to proceed with the work, should be discharged to clean, closed top, watertight transportable holding tanks, treated, and disposed of in accordance with federal, state, and local laws.

Costs

Prevention of leaks and spills is inexpensive. Treatment or disposal of contaminated soil can be quite expensive.

Inspection and Maintenance

- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities. While activities associated with the BMP are under way, inspect BMPs in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Arrange for contractor's Water Pollution Control Manager, foreman, and/or construction supervisor to monitor onsite contaminated soil storage and disposal procedures.
- Monitor air quality continuously during excavation operations at all locations containing hazardous material.
- Coordinate contaminated soils and hazardous substances/waste management with the appropriate federal, state, and local agencies.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

- Implement WM-4, Spill Prevention and Control, to prevent leaks and spills as much as possible.

Stormwater Management for Construction Activities; Developing Pollution Prevention Plans and Best Management Practice, EPA 832-R-92005; USEPA, April 1992.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

Description and Purpose

Prevent the discharge of pollutants to stormwater from concrete waste by conducting washout onsite or offsite in a designated area, and by employee and subcontractor training.

The General Permit incorporates Numeric Action Levels (NAL) for pH (see Section 2 of this handbook to determine your project's risk level and if you are subject to these requirements).

Many types of construction materials, including mortar, concrete, stucco, cement and block and their associated wastes have basic chemical properties that can raise pH levels outside of the permitted range. Additional care should be taken when managing these materials to prevent them from coming into contact with stormwater flows and raising pH to levels outside the accepted range.

Suitable Applications

Concrete waste management procedures and practices are implemented on construction projects where:

- Concrete is used as a construction material or where concrete dust and debris result from demolition activities.
- Slurries containing Portland cement concrete (PCC) are generated, such as from saw cutting, coring, grinding, grooving, and hydro-concrete demolition.
- Concrete trucks and other concrete-coated equipment are washed onsite.

Nutrients	
Trash	
Metals	<input checked="" type="checkbox"/>
Bacteria	
Oil and Grease	
Organics	

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

- Mortar-mixing stations exist.
- Stucco mixing and spraying.
- See also NS-8, Vehicle and Equipment Cleaning.

Limitations

- Offsite washout of concrete wastes may not always be possible.
- Multiple washouts may be needed to assure adequate capacity and to allow for evaporation.

Implementation

The following steps will help reduce stormwater pollution from concrete wastes:

- Incorporate requirements for concrete waste management into material supplier and subcontractor agreements.
- Store dry and wet materials under cover, away from drainage areas. Refer to WM-1, Material Delivery and Storage for more information.
- Avoid mixing excess amounts of concrete.
- Perform washout of concrete trucks in designated areas only, where washout will not reach stormwater.
- Do not wash out concrete trucks into storm drains, open ditches, streets, streams or onto the ground. Trucks should always be washed out into designated facilities.
- Do not allow excess concrete to be dumped onsite, except in designated areas.
- For onsite washout:
 - On larger sites, it is recommended to locate washout areas at least 50 feet from storm drains, open ditches, or water bodies. Do not allow runoff from this area by constructing a temporary pit or bermed area large enough for liquid and solid waste.
 - Washout wastes into the temporary washout where the concrete can set, be broken up, and then disposed properly.
 - Washouts shall be implemented in a manner that prevents leaching to underlying soils. Washout containers must be water tight and washouts on or in the ground must be lined with a suitable impervious liner, typically a plastic type material.
- Do not wash sweepings from exposed aggregate concrete into the street or storm drain. Collect and return sweepings to aggregate base stockpile or dispose in the trash.
- See typical concrete washout installation details at the end of this fact sheet.

Education

- Educate employees, subcontractors, and suppliers on the concrete waste management techniques described herein.

- Arrange for contractor's superintendent or representative to oversee and enforce concrete waste management procedures.
- Discuss the concrete management techniques described in this BMP (such as handling of concrete waste and washout) with the ready-mix concrete supplier before any deliveries are made.

Concrete Demolition Wastes

- Stockpile concrete demolition waste in accordance with BMP WM-3, Stockpile Management.
- Dispose of or recycle hardened concrete waste in accordance with applicable federal, state or local regulations.

Concrete Slurry Wastes

- PCC and AC waste should not be allowed to enter storm drains or watercourses.
- PCC and AC waste should be collected and disposed of or placed in a temporary concrete washout facility (as described in Onsite Temporary Concrete Washout Facility, Concrete Transit Truck Washout Procedures, below).
- A foreman or construction supervisor should monitor onsite concrete working tasks, such as saw cutting, coring, grinding and grooving to ensure proper methods are implemented.
- Saw-cut concrete slurry should not be allowed to enter storm drains or watercourses. Residue from grinding operations should be picked up by means of a vacuum attachment to the grinding machine or by sweeping. Saw cutting residue should not be allowed to flow across the pavement and should not be left on the surface of the pavement. See also NS-3, Paving and Grinding Operations; and WM-10, Liquid Waste Management.
- Concrete slurry residue should be disposed in a temporary washout facility (as described in Onsite Temporary Concrete Washout Facility, Concrete Transit Truck Washout Procedures, below) and allowed to dry. Dispose of dry slurry residue in accordance with WM-5, Solid Waste Management.

Onsite Temporary Concrete Washout Facility, Transit Truck Washout Procedures

- Temporary concrete washout facilities should be located a minimum of 50 ft from storm drain inlets, open drainage facilities, and watercourses. Each facility should be located away from construction traffic or access areas to prevent disturbance or tracking.
- A sign should be installed adjacent to each washout facility to inform concrete equipment operators to utilize the proper facilities.
- Temporary concrete washout facilities should be constructed above grade or below grade at the option of the contractor. Temporary concrete washout facilities should be constructed and maintained in sufficient quantity and size to contain all liquid and concrete waste generated by washout operations.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

- Temporary washout facilities should have a temporary pit or bermed areas of sufficient volume to completely contain all liquid and waste concrete materials generated during washout procedures.
- Temporary washout facilities should be lined to prevent discharge to the underlying ground or surrounding area.
- Washout of concrete trucks should be performed in designated areas only.
- Only concrete from mixer truck chutes should be washed into concrete wash out.
- Concrete washout from concrete pumper bins can be washed into concrete pumper trucks and discharged into designated washout area or properly disposed of or recycled offsite.
- Once concrete wastes are washed into the designated area and allowed to harden, the concrete should be broken up, removed, and disposed of per WM-5, Solid Waste Management. Dispose of or recycle hardened concrete on a regular basis.
- Temporary Concrete Washout Facility (Type Above Grade)
 - Temporary concrete washout facility (type above grade) should be constructed as shown on the details at the end of this BMP, with a recommended minimum length and minimum width of 10 ft; however, smaller sites or jobs may only need a smaller washout facility. With any washout, always maintain a sufficient quantity and volume to contain all liquid and concrete waste generated by washout operations.
 - Materials used to construct the washout area should conform to the provisions detailed in their respective BMPs (e.g., SE-8 Sandbag Barrier).
 - Plastic lining material should be a minimum of 10 mil in polyethylene sheeting and should be free of holes, tears, or other defects that compromise the impermeability of the material.
 - Alternatively, portable removable containers can be used as above grade concrete washouts. Also called a “roll-off”; this concrete washout facility should be properly sealed to prevent leakage and should be removed from the site and replaced when the container reaches 75% capacity.
- Temporary Concrete Washout Facility (Type Below Grade)
 - Temporary concrete washout facilities (type below grade) should be constructed as shown on the details at the end of this BMP, with a recommended minimum length and minimum width of 10 ft. The quantity and volume should be sufficient to contain all liquid and concrete waste generated by washout operations.
 - Lath and flagging should be commercial type.
 - Plastic lining material should be a minimum of 10 mil polyethylene sheeting and should be free of holes, tears, or other defects that compromise the impermeability of the material.

- The base of a washout facility should be free of rock or debris that may damage a plastic liner.

Removal of Temporary Concrete Washout Facilities

- When temporary concrete washout facilities are no longer required for the work, the hardened concrete should be removed and properly disposed or recycled in accordance with federal, state or local regulations. Materials used to construct temporary concrete washout facilities should be removed from the site of the work and properly disposed or recycled in accordance with federal, state or local regulations.
- Holes, depressions or other ground disturbance caused by the removal of the temporary concrete washout facilities should be backfilled and repaired.

Costs

All of the above are low cost measures. Roll-off concrete washout facilities can be more costly than other measures due to removal and replacement; however, provide a cleaner alternative to traditional washouts. The type of washout facility, size, and availability of materials will determine the cost of the washout.

Inspection and Maintenance

- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Temporary concrete washout facilities should be maintained to provide adequate holding capacity with a minimum freeboard of 4 in. for above grade facilities and 12 in. for below grade facilities. Maintaining temporary concrete washout facilities should include removing and disposing of hardened concrete and returning the facilities to a functional condition. Hardened concrete materials should be removed and properly disposed or recycled in accordance with federal, state or local regulations.
- Washout facilities must be cleaned, or new facilities must be constructed and ready for use once the washout is 75% full.
- Inspect washout facilities for damage (e.g. torn liner, evidence of leaks, signage, etc.). Repair all identified damage.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

Sanitary/Septic Waste Management WM-9

Description and Purpose

Proper sanitary and septic waste management prevent the discharge of pollutants to stormwater from sanitary and septic waste by providing convenient, well-maintained facilities, and arranging for regular service and disposal.

Suitable Applications

Sanitary septic waste management practices are suitable for use at all construction sites that use temporary or portable sanitary and septic waste systems.

Limitations

None identified.

Implementation

Sanitary or septic wastes should be treated or disposed of in accordance with state and local requirements. In many cases, one contract with a local facility supplier will be all that it takes to make sure sanitary wastes are properly disposed.

Storage and Disposal Procedures

- Temporary sanitary facilities should be located away from drainage facilities, watercourses, and from traffic circulation. If site conditions allow, place portable facilities a minimum of 50 feet from drainage conveyances and traffic areas. When subjected to high winds or risk of high winds, temporary sanitary facilities should be secured to prevent overturning.

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Sanitary/Septic Waste Management WM-9

- Temporary sanitary facilities must be equipped with containment to prevent discharge of pollutants to the stormwater drainage system of the receiving water.
- Consider safety as well as environmental implications before placing temporary sanitary facilities.
- Wastewater should not be discharged or buried within the project site.
- Sanitary and septic systems that discharge directly into sanitary sewer systems, where permissible, should comply with the local health agency, city, county, and sewer district requirements.
- Only reputable, licensed sanitary and septic waste haulers should be used.
- Sanitary facilities should be located in a convenient location.
- Temporary septic systems should treat wastes to appropriate levels before discharging.
- If using an onsite disposal system (OSDS), such as a septic system, local health agency requirements must be followed.
- Temporary sanitary facilities that discharge to the sanitary sewer system should be properly connected to avoid illicit discharges.
- Sanitary and septic facilities should be maintained in good working order by a licensed service.
- Regular waste collection by a licensed hauler should be arranged before facilities overflow.
- If a spill does occur from a temporary sanitary facility, follow federal, state and local regulations for containment and clean-up.

Education

- Educate employees, subcontractors, and suppliers on sanitary and septic waste storage and disposal procedures.
- Educate employees, subcontractors, and suppliers of potential dangers to humans and the environment from sanitary and septic wastes.
- Instruct employees, subcontractors, and suppliers in identification of sanitary and septic waste.
- Hold regular meetings to discuss and reinforce the use of sanitary facilities (incorporate into regular safety meetings).
- Establish a continuing education program to indoctrinate new employees.

Costs

All of the above are low cost measures.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

Sanitary/Septic Waste Management WM-9

Inspection and Maintenance

- BMPs must be inspected in accordance with General Permit requirements for the associated project type and risk level. It is recommended that at a minimum, BMPs be inspected weekly, prior to forecasted rain events, daily during extended rain events, and after the conclusion of rain events.
- Arrange for regular waste collection.
- If high winds are expected, portable sanitary facilities must be secured with spikes or weighed down to prevent over turning.
- If spills or leaks from sanitary or septic facilities occur that are not contained and discharge from the site, non-visible sampling of site discharge may be required. Refer to the General Permit or to your project specific Construction Site Monitoring Plan to determine if and where sampling is required.

References

Stormwater Quality Handbooks - Construction Site Best Management Practices (BMPs) Manual, State of California Department of Transportation (Caltrans), March 2003.

Stormwater Management for Construction Activities; Developing Pollution Prevention Plans and Best Management Practice, EPA 832-R-92005; USEPA, April 1992.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

Description and Purpose

Liquid waste management includes procedures and practices to prevent discharge of pollutants to the storm drain system or to watercourses as a result of the creation, collection, and disposal of non-hazardous liquid wastes.

Suitable Applications

Liquid waste management is applicable to construction projects that generate any of the following non-hazardous by-products, residuals, or wastes:

- Drilling slurries and drilling fluids
- Grease-free and oil-free wastewater and rinse water
- Dredgings
- Other non-stormwater liquid discharges not permitted by separate permits

Limitations

- Disposal of some liquid wastes may be subject to specific laws and regulations or to requirements of other permits secured for the construction project (e.g., NPDES permits, Army Corps permits, Coastal Commission permits, etc.).
- Liquid waste management does not apply to dewatering operations (NS-2 Dewatering Operations), solid waste management (WM-5, Solid Waste Management), hazardous wastes (WM-6, Hazardous Waste Management), or

Organics	

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

concrete slurry residue (WM-8, Concrete Waste Management).

- Typical permitted non-stormwater discharges can include: water line flushing; landscape irrigation; diverted stream flows; rising ground waters; uncontaminated pumped ground water; discharges from potable water sources; foundation drains; irrigation water; springs; water from crawl space pumps; footing drains; lawn watering; flows from riparian habitats and wetlands; and discharges or flows from emergency fire fighting activities.

Implementation

General Practices

- Instruct employees and subcontractors how to safely differentiate between non-hazardous liquid waste and potential or known hazardous liquid waste.
- Instruct employees, subcontractors, and suppliers that it is unacceptable for any liquid waste to enter any storm drainage device, waterway, or receiving water.
- Educate employees and subcontractors on liquid waste generating activities and liquid waste storage and disposal procedures.
- Hold regular meetings to discuss and reinforce disposal procedures (incorporate into regular safety meetings).
- Verify which non-stormwater discharges are permitted by the statewide NPDES permit; different regions might have different requirements not outlined in this permit.
- Apply NS-8, Vehicle and Equipment Cleaning for managing wash water and rinse water from vehicle and equipment cleaning operations.

Containing Liquid Wastes

- Drilling residue and drilling fluids should not be allowed to enter storm drains and watercourses and should be disposed of.
- If an appropriate location is available, drilling residue and drilling fluids that are exempt under Title 23, CCR § 2511(g) may be dried by infiltration and evaporation in a containment facility constructed in conformance with the provisions concerning the Temporary Concrete Washout Facilities detailed in WM-8, Concrete Waste Management.
- Liquid wastes generated as part of an operational procedure, such as water-laden dredged material and drilling mud, should be contained and not allowed to flow into drainage channels or receiving waters prior to treatment.
- Liquid wastes should be contained in a controlled area such as a holding pit, sediment basin, roll-off bin, or portable tank.
- Containment devices must be structurally sound and leak free.
- Containment devices must be of sufficient quantity or volume to completely contain the liquid wastes generated.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

- Precautions should be taken to avoid spills or accidental releases of contained liquid wastes. Apply the education measures and spill response procedures outlined in WM-4, Spill Prevention and Control.
- Containment areas or devices should not be located where accidental release of the contained liquid can threaten health or safety or discharge to water bodies, channels, or storm drains.

Capturing Liquid Wastes

- Capture all liquid wastes that have the potential to affect the storm drainage system (such as wash water and rinse water from cleaning walls or pavement), before they run off a surface.
- Do not allow liquid wastes to flow or discharge uncontrolled. Use temporary dikes or berms to intercept flows and direct them to a containment area or device for capture.
- Use a sediment trap (SE-3, Sediment Trap) for capturing and treating sediment laden liquid waste or capture in a containment device and allow sediment to settle.

Disposing of Liquid Wastes

- A typical method to handle liquid waste is to dewater the contained liquid waste, using procedures such as described in NS-2, Dewatering Operations, and SE-2, Sediment Basin, and dispose of resulting solids per WM-5, Solid Waste Management.
- Methods of disposal for some liquid wastes may be prescribed in Water Quality Reports, NPDES permits, Environmental Impact Reports, 401 or 404 permits, and local agency discharge permits, etc. Review the SWPPP to see if disposal methods are identified.
- Liquid wastes, such as from dredged material, may require testing and certification whether it is hazardous or not before a disposal method can be determined.
- For disposal of hazardous waste, see WM-6, Hazardous Waste Management.
- If necessary, further treat liquid wastes prior to disposal. Treatment may include, though is not limited to, sedimentation, filtration, and chemical neutralization.

Costs

Prevention costs for liquid waste management are minimal. Costs increase if cleanup or fines are involved.

Inspection and Maintenance

- Inspect and verify that activity-based BMPs are in place prior to the commencement of associated activities. While activities associated with the BMP are under way, inspect weekly during the rainy season and of two-week intervals in the non-rainy season to verify continued BMP implementation.
- Inspect BMPs subject to non-stormwater discharge daily while non-stormwater discharges occur.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

- Remove deposited solids in containment areas and capturing devices as needed and at the completion of the task. Dispose of any solids as described in WM-5, Solid Waste Management.
- Inspect containment areas and capturing devices and repair as needed.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

VI. The following items were monitored:

"In place" BMPs	Yes <input type="checkbox"/>	No <input type="checkbox"/>	Material storage areas	Yes <input type="checkbox"/>	No <input type="checkbox"/>	N/A <input type="checkbox"/>
Construction entrances and exits	Yes <input type="checkbox"/>	No <input type="checkbox"/>	Disturbed soils	Yes <input type="checkbox"/>	No <input type="checkbox"/>	N/A <input type="checkbox"/>
Equipment storage areas	Yes <input type="checkbox"/>	No <input type="checkbox"/>	Runon/Runoff Locations	Yes <input type="checkbox"/>	No <input type="checkbox"/>	N/A <input type="checkbox"/>

VII. Changes observed since last inspection:

- a. A change in plans, construction, operation or maintenance that may affect discharges of pollutants from our site? Yes No
- b. A regulatory agency inspection that caused changes to the SWPPP or additional BMPs added to the community. Yes No
- c. Additional or modified BMPs used or needed that are not included in current list of BMPs in the SWPPP. Yes No
- d. Incidents of non-compliance with the requirements of the Permit. Yes No

If answering "yes" to any of the questions above, describe the event; date, time, cause, and what action was/will be taken (Be specific)

If answering "YES" to any of the questions in Section VII, the SWPPP needs to be amended. Contact the DEM or REM for assistance

General Comments:

VIII. Describe "Action Required" items in Section V and corrective action needed. Be specific on location of the work needed.

All actions needed must begin within 72 hours of the inspection. Document, initial and date items corrected.

Item #	Observed Item to be Corrected	Action Needed	Date Action Started	Date Action Completed	Initials

Responsible Parties

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

RESPONSIBLE PARTIES

Certifications of the authorized representatives for this SWPPP are provided in Section 0 and below. A list of authorized representatives is also provided in Appendix J.

The Legally Responsible Person (LRP) for this project is:

City of Goleta
Department of Neighborhood Services and Public Safety
Jaime Valdez
130 Cremona Drive, Suite
Goleta, CA 93117

The Site Stormwater Manager (SSWM) for this project is:

The Qualified SWPPP Developer (QSD) during SWPPP/ESCP Preparation for this project is:

Jonathan Buck
ENGEIO Incorporated
925-866-9000

The Qualified SWPPP Developer (QSD) during Implementation for this project is:

The Qualified SWPPP Practitioner (QSP) during Implementation for this project is:

The SWPPP Delegate representative, supervised and trained by the QSP, for this project is:

Date: _____

California Regional Water Quality Control Board

Re: Delegating an "Authorized Representative" for Project Name
WDID # _____

To Whom It May Concern:

This letter serves to designate the specifically described individual or position as an authorized person for signing reports and performing certain activities requested by the LRP or required by the NPDES Construction General Permit until further notice is provided in writing. This authorization cannot be used for signing ORDER NO. 2022-0057-DWQ Permit Registration Documents (e.g., Notice of Intent (NOI), Notice of Termination (NOT) and Annuals Reports). The following position is hereby authorized to perform storm water site inspections and to prepare, sign, and certify storm water inspection reports:

By signing this authorization, I confirm that I meet the requirements to make such a designation as set forth in the California General Permit for stormwater discharges associated with construction and land disturbance activities ORDER NO. 2022-0057-DWQ.

Sincerely,

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

Subcontractor Notification Letter and Notification Log

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

SWPPP Notification Sample

Company
Address
City, State, ZIP

Dear Sir/Madam,

Please be advised that the California State Water Resources Control Board has adopted the General Permit (General Permit) for Storm Water Discharges Associated with Construction Activity (CAS000002). The goal of these permits is prevent the discharge of pollutants associated with construction activity from entering the storm drain system, ground and surface waters.

ENGEO has developed a Storm Water Pollution Prevention Plan (SWPPP) in order to implement the requirements of the Permits.

As a subcontractor, you are required to comply with the SWPPP and the Permits for any work that you perform on site. Any person or group who violates any condition of the Permits may be subject to substantial penalties in accordance with state and federal law. You are encouraged to advise each of your employees working on this project of the requirements of the SWPPP and the Permits. A copy of the Permits and the SWPPP are available for your review at the construction office. Please contact me if you have further questions.

Sincerely,

Name

APPENDIX L

Construction Site Monitoring Program
(Excerpted SWPPP Section 6.0)

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

6.0 CONSTRUCTION SITE MONITORING PROGRAM

The General Permit requires that a written site-specific Construction Site Monitoring Program (CSMP) be developed prior to the commencement of construction activities and be revised as necessary to reflect project revisions and that the CSMP be included with the SWPPP. The purpose of the CSMP is to describe specific requirements and objectives of the General Permit for the project's Risk Level. The project CSMP is described in the following sections with relevant monitoring, sampling, and activity forms located in Appendices H, M, and N. Submitted forms are to be inserted in Appendixes O, P, Q, and R.

This CSMP has been developed by the QSD and is a guide for the QSP and/or qualified individual(s) supervised by the QSP for monitoring and sampling procedures and instructions. The QSP, in coordination with the QSD, is to determine whether BMPs included in the SWPPP are effective, if immediate actions are needed and/or SWPPP revisions are necessary to reduce pollutants in stormwater and authorized non-stormwater discharges.

6.1 EFFLUENT STANDARDS AND DISCHARGE PROHIBITIONS

6.1.1 Narrative Effluent Standards

This Risk Level 2 site is subject to narrative effluent standards as follows.

1. Stormwater discharges and authorized non-stormwater discharges regulated by the General Permit shall not contain a hazardous substance equal to or in excess of reportable quantities established in 40 C.F.R. §§117.3 and 302.4, unless a separate NPDES Permit has been issued to regulate those discharges.
2. Dischargers shall minimize or prevent pollutants in stormwater discharges and authorized non-stormwater discharges through the use of controls, structures, and management practices that achieve BAT for toxic and non-conventional pollutants and BCT for conventional pollutants.

6.1.2 Numeric Action Level (NAL)

Risk Level 2 dischargers are subject to the following numeric action levels (NALs):

- Storm event daily average pH below 6.5 or above 8.5.
- Storm event daily average turbidity greater than 250 NTU.

6.1.3 TMDL Requirement Standards

This Risk Level 2 site does not discharge to any waterbody or watershed listed for Region 3 in Table H-2 of the 2022 CGP. No TMDL NAL or Numeric Effluent Limit (NEL) is applicable for this site.

6.1.4 Discharge Prohibitions

1. Unless granted an exception by the State Water Board, discharges from this site shall not violate any prohibitions contained in the applicable Basin Plan or statewide water control

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

plans. Waste discharges to Areas of Special Biological Significance (ASBS) are prohibited by the California Ocean Plan.

2. The General Permit prohibits the discharge of pollutants other than stormwater and non-stormwater discharges authorized by this General Permit or another NPDES permit (see authorized non-stormwater discharges and conditions for discharges in Section 5). The Regional Board will be notified if the QSP or site management directed by the QSP anticipates any non-stormwater discharges not already authorized by this General Permit or another NPDES Permit. The Regional Board will determine if a separate NPDES permit will be necessary.
3. Debris¹ resulting from construction activities is prohibited from being discharged from construction sites.

6.2 MONITORING LOCATIONS

Sampling locations are based on proximity to planned stormwater run-on and runoff (discharge) locations, non-visible pollutant storage, occurrence or use; accessibility for sampling, personnel safety; and other factors in accordance with the applicable requirements in the General Permit.

Sampling locations are to be determined by the QSP or QSD based on site progress during construction and run-off patterns until final grades are established. Proposed sampling locations are shown on the Erosion and Sediment Control Plan in Appendix B.

If an operational activity or stormwater monitoring event conducted 48 hours prior to or during a rain event identifies (1) the presence of a material storage, waste storage, or operations area with spills; or (2) the potential for the discharge of non-visible pollutants to surface waters or a storm drain system that was an unplanned location, non-sediment sampling locations will be selected using the same rationale as that used to identify sediment sampling locations.

6.3 SAFETY

Site monitoring and sampling should be performed by the QSP, and/or a person trained in proper SWPPP management and water quality sampling protocol under the direction of the QSP. Anticipated site hazards during monitoring and sampling activities include the following.

- Traffic and noise
- Construction equipment
- Excavations and trenches
- Miscellaneous slip, trip and fall hazards
- Various chemical hazards

Accordingly, personal protective equipment for monitoring and sampling personnel should include the following, as applicable.

- Hard hat
- Safety boots
- Safety vest
- Hearing protection

¹ Litter, rubble, discarded refuse, and remains of destroyed inorganic anthropogenic (derived from human activities) waste.

- Safety glasses
- Nitrile gloves

6.4 INSPECTIONS

6.4.1 Frequency and Procedures

QSD, QSP(s), and QSP Delegates are identified for the project are identified in Appendix J.

The **QSD** will have primary responsibility for assessing how construction activities will affect sediment transport, erosion, and other discharges of pollutants in stormwater runoff throughout the project. The QSD is required to revise the SWPPP to address potential problems identified by visual inspections, sampling data, comments from a QSP, or their own site observations. The QSD is required to perform the following on-site visual inspections:

- Within 30 days of construction activities commencing on site;
- Within 30 days when a new QSD is assigned to the project;
- Twice annually, once August through October and once January through March;
- Within 14 calendar days after a numeric action level exceedance; and
- Within the time period requested in writing from Regional Water Board staff.

The **QSP** will have primary responsibility and significant authority for the implementation, maintenance, and inspection/monitoring of SWPPP requirements. The QSP will be available at all times throughout the duration of the project. The QSP duties include but are not limited to:

- Implementing all elements of the 2022 CGP and SWPPP, including, but not limited to:
 - Performing the following on-site visual inspections:
 - One inspection per calendar month; other weekly inspections in the month can be delegated to a trained QSP Delegate under the specific direction of the QSP.
 - Within 72 hours prior to a forecasted Qualifying Precipitation Event² (QPE) from the National Oceanic and Atmospheric Administration (NOAA) National Weather Service, to inspect any areas of concern and to verify the status of any deficient BMPs, or other identified issues at the site. If extended forecast precipitation data (greater than 72 hours) is available from the *National Weather Service*, then the Pre-Precipitation Event inspection may be done up to 120 hours in advance.
 - Within 14 days after a NAL exceedance, the QSP shall visually inspect the drainage area for exceedance and document any areas of concern.
 - Prior to the submittal for the NOT or COI (for acreage changes) for all or part of the site.
 - Ensuring that all BMPs are implemented, inspected, and properly maintained;

² Qualifying Precipitation Event (QPE): Any weather pattern that is forecast to have a greater than or equal to 50% probability of precipitation (POP) and greater than or equal to ½ inches of Quantitative Precipitation Forecast (QPF) within a 24-hour period. POP is the likelihood of a measurable amount (greater than or equal to 0.01 inches) of precipitation. QPF is a spatial and temporal precipitation forecast that will predict the potential amount of future precipitation for a specified area.

- Ensure that the SMARTS generated WDID Number Notification form is posted on-site, in a location viewable by the public or readily available upon request, and the dates are correct and match the dates listed in SMARTS.
- Implementing non-stormwater management, and materials and waste management activities such as: monitoring discharges; general Site clean-up; vehicle and equipment cleaning, fueling and maintenance; spill control; ensuring that no materials other than stormwater are discharged in quantities which will have an adverse effect on receiving waters or storm drain systems, etc.
- Ensuring elimination of unauthorized discharges.
- Authorized by the LRP to mobilize crews in order to make immediate repairs to the control measures.
- Coordinating with the Contractor(s) to assure the necessary corrections/repairs are made immediately and that the project complies with the SWPPP, the 2022 CGP, and approved plans at all times.
- Notifying the LRP or Duly Authorized Representative immediately of off-site discharges or other non-compliance events.
- Providing foundation and site-specific training to QSP Delegates and overseeing QSP Delegate work. Tasks that may be delegated to appropriately trained QSP-delegates include:
 - Performing non-stormwater and stormwater visual observations and inspections;
 - Performing stormwater sampling and analysis, as required; and
 - Performing routine inspections and observations.

TABLE 6.4.1: QSP and QSP Delegate Authorized Inspections

	WEEKLY BMP AND NSW	PRE-QPE	DAILY-QPE VISUAL INSPECTIONS	POST-QPE VISUAL INSPECTIONS	POST NAL EXCEEDANCES	MONTHLY BMP AND NSW	NOT
QSP*	X	X	X	X	X	X	X
QSP Delegate	X		X	X			

* or QSD

Recordkeeping:

For weekly, pre-storm event, extended storm event, post storm event, and quarterly non-stormwater inspections:

- Completely fill out and sign the inspection report to document the conditions found during the inspection.
- Describe any actions needed and the location of the action in the corrective action log and include a description of any additional BMPs that need to be installed.
- Review previous inspection reports that may have open corrective action items to confirm they have been completed.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

- Upon completion of a repair or maintenance items, the inspector will initial and date when corrective actions began and when they were completed on the corrective action log of the inspection form(s). All actions needed must begin within 72 hours of identification and be completed as soon as possible.

Update the Site Map:

Document and update the site map as site conditions or locations change during construction including:

- Current and up-to-date boundaries of operational control
- Drainage areas
- Discharge locations
- Areas of soil disturbance (cut or fill)
- Locations of sensitive habitats, watercourses, or other features which are not to be disturbed
- Run-on and run-off BMPs
- Sediment and erosion controls
- Temporary and permanent stabilization
- Waste disposal areas including dumpsters and portable toilets
- Material storage
- Vehicle/equipment storage areas
- Fueling and water storage, water transfer for dust control and compaction
- Stockpiles and protection
- Active and inactive inlets and protection
- Stabilized entrances or exits
- Sampling locations
- Construction trailers

Track Dates of:

- Start of major grading activity
- Completion of major grading activity
- Temporary and final stabilization
- Addition or reduction in acreage
- Change in ownership
- Date and initial all changes, additions, and or deletions to the site map

The site map will be kept as a permanent record. If a site map becomes too cluttered with documentation, a new site map will be developed and updated and the old site map will be kept as a permanent record in the SWPPP. The old site map is not to be discarded under any circumstances.

Annual Reporting:

By September 1 each year the WDID is active, an Annual Compliance Report will be electronically submitted to the State Water Resources Control Board via the SMARTS website. A copy of the annual report is to be kept in Appendix S of the SWPPP. The Annual Compliance Report will include:

- A summary and evaluation of sampling and analysis results, including laboratory reports.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

- The analytical method(s), method reporting unit(s), and method detection limit(s) of each analytical parameter (analytical results that are less than the method detection limit shall be reported as "less than the method detection limit").
- A summary of all corrective actions taken during the compliance year.
- Identification of any compliance activities or corrective actions that were not implemented.
- A summary of all violations of the General Permit.
- The names of individual(s) who performed the facility inspections, sampling, visual observation (inspections), and/or measurements.
- The date, place, time of facility inspections, sampling, visual observation (inspections), and/or measurements, including precipitation (rain gauge).
- The visual observation and sample collection exception records and reports.
- Documentation of all training for individuals responsible for all activities associated with compliance with this General Permit.
- Documentation of all training for individuals responsible for BMP installation, inspection, maintenance, and repair.
- Documentation of all training for individuals responsible for overseeing, revising, and amending the SWPPP.

6.5 QUALIFYING PRECIPITATION EVENT TRIGGERED OBSERVATIONS AND INSPECTIONS

Visual observations of the site and inspections of BMPs are required prior to a qualifying precipitation event; following a qualifying precipitation event, and every 24-hour period during a qualifying precipitation event. Pre-Qualifying Precipitation Event inspections will be conducted after reviewing NOAA (National Weather Service) and determining that a precipitation event with a 50 percent or greater Probability of Precipitation (PoP) and a Qualifying Precipitation Forecast (QPF) of 0.5 inch or more precipitation within a 24-hour period has been predicted by the National Weather Service Forecast Office.

6.5.1 Visual Observations Prior to a Forecasted Qualifying Precipitation Event

Within 72 hours prior to a qualifying precipitation event or up to 120 hours prior, if extended forecast precipitation data is available, a stormwater visual monitoring site inspection will include observations of the following locations:

- All stormwater drainage areas to identify leaks, spills, or uncontrolled pollutant sources and when necessary, implement appropriate corrective actions.
- All BMPs to identify whether they have been properly implemented per the SWPPP and implement appropriate corrective actions, as necessary.
- All stormwater storage and containment areas to detect leaks and check for available capacity to prevent overflow.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

The QSP must conduct the inspection prior to the qualifying precipitation event. Consistent with the requirements for a qualifying precipitation event, pre-rain BMP inspections and visual monitoring will be triggered by a NOAA forecast that indicates a 50 percent or greater probability of 0.5 inch of precipitation or more in a 24-hour period in the project area.

6.5.2 BMP Inspections During a Qualifying Precipitation Event

During an extended qualifying precipitation event, BMP inspections will be conducted at least once every 24 hours. Qualifying precipitation events are extended for each subsequent 24-hour period forecast to have at least 0.25 inch of precipitation. The BMP inspections are to identify and record:

- If BMPs were adequately designed, implemented and effective.
- BMPs that require repair or replacement due to damage.
- Additional BMPs that need to be implemented and revise the SWPPP accordingly.

If the construction site is not accessible during the rain event, the visual inspections shall be performed at all relevant outfalls, discharge points, downstream locations. The inspections should record any projected maintenance activities.

6.5.3 Visual Observations Following a Qualifying Precipitation Event

Within 96 hours following the end of a qualifying precipitation event a stormwater visual monitoring site inspection is required to observe:

- If BMPs were adequately designed, implemented and effective.
- BMPs that require repair or replacement due to damage.
- Additional BMPs that need to be implemented and revise the SWPPP accordingly.

6.6 STORMWATER DISCHARGE WATER QUALITY SAMPLING

For this Risk Level 2 project, the General Permit requires effluent monitoring subject to NALs for stormwater discharges. The monitoring is triggered for Qualifying Precipitation Events, defined in Section 6.4 and 6.5. During rain events producing run-off, the QSP or their designated personnel will collect stormwater grab samples from designated sampling locations.

Periodically, it will be necessary to re-evaluate sample locations as site conditions change. The sample location(s) must be representative of current site conditions with respect to disturbed areas and construction phase(s).

Risk Level 2 dischargers shall electronically submit daily average storm event sampling results to the SWRCB SMARTS site during the reporting year. This documentation is required as part of the Annual Report.

6.6.1 Stormwater Analytical Methods

The following analytical methods will be implemented at the site.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

- pH: perform pH analysis on site with a field pH meter.
- Turbidity: perform turbidity analysis with a field turbidity meter or by collecting a sample and delivering to an accredited laboratory for turbidity testing.

An example of the pH and turbidity sampling form is located in Appendix H. Once the form is completed, retain these records in the SWPPP in Appendix Q.

6.6.2 Stormwater Sampling Protocol

- Collect one sample per day of discharge from each discharge location during the qualifying event.
- Analyze effluent samples for pH and turbidity.
- Ensure samples are representative of effluent for entire disturbed area.
- Monitor, sample, and report site run-on from surrounding areas if there is reason to believe through visual observation that run-on may contribute to an exceedance of NALs.
 - Document findings on the sample log and inspection report.
- Physical sampling is not required if:
 - There are dangerous weather conditions such as flooding and electrical storms.
 - Rain event duration is outside of scheduled business hours.
- If no required visual observation (inspection) or sampling are collected, include an explanation in the SWPPP and in the Annual Report documenting why the sampling or inspections were not conducted.

6.6.3 Stormwater Sampling Locations

- Collect effluent samples at all discharge points where stormwater is discharged offsite from disturbed areas. Consult the site map for locations.
- Collect samples of stored or contained stormwater during a qualifying rain event. Consult the site map for location(s).
- Collect samples within designated drainage areas on the site map that are representative of current or recent construction activities that were exposed to stormwater prior to reaching the discharge location³.
 - Locations will be determined based on current construction activities
- If non-visible or visible non-stormwater pollutants other than pH or sediment or the potential of these pollutants are observed due to material or waste exposure to stormwater, follow non-visible and/or non-stormwater sampling protocol in Sections 6.7 or 6.8 (as necessary).

³ For example if there is recent concrete work exposed to stormwater, a pH sample shall be taken of drainage from this area.

6.6.4 Stormwater Sample Collection, Handling, and Testing Instructions

6.6.4.1 Stormwater Sample Collection

- Label the collection bottle with the site number, date, and time.
- Remove the cap from the bottle just before sampling. Avoid touching the inside of the bottle or the cap. If you accidentally touch the inside of the bottle, use another one.
- Work from downstream to upstream locations to avoid contamination of downstream samples.
- Try to disturb as little bottom sediment as possible. In any case, be careful not to collect water that has sediment from bottom disturbance. Stand facing upstream. Collect the water sample on your upstream side, in front of you. You may also tape your bottle to an extension pole to sample from deeper water.
- Hold the bottle near its base and plunge it (opening downward) below the water surface. If you are using an extension pole, remove the cap, turn the bottle upside down, and plunge it into the water, facing upstream. Collect a water sample mid-way between the surface and the bottom. If necessary, clean gravel bags can be used to pond water for collection in low flow. Carefully place the bags in a semi-circle taking care to not stir up sediment.
- Turn the bottle underwater into the current and away from you. In slow-moving stream reaches, push the bottle underneath the surface and away from you in an upstream direction.
- Leave a 1-inch air space. Do not fill the bottle completely (so that the sample can be shaken just before analysis). Recap the bottle carefully, remembering not to touch the inside.
- Fill in the bottle number and/or site number on the appropriate field data sheet.

6.6.4.2 Stormwater Sample Handling/Testing

Turbidity Determination (Laboratory)

If a California-accredited Laboratory will perform the analysis, test methods must be either Standard method 2130 or USEPA method 180.1.

- Using containers provided by the laboratory to collect samples, sample bottles will be capped and labeled, then placed in a cooler with ice to maintain 4°C for transport to the lab.
- Chain of Custody form will be completed.
- Within 24 hours of sampling (unless otherwise required by the laboratory), samples will be delivered to an accredited lab such as:

Laboratory Name: CAPCO Analytical Services, Inc.
Address: 2978 Seaborg Avenue, Suite 4
Ventura, CA 93003
Telephone Number: 805-644-1095
Email Address: rhernandez@capcoenv.com

Turbidity Determination (Field Meter)

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

Use the following steps to determine the turbidity of your sample:

- Prepare the turbidity meter for use according to the manufacturer's directions.
- Calibrate the meter using the turbidity standards provided with the meter. Make sure it is reading accurately in the range in which you will be working.
- Shake the sample vigorously and wait until the bubbles have disappeared. You might want to tap the sides of the bottle gently to accelerate the process.
- Use a lint-free cloth to wipe the outside of the sampling cell (cell) into which the grab sample will be poured. Be sure not to handle the cell below the line where the light will pass when the cell is placed in the meter.
- Pour the sample water into the cell. Wipe off any drops on the outside of the cell.
- Set the meter for the appropriate turbidity range. Place the cell in the meter and read the turbidity measurement directly from the meter display.
- Record the result on sampling activity log sheet.
- Repeat Steps 3-7 for each sample.

pH Determination (Field Meter)

Since samples for pH must be analyzed onsite within 2 hours of sample collection, we anticipate a calibrated portable field meter will be utilized in lieu of an accredited laboratory. Use the following steps to determine the pH of your sample:

- Prepare the pH meter for use according to the manufacturer's directions.
- Calibrate the meter using the standards provided with the meter. Make sure it is reading accurately in the range in which you will be working.
- Rinse the electrode well with deionized water.
- Place the pH meter or electrode into the sample.
- Depress the dispenser button once to dispense electrolyte.
- Read and record the temperature and pH in the appropriate column on the data sheet.
- Rinse the electrode well with deionized water.
- Measure the pH of the 4.0 and 7.0 buffers periodically to ensure that the meter is not drifting off calibration. If it has drifted, recalibrate it.

The pH meter should be calibrated prior to sample analysis and according to the instructions that come with them. If you are using a laboratory grade meter, use at least two pH standard buffer solutions: 4.0 and 7.0 (Buffers can be purchased from test kit supply companies, such as Oakton, Hach, or LaMotte). Following are notes regarding buffers.

- The buffer solutions should be at room temperature when you calibrate the meter.
- Do not use a buffer after its expiration date.
- Always cap the buffers during storage to prevent contamination.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

- Because buffer pH values change with temperature, the meter must have a built-in temperature sensor that automatically standardizes the pH when the meter is calibrated.
- Do not reuse buffer solutions.

The following field instruments will be used to analyze the following constituents:

TABLE 6.6.4.2-1: Field Instruments

FIELD INSTRUMENT	CONSTITUENT
Oakton ECOTestr pH2+, or equivalent	pH
LaMotte 2020we Turbidimeter, or equivalent	Turbidity

For samples collected for field analysis, collection, analysis and equipment calibration will be in accordance with field instrument manufacturer's specifications.

- The instruments will be maintained in accordance with manufacturer's instructions.
- The instrument(s) will be calibrated per manufacturer's guidelines prior to sampling.
- Maintenance and calibration records will be maintained with the SWPPP.

6.6.5 NAL Exceedance

If an individual sample of pH measured in the field are less than 6.5 or greater than 8.5, or if an individual sample of turbidity measured is in excess of 250 NTUs, the permitted NAL has been exceeded. In this event, the QSP should perform the following:

- Conduct inspection for run-on source(s) or onsite construction activities such as but not limited to erosion, rilling, uncovered stockpiles, concrete, lime, mortar or masonry activities that may have contributed to the exceedance.
- Fill out the sampling activity log and document:
 - The sources of the pollutants suspected to be causing the exceedance of the NAL
 - Whether additional BMPs are required to:
 - Meet BAT/BCT requirements
 - Reduce or prevent pollutants in stormwater discharges from causing exceedance of receiving water objectives and determine what corrective action(s) were taken or will be taken with a description of the schedule for completion.
 - If applicable, report and document if the sources of pollutants were related to run-on associated with the construction site and whether additional BMPs are required to:
 - Meet BAT/BCT requirements
 - Reduce or prevent pollutants in stormwater discharges from causing exceedance of receiving water objectives and
 - Determine what corrective action(s) were taken or will be taken with a description of the schedule for completion
- Implement appropriate BMPs as needed according to the schedule described in the exceedance report.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

6.6.6 NAL Exceedance Reporting

In the event of an NAL exceedance, the QSD shall prepare an NAL exceedance report that is submitted to the LRP and filed into Appendix R.

Either the QSD or LRP/AS will also electronically report all qualifying storm event sampling results to the State Water Board through the SMARTS system within 10 days after the conclusion of the storm event. If the Regional Board notifies the LRP that an NAL Exceedance Report is required, authorized personnel will submit the already prepared report into the SMARTS system.

6.7 NON-STORMWATER DISCHARGE WATER QUALITY SAMPLING

If at any time during BMP inspections non-stormwater discharge(s) are observed going offsite through inlets or at outfall locations, sample the discharge at all points where it leaves the site. See the pollutant lists in Appendix N for potential pollutants and follow sampling and handling protocols in Section 6.6.4. Send all samples to the certified lab identified in Section 6.6.4.2 and document sampling results in Appendix M.

Indicate on the inspection report if run-on from surrounding areas is contributing to non-stormwater discharges that may cause or contribute to an exceedance of receiving water standards, or may exceed NALs. If NAL exceedance is measured for pH or Turbidity from run-on, document and report per Section 6.6.6.

6.8 NON-VISIBLE POLLUTANT SAMPLING

6.8.1 Non-Visible Sampling Schedule

If applicable, during the first 2 hours of rain events, samples for non-visible pollutant(s) and a sufficiently large uncontaminated background sample shall be collected during business hours and rain events that generate run-off. Samples shall be collected regardless of the time of year or status of the construction site. In conformance with the SWRCB definition, a minimum of 48 hours of dry weather will be used to distinguish between separate rain events.

Collection of discharge samples for non-visible pollutant monitoring will be triggered when any of the following conditions are observed during the required inspections conducted before or during rain events:

- Materials or wastes containing potential non-visible pollutants are not stored under watertight conditions. Watertight condition is defined as:
 - storage in a watertight container,
 - storage under a watertight roof or within a building, or
 - protected by temporary cover and containment that prevents stormwater contact and run-off from the storage area.
- Materials or wastes containing potential non-visible pollutants are stored under watertight conditions, but
 - a breach, leakage, malfunction, or spill is observed,
 - the leak or spill is not cleaned up prior to the rain event, and
 - there is the potential for discharge of non-visible pollutants to surface waters or a storm sewer system.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

- An operational activity with the potential to contribute non-visible pollutants:
 - was occurring just prior to the rain event,
 - applicable BMPs were observed to be breached, malfunctioning, or improperly implemented, and
 - there is the potential for discharge of non-visible pollutants to surface waters or a storm sewer system.
- Soil amendments/stabilizers that have the potential to alter pH levels or have unacceptable concentrations of non-visible pollutants have been applied, and there is the potential for discharge of non-visible pollutants to surface waters or a storm sewer system.
- Stormwater run-off from an area contaminated by historical usage of the site has been observed to combine with stormwater run-off, and there is the potential for discharge of non-visible pollutants to surface waters or a storm sewer system.

6.8.2 Non-Visible Sample Locations

If a visual inspection identifies any breach, malfunction, leakage or spill which could result in the discharge of non-visible pollutants to surface waters or a storm sewer system, the location(s) will be identified on the Site Map by the QSP or a qualified individual supervised by the QSP.

Sample locations shall include, at a minimum, the following areas and will be documented on the site map.

- All discharge location(s) downstream of the non-visible pollutant discharge that is safely accessible.
- A location upstream of the non-visible pollutant discharge where stormwater has not come into contact with the disturbed soils or material stored or used on site.

6.8.3 Non-Visible Sampling Preparation

In preparation of non-visible sampling, activities will include:

- Review hazardous materials inventory.
- Store sampling bottles, transport vessel, latex gloves and field equipment.
- Pre-print Chain of Custody, with date and time to be completed after sampling.
- Inspect hazardous materials storage areas for exposed, unsealed or damaged containers or spills.
- Identify run-off/discharge locations down grade of any breach, malfunction, leakage or spill observed which can result in the discharge of pollutants and sample the flow line.
- Identify run-off/discharge locations to take a representative background sample of flows known to be free of site materials with a potential to pollute.

6.8.4 Non-Visible Analytical Constituents

The following table lists the specific sources of and types of potential non-visible pollutants that may be found on the project and the applicable water quality indicator constituent(s) for that pollutant. Additional pollutants can be reviewed in Appendix N.

TABLE 6.8.4-1: Potential Non-Visible Pollutants and Water Quality Constituent

POLLUTANT SOURCE	POLLUTANT	WATER QUALITY INDICATOR CONSTITUENT
Batteries - Staging, streets, and material storage areas	Sulfuric acid, Lead, pH	pH, Lead
Portland Concrete Cement, Stucco, Chemical Stabilization	pH	pH
Landscaping	TDS	TDS
Pulverized Asphalt Concrete, Equipment Fluids	PAH, TPH, Oil	PAH, TPH, Oil

For correct sample management and analysis, the following will be observed:

TABLE 6.8.4-2: Analytical Constituents

ANALYTE/CONSTITUENT*	CONTAINER	VOLUME	PRESERVATIVE	HOLD TIME
Total Dissolved Solids (TDS)	Plastic	500 ml	Cool 4°C	7 days
pH	Plastic	500 ml	Cool 4°C	Immediately
Salinity	Plastic	500 ml	Cool 4°C	28 days
Conductivity	Plastic	500 ml	Cool 4°C	48 hrs
Biological Oxygen Demand (BOD)	Plastic	500 ml	Cool 4°C	48 hrs
Oil & Grease	Glass	500 ml	HCl	28 days
Total Petroleum Hydrocarbons as Gasoline/BTEX (TPHg)	VOA	3-40 ml	HCl	14 days
Total Petroleum Hydrocarbons as Diesel (TPHd)	Glass	2-1 L	Cool 4°C	14 days
Polynuclear Aromatic Hydrocarbons (PAH)	Plastic	500 ml	Cool 4°C	48 hrs
Chlorinated Volatile Organic Compounds (CVOC)	VOA	3-40 ml	HCl	14 days
Polychlorinated Biphenyls (PCB)	Glass	2-1 L	Cool 4°C	7 days
Metals (Lead)	Plastic	500 ml	HNO ₃	6 mos
Dissolved Oxygen	VOA	2-50 ml	H ₂ SO ₄	8 hrs

* For additional constituents and details see Appendices M and N

6.8.5 Non-Visible Sample Collection and Handling

6.8.5.1 Non-Visible Sample Collection

Samples of non-visible discharge(s) and an uncontaminated sample will be collected at the locations determined during visual inspections. Grab samples will be collected and preserved in accordance with the methods identified in the "Sample Collection, Preservation and Analysis for Monitoring Non-Visible Pollutants" table provided above and in Appendix M. Only personnel trained in proper water quality sampling will collect samples. Samples will be collected by placing a separate lab-provided sample container directly into a stream of water downgradient and within close proximity to the potential non-visible pollutant discharge location. This separate lab-provided sample container will be used to collect water, which will be transferred to sample bottles for laboratory analysis. The upgradient and uncontaminated background samples shall be collected after collecting the downgradient contaminated sample to minimize cross-contamination. The sampling personnel will collect the water upgradient of where they are standing.

Once the separate lab-provided sample container is filled, the water sample will be poured directly into sample bottles provided by the laboratory for the analyte(s) being monitored. Sample bottles will be filled completely. To maintain sample integrity and prevent cross-contamination, sampling collection personnel will:

- Wear a clean pair of surgical gloves prior to the collection and handling of each sample at each location.
- Not contaminate the inside of the sample bottle by allowing it to come into contact with any material other than the water sample.
- Discard sample bottles or sample lids that have been dropped onto the ground prior to sample collection.
- Not leave the cooler lid open for an extended period of time once samples are placed inside.
- Not sample near a running vehicle where exhaust fumes may impact the sample.
- Not touch the exposed end of a sampling tube, if applicable.
- Avoid allowing rain water to drip from rain gear or other surfaces into sample bottles.
- Not eat, smoke, or drink during sample collection.
- Not sneeze or cough in the direction of an open sample bottle.
- Minimize the exposure of the samples to direct sunlight, as sunlight may cause biochemical transformation of the sample.
- Decontaminate sampling equipment prior to sample collection using a TSP-soapy water wash, distilled water rinse, and final rinse with distilled water.

6.8.5.2 [Non-Visible Sample Handling Procedures](#)

Immediately following collection, sample bottles for laboratory analytical testing will be capped, labeled, documented on a Chain-of-Custody form provided by the analytical laboratory, sealed in a re-sealable storage bag, placed in an ice-chilled cooler, at as near to 4 degrees Celsius as practicable, and either retrieved by or delivered within 24 hours to the following California state-certified laboratory:

Laboratory Name: CAPCO Analytical Services, Inc.
Address: 2978 Seaborg Avenue, Suite 4
Ventura, CA 93003
Telephone Number: 805-644-1095
Email Address: rhernandez@capcoenv.com

Immediately following collection, samples for field analysis will be tested in accordance with field instrument manufacturer's instructions and results recorded on the Sampling Activity Log (Appendix M).

6.8.5.3 [Sample Documentation Procedures](#)

All original data documented on sample bottle identification labels, Chain-of-Custody forms, Sampling Activity Logs, and Inspection Checklists will be recorded using ink. These will be considered accountable documents. If an error is made on an accountable document, the individual will make corrections by lining through the error and entering the correct information.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

The erroneous information will not be obliterated. All corrections will be initialed and dated. Copies of the Chain-of-Custody form and Sampling Activity Log are provided in Attachment M.

6.8.5.4 Sample Bottle Identification Labels

Sampling personnel will attach an identification label to each sample bottle. At a minimum, the following information will be recorded on the label, as appropriate:

- Project name
- Project number
- Unique sample identification number and location.
- Quality assurance/quality control (QA/QC) samples shall be identified similarly using a unique sample number or Collection date/time (No time applied to QA/QC samples)
 - Separate times for collected samples and QA/QC samples recorded to the nearest minute
- Analysis constituent
- Sampling Activity Logs: A log of sampling events will identify:
 - Sampling date
 - Unique sample identification number and location
 - Analysis constituent
 - Names of sampling personnel
 - Weather conditions (including precipitation amount)
 - Field analysis results
 - Other pertinent data
- Chain-of-Custody (COC) forms:
 - All samples to be analyzed by a laboratory will be accompanied by a COC form provided by the laboratory. Only the sample collectors will sign the COC form over to the lab. COC procedures will be strictly adhered to for QA/QC purposes.
- BMP Inspection Report: When applicable, the qualified stormwater inspector will document on the report that samples for non-visible pollutants were taken during a rain event.

6.8.6 Data Management and Reporting

Laboratory reports and COC forms will be reviewed for consistency between laboratory methods, sample identifications, dates, and times for both primary samples and QA/QC samples. All data, including COC forms and Sampling Activity Logs, shall be kept with the SWPPP document, which is to remain at the construction site at all times until a Notice of Termination has been submitted and approved.

6.8.7 Data Evaluation

Inspection results, site observations and comparative laboratory sample analysis of up and downstream locations (where applicable) will be evaluated for evidence of and potential for pollution. Once these are understood:

- Evaluate BMPs for their adequacy and effectiveness.
- If inadequate or not effective, BMPs will be changed to address the existing conditions.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

- If/when BMPs are overwhelmed, an immediate and effective response is required to correct potential issues.
- All changes will be documented in the SWPPP and on the Site Map.
- If different BMPs are needed not already designated in the SWPPP, the QSP will contact the QSD and an appropriate amendment will be made to the SWPPP.

6.8.8 Change in Conditions

Whenever SWPPP monitoring indicates a change in site conditions that might affect the appropriateness of sampling locations or introduce additional non-visible pollutants of concern, testing protocols will be revised accordingly. All such revisions will be recorded as amendments to the SWPPP by the QSD and filed in Appendix C.

6.9 SPILL RESPONSE PROCEDURES

6.9.1 Accidental Minor Spills

Minor spills involve small quantities of oil, gasoline, paint, etc., easily controlled by the first responder at the discovery of the spill. The practices followed for minor spills are to:

- Contain the spill.
 - Stop the spill from continuing and berm around spill area if necessary.
- Recover spilled materials.
 - Sweep up spilled dry materials. Do not wash them away with water or bury.
 - Recover liquid spills on paved or impermeable surfaces using dry absorbent materials such as cat litter, and/or rags.
- Clean the contaminated area and/or dispose of contaminated materials.
 - Cleanup rags may be considered hazardous waste that must be sent to a certified industrial laundry or dry cleaner, or disposed of properly. Place small, non-hazardous spill residues and materials inside a sealed container before discarding into garbage or dumpster.
 - Dispose of contaminated materials in a proper waste container. Toxic liquid wastes (used oils, solvents, and paints) and chemicals (acids, pesticides, additives, and curing compound) shall not be disposed of in dumpsters designated for construction materials.
 - Examine labels of spilled materials for proper waste disposal instructions.

6.9.2 Accidental Semi-Significant Spills

Semi-significant spills can be controlled by the first responder along with the aid of other personnel such as laborers, foremen, contractors, etc. Spills should be cleaned up immediately. Spill control measures should be consistent with those used for minor spills and as recommended in Appendix G, WM-4. In addition, the following actions should occur upon discovery of a semi-significant spill.

- If the spill occurs in a dirt area, contain the spill by constructing an earthen dike. Dig and properly dispose of all contaminated soil.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

- If the spill occurs on a paved or impermeable surface, clean up using “dry” methods, i.e. absorbent materials, cat litter and/or rags. Contain the spill by encircling with absorbent materials and do not let the spill spread.
- If the spill occurs during rain, cover the affected area if possible to avoid runoff.
- Notify the project foreman immediately.

6.9.3 Accidental Significant/Hazardous Spills

Significant or hazardous spills cannot be completely controlled by on-site personnel or are deemed too hazardous to control by on-site personnel. The following steps should be taken:

- Notify the local emergency response agency by dialing **911** and notify the proper City officials. All necessary emergency telephone numbers must be made available at the construction trailer.
- Notify the Governor’s Office of Emergency Services Warning Center at **(916) 845-8911**.
- For spills of federally reportable quantities, in conformance with the requirements in 40 CFR, notify the National Response Center at **(800) 424-8802**.
- Notification should first be made by telephone and followed with a written report as soon as possible.
- A spill cleanup contractor or Haz-Mat team should be contacted immediately. Construction personnel should not attempt to clean up until the appropriate qualified personnel have arrived and given instructions.
- Other agencies which may need to be consulted include but are not limited to the local Fire Protection District, the local police, the Highway Patrol, the State Department of Toxic Substance Control, the California Division of Oil and Gas, the California Department of Fish and Game and Cal/OSHA.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

FIELD OPERATION PROTOCOL

Sampling Preparations

1. Laboratory Coordination
 - a. Call specified labs approximately one week prior to the proposed sampling date to confirm and order glassware required for the sampling. Test for the analytes listed in SWPPP.
 - b. Arrange for appropriate type and quantity of bottles to be delivered or arrange for pick-up.
 - c. Confirm holding time and other details applicable for the proposed testing.
 - d. Check requirements for sample preservation, such as ice packs, etc. and request ice-chests to transport samples.
 - e. Carry ice for sample preservation, if needed.
2. Print out the following and make sure to carry some extra copies:
 - a. Checklist of field equipment and supplies needed for the tasks (see below).
 - b. Chain of Custody forms (see attachment).
3. Field equipment and supplies checklist.
 - a. Chain of Custody forms
 - b. Field Sampling Data forms
 - c. Sampling bottles
 - d. Pencil/pen
 - e. Disposable gloves
 - f. Digital camera
 - g. Cooler with ice
 - h. 5-gallon bucket
 - i. Orange vest, hard hat, and other appropriate safety equipment
 - j. Consider taking a 4-wheel-drive vehicle if sampling in rainy season
 - k. Rubber boots

Sampling Procedures

1. Complete the Sampling Data forms for each sampling location.
2. Take precautions to avoid contamination of the samples by using gloves and avoid touching the rims and caps of the sample bottles.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

3. If sampling for Coliform test, sample it last.
4. Avoid sampling surface scum; grab samples should be taken from middle of flow approximately 1/3 of the way down from the water surface.
5. Label all samples with location and Project name/number. Record the time samples were taken. All samples should be transported to the lab within the holding time limit.
6. In the comments section, add any useful information such as color, odor, etc.
7. Cap the samples tightly to prevent spills and contamination.
8. Place all samples collected in the ice chest, filled with ice and follow any other appropriate and applicable sample handling procedures.
9. Place the samples and ice-chest in a shady area, away from direct sunlight.

Post-Sampling Procedures

1. Make sure vehicle tires are clean before leaving the site.
2. Transport collected samples to the laboratory within any holding time requirements.
3. Hand over the Chain of Custody forms after filling, executing and relinquishing, and retain a copy for the project's records.
4. Return unopened extra bottle boxes to the laboratory or to the storage shed.
5. Note the condition of equipment at the end of the day. Inform Project Manager regarding any malfunctioning or broken equipment.
6. Return empty ice-chests to the office or storage shed.
7. File the Field Irrigation Well Sampling Data forms in the project folder.
8. File the Chain of Custody forms in the project folder. Give a copy to the project manager.

Important Points to Note

1. Do not drive through planted crops, areas of erosion hydroseeding, fabric, tilled areas or drainages for any reason. Keep your vehicle on existing construction roads.
2. Follow the posted speed limit. For construction roads, drive at or below 10 miles per hour to minimize dust.

EXHIBIT "C" (Stormwater Pollution Prevention Plan)

3. Do not drive on saturated roads.
4. Do not litter.

Quality Assurance

1. For QA/QC purposes, duplicate samples should be collected at 10 percent of the site locations. Mark them with unique location name/number.

Appendix N Pollutant Testing Guidance Table ¹

Category	Construction Site Material	Visually Observable?	Pollutant Indicators ²	Suggested Analyses Field ³	Laboratory
	Ammoniacal-Copper-Arsenate (ACA) Copper Naphthenate		Zinc		
	Creosote	Yes - Rainbow Surface or Brown Suspension	Visually Observable - No Testing Required		

Notes:

1. 1 If specific pollutant is known, analyze only for that specific pollutant. See MSDS to verify.
2. For each construction material, test for one of the pollutant indicators. Bolded pollutant indicates lowest analysis cost or best indicator. However, the composition of the specific construction material, if known, is the first criterion for selecting which analysis to use.
3. See www.hach.com, www.lamotte.com, www.ysi.com and www.chemetrics.com for some of the test kits
4. If the type of inorganic fertilizer is unknown, analyze for all pollutant indicators listed.
5. Only if special handling requirements are required in the contract documents for aerially deposited lead (ADL)
6. If used with a dye or fiber matrix, it is considered visually observable and no testing is required.
7. Based upon research conducted by the State of California Department of Transportation (Caltrans), the following copolymers/polymers do not discharge pollutants and water quality sampling and analysis is **not** required: Super Tak™, M-Binder™, Fish Stik™, Pro40dc™, Fisch-Bond™, and Soil Master WR™.

Goleta, California

STORMWATER CONTROL PLAN

Dear Mr. Keenan:

We are pleased to present this Stormwater Control Plan (SWCP) for the subject project, Goleta Train Depot, located at 27 South La Patera Lane in Goleta, California. This SWCP has been prepared according to the Santa Barbara County Stormwater Technical Guide standards.

If you have any questions regarding this report, please do not hesitate to contact us.

Sincerely,

ENGEO Incorporated

Randall Rettig

EXHIBIT "D" (SWCP)

I. Project Data

Table 1. Project Data

Project Name/Job Number	Goleta Train Depot/16370.000.000 APN 073-050-033	
Project Location	27 South La Patera Lane, Goleta, CA 93117	
Project Phase No.	Not Applicable	
Project Type and Description	Demolition of existing warehouse and construction of an 8,500 square foot (SF) single-story train depot with a lobby, ticketing area, café, community room and improvements along railroad right-of-way and along South La Patera between Hollister Avenue and proposed depot.	
Total Project Site Area (acres)	2.6 acres / 113,065 SF	
Total New Impervious Surface Area	83,135 SF	
Total Replaced Impervious Surface Area	98,269 SF	(A portion of the existing concrete paving will be protected in place)
Total Pre-Project Impervious Surface Area	109,576 SF±	
Total Post-Project Impervious Surface Area	83,135 SF	
Reduced Impervious Area Credit	26,441 SF	
Net Impervious Area	83,135 SF	
Applicable Requirements	Tier 4	
Watershed Management Zone	1	
Design Storm Frequency and Depth	2.2 inches (95th percentile)	
Urban Sustainability Area	The project is not in an Urban Sustainability Area	

II. Setting

II.A. Project Location and Description

This project involves the demolition of an existing warehouse building and parking lot and replacement with a new train depot building, lobby, ticketing area, waiting room, café, community room, restrooms/showers, storage lockers, and parking lot. The parcel fronts an arterial roadway, as shown in Figure 1.

The proposed use is consistent with current commercial zoning.

EXHIBIT "D" (SWCP)

II.B. Existing Site Features and Conditions

The rectangular, relatively flat site lies in a commercial region of Goleta, California, as shown on Figure 2. Most of the existing site is covered with a paved parking lot and warehouse. Based on a geotechnical study performed by ENGE0, on-site soil is silty clay, typical of the area. This soil is classified as Hydrologic Soil Group ("D") according to the United States Soil Conservation Service, with little ability to infiltrate stormwater. The existing on-site storm drainage system is connected to a municipal storm drain on South La Patera Lane along the north and east of the site.

II.C. Opportunities and Constraints for Stormwater Control

Constraints include low infiltration rate soil (Hydrologic Soil Group D), high intensity land use, expansive soil, and flat topography. Disposal of runoff to deep infiltration is not feasible on this site due to the low permeability of the on-site silty clay soil. High land values, the objective of creating a dense retail area, and parking requirements limit opportunities to reduce site imperviousness.

Stormwater controls for the project are to be included in the center and northwest corner of the site. The City storm drain system along South La Patera Lane is deep enough to provide sufficient hydraulic head to route runoff across the surface of the site to the proposed stormwater treatment facilities.

III. Low Impact Development Design Strategies

III.A. Site Design and Runoff Reduction

The site is densely developed infill within the existing urbanized area. The future train depot complex is proposed to include biofiltration regions for reducing stormwater runoff in general conformance with the Santa Barbara County Stormwater Technical Guide to address the County's stormwater requirements.

III.B. Site Constraints

Conventional Portland cement and asphalt concrete are to be used to construct the circulation and parking areas. Permeable pavements were considered but were not found to be cost-effective for this site, in part because the pavements overlie expansive clay soil. This condition would necessitate a very deep gravel base course, which would, in turn, require large quantities of excavation and offhaul.

EXHIBIT "D" (SWCP)

IV. Documentation of Drainage Design

IV.A. Descriptions of Each Drainage Management Area

IV.A.1. Drainage Management Areas

Table 2. Drainage Management Areas (DMAs), as shown on Appendix A.

DMA Name	DMA Type	Area (SF)	Surface Type
DMA-1	Drains to SCM-1	68,899 SF	Paving/Roof
DMA-2	Drains to SCM-2	29,380 SF	Paving/Roof

IV.A.2. Drainage Management Area Descriptions

DMA 1, totaling 68,889 square feet, drains the perimeter of the parking areas, the full roof area of the train depot building, and a portion of a paved traffic island. DMA-1 drains to the Bioretention Facility SCM 1 in the northwestern corner of the property.

DMA 2, totaling 29,380 square feet, drains the central sections of the property. DMA-2 drains to the Bioretention Facility SCM 2 in the center of the property; all three planters are to be hydraulically connected via an 8-inch pipe.

IV.B. Stormwater Control Measures

Runoff from all impervious areas on the site, including roofs and paved areas, will be routed to two bioretention facilities (see Figure 4 in Appendix A). The facilities will be designed and constructed in accordance with the Santa Barbara County Project Clean Water Stormwater Technical Guide (February 2017). Design features will include:

- A perimeter concrete curb. Where adjacent to pavement, curbs will be thickened, and an impermeable vertical cutoff wall will be included.
- Each layer is built level, and to the elevations specified in the plans.
 - Bottom of Gravel Layer (BGL)
 - Top of Gravel Layer (TGL)
 - Top of Soil Layer (TSL)
 - Overflow Grate
 - Facility Rim
- Caltrans Class 2 permeable per Caltrans Standard Specifications Section 68-2.02F (3), depth as specified in the Stormwater Control Measure Sizing Calculator output
- 24 inches sand/compost mix meeting BASMAA specifications
- 4-inch-diameter PVC SDR 35 perforated pipe underdrain, installed with the invert at the top of the Class 2 permeable layer with holes facing down, and connected to the overflow structure at that same elevation
- 6-inch-deep reservoir between top of soil and overflow grate

Figure 3. Bioretention Facility Cross-Section (Schematic)

EXHIBIT "D" (SWCP)

- Concrete drop inlet with frame overflow structure, with grate set to specified elevation, connected to storm drain in Main Street
- Vertical cutoff walls to protect adjacent pavement
- Plantings selected for water conservation
- Irrigation system on a separate zone, with drip emitters and “smart” irrigation controllers
- Sign identifying the facility as a stormwater treatment facility.

IV.C. Tabulation and Sizing Calculations

IV.C.1. Information Summary for LID Facility Design

See the entries and output from the Central Coast Region Stormwater Control Measure Sizing Calculator Spreadsheet in Appendix B.

IV.D. HydroCAD Calculation: Pre and Post Development Peak Flows

The Goleta Train Depot will be replacing 102,955 square feet of existing development, as shown in the Project Data summary. This places the Project under a Tier 4 classification as defined by the Santa Barbara County Stormwater Technical Guide. Santa Barbara County requires the utilization of software, such as HydroCAD, to demonstrate that peak flows from the 2-year through 100-year, 24-hour recurrence interval storms will be reduced in the post-project condition. Due to the incorporation of LID measures, the Project will result in lower peak flows than the predevelopment condition. HydroCAD calculation summary (pre and post development) are included in Appendix C; we provide a summary in Table 3.

Table 3. HydroCAD Summary of Pre and Post Development Peak Flows

	Design Storm ¹					
	2-year 3.35in ¹	5-year 4.29in ¹	10-year 5.04in ¹	25-year 6.02in ¹	50-year 6.76in ¹	100-year 7.49in ¹
Pre-Project Peak Runoff (cfs)	1.12	1.44	1.70	2.04	2.28	2.54
Post-Project Peak Runoff (cfs)	1.07	1.40	1.66	2.00	2.26	2.51
Percent Reduction	-4.46%	-2.78%	-2.35%	-1.96%	-0.88%	-1.18%

V. Source Control Measures

V.A. Site activities and potential sources of pollutants

On-site activities that could potentially produce stormwater pollutants include:

- Driveways and parking lots
- Food Service
- Trash Management

EXHIBIT "D" (SWCP)

V.B. Potential Pollutant Sources and Source Control Measures

Table 4. Pollutant Sources and Source Control Measures

Potential Source of Runoff Pollutants	Permanent Source Control BMPs	Operational Source Control BMPs
Inlets (bioretention overflows)	All inlets will be marked with “No Dumping! Flows to Local Waterways” or similar	Markings will be regularly inspected and repainted or replaced as needed. Lessees will receive stormwater pollution prevention brochures. Lease agreements will include the following provision: “Tenant shall not allow anyone to discharge anything to storm drains or to store or deposit materials so as to create a potential discharge to storm drains.”
Indoor and Structural Pest Control		Owner will retain only companies that are certified in Integrated Pest Management (IPM) for on-site pest management.
Landscape Maintenance	Landscaping will minimize irrigation and runoff and be selected for pest resistance and will minimize the need for fertilizers and pesticides. Plants will be selected appropriate to site soil, slopes, climate, sun, wind rain, land use, air movement, ecological consistency, and plant interactions.	Landscaping will be maintained using minimum or no pesticides. IPM information will be provided to new owners, lessees, and operators.
Food Service	Café will include a floor sink for cleaning floor mats, containers, and equipment. The floor sink will be connected to a grease interceptor before discharging to the sanitary sewer.	
Refuse Area	Refuse and recycled materials will be handled in the refuse area. This area is to be roofed and bermed.	All dumpsters will be posted with signs stating “Do not dump hazardous materials here” or similar.
Plazas, Sidewalks, and Parking Lots		Trash receptacles to be provided in plaza area and on drive-through and emptied daily. Site to be regularly maintained for trash. Plazas, sidewalks, and parking lots will be swept regularly. Debris and wash water from periodic pressure washing will be collected and disposed of to the sanitary sewer.

EXHIBIT "D" (SWOP)

VI. Stormwater Facility Maintenance

VI.A. Ownership and Responsibility for Maintenance in Perpetuity

The owner accepts responsibility for the operation and maintenance of stormwater treatment and flow-control facilities for the life of the project until such time as this responsibility is formally transferred to subsequent owners. The facility maintenance for this project will be financed publicly and implemented by the City of Goleta in perpetuity for the life of the project. Any future change or alteration, or the failure to maintain any feature described herein can result in penalties including but not limited to fines, property liens, and other actions for enforcement of a civil judgment.

VI.B. Summary of Maintenance Requirements for Each Stormwater Facility

The two bioretention facilities will be maintained on the following minimum schedule. Details of maintenance responsibilities and procedures will be included in a Stormwater Facility Operation and Maintenance Plan to be submitted for approval, as required in the conditions of approval.

At no time will synthetic pesticides or fertilizers be applied, nor will any soil amendments, other than aged compost mulch or sand/compost mix, be introduced.

Daily: The facilities will be examined for visible trash during regular site inspections, and trash will be removed.

After Significant Rain Events: A significant rain event is one that produces approximately ½ inch or more rainfall in a 24-hour period. Within 24 hours after each such event, the following will be conducted.

- The surface of the facility will be observed to confirm there is no ponding.
- Inlets will be inspected, and any accumulations of trash or debris will be removed.
- The surface of the mulch layer will be inspected for movement of material. Mulch will be replaced and raked smooth if needed.

Prior to the Start of the Rainy Season: In September of each year, the facility will be inspected to confirm there is no accumulation of debris that would block flow, and that growth and spread of plantings does not block inlets or the movement of runoff across the surface of the facility.

Annual Landscape Maintenance: In December through February of each year, vegetation will be cut back, as needed, debris removed, and plants and mulch replaced, as needed. The concrete work will be inspected for damage. The elevation of the top of soil and mulch layer will be confirmed to be consistent with the 6-inch reservoir depth.

EXHIBIT "D" (SWCP)

VII. Stormwater Control Plan/Construction Documents Cross-Checklist

See Appendix E for the Bioretention Construction Inspection Checklist and Table 5.

Table 5. Stormwater Control Plan/Construction Documents Cross-Checklist

Stormwater Control Plan Page #	Source Control or LID Facility	See Plan Sheet #s
3 and Exhibit	Drainage from DMAs 1 and 2 are retained by surrounding curbs.	
3 and Exhibit	DMA 1 drains to Bioretention Facility #1; facility is designed as specified	
3 and Exhibit	DMA 2 drains to Bioretention Facility #2; facility is designed as specified	
5	Bioretention Facility #1 and #2 overflows are marked with "No Dumping" message	
6	Café/food service facility is equipped with a floor sink connected to a grease interceptor and then to sanitary sewer	
6	Trash receptacles are located in plaza area and are accessible to drive-through lane	

VIII. Certifications

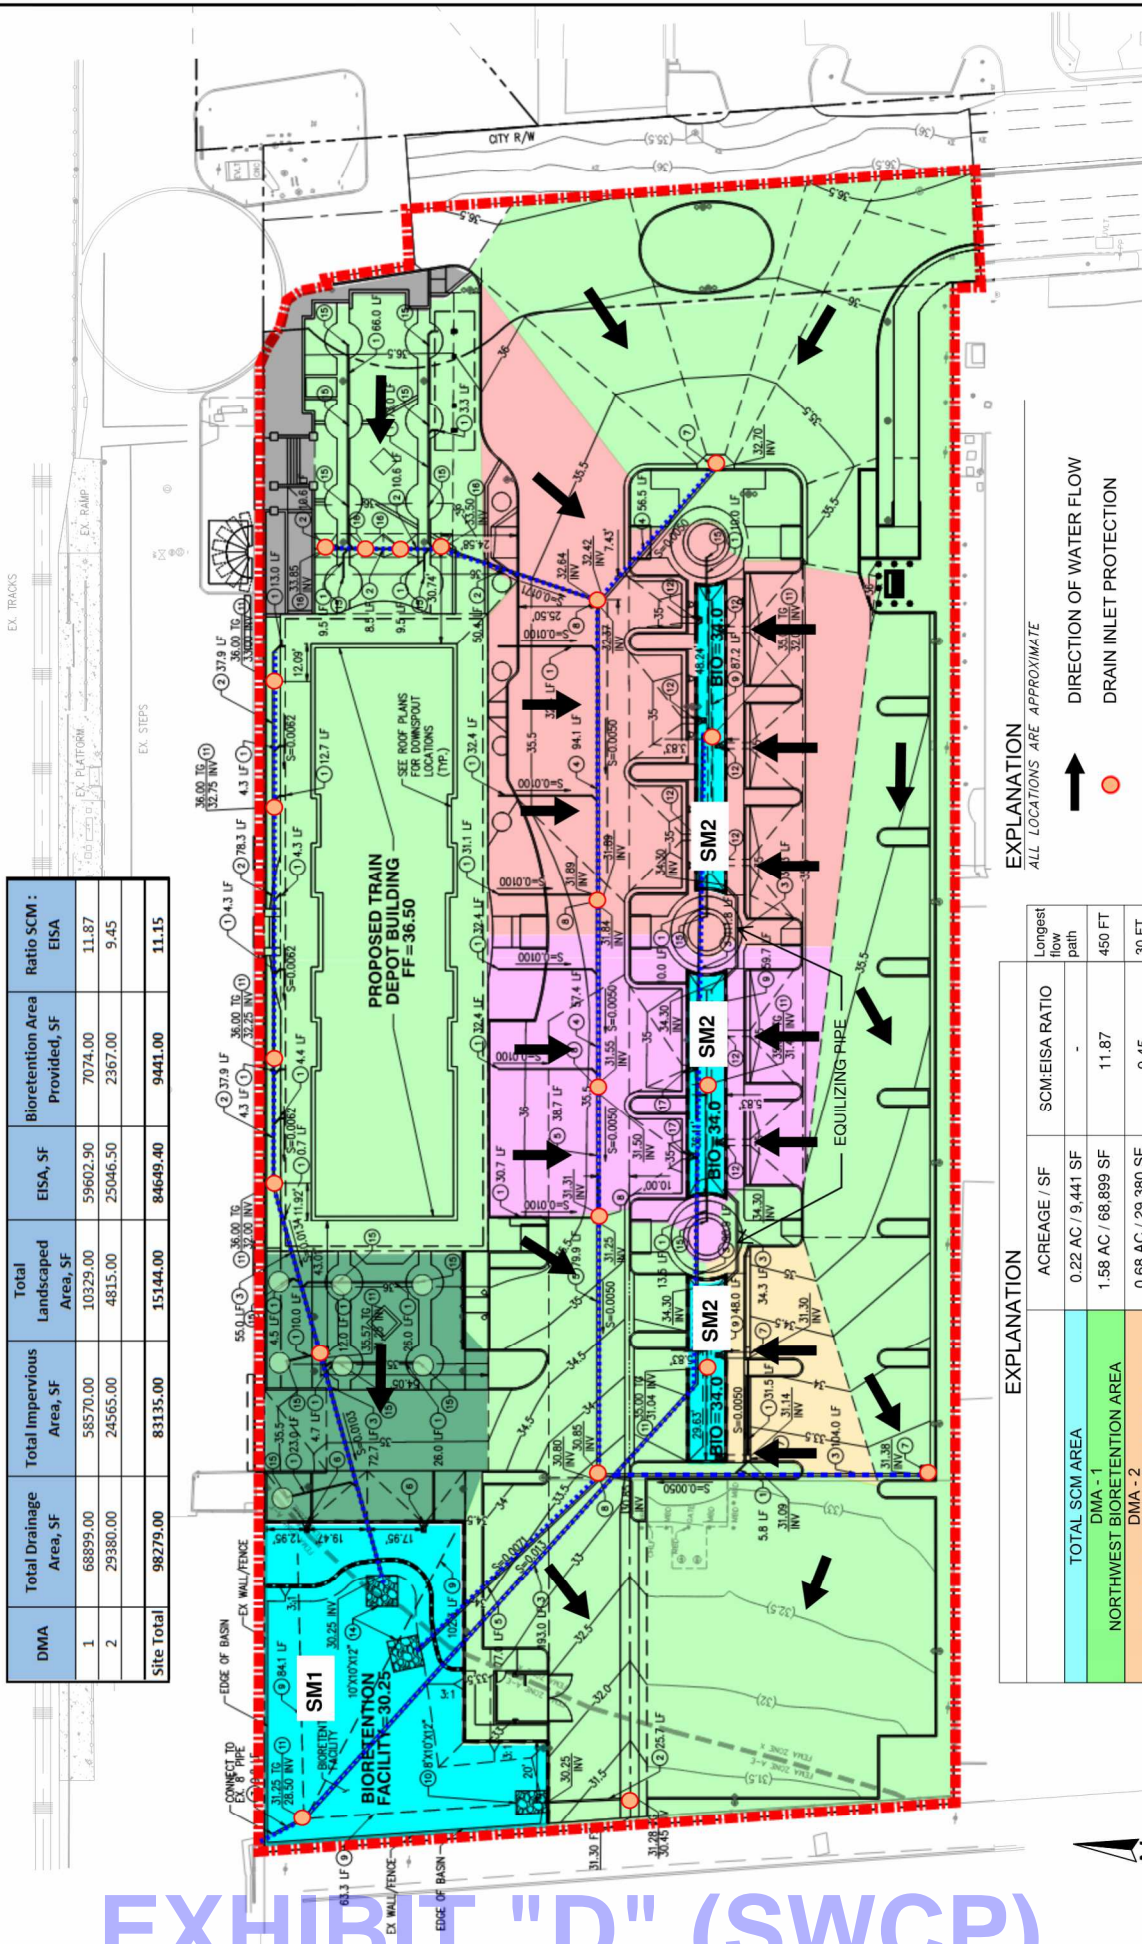

The preliminary design of Stormwater Control Measures and other stormwater pollution control measures in this plan are in accordance with the current edition of the Santa Barbara County Project Clean Water's Stormwater Technical Guide.

Appendix D. Stormwater Pollutant Sources/Source Controls Checklist

How to use this worksheet (also see instructions on page 3-6 of the *Stormwater Technical Guide*):

1. Review Column 1 and identify which of these potential sources of stormwater pollutants apply to your site. Check each box that applies.
2. Review Column 2 and incorporate all of the corresponding applicable BMPs in your Stormwater Control Plan drawings.
3. Review Columns 3 and 4 and incorporate all of the corresponding applicable permanent controls and operational BMPs in a table in your Stormwater Control Plan. Use the format shown in Table 3-1 on page 3-6 of the *Stormwater Technical Guide*. Describe your specific BMPs in an accompanying narrative and explain any special conditions or situations that required omitting BMPs or substituting alternative BMPs for those shown here.

IF THESE SOURCES WILL BE ON THE PROJECT SITE ...	THEN YOUR STORMWATER CONTROL PLAN SHOULD INCLUDE THESE SOURCE CONTROL BMPs		
1 Potential Sources of Runoff Pollutants	2 Structural/Permanent Controls—Show on Stormwater Control Plan Drawings	3 Structural/Permanent Controls—List in Stormwater Control Plan Table and Narrative	4 BMPs—Include in Stormwater Control Plan Table and Narrative
<ul style="list-style-type: none"> ■ A. On-site storm drain inlets (unauthorized non-stormwater discharges and accidental spills or leaks) 	<ul style="list-style-type: none"> ■ Locations of inlets. 	<ul style="list-style-type: none"> ■ Mark all inlets with the words “No Dumping! Flows to Bay” or similar. 	<ul style="list-style-type: none"> ■ Maintain and periodically repaint or replace inlet markings. ■ Provide stormwater pollution prevention information to new site owners, lessees, or operators. <input type="checkbox"/> See applicable operational BMPs in Fact Sheet SC-44, “Drainage System Maintenance,” in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com ■ Include the following in lease agreements: “Tenant shall not allow anyone to discharge anything to storm drains or to store or deposit materials so as to create a potential discharge to storm drains.”

IF THESE SOURCES WILL BE ON THE PROJECT SITE ...	THEN YOUR STORMWATER CONTROL PLAN SHOULD INCLUDE THESE SOURCE CONTROL BMPs		
1 Potential Sources of Runoff Pollutants	2 Structural/Permanent Controls—Show on Stormwater Control Plan Drawings	3 Structural/Permanent Controls—List in Stormwater Control Plan Table and Narrative	4 BMPs—Include in Stormwater Control Plan Table and Narrative
<input type="checkbox"/> B. Interior floor drains and elevator shaft sump pumps		<input type="checkbox"/> State that interior floor drains and elevator shaft sump pumps will be plumbed to sanitary sewer.	<input type="checkbox"/> Inspect and maintain drains to prevent blockages and overflow.
<input type="checkbox"/> C. Interior parking garages		<input type="checkbox"/> State that parking garage floor drains will be plumbed to the sanitary sewer.	<input type="checkbox"/> Inspect and maintain drains to prevent blockages and overflow.
<input type="checkbox"/> D1. Need for future indoor & structural pest control		<input type="checkbox"/> Note building design features that discourage entry of pests.	<input type="checkbox"/> Provide Integrated Pest Management information to owners, lessees, and operators.
<input checked="" type="checkbox"/> D2. Landscape/ Outdoor Pesticide Use/Building and Grounds Maintenance	<input type="checkbox"/> Show locations of native trees or areas of shrubs and ground cover to be undisturbed and retained. <input type="checkbox"/> Show self-retaining landscape areas, if any. <input checked="" type="checkbox"/> Show stormwater treatment and retention SCMs. (See instructions in Chapter 4.)	<p>State that final landscape plans will accomplish all of the following.</p> <input type="checkbox"/> Preserve existing native trees, shrubs, and ground cover to the maximum extent possible. <input checked="" type="checkbox"/> Design landscaping to minimize irrigation and runoff, to promote surface infiltration where appropriate, and to minimize the use of fertilizers and pesticides that can contribute to stormwater pollution. <input type="checkbox"/> Where landscaped areas are used to retain or detain stormwater, specify plants that are tolerant of saturated soil conditions. Consider using pest-resistant plants, <input type="checkbox"/> especially adjacent to hardscape. To ensure successful establishment, select <input checked="" type="checkbox"/> plants appropriate to site soils, slopes, climate, sun, wind, rain, land use, air movement, ecological consistency, and plant interactions.	<input checked="" type="checkbox"/> Maintain landscaping using minimum or no pesticides. <input type="checkbox"/> See applicable operational BMPs in Fact Sheet SC41, “Building and Grounds Maintenance,” in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com <input checked="" type="checkbox"/> Provide IPM information to new owners, lessees, and operators.

IF THESE SOURCES WILL BE ON THE PROJECT SITE ...	THEN YOUR STORMWATER CONTROL PLAN SHOULD INCLUDE THESE SOURCE CONTROL BMPs		
1 Potential Sources of Runoff Pollutants	2 Structural/Permanent Controls—Show on Stormwater Control Plan Drawings	3 Structural/Permanent Controls—List in Stormwater Control Plan Table and Narrative	4 BMPs—Include in Stormwater Control Plan Table and Narrative
<input type="checkbox"/> E. Pools, spas, ponds, decorative fountains, and other water features.	<input type="checkbox"/> Show location of water feature and a sanitary sewer cleanout in an accessible area within 10 feet.	If the local municipality requires pools to be plumbed to the sanitary sewer, place a note on the plans and state in the narrative that this connection will be made according to local requirements.	<input type="checkbox"/> See applicable operational BMPs in Fact Sheet SC-72, “Fountain and Pool Maintenance,” in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com
<input checked="" type="checkbox"/> F. Food service	<input checked="" type="checkbox"/> For restaurants, grocery stores, and other food service operations, show location (indoors or in a covered area outdoors) of a floor sink or other area for cleaning floor mats, containers, and equipment. <input type="checkbox"/> On the drawing, show a note that this drain will be connected to a grease interceptor before discharging to the sanitary sewer.	<input type="checkbox"/> Describe the location and features of the designated cleaning area. <input type="checkbox"/> Describe the items to be cleaned in this facility and how it has been sized to ensure that the largest items can be accommodated.	
<input checked="" type="checkbox"/> G. Refuse areas	<input type="checkbox"/> Show where site refuse and recycled materials will be handled and stored for pickup. See local municipal requirements for sizes and other details of refuse areas. <input type="checkbox"/> If dumpsters or other receptacles are outdoors, show how the designated area will be covered, graded, and paved to prevent run-on and show locations of berms to prevent runoff from the area. <input type="checkbox"/> Any drains from dumpsters, compactors, and tallow bin areas shall be connected to a grease removal device before discharge to sanitary sewer.	<input type="checkbox"/> State how site refuse will be handled and provide supporting detail to what is shown on plans. <input checked="" type="checkbox"/> State that signs will be posted on or near dumpsters with the words “Do not dump hazardous materials here” or similar.	<input checked="" type="checkbox"/> State how the following will be implemented: Provide adequate number of receptacles. Inspect receptacles regularly; repair or replace leaky receptacles. Keep receptacles covered. Prohibit/prevent dumping of liquid or hazardous wastes. Post “no hazardous materials” signs. Inspect and pick up litter daily and clean up spills immediately. Keep spill control materials available on-site. See Fact Sheet SC-34, “Waste Handling and Disposal” in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com

IF THESE SOURCES WILL BE ON THE PROJECT SITE ...	THEN YOUR STORMWATER CONTROL PLAN SHOULD INCLUDE THESE SOURCE CONTROL BMPs		
1 Potential Sources of Runoff Pollutants	2 Structural/Permanent Controls—Show on Stormwater Control Plan Drawings	3 Structural/Permanent Controls—List in Stormwater Control Plan Table and Narrative	4 BMPs—Include in Stormwater Control Plan Table and Narrative
<input type="checkbox"/> H. Industrial processes.	<input type="checkbox"/> Show process area.	<input type="checkbox"/> If industrial processes are to be located on site, state: “All process activities to be performed indoors. No processes to drain to exterior or to storm drain system.”	<input type="checkbox"/> See Fact Sheet SC-10, “Non-Stormwater Discharges” in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com
<input type="checkbox"/> I. Outdoor storage of equipment or materials. (See rows J and K for source control measures for vehicle cleaning, repair, and maintenance.)	<input type="checkbox"/> Show any outdoor storage areas, including how materials will be covered. Show how areas will be graded and bermed to prevent run-on or run-off from area. <input type="checkbox"/> Storage of non-hazardous liquids shall be covered by a roof and/or drain to the sanitary sewer system, and be contained by berms, dikes, liners, or vaults. <input type="checkbox"/> Storage of hazardous materials and wastes must be in compliance with the local hazardous materials ordinance and a Hazardous Materials Management Plan for the site.	<input type="checkbox"/> Include a detailed description of materials to be stored, storage areas, and structural features to prevent pollutants from entering storm drains. <input type="checkbox"/> Where appropriate, reference documentation of compliance with the requirements of programs for: Hazardous Waste Generation Hazardous Materials Release Response and Inventory California Accidental Release (CalARP) Aboveground Storage Tank Uniform Fire Code Article 80 Section 103(b) & (c) 1991 Underground Storage Tank	<input type="checkbox"/> See the Fact Sheets SC-31, “Outdoor Liquid Container Storage” and SC-33, “Outdoor Storage of Raw Materials” in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com

IF THESE SOURCES WILL BE ON THE PROJECT SITE ...	THEN YOUR STORMWATER CONTROL PLAN SHOULD INCLUDE THESE SOURCE CONTROL BMPs		
1 Potential Sources of Runoff Pollutants	2 Structural/Permanent Controls—Show on Stormwater Control Plan Drawings	3 Structural/Permanent Controls—List in Stormwater Control Plan Table and Narrative	4 BMPs—Include in Stormwater Control Plan Table and Narrative
<input type="checkbox"/> J. Vehicle and Equipment Cleaning	<input type="checkbox"/> Show on drawings as appropriate: (1) Commercial/industrial facilities having vehicle/ equipment cleaning needs shall either provide a covered, bermed area for washing activities or discourage vehicle/equipment washing by removing hose bibs and installing signs prohibiting such uses. (2) Multi-dwelling complexes shall have a paved, bermed, and covered car wash area (unless car washing is prohibited on site and hoses are provided with an automatic shut-off to discourage such use). (3) Washing areas for cars, vehicles, and equipment shall be paved, designed to prevent run-on to or runoff from the area, and plumbed to drain to the sanitary sewer. (4) Commercial car wash facilities shall be designed such that no runoff from the facility is discharged to the storm drain system. Wastewater from the facility shall discharge to the sanitary sewer, or a wastewater reclamation system shall be installed.	<input type="checkbox"/> If a car wash area is not provided, describe measures taken to discourage on-site car washing and explain how these will be enforced.	Describe operational measures to implement the following (if applicable): <input type="checkbox"/> Wash water from vehicle and equipment washing operations shall not be discharged to the storm drain system. <input type="checkbox"/> Car dealerships and similar may rinse cars with water only. See Fact Sheet SC-21, “Vehicle and Equipment Cleaning,” in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com

IF THESE SOURCES WILL BE ON THE PROJECT SITE ...	THEN YOUR STORMWATER CONTROL PLAN SHOULD INCLUDE THESE SOURCE CONTROL BMPs		
1 Potential Sources of Runoff Pollutants	2 Structural/Permanent Controls—Show on Stormwater Control Plan Drawings	3 Structural/Permanent Controls—List in Stormwater Control Plan Table and Narrative	4 BMPs—Include in Stormwater Control Plan Table and Narrative
<input type="checkbox"/> K. Vehicle/Equipment Repair and Maintenance	<input type="checkbox"/> Accommodate all vehicle equipment repair and maintenance indoors. Or designate an outdoor work area and design the area to prevent run-on and runoff of stormwater. <input type="checkbox"/> Show secondary containment for exterior work areas where motor oil, brake fluid, gasoline, diesel fuel, radiator fluid, acid-containing batteries or other hazardous materials or hazardous wastes are used or stored. Drains shall not be installed within the secondary containment areas. <input type="checkbox"/> Add a note on the plans that states either (1) there are no floor drains, or (2) floor drains are connected to wastewater pretreatment systems prior to discharge to the sanitary sewer and an industrial waste discharge permit will be obtained.	<input type="checkbox"/> State that no vehicle repair or maintenance will be done outdoors, or else describe the required features of the outdoor work area. <input type="checkbox"/> State that there are no floor drains or if there are floor drains, note the agency from which an industrial waste discharge permit will be obtained and that the design meets that agency’s requirements. <input type="checkbox"/> State that there are no tanks, containers or sinks to be used for parts cleaning or rinsing or, if there are, note the agency from which an industrial waste discharge permit will be obtained and that the design meets that agency’s requirements.	In the Stormwater Control Plan, note that all of the following restrictions apply to use the site: <input type="checkbox"/> No person shall dispose of, nor permit the disposal, directly or indirectly of vehicle fluids, hazardous materials, or rinse water from parts cleaning into storm drains. <input type="checkbox"/> No vehicle fluid removal shall be performed outside a building, nor on asphalt or ground surfaces, whether inside or outside a building, except in such a manner as to ensure that any spilled fluid will be in an area of secondary containment. Leaking vehicle fluids shall be contained or drained from the vehicle immediately. <input type="checkbox"/> No person shall leave unattended drip parts or other open containers containing vehicle fluid unless such containers are in use or in an area of secondary containment.

IF THESE SOURCES WILL BE ON THE PROJECT SITE ...	THEN YOUR STORMWATER CONTROL PLAN SHOULD INCLUDE THESE SOURCE CONTROL BMPs		
1 Potential Sources of Runoff Pollutants	2 Structural/Permanent Controls—Show on Stormwater Control Plan Drawings	3 Structural/Permanent Controls—List in Stormwater Control Plan Table and Narrative	4 BMPs—Include in Stormwater Control Plan Table and Narrative
<input type="checkbox"/> L. Fuel Dispensing Areas	<input type="checkbox"/> Fueling areas shall have impermeable floors (i.e., Portland cement concrete or equivalent smooth impervious surface) that are: a) graded at the minimum slope necessary to prevent ponding; and b) separated from the rest of the site by a grade break that prevents run-on of stormwater to the maximum extent practicable. <input type="checkbox"/> Fueling areas shall be covered by a canopy that extends a minimum of ten feet in each direction from each pump. [Alternative: The fueling area must be covered and the cover’s minimum dimensions must be equal to or greater than the area within the grade break or fuel dispensing area ¹ .] The canopy [or cover] shall not drain onto the fueling area.		<input type="checkbox"/> The property owner shall dry sweep the fueling area routinely. <input type="checkbox"/> See the Business Guide Sheet, “Automotive Service—Service Stations” in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com

¹The fueling area shall be defined as the area extending a minimum of 6.5 feet from the corner of each fuel dispenser or the length at which the hose and nozzle assembly may be operated plus a minimum of one foot, whichever is greater.

IF THESE SOURCES WILL BE ON THE PROJECT SITE ...	THEN YOUR STORMWATER CONTROL PLAN SHOULD INCLUDE THESE SOURCE CONTROL BMPs		
1 Potential Sources of Runoff Pollutants	2 Structural/Permanent Controls—Show on Stormwater Control Plan Drawings	3 Structural/Permanent Controls—List in Stormwater Control Plan Table and Narrative	4 BMPs—Include in Stormwater Control Plan Table and Narrative
<input type="checkbox"/> M. Loading Docks	<input type="checkbox"/> Show a preliminary design for the loading dock area, including roofing and drainage. Loading docks shall be covered and/or graded to minimize run-on to and runoff from the loading area. Roof downspouts shall be positioned to direct stormwater away from the loading area. Water from loading dock areas shall be drained to the sanitary sewer or diverted and collected for ultimate discharge to the sanitary sewer. <input type="checkbox"/> Loading dock areas draining directly to the sanitary sewer shall be equipped with a spill control valve or equivalent device, which shall be kept closed during periods of operation. Provide a roof overhang over the loading area or install door skirts (cowling) at each bay that enclose the end of the trailer. <input type="checkbox"/>		<input type="checkbox"/> Move loaded and unloaded items indoors as soon as possible. <input type="checkbox"/> See Fact Sheet SC-30, “Outdoor Loading and Unloading,” in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com
<input type="checkbox"/> N. Fire Sprinkler Test Water		<input type="checkbox"/> Provide a means to drain fire sprinkler test water to the sanitary sewer.	<input type="checkbox"/> See the note in Fact Sheet SC-41, “Building and Grounds Maintenance,” in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com

IF THESE SOURCES WILL BE ON THE PROJECT SITE ...	THEN YOUR STORMWATER CONTROL PLAN SHOULD INCLUDE THESE SOURCE CONTROL BMPs		
1 Potential Sources of Runoff Pollutants	2 Structural/Permanent Controls—Show on Stormwater Control Plan Drawings	3 Structural/Permanent Controls—List in Stormwater Control Plan Table and Narrative	4 BMPs—Include in Stormwater Control Plan Table and Narrative
<p>O. Miscellaneous Drain or Wash Water or Other Sources</p> <ul style="list-style-type: none"> <input type="checkbox"/> Boiler drain lines <input type="checkbox"/> Condensate drain lines <input type="checkbox"/> Rooftop equipment <input type="checkbox"/> Drainage sumps <input type="checkbox"/> Roofing, gutters, and trim. <input type="checkbox"/> Other sources 		<ul style="list-style-type: none"> <input type="checkbox"/> Boiler drain lines shall be directly or indirectly connected to the sanitary sewer system and may not discharge to the storm drain system. <input type="checkbox"/> Condensate drain lines may discharge to landscaped areas if the flow is small enough that runoff will not occur. Condensate drain lines may not discharge to the storm drain system. <input type="checkbox"/> Rooftop equipment with potential to produce pollutants shall be roofed and/or have secondary containment. <input type="checkbox"/> Any drainage sumps on-site shall feature a sediment sump to reduce the quantity of sediment in pumped water. <input type="checkbox"/> Avoid roofing, gutters, and trim made of copper or other unprotected metals that may leach into runoff. <input type="checkbox"/> Include controls for other sources as specified by local reviewer. 	
<ul style="list-style-type: none"> <input checked="" type="checkbox"/> P. Plazas, sidewalks, and parking lots. 			<ul style="list-style-type: none"> <input checked="" type="checkbox"/> Sweep plazas, sidewalks, and parking lots regularly to prevent accumulation of litter and debris. Collect debris from pressure washing to prevent entry into the storm drain system. Collect wash water containing any cleaning agent or degreaser and discharge to the sanitary sewer not to a storm drain.

APPENDIX E

Bioretention Construction Inspection Checklist

EXHIBIT "D" (SWCP)

Appendix E. Bioretention Construction Inspection Checklist

Layout (to be confirmed prior to beginning excavation)

- Square footage of the facility meets or exceeds minimum shown in Stormwater Control Plan
- Site grading and grade breaks are consistent with the boundaries of the tributary Drainage Management Area(s) (DMAs) shown in the Stormwater Control Plan
- Inlet elevation of the facility is low enough to receive drainage from the entire tributary DMA
- Locations and elevations of overland flow or piping, including roof leaders, from impervious areas to the facility have been laid out and any conflicts resolved
- Rim elevation of the facility is laid out to be level all the way around, or elevations are consistent with a detailed cross-section showing location and height of interior dams
- Locations for vaults, utility boxes, and light standards have been identified so that they will not conflict with the facility
- Location for signage is identified
- Facility is protected as needed from construction-phase runoff and sediment

Excavation (to be confirmed prior to backfilling or pipe installation)

- Excavation conducted with materials and techniques to minimize compaction of soils within the facility area
- Excavation is to accurate area and depth
- Slopes or side walls protect from sloughing of native soils into the facility
- Vertical moisture barrier, if specified, has been added to protect adjacent pavement or structures.
- Native soils at bottom of excavation are ripped or loosened to promote infiltration

Overflow or Surface Connection to Storm Drainage

(to be confirmed prior to backfilling with any materials)

- Overflow is at specified elevation
- No knockouts or side inlets are in overflow riser
- Overflow location selected to minimize surface flow velocity (near, but offset from, inlet recommended)
- Grating excludes mulch and litter (beehive or atrium-style grates with ¼" openings recommended)
- Overflow is connected to storm drain via appropriately sized piping

Underground connection to storm drain/outlet orifice

(to be confirmed prior to backfilling with any materials)

- Perforated pipe underdrain (PVC SDR 35 or approved equivalent) is installed with holes facing down
- Perforated pipe is connected to storm drain at specified elevation (typ. bottom of soil elevation)
- Cleanouts are in accessible locations and connected via sweep bends
- Monitoring well, if required, is installed.
- Structures (arches or large diameter pipes) for additional surface storage are installed as shown in plans and specifications and have the specified volume

EXHIBIT "D" (SWCP)

Drain Rock/Subdrain (to be confirmed prior to installation of soil mix)

- Rock is installed as specified. Class 2 permeable, Caltrans specification 68-2.02(F)(3) recommended, or 4"-6" depth of pea gravel is installed at the top of the crushed rock layer to prevent migration of fines into gravel layer
- Rock is smoothed to a level top elevation. Depth and top elevation are as shown in plans
- Slopes or side walls protect from sloughing of native soils into the facility
- No filter fabric is placed between the subdrain and soil mix layers

Soil Mix

- Soil mix is as specified.
- Mix installed in lifts not exceeding 12"
- Mix is not compacted during installation but may be thoroughly wetted to encourage consolidation
- Mix is smoothed to a level top elevation. Depth of mix (24" min.) and top elevation are as shown in plans, accounting for depth of mulch to follow and required reservoir depth

Irrigation

- Irrigation system is installed so it can be controlled separately from other landscaped areas. Smart irrigation controllers and drip emitters are recommended
- Spray heads, if any, are positioned to avoid direct spray into outlet structures

Planting

- Plants are installed consistent with approved planting plan
- Any trees and large shrubs are staked securely
- No fertilizer is added; compost tea may be used
- No native soil or clayey material are imported into the facility with plantings
- 1"-2" mulch may be applied following planting; mulch selected to avoid floating
- Final elevation of soil mix maintained following planting
- Curb openings are free of obstructions

Final Engineering Inspection

- Drainage Management Area(s) are free of construction sediment and landscaped areas are stabilized
- Inlets are installed to ensure entry of runoff from adjoining pavement, have sufficient reveal (drop from the adjoining pavement to the top of the mulch or soil mix, and are not blocked)
- Rock or other energy dissipation at piped or surface inlets is adequate
- Inflows from roof leaders and pipes are connected and operable
- Temporary flow diversions are removed
- Overflow outlets are configured to allow the facility to flood and fill to near rim before overflow
- Plantings are healthy and becoming established
- Irrigation is operable
- Facility drains rapidly; no surface ponding is evident
- Any accumulated construction debris, trash, or sediment is removed from facility
- Permanent signage is installed and is visible to site users and maintenance personnel

EXHIBIT "D" (SWCP)

APPENDIX F

Technical Criteria for Non-LID Treatment Facilities

EXHIBIT "D" (SWCP)

Appendix C. Technical Criteria for Non-LID Treatment Facilities

Non-LID Treatment Facilities may be either tree-box-type high-flowrate biofilters or vault-based high-flowrate media filters.

General

- Design inflow rate is that generated by a continuous rainfall intensity of 0.2 inches per hour.
- Landscape and non-impervious surfaces should be made self-treating or self-retaining and not drain to treatment facilities, if feasible.
- Use the runoff factors in Table 4-1 (on p. 4-4) of the *Stormwater Technical Guide*.
- The applicant's Stormwater Control Plan (Plan) must include, as an attachment, a letter from the manufacturer stating the manufacturer has reviewed the Plan, the proposed device meets these technical criteria, and the manufacturer will provide a warranty for two years following activation of the facility.

High-Flowrate Tree-Box-Type Biofilters

- Maximum design surface loading rate of 50 inches per hour.
- Precast concrete construction.
- Inlet design to capture flows at least up to the maximum design surface loading rate and to bypass high flows.
- Minimum media depth of 1.8 feet (may be reduced, but maintaining the same media volume, if required because of inadequate head to discharge point).
- Media and facility configuration supports a healthy tree or other vegetation.

Vault-Based High-Flowrate Media Filters

- Replaceable cartridge filters.
- Maximum design filter surface loading rate (to cartridge filters) of 1 gpm/ft²
- Storage volume detains runoff and allows settling of coarse solids prior to filtration.
- Flow through the cartridge filters is controlled by an orifice or other device so that the design surface loading rate is not exceeded.

Alternatively, applicants may specify treatment systems that have received a General Use Level Designation (GULD) for Basic Treatment from the Washington State Department of Ecology based on independently verified field testing following the Technical Assessment Protocol – Ecology (TAPE). Treatment systems must be sized to treat the water quality flow rate at the design operating rate for which they received TAPE GULD certification for Basic Treatment.

Media filters and high flow rate tree well filters currently holding this certification can be found at the following link:

EXHIBIT "D" (SWCP)

EXHIBIT E

INSURANCE REQUIREMENTS FOR AMTRAK AND UPRR

INSURANCE REQUIREMENTS

NATIONAL RAILROAD PASSENGER CORPORATION (AMTRAK)

Revised as of December 5, 2019

DEFINITIONS

In these Insurance Requirements, "Railroad" or "Amtrak" shall mean National Railroad Passenger Corporation and, as appropriate, its subsidiary, Washington Terminal Company ("WTC"). "Contractor" shall mean the party identified as "Permittee" in the Temporary Permit to Enter Upon Property or the party with whom Amtrak has contracted in another agreement (e.g., Preliminary Engineering Agreement, Design and/or Construction Phase Agreement, Force Account Agreement, License Agreement), as well as its officers, employees, agents, servants, contractors, subcontractors, or any other person acting for or by permission of Contractor. "Operations" shall mean activities of or work performed by Contractor. "Agreement" shall mean the Temporary Permit to Enter Upon Property or other such agreement, as applicable.

INSURANCE

Contractor shall procure and maintain, at its sole cost, the types of insurance specified below:

1. **Workers' Compensation Insurance** complying with the requirements of the statutes of the jurisdiction(s) in which the Operations will be performed, covering all employees of Contractor. Employer's Liability coverage shall have the following minimum limits of coverage:

\$1,000,000	Each Accident
\$1,000,000	Disease Policy Limit
\$1,000,000	Disease Each Employee

In the event the Operations are to be performed on, over, or adjacent to navigable waterways, a U.S. Longshoremen and Harbor Workers' Compensation Act Endorsement and an Outer Continental Lands Act Endorsement are required.

2. **Commercial General Liability (CGL) Insurance** covering liability of Contractor with respect to all operations to be performed and all obligations assumed by Contractor under the terms of the Agreement. Products-completed operations, independent contractors and contractual liability coverages are to be included, with the contractual exclusion related to construction/demolition activity within fifty (50) feet of the railroad deleted and with no exclusions for Explosion/Collapse/ Underground (X-C-U). Coverage shall include bodily injury (including disease or death), personal injury and property damage (including loss of use) liability.

This policy shall have the following minimum limits of coverage:

\$5,000,000	Each Occurrence
\$5,000,000	Annual Policy Aggregate
\$5,000,000	Products and Completed Operations

In addition, the following shall apply:

- A. The policy shall name National Railroad Passenger Corporation (and, as appropriate, WTC) and all commuter agencies and railroads that operate over the property or tracks at issue as additional insureds with respect to the operations to be performed.
 - B. The policy shall include an ISO endorsement Form CG 24 17 10 01 or its equivalent providing contractual liability coverage for railroads listed as additional insureds.
 - C. Coverage for such additional insureds shall be primary and non-contributory with respect to any other insurance the additional insureds may carry.
 - D. Such coverage may be provided by a combination of a primary CGL policy and a following form excess or umbrella liability policy.
3. **Automobile Liability Insurance** covering the liability of Contractor arising out of the use of any vehicles which bear, or are required to bear, license plates according to the laws of the jurisdiction in which they are to be operated, and which are not covered under Contractor's CGL insurance. The policy shall have the following minimum limits of coverage:

\$1,000,000	Each Occurrence, Combined Single Limit
-------------	---

In addition, the following shall apply:

- A. The policy shall name National Railroad Passenger Corporation (and, as appropriate, WTC) and all commuter agencies and railroads that operate over the property or tracks at issue as additional insureds with respect to the operations to be performed.
 - B. Coverage shall include bodily injury (including disease or death), personal injury and property damage (including loss of use) liability and cover damages resulted from loading and unloading activities.
 - C. In the event Contractor will be transporting and/or disposing of any hazardous material or waste off of the jobsite, a MCS-90 Endorsement is to be added to this policy and the limits of liability are to be increased to \$5 million each occurrence.
4. **Railroad Protective (RRP) Liability Insurance** covering the Operations performed by Contractor within fifty (50) feet vertically or horizontally of railroad tracks. The policy shall be written on a current ISO Occurrence Form (claims-made forms are unacceptable) in the name of National Railroad Passenger Corporation (and, as appropriate WTC) and all commuter agencies and railroads that operate over the property or tracks at issue). The policy shall have the following minimum limits of coverage:

\$2,000,000	Each Occurrence
\$6,000,000	Policy Aggregate

In addition, the following shall apply:

- A. The policy shall have coverage for losses arising out of injury to or death of all persons, and for physical loss or damage to or destruction of property, including the loss of use thereof.
- B. Policy Endorsement CG 28 31 - Pollution Exclusion Amendment is required to be endorsed onto the policy.
- C. "Physical Damage to Property" as defined in the policy is to be deleted and replaced by the following endorsement:

"It is agreed that 'Physical Damage to Property' means direct and accidental loss of or damage to all property owned by any named insured and all property in any named insured's care, custody and control."

5. **All Risk Property Insurance** covering damage to or loss of all personal property of Contractor used during Operations including, but not limited to, tools, equipment, construction trailers and their contents and temporary scaffolding at the project site, whether owned, leased, rented or borrowed for the full replacement cost value. Such insurance policies shall include a waiver of subrogation and any other rights of recovery in favor of Amtrak.

6. **Contractor's Pollution Liability Insurance** covering the liability of Contractor arising out of any sudden and/or non-sudden pollution or impairment of the environment, including clean-up costs and defense, which arise from the Operations of Contractor. The policy shall have the following minimum limits of coverage:

\$2,000,000	Each Occurrence
\$2,000,000	Annual Policy Aggregate

In addition, the following shall apply:

- A. The policy shall name National Railroad Passenger Corporation (and, as appropriate, WTC) and all commuter agencies and railroads that operate over the property or tracks at issue as additional insureds.
 - B. The coverage shall be maintained during the term of the Operations and for at least two (2) years following completion thereof.
7. **Pollution Legal Liability Insurance** is required if any hazardous material or waste is to be transported or disposed of off of the jobsite. Contractor or its transporter, as well as the disposal site operator, shall maintain this insurance. The policy shall have the following minimum limits of coverage:

\$2,000,000	Each Occurrence
\$2,000,000	Annual Policy Aggregate

In addition, the following shall apply:

- A. Contractor shall designate the disposal site and provide a certificate of insurance from the disposal facility to Amtrak.
 - B. The policy shall name National Railroad Passenger Corporation (and, as appropriate, WTC) and all commuter agencies and railroads that operate over the property or tracks at issue as additional insureds.
 - C. Any additional insurance coverages, permits, licenses and other forms of documentation required by the United States Department of Transportation, the Environmental Protection Agency and/or related state and local laws, rules and regulations shall be obtained by Contractor.
8. **Professional Liability Insurance** covering the liability of Contractor for any errors or omissions committed by Contractor providing professional design or engineering services in the performance of

the Operations, regardless of the type of damages. The policy shall have the following minimum levels of coverage:

\$2,000,000	Per Claim
\$2,000,000	Annual Policy Aggregate

In addition, the following shall apply:

- A. The coverage shall be maintained during the Operations and for at least three (3) years following completion thereof.
- B. The policy shall have a retroactive date that coincides with or precedes any design work on the project.
- C. If Contractor is not performing professional design or engineering services, Contractor may elect to satisfy this requirement through the addition of endorsement CG2279 “Incidental Professional Liability” to its CGL policy.

MISCELLANEOUS

1. General

- A. All insurance shall be procured from insurers authorized to do business in the jurisdiction(s) where the Operations are to be performed.
 - B. Contractor shall require all subcontractors to carry the insurance required herein or Contractor may, at its option, provide the coverage for any or all subcontractors, provided the evidence of insurance submitted by Contractor to Amtrak so stipulates.
 - C. The insurance shall provide for thirty (30) days prior written notice to Amtrak in the event coverage is substantially changed, canceled or non-renewed.
 - D. Unless noted otherwise herein, all insurance shall remain in force until all Operations are satisfactorily completed, all Contractor personnel and equipment have been removed from Railroad property, and any work has been formally accepted.
 - E. Contractor may provide for the insurance coverages with such deductible or retained amount as Amtrak may approve from time to time, except, however, that Contractor shall, at its sole cost, pay for all claims and damages which fall within such deductible or retained amount on the same basis as if there were full commercial insurance in force.
 - F. Contractor's failure to comply with the insurance requirements set forth in these Insurance Requirements shall constitute a violation of the Agreement.
2. **Waiver of Subrogation** As to all insurance policies required herein, Contractor waives all rights of recovery, and its insurers must waive all rights of subrogation of damages against Amtrak (and, as appropriate, WTC) and their agents, officers, directors, and employees. The waiver must be stated on the certificates of insurance.
3. **Punitive Damages** Unless prohibited by law, no liability insurance policies required herein shall contain an exclusion for punitive or exemplary damages.
4. **Claims-Made Insurance** If any liability insurance specified herein shall be provided on a claims-made basis then, in addition to coverage requirements above, the following shall apply:

- A. The retroactive date shall coincide with or precede Contractor's start of Operations (including subsequent policies purchased as renewals or replacements);
- B. The policy shall allow for the reporting of circumstances or incidents that might give rise to future claims;
- C. Contractor shall maintain similar insurance under the same terms and conditions that describe each type of policy listed above (e.g., CGL, Professional Liability, Pollution Legal Liability) for at least three (3) years following completion of Operations; and
- D. If insurance is terminated for any reason, Contractor shall purchase an extended reporting provision of at least six (6) years to report claims arising from Operations.

5. **Evidence of Insurance**

- A. Contractor shall submit to Amtrak the original RRP Liability Insurance Policy and certificates of insurance evidencing the other required insurance. In addition, Contractor agrees to provide certified copies of the insurance policies for the required insurance within thirty (30) days of Amtrak's written request.
- B. Contractor shall furnish evidence of insurance as specified herein at least fifteen (15) days prior to commencing Operations. The fifteen (15) day requirement may be waived by Amtrak in situations where such waiver will benefit Amtrak, but under no circumstances will Contractor begin Operations without providing satisfactory evidence of insurance as approved by Amtrak.
- C. Prior to the cancellation, renewal, or expiration of any insurance policy specified above, Contractor shall furnish evidence of insurance replacing the cancelled or expired policies.
- D. ALL INSURANCE DOCUMENTS SHALL INCLUDE A DESCRIPTION OF THE PROJECT AND THE LOCATION ALONG THE RAILROAD RIGHT-OF-WAY (typically given by milepost designation) IN ORDER TO FACILITATE PROCESSING.
- E. Evidence of insurance coverage shall be sent to: jointprojects@amtrak.com and permit@amtrak.com.

UPRR
CONTRACTOR INSURANCE REQUIREMENTS

UPRR NSURANCE REQUIREMENTS

Contractor is required to comply with UPRR Insurance Requirements as stipulated in the Unition Pacific Public Project Manual, Section 11.

Section 11.5

Insurance Requirement for Public Projects The licensee shall, at its own sole cost and expense, procure the following kinds of insurance and promptly pay, when due, all premiums for that insurance. The following insurance shall be kept in force during the life of the applicable agreement:

- Commercial General Liability Insurance
- Business Automobile Liability Insurance
- Worker’s Compensation Insurance
- Railroad Protective Liability Insurance (RPLI; during construction or maintenance only).

The limits of coverage under each of the required insurance policies will be based on the activity and risk involved with the specific project. Specific insurance requirements will be provided to you in the agreement covering your project when it is approved by the Railroad.

Section 11.5.1

Railroad Protective Liability Insurance Railroad Protective Liability Insurance (RPLI) is for projects under \$10 million that do not exceed 12 months. When working within Railroad ROW, your company will be required to obtain RPLI for the project. For RPLI application requests, you may be asked by your insurance carrier to provide train movement information. For security and safety reasons, UP employees no longer supply train information to parties outside the Railroad. The major insurance companies are aware of this. Public information is available on the FRA Office of Safety Analysis’ Crossing Inventory Database, if needed. A Railroad Protective Liability Program is available through the national broker, MARSH. Visit the MARSH website for an application and contact information. New Highway-Rail Grade Crossing Agreements require the following:

1. New individual and residential Private Crossings and Encroachments:
 - a. General Public Liability providing \$1 million for each occurrence and general aggregate limit of \$1 million
 - b. Automobile Public Liability providing \$500,000 for each occurrence
2. Commercial and industrial crossings and Encroachments and Contractors’ Private Crossings and Encroachments:
 - a. General Public Liability providing \$5 million for each occurrence and general aggregate limit of \$10 million
 - b. Automobile Public Liability providing \$2 million for each occurrence
 - c. Worker’s Compensation covering the statutory liability determined by state law
 - d. Railroad Protective Liability providing \$2 million for each occurrence and aggregate limit of \$6 million.

Examples of the insurance required for various types of projects are found on the UP Insurance Requirements website.

EXHIBIT F

**EASEMENT AGREEMENT (AMTRAK AT LUMBERYARD)
DATED AUGUST 18, 2009**

AND

**GOLETA MOU AGREEMENT WITH AMTRAK
DATED JULY 22, 2009.**

ORIGINAL

Agreement No. 2009-067
City of Goleta, California

MEMORANDUM OF UNDERSTANDING

BETWEEN THE CITY OF GOLETA
AND
NATIONAL RAILROAD PASSENGER CORPORATION

This Memorandum of Understanding (MOU) is made and entered into this 22nd day of July, 2009, by and between the CITY OF GOLETA, a municipal corporation organized under the laws of the State of California, with an address at 130 Cremona Drive, Suite B, Goleta, CA 93117 (herein referred to as "CITY") and the National Railroad Passenger Corporation, a corporation organized under the Rail Passenger Service Act (recodified at 49 U.S.C. §24101 et seq.) and the laws of the District of Columbia, with its principal office located at 60 Massachusetts Avenue, N.E., Washington D.C. 20002 (herein referred to as "AMTRAK").

CITY and AMTRAK agree as follows:

RECITALS

WHEREAS, AMTRAK entered into an agreement with the State of California Department of Transportation (herein referred to as "CALTRANS"), dated August 18, 2005, as amended, ("State Agreement") whereby CALTRANS granted AMTRAK funds to perform capital improvements for the property located at 25 S. La Patera Lane, Goleta, CA 93117 ("Goleta Station");

WHEREAS, AMTRAK agreed to the construction of a bus turning circle, described in Exhibit A attached to this agreement (the "Project") as part of the State Agreement;

WHEREAS, AMTRAK requested that the CITY provide for a funding shortfall of \$66,000 to complete the Project;

WHEREAS, CITY desires that AMTRAK complete the Project to improve the efficiency of transportation services at, and to enhance, Goleta Station; and

WHEREAS, CITY desires to grant funding of \$66,000 to AMTRAK to complete the Project.

NOW, THEREFORE, for and in consideration of good and valuable consideration, CITY and AMTRAK agree as follows:

EXHIBIT "F" (ACCESS AGREEMENT)

AGREEMENT

1. The Work.

AMTRAK will hire a contractor to construct the Project in accordance with the applicable plans and specifications as provided under Exhibit A of the State Agreement (the "Work").

2. CITY's Obligations.

- a. CITY will pay to AMTRAK the sum of \$66,000 for the completion of the Project ("City Funding") within 10 days of receipt of a written invoice from AMTRAK.

The invoice shall be submitted to:

Community Services Department
City of Goleta
130 Cremona Drive, Suite B
Goleta, CA 93117

- b. To the maximum extent permitted by law, CITY hereby agrees to defend, indemnify and hold harmless AMTRAK from and against any claims, losses, liabilities, fines, penalties, actions, damages, costs and expenses which AMTRAK may hereafter incur or be responsible for which arise out of CITY's unreasonable delay or failure to deliver the City Funding to AMTRAK in accordance with Section 2(a) above.
- c. Except as otherwise stated herein, CITY shall have no rights with respect to the AMTRAK's management, inspection or oversight of the Work.
- d. Neither CITY nor any officer or employee thereof is responsible for any damage or liability occurring by reason of anything done or omitted to be done by AMTRAK under or in connection with any work, authority or jurisdiction delegated to AMTRAK under this MOU. It is understood and agreed that pursuant to Government Code Section 895.4, AMTRAK shall fully defend, indemnify and save harmless CITY, all officers and employees from all claims, suits or actions of every name, kind and description brought for or on account of injury (as defined by Government Code Section 810.8) occurring by reason of anything done or omitted to be done by AMTRAK under or in connection with any work, authority or jurisdiction delegated to AMTRAK under this MOU.

3. AMTRAK's Obligations.

- a. AMTRAK shall utilize the CITY Funding for the completion of the Work.

EXHIBIT "F" (ACCESS AGREEMENT)

- b. AMTRAK shall assure that all work shall be performed pursuant to any and all applicable State prevailing wages requirements.
 - c. AMTRAK shall complete the Work in a timely manner, but no later than June 30, 2010.
 - d. AMTRAK acknowledges and agrees that CITY has no obligation to maintain any portion of the Project.
 - e. If CITY requests so in writing prior to the execution of any contract for the provision of the Work, AMTRAK agrees to include a requirement that any warranties provided thereunder (including contractor, manufacturer and supplier warranties) shall be for the benefit of CITY and AMTRAK.
4. Termination.
- a. This MOU shall terminate upon the completion of the Project. Either party may terminate this MOU upon 10 days' written notice in the event of a material breach by the other party.
 - b. If this MOU is earlier terminated by CITY due to a material breach by AMTRAK, AMTRAK shall return the entire City Funding to CITY.
 - c. If this MOU is earlier terminated by AMTRAK due to a material breach by CITY, AMTRAK shall return to CITY the City Funding, less all costs and expenses paid or incurred by AMTRAK that are directly attributable to said breach by CITY.
 - d. If this MOU is earlier terminated by AMTRAK for any other reason, AMTRAK shall return to CITY the full amount of City Funding, without any setoff of costs or expenses.
 - e. If the Project is not completed by the above-stated completion date, AMTRAK shall return to CITY the full amount of City Funding, without any setoff of costs or expenses.
5. General Provisions.
- a. In the event of a conflict between this MOU and the applicable provisions of Exhibit A of the State Agreement (a copy of which is attached hereto) regarding design and construction of the PROJECT, the latter controls.
 - b. Nothing in the provisions of this MOU is intended to create duties or obligations to or rights in third parties not party to this MOU or affect the legal liability of either party to the MOU by imposing any standard of care

EXHIBIT "F" (ACCESS AGREEMENT)

with respect to the construction or maintenance of roads different from the standard of care imposed by applicable law.

- c. Any notices required to be given hereunder shall be deemed to have been given if personally delivered or sent by registered or certified mail, postage prepaid, and addressed as follows:

TO CITY: Attention: Daniel Singer, City Manager
City of Goleta
130 Cremona Drive, Suite B
Goleta, CA 93117

TO AMTRAK: Attention: Bruce Looloian, AVP Real Estate Dev.
National Railroad Passenger Corp.
2955 Market Street, Box 25
Philadelphia, PA 19104

And

Attention: Project Director
Real Estate Development
National Railroad Passenger Corp.
530 Water Street, 5th Floor
Oakland, CA 94607

- d. This MOU constitutes the entire agreement between the parties. There are no other agreements, express or implied. All prior agreements and understandings between them with respect to the Work are subsumed within this MOU. No alteration or variation of the terms of this MOU shall be valid unless made in writing and signed by the parties hereto and no oral understanding or agreement shall be binding on any of the parties hereto.
- e. This MOU is governed by and construed in accordance with the laws of the State of California, without regard to its choice of law provisions.
- f. The parties hereto agree that all actions or proceedings arising in connection with this MOU shall be tried and litigated exclusively in the State courts located in the County of Santa Barbara, State of California and federal courts of the Central District of California. The aforementioned choice of venue is intended by the parties to be mandatory and not permissive in nature, thereby precluding the possibility of litigation between the parties with respect to or arising out of this Agreement in any jurisdiction other than that specified in this paragraph. Each party hereby waives any right it may have to assert the doctrine of forum non conveniens or similar doctrine or to object to venue with respect to any proceeding brought in accordance with this paragraph, and stipulates that said courts shall have in personam jurisdiction and venue

EXHIBIT "F" (ACCESS AGREEMENT)

over each of them for the purpose of litigating any dispute, controversy, or proceeding arising out of or related to this MOU. Each party hereby authorizes and accepts service of process sufficient for personal jurisdiction in any action against it as contemplated by this paragraph by registered or certified mail, return receipt requested, postage prepaid, to its address for the giving of notices as set forth in this MOU. Any final judgment rendered against a party in any action or proceeding shall be conclusive as to the subject of such final judgment and may be enforced in other jurisdictions in any manner provided by law.

IN WITNESS WHEREOF, the parties hereto have executed this MOU as of the day and year first above written.

EXHIBIT A
Goleta Amtrak Station Enhancements

PROJECT DESCRIPTION

This Project will redesign the turning circle at the station's entrance and provide for pedestrian improvements, enhanced paving, landscaping, and signage, enhance lighting, and other amenities.

SCOPE OF WORK

Perform 30% design and 100% environmental clearance for the construction of the Project described above including: bus turning circle to accommodate full-size buses and semi-trucks; new bus loading area/shelter; redesign of walkway to the rail platform; new restroom facilities; and improved signage, benches; lighting, landscaping, paving and sidewalk. Amtrak will also perform construction management oversight of its A&E contractor.

LOCATION

Goleta Amtrak Station in the City of Goleta, Santa Barbara County, California, at the end of La Patera Lane on the Pacific Surfliner Corridor

SCHEDULE AND EXPIRATION

This Project shall commence August 18, 2005 and shall be completed on or before August 18, 2007, unless extended by mutual agreement between the State and Amtrak.

FUNDING

Total State funding for this Project is \$90,000 for the above Scope of Work.

BUDGET

The detailed Project Budget will be developed by Amtrak and is included in the above Scope of Work. Amtrak will be reimbursed for all allowable costs incurred after the date of this Agreement for engineering and estimating (this does not include Project Management during construction) not to exceed 5% of the total funding amount, unless mutually agreed by the parties. The budget will be in sufficient detail to outline each major element of work as determined by Amtrak based on the above Scope of Work, yet not to exceed the funding amount shown above. Amtrak will submit the Budget to the State for approval and receive written approval of the Budget from the State prior to incurring any further costs on the Project.

The total estimated cost to provide the above services will not exceed \$90,000.00. The funding source is the California Transportation Commission (CTC) and is allocated in the following manner:

- PS&E and Construction Management - \$60,000.00
- Environmental Clearances - \$30,000.00

EASEMENT AGREEMENT

THIS EASEMENT AGREEMENT (this "Agreement") is made and entered into this 31st day of March, 2009, by and between HOMER T. HAYWARD LUMBER CO., a California corporation, who holds title as HAYWARD LUMBER COMPANY, INC., a California corporation ("Grantor"), and NATIONAL RAILROAD PASSENGER CORPORATION, a District of Columbia corporation d/b/a Amtrak ("Grantee").

Recitals

A. Grantor is the owner of that certain real property in the County of Santa Barbara, State of California, commonly known as 20 S. La Patera Lane, Santa Barbara, California 93117 and designated as Assessor's Parcel No. 073-080-075 (the "Hayward Property").

B. Grantee desires to acquire an easement over approximately 5,119 square feet of the Hayward Property ("Easement Area") to construct improvements serving and to provide access to the existing Amtrak train station located on that certain real property adjacent to the Hayward

Property and designated as Assessor's Parcel No. 073-010-014 ("Goleta Station"). A description of the improvements to be constructed on the Easement Area (the "Easement Improvements") and the uses to be made thereof is set forth in Exhibit "A" attached hereto and incorporated herein by this reference. The location of the Easement Area is described on Exhibit "B" and is graphically depicted on Exhibit "C", which Exhibits are attached hereto and incorporated herein by this reference.

C. The parties desire to set forth herein their agreement relating to the granting of the Easement by Grantor to Grantee and Grantee's obligations in connection therewith.

NOW THEREFORE, for good and valuable consideration the parties hereto, intending to be legally bound hereby, agree as follows:

1. GRANT OF EASEMENT

Grantor hereby grants bargains and conveys to Grantee and Grantee's successors and assigns the right to enter on and upon the property described on Exhibits "B" and "C" for the purposes of constructing, maintaining, repairing, reconstructing and replacing the Easement Improvements and undertaking the uses described on Exhibit "A" ("Easement"). In exercising its rights hereunder, Grantee shall not permanently block or unreasonably interfere with Grantor's ingress into or egress from its property.

2. CONSIDERATION

Grantee hereby agrees to pay Grantor the sum of One Hundred Fifty-Eight Thousand Five Hundred Dollars (\$158,500), which shall constitute the entire consideration for the Easement granted hereunder ("Easement Fee"). Grantee shall deliver the Easement Fee in accordance with the following terms and conditions:

A. A deposit in the amount of Seventy-Five Thousand Dollars (\$75,000) upon Grantee's execution of this Agreement ("Deposit").

B. The balance of the Easement Fee by wire transfer of immediately available U.S. Federal funds to Grantor pursuant to written wire transfer, or other written payment, instructions which Grantor shall provide to Grantee within 90 days, or such later date as mutually agreed in writing by the parties. Grantee shall not commence construction of the Easement Improvements prior to payment of the balance of the Easement Fee to Grantor.

C. In the event that Grantee shall fail to pay the Easement Fee within the 90-day time period specified in subsection 2.B. above, this Agreement and all rights and obligations hereunder shall terminate and within 60 days after such termination Grantee shall quitclaim, release and convey the Easement Area to Grantor ("Easement Release"). Concurrently with the Easement Release, Grantor shall refund to Grantee the entire Deposit.

EXHIBIT "F" (ACCESS AGREEMENT)

3. OBLIGATIONS OF GRANTEE

- A. Grantee shall be responsible, at Grantee's sole cost and expense, for the construction, maintenance, repair, reconstruction and replacement of the Easement Improvements, which activities shall be undertaken by Grantee in strict accordance with all applicable laws, rules, regulations, permit requirements, standards and specifications.
- B. Grantee, at its expense, shall connect a water pipe to the existing water meter (which, as of the date of this Agreement, is located in a landscaped area in the Goleta Station and shown on Exhibit "C" with the designation "protect existing utilities in place") and extend such water pipe underground into the Hayward Property to a point which is 10 feet past the property line or to such other location as to which the parties shall reasonably agree and terminate said water pipe into a junction box to be supplied by Grantee. Notwithstanding the foregoing, in no event shall Grantee be responsible for any costs or expenses associated with Grantor's utility use including water usage.

4. INDEMNIFICATION

- A. Grantee agrees to indemnify, defend and hold harmless Grantor and its officers, directors, shareholders, employees and agents from and against any and all losses, costs, damages, liabilities and expenses (including all costs of defense and attorneys' fees) for injury or death of any person, or damage to or destruction of any property directly arising out of (i) the construction, maintenance, repair, reconstruction, replacement, or any of the foregoing, of the Easement Improvements, (ii) the use of the Easement, the Easement Improvements or both, by Grantee, its employees, contractors, agents, customers, passengers, invitees or any other person acting for or with Grantee's permission, or (ii) Grantee's breach of any of the provisions hereof.
- B. Grantor agrees to indemnify, defend and hold harmless Grantee and its officers, directors, employees, agents, servants, invitees, licensees, subsidiaries, affiliates and contractors and each of their successors and assigns from and against any and all losses, costs, damages, liabilities and expenses (including all costs of defense and attorneys' fees) for injury or death of any person, or damage to or destruction of any property arising out of or related to Grantor's ownership of the Easement Area, the condition of the Easement Area prior to the conveyance of the Easement to Grantee hereunder, or both, but excluding anything or any claim relating to Grantee's obligations set forth in Section 3 or Subsection 4.A. above.

5. INSURANCE

- A. Grantee, at its sole cost and expense, shall maintain at all times on all Easement Improvements, a policy of standard fire and extended coverage (all-risk) insurance to be in the amount of their full replacement value. The proceeds from any such policy shall be used by Grantee for the replacement, repair and/or restoration of the Easement Improvements.
- B. Grantee, at its sole cost and expense, shall also maintain at all times comprehensive general liability and property damage insurance in an amount approved by Grantor in Grantor's reasonable discretion, for bodily injury and property damage, insuring Grantor and Grantee against all liability arising out of and in connection with the use or occupancy of the Easement and the Easement Improvements by Grantee or by any other person or entity. Said insurance shall also insure performance by Grantee of the indemnification, defense and hold harmless

provisions in Section 4, above, but the limits of such insurance shall not limit the liability of Grantee hereunder.

C. Promptly following the execution of this Agreement, Grantee shall supply Grantor with a certificate evidencing the insurance coverage required hereunder. Said certificate shall name Grantor as an additional insured and shall expressly provide that the policy(ies) evidenced by the certificate may not be cancelled or altered without thirty (30) days' prior written notice to Grantor (ten (10) days in the event of nonpayment of premiums). Grantee shall provide Grantor with current certificates of insurance prior to the expiration of any policy required hereunder.

D. Grantee reserves the right to self-insure any and all of the insurance requirements listed in this Section 5 of this Agreement in the amount of Twenty Million Dollars (\$20,000,000) or the current level of self-insurance maintained by Grantee, whichever is higher. Grantee agrees at all times to act in good faith with regard to setting the then current dollar amount of its self-insured retention, so as to be able to meet its obligations in regard thereto.

6. WAIVER AND RELEASE

A. Grantee hereby irrevocably and unconditionally assumes any and all risks, and waives all claims against Grantor, arising solely out of the use of the Easement, the Easement Improvements by Grantee's, its employees, contractors, customers, passengers, invitees or any other person acting for or with Grantee's permission, whether such risks or claims are presently known or unknown.

B. Subject to the provisions of Sections 3 and 4.A. above, Grantor acknowledges and agrees that it is responsible for all risks associated with its ownership of the Easement Area and the condition of the Easement Area prior to the conveyance of the Easement to Grantee hereunder. Grantor hereby irrevocably and unconditionally releases Grantee from and waives all claims against Grantee arising out of or in any way connected to Grantor's ownership of the Easement Area, the condition of the Easement Area, or both prior to the conveyance of the Easement to Grantee hereunder.

7. ATTORNEYS' FEES

Should any litigation or arbitration be commenced between the parties to this Agreement concerning the enforcement or interpretation of any rights or obligations hereunder, the prevailing party shall be entitled to recover attorneys' fees, in addition to such other relief as may be granted.

8. SUCCESSORS IN INTEREST

This Agreement relates to an interest affecting the title to and possession of the Hayward Property and the Easement area. All the terms, covenants and conditions contained herein shall be binding upon and inure to the benefit of the successors in interest of the parties hereto, and shall run with the Hayward Property and the Easement area or any part thereof.

EXHIBIT "F" (ACCESS AGREEMENT)

IN WITNESS WHEREOF, the parties have executed this Easement Agreement and make it effective as of the date first set forth above.

1.0 Summary

At the request of the City of Goleta, All Phase Environmental, Inc. (APEI) have been asked to prepare a work plan for a limited Phase II investigation of the site located at 27 South La Patera Lane, Goleta, California 93117, hereinafter referred to as the “subject property.”

This work plan contains a summary of the history of the subject property, the goals of the investigation, the work procedures to be carried out, the reasons and locations for the proposed borings, and a summary of the Ground Penetrating Radar (GPR) work already completed in the area of the reportedly removed 7,000 gallon gasoline UST.

2.0 Subject Property Description

The subject property is a lot of approximately 2.48-acres, and the street address is 27 South Patera Lane, in the City of Goleta, in the County of Santa Barbara, California, 93117. The subject property is composed of one parcel with APN number 073-050-033. The subject property is located on the west and south side of South Patera Lane. South Patera Lane delimits the subject property to the east and to the north where it is being used as the Goleta Amtrack Train Depot. Industrial sites delimit the subject property to the south and west.

The subject property is developed with a one-story office and industrial warehouse structure. The building is approximately 30,000-square feet and was constructed in approximately 1967. There are office spaces along the south side of the building with a small mezzanine office and storage space in the southwest corner of the building. The remainder of the building is composed of two open warehouse areas. On the west end of the building is a grade level warehouse area. A loading dock is located on the east side of the warehouse and a ramp and receiving dock are situated in the northwest corner of the building. Outside the southwest corner of the building are a diesel generator and an 1,800-gallon diesel UST that remains operational. At the time of the investigation, the building was partially occupied by a tenant using it for intermittent classes, office space, and warehouse space.

Concrete paving covers the west end of the parcel and the land east of the east loading dock. An asphalt paved parking lot covers the remainder of the land south and east of the office area of the building. There are landscaped planters along the east border and strips of landscaped grounds bordering the east loading dock. The subject property can be accessed via a driveway from South La Patera to the east, and roll-up doors in the warehouse open to the Union Pacific Railroad to the north.

3.0 Summary of Historical Uses

Tenant History

The following is a summary of historical uses of the subject property obtained from a Phase I ESA previously performed by APEI in 2016:

- Orchards from prior to 1943 through 1947.
- Cleared of orchards between 1947 and 1967.
- Developed with the existing subject property building in 1967.
- Occupied by Sears from 1967 through 1988, most likely used as offices and warehouse space.
- Portions of the subject property were occupied by several delivery and transportation firms from at least 1980 through 1992. Durham Transportation was one of these tenants who stored small quantities of hazardous substances and petroleum products. Durham Transportation reportedly performed bus repairs on the subject property.
- Raytheon occupied the subject property from 1982 through August of 1990, and most likely used the building for offices and warehouse space.
- In 2018, the City of Goleta acquired the subject property for the purposes of constructing the Goleta Train Depot.
- The owner prior to acquisition by the City of Goleta in 2018 was Direct Relief International, which has occupied portions or all of the subject property since at least 1999.

Environmental History

The following is a summary of significant hazardous substances and petroleum product storage and uses on the subject property (APEI, 2016):

- Organochlorine pesticides may have been used when the subject property was occupied by orchards from prior to 1943 through 1947.
- Sears installed the former approximately 7,500-gallon diesel UST in 1967. Documents reviewed indicated that the associated piping and dispenser were located directly over the tank.
- Under permit and regulatory oversight, the tank, associated piping, and dispenser were removed from the subject property on April 12, 1990. Some visually stained soil was identified. The Santa Barbara County, Environmental Health Services (EHS) and Santa Barbara County Fire were present during the tank removal. The tank was reported to be in good condition, no groundwater was encountered but some discolored soils were noted at the midpoint of the tank. Soil samples were taken from the bottom and sidewall of the excavation and from stockpiled soils. Soil samples were analyzed for total petroleum hydrocarbons (TPH), benzene, toluene, ethylbenzene, and xylene (BTEX), and total lead. Total lead was reported to be at background levels. The sidewall results for fuel constituents were below laboratory detection levels. The bottom sample had detectable levels of TPH at 2.1 parts per million (mg/kg or ppm) and trace BTEX concentrations. All results were reported to be below cleanup levels. Samples of excavated soils contained up to 11 ppm gasoline and 110 ppm diesel. No further action was recommended. Supporting documents indicated the soil and UST had been taken offsite for disposal.
- Documents reviewed indicated that the 7,500 gallon UST may have been used for diesel and gasoline.
- Direct Relief International installed the existing diesel generator and associated 1,800 gallon diesel UST in 2008.
- The remaining diesel UST is a double walled fiberglass tank with an outer reinforced steel jacket and double walled piping equipped with an interstitial Veeder Root monitoring system.
- During a 2016 ESA performed on the subject property for due diligence purposes prior to purchase, two unlabeled 55-gallon drums of an unknown solid were observed in the northwest corner of the subject property. These have since been removed.
- A 55-gallon drum of unidentified contents remains next to the diesel generator. This drum was labeled as hazardous waste.
- A waste oil AST and a clarifier were observed on the north adjacent site on the west end of the subject property that remain there as of the publication of this work plan.

4.0 Geology

The subject property is located in the Goleta Valley, a low-lying, gently southwest sloping coastal plain. The Goleta Valley is bounded to the north by the Santa Ynez Mountains, to the south and west by the Pacific Ocean, and to the east by the Mesa Hills and relatively elevated alluvial terraces. The surrounding highlands are composed of steeply south sloped consolidated sedimentary rocks of Tertiary age. These Tertiary age materials are interpreted to be present at depths of approximately 500-feet below the ground surface (Olson, 1982). Folded consolidated bedrock is unconformably overlain by almost flat-lying, unconsolidated sediments, including greater than approximately 430 feet of the Plio-Pleistocene Santa Barbara Formation, and approximately 70-feet of Recent alluvial deposits. The subject property is underlain by these alluvial deposits.

According to the Web Soil Survey by the National Resources Conservation Service dated September 3, 2015, the primary soil type at the subject property is Milpitas-Positas fine sandy loams. The landform setting for this soil is described as terraces with a slope of 2 to 9 percent. This soil is moderately well drained and the depth to the water table is more than 80-inches.

5.0 Hydrogeology

Unconfined groundwater exists within the younger alluvium in the basin but the vast majority of the groundwater is present in a confined or semi-confined condition. Most wells within the basin derive groundwater from the Santa Barbara Formation (Upson, 1951). Subsurface data was reviewed from investigations on the west adjacent site, Bardex Corporation. In a report, dated January 16, 2015, by The Source Group, Inc. entitled "Second Half 2014 Groundwater Monitoring Report" groundwater was reported to be at a depth of approximately 14.89 to 36.62 feet below the top of the well casing. Because these wells are located down a slope of at least ten-feet, groundwater below the subject property is expected to be deeper. The groundwater flow direction has historically been reported as variable, ranging in direction from westerly to southerly.

A geotechnical report by ENGIO in 2020, determined that the underlying soils were generally impermeable.

6.0 Geophysical Investigation Findings

The purpose of the investigation was to locate detectable utilities in the vicinity of the advancement of 10 proposed borings. The work also included a search for potential subsurface structures associated with the former 6,000 to 7,500-gallon Underground Storage Tank (UST) and pump island formerly located adjacent to the southern property boundary. Lastly, the investigation was to investigate three (3) areas roughly 25 feet by 25 feet in size. The three areas were to be searched for traces of subsurface structures associated with possible sumps and/or drain systems inside the subject property building.

All 10 borings were cleared of identifiable utilities.

The three areas investigated inside the subject property building did not identify any subsurface structures. One floor drain near the southeast corner of the large warehouse was deemed to have not been an industrial wastewater drain but was instead, a sanitary drain formerly associated with the adjacent bathrooms.

The Ground Penetrating Radar (GPR) investigation identified two anomalies that could not be attributed to above ground cultural features and/or detected utilities. A search of the area depicted on regulatory record drawings showed undisturbed soil. It was deemed that these hand-drawn maps were not accurate. Searching further to the west, an area was identified where there had been significant disturbance to the soil below the asphalt. This was then determined to likely have been the location of the former UST. In addition to disturbed soil, two anomalies were identified.

Anomaly A was approximately 26-feet by 17-feet in size and at a depth of approximately 3 to 6 feet below the surface. Using GPR it was revealed that it was possibly reinforced concrete mesh beneath the asphalt in an area of disturbed soil. The presence of reinforced concrete mesh is only an estimate, it is possible that the anomaly is some other object. It is also possible that something else lies beneath the reinforced concrete mesh/object that was not detected which could be a UST.

Anomaly B was approximately 31-feet by 12-feet in size and at a depth of approximately 3 to 6 feet below the surface. Using GPR it was revealed that it was possibly reinforced concrete mesh beneath the asphalt with an additional uneven layered reflection deeper in the profiles in an area of disturbed soil. The presence of reinforced concrete mesh is only an estimate, it is possible that the anomaly is some other object. Readings interpreted from deeper analysis indicated that the area below the reinforced concrete mesh/object was deemed not typical of an excavation or a UST.

Because Spectrum could not 100% confirm that USTs were not present, they recommended further investigation in these areas to determine the sources. APEI agrees that these areas should be investigated by excavation at some time in the future. However, if no contamination is identified in borings B1, B2, or B3, then it is likely that the anomalies are not USTs, or at least have not led to significant subsurface impact. It would then be advised that this area be excavated during the redevelopment and grading of the subject property.

7.0 Boring Locations, Strategies, and Descriptions

Figure 1 in Appendix A contains a drawing illustrating the proposed boring locations and Appendix C contains photographs of the locations.

Boring Locations B1, B2, and B3

These three borings are intended to identify possible releases from the former 7,500 gallon diesel/gasoline UST. The locations were selected using the data from the GPR report. All three borings are situated around the identified anomalies since drilling into the anomalies would likely result in refusal. B1 will be advanced to a terminal depth of 36 feet below ground surface (bgs) or refusal and is intended to investigate possible releases from the former underground tank, associated piping, or dispensers not previously identified during the tank removal. Borings B2 and B3 will be advanced to a terminal depth of 10 feet below ground surface (bgs) or refusal and are intended to investigate for releases from the associated piping or dispensers not previously identified during the tank removal.

Boring Location B4

B4 is intended to identify possible undetected releases from the existing 1,800 gallon diesel UST. It will be advanced to a terminal depth of 36 feet bgs or refusal. The location was selected to be nearest to the tank and associated piping without being located in the tank excavation (which would be filled with pea gravel).

Boring Location B5

B5 is intended to identify possible undetected releases that may have migrated to this corner where there is a stormwater collection drain for the west side of the subject property. It is postulated that Durham Transportation performed bus repairs on the west side of the subject property and any spills in this area would migrate to this corner. In addition, two unlabeled 55 gallon drums of an unknown solid were previously observed in this corner. B5 will be advanced to a terminal depth of 5 feet bgs or refusal.

Boring Location B6

B6 is intended to identify possible undetected releases that may have migrated to this area from stored materials, improper disposal into solid waste dumpsters formerly located in this area, and from the north adjacent waste oil AST and clarifier. B6 will be advanced to a terminal depth of 5 feet bgs or refusal.

Boring Location B7

B7 is intended to identify possible undetected releases that may have migrated to this area from the east loading dock and from a drain/sump located in this corner. B7 will be advanced to a terminal depth of 5 feet bgs or refusal.

Boring Location B8

B8 is intended to identify possible undetected releases that may have migrated to this area from former work performed in the west end warehouse space. This location was selected because it was the lowest elevation in this area and there were no other conduits to the subsurface identified during the visual and GPR survey. It is not known what work may have been performed in this area of the warehouse but if vehicle repairs were being performed by Durham Transportation, it is likely that they would have used this area of the warehouse. B8 will be advanced to a terminal depth of 5 feet bgs or refusal.

Boring Locations B9 and B10

B9 and B10 are intended to identify possible undetected releases that may have occurred from former onsite operations in the main area of the subject property warehouse. The visual and GPR survey did not identify any subsurface anomalies worthy of testing. There were no areas in the warehouse where trenching or signs of prior uses, other than warehousing, were evident. Therefore, if there had been a release in the main warehouse, it would have likely been due to spillage from stored materials in the building. Boring B9 was located next to what looks like a boring from a prior investigation. Boring B10 was located next to a rack that had an eyewash station, typical of an area where hazardous materials would have been stored. B9 and B10 will be advanced to a terminal depth of 15 feet bgs or refusal.

8.0 Sampling Depths, Media, and Laboratory Analysis

B1

- Advanced to a terminal depth of 36 feet bgs or refusal.
- Soil samples will be taken at depths of 5', 10', 15', 20', 25', 36'. These will be analyzed for TPH-G.
- Soil vapor probes will be installed at depths of 5' and at the terminal depth or shallower if groundwater is encountered. Soil Vapor samples will be analyzed at 5' and terminal depth for VOCs.
- A groundwater grab sample will be collected if available at less than 36 feet bgs and analyzed for VOCs.

B2 and B3

- Advanced to a terminal depth of 10 feet bgs or refusal.
- Soil samples will be taken at depths of 5' and 10'. These will be analyzed for TPH-G.
- Soil vapor probes will be installed at depths of 5' and 10'. Soil Vapor samples will be analyzed at both depths for VOCs.

B4

- Advanced to a terminal depth of 36 feet bgs or refusal.
- Soil samples will be taken at depths of 5', 10', 15', 20', 25', 36'. These will be analyzed for TPH-D/MO.
- A groundwater grab sample will be collected if available at less than 36 feet bgs and analyzed for TPH-D/MO.

B5

- Advanced to a terminal depth of 5 feet bgs or refusal.
- Soil samples will be taken at 5' and analyzed for TPH-G, TPH-D/MO, organochlorine pesticides, and Title 22 Metals (CAM15).
- A soil vapor probe will be installed at 5' and analyzed for VOCs and TPH-G.

B6

- Advanced to a terminal depth of 5 feet bgs or refusal.
- Soil samples will be taken at 5' and analyzed for TPH-Gallon and TPH-D/MO.
- A soil vapor probe will be installed at 5' and analyzed for VOCs and TPH-G.

B7

- Advanced to a terminal depth of 5 feet bgs or refusal.
- Soil samples will be taken at 5' and analyzed for TPH-Gallon and TPH-D/MO.
- A soil vapor probe will be installed at 5' and analyzed for VOCs and TPH-G.

B8

- Advanced to a terminal depth of 5 feet bgs or refusal.
- Soil samples will be taken at 5' and analyzed for TPH-Gallon and TPH-D/MO.
- A soil vapor probe will be installed at 5' and analyzed for VOCs and TPH-G.

B9 and B10

- Advanced to a terminal depth of 15 feet bgs or refusal.
- Soil samples will be taken at depths of 5' and 15'. The 5' samples will be analyzed for TPH-G, TPH-D/MO, and Title 22 Metals (CAM15). Soil samples at 15' will be preserved for possible additional analysis pending the results from the 5' samples.
- Soil vapor probes will be installed at depths of 5' and 15'. Soil Vapor samples will be analyzed at both depths for VOCs, TPH-G, and methane. One duplicate soil vapor sample will be collected and analyzed for VOCs, TPH-G, and methane.

9.0 Soil Sampling Protocol

Soil borings will be advanced using a direct-push sampling rig. The direct-push system is driven by a hydraulic hammer and is equipped with a dual-tube core barrel. As the hollow dual-tube core barrel is driven downward, soil is pushed into a 4-foot long acetate sleeve that is located within the inner core barrel. The inner core barrel is lifted up and the acetate sleeve is removed, and another empty sleeve is inserted into the inner core barrel. The outer core barrel is temporarily left in place to provide bore-hole stability. This procedure is repeated until the desired depth is reached.

At select depths, soil samples are collected within the acetate sleeve and a six-inch long portion of the sleeve is isolated and cut from the 4-foot long sleeve. That sample is immediately capped and preserved with Teflon tape and end caps and chilled on ice in a cooler pending delivery to a State certified laboratory. When soil samples are slated for analysis of VOCs and TPHg, an encore device will be used to extract approximately 5-grams of soil from the 6-inch sample sleeve (EPA Method 5035).

During drilling, a photo-ionization detector will be used to screen all soil samples collected from the borings for VOCs and for worker health and safety concerns. The PID will be calibrated with hexane (100 ppmV) in the field in the morning prior to the commencement of any field activities. The identified lithology (Unified Soil Classification System) along with the PID readings will be recorded on a boring log.

10.0 Soil Vapor Probe Installation and Sampling Protocol

Several borings will receive soil vapor probes that are used to measure and specify the type of VOCs present in soil gas. During drilling, at the desired depth, a 2-inch long vapor probe fitted with ¼-inch ID tubing will be placed within the outer core barrel and the barrel will be lifted out of the bore hole. A 1-foot thick sand pack will be placed above and below the probe followed by 6-inches of dry bentonite and then hydrated bentonite to the near surface. If multiple probes are placed in the same borehole, the same installation procedure will be used, but the deepest probe will be distinguished from the shallow by slightly longer tubing and labeling. The probes will be allowed to equilibrate for a minimum of 4-hours prior to sampling, and the probes will be purged and sampled in general accordance with the DTSC vapor intrusion guidance specifications (DTSC's Supplemental Guidance, Screening and Evaluating Vapor Intrusion, February 2020).

Each probe head will be attached to the sampling train assembly of Teflon tubing, valves, and fittings and connected to a purge pump. The pump will be used to evacuate the sealed system using an applied maximum vacuum of 100 inches of water column (in. WC). The vacuum on each probe will be monitored for 90 seconds with the sampling train system sealed. After the shut-in test is validated, the sampling train will be leak tested. Liquid isopropyl alcohol will be applied to a cloth and placed around all connections in the sampling train to evaluate whether the system is sealed from ambient air leaks. A detection of 10 times the reporting limit of this compound may suggest that ambient air leakage has occurred.

Each probe will be purged prior to sampling, and the purpose of purging is to remove stagnant air from the vapor sampling train to ensure representative samples are obtained. The probes will be purged of three purge volumes of soil gas (a purge volume includes the volume of tubing plus the void space of the sand pack around the probe) using an adjustable vacuum pump. The purge rate will be set at 200 mL/minute.

After purging three volumes through the system, soil gas samples will be collected in glass syringes from each probe by a technician operating a mobile lab from A&R Laboratories. Each sample will be analyzed for TPHg (EPA Method 8015M, methane (EPA Method 8015M), and/or VOCs (EPA Method 8260B). A greater volume of air from the sample will be used for the analysis to achieve detection limits for each compound comparable to the EPA Method TO-15 test, which should meet residential standards.

11.0 Groundwater Grab Sampling Protocol

During drilling, if groundwater is encountered, the inner rod will be extracted and fitted with a 4-foot long stainless steel screen at the end. This screen will be driven down into the saturated section in an attempt to retrieve a water sample. A 3/8-inch ID Teflon tube will be placed through the core barrel to the total depth. A removable bailer with a check valve will be attached to the bottom of the tubing, and the tube will be manually pumped to collect water into the tube. Two 40-ml vials, preserved with HCL, will be used to collect the water, and each vial will be labeled, sealed with an end cap, and chilled in a cooler pending shipment to a State certified laboratory for analysis.

12.0 Soil Sampling Drill Rigs

The truck mounted direct push (Geoprobe) rig that is planned to be used to perform the work will not be able to obtain the samples inside the warehouse space of the subject property building. The proximity of the shelving installed in the warehouse is too close for this rig to reach the sample locations. A mobile Geoprobe unit will need to be brought to the subject property in order to advance these borings. There is an additional fee of approximately \$2,000.00 for labor and equipment to make this possible.

13.0 Cultural Resources Observation

APEI is prepared to have a Native American representative onsite to perform cultural resources observation during subsurface work. However, due to the following considerations, it is advised that this service be used during other subsurface disturbances that will be more impactful to the subject property:

- The total of all ten soil borings being advanced on the subject property will have a combined diameter of less than one square foot.
- When the subject property was developed, it is likely that the grading practice included the disturbance and recompaction of at least the top five feet of the entire subject property (deeper in areas below the building). The areas most likely to contain artifacts near the surface would have been extensively disturbed and damaged from past grading activities.
- The Professional Geologist will be inspecting the soil removed during sampling operations. If any artifacts are identified, work will stop and the Native American representative will be contacted for inspection.

16.0 Qualifications of Environmental Professionals

Doug Kochanowski

**Environmental Professional, Senior Environmental Scientist, and Biologist
CHMM (#9970), CAC (#99-2699)**

Professional Experience:

Mr. Kochanowski has been performing Phase I Environmental Site Assessments (ESAs) since 1988 and is considered an industry expert. The environmental consulting profession was in its infancy when he performed his first ESA. Over the past three decades, Mr. Kochanowski has performed ESAs on almost every type of real property in over ten different states and in Europe. This includes military bases, medical facilities, high-rise office buildings, learning institutions, factories, shopping malls and plazas, gasoline stations, industrial parks, manufacturing facilities, vacant land, agricultural land, housing tracks, multifamily developments, and government facilities. His wide array of experience has made him a key component for conducting complex ESAs and his expertise is sought after by a wide variety of clients and other consulting firms. His practical approach and comprehensive knowledge of the ASTM standards result in ESAs that are accurate, comprehensive, and address environmental issues with a common-sense approach.

Mr. Kochanowski's environmental portfolio also includes experience conducting a variety of additional services that include soil, groundwater, and soil vapor testing, modeling, landfill leachate testing, indoor air sampling, lead-based paint sampling, and conducting human health risk assessments. He has managed several large IDT contracts for the European District Corps of Engineers, working at over twenty bases in Germany and Spain. Projects included remediation design, soil and groundwater sampling, landfill leachate testing, asbestos surveys, air monitoring, and radon testing.

For as long as Mr. Kochanowski has been writing ESAs he has also been performing asbestos testing and consulting. He is a California Certified Asbestos Consultant and is NIOSH 582 Certified to analyze Polarized Light Microscopy (PLM) samples. Mr. Kochanowski performs asbestos surveys, develops removal specifications and drawings, writes Operations and Management (O&M) Plans, and conducts contractor observation and air monitoring during abatement projects. His asbestos experience includes schools, nuclear facilities, universities, airports, hospitals, military bases, shopping malls, high-rise office buildings, industrial complexes, port facilities, apartments and single-family homes. Mr. Kochanowski was the Manager and Facility Security Officer (FSO) for a high-profile asbestos survey, air monitoring and abatement project of the White House, Washington D.C. His AHERA survey experience includes inspecting over eight million square feet of building space for school districts in California, Kansas, New Mexico and Tennessee.

Mr. Kochanowski has teaching experience including conducting OSHA 1910.120 HAZWOPR, Confined Space Entry, and asbestos awareness classes.

He has served as Secretary on the Board of Directors and was a founding father for the SoCal ACHMM chapter. In the past, he has served on the technical committee for a Local Emergency Planning Commission (LEPC) and was elected Secretary on the Board of Directors for the Rhine-Main Post of the Society of American Military Engineers (SAME).

Education:

Bachelor of Science, Biology, San Diego State University, 1987.
Continuing Education; Strategies for Conducting Meaningful Microbial IAQ Investigations/American Indoor Air Quality Council

Registrations and Certifications:

CHMM, Master Level; Secretary of the SoCal ACHMM Chapter
California Certified Asbestos Consultant (#09-2699)
NIOSH 582 Accredited Sampling and Evaluation Airborne Asbestos
Certified, OSHA 40Hr Trained 1910.120/Site Supervisor
Certified TRGS 519 Under German Hazardous Materials Regulations
AHERA Certified Asbestos Inspector, Management Planner, Designer, and Abatement
Supervisor
Certified Radiation Worker
Confined Space Entry Certified

1.0 Summary

At the request of the City of Goleta, All Phase Environmental, Inc. (APEI) conducted a limited Phase II investigation of the site located at 27 South La Patera Lane, Goleta, California 93117, hereinafter referred to as the “subject property.”

APEI performed a Phase I ESA of the subject property in 2016. The City of Goleta later purchased the subject property with the intent to convert the warehouse/industrial site into a new train depot facility. The purpose of this investigation was to screen the soil and groundwater, if encountered, for possible chemical impacts from past uses in the most likely areas.

Between January 25 and 28, APEI advanced ten borings on the subject property to varying depths ranging from 5 to 30 feet below ground surface (bgs), installed soil vapor probes, and performed soil and vapor sampling. Soil and soil vapor samples were collected from various depths and selectively analyzed for TPH-G, VOCs, TPH-D/MO, organochlorine pesticides, Title 22 Metals (CAM15), and methane.

The results from this work indicated no detectable concentrations of petroleum hydrocarbons in soil, no concentrations of heavy metals in soil that exceed current residential or commercial screening levels, and no concentrations of VOC in soil gas that exceed current commercial screening levels. The results from laboratory analysis of methane indicated no detectable concentrations. Based on these results, no further sampling is recommended.

APEI also performed a geophysical survey of the subject property to clear borings and to confirm the removal of a former UST from the subject property. The geophysical survey could not completely rule out the existence of an existing UST. Although only low concentrations of Total Petroleum Hydrocarbons in the gasoline range (TPHg), benzene, and toluene were detected in this area (SG1-10), the presence of higher concentrations of petroleum compounds in the area of the former UST cannot be ruled out.

Due to the limited nature of the Phase II performed on the subject property and the presence of low levels of petroleum compounds identified in the soil vapor near the former UST area, and the long historical use of the subject property for commercial and industrial purposes, the development and implementation of a Soil Management Plan (SMP) is recommended as a measure to manage encountered impacted soils, if any.

2.0 Subject Property Description

The subject property is a parcel that occupies approximately 2.48-acres, and the street address is 27 South Patera Lane, in the City of Goleta, in the County of Santa Barbara, California, 93117. The subject property is composed of one parcel with APN number 073-050-033. The subject property is located on the west and south side of South Patera Lane. South Patera Lane delimits the subject property to the west, Union Pacific Railroad Runway delimits the subject property to the north, and office building and industrial site delimits the subject property to the south, and an industrial site delimits the subject property to the east.

The subject property is developed with a one-story office and industrial warehouse structure. The building is approximately 30,000-square feet and was constructed in approximately 1967. There are office spaces along the south side of the building with a small mezzanine office and storage space in the southwest corner of the building. The remainder of the building is composed of two open warehouse areas. On the west end of the building is a grade level warehouse area. A loading dock is located on the east side of the warehouse and a ramp and receiving dock are situated in the northwest corner of the building. Outside the southwest corner of the building are a diesel generator and an 1,800-gallon diesel UST that remains operational. At the time of the investigation, the building was partially occupied by a tenant using it for intermittent classes, office space, and warehouse space.

Concrete paving covers the west end of the parcel and the land east of the east loading dock. An asphalt paved parking lot covers the remainder of the land south and east of the office area of the building. There are landscaped planters along the east border and strips of landscaped grounds bordering the east loading dock. The subject property can be accessed via a driveway from South La Patera to the east, and roll-up doors in the warehouse open to the Union Pacific Railroad Runway to the north.

3.0 Summary of Historical Uses

Tenant History

The following is a summary of historical uses of the subject property obtained from a Phase I ESA previously performed by APEI in 2016:

- Orchards from prior to 1943 through 1947.
- Cleared of orchards between 1947 and 1967.
- Developed with the existing subject property building in 1967.
- Occupied by Sears from 1967 through 1988, most likely used as offices and warehouse space.
- Portions of the subject property were occupied by several delivery and transportation firms from at least 1980 through 1992. Durham Transportation was one of these tenants who stored small quantities of hazardous substances and petroleum products. Durham Transportation reportedly performed bus repairs on the subject property.
- Raytheon occupied the subject property from 1982 through August of 1990, and most likely used the building for offices and warehouse space.
- In 2018, the City of Goleta acquired the subject property for the purposes of constructing the Goleta Train Depot.
- The owner prior to acquisition by the City of Goleta in 2018 was Direct Relief International, which has occupied portions or all of the subject property since at least 1999.

Environmental History

The following is a summary of significant hazardous substances and petroleum product storage and uses on the subject property (APEI, 2016):

- Organochlorine pesticides may have been used when the subject property was occupied by orchards from prior to 1943 through 1947.
- Sears installed a former 7,500-gallon diesel UST in 1967. Documents reviewed indicated that the associated piping and dispenser were located directly over the tank.
- Under permit and regulatory oversight, the tank, associated piping, and dispenser were removed from the subject property on April 12, 1990. Some visually stained soil was identified. The Santa Barbara County, Environmental Health Services (EHS) and Santa Barbara County Fire were present during the tank removal. The tank was reported to be in good condition, no groundwater was encountered but some discolored soils were noted at the midpoint of the tank. Soil samples were taken from the bottom and sidewall of the excavation and from stockpiled soils. Soil samples were analyzed for total petroleum hydrocarbons (TPH), benzene, toluene, ethylbenzene, and xylene (BTEX), and total lead. Total lead was reported to be at background levels. The sidewall results for fuel constituents were below laboratory detection levels. The bottom sample had detectable levels of TPH at 2.1 parts per million (mg/kg or ppm) and trace BTEX concentrations. All results were reported to be below cleanup levels. Samples of excavated soils contained up to 11 ppm gasoline and 110 ppm diesel. No further action was recommended. Supporting documents indicated the soil and UST had been taken offsite for disposal.
- Documents reviewed indicated that the 7,500 gallon UST may have been used for diesel and gasoline.
- Direct Relief International installed the existing diesel generator and associated 1,800 gallon diesel UST in 2008.
- The remaining diesel UST is a double walled fiberglass tank with an outer reinforced steel jacket and double walled piping equipped with an interstitial Veeder Root monitoring system.
- During a 2016 ESA performed on the subject property for due diligence purposes prior to purchase, two unlabeled 55-gallon drums of an unknown solid were observed in the northwest corner of the subject property. These have since been removed.
- A 55-gallon drum of unidentified contents remains next to the diesel generator. This drum was labeled as hazardous waste.
- A waste oil AST and a clarifier were observed on the north adjacent site on the west end of the subject property that remain there as of the publication of this work plan.

4.0 Geology

The subject property is located in the Goleta Valley, a low-lying, gently southwest sloping coastal plain. The Goleta Valley is bounded to the north by the Santa Ynez Mountains, to the south and west by the Pacific Ocean, and to the east by the Mesa Hills and relatively elevated alluvial terraces. The surrounding highlands are composed of steeply south sloped consolidated sedimentary rocks of Tertiary age. These Tertiary age materials are interpreted to be present at depths of approximately 500-feet below the ground surface (Olson, 1982). Folded consolidated bedrock is unconformably overlain by almost flat-lying, unconsolidated sediments, including greater than approximately 430 feet of the Plio-Pleistocene Santa Barbara Formation, and approximately 70-feet of Recent alluvial deposits. The subject property is underlain by these alluvial deposits.

According to the Web Soil Survey by the National Resources Conservation Service dated September 3, 2015, the primary soil type at the subject property is Milpitas-Positas fine sandy loams. The landform setting for this soil is described as terraces with a slope of 2 to 9 percent. This soil is moderately well drained and the depth to the water table is more than 80-inches.

Based on the drilling logs the sediments beneath the site consist mostly of silty clay and sandy clay deposits to 15 feet below grade underlain by silty sand and sand deposits to 30 feet below grade where a dense and hard sand or silty clay layer was encountered and drilling was terminated due to refusal conditions. Groundwater was not encountered to 30 feet below grade, the maximum depth of exploration. The drilling logs are presented in Appendix C.

5.0 Hydrogeology

Unconfined groundwater exists within the younger alluvium in the basin but the vast majority of the groundwater is present in a confined or semi-confined condition. Most wells within the basin derive groundwater from the Santa Barbara Formation (Upson, 1951). Groundwater was not encountered in any of the borings with the deepest drilled to 30 feet bgs.

Based on information available on the GeoTracker website, the depth to groundwater at a site located about 250 feet west of the property was less than 10 feet below grade when last measured in 2004. (Bardex Corp Machine Shop, 6338 Lindmar Drive, Goleta CA, Global ID T10000008818).

6.0 Geophysical Investigation Findings

The purpose of the geophysical investigation was to locate detectable utilities in the vicinity of the advancement of the 10 borings. The work also included a search for potential subsurface structures associated with the former 6,000 to 7,500-gallon Underground Storage Tank (UST) and pump island formerly located adjacent to the southern property boundary. Lastly, the investigation was to investigate three (3) areas roughly 25 feet by 25 feet in size. The three areas were to be searched for traces of subsurface structures associated with possible sumps and/or drain systems inside the subject property building.

All 10 borings were cleared of identifiable utilities.

The three areas investigated inside the subject property building did not identify any subsurface structures. One floor drain near the southeast corner of the large warehouse was deemed to be a sanitary drain formerly associated with the adjacent bathrooms and not an industrial wastewater drain.

The Ground Penetrating Radar (GPR) investigation identified two anomalies that could not be attributed to above ground cultural features and/or detected utilities. A search of the area depicted on regulatory record drawings showed undisturbed soil. It was deemed that these hand-drawn maps were not accurate. Searching further to the west, an area was identified where there had been significant disturbance to the soil below the asphalt. This was then determined to likely have been the location of the former UST. In addition to disturbed soil, two anomalies were identified.

Anomaly A was approximately 26-feet by 17-feet in size and at a depth of approximately 3 to 6 feet below the surface. Using GPR it was revealed that it was possibly reinforced concrete mesh beneath the asphalt in an area of disturbed soil. The presence of reinforced concrete mesh is only an estimate, it is possible that the anomaly is some other object. It is also possible that something else lies beneath the reinforced concrete mesh/object that was not detected which could be a UST.

Anomaly B was approximately 31-feet by 12-feet in size and at a depth of approximately 3 to 6 feet below the surface. Using GPR it was revealed that it was possibly reinforced concrete mesh beneath the asphalt with an additional uneven layered reflection deeper in the profiles in an area of disturbed soil. The presence of reinforced concrete mesh is only an estimate, it is possible that the anomaly is some other object. Readings interpreted from deeper analysis indicated that the area below the reinforced concrete mesh/object was deemed not typical of an excavation or a UST.

The geophysical survey could not completely rule out the existence of an existing UST, so these areas were targeted for subsurface exploration. Only native sediments were encountered in these locations indicating no UST was present.

7.0 Boring Locations, Strategies, and Descriptions

Figure 1 in Appendix A contains a drawing illustrating the boring locations and Appendix F contains photographs of each boring location.

Boring Locations B1, B2, and B3

These three borings were intended to identify possible releases from the former 7,500 gallon diesel/gasoline UST. The locations were selected using the data from the GPR report. All three borings were situated around the identified anomalies since drilling into the anomalies would likely have resulted in refusal. The targeted depth of boring B1 was 36 feet bgs but due to refusal, the terminal depth was 30 feet below grade. This boring was intended to investigate possible releases from the former underground tank, associated piping, and dispensers not previously identified during the tank removal. Borings B2 and B3 were advanced to a terminal depth of 10 feet below ground surface (bgs) and were intended to investigate for releases from the associated piping or dispensers not previously identified during the tank removal.

Boring Location B4

B4 was intended to identify possible undetected releases from the existing 1,800 gallon diesel UST. The targeted depth at B4 was 36 feet bgs but due to refusal, the terminal depth was 30 feet below grade. The location was selected to be nearest to the tank and associated piping without being located in the tank excavation (which would be filled with pea gravel).

Boring Location B5

B5 is intended to identify possible undetected releases that may have migrated to this corner where there is a stormwater collection drain for the west side of the subject property. It is postulated that Durham Transportation performed bus repairs on the west side of the subject property and any spills in this area would migrate to this corner. In addition, two unlabeled 55 gallon drums of an unknown solid were previously observed in this corner. B5 was advanced to a terminal depth of 5 feet bgs.

Boring Location B6

B6 was intended to identify possible undetected releases that may have migrated to this area from stored materials, improper disposal into solid waste dumpsters formerly located in this area, and from the north adjacent waste oil AST and clarifier. B6 was advanced to a terminal depth of 5 feet bgs.

Boring Location B7

B7 was intended to identify possible undetected releases that may have migrated to this area from the east loading dock and from a drain/sump located in this corner. B7 was advanced to a terminal depth of 5 feet bgs.

Boring Location B8

B8 was intended to identify possible undetected releases that may have migrated to this area from former work performed in the west end warehouse space. This location was selected because it was the lowest elevation in this area and there were no other conduits to the subsurface identified during the visual and GPR survey. It is not known what work may have been performed in this area of the warehouse but if vehicle repairs were being performed by Durham Transportation, it is likely that they would have used this area of the warehouse. B8 was advanced to a terminal depth of 5 feet bgs.

Boring Locations B9 and B10

B9 and B10 were intended to identify possible undetected releases that may have occurred from former onsite operations in the main area of the subject property warehouse. The visual and GPR survey did not identify any subsurface anomalies worthy of testing. There were no areas in the warehouse where trenching or signs of prior uses, other than warehousing, were evident. Therefore, if there had been a release in the main warehouse, it would have likely been due to spillage from stored materials in the building. Boring B9 was located next to what looks like a boring from a prior investigation. Boring B10 was located next to a rack that had an eyewash station, typical of an area where hazardous materials would have been stored. Finally, these boring locations were located next to the north rollup doors where spills from materials being loaded onto the adjacent railway would most likely occur. B9 and B10 were advanced to a terminal depth of 15 feet bgs.

8.0 Sampling Depths, Media, and Laboratory Analysis

The following is a list of the sampling depths achieved, the media collected, and analysis performed in each of the ten (10) borings.

B1

- Advanced to a terminal depth of 30 feet bgs or refusal.
- Soil samples were collected at depths of 5', 10', 15', 20', 25', 30'. These were analyzed for TPH-G.
- Soil vapor probes were installed at 5' and at the terminal depth of 30'. Soil Vapor samples were analyzed for VOCs.
- Groundwater was not encountered and therefore could not be sampled.

B2 and B3

- Advanced to a terminal depth of 10 feet bgs.
- Soil samples were collected at depths of 5' and 10'. These were analyzed for TPH-G.
- Soil vapor probes were installed at depths of 5' and 10'. Soil Vapor samples were analyzed at both depths for VOCs.

B4

- Advanced to a terminal depth of 30 feet bgs or refusal.
- Soil samples were collected at depths of 5', 10', 15', 20', 25', 30'. These were analyzed for TPH-D/MO.
- Groundwater was not encountered and therefore could not be sampled.

B5

- Advanced to a terminal depth of 5 feet bgs.
- A soil sample was collected at 5' and analyzed for TPH-G, TPH-D/MO, organochlorine pesticides, and Title 22 Metals (CAM15).
- A soil vapor probe was installed at 5' and analyzed for VOCs and TPH-G.

B6

- Advanced to a terminal depth of 5 feet bgs.
- A soil sample was collected at 5' and analyzed for TPH-Gallon and TPH-D/MO.
- A soil vapor probe was installed at 5' and analyzed for VOCs and TPH-G.

B7

- Advanced to a terminal depth of 5 feet bgs.
- A soil sample was collected at 5' and analyzed for TPH-Gallon and TPH-D/MO.
- A soil vapor probe was installed at 5' and analyzed for VOCs and TPH-G.

B8

- Advanced to a terminal depth of 5 feet bgs.
- A soil sample was collected at 5' and analyzed for TPH-Gallon and TPH-D/MO.
- A soil vapor probe was installed at 5' and analyzed for VOCs and TPH-G.

B9 and B10

- Advanced to a terminal depth of 15 feet bgs.
- Soil samples were collected at depths of 5' and 15'. The 5' samples were analyzed for TPH-G, TPH-D/MO, and Title 22 Metals (CAM15). The soil samples at 15' were preserved for possible additional analysis pending the results from the 5' samples.
- Soil vapor probes were installed at depths of 5' and 15'. Soil vapor samples were analyzed at both depths for VOCs, TPH-G, and methane. One duplicate soil vapor sample was collected and analyzed for VOCs, TPH-G, and methane.

9.0 Soil Sampling Protocol

Soil borings were advanced using a direct-push sampling rig. The direct-push system is driven by a hydraulic hammer and was equipped with a dual-tube core barrel. As the hollow dual-tube core barrel was driven downward, soil was pushed into a 4-foot long acetate sleeve that was located within the inner core barrel. The inner core barrel was lifted up and the acetate sleeve was removed, and another empty sleeve was inserted into the inner core barrel. The outer core barrel was temporarily left in place to provide bore-hole stability. This procedure was repeated until the desired depth was reached.

At select depths, soil samples were collected within the acetate sleeve and a six-inch long portion of the sleeve was isolated and cut from the 4-foot long sleeve. That sample was immediately capped and preserved with Teflon tape and end caps and chilled on ice in a cooler pending delivery to a State certified laboratory.

During drilling, a photo-ionization detector was used to screen all soil samples collected from the borings for VOCs and for worker health and safety concerns. The PID was calibrated with hexane (100 ppmV) in the field in the morning prior to the commencement of any field activities. The identified lithology (Unified Soil Classification System) along with the PID readings were recorded on boring logs.

10.0 Soil Vapor Probe Installation and Sampling Protocol

All but boring B4 received soil vapor probes that were used to measure and specify the type of VOCs present in soil gas. During drilling, at the desired depth, a 2-inch long vapor probe fitted with ¼-inch ID tubing was placed within the outer core barrel and the barrel was lifted out of the bore hole. A 1-foot thick sand pack was placed above and below the probe followed by 6-inches of dry bentonite and then hydrated bentonite to the near surface. Where multiple probes were placed in the same borehole, the same installation procedure was used, but the deepest probe was distinguished from the shallow by slightly longer tubing and labeling. The probes were allowed to equilibrate for a minimum of 4-hours prior to sampling, and the probes were purged and sampled in general accordance with the DTSC vapor intrusion guidance specifications (DTSC's Supplemental Guidance, Screening and Evaluating Vapor Intrusion, February 2020).

Each probe head was attached to the sampling train assembly of Teflon tubing, valves, and fittings and connected to a purge pump. The pump was used to evacuate the sealed system using an applied maximum vacuum of 100 inches of water column (in. WC). The vacuum on each probe was monitored for 90 seconds with the sampling train system sealed. After the shut-in test was validated, the sampling train was leak tested. Liquid isopropyl alcohol was applied to a cloth and placed around all connections in the sampling train to evaluate whether the system was sealed from ambient air leaks. A detection of 10 times the reporting limit of this compound was not measured suggesting that ambient air leakage had not occurred.

Each probe was purged prior to sampling, and the purpose of purging was to remove stagnant air from the vapor sampling train to ensure representative samples are obtained. The probes were purged of three purge volumes of soil gas (a purge volume includes the volume of tubing plus the void space of the sand pack around the probe) using an adjustable vacuum pump. The purge rate was set at 200 mL/minute.

After purging three volumes through the system, soil gas samples were collected in glass syringes from each probe by a technician operating a mobile lab from A&R Laboratories. Each sample was analyzed for TPHg (EPA Method 8015M, methane (EPA Method 8015M), and/or VOCs (EPA Method 8260B). A greater volume of air from the sample was used for the analysis to achieve detection limits for each compound comparable to the EPA Method TO-15 test, which should meet residential standards.

11.0 Cultural Resources Observation

During soil sample collection, the Professional Geologist inspected the soil removed during drilling operations. There were no bones, artifacts, or evidence of any manmade materials identified in the soil removed from the subject property.

12.0 Groundwater Results

Groundwater was not encountered in any of the borings with the deepest drilled to 30 feet bgs.

13.0 Soil Vapor Sample Results

The results from soil vapor sampling indicated none of the samples had significant concentrations of TPHg with two samples having a maximum of just 3.3 ug/L (in sample SG1-10). The results from VOC analysis indicated two isolated detections of benzene with 0.010 ug/L detected in samples SG1-10 and SG9-15. This concentration is below the commercial screening level of 0.014 ug/L. Two samples also had detectable concentrations of trichloroethene (TCE) with 0.010 ug/L detected in both SG6-5 and SG10-5. These concentrations are well below the commercial screening level of 0.100 ug/L. Other much less sensitive VOC including toluene and trimethylbenzene were detected in some samples, none approaching commercial screening levels. In addition, the results from methane sampling indicated no detectable concentrations in either sample. These results are summarized in Table 2. The laboratory report from soil vapor sampling is included in Appendix D.

14.0 Soil Sample Results

The results from soil sampling indicated none of the samples had detectable concentrations of petroleum hydrocarbons. The three soil samples (B5-4, B9-5, and B10-5) analyzed for heavy metals indicated none had concentrations approaching residential or commercial screening levels. No OCP was detected in sample B5-4. These results are summarized in Tables 1 and 1A. The laboratory report from soil sampling is included in Appendix E.

15.0 Methane Sample Results

During purging of the soil gas, some samples had notable concentrations of methane. Based on these results, two samples were preserved for methane analysis by the laboratory by EPA Method 8015. These results are summarized in Table 2. The laboratory report from soil sampling is included in Appendix G.

16.0 Findings, Conclusions, and Recommendations

The site has a long history of commercial use, and it formerly maintained USTs. Based on the site history, a subsurface investigation was recommended. In January 2024 APE conducted a site assessment that included installation of 10 soil borings in targeted area across the site. Each boring was completed as a soil gas sampling probe; six of them with two sampling tips installed at discrete depths ranging from 5 to 30 feet below grade. The investigation included laboratory analysis of 20 soil samples and 16 soil gas samples for a variety of suspect contaminants including petroleum hydrocarbons, VOC, heavy metals, and OCP. In addition, field monitoring indicated the presence of methane in significant concentrations, so two soil gas samples were laboratory tested for methane.

The results from this work indicated no detectable concentrations of petroleum hydrocarbons in soil, no concentrations of heavy metals in soil that exceed current residential or commercial screening levels, and no concentrations of VOC in soil gas that exceed current commercial screening levels. The results from laboratory analysis of methane indicated no detectable concentrations. Based on these results, no further sampling is recommended.

Due to the limited nature of the Phase II performed on the subject property and the presence of low levels of petroleum compounds identified in the soil vapor near the former UST area, and the long historical use of the subject property for commercial and industrial purposes, the development and implementation of a Soil Management Plan (SMP) is recommended as a measure to manage encountered impacted soils, if any.

19.0 Qualifications of Environmental Professionals

Doug Kochanowski

**Environmental Professional, Senior Environmental Scientist, and Biologist
CHMM (#9970), CAC (#99-2699)**

Professional Experience:

Mr. Kochanowski has been performing Phase I Environmental Site Assessments (ESAs) since 1988 and is considered an industry expert. The environmental consulting profession was in its infancy when he performed his first ESA. Over the past three decades, Mr. Kochanowski has performed ESAs on almost every type of real property in over ten different states and in Europe. This includes military bases, medical facilities, high-rise office buildings, learning institutions, factories, shopping malls and plazas, gasoline stations, industrial parks, manufacturing facilities, vacant land, agricultural land, housing tracks, multifamily developments, and government facilities. His wide array of experience has made him a key component for conducting complex ESAs and his expertise is sought after by a wide variety of clients and other consulting firms. His practical approach and comprehensive knowledge of the ASTM standards result in ESAs that are accurate, comprehensive, and address environmental issues with a common-sense approach.

Mr. Kochanowski's environmental portfolio also includes experience conducting a variety of additional services that include soil, groundwater, and soil vapor testing, modeling, landfill leachate testing, indoor air sampling, lead-based paint sampling, and conducting human health risk assessments. He has managed several large IDT contracts for the European District Corps of Engineers, working at over twenty bases in Germany and Spain. Projects included remediation design, soil and groundwater sampling, landfill leachate testing, asbestos surveys, air monitoring, and radon testing.

For as long as Mr. Kochanowski has been writing ESAs he has also been performing asbestos testing and consulting. He is a California Certified Asbestos Consultant and is NIOSH 582 Certified to analyze Polarized Light Microscopy (PLM) samples. Mr. Kochanowski performs asbestos surveys, develops removal specifications and drawings, writes Operations and Management (O&M) Plans, and conducts contractor observation and air monitoring during abatement projects. His asbestos experience includes schools, nuclear facilities, universities, airports, hospitals, military bases, shopping malls, high-rise office buildings, industrial complexes, port facilities, apartments and single-family homes. Mr. Kochanowski was the Manager and Facility Security Officer (FSO) for a high-profile asbestos survey, air monitoring and abatement project of the White House, Washington D.C. His AHERA survey experience includes inspecting over eight million square feet of building space for school districts in California, Kansas, New Mexico and Tennessee.

Mr. Kochanowski has teaching experience including conducting OSHA 1910.120 HAZWOPR, Confined Space Entry, and asbestos awareness classes.

He has served as Secretary on the Board of Directors and was a founding father for the SoCal ACHMM chapter. In the past, he has served on the technical committee for a Local Emergency Planning Commission (LEPC) and was elected Secretary on the Board of Directors for the Rhine-Main Post of the Society of American Military Engineers (SAME).

Education:

Bachelor of Science, Biology, San Diego State University, 1987.
Continuing Education; Strategies for Conducting Meaningful Microbial IAQ Investigations/American Indoor Air Quality Council

Registrations and Certifications:

CHMM, Master Level; Secretary of the SoCal ACHMM Chapter
California Certified Asbestos Consultant (#09-2699)
NIOSH 582 Accredited Sampling and Evaluation Airborne Asbestos
Certified, OSHA 40Hr Trained 1910.120/Site Supervisor
Certified TRGS 519 Under German Hazardous Materials Regulations
AHERA Certified Asbestos Inspector, Management Planner, Designer, and Abatement Supervisor
Certified Radiation Worker
Confined Space Entry Certified

Daniel R. Louks
California Professional Geologist

Education

M.S. Candidate, Applied Geophysics, California State University, Northridge, Ca.
B.S. Geology, University of California, Los Angeles, Ca, 1983.

Professional Affiliations

California Professional Geologist
California Professional Civil Engineer

Professional Experience

Mr. Louks has worked as an Engineer and Hydrogeologist, responsible for the design, planning, budgeting, and operations of all environmental and hydrogeological related projects. He provides environmental engineering and consulting services with expertise. Project experience includes injection of oxidants and electron donor materials within the saturated zone for the chemical and biologic decomposition of halogenated solvents and petroleum compounds. Mr. Louks has experience with the operation of vapor and dual-phase extraction systems for the physical removal of volatile solvents and petroleum compounds.

Mr. Louks has worked as a Senior Geologist responsible for the design, implementation, budgeting, and operations of environmental and geological projects. He has participated in the development and management of financial operations associated with hydrogeological groups.

Mr. Louks has developed and managed hydrogeologic service groups. He was responsible for the design, implementation, budgeting, and operations of environmental related projects. Mr. Louks participated in the development and management of financial operations associated with a hydrogeological group. He has been responsible for the design, implementation, and operations of bioreclamation projects.

1.0 INTRODUCTION

On November 28th, 2023, Spectrum Geophysics conducted a geophysical investigation on the property of the former Ratheon Site 27 Facility and future Goleta Train Depot located on 27 South La Patera Lane in Goleta, California (hereinafter referred to as the Property).

The purpose of the investigation was to locate detectable steel underground storage tanks (USTs) and to investigate 10 proposed boring locations for detectable utilities. The area of investigation for the USTs and 3 of 10 proposed boring locations was approximately 95 x 40 feet in size and asphalt covered.

Site interferences included a utility pole, parking blocks, a metal fence and a sheared metal pipe.

2.0 EQUIPMENT

The equipment used during this investigation consisted of a Geonics EM-61 high-sensitivity metal detector (EM-61), a Sensors & Software “Noggin Smart Cart” ground penetrating radar (GPR) unit coupled to a 500-MHz antenna, a Fisher TW-6 M-Scope shallow-focus metal detector (M-Scope) and a RadioDetection RD4000 electromagnetic utility locator (RD4000). A Trimble Pro 6H GPS unit and a digital field computer were used during EM-61 data acquisition.

3.0 METHODS AND FIELD PROCEDURES

3.1 EM-61 High Sensitivity Metal Detector

The EM-61 high-sensitivity metal detector was used in an effort to delineate areas where metallic objects (such as underground storage tanks and metallic piping) may be buried. The EM-61 transmitter generates short pulses of a primary magnetic field that induces electromagnetic currents in nearby metallic objects. Between pulses, the two receiver coils measure the decay of these electromagnetic currents in millivolts (mV). The measured values are proportional to the metal content (ferrous and non-ferrous) of the nearby objects.

Prior to data acquisition the EM-61 battery level was checked and found to be at a proper level for data acquisition. After the EM-61 had a few minutes to warm up, the unit was nulled in a location with more than four meters of separation between the coils and any known metallic objects. A cable-shake test was performed to assure the cables were in good working condition and the connectors were fastened properly. Finally, a static test was performed in which the instrument

*EM-61 data acquisition
(archive photo)*

response to soil and a metal bolt was monitored for amplitude and consistency of the readings. The EM-61 used in this survey was found to be working as expected.

During this investigation, EM-61 readings were collected along roughly parallel survey lines spaced between 4 and 5 feet apart within the area of the investigation. These measurements were recorded at a rate of 5 readings per second and stored in the Archer digital field computer. GPS positions were streamed into the field computer at one second intervals, and the EM-61 measurements were interpolated between GPS positions. This resulted in a 1-foot station spacing on average. Survey lines were displayed on the field computer in real time for navigation. If the submeter accuracy was lost during data acquisition an alarm from the field computer was sounded and data acquisition was paused until accuracy was regained. These data were processed in the field and used to generate contour maps to assist in identifying anomalies that may be caused by large buried metallic objects like USTs. Linear EM-61 anomalies were relocated with the utility locating equipment in an attempt to determine their source.

Top or bottom coil EM-61 data can be useful for identifying near-surface metallic objects; although, the top coil generally has a larger response than the bottom coil to deeply buried objects. Top coil data are also useful for identifying buried utilities and other shallow linear features. The differential data (bottom coil data subtracted from the top coil data) was used during this survey to distinguish deeper targets (such as metallic USTs) from shallow ones such as a vault lid or scrap metal. Utilization of the differential data allows for the suppression of near surface targets that might mask the response from deeper targets of interest.

3.2 Ground Penetrating Radar

EM-61 anomalies that could not be attributed to aboveground cultural features or detected underground utilities were further investigated using GPR methods. The overgrown nature of the site made GPR data collection difficult in many locations. GPR data were collected over suspect areas and interpreted in the field for anomalies whose signatures might indicate the presence of utilities or other features of interest.

Data collection using the Noggin GPR (archive photo)

During GPR surveys, a high frequency (500 MHz) radio signal is transmitted into the ground via the antenna. As radio waves propagate into the ground, these signals are reflected off of structures with differing electrical properties. These reflected signals are then captured by the receiver and are presented as vertical profiles on the GPR unit. The profiles were then interpreted for the presence of buried utilities and other features of interest.

The areal extents and/or surface traces of detected features were marked on the ground with spray paint.

3.3 Electromagnetic Utility Location

During this investigation, active electromagnetic (EM) utility-locating methods were used to relocate linear EM-61 anomalies and to delineate the surface trace of detectable underground utilities.

Active locating was initiated by transmitting an alternating current at a known frequency (8 kHz for this site) on a street lighting line exposed at the surface. A receiver, tuned to 8 kHz, was then used to locate the signal maxima (or surface trace) of the applied signal. The street lighting did not pass through the area of investigation and was not mapped.

The Fisher M-Scope metal detector was used to relocate shallow buried metallic features identified in the EM-61 data. The M-Scope has a transmitter and a receiver at the ends of a short boom. The transmitter emits a radio-frequency source signal that induces a secondary magnetic field in metallic material in its immediate vicinity. The receiver measures the signal strength of this secondary magnetic field and emits an audible response, the volume and pitch of which increase in the presence of metallic material. The sensitivity of the M-Scope allows the operator to locate the lateral boundaries of a metallic object.

Detected utilities were marked on the ground with surveyor's paint.

3.4 Investigation of Proposed Borings

The following procedures were used for each proposed boring location at the Site:

- The area surrounding each boring location was visually inspected for evidence of subsurface utilities or other buried features.
- Each identified utility was investigated using active electromagnetic utility-locating instruments and its surface trace was demarcated on the ground using color-coded spray paint.
- Each boring location was investigated with a passive electromagnetic receiver tuned to 50/60 cycle electrical current to detect possible electrical lines (with voltages up to 30,000 volts) in the vicinity. The surface trace of any detected electrical lines was demarcated on the ground using red spray paint. In addition, each boring location was investigated using audio, radio, and 1KHz frequencies to identify utilities re-radiating these ambient signals.
- Each boring was investigated using an electromagnetic transmitter placed over the boring location while the operator walked an equidistance with the receiver around the location to detect increases in signal strength that would suggest possible subsurface utilities. Each suspect signal increase was further investigated to discern a signal propagating utility.
- Each boring location was investigated using a shallow focus terrain conductivity meter (M-Scope) to identify possible buried and abandoned conduits as well as piping that had no surface expression

Utility location using the RD4000

- A signal was directed onto any identified electrical and telephone lines and their surface trace was determined by identifying the signal maxima.
- Accessible vaults in the vicinity of each boring location were opened and investigated for detectable utilities originating from the vault. If the vault was adjacent to the proposed boring, the subsurface extent of the vault was delineated and marked on the ground surface.
- Each boring location was investigated using ground penetrating radar (GPR). Using this method, one or more GPR profiles are established across the subject boring location, where a GPR unit (typically the Noggin Smart Cart) is used in an effort to identify possible subsurface obstructions in the immediate vicinity of the boring. During operation, a high-frequency radio signal is transmitted into the ground via the antenna. As radio waves propagate into the ground, these signals are reflected off structures with differing electrical properties. These reflected signals are then captured by the receiver and are presented as vertical profiles on the GPR unit.

4.0 RESULTS

A geophysical interpretation map is presented in Figure 1, and a contour map of the EM-61 differential data is presented in Figure 2.

4.1 EM-61

The color scale in the contour map of the EM-61 differential data displays the magnitudes of the measured EM-61 values where blue and green colors represent negative readings (indicative of surface metal), light green to yellow colors represent background readings and orange to pink colors represent increasing values above background. Due to the sensitivity of the EM-61, anomalies are usually exaggerated compared to the actual dimensions of the source metal. It is common for a sheared fence post to produce a 7-foot by 7-foot EM-61 anomaly while a 500-gallon UST buried 4 feet below ground surface can produce an EM-61 anomaly with dimensions of 15 feet by 15 feet. The findings of the survey are discussed below.

Two anomalies were detected in the EM-61 differential data (Figure 2) that could not be attributed to above ground cultural features and/or detected utilities.

Anomaly A was observed as a high amplitude anomaly in both the EM-61 top coil and differential data, identified in Figure 1 as a red dashed box. This anomaly is 26 feet x 17 feet in size and is located along Eastings 6005914 to 6005942 and between Northing 1986540 to 1986521. Two conduits were detected using EM-utility location methods within the bounds of the anomaly however, they could not be determined as the sole sources. Follow up using GPR revealed possible reinforced concrete mesh beneath the asphalt. The existence of this reinforcement and soil conditions precludes determining the presence of a UST. Spectrum recommends further investigation in this area to determine the source(s).

Anomaly B was observed as a high amplitude anomaly in both the EM-61 top coil and differential data, identified in Figure 1 as a red dashed box. This anomaly is approximately 31 feet x 12 feet in size and is located along Eastings 6005912 to 6005943 and between Northing 1986522 to 1986507. A conduit was detected using EM-utility location methods within the bounds of the anomaly however, it could not be determined as the sole source of the anomaly. Follow up using GPR revealed possible reinforced concrete beneath the asphalt and an additional uneven layered reflection deeper in the profiles. No source for this signature was determined and it was atypical for an excavation or a UST. Spectrum recommends additional investigation in this area.

5.0 LIMITATIONS

The detection of subsurface objects and utilities is dependent upon acquiring reliable data with geophysical instruments above ground. These data may be interpreted as representative of subsurface objects. The electromagnetic waves or fields being measured, however, may be attenuated and/or distorted by a number of factors including soil moisture, corrosion, and proximity to other surface and subsurface structures. A discussion of the limitations of each method follows.

5.1 EM-61

The EM-61 is capable of detecting a 55-gallon drum up to a depth of 3 meters under favorable conditions. We recommended a minimum 10-foot buffer between the survey area and any metallic or metal bearing surface cultural features such as the metal fence, utility pole, parking blocks, and the sheared metal pipe which could severely compromise the quality of the data. As a result, Spectrum cannot guarantee that metallic USTs are not present near or beneath these features.

5.2 GPR

The performance capability of GPR is dependent on the electrical conductivity of the soil at the site. If the soil conductivity is high, attenuation of the radar signal in the soil can severely restrict the maximum penetration depth of the radar signal. Under favorable conditions depth of penetration can be greater than 10 feet; however, average depths of GPR penetration in Southern California tend to range between 2-5 feet. Soils high in clay content and moisture will have higher signal attenuation. GPR surveys should be performed in the dry season if at all possible, especially at sites located in Southern California.

5.3 Positioning

The features identified in Figure 1 were located using GPS for positioning (sub-meter accuracy). In addition, because the site map and the EM-61 data contour maps were created using GPS for positioning, the anomalies identified may also contain some positioning error. As a result, all features depicted in Figure 1 may be in error with regards to their true GPS position by as much as 3 feet.

QUALIFIERS

B = Detected in the associated Method Blank at a concentration above the routine RL.
 B1 = BOD dilution water is over specifications . The reported result may be biased high.
 D = Surrogate recoveries are not calculated due to sample dilution.
 E = Estimated value; Value exceeds calibration level of instrument.
 H = Analyte was prepared and/or analyzed outside of the analytical method holding time
 I = Matrix Interference.
 J = Analyte concentration detected between RL and MDL.
 Q = One or more quality control criteria did not meet specifications. See Comments for further explanation.
 S = Customer provided specification limit exceeded.

ABBREVIATIONS

DF = Dilution Factor
 RL = Reporting Limit, Adjusted by DF
 MDL = Method Detection Limit, Adjusted by DF
 Qual = Qualifier
 Tech = Technician

- APPENDIX D Analytical Laboratory Documentation & Chain of Custody

1.0 Summary

At the request of City of Goleta, All Phase Environmental, Inc. (APEI) performed a survey for asbestos-containing materials (ACM) and a visual inspection for hazardous materials and universal wastes in the industrial building located at 27 South La Patera Lane, Goleta, California, 93117, hereinafter referred to as the "Building" on November 16 and 28, 2023. Douglas B. Kochanowski, a State of California Certified Asbestos Consultant #99-2699 and APEI Project Manager, conducted the survey.

The following materials were identified as asbestos containing; black floor tile mastic, floor tile contaminated by floor tile mastic, carpeting contaminated by floor tile mastic, mirror mastic, a flue, and roof tar sealing bolts penetrating the roof.

Hazardous materials, petroleum products, and universal wastes identified included: a canister of fire retardant, florescent light ballasts and tubes, a hydraulic dock leveler, pole-mounted transformers, mercury vapor/sodium vapor/halogen lights, one 55 drum of unknown contents labeled as hazardous waste, smoke detectors, one 1,800 gallon diesel UST, three gallons of latex paint, HVAC chemicals, and batteries in exit signs, emergency lights, and soap/sanitizer dispensers.

None of the materials posed an immediate threat to the environmental integrity of the subject property or occupants but prior to the start of demolition they must be removed and disposed of or recycled.

2.0 Building Profile

General

The Building was a one-story office and industrial structure with a small mezzanine office and storage space in the southwest corner of the building. The building was approximately 30,000-square feet and was constructed in approximately 1967. The building has undergone several renovations since its original construction. At the time of the investigation, the Building was partially occupied by a tenant using it for intermittent classes, office space, and warehouse space.

Structural System and Building Envelope

The Building consisted of a steel frame structure with corrugated sheet metal on the exterior walls and the roof.

Interior Construction and Finishes

Interior construction consisted of gypsum board walls and exposed corrugated sheet metal. Ceilings were finished with gypsum board and drop ceiling tiles or exposed corrugated sheet metal. Floor finishes included floor tile, carpeting, linoleum, ceramic tile, and finished concrete slab.

Mechanical Systems

Gas and electrical HVAC units provided heating and cooling to the office areas of the building. The air ducts and pipe insulation observed during this project were visually identified as being insulated with fiberglass or rubber. Hot water was provided by local hot water heaters and domestic hot water piping was visually identified as being insulated with fiberglass or uninsulated.

3.0 Asbestos Findings

The asbestos survey was performed by APEI in preparation for the demolition of the Building. APEI Project Manager Doug Kochanowski, a California Certified Asbestos Consultant (99-2699), performed the survey on November 16 and 28, 2023. Bulk samples were taken of suspect ACM including both interior and exterior materials. Destructive sampling techniques were employed in order to assess all materials. This survey was performed in accordance with Asbestos and Hazard Emergency Response Act (AHERA) sampling protocol modified to include exterior and roofing materials and to meet the requirements for an asbestos survey required prior to demolition or renovation. Duplicate samples were taken where appropriate to ensure proper qualification of materials. Bulk samples of suspect ACM were collected, labeled, documented on a chain of custody form and delivered to an NVLAP certified analytical laboratory. This survey represents comprehensive pre-demolition survey that, while some well-hidden suspect ACM may have escaped evaluation, all layers of suspect building material (to joist- or frame-level) as well as materials above plenums, inside soffits, or other concealed spaces have been evaluated.

The analytical laboratory used for analysis of bulk asbestos samples was Patriot Lab and Analytical Services. Patriot Lab is located at 1041 South Placentia Avenue, Fullerton, California 92831. Patriot is a NIST/NVLAP certified laboratory (#20358-0) Standard laboratory quality control procedures were followed. Polarized Light Microscopy - Dispersion Staining (PLM-DS) by EPA Method 600/R-93/116 was used to analyze the samples.

A summary of materials found to contain detectable asbestos is provided below in Table I. Appendix A contains drawings illustrating the locations of the bulk samples and the locations of materials identified as asbestos containing. All quantities listed are approximate values and any contractor bidding on the removal of asbestos from the Building should use these numbers as a guideline only. Any contractor using these numbers to formulate a bid for removal does so at their own risk.

Table I						
Summary of Asbestos Containing Materials						
Sample #	Material	Friable	Condition	Material Location	Estimated Quantity	Asbestos Content
01-1, 10-1, 12-1, and 13-1	Black Floor Tile Mastic	No	Good	Throughout 1 st floor office area except bathrooms, northeast corner office, router room, and electrical space	7,975 Square Feet	3% to 5% Chrysotile
14-1 to 14-3	Mirror Mastic	No	Good	Glue adhering mirrors to the walls in the bathrooms	200 Square Feet	5% Chrysotile
19-1 to 19-3	Roof Tar Sealing Bolts Penetrating Roof	No	Good	Dollop of tar at each bolt penetrating the roof	Throughout	5% Chrysotile
22-1	Transite Flue	No	Good	Vertically pasting through the building and roof near the bathrooms	4" x 30'	13% Chrysotile

Within the State of California, the State of California Division of Occupational Safety and Health (DOSH) defines ACM (or Asbestos Containing Construction Material (ACCM), the nomenclature used by DOSH) as any manufactured material which contains greater than 1/10 of one percent (0.1%) asbestos by weight. The laboratory's Limit of Quantification (LOQ) for PLM-DS is 1% asbestos and greater. Therefore, the designation of "trace" indicates the presence of asbestos below the LOQ, that is, below 1%. Samples found to contain trace (less than 1%) asbestos, if any, were re-analyzed for asbestos content using 1,000-field point count analysis. Any ACM that contains trace asbestos, (less than 1% but more than 0.1%) must be treated as ACM if disturbed but its disposal is not regulated as an asbestos containing waste.

There were no materials tested that were found to contain trace amounts of asbestos. Table II below contains a summary of all of the samples taken and the laboratory analysis results.

Table II Asbestos Sample Results Summary					
Sample #	Material	Friable	Condition	Sample Location	Asbestos Content
01-1 Layer 1	Tan 12" Floor Tile	No	Good	Reception, southwest corner	None Detected
01-1 Layer 2	Tan 12" Floor Tile Mastic	No	Good	Reception, southwest corner	3% Chrysotile Asbestos

21-3	Roof Penetration Tar	No	Good	Upper roof, near southwest corner, at skylight	None Detected
22-1	Transite Flue	No	Good	Upper roof, south of center, near the area over the office area bathrooms	13% Chrysotile Asbestos

The following is a discussion of the ACMs identified at the Building.

Black Floor Tile Mastic

Asbestos was detected in black floor tile mastic in samples 01-1, 10-1, 12-1, and 13-1. Because these were found to contain asbestos, the subsequent black mastic layers from these homogeneous groups were not analyzed (01-2, 01-3, 10-2, 10-3, 12-2, 12-3, 13-2, and 13-3). The mastic was found to contain between three and five percent (3%-5%) chrysotile asbestos. This material was non-friable and was in good condition. There were approximately 7,975 square feet of asbestos containing black mastic in the subject property building.

It appears that when the subject property building was constructed, most of the first floor office area had been finished with floor tile that was adhered to the floor with black asbestos containing mastic. Over the years, some of the floor tiles have been removed and replaced with carpeting. None of the floor tiles sampled were found to be asbestos containing. Therefore, in areas with floor tile, either the floor tile installed did not contain asbestos or the asbestos containing floor tile had been replaced with the existing newer tile that does not contain asbestos.

Because the black asbestos containing mastic remains adhered to the floor tile, even though the floor tile itself does not contain asbestos, it must be treated as asbestos containing during removal.

In addition, when peeling back the carpeting to sample the flooring, it was noted that in areas where there was no floor tile below the carpeting and the carpet was placed directly over the black floor tile mastic, the black mastic adhered to the carpeting in some areas. In these instances, the carpet would be contaminated with the asbestos containing mastic and must therefore be removed and disposed of as asbestos containing.

Mirror Mastic

The mastic adhering the mirrors to the walls in the bathrooms (samples 14-1, 14-2, and 14-3) contains five percent (5%) chrysotile asbestos. Because sample 14-1 was found to contain asbestos, samples 14-2 and 14-3 were not analyzed. This material is non-friable and was found to be in good condition. There are an estimated 120 square feet of this material.

Roof Tar Sealing Bolts Penetrating Roof

The bolts on the roof that are holding down the sheet metal roof had been sealed with a roof tar (samples 19-1, 19-2 and 19-3) that contains five percent (5%) chrysotile asbestos. Because the first sample of this tar was found to contain asbestos, the subsequent samples were not analyzed. This material is located throughout the roof where there is a small dollop of tar sealing each bolt. This material is non-friable and was found to be in good condition.

Transite Flue

A flue that runs through the building and through the roof (sample 22-1) contains thirteen percent (13%) chrysotile asbestos. This material is located near the office bathrooms and is presumed to run from the floor through the roof of the building. This material is non-friable and was found to be in good condition. There is an estimated thirty feet of this four inch diameter flue.

Recommendations

In their current condition, the identified ACMs are not a threat to the health of tenants in the building.

Because the subject property building is to be demolished, a California licensed asbestos abatement contractor must first remove and properly dispose of these materials prior to disturbance or demolition.

It is recommended that a consultant such as All Phase Environmental, Inc. be retained to develop asbestos abatement specifications for the asbestos removal and direct a pre-bid job walk to familiarize the contractors with the abatement conditions and expectations. It is also recommended that the consultant be retained to perform construction observation, area air monitoring during the abatement, and post removal area air clearance.

4.0 Hazardous Fire Extinguishing Systems

APEI surveyed the subject building for the presence of hazardous fire extinguishing systems. Hazardous fire extinguishing systems include the use of halon to displace oxygen or extinguishing systems containing N,N- Didecyl-N,N-Dimethylammonium Chloride or N-Alkyl dimethyl-N-benzylammonium chloride. APEI did not note any evidence of these types of hazardous fire extinguishing systems in the Building.

In the large open warehouse area one canister of fire retardant was noted along the south wall north of the open office areas. The disposal requirements for this material was not identified. It is advised that the fire department be consulted for disposal restrictions.

5.0 Polychlorinated Biphenyls (PCB)

APEI surveyed the subject building for the presence of electrical components that are suspected of containing polychlorinated biphenyls (PCBs). In 1977, the EPA made it illegal to use PCBs as an additive in cooling oils.

Florescent Light Ballasts

Where feasible, it is advised that all fluorescent light fixtures be reused. Fluorescent light ballasts contain cooling oils that require these items to be segregated from solid waste and be disposed of properly. Ballasts manufacturing prior to 1977 may contain PCBs. Ballasts manufactured without PCBs will be labeled, "Non PCB." Because some of the light fixtures may have been replaced, even though the subject property building was constructed in 1967, they may be free of PCBs but will still contain cooling oils and must be segregated for proper disposal. The label from each fixture must be inspected and the ballasts sorted accordingly.

Approximately 244 florescent light ballasts were identified in the subject property building.

Hydraulic Oil

Where feasible, it is advised that all hydraulic equipment be reused. Hydraulic fluids prior to 1977 may contain PCBs. If hydraulic components must be demolished, the hydraulic fluids must first be drained and either tested for PCBs or treated as PCB containing.

There was one (1) hydraulic dock leveler located in the northwest receiving dock. Evidence of leaks from the dock leveler was not observed.

Transformers

Six pole-mounted electrical transformers were observed along the south subject property border. PCBs were typically removed from transformers in the southern California area in the late 1970s and early 1980s. The units appeared in good condition and evidence of leaks was not observed. These transformers are the property of the Southern California Edison (SCE), the electrical utility. It is the responsibility of SCE to remove these from the subject property and properly handle or dispose of the hydraulic fluids.

Electrical Equipment

Switch boxes and capacitors may contain PCBs. This equipment was not observed but it is still recommended that an electrical contractor be consulted prior to disposing of any hydraulic or electrical equipment fluids.

6.0 Mercury and Sodium Containing Components

APEI surveyed the subject building for the presence of mercury vapor containing components.

Fluorescent Light Tubes

Where feasible, it is advised that all fluorescent light tubes be reused. Fluorescent light tubes suspected of containing mercury vapor were found throughout the building. The presence of fluorescent light tubes in the building is not a threat to the health of the tenants or the environmental integrity of the Property. Their disposal, however, is regulated.

In California, the California Environmental Protection Agency Department of Toxic Substances Control (DTSC) is the agency, that, in general, regulates the management of spent fluorescent light tubes and spent mercury vapor lamps destined for disposal as hazardous wastes, because mercury is listed as a hazardous waste under Title 22, California Code of Regulations, Section 66261.126, and because the spent tubes and lamps typically contain enough mercury to qualify as toxic hazardous wastes under Title 22, CCR, Section 66699. It is recommended that these tubes be maintained in place unless they are scheduled to be removed. If they are to be removed, it is recommended that the tubes be placed, unbroken, into protective packaging for off-site disposal or recycling.

Approximately 573 fluorescent light tubes were identified in the subject property building.

Mercury Vapor Lights

Where feasible, it is advised that all mercury lights be reused. Mercury vapor lights were observed in the warehouse areas of the Building. The presence of mercury vapor lights in the Building is not a threat to the health of the tenants or the environmental integrity of the Property. Their disposal, however, is regulated.

Approximately 60 mercury vapor lights were identified in the subject property building.

Mercury, Sodium, or Halogen Lights

Where feasible, it is advised that all mercury, sodium, or halogen lights be reused. These types of lights were observed mounted on the exterior walls of the Building. The presence of these lights is not a threat to the health of the tenants or the environmental integrity of the Property. Their disposal, however, is regulated.

Approximately 20 mercury, sodium, or halogen lights were identified outside the subject property building.

Smoke Detectors

A quantity of smoke detectors was not obtained. Photoelectric smoke detectors generally can be disposed of as solid waste. Ionizing types of detectors require appropriate recycling. It is advised that the smoke detectors be collected and the local waste disposal department be consulted for disposal requirements.

Unidentified Light Fixtures

There were approximately 15 smaller wall-mounted or can lights in the Building that could not be identified. It is advised that these be collected and segregated for proper disposal.

7.0 Batteries

APEI surveyed the subject building for the presence of batteries. Where feasible, it is advised that any components containing batteries be reused. Battery powered exit signs, emergency lights, and soap/sanitizer dispensers were observed in the subject property building.

Approximately 3 emergency light fixtures were observed.

Approximately 7 exit signs with emergency lights were observed.

Approximately 5 exit signs were observed.

Approximately 5 battery powered soap or hand sanitizer dispensers were observed.

Approximately 6 exterior unidentified lights on poles were observed.

8.0 Hazardous Materials

APEI surveyed the subject building for the presence of hazardous materials.

Drums

One 55 gallon drum labeled, "Hazardous Waste" was observed next to the emergency generator on the west side of the subject property building. The specific contents were not identified on the container. There were no signs of spills or releases from this drum. If the contents of this drum were not a result of work performed by, or for, the City of Goleta, then it is advised that the subject property tenant be asked to define its contents and remove the drum. If the drum is not the responsibility of the tenant, then its contents must be tested by the City and the material be properly removed and disposed of.

USTs

One approximately 1,800 gallon diesel UST remains outside the southwest corner of the Building next to the emergency generator. Prior to demolition, a permit must be obtained for the proper decommissioning and removal of the tank and all associated piping.

Miscellaneous Chemicals

One gallon of latex paint was observed in the main large warehouse, along the south wall, near the east end, east of the entrance to the offices.

Two one gallon containers of paint were observed in the storage room north of the main reception room.

It is advised that these containers of paint be removed from the subject property and properly disposed of.

HVAC Chemicals

The quantity and condition of the HVAC chemicals could not be determined. It is advised that an HVAC qualified engineer be consulted for the proper capture and recycling or disposal of all HVAC chemicals.

9.0 Compressed Gasses

Other than HVAC and fire retardant chemicals discussed above, there were no compressed gasses identified in the Building.

10.0 Environmental Professionals Signatures

The undersigned certifies that the professional services have been conducted, our findings obtained, and our recommendations have been prepared in accordance with customary principles and practices in the field of environmental science and engineering. APEI has acted in good faith and has no relationship with sellers, buyers or agents of the subject property. There have been no conflicts of interest involved in the drawing of conclusions, which have been based solely on materials reviewed and visual inspections conducted by APEI.

11.0 Qualifications Of Environmental Professionals

Doug Kochanowski
Environmental Professional, Senior Environmental Scientist, and Biologist
CHMM (#9970), CAC (#99-2699)

Professional Experience:

Mr. Kochanowski has been performing Phase I Environmental Site Assessments (ESAs) since 1988 and is considered an industry expert. The environmental consulting profession was in its infancy when he performed his first ESA. Over the past three decades, Mr. Kochanowski has performed ESAs on almost every type of real property in over ten different states and in Europe. This includes military bases, medical facilities, high-rise office buildings, learning institutions, factories, shopping malls and plazas, gasoline stations, industrial parks, manufacturing facilities, vacant land, agricultural land, housing tracks, multifamily developments, and government facilities. His wide array of experience has made him a key component for conducting complex

All Phase Environmental, Inc.

EXHIBIT "I" (Asbestos and HazMat Inspection)

ESAs and his expertise is sought after by a wide variety of clients and other consulting firms. His practical approach and comprehensive knowledge of the ASTM standards result in ESAs that are accurate, comprehensive, and address environmental issues with a common-sense approach.

Mr. Kochanowski's environmental portfolio also includes experience conducting a variety of additional services that include soil, groundwater, and soil vapor testing, modeling, landfill leachate testing, indoor air sampling, and conducting human health risk assessments. He has managed several large IDT contracts for the European District Corps of Engineers, working at over twenty bases in Germany and Spain. Projects included remediation design, soil and groundwater sampling, landfill leachate testing, asbestos surveys, air monitoring, and radon testing.

For as long as Mr. Kochanowski has been writing ESAs he has also been performing asbestos testing and consulting. He is a California Certified Asbestos Consultant and is NIOSH 582 Certified to analyze Polarized Light Microscopy (PLM) samples. Mr. Kochanowski performs asbestos surveys, develops removal specifications and drawings, writes Operations and Management (O&M) Plans, and conducts contractor observation and air monitoring during abatement projects. His asbestos experience includes schools, nuclear facilities, universities, airports, hospitals, military bases, shopping malls, high-rise office buildings, industrial complexes, port facilities, apartments and single-family homes. Mr. Kochanowski was the Manager and Facility Security Officer (FSO) for a high-profile asbestos survey, air monitoring and abatement project of the White House, Washington D.C. His AHERA survey experience includes inspecting over eight million square feet of building space for school districts in California, Kansas, New Mexico and Tennessee.

Mr. Kochanowski has teaching experience including conducting OSHA 1910.120 HAZWOPR, Confined Space Entry, and asbestos awareness classes.

He has served as Secretary on the Board of Directors and was a founding father for the SoCal ACHMM chapter. In the past, he has served on the technical committee for a Local Emergency Planning Commission (LEPC) and was elected Secretary on the Board of Directors for the Rhine-Main Post of the Society of American Military Engineers (SAME).

Jorge Castillo - Analyst

Kwin Sheena Legaspi - Lab Manager - Approved By

Bulk sample(s) submitted was (were) analyzed in accordance with the procedure outlined in the US Federal Register 40 CFR Appendix E to Subpart E of Part 763; EPA-600/R-93/116 (Method for Determination of Asbestos in Building Materials), and EPA-600/M4-82-020 (US EPA Interim Method for the Determination of Asbestos in Bulk Insulation Samples). Samples were analyzed using Calibrated Visual Estimations (CVES); therefore, results may not be reliable for samples of low asbestos concentration levels. Samples of wall systems containing discrete and separable layers are analyzed separately and reported as composite unless specifically requested by the customer to report analytical results for individual layers. This report applies only to the items tested. Results are representative of the samples submitted and may not represent the entire material from which the samples were collected. "None Detected" means that no asbestos was observed in the sample. "<1%" (less than one percent) or Trace means that asbestos was observed in the sample but the concentration is below the quantifiable level of 1%. This report was issued by a NIST/NVLAP (Lab Code 200358-0) and CA Water Board ELAP (Cert. No. 2540) accredited laboratory and may not be reproduced, except in full without the expressed written consent of Patriot Environmental Laboratory Services, Inc. This report may not be used to claim product certification, approval or endorsement by NIST, NVLAP, CA-ELAP or any government agency.

Bulk sample(s) submitted was (were) analyzed in accordance with the procedure outlined in the US Federal Register 40 CFR Appendix E to Subpart E of Part 763; EPA-600/R-93/116 (Method for Determination of Asbestos in Building Materials), and EPA-600/M4-82-020 (US EPA Interim Method for the Determination of Asbestos in Bulk Insulation Samples). Samples were analyzed using Calibrated Visual Estimations (CVES); therefore, results may not be reliable for samples of low asbestos concentration levels. Samples of wall systems containing discrete and separable layers are analyzed separately and reported as composite unless specifically requested by the customer to report analytical results for individual layers. This report applies only to the items tested. Results are representative of the samples submitted and may not represent the entire material from which the samples were collected. "None Detected" means that no asbestos was observed in the sample. "<1%" (less than one percent) or Trace means that asbestos was observed in the sample but the concentration is below the quantifiable level of 1%. This report was issued by a NIST/NVLAP (Lab Code 200358-0) and CA Water Board ELAP (Cert. No. 2540) accredited laboratory and may not be reproduced, except in full without the expressed written consent of Patriot Environmental Laboratory Services, Inc. This report may not be used to claim product certification, approval or endorsement by NIST, NVLAP, CA-ELAP or any government agency.

- APPENDIX D Photographs**

1.0 SUMMARY

At the request of the City of Goleta, All Phase Environmental, Inc. (APEI) performed a survey for lead-based paint (LBP) of the industrial building located at 27 South La Patera Lane, Goleta, California 93117, hereinafter referred to as the "Building." Dr. Zainul Abedin, an accredited lead inspector, conducted the testing on November 16, 2023, using a RMD XRF instrument under EPA guidelines for a lead inspection.

As defined in U.S. Department of Housing and Urban Development (HUD) regulation 24 CFR 965.706@ (53FR 20803, June 6, 1988), the action level is a lead concentration at or above 0.7 mg/cm² measured by the XRF instrument in Santa Barbara County. The XRF instrument displays the lead concentration in mg/cm² when its scanner was opened against the paint surfaces by pressing the shutter. Shot number, sample location, component, substrate, condition, and test results are recorded for each XRF sample taken.

In general, the interior building components and paint surfaces observed during the inspection showed no deterioration, missing components, or moisture damage. All interior and exterior doors, windows, closets, cabinets, walls, and other miscellaneous components had intact paint surfaces.

Based on XRF measurements, lead-based paint above the regulatory action level was not detected on painted interior walls, doors and windows and other components in the office rooms and warehouse, and in all exterior paint components.

Based on XRF measurements, lead-based paint above the regulatory action level was detected only in the interior ceramic wall trim in the men's and women's bathrooms in the office area. There was approximately 120 square feet of this material. Appendix C contains a drawing of the location of this material and Appendix D contains photographs of the material.

2.0 BUILDING DESCRIPTION

At the time of the asbestos survey on October 17, 2023, the subject property was developed with an office and warehouse building. The building was constructed in approximately 1967 and was approximately 30,000 square feet. The building has undergone several renovations since its original construction. The building is a one-story structure with a small mezzanine office and storage space in the northwest corner of the building. The building was subdivided into offices, bathrooms, common areas, meeting rooms, open office spaces, storage rooms, break room, and a large open warehouse area with a smaller warehouse area on the north end. Finishing materials included: drywall, drop-ceiling tiles, finished concrete slab, floor tile, linoleum, and carpeting. The building consisted of a steel frame structure with corrugated sheet metal walls and roof. Gas and electrical HVAC units provided heating and cooling to the office areas of the building.

3.0 LEAD CONTAINING XRF RESULTS

The LBP survey was performed in preparation for the demolition of the Building. Dr. Zainul Abedin, an accredited lead inspector, conducted the testing on November 16, 2023, using a RMD XRF instrument under EPA guidelines for a lead inspection.

As defined in U.S. Department of Housing and Urban Development (HUD) regulation 24 CFR 965.706@ (53FR 20803, June 6, 1988), the action level is a lead concentration at or above 0.7 mg/cm² measured by the XRF instrument in Santa Barbara County. The XRF instrument displays the lead concentration in mg/cm² when its scanner was opened against the paint surfaces by pressing the shutter. Shot number, sample location, component, substrate, condition, and test results are recorded for each XRF sample taken.

Lead-based paint above the regulatory action level was detected only in the interior ceramic wall trim in the men's and women's bathrooms in the office area. There is approximately 120 square feet of this material. Appendix C contains a drawing of the location of this material and Appendix D contains photographs of the material. The following lists detail the XRF readings that were identified as lead containing. Appendix B contains the complete list of all XRF results both positive and negative.

LEAD CONTAINING XRF RESULTS

Shot	Location	Component	Substrate	Condition	Results mg/cm²
120	North	Wall Trim	Ceramic Tiles	Intact	>9.9
124	East	Wall Trim	Ceramic Tiles	Intact	>9.9
131	South	Wall Trim	Ceramic Tiles	Intact	>9.9
147	South	Wall Trim	Ceramic Tiles	Intact	>9.9
152	West	Wall Trim	Ceramic Tiles	Intact	>9.9

4.0 SUMMARY AND RECOMMENDATIONS

We recommend the following actions at the Building based on our findings and observation.

- The only identified lead based paint component was the lead-laden ceramic wall trim in the office area men's and women's bathrooms. There was approximately 120 square feet of this material on several of the walls in these rooms.
- The lead-laden ceramic wall trim in bathrooms were non-friction surfaces and warrant no immediate removal in its current intact condition. Occupants should be advised of the presence of lead in this material. This component should be removed by a California licensed lead abatement contractor prior to the planned demolition of the Building. It is advised that the removal of the lead-laden ceramic tile be added to the scope of work for the asbestos abatement since most contractors who remove asbestos also remove lead-based paint components.

- Until the lead-laden ceramic wall trim is removed, it is advised that it be maintained in good condition. Never sand, dry scrape, power wash, or sandblast any painted surfaces unless they have been tested and have no lead. Lead dust from the paint can spread and poison your family, workers, and neighbors. In the human body, low levels of lead damage the brain and nerves in fetuses and young children, resulting in learning deficits and lower IQ.
- Because of the scattered testing protocol and the consistent and definable nature of the results, untested components are assumed to follow the same pattern.

APEI believed that all areas had been assessed. However, it is possible that there had been hidden inaccessible areas that were not accessed. The conclusions and recommendations describe only the conditions present at the time of our survey in areas that were observed. This survey was performed following the standards of care and diligence usually practiced by recognized consulting firms in performing services of a similar nature.

5.0 ENVIRONMENTAL PROFESSIONALS' SIGNATURES

The undersigned certifies that the professional services have been conducted, our findings obtained, and our recommendations have been prepared in accordance with customary principles and practices in the field of environmental science and engineering. APEI has acted in good faith and has no relationship with sellers, buyers or agents of the subject property. There have been no conflicts of interest involved in the drawing of conclusions, which have been based solely on materials reviewed and visual inspections conducted by APEI.

6.0 QUALIFICATIONS OF ENVIRONMENTAL PROFESSIONALS

Mr. Zainul Abedin
Senior Project Manager

Summary

Mr. Abedin is a California Department of Public Health (CDPH) certified Lead Inspector/Assessor who will be performing the lead-based paint inspection. He is proficient and licensed to use an X-ray fluorescence (XRF) detector which will be used to perform the lead-based paint survey for the City.

Education

Ph.D. Civil Engineering, Kensington University, Glendale, CA. 1993
M.S. Environmental Engineering, Washington State University, Pullman, WA. 1988
M.Sc. Water Resources, University of Alberta, Edmonton, Canada, 1980
M.Eng. Civil, Memorial University of Newfoundland, St. John, Nfld., Canada, 1978
B.Eng. Ag. Engineering, Punjab Agricultural University, Ludhiana, India, 1976

Specific Qualification For This Project

Mr. Abedin is a 40 plus years veteran in the environmental site assessment & remediation business with an emphasis on lead-based paint inspections. He also has extensive experience with lead management monitoring, and remediation.

Current Certifications and Registrations

California Department of Public Health (CDPH) certified Lead Project Manager, Inspector/Assessor, and Supervisor.

Work Experience

Mr. Abedin has provided lead-based testing throughout California at hundreds of locations including shopping plazas, residences, industrial sites, and office buildings.

Doug Kochanowski
Environmental Professional, Senior Environmental Scientist, and Biologist
CHMM (#9970), CAC (#99-2699)

Professional Experience:

Mr. Kochanowski has been performing Phase I Environmental Site Assessments (ESAs) since 1988 and is considered an industry expert. The environmental consulting profession was in its infancy when he performed his first ESA. Over the past three decades, Mr. Kochanowski has performed ESAs on almost every type of real property in over ten different states and in Europe. This includes military bases, medical facilities, high-rise office buildings, learning institutions, factories, shopping malls and plazas, gasoline stations, industrial parks, manufacturing facilities, vacant land, agricultural land, housing tracts, multifamily developments, and government facilities. His wide array of experience has made him a key component for conducting complex ESAs and his expertise is sought after by a wide variety of clients and other consulting firms. His practical approach and comprehensive knowledge of the ASTM standards result in ESAs that are accurate, comprehensive, and address environmental issues with a common-sense approach.

Mr. Kochanowski's environmental portfolio also includes experience conducting a variety of additional services that include soil, groundwater, and soil vapor testing, modeling, landfill leachate testing, indoor air sampling, lead-based paint sampling, and conducting human health risk assessments. He has managed several large IDT contracts for the European District Corps of Engineers, working at over twenty bases in Germany and Spain. Projects included remediation design, soil and groundwater sampling, landfill leachate testing, asbestos surveys, air monitoring, and radon testing.

For as long as Mr. Kochanowski has been writing ESAs he has also been performing asbestos testing and consulting. He is a California Certified Asbestos Consultant and is NIOSH 582 Certified to analyze Polarized Light Microscopy (PLM) samples. Mr. Kochanowski performs asbestos surveys, develops removal specifications and drawings, writes Operations and Management (O&M) Plans, and conducts contractor observation and air monitoring during abatement projects. His asbestos experience includes schools, nuclear facilities, universities, airports, hospitals, military bases, shopping malls, high-rise office buildings, industrial complexes, port facilities, apartments and single-family homes. Mr. Kochanowski was the Manager and Facility Security Officer (FSO) for a high-profile asbestos survey, air monitoring and abatement project of the White House, Washington D.C. His AHERA survey experience includes inspecting over eight million square feet of building space for school districts in California, Kansas, New Mexico and Tennessee.

Mr. Kochanowski has teaching experience including conducting OSHA 1910.120 HAZWOPR, Confined Space Entry, and asbestos awareness classes.

He has served as Secretary on the Board of Directors and was a founding father for the SoCal ACHMM chapter. In the past, he has served on the technical committee for a Local Emergency Planning Commission (LEPC) and was elected Secretary on the Board of Directors for the Rhine-Main Post of the Society of American Military Engineers (SAME).

Education:

Bachelor of Science, Biology, San Diego State University, 1987.
Continuing Education; Strategies for Conducting Meaningful Microbial IAQ Investigations/American Indoor Air Quality Council

Registrations and Certifications:

CHMM, Master Level; Secretary of the SoCal ACHMM Chapter
California Certified Asbestos Consultant (#09-2699)
NIOSH 582 Accredited Sampling and Evaluation Airborne Asbestos
Certified, OSHA 40Hr Trained 1910.120/Site Supervisor
Certified TRGS 519 Under German Hazardous Materials Regulations
ASHERA Certified Asbestos Inspector, Management Planner, Designer, and Abatement Supervisor
Certified Radiation Worker
Confined Space Entry Certified

STATE OF CALIFORNIA
DEPARTMENT OF PUBLIC HEALTH

LEAD-RELATED CONSTRUCTION CERTIFICATE

INDIVIDUAL:

Zainul Abedin

CERTIFICATE TYPE:

- Lead Project Monitor
- Lead Inspector/Assessor
- Lead Supervisor

NUMBER:

- LRC-00004480
- LRC-00004479
- LRC-00004478

EXPIRATION DATE:

- 12/15/2023
- 12/15/2023
- 12/15/2023

Disclaimer: This document alone should not be relied upon to confirm certification status. Compare the individual's photo and name to another valid form of government issued photo identification. Verify the individual's certification status by searching for Lead-Related Construction Professionals at www.cdph.ca.gov/programs/clppb or calling (800) 597-LEAD

Executive Summary

This document is an Environmental Impact Report (EIR) analyzing the environmental effects of the proposed Goleta Train Depot Project (proposed project). This section summarizes the characteristics of the proposed project, alternatives to the proposed project, and the environmental impacts and mitigation measures associated with the proposed project.

Project Description

This EIR has been prepared to examine the potential environmental effects of the Goleta Train Depot Project. The following is a summary of the full project description, which can be found in Section 2.0, *Project Description*.

The proposed project is located within Santa Barbara County, California, in the City of Goleta. The site is addressed as 27 South La Patera Lane, which is located at the northern terminus of the cul-de-sac, adjacent to the existing Goleta Rail Station. The project site is approximately a 2.5-acre, relatively flat, and rectangular lot. The site is currently developed with a 39,800 square-foot vacant warehouse structure, with an associated parking lot, outdoor storage area, and vehicle yard. The project site is currently zoned for light industrial and business park uses. The existing setting and surrounding land uses include the Goleta Rail Station, as well as the Union Pacific Railroad and US Route 101, which are both located to the north of the project site.

Project Characteristics

The proposed project would demolish and remove the existing industrial warehouse structure in order to develop a new Goleta Train Depot (Depot) on the City-owned property adjacent to the existing Goleta Rail Station. New pedestrian connections would be provided to the Goleta Rail Station's existing platform and platform canopy. No improvements to the existing platform or platform canopy are proposed as part of this project as they are both located on Union Pacific Railroad owned property.

After demolition, a new Goleta Train Depot building and required associated amenities for the Depot would be constructed. The proposed Depot structure would be approximately 9,000 square

feet in size and would provide a permanent, enclosed, and safe structure for Amtrak passengers to use as they wait to board or after they disembark from trains. The architecture of the structure would be a traditional depot design with modern elements. The structure would have large windows and columns to support a roof overhang to create protected outdoor areas around the building.

The proposed project would also include a number of on-site amenities that are intended to increase train ridership and improve upon the overall enjoyment and convenience of rail travel. These amenities include a lobby, vending machines, a café and kitchen area for riders to purchase beverages and food, restroom facilities, multiple indoor waiting areas, a meeting room, an on-site ticketing area, as well as adequate luggage and storage space for the public to use. In addition to amenities located inside the proposed Depot building, the project would also provide adequate vehicle parking within an adjacent surface parking lot. Historical displays both inside and outside of the proposed Depot building would provide riders and visitors with a chance to learn more about the railroad history of Goleta and the South Coast area

Parking and Site Access

Access to the site would be reconfigured from its existing single two-way ingress/egress located at the southeast corner of the project site to two one-way entrance and exit driveways located off South La Patera Lane at the northeastern and southeastern corners of the site. The driveways would also be connected by an internal, U-shaped accessway, which would be located to the south of the proposed Depot building. An additional turnaround would be located at the entry of the site and would be designed to allow buses and shuttles to provide easy drop-off and pick-up passengers. Approximately 111 parking spaces would be provided for passengers to leave their vehicles for various lengths of time. Additionally, electric vehicle charging stations would be provided on site, pursuant to Chapter 17.38 of the Goleta Municipal Code.

Off-Site Improvements

Project implementation proposes to include incorporating several existing off-site activities and improvements. These include use of an existing turnaround located at the northern terminus of S. La Patera Lane, which serves as the stopping point and turnaround for Santa Barbara Metropolitan Transit District (MTD) and Amtrak buses accessing the existing Goleta Rail Station. The project proposes to relocate the existing turnaround southward in order to move the portion of the existing turnaround that is partially located within UPRR right-of-way. The relocated turnaround would also allow space for new amenities and services for passengers on the east side of the Train Depot. A new bus stop would also be located at the turnaround area, which would provide an additional stop for the Santa Barbara Metropolitan Transit District (MTD) peak hour and bus services and future expanded shuttle services.

Construction and Grading

Construction of the proposed project is expected to occur over approximately 24 months and would occur in the following five phases:

1. The first phase of construction would involve demolition and removal of all debris and waste materials associated with the existing 39,800 square foot warehouse structure;
2. The second phase would include initial site preparation to remove any remnant concrete foundations and any remaining miscellaneous debris and vegetation within the development area to prepare for rough grading of the site;

3. The third phase would include rough grading to prepare it for construction activities;
4. The fourth phase would involve construction and painting of the new Depot, as well as any associated finish grading around the site; and
5. The fifth phase would involve paving and striping of the parking lot and ingress/egress areas, as well as the installation of site landscaping, lighting, and signage.

Green Building Features

The project would be constructed to California Building Code (CBC) Title 24, which requires implementation of energy-efficient light fixtures and building materials, newly constructed buildings to meet energy performance standards, and the installation of low-flow water features. Electric vehicle charging stations would be provided on site, pursuant to Chapter 17.38 of the Goleta Municipal Code. Bicycle locks and on-site bicycle storage facilities would also be provided to support alternative modes of transportation. Also, approximately half of the roof would contain solar panels to capture solar energy. In addition, City Resolution No. 12-65 states, “all new building construction for City owned and operated buildings of 2,000 square feet or greater of conditioned space must achieve the United States Green Building Council's (USGBC) Leadership in Energy and Environmental Design (LEED) rating system Silver certification,” unless the project meets certain exceptions. The proposed Depot would be designed and constructed consistent with City Resolution No. 12-65.

Project Objectives

- Construct a full-service, multi-modal train depot that provides high-demand, modern, user-friendly amenities for train riders.
- Develop civic pride and identity through a traditional depot design and community education at the Depot.
- Increase train ridership along the Pacific Surfliner train corridor, especially during peak rail service, to help implement State and regional transit plans.
- Reduce regional greenhouse gas emissions from transportation sources by improving transit use and reducing vehicle miles travelled by single-occupancy vehicles.
- Improve overall connectivity with the local transit system and the Depot to connect passengers with their destinations and create a regional transit hub.

Alternatives

As required by the California Environmental Quality Act (CEQA), this EIR examines alternatives to the proposed project. Studied alternatives include the following two alternatives. Based on the alternatives analysis, Alternative 2 was determined to be the environmentally superior alternative.

- Alternative 1: No Project/Existing Warehouse
- Alternative 2: Reduced Depot Footprint and On-Site Amenities

Alternative 1 (No Project/Existing Warehouse) assumes that the proposed depot building with indoor waiting areas, café, and restroom facilities, parking lot area, and City and Amtrak signage are not constructed. Current uses on the project site consist of a mostly vacant warehouse structure, with only a portion occupied by a local food bank, a parking lot, and an outdoor storage area. The existing site and uses would remain under this alternative. However, the No Project Alternative would not fulfill any Project Objectives because the existing warehouse would not provide a train

depot to improve train ridership or City identity, improve transit connectivity, or reduce greenhouse gas emissions.

Alternative 2 (Reduced Depot Footprint and On-Site Amenities) would involve demolition of the existing warehouse to develop the site with a train depot which would support the adjacent Amtrak passenger train platform. However, the depot under this alternative would be reduced in size to approximately 2,000 square feet and would not include a café or kitchen area, meeting room, or formal lobby. The alternative would still provide on-site parking, passenger drop-off areas, bicycle parking, and landscaping. Alternative 2 would meet most of the project objective, except for providing a full-service train depot since the amenities on site would be reduced and limited under this alternative.

Refer to Section 6.0, *Alternatives*, for the complete alternatives analysis.

Areas of Known Controversy

The EIR scoping process did not identify any areas of known controversy for the proposed project. Responses to the Notice of Preparation of a Draft EIR and input received at the EIR scoping meeting held by the City are summarized in Table 1-1 in Section 1.0, *Introduction*.

Issues to be Resolved

The proposed project would require a demolition and building permit. The project is recommended for Advisory Review, but not required to be reviewed by the Design Review Board and Public Trees Committee for recommendations. In addition, City Council approval would be required.

Issues Not Studied in Detail in the EIR

Table 1-2 in Section 1 summarizes issues from the environmental checklist that were addressed in the Initial Study (Appendix A).

Summary of Impacts and Mitigation Measures

Table ES-1 summarizes the environmental impacts of the proposed project, proposed mitigation measures, and residual impacts (the impact after application of mitigation, if required). Impacts are categorized as follows:

- **Significant and Unavoidable.** An impact that cannot be reduced to below the threshold level given reasonably available and feasible mitigation measures. Such an impact requires a Statement of Overriding Considerations to be issued if the project is approved per §15093 of the CEQA Guidelines.
- **Less than Significant with Mitigation Incorporated.** An impact that can be reduced to below the threshold level given reasonably available and feasible mitigation measures. Such an impact requires findings under §15091 of the CEQA Guidelines.
- **Less than Significant.** An impact that may be adverse but does not exceed the threshold levels and does not require mitigation measures. However, mitigation measures that could further lessen the environmental effect may be suggested if readily available and easily achievable.
- **No Impact:** The proposed project would have no effect on environmental conditions or would reduce existing environmental problems or hazards.

Table ES-1 Summary of Environmental Impacts, Mitigation Measures, and Residual Impacts

Impact	Mitigation Measure (s)	Residual Impact
Air Quality		
Impact AQ-1. The project would not directly or indirectly increase growth in the area and would help meet VMT reduction and transportation control measures set forth in SBAPCD's 2019 Ozone Plan. There would be no impacts.	None required	Less than significant
Impact AQ-2. Construction and operational emissions would not exceed SBAPCD's thresholds and would comply with all of SBAPCD's required emissions reduction measures. This impact would be less than significant.	None required	Less than significant
Impact AQ-3. The project does not include any sensitive uses and would not result in the emissions of TACs or other air contaminants during construction or operation which would significantly impact sensitive receptors. Impacts would be less than significant.	None required	Less than significant
Impact AQ-4. The project does not contain uses that would generate significant odor impacts. This impact would be less than significant.	None required	Less than significant
Biological Resources		
Impact BIO-1 (Initial Study). The existing warehouse building on the project site may provide suitable roosting locations for three species of bats, all CDFW Species of Special Concern. Also, the project site provides habitat for nesting birds.	BIO-1a Special-status Bat Species Avoidance and Minimization. To avoid disturbance of maternal bat roosts, demolition of the warehouse building and any other structures that may support roosting bats shall be conducted outside of the bat breeding season (typically April 1 through August 31), if feasible. If work must begin during the bat breeding season, a qualified biologist shall conduct presence/absence surveys for bats where suitable roosting habitat is present no more than 30 days prior to initiation of project activities. Surveys shall be conducted using acoustic detectors and by visually searching ledges, crevices, and overhangs in the warehouse and any other locations in the study area where bats may roost. If a maternal roost is detected, project activity shall cease. CDFW shall be consulted to determine if protective buffers may be established surrounding the roost, allowing project activities to resume in other parts of the project site. Demolition of a structure supporting a maternal roost shall not occur until the young have left the site. If a non-breeding roost is detected, CDFW shall be consulted to determine if the bats can be safely evicted.	Less than significant

Impact	Mitigation Measure (s)	Residual Impact
	<p>If no roosting bats are observed during pre-construction surveys, no further actions would be necessary.</p> <p>BIO-1b Preconstruction Nesting Bird Surveys. To avoid disturbance of nesting and special-status birds, including raptor species protected by the MBTA and CFGC, project activities including vegetation removal, ground disturbance, construction, and demolition shall occur outside of the bird breeding season (February 1 through August 31), if feasible.</p> <p>If work must begin during the breeding season, a pre-construction nesting bird survey shall be conducted no more than seven days prior to initiation of project activities. The nesting bird survey shall be conducted inside the project footprint plus a 500-foot for raptors and special-status species and a 300-foot buffer for all other birds. Inaccessible parts of the survey area shall be scanned using binoculars to ensure 100 percent visual coverage. The survey shall be conducted by a biologist familiar with the identification of bird species known to occur in southern California communities.</p> <p>If active nests (those containing eggs, nestlings, or associated with dependent fledglings) are found on-site, an avoidance buffer shall be implemented around each nest and demarcated with fencing or flagging. The size of the buffers shall be determined by the biologist based upon the species, the proposed work activity, and existing disturbances associated with land uses outside of the site. No project activity shall occur inside a nest buffer until the biologist determines that the nest is no longer active.</p> <p>If no nesting birds are observed during pre-construction surveys, no further actions would be necessary.</p>	
Cultural Resources		
<p>Impact CR-1 (Initial Study). The area is considered sensitive for archaeological resources, and unanticipated discoveries of archaeological resources during construction activities would be potentially significant.</p>	<p>CR-1 Unanticipated Discovery of Cultural Resources. If cultural resources are encountered during ground-disturbing activities, work in the immediate area must halt and an archaeologist meeting the Secretary of the Interior’s Professional Qualifications Standards for archaeology (National Park Service 1983) should be contacted immediately to evaluate the find. If the discovery proves to be eligible for listing on the California Register of Historical Resources, additional work may be warranted, such as data recovery excavation, Native American consultation, and archaeological monitoring to treat the find.</p>	<p>Less than significant</p>
Geology and Soils		
<p>Impact GEO-1 (Initial Study). Unanticipated fossil discoveries during any ground-disturbing activities associated with the project remain a possibility and impacts to any such resources would be potentially significant.</p>	<p>GEO-1 Unanticipated Discovery of Paleontological Resources. In the event an unanticipated fossil discovery is made during construction, in accordance with SVP (2010) guidelines, construction shall stop within 50 feet of the find or be redirected to another area of the site and a qualified professional paleontologist shall be retained to evaluate the discovery, determine its significance and if additional mitigation or treatment is warranted. Work in the area of the find will resume once the find is properly documented and authorization is given to resume</p>	<p>Less than significant</p>

Impact	Mitigation Measure (s)	Residual Impact
	<p>construction work by the qualified paleontologist in coordination with the City. Any significant paleontological resources found during construction monitoring will be prepared, identified, analyzed, and permanently curated in an approved regional museum repository (e.g., UCMP).</p>	
Greenhouse Gas Emissions		
<p>Impact GHG-1. The project’s construction and operational GHG emissions would not exceed established GHG thresholds. In addition, the project would indirectly reduce regional GHG emissions and vehicle miles traveled. Impact would be less than significant.</p>	<p>None required</p>	<p>Less than significant</p>
<p>Impact GHG-2. The proposed project would not conflict with applicable policies or plans and impacts would be less than significant.</p>	<p>None required</p>	<p>Less than significant</p>
Hazards and Hazardous Materials		
<p>Impact HAZ-1. The project is located on a site previously used for agricultural and industrial purposes and is located adjacent to active railroad tracks. The site contains hazardous materials that may be exposed during construction activities. With adherence to mitigation measures HAZ-1 and HAZ-2, impacts would be reduced to less than significant.</p>	<p>HAZ-1 Assessment Removal, and Remediation. Prior to demolition or onsite grading/site disturbance or improvements, a soil, soil vapor, and/or groundwater sampling assessment shall be completed to identify and/or define hazardous material impacts in the areas of concern. The areas of concern and associated chemicals of concern include:</p> <ul style="list-style-type: none"> ▪ Former agricultural use of the subject property – pesticides and arsenic; ▪ Adjacent presence of railroad tracks along the northern site boundary which transport and produce pesticides, heavy metals, petroleum hydrocarbons, herbicides, and SVOCs (including creosote, naphthalene); ▪ Former and current USTs/AST onsite - historic 6,000-gallon UST, existing 1,800-gallon diesel UST, and existing 3,000-gallon AST with secondary containment and associated drum that is utilized to store emergency overflow used oil onsite - heavy metals, petroleum hydrocarbons, and VOCs; and ▪ Former use of a bus ‘service shop’ that includes underground sumps, trench drains and possibly other features - heavy metals, petroleum hydrocarbons, and VOCs. <p>A geophysical survey shall be conducted to locate the historical UST prior to sampling. The sampling assessment shall be performed under the supervision of a professional geologist or other qualified environmental professional. The analytical results shall be compared to the most current applicable environmental screening levels, as recommended by Santa Barbara County Environmental Health – Hazardous Materials Unit.</p> <p>A Soil Management Plan (SMP) shall be prepared and followed by the demolition/grading contractor. The SMP will identify procedures to address the current onsite</p>	<p>Less than significant</p>

Impact	Mitigation Measure (s)	Residual Impact
	<p>features and unidentified features (USTs, clarifiers, sumps or other underground features) that are uncovered during the redevelopment of the site. If the sampling assessment analytical results are greater than the environmental screening levels, the Santa Barbara County Environmental Health – Hazardous Materials Unit shall be contacted to review and oversee the SMP and any additional assessments, site remediation, and/or health risk assessments that are deemed necessary. The onsite USTs, AST, drum, trench drains, and sumps shall be removed in accordance with local permits and guidelines as identified and required by Santa Barbara County Environmental Health – Hazardous Materials Unit.</p> <p>All necessary reports, regulations and permits shall be followed to achieve remediation of the site. The contaminated materials shall be remediated under the supervision of an environmental consultant licensed to oversee such remediation and under the direction of the lead oversight agency. The remediation program shall also be approved by a regulatory oversight agency, such as the Santa Barbara County Environmental Health – Hazardous Materials Unit. Alternatively, the Hazardous Materials Unit may determine that RWQCB or DTSC should be the lead agency for remediation oversight.</p> <p>All proper waste handling and disposal procedures shall be followed. Upon completion of the remediation, the environmental professional shall prepare a report summarizing the project, the remediation approach implemented, and the analytical results after completion of the remediation (including all waste disposal or treatment manifests) and site closure by the lead agency will be obtained.</p> <p>HAZ-2 Hazardous Building Material Survey and Demolition Plan. A hazardous building material survey shall be conducted prior to demolition or removal of any onsite structures. If any ACM, LBP, or PCBs are identified, the materials shall be removed in accordance with California and Federal OSHA as well as other state and federal regulations by licensed abatement contractors. All ACM, LBP, and PCB materials removed from the site shall be hauled and disposed of by a transportation company certified to handle these materials.</p>	
Noise		
<p>Impact NOI-1. Short-term construction of the project would temporarily increase local noise levels. The anticipated increase in construction noise would be less than significant to nearby sensitive receivers.</p>	<p>None required</p>	<p>Less than significant</p>

Impact	Mitigation Measure (s)	Residual Impact
Impact NOI-2. The project would include stationary sources that would increase noise levels. However, Noise levels generated by the project would not exceed 60 dba at the nearest property line. Impacts would be less than significant	None required	Less than significant
Impact NOI-3. The project would generate new vehicle trips that would increase noise levels on nearby roadways. However, ambient noise would not exceed the conditional noise levels for the site or affected receptors, and project-related changes in noise levels would not exceed 5 dba. Impacts would be less than significant	None required	Less than significant
Impact NOI-4. The project would result in groundborne vibration in the project area vicinity, during the construction phase. Vibration levels during project construction would not cause damage to nearby structures or substantially impact residents in nearby dwellings. This impact would be less than significant.	None required	Less than significant
Transportation and Traffic		
Impact T-1. The project would develop a new Train Depot, a primary objective of which is to reduce regional vehicle miles traveled (VMT). Impacts would be less than significant.	None required	Less than significant
Impact T-2. Construction or operation of the project would not result in a significant increase in transportation hazards in the area or on the project site. Impacts would be less than significant	None required	Less than significant
Impact T-3. Implementation of the project would not result in inadequate emergency access. This impact would be less than significant	None required	Less than significant
Tribal Cultural Resources		
Impact TCR-1. Grading and other ground-disturbing activities on the project site could result in impacts to previously unidentified tribal cultural resources. Therefore, this impact would be significant but mitigable.	TCR-1 Archaeological and Native American Monitoring. Prior to the issuance of a Grading Permit, or ground-disturbing activities, the developer shall obtain a qualified archaeological and Native American monitor for the ground disturbing activities of the project. Archaeological monitoring should be performed under the direction of the qualified archaeologist, defined as an archaeologist meeting the Secretary of the Interior's Professional Qualifications Standards for archaeology (NPS 1983). The	Less than significant

Impact	Mitigation Measure (s)	Residual Impact
	<p>qualified archaeologist, in consultation with the City of Goleta and the Native American monitor, may recommend the reduction or termination of monitoring depending upon observed conditions (i.e., no resources encountered within the first 50 percent of ground disturbance).</p> <p>TCR-2 Unanticipated Discovery of Tribal Cultural Resources. In the event that cultural resources of Native American origin are identified during construction activity all work shall be halted in the vicinity of the discovery until the significance of the resource can be assessed. The city shall begin or continue Native American consultation procedures, in coordination with a qualified archaeologist, if appropriate. If the city, in consultation with local Native Americans, determines that the resource is a tribal cultural resource and thus significant, a mitigation plan shall be prepared and implemented in accordance with state guidelines and in consultation with local Native American group(s). The mitigation plan may include but would not be limited to capping and avoidance, excavation and removal of the resource, interpretive displays, sensitive area signage, or other mutually agreed upon measure</p>	
Utilities and Service Systems		
<p>Impact U-1. The GWD has adequate supplies and water demand reduction strategies to serve the project and foreseeable development under normal and dry years. The water use from the Depot would not exceed available on-site credits and would comply with the SAFE Water Supplies Ordinance. Impacts on water supplies would be less than significant.</p>	<p>None required</p>	<p>Less than significant</p>

1 Introduction

This document is an Environmental Impact Report (EIR) for a proposed train depot development located at 27 South La Patera Lane, Goleta, California. The proposed Goleta Train Depot Project (hereafter referred to as the “proposed project” or “project”) would be constructed on a site currently occupied by one industrial warehouse structure. The project would involve demolition of the existing warehouse structure and construction of a new train depot building. Other components of the project include a parking lot and a passenger drop-off area, outdoor waiting areas, bike storage, signage, outdoor lighting, and landscaping.

This section discusses (1) the project and EIR background; (2) the legal basis for preparing an EIR; (3) the scope and content of the EIR; (4) issue areas found not to be significant by the Initial Study; (5) the lead, responsible, and trustee agencies; and (6) the environmental review process required under the California Environmental Quality Act (CEQA). The proposed project is described in detail in Section 2.0, *Project Description*.

1.1 Environmental Impact Report Background

Pursuant to *CEQA Guidelines* Section 15060(d), the city initiated the environmental process with the preparation of an Initial Study for the project (using the CEQA Environmental Checklist) to determine if it would have a potentially significant effect on the environment and to determine the preliminary scope of the EIR. The City of Goleta distributed the Initial Study and a Notice of Preparation (NOP) of the EIR for a 30-day agency and public review period starting on May 25, 2020 and ending on June 24, 2020. Due to the COVID-19 stay at home orders and health concerns, the City posted an EIR Scoping Presentation on May 25, 2020 to June 24, 2020. The Presentation was aimed at providing information about the proposed project to members of public agencies, interested stakeholders and residents/community members, and provided opportunities for questions or comments. The NOP and the public comments received are both presented in Appendix B of this EIR. Table 1-1 on the following page summarizes the content of the public comments and where the issues raised are addressed within the EIR.

1.2 Purpose and Legal Authority

The proposed project requires the discretionary approval of the City of Goleta City Council; therefore, the project is subject to the environmental review requirements of CEQA. In accordance with Section 15121 of the *CEQA Guidelines* (California Code of Regulations, Title 14), the purpose of this EIR is to serve as an informational document that:

“will inform public agency decision makers and the public generally of the significant environmental effects of a project, identify possible ways to minimize the significant effects, and describe reasonable alternatives to the project.”

This EIR has been prepared as a project EIR pursuant to Section 15161 of the *CEQA Guidelines*. A Project EIR is appropriate for a specific development project. As stated in the *CEQA Guidelines*:

“This type of EIR should focus primarily on the changes in the environment that would result from the development project. The EIR shall examine all phases of the project, including planning, construction, and operation.”

This EIR is to serve as an informational document for the public and City of Goleta review authorities and decision-makers. The process will include public hearings before City Council to consider certification of a Final EIR and approval of the proposed project.

Table 1-1 NOP Comments and EIR Response

Commenter	Comment/Request	How and Where It Was Addressed
Agency Comments		
Native American Heritage Commission (NAHC)	Acknowledged the receipt of the NOP and recommended applicable tribal consultation under AB 52 or SB 18.	Comment addressed in Section 4.6, <i>Tribal Cultural Resources</i> .
Santa Ynez Band of Chumash Indians	Requested formal notice and information on all projects in which Goleta would be the lead agency under CEQA and requests AB 52 consultation for the proposed project.	Comment addressed in Section 4.6, <i>Tribal Cultural Resources</i> .
California Department of Transportation	Provided a letter of support for the project.	No response required.
California Highway Patrol	Acknowledged receipt of the NOP and stated there would be no impacts to the Santa Barbara area operations.	No response required.
Public Comments		
Frank Arredondo of Ksen' Sku' Mu Chumash	The commenter provides comments on the adequacy of the Cultural Resources Report prepared for the project, which was included as Appendix B to the Initial Study. The commenter requested a survey by an archaeologist, an extended Phase I testing study, reevaluation of the previous research, and updated mitigation measures.	An additional site visit and survey by an archaeologist was conducted on September 10, 2020. Updated mitigation measures were recommended in the Cultural Report and included in Section 4.6, <i>Tribal Cultural Resources</i> . Due to the paved nature of the site and the continued use of the site and adjacent train station, an extended Phase 1 testing survey was not recommended. Mitigation measures were determined to cover concerns over potential resources on site.
	The commenter stated that AB 52 consultation should have begun in January 2019 when the City received a grant from the Santa Barbara County Association of Governments for the development of a new train station.	The Goleta Train Depot Master Plan was adopted in early February 2020 by the Goleta City Council. The Master Plan was developed to implement a multi-modal train depot on the City-own property adjacent to the Amtrak station, and was not considered a project under CEQA. With the adoption of the Master Plan in February 2020, the City moved forward with preparing plans for the proposed project. As discussed in Section 4.6, <i>Tribal Cultural Resources</i> , the City distributed AB 52 consultation letters for the proposed project to seven tribes and tribal representatives listed by NAHC as having interest in the project area in February 2020.

Commenter	Comment/Request	How and Where It Was Addressed
Julie Tumamait-Stenslie	The commenter requested a third-party review of the Cultural Report and monitoring during on-site demolition of the existing warehouse. The commenter also requested the use of native plants and that Barbareno/Ventureno Band of Mission Indians cultural interpretations be included in the project.	Comments on the overall landscaping design and cultural interpretations do not pertain to a CEQA issue but have been received by the City of Goleta. Mitigation measure have been included in Section 4.6, <i>Tribal Cultural Resources</i> .

1.3 Scope and Content

This EIR addresses impacts identified by the Initial Study to be potentially significant. The following specific issue areas were found to include potentially significant impacts and have been further analyzed within this EIR:

- Air Quality
- Greenhouse Gas Emissions
- Hazards and Hazardous Materials
- Noise
- Transportation
- Tribal Cultural Resources
- Utilities and Service Systems

The EIR preparers made use of pertinent City policies, guidelines, zoning regulations, certified EIRs and adopted CEQA documents, and other background documents.

The alternatives section of the EIR (Section 6.0) was prepared in accordance with Section 15126.6 of the *CEQA Guidelines* and focuses on alternatives that are capable of eliminating or reducing adverse effects associated with the project to a level that is less than significant while feasibly attaining most of the basic project objectives. In addition, the alternatives section identifies the “environmentally superior” alternative among all alternatives assessed. The alternatives evaluated include the CEQA-required “No Project” alternative and two alternative development scenarios for the project area.

The level of detail contained throughout this EIR is consistent with the requirements of CEQA. Section 15151 of the *CEQA Guidelines* provides the standard of adequacy on which this document is based. The *CEQA Guidelines* state:

An EIR should be prepared with a sufficient degree of analysis to provide decision-makers with information which enables them to make a decision which intelligently takes account of environmental consequences. An evaluation of the environmental effects of the proposed project need not be exhaustive, but the sufficiency of an EIR is to be reviewed in light of what is reasonably feasible. Disagreement among experts does not make an EIR inadequate, but the EIR should summarize the main points of disagreement among the experts. The courts have looked not for perfection, but for adequacy, completeness, and a good faith effort at full disclosure.

1.4 Issues Not Studied in Detail within the EIR

Table 1-2 summarizes issues from the environmental checklist that were addressed in the Initial Study (Appendix A). As indicated in the Initial Study, there is either no substantial evidence that significant impacts would occur in any of these specific issue areas, or that identified impacts could be mitigated to a level of less than significant through the implementation of mitigation measures. The mitigation measures proposed in the Initial Study are included in the Executive Summary Table ES-1 of this EIR.

Table 1-2 Issues Not Studied in Detail within the EIR

Issue Area	Initial Study Findings
Aesthetics	<p>The project site would not substantially impact scenic views, nor is it located on a State Scenic Highway. The site also lacks scenic resources such as trees, rock outcroppings, and vegetation. Therefore, impacts to scenic vistas would be less than significant.</p> <p>The proposed project would not substantially degrade the existing visual character or quality of the site and its surroundings, nor would it create significant impacts with respect to increased lighting. Impacts to these resources would be less than significant.</p>
Agricultural Resources	<p>The project site is within an urbanized area of Goleta that lacks agricultural lands or forests. Therefore, no impact to these resources would occur.</p>
Biological Resources	<p>The project site has the potential to have three sensitive wildlife species of bats to occur on-site. In addition, construction has the potential to impact protected nesting birds. Implementation of Mitigation Measure BIO-1 and BIO-2, which would require bat species avoidance and minimization measures and pre-construction nesting bird surveys would reduce potential impacts to a level that is less than significant.</p> <p>The project site is within an urbanized area and no sensitive habitats; locally designated; locally designated natural communities; habitat conservation plans; wetland habitats; or wildlife corridors exist on the site. Therefore, no impact would occur to these types of sensitive resources.</p> <p>The project site has limited vegetation and there are no trees on-site that are projected under the Goleta Municipal Code. Therefore, no impacts would occur to protected tree species.</p>
Cultural Resources	<p>The existing warehouse on the project site is not eligible for listing as a historical resource. In addition, the project would not directly or indirectly impact the Daniel Hill Adobe. As such, no protected historical resource would be impacted.</p> <p>Based on positive results of the Sacred Lands File (SLF) search, the ethnographic settlement patterns of the Chumash, and contact from the Santa Ynez Band of Chumash Indians, the area is considered sensitive for archaeological resources. Due to the existing level of ground disturbance and pedestrian survey, there is a low potential for encountering archaeological resources. Implementation of Mitigation Measure CR-1 would reduce any potential impacts to unanticipated discovery of any resources to a level that is less than significant.</p> <p>With adherence to existing required regulations, and the proposed mitigation measure CR-1, the project would have a less than significant impact on disturbing human remains.</p>
Energy	<p>Energy use during construction would be temporary and typical of similar projects, and project construction contractors would demonstrate compliance with applicable CARB regulations. Operational energy use would comply with standards set in California Building Code (CBC) Title 24, which would minimize the wasteful, inefficient, or unnecessary consumption of energy resources. Also, the project would reduce overall fuel energy demand by increasing ridership on passenger trains. Therefore, the project would not create significant impacts to energy use.</p> <p>The project does not conflict with energy reduction policies in the City's General Plan or Climate Action Plan. As such, there would be no impact related to energy policy inconsistencies.</p>

Issue Area	Initial Study Findings
Geology and Soils	<p>The project site is not located in an Alquist-Priolo Earthquake Fault Zone. Furthermore, the project would be subject to compliance with the seismic safety standards of the California Building Code (CBC), which are adopted and incorporated into the Goleta Municipal Code. Therefore, impacts to seismic ground shaking and rupture would be less than significant.</p> <p>Additionally, the project site is not located in an area with landslide risk. The Geotechnical Report concluded lateral spreading of soil due to lurching or liquefaction is relatively low on the project site as a silty-sand layer found below the groundwater level is potentially liquefiable. However, compliance with recommendations in the Geotechnical Report would reduce any potential impacts to less than significant.</p> <p>Compliance with the required NPDES permit and standard “best management practices” (BMPs) mitigation measures during construction, such as straw wattles and silt fencing, would reduce potential geological and soils related impacts resulting from loss of topsoil to a level that is less than significant.</p> <p>The project would not use septic tanks. Therefore, there would not be impacts from their use.</p> <p>Given that the fossiliferous deposits occur at greater depths than anticipate ground disturbance, the potential for encountering fossil resources is low and impacts to paleontological resources are not expected. Although unanticipated fossil discoveries during any ground-disturbing activities associated with the project remain a possibility, Implementation of Mitigation Measure GEO-1 would reduce potential impacts to paleontological resources to a level that is less than significant.</p>
Hazards and Hazardous Materials	<p>The nearest school is La Patera Elementary School, which is located approximately 0.7 mile to the north. Therefore, the project would not handle hazardous materials within 0.25 mile of an existing school and no significant impact would occur.</p> <p>According to the hazardous materials records search results, the project site was not listed in any databases that are indicative of a hazardous materials release. Three adjacent properties were listed in databases searches; but, based on the documents reviewed, the Phase I ESA for the proposed project concluded that the three adjacent sites are not expected to impact the subject property. Therefore, impacts would be less than significant.</p> <p>The project site is located approximately 0.3 mile north of the Santa Barbara Municipal Airport and within the adopted 1993 (ALUP) for the Santa Barbara Municipal Airport. Transit uses, such as the proposed project, are determined to be compatible within the Safety Zone 2/Approach Zone. Additionally, the proposed project would not require a General Plan Amendment and would comply with all applicable ALUP development standards and land use regulations, specifically those related to limiting building height and lot density. Therefore, the project would be considered consistent with the ALUP and the City’s General Plan and would not result in significant impacts related to safety hazards.</p> <p>The proposed project would comply with all existing zoning regulations and all building and safety standards. As such, it would not result in the construction of any new facilities or establishment of new uses that could impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan in the City of Goleta. Therefore, no impacts to hazards or hazardous materials would occur.</p> <p>The project site is located within a 5-minute response time of Fire Station #1411. Additionally, the site is not located near areas designated to have risks to wildland fires. Therefore, there would be no impacts related to wildland fires.</p>
Hydrology and Water Quality	<p>Conformance with National Pollutant Discharge Elimination System (NPDES) Statewide General Construction Activity Stormwater permit, City of Goleta Municipal Code Section 15.09.290, which requires an Erosion and Sediment Control Plan, and implementation of a Stormwater Pollution Prevention Plan (SWPPP) along with project-specific BMPs would ensure that the proposed project does not violate any water quality standards or waste discharge requirements during construction. Additionally, the project would be subject to the Central Coast Regional Water Quality Control Board’s Central Coast Post Construction Requirements and would submit a Stormwater Control Plan to demonstrate adequate stormwater management features and facilities to treat and capture stormwater on-site. Integrating these</p>

Issue Area	Initial Study Findings
	<p>mitigation measures would ensure that the proposed project would not create any significant impacts related to hydrology and water quality.</p> <p>The project would connect to existing Goleta Water District water service and would not involve on-site groundwater extraction. As such, the project would not result in any drawdown of an underlying aquifer. Therefore, potential impacts would be at a level that is less than significant.</p> <p>The project site is not located in a floodway or flood zone and does not contain a river or stream that would be altered and result in flooding on- or off-site. Compliance with NPDES requirements, implementation of a SWPPP, installing on-site BMPs and an Erosion and Sediment Control Plan, and following the Stormwater Control Plan would further ensure that no unintended or significant impacts would occur. As such, the project would not impact erosion or siltation on or off site, the transport of pollutants in runoff, or the stormwater drainage systems. Furthermore, the project would not violate water quality standards or degrade water quality during construction or operation and, therefore, would not interfere with the implementation of the Basin Plan. Therefore, potential impacts would be less than significant.</p>
Land Use and Planning	<p>The project site is surrounded by a mix of office and light industrial development. The project would be located entirely within a parcel that is currently developed by an existing warehouse structure. Therefore, there would be no impacts to land use and planning.</p> <p>The project does not involve any General Plan Amendment or any amendment to an existing Specific Plan. The project site is located within the Business Park (BP) Zoning District, and transportation terminals are an allowed use in the BP zone with the approval of a Major Conditional Use Permit. The proposed land use would not conflict with the Zoning District development standards and the train depot would comply with all applicable site development standards and City regulations, including height, lot coverage, setbacks, parking, lighting, landscaping, and signage, or would request a modification to one or more of those standards. Pursuant to the City’s General Plan, deviations from City development standards are permissible, but would require the approval of a Resolution by the City Council. As proposed, land use and planning impacts would be less than significant.</p>
Mineral Resources	<p>There are no existing or planned surface mining operations within the City. As such, no impact would occur related to protected mineral resources.</p>
Noise	<p>The project is located outside the Noise Exposure Range of the adopted Santa Barbara Airport ALUP. Therefore, noise-related impacts would be at a level that is less than significant.</p>
Population and Housing	<p>The proposed project would serve both local Goleta residents as well as residents throughout the State of California using Amtrak’s Pacific Surfliner rail services. Therefore, the project would not induce a substantial unplanned population growth in the area either directly or indirectly and impacts would be less than significant.</p> <p>The project site is currently occupied by an existing warehouse structure that is partially occupied by the Food Bank of Santa Barbara County and serving as temporary as-needed office space for the City during the COVID-19 pandemic. There are neither existing housing units on the project site nor are there people residing on the project site in any form of temporary housing or shelter. Therefore, the project would not displace any existing housing units or people and no impacts to population and housing would occur.</p>

Issue Area	Initial Study Findings
Public Services	<p>Fire protection services would continue to be provided to the site by Santa Barbara County Fire Department (SBCFD), and police protection services would be provided by the Santa Barbara County Sheriff's Office (SBCSO). The project site is located in an urban area of the City, which is developed with office and light industrial uses, and is currently served by these fire and police services. The new train depot would not exceed the capacity of the SBCFD or SBCSO to provide protective services or result in the need for new or expanded fire or police facilities. Additionally, access to the site would continue to be taken from South La Patera Lane, a public road right-of-way of the City of Goleta. Therefore, potential impacts to public services would be less than significant.</p> <p>The proposed project is for the upgrading of an existing public transportation facility from a simple train stop to a train depot. The project would not involve new housing nor would it result in direct or indirect population growth. As such, the project would not result in additional enrollment of school aged children in either Goleta Union or Santa Barbara Unified School Districts or an increased demand for parks or other public facilities. Therefore, there would be no potentially significant impacts to public services.</p>
Recreation	<p>The proposed project is for the upgrading of an existing public transportation facility from a simple train stop to a train depot. The project would not result in a direct or indirect increase in population growth, would not increase the use of recreational facilities in the City, nor would it require the construction or expansion of recreational facilities. Therefore, there would not be any potentially significant impacts to recreation.</p>
Utilities	<p>The proposed project site is currently served by existing connections to water, wastewater, stormwater, electric, gas, and telecommunication facilities. The project may require minor relocations or improvements of the existing utility connections to serve the project, but these would occur within the footprint of existing on-site development. Therefore, any potential impacts would be at a level that is less than significant.</p> <p>Wastewater from the proposed project would be collected and treated by the Goleta Sanitary District (GSD), which operates the Goleta Wastewater Treatment Plant. The development of a new 9,000 square foot train depot would not increase wastewater production compared to existing conditions, which included a 39,800 square foot warehouse. In addition, there is adequate capacity at the wastewater treatment plant to handle additional flows. Impacts would be less than significant.</p> <p>Solid waste generated by the proposed project as well as throughout the rest of the City is disposed of at the Tajiguas Landfill, which has a maximum permitted capacity of 23.3 million cubic yards and a maximum daily capacity of 1,500 tons per day. Construction waste would comply with CalGreen Construction and Demolition (C&D) Debris Recycling Requirements, which required the diversion of 65 percent of construction waste. According to the City's adopted CEQA Thresholds Manual, a project specific impact threshold is 196 tons of solid waste per year. The operation of the Depot would produce approximately 23 tons of solid waste per year, which is below adopted thresholds of significance. Therefore, potentially significant impacts to solid waste infrastructure would be less than significant.</p> <p>The City is a part of the Santa Barbara Regional Integrated Waste Management Reporting Authority and is meeting its waste disposal requirements under AB 939. The project is a City project and would be required to comply with all applicable solid waste diversion programs and State reduction statutes. Therefore, potential impacts related to solid waste management would be less than significant.</p>
Wildfire	<p>The proposed project site is located within an urbanized area of the City of Goleta and is surrounded by existing urban development, including industrial, commercial, interstate highway, and railway development. The project is not located within a high fire hazard severity zone with the nearest high fire zone being approximately 0.9 miles to the north southwest. Therefore, there would be no potentially significant impact to the risk of wildfire.</p>

1.5 Lead, Responsible, and Trustee Agencies

The *CEQA Guidelines* define lead, responsible and trustee agencies. The City of Goleta is the lead agency for the project because it holds principal responsibility for approving the proposed project.

A responsible agency refers to a public agency other than the lead agency that has discretionary approval over the project. Responsible agencies for the proposed project include the Central Coast Regional Water Quality Control Board (RWQCB), which regulates water quality in the region, the Goleta Water District (GWD), which regulates potable water in the region, and the Goleta Sanitary District (GSD), which regulates sanitary waste disposal. The EIR will also be submitted to these agencies for review and comment.

A trustee agency refers to a State agency having jurisdiction by law over natural resources affected by a project. There are no trustee agencies for the proposed project.

1.6 Environmental Review Process

The environmental review process, as required under CEQA, is summarized below and illustrated in Figure 1-1. The steps are presented in sequential order.

1. **Notice of Preparation (NOP) and Initial Study.** After deciding that an EIR is required, the lead agency (City of Goleta) must file a NOP soliciting input on the EIR scope to the State Clearinghouse, other concerned agencies, and parties previously requesting notice in writing (*CEQA Guidelines* Section 15082; Public Resources Code Section 21092.2). The NOP must also be posted in the County Clerk's office for 30 days. The NOP may be accompanied by an Initial Study that identifies the issue areas for which the project could potentially create significant environmental impacts. The City of Goleta prepared an Initial Study to determine the scope and content of the Draft EIR.
2. **Draft EIR Prepared.** The Draft EIR must contain: a) table of contents or index; b) summary; c) project description; d) environmental setting; e) discussion of significant impacts (direct, indirect, cumulative, growth-inducing and unavoidable impacts); f) a discussion of alternatives; g) mitigation measures; and h) discussion of irreversible changes.
3. **Notice of Completion (NOC).** The lead agency must file a NOC with the State Clearinghouse when it completes a Draft EIR and then prepare a Public Notice of Availability of the Draft EIR. The lead agency must place the NOC in the County Clerk's office for 30 days (Public Resources Code Section 21092) and send a copy of the NOC to any interested party requesting it (*CEQA Guidelines* Section 15087). Additionally, public notice of the availability of the Draft EIR must also be given through at least one of the following procedures: a) publication in a newspaper of general circulation; b) posting on and off the project site; and/or c) direct mailing to both owners and occupants of contiguous properties to the proposed project site. The lead agency must solicit input from other agencies and the public and respond in writing to all comments received (Public Resources Code Sections 21104 and 21253). The public review period for the Draft EIR is 45 days (Public Resources Code 21091).
4. **Final EIR.** A Final EIR must include: a) the Draft EIR; b) copies of comments received during public review; c) a list of persons and entities commenting; and d) responses to comments.
5. **Certification of Final EIR.** Prior to making a decision on a proposed project, the lead agency must certify the following: a) the Final EIR has been completed in compliance with CEQA; b) the Final EIR was presented to the decision-making body of the lead agency; and c) the decision-

making body reviewed and considered the information in the Final EIR prior to approving the project (*CEQA Guidelines* Section 15090).

6. **Lead Agency Project Decision.** The lead agency may a) disapprove the project because of its significant environmental effects; b) require changes to the project to reduce or avoid significant environmental effects; or c) approve the project despite its significant environmental effects, if the proper findings and a statement of overriding considerations are adopted (*CEQA Guidelines* Sections 15042 and 15043).
7. **Findings/Statement of Overriding Considerations.** For each significant impact of the project identified in the EIR, the lead agency must find, based on substantial evidence, that either a) the project has been changed to avoid or substantially reduce the magnitude of the impact; b) changes to the project are within another agency's jurisdiction and such changes have or should be adopted; or c) specific economic, social, or other considerations make the mitigation measures or project alternatives infeasible (*CEQA Guidelines* Section 15091). If a lead agency approves a project with unavoidable significant environmental effects, it must prepare a written Statement of Overriding Considerations that sets forth the specific social, economic, or other reasons supporting the lead agency's decision.
8. **Mitigation Monitoring Reporting Program.** When the lead agency makes findings on significant effects identified in the EIR, it must also adopt a reporting or monitoring program for the mitigation measures that were adopted or made conditions of project approval to mitigate the significant effects.
9. **Notice of Determination (NOD).** The lead agency must file a NOD after deciding to approve a project for which an EIR was prepared (*CEQA Guidelines* Section 15094). A local agency must file the NOD with the County Clerk. The NOD must be posted for 30 days and sent to any interested party previously requesting notice. Posting of the NOD starts a 30-day statute of limitations on CEQA legal challenges (Public Resources Code Section 21167[c]).

2.3 Project Location

The proposed project is located within Santa Barbara County, California, in the City of Goleta. The site is addressed as 27 South La Patera Lane, which is located at the northern terminus of the cul-de-sac, adjacent to the existing Goleta Rail Station. The project site is denoted by Assessor's Parcel Number 073-050-033 and is approximately a 2.5-acre, relatively flat, and rectangular lot. The site is currently developed with a 39,800 square-foot vacant warehouse structure, with an associated parking lot, outdoor storage area, and vehicle yard. The existing warehouse structure covers approximately 50 percent of the overall site and is situated in the middle of the northern side of the project site.

The proposed project site is regionally accessible from U.S. Route 101 (U.S. 101) and locally accessible from Hollister Avenue, which transects the City from east to west. Figure 2-1 shows the regional location of the project, which is located in Santa Barbara County. The project is located near a number of regionally important areas, land uses, and transportation facilities, which include Old Town Goleta, University of California Santa Barbara (UCSB), the Santa Barbara Airport, the Union Pacific Railroad (UPRR), U.S. 101, Goleta Beach, and the existing Goleta Rail Station, as shown in Figure 2-2. Figure 2-3 shows the specific project location and its neighborhood context, which is an urban area surrounded by a roadway to the north and urban structures (office buildings, warehouses, and commercial buildings) on each of the remaining sides.

Fig. 2 Project Location

2.4 Existing Site Characteristics

2.4.1 Current Land Use Designation and Zoning

The project site's land use designation is listed as Business Park (I-BP) according to the City's General Plan/Coastal Land Use Plan (General Plan). The zoning designation of the project site is depicted as an Office District with a Business Park (BP) designation under the City's Title 17 Zoning Ordinance. Uses that are generally permitted in the BP zone include Public/Quasi-Public Uses (e.g., Day Care Facilities, Emergency Shelters, Government Buildings, etc.); Commercial Uses (e.g., Business Services, Information Technology Services, etc.); Industrial Uses (e.g., Limited Industrial, R&D and Technology, etc.); Transportation, Communication, and Utility Uses (e.g., Antennas and Passenger Terminals [with a Major Conditional Use Permit]); and various Accessory Uses that are customarily incidental to the principally permitted use. Lastly, numerous other uses may also be allowable and permitted within BP zoning districts upon request and approval of either a Minor or Major Conditional Use Permit.

2.4.2 Surrounding Land Uses

The project site is currently zoned for light industrial and business park uses. The existing setting and surrounding land uses include the Goleta Rail Station, as well as the Union Pacific Railroad (UPRR) and U.S. 101, which are both located to the north of the project site. To the east and west of the project site sit existing light industrial and warehouse facilities. Office and business park uses are also located to the south of the project site along Hollister Avenue. Also located near the southern property line of the project site is the historic Daniel Hill Adobe, which has been designated by Santa Barbara County as a Place of Historic Merit and is also recognized in the City of Goleta's General Plan as a locally significant historic resource.

2.5 Project Characteristics

The adjacent Goleta Rail Station opened in 1998 and lacks sufficient amenities for train riders. There is a shortage of adequate parking stalls for personal vehicles, limited waiting areas and shelters for riders, minimal bicycle parking facilities, safety concerns due to poor lighting and access, a lack of nearby food or beverage options, and a lack of convenient amenities such as WiFi or electronic device charging areas. The proposed project would demolish and remove the existing industrial warehouse structure in order to develop a new Goleta Train Depot (Depot) on the City-owned property adjacent to the existing Goleta Rail Station. New pedestrian connections would be provided to the Goleta Rail Station's existing platform and platform canopy. No improvements to the existing platform or platform canopy are proposed as part of this project as they are both located on UPRR owned property. Figure 2-4a and Figure 2-4b show photographs of the existing on-site structure that would be demolished and the property line adjacent to the Goleta Rail Station. After demolition, a new Goleta Train Depot building and required associated amenities for the Depot would be constructed. These amenities would be located both within the project site as well as within the City-owned right-of-way adjacent to and leading to the site.

The proposed Depot structure would be approximately 9,000 square feet in size and would provide a permanent, enclosed, and safe structure for Amtrak passengers to use as they wait to board or after they disembark from trains. The Depot would be located in the northern portion of the project site, adjacent to the railroad right-of-way, as shown on the site plan in Figure 2-5. The parking lot and driveways would be located in the southern portion of the project site, with site landscaping,

Figure 2-4a Site Photographs

View of the east side of the existing building looking northwest

View of the south side of the existing building looking east towards S. Patera Lane

Figure 2-4b Site Photographs

View of the north side of the existing building looking east along the railroad right-of-way

Figure 2-5 Site Plan

Goleta Depot - Overall Site Plan

SCALE: 1" = 20'

lighting, and signage located throughout the site. The architecture of the structure would be a traditional depot design with modern elements. The structure would have large windows and columns to support a roof overhang to create protected outdoor areas around the building.

2.5.1 Design

The Depot design process has included an extensive community outreach effort as well as an internal design review process through the City's Design Review Board (DRB). The architect originally developed three design concepts inspired by the history, architecture and culture of the Goleta Valley as well as the function and "gateway" characterization of the proposed Depot. The concepts included an agrarian and traditional California train depot inspired design, a contemporary "sunrise" building, and a modern thematic design emulating a schooner, an icon of the City of Goleta and the Spanish meaning of the word goleta. The concepts were presented to the community through the Notice of Preparation hearing, a project review workshop for the community as well as an online survey. In addition, the design concepts were presented to the City Council a number of times. The consensus was to proceed with the traditional California train depot design. The architect then presented the design to the City DRB who provided extensive input over three meetings and provided input such that the design adheres more strictly to the traditional California train depot design aesthetic. The proposed Depot structure would be a traditional California train depot.

2.5.2 On-Site Amenities

The proposed project would also include a number of on-site amenities that are intended to increase train ridership and improve upon the overall enjoyment and convenience of rail travel. These amenities include a lobby, vending machines, a café and kitchen area for riders to purchase beverages and food, restroom facilities, multiple indoor waiting areas, a meeting room, an on-site ticketing area, as well as adequate luggage and storage space for the public to use. The project would also accommodate bicycle access and provide on-site bicycle storage options.

In addition to amenities located inside the proposed Depot building, the project would also provide adequate vehicle parking within an adjacent surface parking lot. Additionally, an outdoor seating and a play area for children, and a proposed "Kiss N' Ride" space in front of the building would allow for designated pick-up and drop-off locations for passengers, including a separate space to accommodate Transportation Network Companies (TNCs) such as Uber and Lyft. Finally, historical displays both inside and outside of the proposed Depot building would provide riders and visitors with a chance to learn more about the railroad history of Goleta and the South Coast area.

2.5.3 Signage

Signage at the proposed new Train Depot would be provided for convenient and effective wayfinding throughout the site for train users. The signs would be designed in compliance with *Amtrak Graphic Signage Standards Manual* and would be consistent in general appearance with other Amtrak stations up and down the coast. The proposed signage would also be designed and situated on site to be consistent with the City's sign regulations in Title 17. Proposed signage to be included in the Goleta Train Depot would include:

- **Service Identification Signs.** Identifying service and amenities at the Train Depot.
- **Curb Identifier Signs.** Identifying designated areas for passenger pick-up or drop-off, as well as designating areas for TNC services.

- **Freestanding Displays.** To provide information on shuttle and bus services as well as other historical information.
- **Monument Signs.** In addition to traditional wayfinding signage, a limited number of project monument signage with project identification would also be installed throughout the site.
- **Electronic Changeable Copy.** To provide updated information on train timing and information for passengers.

2.5.4 Lighting and Safety Features

On-site lighting would be low intensity, hooded, directed downward, and fully cut-off. The proposed lighting would be installed throughout the project site within the parking lot, along pedestrian walkways, and outside the Train Depot building in order to improve on-site wayfinding and public safety. Lighting would be designed in compliance with the City's General Plan policies and development standards within Title 17, Zoning Ordinance relating to outdoor lighting. In addition to on-site lighting, the project would also provide designated crosswalk areas between the Depot's parking lot and the proposed Train Depot building, as shown in Figure 2-5.

Law enforcement would be provided by the Santa Barbara County Sheriff's Department, which is contracted by the City to provide police services. Fire services would be provided by Santa Barbara County Fire Department (SBCFD).

2.5.5 Landscaping

The proposed project would also include adequate landscaping throughout the site, both within parking lot planters, within the Goleta Train Depot entrance median, and to the east and west of the proposed Depot building itself, consistent with Chapter 17.34 of the Goleta Zoning Ordinance. Newly planted native trees would be located adjacent to the Depot building and would provide shade for waiting passengers. All plants and landscaping would use drought-tolerant, low-water usage plant varieties. Lastly, a large percentage of the site landscape areas would be designed to accommodate low impact design (LID) measures for storm water management using flow-through rain gardens, optional filter boxes, permeable pavers, and/or other forms of porous pavement. Water for on-site landscaping would be supplemented by water trucks from the Goleta Water District's (GWD) Recycled Water Hauling Program.

2.5.6 Off-Site Improvements

Project implementation proposes to include incorporating several existing off-site activities and improvements. These include use of an existing turnaround located at the northern terminus of South La Patera Lane, which serves as the stopping point and turnaround for Santa Barbara Metropolitan Transit District (MTD) and Amtrak buses accessing the existing Goleta Rail Station. This area also provides access to the Rail Station, areas for designated passenger pick-up and drop-off, and space for large vehicles and buses using South La Patera Lane to turn around. The project proposes to relocate the existing turnaround southward in order to move the portion of the existing turnaround that is partially located within UPRR right-of-way. The relocated turnaround would also allow space for new amenities and services for passengers on the east side of the Train Depot. The relocated turnaround would continue to provide an adequate area for emergency vehicles, buses, and large trucks. A new bus stop would also be located at the turnaround area, as shown in Figure 2-5, which would provide an additional stop for the Santa Barbara Metropolitan Transit District (MTD) peak hour and bus services and future expanded shuttle services. Each of these

proposed improvements would occur entirely within City's road right-of-way and would involve various roadway and sidewalk improvements.

2.5.7 Parking and Site Access

Access to the site would be reconfigured from its existing single two-way ingress/egress located at the southeast corner of the project site to two one-way entrance and exit driveways located off South La Patera Lane at the northeastern and southeastern corners of the site, as shown in Figure 2-5. The driveways would also be connected by an internal, U-shaped accessway, which would be located to the south of the proposed Depot building. An additional turnaround would be located at the entry of the site and would be designed to allow buses and shuttles to provide easy drop-off and pick-up passengers. Approximately 111 parking spaces would be provided for passengers to leave their vehicles for various lengths of time. Additionally, electric vehicle charging stations would be provided on site, pursuant to Chapter 17.38 zoning requirements of the Goleta Municipal Code.

2.5.8 Utilities

Electricity to the project site would continue to be provided by Southern California Edison (SCE) and natural gas would continue to be provided by the Southern California Gas Company (SoCalGas). Potable water would be supplied by the GWD and sanitary sewer services would be provided by the Goleta Sanitary District (GSD). ~~Law enforcement would be provided by the Santa Barbara County Sheriff's Department, which is contracted by the City to provide police services. Fire services would be provided by Santa Barbara County Fire Department (SBCFD), which is also contracted by the City to provide fire emergency services.~~

In general, the project would connect to and use all of the different existing utilities, infrastructure, and other facilities that are currently providing services to the project site and other surrounding development.

The project site and surrounding area are served by existing internet, telephone, and television providers operating in the City. Due to the nature of the proposed project, internet services would be the main need for the project. There are a number of internet providers that can serve the project site, including but not limited to Frontier, Spectrum, Cox Communications, and Viasat. The internet provider would be chosen at a later date.

2.5.9 Construction and Grading

Construction of the proposed project is expected to occur over approximately 24 months and would occur in the following five phases:

1. The first phase of construction would involve demolition and removal of all debris and waste materials associated with the existing 39,800 square foot warehouse structure;
2. The second phase would include initial site preparation to remove any remnant concrete foundations and any remaining miscellaneous debris and vegetation within the development area to prepare for rough grading of the site;
3. The third phase would include rough grading to prepare it for construction activities;
4. The fourth phase would involve construction and painting of the new Depot, as well as any associated finish grading around the site; and

5. The fifth phase would involve paving and striping of the parking lot and ingress/egress areas, as well as the installation of site landscaping, lighting, and signage.

2.5.10 Green Building Features

The project would be constructed to California Building Code (CBC) Title 24, which requires implementation of energy-efficient light fixtures and building materials, newly constructed buildings to meet energy performance standards, and the installation of low-flow water features. Electric vehicle charging stations would be provided on site, pursuant to Chapter 17.38 of the Goleta Municipal Code. Bicycle locks and on-site bicycle storage facilities would also be provided to support alternative modes of transportation. Also, approximately half of the roof would contain solar panels to capture solar energy. In addition, City Resolution No. 12-65 states, “all new building construction for City owned and operated buildings of 2,000 square feet or greater of conditioned space must achieve the United States Green Building Council's (USGBC) Leadership in Energy and Environmental Design (LEED) rating system Silver certification,” unless the project meets certain exceptions. The proposed Depot would be designed and constructed consistent with City Resolution No. 12-65.

2.6 Project Objectives

- Construct a full-service, multi-modal train depot that provides high-demand, modern, user-friendly amenities for train riders.
- Develop civic pride and identity through a traditional depot design and community education at the Depot.
- Increase train ridership along the Pacific Surfliner train corridor, especially during peak rail service, to help implement State and regional transit plans.
- Reduce regional greenhouse gas emissions from transportation sources by improving transit use and reducing vehicle miles travelled by single-occupancy vehicles.
- Improve overall connectivity with the local transit system and the Depot to connect passengers with their destinations and create a regional transit hub.

2.7 Required Review and Approvals

The proposed project would require the following City review and approvals and entitlements, along with standard building and grading permits:

- City Council adoption of EIR

In addition, review and approval from the following agencies would also be required:

- **Santa Barbara County Association of Government (SBCAG).** SBCAG is the Regional Transportation Planning Agency and the recipient of the TIRCIP grant funding for the project
- **Union Pacific.** Work and improvements within Union Pacific right-of-way would require consultation and approval
- **Amtrak.** On-site amenities would have to be consistent with *Amtrak Station Program and Planning Guidelines*

- **Goleta Water District.** A can-and-will serve letter would be required prior to approval of the project
- **Goleta Sanitary District.** A can-and-will serve letter would be required prior to approval of the project

This page intentionally left blank.

3 Environmental Setting

This section provides a general overview of the environmental setting for the proposed project, including the cumulative projects setting. More detailed descriptions of the environmental setting for each environmental issue area can be found in Section 4.0, *Environmental Impact Analysis*.

3.1 Regional Setting

The project site is located in the City of Goleta, approximately 0.3 miles north of the Santa Barbara Airport, 1.4 miles north of the University of California Santa Barbara (UCSB), 1.6 miles inland from the Pacific Ocean, and eight miles west of the civic center of the City of Santa Barbara and County of Santa Barbara. Figure 2-1 in Section 2.0, *Project Description*, shows the location of the project site in the region and Figures 2-2 and 2-3 show the location of the project site in relationship to the surrounding neighborhood.

A grid system of east-west and north-south roadways, including freeways, arterials, collectors, and local streets, provide vehicular access throughout the City. The nearby major roadways include Hollister Avenue, S. Fairview Avenue, and Storke Road. The closest freeways are U.S. 101 and State Route 217 (SR 217). The UPRR railroad right-of-way and the Goleta Amtrak Station are located adjacent to the project site to the north. The Mediterranean climate of the region and the coastal influence produce moderate temperatures year-round, with rainfall concentrated in the winter months. Although air quality in the area has steadily improved in recent years, the Santa Barbara region remains a nonattainment area for particulate matter (SBAPCD 2020a).

3.2 Project Site Setting

As shown in Figure 2-3 in Section 2.0, *Project Description*, the project site is bordered by light industrial and warehouse uses to the east and west, office and business park development to the south, and UPRR and U.S. 101 right-of-way to the north. There is a two-story warehouse building to the east across South La Patera Lane from the project site, a three-story office building and the historic Daniel Hill Adobe immediately to the south, and a large, one-story office and warehouse building to the west. The project site is currently occupied by a 38,000 square-foot one-story warehouse structure that is only partially occupied by the local Food Bank of Santa Barbara County and available for use by City Public Works staff during the COVID-19 pandemic.

3.3 Cumulative Development

In addition to the specific impacts of individual projects, CEQA requires EIRs to consider potential cumulative impacts of a proposed project. CEQA defines “cumulative impacts” as two or more individual impacts that, when considered together, are substantial or will compound other environmental impacts. Cumulative impacts are the combined changes in the environment that result from the incremental impact of development of the proposed project and other nearby projects. For example, traffic impacts of two nearby projects may be less than significant when analyzed separately but could have a significant impact when analyzed together. Cumulative impact analysis allows the EIR to provide a reasonable forecast of future environmental conditions and can more accurately gauge the effects of a series of projects.

CEQA requires cumulative impact analysis in EIRs to consider either a list of planned and pending projects that may contribute to cumulative effects or a forecast of future development potential. Current planned and pending projects in Goleta and surrounding areas, including the City of Santa Barbara are listed in Table 3-1. Cumulative projects include a listing of all major discretionary projects which are either pending, approved, or currently under construction. The list of City of Goleta projects was compiled on February 25, 2021. There were no cumulative projects in the County of Santa Barbara near the proposed project, but two cumulative projects were identified on the UCSB campus. Cumulative projects in the City of particular note include the 7,000 Hollister Avenue residential development and 5955 Calle Real hotel, which are either located in close proximity or along the same major arterial as the project site, or are major projects in the City. These projects are considered in the cumulative analyses in Section 4.0, *Environmental Impact Analysis*.

Table 3-1 Cumulative Projects List

Project No.	Project Location ¹	Land Use and Size	Status
City of Goleta			
1	22 South Fairview Ave.	Commercial/Industrial, 6,519 sf	Under Construction
2	6830 Cortona Dr.	Residential, 176 units	Under Construction
3	n/a	Oil Infrastructure removal	Under Construction
4	n/a	Oil Infrastructure plug	Under Construction
5	n/a	Oil Infrastructure plug	Under Construction
6	7388 Calle Real	Residential, 10 units	Under Construction
7	S. Kellogg Ave.	Residential/Commercial, 175 units	Under Construction
8	301 Coromar Dr.	Office/Light Industrial, 44,924 sf	Under Construction
9	7000 Hollister Ave.	Residential, 27 units	Under Construction
10	909 S. Kellogg Ave.	Industrial	Under Construction
11	n/a	Trails and Coastal Access improvements	Approved
12	n/a	Tree removal	Approved
13	30 Las Armas Rd	Battery Storage	Approved
14	6765 Navigator Way	Office/Light Industrial, 16,750 sf	Under Construction
15	6759 Navigator Way	Office/Light Industrial, 31,584 sf	Under Construction
16	355 Coromar Dr.	Industrial, 98,780 sf	Approved
17	130 Robin Hill Rd.	Industrial, 1,100 sf	Under Construction
18	6789 Navigator Way	Office/ Light Industrial, 23,882 sf	Approved
19	10 S. Kellogg Ave.	Industrial, 136,067 sf	Approved
20	8301 Hollister Ave.	Residential, 1 unit	Approved
21	180 N. Fairview Ave	Commercial 2,396 sf	Approved
22	6045 Stow Canyon Rd.	Residential, 8,134 sf	Approved
23	7414 and 7418 Hollister Ave.	Industrial, subdivision	Approved
24	n/a	Open space, management plan	Approved
25	625 Dara Rd.	Residential, land use change	Approved
26	454 S. Patterson Ave.	Commercial, 20,000 sf	Under Construction
27	7400 Cathedral Oaks Rd.	Residential, 60 units	Under Review

Project No.	Project Location ¹	Land Use and Size	Status
28	Calle Real and Calaveras Ave.	Residential, 60 units	Under Review
29	6868 and 6864 Cortona Dr.	Battery Storage	Environmental Review
30	North of Calle Koral and west of Los Carneros	Residential, 228 units and 132 senior units	Under Review
31	5955 Calle Real	Commercial, 132-room hotel	Environmental Review
32	425 S. Kellogg Ave.	Commercial auto center, site improvements and subdivision	Environmental Review
33	907 S. Kellogg Ave.	Industrial, 70,594 sf	Environmental Review
34	5631 Calle Real	Commercial, land use change	Under Review
35	250, 260, and 270 Storke Road	Commercial, 1,339 sf	Under Review
36	334 S. Patterson Ave.	Mixed Use	Under Review
37	351 S. Patterson Ave	Hospital remodel and pool facility	Under Review
38	82 Coromar Dr.	Industrial, battery storage	Pending Project
39	Fairview Ave and Hollister Ave.	Commercial, wireless antenna	Pending Project
40	5392 and 5400 Hollister Ave.	Mixed Use, 11,556 sf	Pending Project
41	355 Coromar Drive	54,080 sf distribution facility	Pending Project
42	5385 Hollister Ave	13,620 sf office building, 33,166 sf R&D building	Pending Project
UCSB			
43	Northeast UCSB main campus	Henly Hall, student facilities	Under Construction
44	Central UCSB main campus	Classroom building	Under Construction

¹ Cumulative project details were sourced from City of Goleta, UCSB, Santa Barbara County, and City of Santa Barbara

4 Environmental Impact Analysis

This section discusses the possible environmental effects of the Goleta Depot Project for the specific issue areas that were identified through the scoping process as having the potential to experience significant effects. A “significant effect” as defined by the *CEQA Guidelines* §15382:

means a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project including land, air, water, minerals, flora, fauna, ambient noise, and objects of historic or aesthetic significance. An economic or social change by itself shall not be considered a significant effect on the environment. A social or economic change related to a physical change may be considered in determining whether the physical change is significant.

The assessment of each issue area begins with a discussion of the environmental setting related to the issue, which is followed by the impact analysis. In the impact analysis, the first subsection identifies the methodologies used and the “significance thresholds,” which are those criteria adopted by the City and other agencies, universally recognized, or developed specifically for this analysis to determine whether potential effects are significant. The next subsection describes each impact of the proposed project, mitigation measures for significant impacts, and the level of significance after mitigation. Each effect under consideration for an issue area is separately listed in bold text with the discussion of the effect and its significance. Each bolded impact statement also contains a statement of the significance determination for the environmental impact as follows:

- **Significant and Unavoidable.** An impact that cannot be reduced to below the threshold level given reasonably available and feasible mitigation measures. Such an impact requires a Statement of Overriding Considerations to be issued if the project is approved per §15093 of the *CEQA Guidelines*.
- **Less than Significant with Mitigation Incorporated.** An impact that can be reduced to below the threshold level given reasonably available and feasible mitigation measures. Such an impact requires findings under §15091 of the *CEQA Guidelines*.
- **Less than Significant.** An impact that may be adverse but does not exceed the threshold levels and does not require mitigation measures. However, mitigation measures that could further lessen the environmental effect may be suggested if readily available and easily achievable.
- **No Impact.** The proposed project would have no effect on environmental conditions or would reduce existing environmental problems or hazards.

Following each environmental impact discussion is a list of mitigation measures (if required) and the residual effects or level of significance remaining after implementation of the measure(s). In cases where the mitigation measure for an impact could have a significant environmental impact in another issue area, this impact is discussed and evaluated as a secondary impact. The impact analysis concludes with a discussion of cumulative effects, which evaluates the impacts associated with the proposed project in conjunction with other planned and pending developments in the area listed in Section 3.0, *Environmental Setting*. The Executive Summary of this EIR summarizes all impacts and mitigation measures that apply to the proposed project.

Section 15065 of the *CEQA Guidelines* also requires the following specific issues be addressed as part of the environmental review for the project:

Goleta Train Depot Project

- The potential for the project to substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory;
- Project impacts that are individually limited but cumulatively considerable. ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects); and
- Environmental effects of the project which will cause substantial adverse effects on human beings, either directly or indirectly.

Section 4, *Biological Resources*, in the Initial Study included as Appendix A describes the project's potential effects of the project on plant and animal species populations, habitats, communities, and migratory patterns. Section 5, *Cultural Resources*, in the Initial Study and Section 4.6, *Tribal Cultural Resources*, in this EIR describes the project's potential effects on important historical and prehistoric cultural and tribal cultural resources. As discussed in these sections, the project would not result in unmitigable, significant impacts to biological, cultural, or tribal cultural resources. Potential adverse environmental effects to human beings are discussed in the Initial Study in Sections 7, *Geology/Soils*, Section 9, *Hazards and Hazardous Materials*, Section 10, *Hydrology and Water Quality*, Section 11, *Land Use/Planning* and in the EIR in Section 4.1, *Air Quality* and Section 4.4, *Noise*. As discussed above, each environmental analysis section of the EIR concludes with a discussion of the project's contribution to cumulative effects and the Initial Study includes a discussion of the issues required in Section 15065 of the *CEQA Guidelines*.

4.1 Air Quality

This section discusses the project’s potential impacts relating to air quality. The modeling from the California Emissions Estimator Model (CalEEMod) was used in the impact analysis. The CalEEMod air quality model results are provided in Appendix C.

4.1.1 Setting

Climate and Topography

The project site is located in the South Central Coast Air Basin (SCCAB), which includes all of San Luis Obispo, Santa Barbara, and Ventura Counties. The 2019 Ozone Plan for Santa Barbara County describes the air quality setting for the county in detail, including the local climate and meteorology, current and projected air quality, and the regulatory framework for the management of air quality. The climate of the SCCAB is strongly influenced by its proximity to the Pacific Ocean and the location of the semi-permanent high-pressure cell in the northeastern Pacific. The Mediterranean climate of the Goleta region produces moderate average temperatures although extreme temperatures can be reached in the winter and summer. The warmest months of the year are August and September, and the coldest month of the year is January. The annual average maximum temperature is 69.3 degrees Fahrenheit (°F), while the annual average minimum temperature is 48.6°F. Rainfall is concentrated in the winter months. Local climate conditions are shown below in Table 4.1-1.

Table 4.1-1 Goleta Climate Conditions

Temperature Condition	Amount
Average annual rainfall	16.3 inches
Annual average maximum temperature	69.3°F
Annual average minimum temperature	48.6°F
Warmest month	August/September
Coolest month	January
Annual mean temperature	59°F

Note: Averages are based on the period of record from January 1, 1894 to June 10, 2016 with the exception of annual mean temperature, which is based on the period of record from January 1, 1894 to October 31, 2012.

Source: Western Regional Climate Center 2016

Temperature inversions (warmer air on top of cooler air) is a common meteorological condition in the area. Inversions in Goleta are formed by the more rapid cooling of air near the ground at night, especially during the winter. This type of inversion is typically seen at lower elevations and is generally accompanied by stable air. Inversions limit the dispersal of air pollutants within the regional airshed because more stable air conditions (i.e., low wind speeds and uniform temperatures) result in lower rates of pollutant dispersion.

Air Pollutants of Primary Concern

The general characteristics of the six criteria pollutants regulated by the federal Clean Air Act and California Clean Air Act are described below.

Ozone

Ozone is produced by a photochemical reaction (triggered by sunlight) between nitrogen oxides (NO_x) and reactive organic gases (ROG).¹ NO_x are formed during the combustion of fuels, while ROG is formed during combustion and evaporation of organic solvents. Because ozone requires sunlight to form, it mostly occurs in concentrations considered serious between the months of April and October. Ozone is a pungent, colorless, toxic gas with direct health effects on humans, including respiratory and eye irritation and possible changes in lung functions. Groups that tend to be the most sensitive to ozone include children, the elderly, people with respiratory disorders, and people who exercise strenuously outdoors.

Carbon Monoxide

Carbon monoxide (CO) is a localized pollutant that is found in high concentrations only near its source. The major source of CO, a colorless, odorless, poisonous gas, is automobile traffic. Therefore, elevated concentrations are usually only found near areas of high traffic volumes. Carbon monoxide health effects are related to its affinity for hemoglobin in the blood. At high concentrations, CO reduces the amount of oxygen in the blood, causing heart difficulties in people with chronic diseases, reduced lung capacity, and impaired mental abilities.

Nitrogen Dioxide

Nitrogen dioxide (NO₂) is a by-product of fuel combustion, with the primary source being motor vehicles and industrial boilers and furnaces. The principal form of nitrogen oxide produced by combustion is nitric oxide (NO), but NO reacts rapidly to form NO₂, creating the mixture of NO and NO₂ commonly called NO_x. Nitrogen dioxide is an acute irritant. A relationship between NO₂ and chronic pulmonary fibrosis may exist, and an increase in bronchitis in young children at concentrations below 0.3 parts per million (ppm) may occur. Nitrogen dioxide absorbs blue light, gives a reddish-brown cast to the atmosphere, and reduces visibility. It can also contribute to the formation of small particulate matter (PM₁₀) and acid rain.

Suspended Particulates

Small particulate matter measuring no more than 10 microns in diameter is considered PM₁₀, while fine particulate matter measuring no more than 2.5 microns in diameter is considered PM_{2.5}. Suspended particulates are mostly dust particles, nitrates, and sulfates. Both PM₁₀ and PM_{2.5} are by-products of fuel combustion and wind erosion of soil and unpaved roads and are directly emitted into the atmosphere through these processes. Suspended particulates are also created in the atmosphere through chemical reactions. The characteristics, sources, and potential health effects associated with PM₁₀ and PM_{2.5} can be very different. PM₁₀ generally comes from windblown dust

¹ CARB defines VOC and ROG similarly as, "any compound of carbon excluding CO, carbon dioxide, carbonic acid, metallic carbides or carbonates, and ammonium carbonate," with the exception that VOC are compounds that participate in atmospheric photochemical reactions (CARB 2009). For the purposes of this analysis, ROG and VOC are considered comparable in terms of mass emissions and the term ROG is used in this report.[1] CARB defines VOC and ROG similarly as, "any compound of carbon excluding CO, carbon dioxide, carbonic acid, metallic carbides or carbonates, and ammonium carbonate," with the exception that VOC are compounds that participate in atmospheric photochemical reactions (CARB 2009). For the purposes of this analysis, ROG and VOC are considered comparable in terms of mass emissions and the term ROG is used in this report. SLOAPCD uses the term ROG to denote organic precursors.

and dust kicked up from mobile sources. PM_{2.5} is generally associated with combustion processes, as well as formation in the atmosphere as a secondary pollutant through chemical reactions. PM_{2.5} is more likely to penetrate deeply into the lungs and poses a health threat to all groups, but particularly to the elderly, children, and those with respiratory problems. More than half of the small and fine particulate matter that is inhaled into the lungs remains there. These materials can damage health by interfering with the body's mechanisms for clearing the respiratory tract or by acting as carriers of an absorbed toxic substance.

Sulfur Dioxide

Sulfur dioxide (SO₂) is included in a group of highly reactive gases known as "oxides of sulfur." The largest sources of SO₂ emissions are from fossil fuel combustion at power plants (73 percent) and other industrial facilities (20 percent). Smaller sources of SO₂ emissions include industrial processes such as extracting metal from ore and the burning of fuels with a high sulfur content by locomotives, large ships, and off-road equipment. Sulfur dioxide is linked with a number of adverse effects on the respiratory system.

Lead

Lead (Pb) is a toxic metal that can be emitted from industrial sources, leaded aviation gasoline, and lead-based paint. Lead may cause a range of health effects, from behavioral problems and learning disabilities to seizures and death.

Toxic Air Contaminants

Toxic air contaminants (TACs) are a diverse group of air pollutants that may cause or contribute to an increase in deaths or serious illness, or that may pose a present or potential hazard to human health. TACs include both organic and inorganic chemical substances that may be emitted from a variety of common sources, including gasoline stations, motor vehicles, dry cleaners, industrial operations, painting operations, and research and teaching facilities. One of the main sources of TACs in California is diesel engines that emit exhaust containing solid material known as diesel particulate matter (DPM), (see CARB 2019a). TACs are different than criteria pollutants because ambient air quality standards have not been established for TACs. TACs occurring at extremely low levels may still cause health effects, and it is typically difficult to identify levels of exposure that do not produce adverse health effects. TAC impacts are described by carcinogenic risk and by chronic (i.e., long duration) and acute (i.e., severe but of short duration) adverse effects on human health.

Current Air Quality

Table 4.1-2 summarizes the annual air quality data for the local airshed. California Air Resources Board (CARB) maintains over 60 air quality monitoring stations throughout California, including two stations in Santa Barbara County. Other monitoring stations in Santa Barbara County are maintained by SBAPCD. The nearest monitoring station to the project site is the Goleta-Fairview station, located at 380 N. Fairview Avenue approximately 0.9-mile northeast of the project site. The pollutants monitored at this station are ozone, PM₁₀, PM_{2.5}, and NO₂. The data collected at this station is generally representative of the baseline air quality experienced in the project area. SO₂ has not been monitored at this station since 2009. The last recorded 24-hour average SO₂ value was 0.001 ppm, which is below the state 24-hour standard of 0.14 ppm and the federal 24-hour standard of 0.04 ppm. CO has not been monitored at this station since 2012. The last recorded 8-hour average CO value was 0.65 ppm, which is below the state and federal 8-hour CO standard of 9.0 ppm.

Table 4.1-2 Ambient Air Quality Data

Pollutant	2017	2018	2018
Ozone (ppm), Worst Hour	0.1	0.077	0.072
Number of days of state exceedances (>0.09 ppm)	1	0	0
Number of days of federal exceedances (>0.12 ppm)	0	0	0
Ozone (ppm), 8-Hour Average ¹	0.068	0.056	0.062
Number of days of state and federal exceedances (>0.07 ppm)	0	0	0
NO ₂ (ppm), Worst Hour	0.035	0.029	0.027
Number of days of state exceedances (>0.18 ppm)	0	0	0
Number of days of federal exceedances (>0.10 ppm)	0	0	0
PM ₁₀ (µg/m ³), Worst 24 Hours	189.0	72.5	61.1
Number of days of state exceedances (>50 µg/m ³)	12	4	2
Number of days of federal exceedances (>150 µg/m ³)	1	0	0
PM _{2.5} (µg/m ³), Worst 24 Hours	130.5	35.6	26.3
Number of days of federal exceedances (>35 µg/m ³)	10	1	0

Source: CARB 2019c

The primary pollutants of concern in the project area are PM₁₀, PM_{2.5}, and ozone. As shown in Table 4.1-2, PM₁₀ concentrations exceeded the state PM₁₀ standard for 12 days day in 2017 and four days in 2018 and for two days in 2019. PM_{2.5} concentrations exceeded the federal standard for ten days in 2017 and for one day in 2018. Ozone exceeded the state standard for one day in 2017.

Sensitive Receptors

Ambient air quality standards have been established to represent the levels of air quality considered sufficient, with an adequate margin of safety, to protect public health and welfare. Standards are designed to protect that segment of the public most susceptible to respiratory distress, such as children under 14; the elderly over 65; persons engaged in strenuous work or exercise; and people with cardiovascular and chronic respiratory diseases. Therefore, the majority of sensitive receptor locations are residences, schools, and hospitals.

Sensitive receptors near the project site consist primarily of the residential areas 500 feet north of the project site across UPRR right-of-way and U.S. 101. The nearest school is La Patera Elementary School located approximately 0.7 mile to the north. The nearest park is the Los Carneros Park and associated hiking trails, which is located as close as 660 feet north from the project site across UPRR right-of-way and U.S. 101. Therefore, the nearest sensitive receptors to the proposed project are the residences and Los Carneros Park located to the north across U.S. 101 from the project site.

4.1.2 Regulatory Setting

Federal and State

The federal and state Clean Air Acts regulate the emission of airborne pollutants from various mobile and stationary sources. The United States Environmental Protection Agency (U.S. EPA) is the federal agency designated to administer air quality regulation, while the CARB is the state equivalent within the California Environmental Protection Agency (CalEPA). These agencies have established ambient air quality standards for the protection of public health. Local air quality

management control and planning is provided through regional Air Pollution Control Districts (APCDs) established by CARB for the 14 statewide air basins. The CARB is responsible for control of mobile emission sources, while the local APCDs are responsible for control of stationary sources and enforcing regulations. As stated above, Goleta is located in the Santa Barbara County portion of the SCCAB, which is under the jurisdiction of the Santa Barbara County Air Pollution Control District (SBAPCD).

The U.S. EPA and CARB establish ambient air quality standards for major pollutants at thresholds intended to protect public health. Federal and state standards have been established for ozone, CO, NO₂, SO₂, lead, PM₁₀, and PM_{2.5}. Table 4.1-3 summarizes the California Ambient Air Quality Standards (CAAQS) and the National Ambient Air Quality Standards (NAAQS) for each of these pollutants. California standards are more restrictive than federal standards for each of these pollutants, except for lead, the eight-hour average for CO, and the eight-hour average for ozone.

Table 4.1-3 Current Federal and State Ambient Air Quality Standards

Pollutant	Federal Standard	California Standard
Ozone	0.070 ppm (8-hr avg)	0.09 ppm (1-hr avg) 0.070 ppm (8-hr avg)
Carbon Monoxide	35.0 ppm (1-hr avg) 9.0 ppm (8-hr avg)	20.0 ppm (1-hr avg) 9.0 ppm (8-hr avg)
Nitrogen Dioxide	0.100 ppm (1-hr avg) 0.053 ppm (annual avg)	0.18 ppm (1-hr avg) 0.030 ppm (annual avg)
Sulfur Dioxide	0.075 ppm (1-hr avg)	0.25 ppm (1-hr avg) 0.04 ppm (24-hr avg)
Lead	0.15 µg/m ³ (rolling 3-month avg) 1.5 µg/m ³ (calendar quarter)	1.5 µg/m ³ (30-day avg)
Particulate Matter (PM ₁₀)	150 µg/m ³ (24-hr avg)	50 µg/m ³ (24-hr avg) 20 µg/m ³ (annual avg)
Particulate Matter (PM _{2.5})	35 µg/m ³ (24-hr avg) 12 µg/m ³ (annual avg)	12 µg/m ³ (annual avg)
Sulfates	No Federal Standards	25 µg/m ³ (24-hr avg)
Hydrogen Sulfide	No Federal Standards	0.03 ppm (1-hr avg)
Vinyl Chloride	No Federal Standards	0.01 ppm (24-hr avg)

ppm= parts per million
µg/m³ = micrograms per cubic meter
Source: CARB 2016

In accordance with Section 109(b) of the federal Clean Air Act, the national ambient air quality standards (NAAQS) established at the federal level are designed to be protective of public health with an adequate margin of safety. The NAAQS were designed to include an adequate margin of safety to be protective of those segments of the public most susceptible to respiratory distress, such as children under the age of 14, the elderly (over the age of 65), persons engaged in strenuous work or exercise, and people with cardiovascular and chronic respiratory diseases. To derive these standards, the U.S. EPA reviews data from integrated science assessments and risk/exposure assessments to determine the ambient pollutant concentrations at which human health impacts occur, then reduces these concentrations to establish a margin of safety (U.S. EPA 2018). As a result,

human health impacts caused by the air pollutants may affect people when ambient air pollutant concentrations are at or above the concentrations established by the NAAQS. The closer a region is to attaining a particular NAAQS, the lower the human health impact is from that pollutant (brief for San Joaquin Valley Unified Air Pollution Control District 2018). Accordingly, ambient air pollutant concentrations below the NAAQS and California standards are considered to be protective of human health (CARB 2019a and 2019b). The NAAQS and the underlying science that forms the basis of the NAAQS are reviewed every five years to determine whether updates are necessary to continue protecting public health with an adequate margin of safety (U.S. EPA 2015).

Ambient air pollutant concentrations are affected by the rates and distributions of corresponding air pollutant emissions, as well as by climactic and topographic influences. The primary determinant of concentrations of non-reactive pollutants (such as CO, PM₁₀ and PM_{2.5}) is proximity to major sources. Ambient CO levels usually closely follow the spatial and temporal distributions of vehicular traffic. SBAPCD monitors criteria pollutant levels to ensure that air quality standards are met, and if they are not met, develops strategies to meet the standards. Depending on whether or not the standards are met or exceeded, the air basin is classified as being in “attainment” or “nonattainment.” Santa Barbara County is designated nonattainment for the state 24-hour and annual standard for PM₁₀ (SBAPC 2020a). The County is also unclassifiable/attainment for the federal PM_{2.5} standard and unclassified for the state PM_{2.5} standard. Effective July 1, 2020 the County is designated as attainment for the state 1-hour and 8-hour standards (SBAPCD 2020b).

SAFE Vehicle Rule

On September 27, 2019, the U.S. EPA and the National Highway Traffic Safety Administration published the Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule Part One: One National Program. The SAFE Rule Part One revokes California’s authority to set its own GHG emissions standards and to adopt its own zero-emission vehicle mandates. On April 30, 2020, the U.S. EPA and the National Highway Traffic Safety Administration published Part Two of the SAFE Vehicles Rule, which revised corporate average fuel economy and CO₂ emissions standards for passenger cars and trucks of model years 2021-2026 such that the standards increase by approximately 1.5 percent each year through model year 2026 as compared to the approximately five percent annual increase required under the 2012 standards (National Highway Traffic Safety Administration 2021). To account for the effects of the SAFE Vehicles Rule, CARB released off-model adjustment factors on June 26, 2020 to adjust GHG emissions outputs from the EMFAC model (CARB 2020).

Local

Santa Barbara County Air Pollution Control District

SBAPCD, the lead air quality regulatory agency for Santa Barbara County, maintains air quality comprehensive programs for planning, regulation, enforcement, technical innovation, and promotion of the understanding of air quality issues. The 2001 Clean Air Plan (CAP) was adopted as the County portion of the State Implementation Plan (SIP), designed to meet and maintain clean air standards. The 2019 Ozone Plan (2019 Plan) is the ninth triennial update to the initial state Air Quality Attainment Plan adopted by the SBAPCD Board of Directors in 1991 (other updates were done in 1994, 1998, 2001, 2004, 2007, 2010, 2013, and 2016). Each of the plan updates have implemented an “every feasible measure” strategy to ensure continued progress toward attainment of the state ozone standards (SBAPCD 2019). SBAPCD also inspects stationary sources to ensure they abide by permit requirements, responds to citizen complaints, monitors ambient air quality

and meteorological conditions, and implements other programs and regulations required by the federal and State Clean Air Acts.

SBAPCD maintains a guidance document for assessing and mitigating air quality impacts under the California Environmental Quality Act (CEQA), which includes tools and methodologies to quantify air pollutant emissions and characterize impacts, and strategies to mitigate impacts (SBAPCD 2017). SBAPCD also adopted its Environmental Review Guidelines pursuant to CEQA, which contains procedures for environmental review, adopted thresholds of significance, time limits, fees, forms, and District-approved exemptions to CEQA review (SBAPCD 2015).

City of Goleta General Plan

The City of Goleta General Plan Conservation Element is intended to guide land use planning by providing goals and policies to preserve air quality. Goals and policies that are applicable to the project include:

Policy CE 12 Protection of Air Quality: To maintain and promote a safe and healthy environment by protecting air quality and minimizing pollutant emissions from new development and from transportation sources

CE 12.2 Control of Air Emissions from New Development: The following shall apply to reduction of air emissions from new development:

- a. Any development proposal that has the potential to increase emissions of air pollutants shall be referred to the Santa Barbara County Air Pollution Control District for comments and recommended conditions prior to final action by the City.
- b. All new commercial and industrial sources shall be required to use the best available air pollution control technology. Emissions control equipment shall be properly maintained to ensure efficient and effective operation.
- c. Wood-burning fireplace installations in new residential development shall be limited to low-emitting state- and U.S. EPA- certified fireplace inserts and woodstoves, pellet stoves, or natural gas fireplaces. In locations near monarch butterfly Environmentally Sensitive Habitat Areas (ESHA), fireplaces shall be limited to natural gas.
- d. Adequate buffers between new sources and sensitive receptors shall be required.
- e. Any permit required by the Santa Barbara County Air Pollution Control District shall be obtained prior to issuance of final development clearance by the City.

CE 12.3 Control of Emissions during Grading and Construction: Construction site emissions shall be controlled by using the following measures:

- a. Watering active construction areas to reduce windborne emissions.
- b. Covering trucks hauling soil, sand, and other loose materials.
- c. Paving or applying nontoxic solid stabilizers on unpaved access roads and temporary parking areas.
- d. Hydroseeding inactive construction areas.
- e. Enclosing or covering open material stockpiles.
- f. Revegetating graded areas immediately upon completion of work.

4.1.3 Impact Analysis

a. Methodology and Significance Thresholds

Methodology

Expected air pollutant emissions from construction and operation of the project were estimated using the CalEEMod version 2016.3.2, based on information provided by the project applicant and CalEEMod default values for projects in Santa Barbara County when project specifics were not known.

Construction

Construction of the proposed project was assumed to begin in August 2022 and conclude August 2023, pursuant to the project schedule, with full operation anticipated to begin in 2024. The model assumed the depot structure would be 9,000 square-feet as a conservative approach. The model included 39,800 square-feet of demolition for the existing on-site warehouse, and also assumed up to 15,000 square-feet of soil export during construction. Construction equipment estimates used CalEEMod assumptions, which are based on surveys of construction projects within California conducted by members of CAPCOA (CAPCOA 2017). If construction is delayed or occurs over a longer period, emissions could be reduced because of (1) a more modern and cleaner burning construction equipment fleet mix than assumed in the CalEEMod, and/or (2) a less intensive buildout schedule (i.e., fewer daily emissions occurring over a longer time interval).

Operation

Operational emissions include mobile source emissions, energy emissions, and area source emissions from the proposed Depot. Mobile source emissions were quantified based on traffic volumes provided in the Traffic Impact Analysis prepared by Linscott, Law & Greenspan (TIA; Appendix F). CalEEMod defaults were used for the remaining operational inputs. See Appendix C for detailed modeling assumptions.

Significance Thresholds

The following thresholds are based on Appendix G of the *State CEQA Guidelines*. Impacts would be significant if the project would:

- Conflict with or obstruct implementation of the applicable air quality plan;
- Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is nonattainment under an applicable federal or state ambient air quality standard;
- Expose sensitive receptors to substantial pollutant concentrations; or
- Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people.

As stated in the *State CEQA Guidelines*, the significance criteria established by the regional air quality management or air quality pollution control district may be relied upon to make determinations. SBAPCD's recommended significance criteria are described in its *Environmental Review Guidelines* and are included below.

Construction Emissions Thresholds

APCD does not currently have quantitative thresholds of significance for short-term construction emissions. However, CEQA requires that the short-term impacts such as exhaust emissions from construction equipment and fugitive dust generation during grading be analyzed. SBAPCD recommends that construction-related NO_x, ROG, PM₁₀, and PM_{2.5} emissions, from diesel and gasoline powered equipment, paving, and other activities, be quantified.

According to the SBAPCD's *Scope and Content of Air Quality Sections in Environmental Documents*, SBAPCD uses 25 tons per year for all pollutants except for CO as a guideline for determining the significance of construction impacts (SBAPCD 2017).

Standard dust control measures must be implemented for any discretionary project involving earthmoving activities, regardless of size or duration. According to the SBAPCD, proper implementation of these required measures reduces fugitive dust emissions to a level that is less than significant (SBAPCD 2017). Therefore, all construction activity would be required to incorporate the SBAPCD requirements pertaining to minimizing construction-related emissions and demolition of existing structures. The City of Goleta also requires implementation of standard emission and dust control techniques for all construction, as outlined in the General Plan/Community Land Use Planning Policy (GP/CLUP) Policy CE 12.3

Operational Emissions Thresholds

As described in SBAPCD's *Scope and Content of Air Quality Sections in Environmental Documents* and in *Environmental Review Guidelines*, a project will have a significant air quality effect on the environment if operation would:

- Emit (from all sources, both stationary and mobile) more than 240 lbs/day for ROG and NO_x or more than 80 lbs/day for PM₁₀.
- Emit more than 25 lbs/day of NO_x or ROG from motor vehicle trips only.
- Cause or contribute to a violation of any California or National Ambient Air Quality Standard (except ozone).
- Exceed the APCD health risk public notification thresholds adopted by the APCD Board (10 excess cancer cases in a million for cancer risk and a Hazard Index of more than 1.0 for non-cancer risk).
- Be inconsistent with the latest adopted federal and state air quality plans for Santa Barbara County.

There is no daily operational threshold for CO. CO is in attainment and due to the relatively low background ambient CO levels in Santa Barbara County, localized CO impacts associated with congested intersections are not expected to exceed the CO health-related air quality standards (SBAPCD 2017).

b. Project Impacts and Mitigation Measures

Threshold: Would the project conflict with or obstruct implementation of the applicable air quality plan?
--

Impact AQ-1 THE PROJECT WOULD NOT DIRECTLY OR INDIRECTLY INCREASE GROWTH IN THE AREA AND WOULD HELP MEET VMT REDUCTION AND TRANSPORTATION CONTROL MEASURES SET FORTH IN SBAPCD'S 2019 OZONE PLAN. THERE WOULD BE NO IMPACTS.

The emission projections used to develop the SBAPCD 2019 Ozone Plan are based on growth profiles, vehicle trends and vehicle miles traveled (VMT). As such, projects that propose development that is consistent with the growth anticipated by the City's General Plan would be consistent with the Clean Air 2019 Ozone Plan. In addition, a project would be inconsistent with the 2019 Ozone Plan if it would fail to incorporate all applicable control measures and transportation control measures.

As discussed in Section 13, *Population and Housing*, of the Initial Study included as Appendix A, the proposed Depot would serve local and statewide residents utilizing Amtrak's Pacific Surfliner rail service to and from the Central Coast. The project has no residential or commercial uses and would not directly or indirectly increase population growth. In addition, one of the main goals of the project is to reduce overall VMT in the region, consistent with the 2019 Ozone Plan. The proposed Depot would provide amenities for train riders such as indoor waiting areas, restrooms, increased parking and drop-off locations, and improved safety features, which are expected to increase ridership on Amtrak's Pacific Surfliner. It is estimated the Depot would reduce overall VMT in the area by approximately six million miles per year (SBCAG 2018). The project would not conflict with the transportation control measures and would help implement transportation control measure T-5, *Improve Commuter Public Transit Service*. There are no other control measures in the 2019 Ozone Plan that are applicable to the proposed project. Therefore, the proposed project would not conflict with or obstruct the implementation of the 2019 Ozone Plan and there would be no impacts.

Mitigation Measures

No mitigation measures would be required.

Significance After Mitigation

No impacts would result.

Threshold: Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?

Impact AQ-2 CONSTRUCTION AND OPERATIONAL EMISSIONS WOULD NOT EXCEED SBAPCD'S THRESHOLDS AND WOULD COMPLY WITH ALL OF SBAPCD'S REQUIRED EMISSIONS REDUCTION MEASURES. THIS IMPACT WOULD BE LESS THAN SIGNIFICANT.

Construction

Construction of the Depot would generate temporary emissions of air pollutants. Ozone precursors (NO_x and ROG) as well as CO and diesel exhaust PM (exhaust PM_{2.5} and PM₁₀) would be emitted by construction equipment, while fugitive dust (PM₁₀) would be emitted by activities that disturb the soil, such as demolition, grading and excavation, road construction, and building construction. Table 4.1-4 shows the estimated maximum daily construction emissions each year during construction.

Table 4.1-4 Estimated Annual Construction Emissions

Construction Year	Maximum Emissions (pounds/day)					
	ROG	SO _x	NO _x	CO	PM ₁₀	PM _{2.5}
2022 Maximum	1.2	0.1	22.3	12.9	4.7	1.1
2023 Maximum	21.1	<0.1	6.5	7.3	0.4	0.3
Maximum	21.1	0.1	22.3	12.9	4.7	1.1
SBAPCD Regional Thresholds	25	-	25	-	25	25
Threshold Exceeded?	No	-	No	-	No	No

Source: CalEEMod Outputs, Appendix C

As shown in Table 4.1-4, the maximum potential annual construction emissions associated with the project would not exceed the SBCAPCD's guideline of 25 tons per year for all pollutants except for CO, which is used for determining significance of construction exhaust emissions. Therefore, impacts to air quality during pre-construction export and construction activities would not violate any air quality standards or contribute substantially to existing or projected air quality violations. In addition, SBCAPCD requires construction emissions and dust control measures for all projects involving earthmoving activities regardless of size or duration. According to the SBCAPCD's *Scope and Content of Air Quality Sections in Environmental Documents* (SBAPCD 2017), implementation of required dust control measures results in fugitive dust emissions that are less than significant. The measures include:

- During construction, use water trucks or sprinkler systems to keep all areas of vehicle movement damp enough to prevent dust from leaving the site. At a minimum, this should include wetting down such areas in the late morning and after work is completed for the day. Increased watering frequency should be required whenever the wind speed exceeds 15 mph. Reclaimed water should be used whenever possible. However, reclaimed water should not be used in or around crops for human consumption.
- Minimize amount of disturbed area and reduce on site vehicle speeds to 15 miles per hour or less.

- If importation, exportation and stockpiling of fill material is involved, soil stockpiled for more than two days should be covered, kept moist, or treated with soil binders to prevent dust generation. Trucks transporting fill material to and from the site should be tarped from the point of origin.
- Gravel pads should be installed at all access points to prevent tracking of mud onto public roads.
- After clearing, grading, earth moving or excavation is completed, treat the disturbed area by watering, or revegetating, or by spreading soil binders until the area is paved or otherwise developed so that dust generation will not occur.
- The contractor or builder should designate a person or persons to monitor the dust control program and to order increased watering, as necessary, to prevent transport of dust offsite. Their duties should include holiday and weekend periods when work may not be in progress. The name and telephone number of such persons should be provided to the Air Pollution Control District prior to grading/building permit issuance and/or map clearance.

The project would implement the above measures as construction best management practices. With implementation of SBAPCD construction and dust control measures, construction emission impacts would be less than significant.

Operation

Operational emissions are those associated with the general operation and use of the Depot after construction. Operational emissions are those associated with vehicle trips, natural gas use, and area sources, such as landscaping, consumption of consumer products, and off-gassing from architectural coatings. Emissions associated with Project-generated daily traffic were estimated based on the trip generation rates provided in the TIA. Table 4.1-5 shows the maximum daily operational emissions resulting from the operation of the Depot.

Table 4.1-5 Estimated Operation Emissions

Source	Maximum Emissions (pounds/day)				
	ROG	NO _x	CO	PM ₁₀	PM _{2.5}
Area Emissions	0.2	<0.1	<0.1	0	0
Mobile Emissions	0.5	1.4	3.0	0.9	0.2
Combined Emissions	0.7	1.4	3.9	0.9	0.2
Mobile Threshold	25	25	-	-	-
Combined Threshold	240	240	-	80	-
Exceed Thresholds?	No	No	-	No	-

Source: CalEEMod Outputs, Appendix C

As shown in Table 4.1-5, the emissions generated by operation of the proposed Depot would not exceed SBAPCD's regional thresholds for criteria pollutants. Therefore, the project would not contribute substantially to an existing or projected air quality violation and impacts would be less than significant.

Mitigation Measures

No mitigation measures would be required.

Significance After Mitigation

Impacts would be less than significant without mitigation.

Threshold: Would the project expose sensitive receptors to substantial pollutant concentrations?

Impact AQ-3 THE PROJECT DOES NOT INCLUDE ANY SENSITIVE USES AND WOULD NOT RESULT IN THE EMISSIONS OF TACS OR OTHER AIR CONTAMINANTS DURING CONSTRUCTION OR OPERATION WHICH WOULD SIGNIFICANTLY IMPACT SENSITIVE RECEPTORS. IMPACTS WOULD BE LESS THEN SIGNIFICANT.

Land uses such as schools, daycare centers, hospitals, or senior centers are sensitive to poor air quality conditions because infants, the elderly, and people with respiratory ailments are more susceptible to air quality-related health problems than the general public. Residential areas are also considered sensitive to air pollution because residents (including children and the elderly) tend to be at home for extended periods of time, resulting in sustained exposure to any pollutants present. The project does not propose a sensitive land use and the nearest sensitive receptors are residential neighborhoods located 500 feet north of the project site, across U.S. 101.

Criteria Pollutants

Construction and operation of the project would result in the release of criteria pollutants such as suspended particles, ozone, and carbon monoxide. As shown in Table 4.1-4 and Table 4.1-5, the project would not generate criteria air pollutant emissions that would exceed adopted SBAPCD emissions thresholds during construction or operational activities or project operation.

A CO hotspot is a localized concentration of CO that is above a CO ambient air quality standard. Localized CO hotspots can occur at intersections with heavy peak hour traffic. Specifically, hotspots can be created at intersections where traffic levels are sufficiently high such that the local CO concentration exceeds the federal one-hour standard of 35.0 ppm or the federal and state eight-hour standard of 9.0 ppm (CARB 2016). SBCAPCD is in conformance with state and federal CO standards, establishing low background concentrations of CO. As discussed in Section 4.5, *Transportation*, the project would have a relatively small trip generation of approximately 351 daily trips and the intersections in the area are not congested. Based on the low background level of CO in the project area, low trip generation and intersection operation in the area, improving vehicle emissions standards for new cars in accordance with state and federal regulations, and the project's low level of operational CO emissions, the project would not create new hotspots or contribute substantially to existing hotspots.

In addition, standard dust control measures would be implemented for the project pursuant to SBAPCD. Therefore, the project would not expose sensitive receptors to substantial criteria pollutant concentrations. Therefore, the project would not impact nearby sensitive receptors.

Toxic Air Contaminants

Construction-related activities would result in temporary project-generated emissions of DPM exhaust emissions from off-road, heavy-duty diesel equipment for site preparation, grading, building construction, and other construction activities (exhaust PM_{2.5} and PM₁₀). A majority of DPM emissions is in the form of PM_{2.5} while some is in the form of PM₁₀. DPM was identified as a toxic air contaminant (TAC) by CARB in 1998. Generation of DPM from construction projects typically occurs in a single area for a short period. According to the OEHHA, health risk assessments, which

determine the exposure of sensitive receptors to toxic emissions, should be based on a 70-year exposure period; however, such assessments should be limited to the period/duration of activities associated with the project.

The maximum DPM emissions would occur during site preparation and grading activities. These activities would last up to three months. DPM emissions would decrease for the remaining construction period because construction activities such as building construction and architectural coating would require less construction equipment. While the maximum DPM emissions associated with site preparation and grading activities would only occur for a portion of the overall construction period, these activities represent the estimated worst-case condition for the total construction period. This would represent less than one percent of the total exposure period for health risk calculation of 70 years. In addition, as shown in Table 4.1-4 under Impact AQ-2 above, PM_{2.5} and PM₁₀ emissions would not exceed SBAPCD thresholds during any stage of construction. Therefore, DPM emissions would not create DPM generated by project construction would not create conditions where the probability is greater than one in one million of contracting cancer for the Maximally Exposed Individual (the individual who would be the most at risk for exposure) or to generate ground-level concentrations of non-carcinogenic TACs that exceed a Hazard Index greater than one for the Maximally Exposed Individual. Emissions from construction activities would not result in significant health impacts.

Operation of the project would include the operation of the proposed Depot and would not result in DPM from off-road, heavy-duty diesel equipment which could create health impacts. Therefore, the project would not expose sensitive receptors to significant pollutant concentrations and impacts would be less than significant.

Mitigation Measures

No mitigation measures would be required.

Significance After Mitigation

Impacts would be less than significant without mitigation.

Threshold: Would the project result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?
--

Impact AQ-4 THE PROJECT DOES NOT CONTAIN USES THAT WOULD GENERATE SIGNIFICANT ODOR IMPACTS. THIS IMPACT WOULD BE LESS THAN SIGNIFICANT.

SBAPCD's *Scope and Content of Air Quality Sections in Environmental Documents* states that certain projects such as fast food restaurants, bakeries, and coffee roasting facilities may have the potential to cause significant odor impacts because of the nature of their operation and their location (SBAPCD 2017). Other uses that are typically associated with significant odor-generating impacts include wastewater treatment plants, landfills, confined animal facilities, composting stations, food manufacturing plants, refineries, and chemical plants.

Odors from construction activities are associated with construction equipment exhaust and the application of asphalt and architectural coatings. Odors emitted from construction activities would be temporary and cease upon completion of project construction. The proposed project does not contain uses that would emit odors and impact surrounding land uses. The train schedule and frequency would not be impacted by the project. The café space within the proposed depot would not result in generation of a high degree of nuisance odors, such as that could be associated with a high-volume food service facility, because it would not be a high-volume food facility. Therefore, impacts would be less than significant.

Mitigation Measures

No mitigation measures would be required.

Significance After Mitigation

Impacts would be less than significant without mitigation.

4.1.4 Cumulative Impacts

The planned and pending projects near the proposed project are listed in Table 3-1 (Section 3, *Environmental Setting*). Cumulative development in the City of Goleta and surrounding areas in the County of Santa Barbara and City of Santa Barbara have the potential to contribute to cumulatively significant impact related to existing exceedances of ambient air quality standard, which are the state 24-hour and annual standard for PM₁₀ and the state 1-hour and 8-hour standards for ozone.

Pursuant to Goleta CEQA thresholds, the project would have a significant cumulative impact if it were inconsistent with the adopted federal and state air quality plans of the region. As discussed in Impact AQ-1, the Project would be consistent with the growth assumptions within the 2019 Ozone Plan. In addition, because criteria pollutant emissions and regional thresholds are cumulative in nature and the proposed project's emissions would not exceed regional thresholds as discussed in Impact AQ-2, the project would not result in a cumulatively considerable net increase of criteria pollutants and cumulative impacts would be less than significant.

4.2 Greenhouse Gas Emissions

This section discusses the proposed project's potential impacts related to greenhouse gas (GHG) emissions and climate change. CalEEMod was used to model the project's GHG impact, which is included in this analysis and provided in Appendix C. The project's trip distribution rates used in emissions estimates are based on the Trip Impact Assessment prepared by Linscott, Law & Greenspan in August 2020 and included as Appendix F.

4.2.1 Setting

Climate Change and Greenhouse Gases

Climate change is the observed increase in the average temperature of Earth's atmosphere and oceans along with other substantial changes in climate (such as wind patterns, precipitation, and storms) over an extended period. The term "climate change" is often used interchangeably with the term "global warming," but "climate change" is preferred to "global warming" because it helps convey other changes in addition to rising temperatures. The baseline against which these changes are measured originates in historical records identifying temperature changes that have occurred in the past, such as during previous ice ages. The global climate changes continuously, as evidenced by repeated episodes of substantial warming and cooling documented in the geologic record. The rate of change has typically been incremental, with warming or cooling trends occurring over the course of thousands of years. The past 10,000 years have been marked by a period of incremental warming, as glaciers have steadily retreated across the globe. However, scientists have observed substantial acceleration in the rate of warming during the past 150 years (Intergovernmental Panel on Climate Change [IPCC] 2014). The understanding of anthropogenic warming and cooling influences on climate has led to a high confidence (95 percent or greater chance) that the global average net effect of human activities has been the dominant cause of warming since the mid-twentieth century (IPCC 2014).

Gases that absorb and re-emit infrared radiation in the atmosphere are called GHGs. The gases widely seen as the principal contributors to human-induced climate change include carbon dioxide (CO₂), methane (CH₄), nitrous oxides (N₂O), fluorinated gases such as hydrofluorocarbons and perfluorocarbons, and sulfur hexafluoride (SF₆). Water vapor is excluded from the list of GHGs because it only stays in the atmosphere for a short time and its atmospheric concentrations are largely determined by natural processes, such as oceanic evaporation.

Both natural processes and human activities emit GHGs. CO₂ and CH₄ are emitted in the greatest quantities from human activities. CO₂ emissions are largely by-products of fossil fuel combustion, whereas CH₄ results from off-gassing associated with agricultural practices and landfills. Observations of CO₂ concentrations, globally averaged temperature, and sea level rise are generally well within the range of the extent of the earlier IPCC projections. Recently observed increases in CH₄ and N₂O concentrations are smaller than those assumed in the scenarios in the previous assessments. Each IPCC assessment used new projections of future climate change that have become more detailed as the models have become more advanced.

Manmade GHGs include fluorinated gases, such as SF₆ many of which have greater heat-absorption potential than CO₂. Different types of GHGs have varying global warming potentials (GWP). The GWP of a GHG is the potential of a gas or aerosol to trap heat in the atmosphere over a specified timescale (generally 100 years). Because GHG absorb different amounts of heat, a common

reference gas (CO₂) is used to relate the amount of heat absorbed to the amount of the gas emissions, referred to as “carbon dioxide equivalent” (CO₂e), and is the amount of a GHG emitted multiplied by its GWP. CO₂ has a 100-year GWP of one. By contrast, CH₄ has a GWP of 25, meaning its global warming effect is 25 times greater than CO₂ on a molecule per molecule basis (IPCC 2007).

The accumulation of GHGs in the atmosphere regulates the earth’s temperature. Without the natural heat trapping effect of GHGs, Earth’s surface would be about 93 degrees °F cooler (California Environmental Protection Agency 2006). However, emissions from human activities, particularly the consumption of fossil fuels for electricity production and transportation, have elevated the concentration of these gases in the atmosphere beyond the level of naturally occurring concentrations.

Greenhouse Gas Inventory

Global

Worldwide anthropogenic emissions of GHG were approximately 46,000 million metric tons (MMT, or gigatonne) of CO₂e in 2010 (IPCC 2014). CO₂ emissions from fossil fuel combustion and industrial processes contributed about 65 percent of total emissions in 2010. Of anthropogenic GHGs, CO₂ was the most abundant accounting for 76 percent of total 2010 emissions. CH₄ emissions accounted for 16 percent of the 2010 total, while N₂O and fluorinated gases account for six and two percent, respectively (IPCC 2014).

Federal

Total United States GHG emissions were 6,456.7 MMT of CO₂e in 2017 (U.S. EPA 2019). Since 1990, total United States emissions have increased by an average annual rate of 0.04 percent, for a total increase of 1.3 percent since 1990. However, emissions decreased by 0.5 percent from 2016 to 2017. The decrease from 2016 to 2017 was a result of multiple factors, including (1) a continued shift from coal to natural gas and other non-fossil fuel energy sources in the electric power sector and (2) milder weather in 2017 resulting in overall decreased electricity usage. In 2017, the industrial and transportation end-use sectors accounted for 30 percent and 29 percent, respectively, of GHG emissions while the residential and commercial end-use sectors accounted for 15 percent and 16 percent of GHG emissions, respectively, with electricity emissions distributed among the various sectors.

California

Based on the CARB California GHG Inventory for 2000-2017, California produced 424.1 MMT of CO₂e in 2017. Transportation is the major source of GHG emissions in California, contributing 41 percent of the state’s total GHG emissions. The industrial sector is the second largest source, contributing 24 percent of the state’s GHG emissions, and electric power accounts for approximately 15 percent (CARB 2019). California emissions are due in part to its large size and large population compared to other states. In 2016, the State of California achieved its 2020 GHG emission reduction targets as emissions fell below 431 MMT of CO₂e (CARB 2019).

City of Goleta Emissions Inventory

The City of Goleta conducted a GHG emissions inventory in the City for 2007, which represents the baseline inventory, or existing conditions in the City. The inventory determined the City produced 325,532 MT CO₂e, excluding stationary sources, which is equivalent to the annual GHG emissions

generated by approximately 68,000 passenger vehicles (Goleta 2014). The major source of GHG emissions in the City are associated with transportation, which contributed 48 percent of the City's total GHG emissions, followed by building energy (electricity and natural gas use) at 44 percent (Goleta 2014).

Potential Effects of Climate Change

Globally, climate change has the potential to affect numerous environmental resources though potential impacts related to future air temperatures and precipitation patterns. Scientific modeling predicts that continued GHG emissions at or above current rates would induce more extreme climate changes during the 21st century than were observed during the 20th century. Long-term trends have found that each of the past three decades have been warmer than all the previous decades in the instrumental record, and the decade from 2000 through 2010 has been the warmest. The observed global mean surface temperature (GMST) for the decade from 2006 to 2015 was approximately 0.87 degrees Celsius (°C) (0.75°C to 0.99°C) higher than the average GMST over the period from 1850 to 1900. Furthermore, several independently analyzed data records of global and regional Land-Surface Air Temperature (LSAT) obtained from station observations are in agreement that LSAT as well as sea surface temperatures have increased. Due to past and current activities, anthropogenic GHG emissions are increasing global mean surface temperature at a rate of 0.2°C per decade. In addition to these findings, there are identifiable signs that global warming is currently taking place, including substantial ice loss in the Arctic over the past two decades (IPCC 2014 and 2018).

According to *California's Fourth Climate Change Assessment*, statewide temperatures from 1986 to 2016 were approximately 1°F to 2°F higher than those recorded from 1901 to 1960. Potential impacts of climate change in California may include loss in water supply from snowpack, sea level rise, more extreme heat days per year, more large forest fires, and more drought years (State of California 2018). While there is growing scientific consensus about the possible effects of climate change at a global and statewide level, current scientific modeling tools are unable to predict what local impacts may occur with a similar degree of accuracy. In addition to statewide projections, *California's Fourth Climate Change Assessment* includes regional reports that summarize climate impacts and adaptation solutions for nine regions of the state as well as regionally-specific climate change case studies (State of California 2018). Below is a summary of some of the potential effects that could be experienced in California and the Central Coast region as a result of climate change.

Air Quality

Higher temperatures, which are conducive to air pollution formation, could worsen air quality in California. Climate change may increase the concentration of ground-level ozone, but the magnitude of the effect, and therefore its indirect effects, are uncertain. As temperatures have increased in recent years, the area burned by wildfires throughout the state has increased, and wildfires have been occurring at higher elevations in the Sierra Nevada Mountains (State of California 2018). If higher temperatures continue to be accompanied by an increase in the incidence and extent of large wildfires, air quality would worsen. However, if higher temperatures are accompanied by wetter, rather than drier conditions, the rains would tend to temporarily clear the air of particulate pollution and reduce the incidence of large wildfires, thereby ameliorating the pollution associated with wildfires. Additionally, severe heat accompanied by drier conditions and poor air quality could increase the number of heat-related deaths, illnesses, and asthma attacks throughout the state (California Natural Resources Agency 2009).

Water Supply

Analysis of paleoclimatic data (such as tree-ring reconstructions of stream flow and precipitation) indicates a history of naturally and widely varying hydrologic conditions in California and the west, including a pattern of recurring and extended droughts. Uncertainty remains with respect to the overall impact of climate change on future precipitation trends and water supplies in California. This uncertainty regarding future precipitation trends complicates the analysis of future water demand, especially where the relationship between climate change and its potential effect on water demand is not well understood. However, the average early spring snowpack in the western United States, including the Sierra Nevada Mountains, decreased by about 10 percent during the last century. During the same period, sea level rose over 5.9 inches along the central and southern California coast (State of California 2018). The Sierra snowpack provides the majority of California's water supply by accumulating snow during the state's wet winters and releasing it slowly during the state's dry springs and summers. A warmer climate is predicted to reduce the fraction of precipitation falling as snow and result in less snowfall at lower elevations, thereby reducing the total snowpack (DWR 2008; State of California 2018). The State of California projects that average spring snowpack in the Sierra Nevada and other mountain catchments in central and northern California will decline by approximately 66 percent from its historical average by 2050 (State of California 2018).

Hydrology and Sea Level Rise

As discussed above, climate change could potentially affect the amount of snowfall, rainfall, and snow pack; the intensity and frequency of storms; flood hydrographs (flash floods, rain or snow events, coincidental high tide and high runoff events); sea level rise and coastal flooding; coastal erosion; and the potential for salt water intrusion. Climate change has the potential to induce substantial sea level rise in the coming century (State of California 2018). The rising sea level increases the likelihood and risk of flooding. The rate of increase of global mean sea levels over the 2001-2010 decade, as observed by satellites, ocean buoys and land gauges, was approximately 3.2 mm per year, which is double the observed 20th century trend of 1.6 mm per year (World Meteorological Organization [WMO] 2013). As a result, global mean sea levels averaged over the last decade were about 8 inches higher than those of 1880 (WMO 2013). Sea levels are rising faster now than in the previous two millennia, and the rise is expected to accelerate, even with robust GHG emission control measures. The most recent IPCC report predicts a mean sea-level rise of 10 to 37 inches by 2100 (IPCC 2018). A rise in sea levels could completely erode 31 to 67 percent of southern California beaches, result in flooding of approximately 370 miles of coastal highways during 100-year storm events, jeopardize California's water supply due to salt water intrusion, and induce groundwater flooding and/or exposure of buried infrastructure (State of California 2018). In addition, increased CO₂ emissions can cause oceans to acidify due to the carbonic acid it forms. Increased storm intensity and frequency could affect the ability of flood-control facilities, including levees, to handle storm events.

Wildfire

Climate change and the potential resulting changes in weather patterns could have ecological effects on a global and local scale. Increasing concentrations of GHGs are likely to accelerate the rate of climate change. Scientists project that the annual average maximum daily temperatures in California could rise by 4.4 to 5.8°F in the next 50 years and by 5.6 to 8.8°F in the next century (State of California 2018a). Soil moisture is likely to decline in many regions, and intense rainstorms are likely to become more frequent. Rising temperatures could have four major impacts on plants and animals related to (1) timing of ecological events; (2) geographic distribution and range; (3) species'

composition and the incidence of nonnative species within communities; and (4) ecosystem processes, such as carbon cycling and storage (Parmesan 2006; State of California 2018). Many of the impacts identified above would impact ecosystems and wildlife in the Central Coast region. Increases in wildfire would further remove sensitive habitat; increased severity in droughts would potentially starve plants and animals of water; and sea level rise will affect sensitive coastal ecosystems.

Agriculture

California has a \$50 billion annual agricultural industry that produces over a third of the country's vegetables and two-thirds of the country's fruits and nuts (California Department of Food and Agriculture 2018). Higher CO₂ levels can stimulate plant production and increase plant water-use efficiency. However, if temperatures rise and drier conditions prevail, certain regions of agricultural production could experience water shortages of up to 16 percent; water demand could increase as hotter conditions lead to the loss of soil moisture; crop-yield could be threatened by water-induced stress and extreme heat waves; and plants may be susceptible to new and changing pest and disease outbreaks (State of California 2018). In addition, temperature increases could change the time of year certain crops, such as wine grapes, bloom or ripen, and thereby affect their quality (California Climate Change Center 2006).

Ecosystems and Wildlife

Climate change and the potential resulting changes in weather patterns could have ecological effects on a global and local scale. Increasing concentrations of GHGs are likely to accelerate the rate of climate change. Scientists project that the annual average maximum daily temperatures in California could rise by 4.4 to 5.8°F in the next 50 years and by 5.6 to 8.8°F in the next century (State of California 2018). Soil moisture is likely to decline in many regions, and intense rainstorms are likely to become more frequent. Rising temperatures could have four major impacts on plants and animals related to (1) timing of ecological events; (2) geographic distribution and range; (3) species' composition and the incidence of nonnative species within communities; and (4) ecosystem processes, such as carbon cycling and storage (Parmesan 2006; State of California 2018).

4.2.2 Regulatory Setting

Federal Regulations

Federal GHG Emissions Regulation

The U.S. Supreme Court in *Massachusetts et al. v. Environmental Protection Agency et al.* ([2007] 549 U.S. 05-1120) held that the U.S. EPA has the authority to regulate motor-vehicle GHG emissions under the federal Clean Air Act. The U.S. EPA issued a Final Rule for mandatory reporting of GHG emissions in October 2009. This Final Rule applies to fossil fuel suppliers, industrial gas suppliers, direct GHG emitters, and manufacturers of heavy-duty and off-road vehicles and vehicle engines and requires annual reporting of emissions. In 2012, the U.S. EPA issued a Final Rule that establishes the GHG permitting thresholds that determine when CAA permits under the New Source Review Prevention of Significant Deterioration (PSD) and Title V Operating Permit programs are required for new and existing industrial facilities.

In 2014, the U.S. Supreme Court in *Utility Air Regulatory Group v. EPA* (134 S. Ct. 2427 [2014]) held that U.S. EPA may not treat GHGs as an air pollutant for purposes of determining whether a source

is a major source required to obtain a PSD or Title V permit. The Court also held that PSD permits that are otherwise required (based on emissions of other pollutants) may continue to require limitations on GHG emissions based on the application of BACT.

California Regulations

CARB is responsible for the coordination and oversight of State and local air pollution control programs in California. California has numerous regulations aimed at reducing the state's GHG emissions. These initiatives are summarized below.

Assembly Bill 1493

AB 1493 (2002), California's Advanced Clean Cars program (referred to as Pavley), requires CARB to develop and adopt regulations to achieve "the maximum feasible and cost-effective reduction of GHG emissions from motor vehicles." On June 30, 2009, U.S. EPA granted the waiver of CAA preemption to California for its GHG emission standards for motor vehicles beginning with the 2009 model year. Pavley I regulates model years from 2009 to 2016 and Pavley II, which is now referred to as "LEV (Low Emission Vehicle) III GHG", regulates model years from 2017 to 2025. The Advanced Clean Cars program coordinates the goals of the LEV, Zero Emissions Vehicles, and Clean Fuels Outlet programs, and would provide major reductions in GHG emissions. By 2025, when the rules will be fully implemented, new automobiles will emit 34 percent fewer GHGs and 75 percent fewer smog-forming emissions from their model year 2016 levels (CARB 2011).

Assembly Bill 32

California's major initiative for reducing GHG emissions is outlined in AB 32, the "California Global Warming Solutions Act of 2006," which was signed into law in 2006. AB 32 codifies the statewide goal of reducing GHG emissions to 1990 levels by 2020 and requires CARB to prepare a Scoping Plan that outlines the main State strategies for reducing GHGs to meet the 2020 deadline. AB 32 requires CARB to adopt regulations to require reporting and verification of statewide GHG emissions. Based on this guidance, CARB approved a 1990 statewide GHG level and 2020 limit of 427 million MTCO₂e. The Scoping Plan was approved by CARB on December 11, 2008 and included measures to address GHG emission reduction strategies related to energy efficiency, water use, and recycling and solid waste, among other measures. Many of the GHG reduction measures included in the Scoping Plan (e.g., Low Carbon Fuel Standard, Advanced Clean Car standards, Cap-and-Trade, etc.) have been adopted since approval of the Scoping Plan.

Senate Bill 32

SB 32, signed into law on September 8, 2016, extends AB 32 by requiring the State to further reduce GHGs to 40 percent below 1990 levels by 2030 (the other provisions of AB 32 remain unchanged). On December 14, 2017, CARB adopted the 2017 Scoping Plan, which provides a framework for achieving the 2030 target. The 2017 Scoping Plan relies on the continuation and expansion of existing policies and regulations, such as the Cap-and-Trade Program, as well as implementation of recently adopted policies and policies, such as SB 350 and SB 1383 (see below). The 2017 Scoping Plan also puts an increased emphasis on innovation, adoption of existing technology, and strategic investment to support its strategies. As with the 2013 Scoping Plan Update, the 2017 Scoping Plan does not provide project-level thresholds for land use development. Instead, it recommends that local governments adopt policies and locally appropriate quantitative thresholds consistent with statewide per capita goals of six MTCO₂e by 2030 and two MTCO₂e by 2050 (CARB 2017). As stated

in the 2017 Scoping Plan, these goals may be appropriate for plan-level analyses (city, county, sub-regional, or regional level), but not for specific individual projects because they include all emissions sectors in the State (CARB 2017).

Senate Bill 100

Adopted on September 10, 2018, SB 100 supports the reduction of GHG emissions from the electricity sector by accelerating the State’s Renewables Portfolio Standard (RPS) Program, which was last updated by SB 350 in 2015. SB 100 requires electricity providers to increase procurement from eligible renewable energy resources to 33 percent of total retail sales by 2020, 60 percent by 2030, and 100 percent by 2045.

Senate Bill 97

Senate Bill (SB) 97, signed in August 2007, acknowledges that climate change is an environmental issue that requires analysis in CEQA documents. In March 2010, the California Natural Resources Agency (Resources Agency) adopted amendments to the State CEQA Guidelines for the feasible mitigation of GHG emissions or the effects of GHG emissions. The adopted guidelines give lead agencies the discretion to set quantitative or qualitative thresholds for the assessment and mitigation of GHG and climate change impacts.

Senate Bill 375

SB 375, signed in August 2008, enhances the state’s ability to reach AB 32 goals by directing CARB to develop regional GHG emission reduction targets to be achieved from passenger vehicles by 2020 and 2035. In addition, SB 375 directs each of the state’s 18 major Metropolitan Planning Organizations (MPOs) to prepare a “sustainable communities strategy” (SCS) that contains a growth strategy to meet these emission targets for inclusion in the Regional Transportation Plan (RTP). On March 22, 2018, CARB adopted updated regional targets for reducing GHG emissions from 2005 levels by 2020 and 2035. The Association of Bay Area Governments (ABAG) was assigned targets of a 10 percent reduction in GHGs from transportation sources by 2020 and a 19 percent reduction by 2035 (CARB 2018b). ABAG’s Plan Bay Area RTP/SCS per-capita CO₂ emissions reductions meet and exceed the SB 375 target for year 2035 due to robust funding of the Climate Initiatives Program.

Senate Bill 1383

Adopted in September 2016, SB 1383 requires CARB to approve and begin implementing a comprehensive strategy to reduce emissions of short-lived climate pollutants. The bill requires the strategy to achieve the following reduction targets by 2030:

- Methane – 40 percent below 2013 levels
- Hydrofluorocarbons – 40 percent below 2013 levels
- Anthropogenic black carbon – 50 percent below 2013 levels

The bill also requires the California Department of Resources Recycling and Recovery (CalRecycle), in consultation with the CARB, to adopt regulations that achieve specified targets for reducing organic waste in landfills.

Executive Order S-B-05

In Jun 2005, the former Governor Arnold Schwarzenegger issued Executive Order S-B-05, which established statewide greenhouse gas reduction targets of 1990 levels by 2020 and 80 percent below 1990 levels by 2050.

Executive Order B-55-18

On September 10, 2018, the governor issued Executive Order B-55-18, which established a new statewide goal of achieving carbon neutrality by 2045 and maintaining net negative emissions thereafter. This goal is in addition to the existing statewide GHG reduction targets established by SB 375, SB 32, SB 1383, and SB 100.

California Integrated Waste Management Act (Assembly Bill 341)

The California Integrated Waste Management Act of 1989, as modified by AB 341, requires each jurisdiction's source reduction and recycling element to include an implementation schedule that shows: diversion of 25 percent of all solid waste by January 1, 1995, through source reduction, recycling, and composting activities; diversion of 50 percent of all solid waste on and after January 1, 2000; and diversion of 75 percent of all solid waste by 2020, and annually thereafter. CalRecycle is required to develop strategies to implement AB 341, including source reduction.

California Building Standards Code

The California Code of Regulations, Title 24, is referred to as the California Building Code. It consists of a compilation of several distinct standards and codes related to building construction including plumbing, electrical, interior acoustics, energy efficiency, handicap accessibility, and so on. The California Building Code's energy efficiency and green building standards are outlined below.

PART 6 – BUILDING ENERGY EFFICIENCY STANDARDS

The California Code of Regulations, Title 24, Part 6 is the Building Energy Efficiency Standards. This code, originally enacted in 1978, establishes energy-efficiency standards for non-residential buildings to reduce California's energy demand. The Building Energy Efficiency Standards is updated periodically to incorporate and consider new energy-efficiency technologies and methodologies as they become available. New construction and major renovations must demonstrate their compliance with the current Building Energy Efficiency Standards through submission and approval of a Title 24 Compliance Report to the local building permit review authority and the California Energy Commission (CEC).

The 2019 standards focus on these key areas: updated thermal envelope standards (preventing heat transfer from the interior to exterior and vice versa); nonresidential ventilation requirements; and nonresidential lighting requirements (CEC 2019). Under the 2019 standards, nonresidential buildings would be 30 percent more energy efficient compared to the 2016 standards (CEC 2019).

PART 11 – CALIFORNIA GREEN BUILDING STANDARDS

The California Green Building Standards Code, referred to as CALGreen, was added to Title 24 as Part 11 first in 2009 as a voluntary code, which then became mandatory effective January 1, 2011 (as part of the 2010 California Building Code). The 2016 CALGreen institutes mandatory minimum environmental performance standards for all ground-up new construction of non-residential structures. It also includes voluntary tiers (I and II) with stricter environmental performance

standards for these same categories of residential and non-residential buildings. Local jurisdictions must enforce the minimum mandatory Green Building Standards and may adopt additional amendments for stricter requirements.

The mandatory standards require the following practices:

1. 20 percent reduction in indoor water use relative to specified baseline levels
2. 50 percent construction/demolition waste diverted from landfills
3. Inspections of energy systems to ensure optimal working efficiency
4. Use of low pollutant emitting exterior and interior finish materials such as paints, carpets, vinyl flooring, and particleboards
5. Implementation of dedicated circuitry to facilitate installation of electric vehicle (EV) charging stations in newly constructed attached garages for single-family and duplex dwellings
6. Installation of EV charging stations at least three percent of the parking spaces for all new multi-family developments with 17 or more units

The voluntary standards require the following:

1. Tier I—15 percent improvement in energy requirements, stricter water conservation requirements for specific fixtures, 65 percent reduction in construction waste, 10 percent recycled content, 20 percent permeable paving, 20 percent cement reduction, cool/solar reflective roof
2. Tier II—30 percent improvement in energy requirements, stricter water conservation requirements for specific fixtures, 75 percent reduction in construction waste, 15 percent recycled content, 30 percent permeable paving, and 30 percent cement reduction, cool/solar reflective roof

Similar to the compliance reporting procedure for demonstrating Building Energy Efficiency Standards compliance in new buildings and major renovations, compliance with the CALGreen water-reduction requirements must be demonstrated through completion of water use reporting forms for new low-rise residential and non-residential buildings. Buildings must demonstrate a 20 percent reduction in indoor water use by either showing a 20 percent reduction in the overall baseline water use as identified in CALGreen or a reduced per-plumbing-fixture water use rate.

Local Regulations

Goleta Climate Action Plan

Adopted in July of 2014, the City of Goleta's Climate Action Plan (CAP; Goleta 2014) sets a 2020 target to achieve a 11 percent reduction below 2007 community-wide emissions. The CAP also has a 2030 target that is derived based on the linear trajectory between the 2020 reduction target and the 2050 target established by Executive Order S-3- 05, which sets a 2030 target of 26 percent below 2020 levels. The CAP contains GHG reduction measures for building energy efficiency, renewable energy, on-road transportation use, water consumption, off-road transportation equipment, solid waste generation, and municipal measures to meet the GHG reduction targets.

Goleta General Plan/Coastal Land Use Plan

The City of Goleta General Plan Conservation Element (Goleta 2006) is intended to guide land use planning by providing goals and policies to reduce GHG emissions. Goals and policies that are applicable to the project include:

Policy CE 13 Energy Conservation: To promote energy efficiency in future land use and development within Goleta, encourage use of renewable energy sources, and reduce reliance upon fossil fuels

CE 13.4 Energy Conservation for City Facilities and Operations: The City shall implement energy conservation requirements for City-owned facilities at the time of major improvements. Energy conservation measures may include energy-efficient interior and exterior building lighting, energy-efficient street lighting, natural ventilation and solar hot water systems, and landscaping with drought-tolerant species and deciduous trees to shade streets and the south and west sides of buildings in summer. For all City construction projects, the City shall comply with the state's energy conservation building standards set forth in Title 24. The City vehicle fleet shall use a mix of fuels that best achieves energy efficiency while meeting operational needs.

Policy CE 15 Water Conservation and Materials Recycling: To conserve scarce water supply resources and to encourage reduction in the generation of waste materials at the source and recycling of waste materials

CE 15.2 Water Conservation for City Facilities: In order to minimize water use, the City shall upgrade City-owned facilities with low water use plumbing fixtures, water conserving landscaping, low flow irrigation, and reclaimed water for exterior landscaping at the time of major improvements.

CE 15.5 Reduction of Construction Wastes: In instances where demolitions of existing buildings and structures are authorized, it is encouraged that such structures be deconstructed and that structural components, fixtures, and materials be salvaged for future reuse. Provisions for recycling of waste materials at all construction sites, including and demolition sites shall be required

Goleta Green Building Program

The City's Green Building Program took effect January 1, 2013 and was incorporated into Chapter 15.12 of the Goleta Municipal Code. The Program contains voluntary measures and incentives for projects utilizing green building practices. Under the Green Building Program, the City adopted a Green Building Policy under Resolution No. 12-65 for new municipal facilities, which states all new City-owned buildings of 2,000 square feet or greater must meet LEED Silver certification standards except in limited instances.

4.2.3 Impact Analysis

a. Methodology and Significance Thresholds

Methodology

Calculations of CO₂, CH₄, and N₂O emissions are provided to identify the magnitude of potential project effects. The analysis focuses on CO₂, CH₄, and N₂O because these make up 98 percent of all

GHG emissions by volume (IPCC 2014) and are the GHGs the project would emit in the largest quantities. Emissions of all GHGs are converted into their equivalent GWP in terms of CO₂ (CO₂e). Minimal amounts of other GHGs (such as chlorofluorocarbons [CFCs]) would be emitted; however, these other GHG emissions would not substantially add to the total calculated CO₂e amounts. GHG emissions from construction and operation of the project were estimated using CalEEMod version 2016.3.2 based on project-specific information. The input data and subsequent construction and operation GHG emission estimates for development facilitated by the project are discussed below, and the CalEEMod output files are included in Appendix C.

Construction Emissions

Project construction emissions were estimated based on:

- anticipated start and finish dates of construction activity
- inventories of construction equipment to be used
- areas to be excavated and graded
- volumes of materials to be exported from and imported to the project site.

The analysis assessed maximum daily emissions from individual construction activities, including demolition, site preparation, grading, building construction, paving, and architectural coating. The model assumed the depot structure would be 9,000 square-feet as a conservative approach. The model also assumed up to 15,000 square-feet of soil export during construction, and construction equipment estimates used CalEEMod defaults, which are based on surveys of construction projects within California conducted by members of CAPCOA (CAPCOA 2017).

Operational Emissions

CalEEMod provides operational emissions of CO₂, CH₄, and N₂O. Emissions from energy use include electricity and natural gas use. The emissions factors for natural gas combustion are based on EPA's AP-42 (*Compilation of Air Pollutant Emissions Factors*) and CCAR General Reporting Protocol. Electricity emissions are calculated by multiplying the energy use times the carbon intensity of the utility district per kilowatt hour (CAPCOA 2017). Electricity emissions are calculated by multiplying the energy use times the carbon intensity of the utility district per kilowatt hour (CAPCOA 2017).

Emissions from area sources, including consumer products, landscape maintenance equipment, and architectural coating were calculated in CalEEMod and utilize standard emission rates from CARB, U.S. EPA, and emission factor values provided by the local air district (CAPCOA 2017). Emissions from waste generation were also calculated in CalEEMod and are based on the IPCC's methods for quantifying GHG emissions from solid waste using the degradable organic content of waste (CAPCOA 2017). Waste disposal rates by land use and overall composition of municipal solid waste in California was primarily based on data provided by CalRecycle. Emissions from water and wastewater usage calculated in CalEEMod were based on the default electricity intensity from the CEC's 2006 Refining Estimates of Water-Related Energy Use in California using the average values for northern and southern California.

Mobile source emissions were quantified based on the Traffic Impact Analysis prepared by Linscott, Law & Greenspan. Because CalEEMod does not calculate N₂O emissions from mobile sources, N₂O emissions were quantified using guidance from CARB and the Emission FACTors (EMFAC) 2017 Emissions Inventory for the Santa Barbara County region for the year 2030 using the EMFAC2011 categories.

Non-residential energy usage was reduced by 30 percent to account for the requirements of 2019 Title 24 standards (CEC 2019). In addition, CalEEMod does not incorporate water use reductions achieved by 2016 CALGreen, which requires a 20 percent increase in indoor water use efficiency. Thus, in order to account for compliance with CALGreen, a 20 percent reduction in indoor water use was included in the water consumption calculations. i.e., AB 341).

The project would be served by Southern California Edison (SCE). Therefore, SCE’s energy intensity factors (i.e., the amount of CO₂, CH₄, and N₂O emitted per megawatt-hour supplied) were used to calculate GHG emissions. As of 2012, SCE procured 20.6 percent of its electricity from renewable sources (SCE 2012). Per SB 100, the statewide Renewables Portfolio Standard (RPS), one of California’s programs for advancing renewable energy, requires electricity providers to increase procurement from eligible renewable energy sources to 33 percent by 2020 and 60 percent by 2030. The default SCE energy intensity factors included in CalEEMod are based on data from 2012. Therefore, the 2012 intensity factor of 702 pounds per megawatt hour (MWh) for CO₂e was used to calculate energy intensity in 2030 in compliance with the RPS Program. As the project’s GHG threshold is based upon 2030 goals (as described further below), this 2030 energy factor was included in CalEEMod for the proposed project scenario. SCE energy intensity factors that include this reduction are shown in Table 4.2-1.

Table 4.2-1 SCE Energy Intensity Factors

	2012 ¹ (lbs/MWh)	2030 (lbs/MWh)
Percent Procurement	20.6	60
Carbon dioxide (CO ₂)	702.44	353.87
Methane (CH ₄)	0.029	0.015
Nitrous Oxide (N ₂ O)	0.006	0.003

¹ SCE 2012

Significance Thresholds

CEQA Guidelines section 15126.2(a) clarifies that an EIR shall focus analysis on the significant effects of a proposed project on the environment. CEQA Guidelines section 15064.4 requires a lead agency to describe, calculate, or estimate the amount of GHG emissions resulting from a project. The lead agency is given discretion whether to:

1. Quantify GHG emissions resulting from a project, and/or
2. Rely on a qualitative analysis or performance-based standards.

The revisions to CEQA Guidelines section 15064.4.(2)(b) clarify that in determining the significance of a project’s greenhouse gas emissions, the lead agency should focus its analysis on the reasonably foreseeable incremental contribution of the project’s emissions to the effects of climate change. A project’s incremental contribution may be cumulatively considerable even if it appears relatively small compared to statewide, national or global emissions. Section 15064.4(b) states that a lead agency should consider the following factors when determining the significance of impacts from GHG emissions on the environment:

1. The extent to which the project may increase or reduce GHG emissions as compared to the existing environmental setting;

2. Whether the project emissions exceed a threshold of significance that the lead agency determines applies to the project; and
3. The extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of GHG emissions.

The lead agency has discretion to select a model or methodology it considers most appropriate to enable decision makers to intelligently account for the project’s incremental contribution to climate change. Currently, neither the State of California nor the City of Goleta has established CEQA significance thresholds for GHG emissions.

In June 2010, the Bay Area Air Quality Management District (BAAQMD) became the first regulatory agency in the nation to approve guidelines that establish thresholds of significance for GHG emissions. These thresholds are summarized in Table 4.2-2.

Table 4.2-2 BAAQMD GHG Emissions Thresholds

GHG Emission Source Categories	Operational Emissions
Land Use Development Projects	1,100 Metric Ton (MT) CO ₂ e/yr or 4.6 MT CO ₂ e/SP/yr
Stationary Source Projects	10,000 MT CO ₂ e /yr

Land use development projects include residential, commercial, industrial, and public land uses and facilities.
 SP = Service Population (residents + employees).
 Stationary Sources include land uses that would accommodate processes and equipment that emit GHG emissions and would require an Air District permit to operate

On June 10, 2010, the Santa Barbara County Planning & Development Department produced a memorandum “Support for Use of Bay Area Air Quality Management District Greenhouse Gas Emissions Standards,” which states, “while Santa Barbara County land use patterns differ from those in the Bay Area as a whole, Santa Barbara County is similar to certain Bay Area counties (Sonoma, Solano, and Marin) in terms of population growth, land use patterns, General Plan/Coastal Land Use Plan policies, and average commute patterns and times. Because of these similarities, the methodology used by BAAQMD to develop its GHG emission significance thresholds, as well as the thresholds themselves, have applicability to Santa Barbara County and represent the best available interim standards for Santa Barbara County.”

The City of Goleta is located in Santa Barbara County and shares meteorological attributes, as well as similar land use patterns and policies, and thresholds deemed applicable in Santa Barbara County would also reasonably apply to projects within the City Goleta. The City has consistently relied on these standards as the methodology for establishing a threshold for analyzing the potential greenhouse gas impacts of a project. Therefore, this analysis uses the BAAQMD/Santa Barbara County Interim Thresholds of Significance to determine the significance of GHG emissions related to this project, based on the 1,100 MT CO₂e/year threshold for commercial land uses. There is no BAAQMD threshold of significance for construction emissions.

SB 32 and Executive Order (EO) S-3-05 extend the state’s GHG reduction goals to meet a state goal of reducing GHG emissions to 1990 levels by 2020, 40 percent below 1990 levels by 2030, and 80 percent below 1990 levels by 2050. Since SB 32 requires the state to reduce GHG levels by 40 percent below 1990 levels by the year, a reasonable SB 32-based working threshold would be 40

percent below the 1,100 MTCO₂e BAAQMD/Santa Barbara County Interim Threshold or $1,100 \times 0.6 = 660$ MTCO₂e. Therefore, for the purpose of evaluating the significance of GHG emissions for a project with a buildout year after 2020, a project estimated to generate 660 MTCO₂e or more GHG emissions would have a significant adverse impact that is cumulatively considerable.

b. Project Impact Analysis

Threshold: Would the project generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment?

Impact GHG-1 THE PROJECT'S CONSTRUCTION AND OPERATIONAL GHG EMISSIONS WOULD NOT EXCEED ESTABLISHED GHG THRESHOLDS. IN ADDITION, THE PROJECT WOULD INDIRECTLY REDUCE REGIONAL GHG EMISSIONS AND VEHICLE MILES TRAVELED. IMPACT WOULD BE LESS THAN SIGNIFICANT (CLASS III).

Construction Emissions

Project construction would generate temporary GHG emissions primarily from diesel-powered construction equipment as well as from vehicles transporting construction workers to and from the project site and heavy trucks to transport building materials and construction equipment. The City of Goleta nor SBCAPCD have adopted significance criteria for construction activities. Therefore, this analysis amortizes construction emissions over the project's lifetime (typically assumed to be 30 years) and adds them to the operational emissions for comparison to the 660 MT CO₂e per year identified above to determine significance. Estimated annual construction-related GHG emissions are shown in Table 4.2-3.

Table 4.2-3 Estimated Construction Emissions of Greenhouse Gases

Construction Year	Annual Emissions MT CO ₂ e
2022	136.3
2023	77.1
Total	213.4
Amortized over 30 years	7.1

Notes: See Appendix C for modeling results. Some numbers may not add up precisely due to rounding considerations.

As shown in Table 4.2-3, project construction would emit approximately 213.4 MT of CO₂e over the construction period, or approximately 7.1 MT of CO₂e per year when amortized over a 30-year period (the assumed minimum project lifetime).

Combined Annual Emissions

The operation of the proposed Depot would generate long-term GHG emissions from new vehicle trips (mobile emissions) to the site, combustion of natural gas and use of electricity (energy emissions), solid waste disposal, water use, and consumer products, architectural coatings, and landscaping equipment (area emissions). Table 4.2-4 summarizes and combines the amortized construction and operational GHG emissions associated with the project.

Table 4.2-4 Estimated Combined Annual GHG Emissions

Emission Source	Emissions (MT CO₂e per year)
Construction	
Amortized over 30 years	7.1
Operational	
Area	<1
Energy	16.1
Solid Waste	4.4
Water	1.0
Mobile ¹	137.5
Total	166.2

¹ Includes N₂O emissions

Source: Appendix C for CalEEMod results

As shown in Table 4.2-4, the project would produce approximately 166 MT CO₂e per year, which would not exceed the established threshold of 660 MT CO₂e per year. In addition, pursuant to City of Goleta Resolution No. 12-65, the project could be required to achieve LEED Silver certification, which could result in fewer annual emissions than estimated due to increased energy savings. The Depot would also replace an existing warehouse, which currently emits GHG emissions through area, energy, solid waste, water, and mobile sources. Also, as discussed in Section 2, *Project Description*, one of the main goals of the project is to reduce regional GHG emissions through increasing train ridership and reducing vehicle miles travelled in the region. According to the Transit and Capital Rail Capital Program application from SBCAG, the project could reduce regional GHG emissions by approximately 525,000 MT CO₂e through implementation (SBCAG 2018). Therefore, the project's GHG emissions would be less than significant.

Mitigation Measures

No mitigation measures would be required.

Significance After Mitigation

Impacts would be less than significant without mitigation.

Threshold: Would the project conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Impact GHG-2 THE PROPOSED PROJECT WOULD NOT CONFLICT WITH APPLICABLE POLICIES OR PLANS AND IMPACTS WOULD BE LESS THAN SIGNIFICANT (CLASS III).

The proposed project was evaluated for consistency with applicable local and State plans that were developed with the intent of reducing GHG emissions. Each applicable plan is discussed separately below.

2017 Scoping Plan

Development facilitated by the project would be consistent with these goals through project design, which includes complying with the latest Title 24 Green Building Code and Building Efficiency Energy Standards. As the goal of the project is to increase residents in urban areas to increase use of alternative modes of transportation for work, school, and recreational activities, it would have the effect of reducing vehicle trips and therefore GHG emissions associated with fossil fuel use. This supports 2017 Scoping Plan goals for the encouragement of alternative transportation use and VMT reduction. Therefore, the project would be consistent with the 2017 Climate Change Scoping Plan.

City of Goleta Climate Action Plan

The City’s CAP is a long-range plan to reduce GHG emissions from city government operations and community activities within Goleta. The CAP is a qualified GHG reduction plan consistent with State CEQA Guidelines Section 15183.5 through year 2020. The CAP also identified an emission reduction target for 2030 and presents an emissions reductions scenario to achieve the target, under the auspices of the Executive Order S-3-05. The City’s 2020 GHG forecast predicts that On-Road Transportation and Land Use will account for approximately 42 percent of the City’s GHG emissions.

The City’s CAP contains policies and programs targeting energy efficiency. As demonstrated in Table 4.2-5, the project would be consistent with the City’s CAP Energy policies that are relevant to this project. As such, the project would not conflict with or obstruct a state or local plan for renewable energy or energy efficiency, and there would be no impact.

Table 4.2-5 Project Consistency with Applicable Climate Action Plan Policies

Policies	Project Consistency
Chapter 3.4: GHG Emission Reductions and Measures for 2020	
Policy T-4: Develop Design Guidelines for Improved Design for New Developments	Consistent. The project building would be designed and equipped with features that conserve and reduce energy consumption. The building would comply with the latest Title 24 standards and City of Goleta Resolution No. 12-65.
Policy T-5: Develop Design Guidelines and Incentives to Encourage Transit-Oriented Development	Consistent. The project would enhance train station amenities and accessibility to reduce the need for single occupancy vehicles and reduce VMT. The project would help facilitate commuters to and from work as well as other destinations. Building would be designed to implement energy conservation features.
Policy T-8: Encourage Bicycle Parking through Development of Design Guidelines and Policies	Consistent. The project would feature several on-site amenities to encourage ridership including bicycle racks and bicycle safety infrastructure.

Policies	Project Consistency
Policy T-11: Continue to Encourage End-of-Trip Facilities	Consistent. The proposed Depot building would include a lobby, a café and kitchen area for riders to purchase beverages and food, restroom facilities, indoor waiting areas, a community room, an on-site ticketing area, and luggage and storage space adjacent to the Amtrak platform.

Source: Goleta 2014

Goleta General Plan/Coastal Land Use Plan

The City of Goleta General Plan Conservation Element is intended to guide land use planning by providing goals and policies to reduce GHG emissions. As demonstrated by Table 4.2-6, the project would be consistent with applicable goals and policies.

Table 4.2-6 Project Consistency with Applicable General Plan Policies

Policies	Project Consistency
Chapter 4.4 City Policies	
CE 13.4 Energy Conservation for City Facilities and Operations: The City shall implement energy conservation requirements for City-owned facilities at the time of major improvements. Energy conservation measures may include energy-efficient interior and exterior building lighting, energy-efficient street lighting, natural ventilation and solar hot water systems, and landscaping with drought-tolerant species and deciduous trees to shade streets and the south and west sides of buildings in summer. For all City construction projects, the City shall comply with the state’s energy conservation building standards set forth in Title 24. The City vehicle fleet shall use a mix of fuels that best achieves energy efficiency while meeting operational needs.	Consistent. The project building would be designed and equipped with features that conserve and reduce energy consumption. The building would comply with the latest Title 24 standards and City of Goleta Resolution No. 12-65.
CE 15.2 Water Conservation for City Facilities: In order to minimize water use, the City shall upgrade City-owned facilities with low water use plumbing fixtures, water conserving landscaping, low flow irrigation, and reclaimed water for exterior landscaping at the time of major improvements.	Consistent. Project facilities would be designed and equipped with features that increase water use efficiency by 20 percent. The building would comply with CALGreen standards.
CE 15.5 Reduction of Construction Wastes: In instances where demolitions of existing buildings and structures are authorized, it is encouraged that such structures be deconstructed and that structural components, fixtures, and materials be salvaged for future reuse. Provisions for recycling of waste materials at all construction sites, including and demolition sites shall be required	Consistent. In accordance with the Goleta Green Building Program, the project would divert 50 percent of construction/demolition waste from landfills through recycling and source reduction activities.
TE 1.1 Alternative Modes: The City’s intent shall be to achieve a realistic and cost-effective balance between travel modes, including bikeways, pedestrian circulation, and bus transit. The City shall encourage the use of alternative modes of transportation, such as bus transit, bicycling, and walking, which have the additional beneficial effect of reducing consumption of non-renewable energy sources.	Consistent. The project would provide a new Depot which would increase train ridership and alternative modes and transport and commuting.
TE 1.5 Multimodal Transportation Center. The City supports consideration of a multimodal transportation center in the city to facilitate interconnection and transfers between express bus routes, automobile, bicycle and pedestrian circulation, and potentially commuter and other passenger rail services. While a proposed area in the vicinity of the current Amtrak terminal should be studied, alternative sites should also be explored; the ultimate location will depend on the results of such study.	Consistent. The Depot would provide a multimodal transportation center for rail users, bus users, bikers, pedestrians, and personal vehicles.

Policies	Project Consistency
<p>TW 8.2 Rail Terminal. Figure 7-4 identifies the location of the existing Amtrak terminal as of 2005. The City, in cooperation with Amtrak and any future commuter rail service provider, should actively explore and promote the development of an expanded multimodal transportation center that includes a rail station in the city as referenced in TE 7.3. As of 2005, facilities were limited to a passenger platform. The City supports regional funding and construction of a terminal facility that includes a building with an indoor waiting area, ticketing, information kiosks, restrooms, and other appropriate amenities; parking; and drop-off and pick-up areas. Small-scale ancillary commercial services, such as a small restaurant, may also be permitted as integral to the terminal facility.</p>	<p>Consistent. The project would develop a multimodal transportation center at the existing Amtrak Station.</p>
<p>Source: Goleta 2006</p>	

Goleta Green Building Program

Pursuant to City of Goleta Resolution No. 12-65, the project would be constructed to achieve LEED Silver certification, unless the exceptions under Resolution No. 12-65 are met. Therefore, the project would be consistent with this program.

Summary

As described above, GHG emissions impacts would be less than significant according to the BAAQMD/Santa Barbara County Interim Thresholds of Significance. In addition, GHG emissions impacts from development facilitated by the project would be less than significant by being consistent with 2017 Scoping Plan, City CAP, City General Plan, and the County Goleta Green Building Program.

Mitigation Measures

No mitigation measures would be required.

Significance After Mitigation

Impacts would be less than significant without mitigation.

4.2.4 Cumulative Impacts

Cumulative development in the City of Goleta and surrounding cities and County would include residential development, warehouses, commercial, office, and public facilities. Each of the proposed developments would generate GHG emissions from vehicle trips, electrical and water use, and other sources. The analysis of GHG emissions is cumulative in nature, as emissions affect the accumulation of GHGs in the earth's atmosphere. Projects that fall below provided thresholds are considered to have a less than significant impact, both individually and cumulatively. The proposed project falls below the applicable threshold of 660 MT CO₂e per year. In addition, the project is estimated to reduce regional GHG emissions by 525,000 MT CO₂e through implementation.

The City of Goleta has a number of projects that would reduce overall GHG emissions in the City. The City's Green Building Program will reduce emissions from current and new users and the cumulative projects in the City. The City also has a number of incentive programs for residences and businesses to reduce their electricity consumption and cumulatively reduce GHG emissions from energy use. The project would comply with Title 24 Building Energy Efficiency and California Green

Building standards and would be required to comply with City Resolution No. 12-65. In addition, the proposed project is expected to reduce GHG emissions associated with fossil fuel use in the City and regionally through encouraging train use over vehicle use. Therefore, cumulative impacts would be less than significant.

4.3 Hazards and Hazardous Materials

Based on Appendix G of the CEQA Guidelines, this section analyzes the project's potential impacts regarding hazards and hazardous materials. The Initial Study concluded the project would not have a significant impact related to hazardous material sites, airport hazards, wildland fires, and emergency response, which are discussed in Section 1, *Introduction*, and in the Initial Study (Appendix A). The analysis considers potential hazards or hazardous conditions from on-site conditions. The analysis in this section is based, in part, on the *Phase I Environmental Site Assessment* (ESA) prepared by Rincon Consultants, Inc. attached as Appendix D of this EIR.

4.3.1 Setting

On-Site Potential Hazards

The project site is located in an area that is primarily composed of commercial and industrial land uses. Properties in the vicinity of the subject property include light industrial and commercial businesses, an Amtrak Station and a railroad right-of-way. A Phase I Environmental Site Assessment (Phase I ESA) was completed to assess potential existing hazards on the project site. The Phase I ESA found the following conditions are present on-site or have the potential to occur:

- 6,000-gallon historic underground storage tank (UST) reported on the subject property;
- 1,800-gallon diesel UST located on the subject property;
- Soil contamination from the former Industrial use of the subject property as a bus transportation facility, as well as the presence of former sumps and "service shops;"
- The presence of railroad tracks adjacent to the north of the subject property; and
- The presence of a capped water supply well reported on the subject property.

Other potential hazards that may occur on the project site include asbestos containing materials and lead based paint, radon, and hazardous material transport. The project site setting associated with each of these potential hazards is discussed more fully below.

Residual Agricultural Chemicals

The Phase I ESA determined the project site was historically used for agricultural purposes, along with the general area around the project site. As a result, residual agricultural chemicals including pesticides, arsenic, and herbicides may be present in the soil.

Asbestos Containing Materials and Lead Based Paint

Asbestos was used as insulation in walls or ceilings or as a component in adhesives in older buildings (pre-1979). Asbestos can pose a health risk when very small particles become airborne. Lead is a highly toxic metal that was used for many years in products found in and around homes, including paint. Lead-based paint (LBP) was commonly used in residential construction prior to the enactment of federal regulations limiting its use in the late 1970s. Exposure to lead can cause a range of health effects, from behavioral problems and learning disabilities, to seizures and death. The primary source of lead exposure in residential settings is deteriorating LBP. Lead dust can form when LBP is dry scraped, dry sanded, or heated. Dust also forms when painted surfaces bump or rub together. LBP that is in good condition is usually not a hazard.

The existing warehouse structure on the project site was constructed in 1967. Due to the age of the on-site structure, asbestos and lead may be present in and near the structure.

Radon

Radon is a naturally occurring gas produced by the breakdown of uranium in soil, rock, and water. Accumulations of this gas inside structures can become a health hazard because radon is known to cause lung cancer. The threat of radon is very low in well-ventilated structures. According to the U.S. EPA, the general area of the project site has a predicted indoor screening level of less than significant per EPA guidelines. Therefore, based upon the reported subsurface characteristics of the area, the project site exhibits no potential for high-level radon exposure (Appendix D).

4.3.2 Regulatory Setting

An overview of regulatory agencies and certain key hazardous materials laws and regulations applicable to the project, and to which the project must conform, is provided below.

Federal Regulations

Several federal agencies regulate hazardous materials. These include the U.S. EPA, the United States Occupational Safety and Health Administration (USOSHA), and the United States Department of Transportation (U.S. DOT). Applicable federal regulations are contained primarily in Titles 10, 29, 40, and 49 of the Code of Federal Regulations (CFR). Some of the major federal laws and issue areas include the following statutes and implementing regulations:

- Resources Conservation and Recovery Act (RCRA) of 1976 - hazardous waste management;
- Hazardous and Solid Waste Amendments Act (HSWA) - hazardous waste management;
- Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) - cleanup of contamination;
- Superfund Amendments and Reauthorization Act (SARA) - cleanup of contamination; and
- Emergency Planning and Community Right-to-Know (SARA Title III) – business inventories and emergency response planning.

The U.S. EPA is the primary federal agency responsible for the implementation and enforcement of hazardous materials regulations. In most cases, enforcement of environmental laws and regulations established at the federal level is delegated to State and local environmental regulatory agencies. In addition, with respect to emergency planning, the Federal Emergency Management Agency (FEMA) is responsible for ensuring the establishment and development of policies and programs for emergency management at the federal, State, and local levels. This includes the development of a national capability to mitigate against, prepare for, respond to, and recover from a full range of emergencies.

The U.S. EPA has authorized the California Department of Toxic Substance Control (DTSC) to enforce hazardous waste laws and regulations in California. Requirements place “cradle-to-grave” responsibility for hazardous waste disposal on the shoulders of hazardous waste generators. Waste generators must ensure that their wastes are disposed of properly, and legal requirements dictate the disposal requirements for many waste streams (i.e., a ban on the disposal of many types of hazardous wastes in landfills).

Asbestos Hazard Emergency Response Act (AHERA) (1986)

This Act is the federal legislation that governs the control and abatement of asbestos hazards present in school buildings. The purpose of this Act is to also require the U.S. EPA to evaluate the extent of danger to human health posed by asbestos in public and commercial buildings and the means to respond to any identified danger.

Federal Occupational Safety and Health Administration (OSHA) - Process Safety Management Standard (29 CFR 1910.119)

This standard includes requirements for preventing or minimizing the consequences of catastrophic releases of toxic, reactive, flammable, or explosive chemicals. Requirements of this standard include providing employees with information pertaining to hazardous chemicals, training employees on the operation of equipment with hazardous materials, and employer requirements to perform a process hazard analysis.

Lead-Based Paint Elimination Final Rule 24 CFR 33

Regulations for lead-based paint (LBP) are contained in the Lead-Based Paint Elimination Final Rule 24 Code of Federal Regulations (CFR) 33, governed by the U.S. Department of Housing and Urban Development, which requires sellers and lessors to disclose known LBP and LBP hazards to prospective purchasers and lessees. Additionally, all LBP abatement activities must be in compliance with California and Federal OSHA and with the State of California Department of Health Services requirements. Only LBP trained and certified abatement personnel are allowed to perform abatement activities. All lead LBP removed from structures must be hauled and disposed of by a transportation company licensed to transport this type of material at a landfill or receiving facility licensed to accept the waste.

State Regulations

The primary State agencies with jurisdiction over hazardous chemical materials management are the DTSC and the State Water Quality Control Board (SWQCB). Other State agencies involved in hazardous materials management and oversight are the Department of Industrial Relations, California OSHA (Cal OSHA) implementation, Office of Emergency Services (OES - California Accidental Release Prevention Implementation), CARB, California Department of Transportation (Caltrans), State Office of Environmental Health Hazard Assessment (OEHHA - Proposition 65 implementation) and CalRecycle (formerly the California Integrated Waste Management Board, CIWMB). The enforcement agencies for hazardous materials transportation regulations are the California Highway Patrol (CHP) and Caltrans. Hazardous materials and waste transporters are responsible for complying with all applicable packaging, labeling, and shipping regulations.

Relevant hazardous materials management laws in California include, but are not limited to, the following statutes and implementation regulations:

- Hazardous Materials Management Act - business plan reporting;
- Hazardous Waste Control Act - hazardous waste management;
- Safe Drinking Water and Toxic Enforcement Act of 1986 (Proposition 65) – release of and exposure to carcinogenic chemicals;
- Hazardous Substance Act - cleanup of contamination;

Goleta Train Depot Project

- Hazard Communication; and
- Hazardous Materials Storage and Emergency Response.

California Environmental Protection Agency

The California Environmental Protection Agency (CalEPA) has broad jurisdiction over hazardous materials management in California. Within CalEPA, the DTSC has primary regulatory responsibility for hazardous waste management and cleanup. Enforcement of regulations has been delegated to local jurisdictions that enter into agreements with DTSC for the generation, transport, and disposal of hazardous materials under the authority of the Hazardous Waste Control Law.

Along with the DTSC, the SWQCB is responsible for implementing regulations pertaining to management of soil and groundwater investigation and cleanup. SWQCB regulations are contained in Title 27 of the California Code of Regulations (CCR). Additional State regulations applicable to hazardous materials are contained in Title 22 of the CCR. Title 26 of the CCR is a compilation of those sections or titles of the CCR that are applicable to hazardous materials.

Department of Toxic Substances Control

RCRA is the principal federal law that regulates the generation, management, and transportation of hazardous materials and other wastes. The DTSC regulates hazardous waste in California primarily under the authority of the federal RCRA, and the California Health and Safety Code. Other laws that affect hazardous waste are specific to handling, storage, transportation, disposal, treatment, reduction, cleanup, and emergency planning. In addition, DTSC reviews and monitors legislation to ensure that the position reflects the DTSC's goals. From these laws, DTSC's major program areas develop regulations and consistent program policies and procedures. The regulations determine what those who handle hazardous waste must do to comply with the laws.

California law provides the general framework for regulation of hazardous wastes by the Hazardous Waste Control Law (HWCL) passed in 1972. DTSC is the State's lead agency in implementing the HWCL. The HWCL provides for State regulation of existing hazardous waste facilities, which include "any structure, other appurtenances, and improvements on the land, used for treatment, transfer, storage, resource recovery, disposal, or recycling of hazardous wastes," and requires permits for, and inspections of, facilities involved in generation and/or treatment, storage and disposal of hazardous wastes.

The oversight of hazardous materials release sites often involves several different agencies that may have overlapping authority and jurisdiction. The DTSC and SWQCB are the two primary State agencies responsible for issues pertaining to hazardous materials release sites. Air quality issues related to remediation and construction at contaminated sites are also subject to federal and State laws and regulations that are administered at the local level.

Investigation and remediation activities that would involve potential disturbance or release of hazardous materials must comply with applicable federal, State, and local hazardous materials laws and regulations. The DTSC has developed standards for the investigation of sites where hazardous materials contamination has been identified or could exist based on current or past uses. The standards identify approaches to determine if a release of hazardous wastes/substances exists at a site and delineate the general extent of contamination; estimate the potential threat to public health and/or the environment from the release and provide an indicator of relative risk; determine if an expedited response action is required to reduce an existing or potential threat; and complete

preliminary project scoping activities to determine data gaps and identify possible remedial action strategies to form the basis for development of a site strategy.

California Accidental Release Prevention Program (CalARP)

The CalARP program (CCR Title 19, Division 2, Chapter 4.5) covers certain businesses that store or handle more than a certain volume of specific regulated substances at their facilities. The list of regulated substances is found in Article 8, Section 2770.5 of the CalARP program regulations. The businesses that use a regulated substance above the noted threshold quantity must implement an accidental release prevention program, and some may be required to complete a Risk Management Plan (RMP). An RMP is a detailed engineering analysis of the potential accident factors present at a business and the mitigation measures that can be implemented to reduce this accident potential. The purpose of an RMP is to decrease the risk of an off-site release of a regulated substance that might harm the surrounding environment and community. An RMP includes the following components: safety information, hazard review, operating procedures, training, maintenance, compliance audits, and incident investigation. The RMP must consider the proximity to sensitive populations located in schools, residential areas, general acute care hospitals, long-term health care facilities, and child day-care facilities, and must also consider external events such as seismic activity.

Regional

Santa Barbara County Air Pollution Control District (SBCAPCD)

The SBCAPCD establishes Rules that regulate or control various air pollutant emissions and emissions sources, including hazardous emissions sources in the County of Santa Barbara within the South Central Coast Air Basin (Basin). The SBCAPCD coordinates its actions with local, State, and federal government agencies, the business community, and private citizens to achieve and maintain healthy air quality.

Local

City of Goleta General Plan

The General Plan Safety Element establishes Goals and Policies addressing community health and safety, including potential hazards and hazardous materials concerns. Goleta Goals and Policies implemented through its General Plan support prevention and education measures acting to minimize the occurrence and effects of hazards, emergencies and disasters; and include measures to allow Goleta to respond appropriately under hazardous, emergency, or disaster conditions.

City of Goleta Emergency Operations Plan

The Emergency Operations Plan (EOP) establishes the overall approach for emergency response, including organization and task management, identification of policies and procedures, and coordination of planning efforts of the various emergency staff and service elements. The purpose of the City's EOP is to define the actions required of the City before, during, and after an emergency to guide the City's response to major emergencies and disasters pursuant to state and federal requirements.

Santa Barbara County Department of Environmental Health

Under the California Unified Hazardous Waste and Hazardous Material Management Regulatory Program, (Chapter 6.11, Division 20, Section 25404 of the Health and Safety Code), hazards/hazardous materials management is addressed locally through the Certified Unified Program Agency (CUPA). The CUPA for Santa Barbara County, including Goleta, is the Santa Barbara County Department of Environmental Health, Hazardous Materials Division. The CUPA oversees the enforcement and administration of six consolidated environmental programs:

- Hazardous Materials Release Response Plans & Inventory (Business Plan)
- Underground Storage Tanks (UST)
- Hazardous Waste Generators
- Onsite Hazardous Waste Treatment
- Aboveground Petroleum Storage Act (APSA)
- California Accidental Release Prevention (CalARP)

Santa Barbara County Airport Land Use Commission

The project site is located within the Santa Barbara Airport Influence Area. The 1993 Santa Barbara County Airport Land Use Compatibility Plan (ALUCP) establishes various policies and compatibility maps for individual ALUCP airports, including Santa Barbara Airport. Santa Barbara County Airport Land Use Commission (Santa Barbara County ALUC) review is required when a project is located within the boundaries of an Airport Influence Area and the project proposes a legislative action like a General Plan Amendment, Specific Plan Amendment, Zone Change, or Zoning Ordinance (Santa Barbara County ALUC 1993). As discussed in the Initial Study, the project is located within the Airport Influence Area but does not include a land use change.

4.3.3 Impact Analysis

a. Methodology and Significance Thresholds

Assessment of impacts is based on the Phase I ESA (Appendix D), prepared for the project site. The Phase I ESA was completed to assess potential existing hazards on the project site. The following tasks were undertaken as part of the Phase I ESA investigation:

- Performed a reconnaissance of the subject property to identify obvious indicators of the existence of hazardous materials.
- Observed adjacent or nearby properties from public thoroughfares in an attempt to see if such properties are likely to use, store, generate, or dispose of hazardous materials.
- Obtained and reviewed an environmental records database search to obtain information about the potential for hazardous materials to exist at the subject property or at properties located in the vicinity of the subject property.
- Reviewed files for the subject property and immediately adjacent properties as identified in the database report, as applicable.
- Reviewed the current United States Geological Survey (USGS) topographic map to obtain information about the subject property and regional topography and uses of the subject property and surrounding sites.

- Reviewed additional pertinent record sources (e.g., California Division of Oil, Gas, and Geothermal Resources records, online databases of hazardous substance release sites, etc.), as necessary, to identify the presence of RECs at the subject property.
- Reviewed reasonably ascertainable historical resources (e.g., aerial photographs, topographic maps, fire insurance maps, city directories, etc.) to assess the historical land use of the subject property and adjacent properties.
- Provided a user interview questionnaire to a representative of the client, the user of the Phase I ESA.
- Provided a property owner interview questionnaire to the property owner or a designated subject property representative identified to Rincon by the client.
- Conducted interviews with other property representatives (e.g., key site manager, occupants, etc.), as applicable.
- Reviewed available client-provided information (e.g., previous environmental reports, title documentation, etc.).

The following thresholds are based on Appendix G of the State CEQA Guidelines. A significant impact related to hazards and hazardous materials would occur if the project would:

1. Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials;
2. Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment;
3. Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school;
4. Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, create a significant hazard to the public or the environment;
5. For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, result in a safety hazard or excessive noise for people residing or working in the project area;
6. Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan; and/or
7. Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires.

The Initial Study (Appendix A) determined the proposed project would have no impact on handling hazardous materials near a school, being located on a hazardous material site, or risk to wildland fire (Thresholds 3-4 and 7). The Initial Study determined the project would have a less than significant impact on hazards from a nearby airport and the impairment of an emergency response plan (Thresholds 5 and 6). The Initial Study concluded the project could result in potentially significant impacts related to Threshold 1 and 2, which are analyzed in this section of the EIR. All other thresholds are discussed in the Initial Study and summarized in Table 1-2 in Section 1, *Introduction*.

Threshold:	Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?
Threshold:	Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the likely release of hazardous materials into the environment?

Impact HAZ-1 THE PROJECT IS LOCATED ON A SITE PREVIOUSLY USED FOR AGRICULTURAL AND INDUSTRIAL PURPOSES AND IS LOCATED ADJACENT TO ACTIVE RAILROAD TRACKS. THE SITE CONTAINS HAZARDOUS MATERIALS THAT MAY BE EXPOSED DURING CONSTRUCTION ACTIVITIES. WITH ADHERENCE TO MITIGATION MEASURES HAZ-1 AND HAZ-2, IMPACTS WOULD BE REDUCED TO LESS THAN SIGNIFICANT.

Construction-Related Impacts

During project construction, accidental conditions could occur as a result of any of the following: direct dermal contact with hazardous materials; incidental ingestion of hazardous materials, or inhalation of airborne dust released from dried hazardous materials. The transportation of hazardous materials could result in accidental spills, leaks, toxic releases, fire, or explosion. Appropriate documentation for all hazardous waste that is transported, stored, or used in connection with specific project-site activities would be provided as required for compliance with existing hazardous materials regulations codified in the CCR.

The Phase I ESA identified potential for the site to contain hazardous materials given its prior agricultural use, current and former onsite storage of hazardous materials in USTs, ASTs, and drums, and past use of a bus transportation facility as well as the presence of former sumps, trench drain, and “service shops”. Former onsite agricultural activities create the potential for residual chemicals used routinely in agricultural production such as pesticides, arsenic, and herbicides to remain onsite in the onsite soil and/or groundwater. Additionally, there is potential for agricultural products to have been transported via railcars/railroad tracks. Based on the previous uses of the site as a bus transportation facility along with sumps, trench drains, and “service shops”, there is also the potential for petroleum hydrocarbons, heavy metals, volatile organic compounds, and other vehicle fluids to be present in onsite soil or groundwater.

The Phase I ESA identified the onsite presence of three AST/USTs: a 6,000-gallon historic UST (which may remain onsite), a 3,000-gallon AST with secondary containment (and associated drum) for emergency overflow used oil, and an existing 1,800-gallon diesel UST. Spills or leaks from the USTs and AST have not been identified, however, an unreported release could have occurred that wasn’t captured in regulatory records. Given the potential for contaminated soils on the project site, there is a possible hazard for construction workers to be exposed to contaminants present in onsite soils and or groundwater. There is also a concern for potential off-site disposal of soils that may occur during project construction.

In addition, the Phase I ESA determined there is potential for hazardous building materials present in the existing warehouse structure such as lead based paint (LBP), asbestos containing materials (ACMs), and polychlorinated biphenyls (PCBs). These materials would likely be encountered during structure demolition for the project. Potential hazardous materials, such as fuel, paint products, lubricants, solvents, and cleaning products, may be used and/or stored on-site during the construction of the proposed project. However, due to the limited quantities of these materials to be used by the project, they are not considered hazardous to the public at large.

Given the potential for residual pesticides, hydrocarbons, metals, VOCs, contaminated soil and groundwater from AST and UST, and other potential contaminants to be present onsite, project construction has the potential to create a significant hazard to construction workers and/or the public and environment during routine activities such as excavation, soil transport, and off-site soil disposal, which would be a potentially significant impact. Adherence to recommendations identified in the ESA and mitigation measures HAZ-1 and HAZ-2 below, would reduce potential impacts to less than significant. Additionally, compliance with federal, State, and local laws, regulations, and Cal/OSHA training programs, would minimize potential impacts associated with the routine transport, use, or disposal of hazardous materials during construction.

Operation-Related Impacts

Generally, maintenance and upkeep of facilities on-site, including cleaning of workspaces, parking areas, restroom facilities and maintenance of landscaping occasionally require the use of various solvents, cleaners, paints, oils/fuels, and pesticides/herbicides. Transport, use, and storage of hazardous materials during the operation of the site would be conducted pursuant to all applicable local, State, and federal laws, including but not limited to Title 49 of the Code of Federal Regulations implemented by Title 13 of the California Code of Regulations, which describes strict regulations for the safe transportation of hazardous materials, and in cooperation with the County's Department of Environmental Health. As required by California Health and Safety Code Section 25507, a business shall establish and implement a Hazardous Materials Business Emergency Plan for emergency response to a release or threatened release of a hazardous material. As required, the hazardous materials would be stored in locations according to compatibility and in storage enclosures (i.e., flammable material storage cabinets and biological safety cabinets) or in areas or rooms specially designed, protected, and contained for such storage, in accordance with applicable regulations.

Adherence to Santa Barbara County Department of Environmental Health guidelines and regulations would reduce the potential for contamination from hazardous materials through proper cleanup, disposal, and remediation. The Santa Barbara County Office of the Fire Marshall regulates and enforces the provisions of the Uniform Fire Code relating to hazardous materials, including the use and storage of hazardous materials that are ignitable, reactive, corrosive, or toxic. Businesses using such materials are subject to permitting and inspection.

Given the above considerations, impacts associated with project operation would be less than significant through compliance with existing regulations.

Mitigation Measures

HAZ-1 Assessment, Removal, and Remediation

Prior to demolition or onsite grading/site disturbance or improvements, a soil, soil vapor, and/or groundwater sampling assessment shall be completed to identify and/or define hazardous material impacts in the areas of concern. The areas of concern and associated chemicals of concern include:

- Former agricultural use of the subject property – pesticides and arsenic;
- Adjacent presence of railroad tracks along the northern site boundary which transport and produce pesticides, heavy metals, petroleum hydrocarbons, herbicides, and SVOCs (including creosote, naphthalene);
- Former and current USTs/AST onsite - historic 6,000-gallon UST, existing 1,800-gallon diesel UST, and existing 3,000-gallon AST with secondary containment and associated drum that is utilized

to store emergency overflow used oil onsite - heavy metals, petroleum hydrocarbons, and VOCs; and

- Former use of a bus 'service shop' that includes underground sumps, trench drains and possibly other features - heavy metals, petroleum hydrocarbons, and VOCs.

A geophysical survey shall be conducted to locate the historical UST prior to sampling. The sampling assessment shall be performed under the supervision of a professional geologist or other qualified environmental professional. The analytical results shall be compared to the most current applicable environmental screening levels, as recommended by Santa Barbara County Environmental Health – Hazardous Materials Unit.

A Soil Management Plan (SMP) shall be prepared and followed by the demolition/grading contractor. The SMP will identify procedures to address the current onsite features and unidentified features (USTs, clarifiers, sumps or other underground features) that are uncovered during the redevelopment of the site. If the sampling assessment analytical results are greater than the environmental screening levels, the Santa Barbara County Environmental Health – Hazardous Materials Unit shall be contacted to review and oversee the SMP and any additional assessments, site remediation, and/or health risk assessments that are deemed necessary. The onsite USTs, AST, drum, trench drains, and sumps shall be removed in accordance with local permits and guidelines as identified and required by Santa Barbara County Environmental Health – Hazardous Materials Unit.

All necessary reports, regulations and permits shall be followed to achieve remediation of the site. The contaminated materials shall be remediated under the supervision of an environmental consultant licensed to oversee such remediation and under the direction of the lead oversight agency. The remediation program shall also be approved by a regulatory oversight agency, such as the Santa Barbara County Environmental Health – Hazardous Materials Unit. Alternatively, the Hazardous Materials Unit may determine that RWQCB or DTSC should be the lead agency for remediation oversight.

All proper waste handling and disposal procedures shall be followed. Upon completion of the remediation, the environmental professional shall prepare a report summarizing the project, the remediation approach implemented, and the analytical results after completion of the remediation (including all waste disposal or treatment manifests) and site closure by the lead agency will be obtained.

HAZ-2 Hazardous Building Material Survey and Demolition Plan

A hazardous building material survey shall be conducted prior to demolition or removal of any onsite structures. If any ACM, LBP, or PCBs are identified, the materials shall be removed in accordance with California and Federal OSHA as well as other state and federal regulations by licensed abatement contractors. All ACM, LBP, and PCB materials removed from the site shall be hauled and disposed of by a transportation company certified to handle these materials.

Significance After Mitigation

Impacts related to the routine transport, use, or disposal of hazardous materials, and risk of upset, would be less than significant with implementation of Mitigation Measures HAZ-1 and HAZ-2.

4.3.4 Cumulative Impact Analysis

Cumulative development in Goleta and the surrounding area would modify existing land use patterns through the development of vacant lots or through redevelopment. Development of the cumulative projects would cumulatively increase the potential for exposure of people to hazards and hazardous materials, including soil contamination, pesticides, LBP, asbestos, groundwater contamination of PCE, and upset risks along major transportation routes. The proposed project would incrementally contribute to this cumulative effect. However, as discussed throughout this section, such risks of exposure are reduced through adherence to existing federal, State, and local regulations. U.S. EPA and U.S. DOT laws regulate the safe interstate transportation of hazardous materials and waste. In addition, the project would be required to comply with Mitigation Measures HAZ-1 and HAZ-2, which would reduce impacts to less than significant.

Impacts associated with hazards and hazardous materials are generally site-specific. Accordingly, as required under applicable laws and regulations, potential impacts associated with cumulative developments would be addressed on a case-by-case basis and appropriate mitigation would be designed to mitigate impacts resulting from individual projects, depending upon the type and severity of hazards present. Enforcement of federal, State, and local laws and regulations would ensure that hazards to the public or environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment would remain less than significant. Therefore, cumulative impacts related to hazards and hazardous materials would be less than significant.

4.4 Noise

This section discusses the project's potential impacts relating to noise and groundborne vibration. The Initial Study determined the project would not have noise impacts related to the nearby Santa Barbara Airport. The purpose of this section is to analyze the project's noise and vibration impacts related to both temporary construction activity and long-term operation of the project. Sound level measurement data is included in Appendix E.

4.4.1 Setting

Environmental Noise

Sound is a vibratory disturbance created by a moving or vibrating source, which is capable of being detected by the hearing organs. Noise is defined as sound that is loud, unpleasant, unexpected, or undesired and may therefore be classified as a more specific group of sounds. The effects of noise on people can include general annoyance, interference with speech communication, sleep disturbance, and, in the extreme, hearing impairment (Caltrans 2013).

Noise levels are commonly measured in decibels (dB) using the A-weighted sound pressure level (dBA). The A-weighting scale is an adjustment to the actual sound pressure levels so that they are consistent with the human hearing response, which is most sensitive to frequencies around 4,000 Hertz and less sensitive to frequencies around and below 100 Hertz (Kinsler et al. 1999). Decibels are measured on a logarithmic scale that quantifies sound intensity in a manner similar to the Richter scale used to measure earthquake magnitudes. A doubling of the energy of a noise source, such as doubling of traffic volume, would increase the noise level by 3 dB; dividing the energy in half would result in a 3 dB decrease (Crocker 2007).

Human perception of noise has no simple correlation with sound energy: the perception of sound is not linear in terms of dBA or in terms of sound energy. Two sources do not "sound twice as loud" as one source. It is widely accepted that the average healthy ear can barely perceive changes of 3 dBA, increase or decrease (i.e., twice the sound energy); that a change of 5 dBA is readily perceptible (8 times the sound energy); and that an increase (or decrease) of 10 dBA sounds twice (half) as loud ([10.5x the sound energy] Crocker 2007).

Sound changes in both level and frequency spectrum as it travels from the source to the receiver. The most obvious change is the decrease in level as the distance from the source increases. The manner by which noise reduces with distance depends on factors such as the type of sources (e.g., point or line, the path the sound will travel, site conditions, obstructions, etc.). Noise levels from a point source typically attenuate, or drop off, at a rate of 6 dBA per doubling of distance (e.g., construction, industrial machinery, ventilation units, etc.). Noise from a line source (e.g., roadway, pipeline, railroad, etc.) typically attenuates at about 3 dBA per doubling of distance (Caltrans 2013). The propagation of noise is also affected by the intervening ground, known as ground absorption. A hard site, such as a parking lot or smooth body of water, receives no additional ground attenuation and the changes in noise levels with distance (drop-off rate) result from simply the geometric spreading of the source. An additional ground attenuation value of 1.5 dBA per doubling of distance applies to a soft site (i.e., soft dirt, grass, or scattered bushes and trees) (Caltrans 2013). Noise levels may also be reduced by intervening structures; the amount of attenuation provided by this "shielding" depends on the size of the object and the frequencies of the noise levels. Natural terrain features such as hills and dense woods, and man-made features such as buildings and walls, can

significantly alter noise levels. Generally, any large structure blocking the line of sight will provide at least a 5-dBA reduction in source noise levels at the receiver (Federal Highway Administration [FHWA] 2011). Structures can substantially reduce exposure to noise as well. The FHWA's guidelines indicate that modern building construction generally provides an exterior-to-interior noise level reduction of 20 to 35 dBA with closed windows.

The impact of noise is not a function of loudness alone. The time of day when noise occurs and the duration of the noise are also important factors of project noise impact. Most noise that lasts for more than a few seconds is variable in its intensity. Consequently, a variety of noise descriptors have been developed. One of the most frequently used noise metrics is the equivalent noise level (L_{eq}); it considers both duration and sound power level. L_{eq} is defined as the single steady A-weighted level equivalent to the same amount of energy as that contained in the actual fluctuating levels over time. Typically, L_{eq} is summed over a one-hour period. L_{max} is the highest root mean squared (RMS) sound pressure level within the sampling period, and L_{min} is the lowest RMS sound pressure level within the measuring period (Crocker 2007).

Noise that occurs at night tends to be more disturbing than that occurring during the day. Community noise is usually measured using Day-Night Average Level (L_{dn}), which is the 24-hour average noise level with a +10 dBA penalty for noise occurring during nighttime (10:00 p.m. to 7:00 a.m.) hours. It is also measured using CNEL, which is the 24-hour average noise level with a +5 dBA penalty for noise occurring from 7:00 p.m. to 10:00 p.m. and a +10 dBA penalty for noise occurring from 10:00 p.m. to 7:00 a.m. (Caltrans 2013). Noise levels described by L_{dn} and CNEL usually differ by about 1 dBA. The relationship between the peak-hour L_{eq} value and the L_{dn} /CNEL depends on the distribution of traffic during the day, evening, and night. Quiet suburban areas typically have CNEL noise levels in the range of 40 to 50 dBA, while areas near arterial streets are in the 50 to 60-plus CNEL range. Normal conversational levels are in the 60 to 65-dBA L_{eq} range; ambient noise levels greater than 65 dBA L_{eq} can interrupt conversations (FHWA 2018).

Groundborne Vibration

Groundborne vibration of concern in environmental analysis consists of the oscillatory waves that move from a source through the ground to adjacent structures. The number of cycles per second of oscillation makes up the vibration frequency, described in terms of Hz. The frequency of a vibrating object describes how rapidly it oscillates. The normal frequency range of most groundborne vibration that can be felt by the human body starts from a low frequency of less than 1 Hz and goes to a high of about 200 Hz (Crocker 2007).

While people have varying sensitivities to vibrations at different frequencies, in general they are most sensitive to low-frequency vibration. Vibration in buildings, such as from nearby construction activities, may cause windows, items on shelves, and pictures on walls to rattle. Vibration of building components can also take the form of an audible low-frequency rumbling noise, referred to as groundborne noise. Groundborne noise is usually only a problem when the originating vibration spectrum is dominated by frequencies in the upper end of the range (60 to 200 Hz), or when foundations or utilities, such as sewer and water pipes, physically connect the structure and the vibration source (Federal Transit Administration [FTA] 2018). Although groundborne vibration is sometimes noticeable in outdoor environments, it is almost never annoying to people who are outdoors. The primary concern from vibration is that it can be intrusive and annoying to building occupants and vibration-sensitive land uses.

Vibration energy spreads out as it travels through the ground, causing the vibration level to diminish with distance away from the source. High-frequency vibrations diminish much more rapidly than

low frequencies, so low frequencies tend to dominate the spectrum at large distances from the source. Discontinuities in the soil strata can also cause diffractions or channeling effects that affect the propagation of vibration over long distances (Caltrans 2020). When a building is impacted by vibration, a ground-to-foundation coupling loss will usually reduce the overall vibration level. However, under rare circumstances, the ground-to-foundation coupling may actually amplify the vibration level due to structural resonances of the floors and walls.

Vibration amplitudes are usually expressed in peak particle velocity (PPV) or RMS vibration velocity. The PPV and RMS velocity are normally described in inches per second (in/sec). PPV is defined as the maximum instantaneous positive or negative peak of a vibration signal. PPV is often used in monitoring of blasting vibration because it is related to the stresses that are experienced by buildings (Caltrans 2020).

Existing Ambient Noise Environment

The primary noise source in the project area is vehicular traffic and train movement on the UPRR. Existing noise levels at the project site were documented during two short-term (i.e., 15 minutes) ambient noise measurements. Ambient noise levels were primarily influenced by vehicular traffic from South La Patera Lane and U.S. 101. No nearby stationary sources of noise were detectable in the project area vicinity.

Noise measurements were conducted using an Extech 407780A integrating sound-level meter positioned at a height of approximately 5 feet above ground level. The short-term noise measurements were conducted at approximately 15 feet from the center line of South La Patera Lane, approximately 50 feet from the UPRR, and approximately 270 feet from the centerline of U.S. 101. Table 4.4-1 describes the short-term sound level measurement location and results. Figure 4.4-1 depicts the sound level measurement locations in the project area vicinity from existing road and rail noise sources.

The closest public airport to the project site is the Santa Barbara Airport, about 0.5 mile south of the project site. According to the Area of Influence and Noise Contour figure in the Santa Barbara County Airport Land Use Compatibility Plan, the project site is not within the 55, 60, or 65 dBA CNEL noise contours of the airport (SBCAG 1993). Therefore, aircrafts do not substantially contribute to the existing ambient noise conditions on the project site and vicinity.

Table 4.4-1 Summary of Measured Short-Term Ambient Noise Levels

Monitoring Location	Monitoring Period	Monitoring Location	Noise Level (dBA)	
			L _{eq}	L _{max}
NM-1	8:58-9:22 AM	North side of the existing building	64.8	87.5
NM-2	9:26-9:41 AM	North side of the existing building	60.8	75.6

Noise measurement survey was conducted on July 10, 2020 using a Larson Davis Laboratories, Type I, Model 820 integrating sound-level meter positioned at a height of approximately 5 feet above ground level. Refer to Figure 4.10-1 for noise measurement locations.

Figure 4.4-1 Ambient Noise Monitoring Location

Imagery provided by Microsoft Bing and its licensors © 2019.

Fig. 4.4-1 Ambient Noise Monitoring Location

As indicated in Table 4.4-1, measured ambient noise levels in the project vicinity ranged from approximately 61 to 65 dBA L_{eq} during the daytime hours. Instantaneous noise levels measured during the daytime hours ranged from approximately 76 to 88 dBA L_{max} . The majority of the noise that occurred during the two measurements came from vehicles driving on U.S. 101. Secondary ambient noise sources include traffic on South La Patera Lane and noise generated from stationary sources in the project vicinity. Noise measurement 1 captured noise from a train on the UPRR. The train arrived at the depot at 9:18 AM and departed at 9:22 AM. The train was audible during its stop at the depot and was the loudest source of noise during the first noise measurement. Noise from the train included a train horn, bells, and noise generated from its operation. Sound level measurement data is included in Appendix E.

The site measurements were conducted during the COVID-19 pandemic. Many businesses and schools were closed at the time noise measurements were collected, and the number of vehicles on the local roadways was potentially reduced compared to typical conditions. Therefore, measured noise levels were estimated to be lower than under typical conditions.

Sensitive Noise Receivers

The General Plan Noise Element defines sensitive receivers as users or types of uses that are interrupted (rather than merely annoyed) by relatively low levels of noise. These include residential neighborhoods, schools, libraries, hospitals and rest homes, auditoriums, certain open space areas, and public assembly places. Uses in the immediate vicinity of the project site consist primarily of commercial and industrial development.

Sensitive receivers nearest to the project site consist of single-family residences 500 feet north of the project site across UPRR right-of-way and U.S. 101. The nearest school is La Patera Elementary School located approximately 0.7 mile to the north. The nearest park is the Los Carneros Park and associated hiking trails, which is located as close as 660 feet north from the project site across UPRR right-of-way and U.S. 101. Therefore, the nearest sensitive receptors to the proposed project are the residences located to the north across U.S. 101 from the project site.

4.4.2 Regulatory Setting

Federal

Federal Transit Administration Criteria

Sections 5 and 6 of the Transit Noise and Vibration Impact Assessment Manual, adopted by the FTA in September 2018, addresses the federal guidelines used to evaluate a project for potential vibration impacts. The vibration impact analysis is a multi-step process used for determining vibration analysis level, determining vibration impact criteria, and evaluating vibration impact. FTA guidelines state that the threshold of perception for humans is approximately 65 vibration decibels (VdB). A vibration level of 85 VdB can result in strong annoyance, and a vibration level of 100 VdB is the threshold of potential damage (FTA 2018). Construction activity can result in varying degrees of ground vibration depending on the equipment and methods employed, and older and more fragile buildings must receive special consideration. These guidelines are advisory and should be used to assess the impacts of ground borne vibrations created from transit and construction sources.

State

The State of California regulates freeway noise, sets standards for sound transmission, provides occupational noise control criteria, identifies noise standards, and provides guidance for local land use compatibility. State law requires each county and city to adopt a General Plan that includes a Noise Element prepared per guidelines adopted by the Governor's Office of Planning and Research. The purpose of the Noise Element is to limit the exposure of the community to excessive noise levels. The California Environmental Quality Act requires all known environmental effects of a project be analyzed, including environmental noise impacts.

California General Plan Guidelines

The California General Plan Guidelines, published by the Governor's Office of Planning and Research, indicate acceptable, specific land use types in areas with specific noise exposure. The guidelines also offer adjustment factors that may be used to arrive at noise acceptability standards that reflect the noise control goals of the community, the particular community's sensitivity to noise, and the community's assessment of the relative importance of noise pollution. These guidelines are advisory, and local jurisdictions, including the City of Goleta, have the responsibility to set specific noise standards based on local conditions.

California Noise Control Act of 1973

California Health and Safety Code Sections 46000 through 46080, known as the California Noise Control Act, find that excessive noise is a serious hazard to public health and welfare and that exposure to certain levels of noise can result in physiological, psychological, and economic damage. The act also finds that there is a continuous and increasing bombardment of noise in urban, suburban, and rural areas. The California Noise Control Act declares that the State of California has a responsibility to protect the health and welfare of its citizens by the control, prevention, and abatement of noise. It is the policy of the State to provide an environment for all Californians that is free from noise that jeopardizes their health or welfare.

The California Administrative Code (CAC), Title 24, Noise Insulation Standards

Interior noise levels for habitable rooms are regulated also by Title 24 of the California Code of Regulations (CCR), California Noise Insulation Standards. Title 24, Chapter 12, Section 1207.4, of the California Building Code requires that interior noise levels attributable to exterior sources not exceed 45 CNEL in any habitable room within a residential structure. A habitable room is a room used for living, sleeping, eating, or cooking. Bathrooms, closets, hallways, utility spaces, and similar areas are not considered habitable rooms for this regulation.

Local

City of Goleta Noise Element

The Noise Element of the Goleta General Plan establishes noise standards for various land use categories based on the U.S. Department of Housing and Urban Development Guidelines and standards from the California Office of Noise Control. The City recommends 50-70 dBA as the "normally acceptable" range and 70-75 dBA as the "conditionally acceptable" range for industrial uses. According to the Goleta General Plan, industrial uses within the "normally acceptable range" are deemed satisfactory, based upon the assumption that any buildings involved are of normal conventional construction, without any special noise insulation requirements. Development of

industrial uses within the “conditionally acceptable” range should be undertaken only after a detailed analysis of the noise reduction requirements is made and needed noise insulation features are included in the design (Goleta 2006). Table 4.4-2 shows the normally acceptable and conditionally acceptable ranges for each land use category. According to Noise Element Policy NE 1.1, the City requires mitigation for development that would subject proposed land uses to noise levels that exceed the acceptable levels shown in Table 4.4-2.

Table 4.4-2 Goleta Noise and Land Use Compatibility Criteria

Land Use Category	Community Noise Exposure Ldn or CNEL, dBA			
	Normally Acceptable	Conditionally Acceptable	Normally Unacceptable	Clearly Unacceptable
Residential – Low Density	50-60	60-65	65-75	75-85+
Residential – Multi-Family	50-60	60-65	65-75	75-85+
Transient Lodging – Motels, Hotels	50-65	65-70	70-80	80-85+
Schools, Libraries, Churches, Hospitals, Nursing Homes	50-60	60-65	65-80	80-85+
Auditoriums, Concert halls, Amphitheaters	NA	50-65	NA	65-85+
Sports Arena, Outdoor Spectator Sports	NA	50-70	NA	70-85+
Playgrounds, Neighborhood Parks	50-70	NA	70-75	75-85+
Golf Courses, Riding Stables, Water Recreation, Cemeteries	50-70	NA	70-80	80-85+
Office Buildings, Business Commercial and Professional	50-67.5	67.5-75	75-85+	NA
Industrial, Manufacturing, Utilities, Agriculture	50-70	70-75	75-85+	NA

Normally Acceptable – Specified land uses is satisfactory, based upon the assumption that any buildings involved are of normal conventional construction, without any special noise insulation requirements.

Conditionally Acceptable – new construction or development should be undertaken only after a detailed analysis of the noise reduction requirements is made, needed noise reduction requirements are made, and needed noise insulation features included in the design. Conventional construction, but with closed windows and fresh air supply systems or air conditioning will normally suffice.

Source: Goleta General Plan Noise Element, 2006

Noise Element Policy NE 6.4 restricts construction activities near or adjacent to residential buildings and other sensitive receivers to the hours of 8:00 AM to 5:00 PM Monday through Friday and 7:00 AM to 4:00 PM Monday through Friday for construction in nonresidential areas. Noise Element Policy NE 6.5 requires the following measures to be incorporated into grading and building plan specifications to reduce construction noise:

- All construction equipment shall have properly maintained sound-control devices, and no equipment shall have an unmuffled exhaust system.
- Contractors shall implement appropriate additional noise mitigation measures including but not limited to changing the location of stationary construction equipment, shutting off idling equipment, and installing acoustic barriers around significant sources of stationary construction noise.

- To the extent practicable, adequate buffers shall be maintained between noise-generating machinery or equipment and any sensitive receivers. The buffer should ensure that noise at the receiver site does not exceed 65 dBA CNEL. For equipment that produces a noise level of 95 dBA at 50 feet, a buffer of 1600 feet is required for attenuation of sound levels to 65 dBA.

Goleta Municipal Code Chapter 9.09

Goleta Municipal Code (GMC) Chapter 9.09 regulates noise in the City. The purpose of the chapter is to preserve public peace and comfort for citizens of Goleta from unwarranted noise and disturbances. The GMC prohibits loud and unreasonable noise from 10:00 PM to 7:00 AM Sunday through Thursday and 12:00 AM to 7:00 AM Friday and Saturday. Loud and unreasonable noise is defined as sound which is clearly discernible at a distance of 100 feet from the property line of the property upon which it is broadcast or sound which is above 60 dBA at the edge of the property line upon which the sounds is broadcast. The City does not have any code requirements related to noise from construction activities, but the GMC noise regulations would apply to construction noise.

4.4.3 Impact Analysis

a. Methodology and Significance Thresholds

Methodology

Construction Noise

Short-term noise impacts associated with construction activities were analyzed based on typical construction equipment noise levels derived from the FHWA's Roadway Construction Noise Model (RCNM) and the FTA's Transit Noise and Vibration Impact Assessment Manual. Typical equipment use for various phases of construction were based on default assumptions identified in the California Emissions Estimator Model (CAPCOA 2018) for representative development projects. Predicted average-hourly construction noise levels (in dBA L_{eq}) were calculated assuming the two loudest pieces of construction equipment operating simultaneously at 500 feet from the nearest sensitive receivers. Noise levels are predicted in RCNM based on an average noise-attenuation rate of 6 dB per doubling of distance from the source.

Vibration Levels Associated with Construction Equipment

Groundborne vibration levels associated with construction activities were estimated based on the 2020 Caltrans Transportation and Construction Vibration Guidance Manual. Potential vibration levels were identified for onsite and offsite locations that are sensitive to vibration, including nearby residences.

The project does not include any substantial vibration sources associated with operation. The project would not increase and change train operations which would lead to changes in vibration levels in the area. Thus, construction activities have the greatest potential to generate ground-borne vibration affecting nearby receivers, especially during grading and excavation of the project site. The greatest vibratory source during construction in the project vicinity would be a large bulldozer. Neither blasting nor pile driving would be required for construction of the project. Construction vibration estimates are based on vibration levels reported by Caltrans and the FTA (Caltrans 2020, FTA 2018). Table 4.4.3 shows typical vibration levels for various pieces of construction equipment used in the assessment of construction vibration (FTA 2018).

Table 4.4.3 Vibration Levels Measured during Construction Activities

Equipment	PPV at 25 ft (in/sec)
Large Bulldozer	0.089
Loaded Trucks	0.076
Small Bulldozer	0.003

Source: FTA 2018

Vibration limits used in this analysis to determine a potential impact to local land uses from construction activities, such as blasting, pile-driving, vibratory compaction, demolition, drilling, or excavation, are based on information contained in Caltrans' *Transportation and Construction Vibration Guidance Manual* and the Federal Transit Administration and the FTA *Transit Noise and Vibration Impact Assessment Manual* (Caltrans 2020; FTA 2018). Maximum recommended vibration limits by the American Association of State Highway and Transportation Officials (AASHTO) are identified in Table 4.4.4.

Table 4.4.4 AASHTO Maximum Vibration Levels for Preventing Damage

Type of Situation	Limiting Velocity (in/sec)
Historic sites or other critical locations	0.1
Residential buildings, plastered walls	0.2–0.3
Residential buildings in good repair with gypsum board walls	0.4–0.5
Engineered structures, without plaster	1.0–1.5

Source: Caltrans 2020

Based on AASHTO recommendations, limiting vibration levels to below 0.1 PPV in/sec for historic sites and 0.2 PPV in/sec at residential structures would prevent structural damage. These limits are applicable regardless of the frequency of the source. However, as shown in Table 4.4.5 and Table 4.4.6, potential human annoyance associated with vibration is usually different if it is generated by a steady state or a transient vibration source.

Table 4.4.5 Human Response to Steady State Vibration

PPV (in/sec)	Human Response
3.6 (at 2 Hz)–0.4 (at 20 Hz)	Very disturbing
0.7 (at 2 Hz)–0.17 (at 20 Hz)	Disturbing
0.10	Strongly perceptible
0.035	Distinctly perceptible
0.012	Slightly perceptible

Source: Caltrans 2020

Table 4.4.6 Human Response to Transient Vibration

PPV (in/sec)	Human Response
2.0	Severe
0.9	Strongly perceptible
0.24	Distinctly perceptible
0.035	Barely perceptible

Source: Caltrans 2020

As shown in Table 4.4.5, the vibration level threshold at which steady vibration sources are considered to be distinctly perceptible is 0.035 in/sec PPV. This is roughly equivalent to the FTA identified threshold of 78 VdB for assessing impacts to residential land uses from infrequent events. This threshold is used for assessing passing trains in the FTA Manual. However, as shown in Table 4.4.6, the vibration level threshold at which transient vibration sources (such as construction equipment) are considered to be distinctly perceptible is 0.24 in/sec PPV. This is roughly equivalent to 94 VdB. This analysis uses the distinctly perceptible threshold for purposes of assessing vibration impacts.

Although groundborne vibration is sometimes noticeable in outdoor environments, groundborne vibration is almost never annoying to people who are outdoors; therefore, the vibration level threshold for human perception is assessed at occupied structures (FTA 2018).

Traffic Noise

Noise levels affecting the proposed project site would be primarily influenced by traffic noise from South La Patera Lane and U.S. 101. The project would primarily generate additional traffic on South La Patera Lane, which abuts the project site to the north and east. Future noise levels affecting the compatibility of the project site were estimated using the FHWA's Traffic Noise Model (TNM). Project trip generation is based on a Traffic Impact Report (TIA) completed by Linscott, Law & Greenspan Engineers, included as Appendix F. Table 4.4-7 shows that existing uses around the project site generate 149 daily trip ends on South La Patera Lane. The proposed project would generate an additional 202 daily trip ends, for a total of 351 daily trip ends on South La Patera Lane.

Table 4.4-7 Project Trip Generation

Land Use	Size	Daily Trip Ends Volumes ²	AM Peak Hour Volumes ²			PM Peak Hour Volumes ²		
			In	Out	Total	In	Out	Total
Proposed Project								
Train Depot ³	126 Spaces	351	42	11	53	14	40	54

Existing Site								
Warehouse ⁴	30,000 GSF	(52)	(4)	(1)	(5)	(2)	(4)	(6)
Office ⁵	10,000 GSF	(97)	(10)	(2)	(12)	(2)	(10)	(12)
Subtotal		(149)	(14)	(3)	(17)	(4)	(14)	(18)
Net Increase Driveway Trips		202	28	8	36	10	26	36

¹ Source: Linscott, Law & Greenspan Engineers. ITE "Trip Generation Manual", 10th Edition, 2017. Trips are one-way traffic movements, entering or leaving.

² Trips are one-way traffic movements, entering or leaving.

³ ITE Land Use Code 90 (Park-and-Ride Lot with Bus or Light Rail Service) trip generation average rates.

- Daily Trip Rate: 2.81 trips/parking space; 50% inbound/50% outbound
- AM Peak Hour Trip Rate: 0.42 trips/parking space; 79% inbound/21% outbound
- PM Peak Hour Trip Rate: 0.43 trips/parking space; 25% inbound/75% outbound

⁴ ITE Land Use Code 150 (Warehousing) trip generation average rates.

- Daily Trip Rate: 1.74 trips/1,000 SF of floor area; 50% inbound/50% outbound
- AM Peak Hour Trip Rate: 0.17 trips/1,000 SF of floor area; 77% inbound/23% outbound
- PM Peak Hour Trip Rate: 0.19 trips/1,000 SF of floor area; 27% inbound/73% outbound

⁵ ITE Land Use Code 710 (General Office Building) trip generation average rates.

- Daily Trip Rate: 9.74 trips/1,000 SF of floor area; 50% inbound/50% outbound
- AM Peak Hour Trip Rate: 1.16 trips/1,000 SF of floor area; 86% inbound/14% outbound
- PM Peak Hour Trip Rate: 1.15 trips/1,000 SF of floor area; 16% inbound/84% outbound

Significance Thresholds

The following criteria are based on Appendix G of the State CEQA Guidelines. An impact would be considered potentially significant if the project would result in one or more of the following conditions:

- Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies;
- Generation of excessive groundborne vibration or groundborne noise levels; or
- For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, exposure of people residing or working in the project area to excessive noise levels.

As discussed in the Initial Study (Appendix A), the project is located outside the Noise Exposure Range of the Santa Barbara Airport, Airport Land Use Plan and was determined to be less than significant. The analysis in this EIR evaluates the potential impacts of the project on the environment. The compatibility of future land uses within the project area with the existing noise environment would be addressed through compliance with applicable city noise regulations and the city's permit approval process.

Short-Term/Construction Noise

The City of Goleta Noise Element restricts construction activities near or adjacent to residential buildings and other sensitive receivers to the hours of 8:00 AM to 5:00 PM Monday through Friday and 7:00 AM to 4:00 PM Monday through Friday for construction in nonresidential areas. Construction activities would generally be considered to have a potentially significant noise impact if average daytime noise levels would exceed 65 dBA CNEL when averaged over an 8-hour period.

Long-Term Operational Noise Impacts

The GMC prohibits loud and unreasonable noise between the hours of 10:00 PM and 7:00 AM Sunday through Thursday and between 12:00 AM and 7:00 AM Friday and Saturday. Loud and unreasonable noise is defined as sound which is clearly discernible at a distance of 100 feet from the property line of the property upon which it is broadcast or sound which is above 60 dBA at the edge of the property line upon which the sounds is broadcast.

For traffic-related noise, impacts would be considered significant if project-generated traffic would result in exposure of sensitive receivers to an unacceptable increase in noise levels. For purposes of this analysis, a significant impact would occur if project-related traffic increases the ambient noise environment of noise-sensitive locations by 3 dBA or more if the locations are subject to noise levels in excess of the conditionally acceptable noise levels in Table 4.4-2, or by 5 dBA or more if the locations are not subject to noise levels in excess of the aforementioned standards.

Exposure to non-transportation noise sources would be considered potentially significant if noise levels at existing noise-sensitive receptors would exceed the City's noise exposure standards for stationary noise sources.

Groundborne Vibration Impacts

To minimize the potential for cosmetic damage to buildings, AASHTO has established vibration thresholds of 0.1 in/sec PPV for sensitive historic structures and 0.2 in/sec PPV for buildings of normal conventional construction. Additionally, the FTA has established a vibration threshold 0.24 in/sec PPV for human annoyance.

b. Project Impacts

Threshold: Would the project result in generation of a substantial temporary increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies? (Construction)

Impact N-1 SHORT-TERM CONSTRUCTION OF THE PROJECT WOULD TEMPORARILY INCREASE LOCAL NOISE LEVELS. THE ANTICIPATED INCREASE IN CONSTRUCTION NOISE WOULD BE LESS THAN SIGNIFICANT TO NEARBY SENSITIVE RECEIVERS.

Construction Noise

Construction noise typically occurs intermittently and varies depending upon the nature or phase of construction (e.g., land clearing, grading, excavation, and paving). Noise generated by construction equipment, including earth movers, material handlers, and portable generators, can reach high levels and be disruptive at nearby noise-sensitive receptors. Although noise ranges are generally similar for all construction phases, the initial site preparation or grading phases tends to involve the most heavy-duty equipment having a higher noise-generation potential. Noise levels associated with individual construction equipment are summarized in Table 4.4-8.

Table 4.4-8 Construction Equipment Noise Levels

Equipment	Noise Level (dBA) at 50 feet from Source Center	
	L _{max}	L _{eq}
Air Compressor	78	74
Backhoe	78	74
Front End Loader	79	75
Compactor (Ground)	83	76
Concrete Mixer Truck	79	75
Concrete Saw	90	83
Crane	81	73
Dozer	82	78
Grader	85	81
Excavator	81	77
Scraper	84	80
Generator	81	78
Gradall	83	79
Hydraulic Break Ram	90	80
Jack Hammer	89	82
Impact Hammer/Hoe Ram (Mounted)	90	83
Roller	80	73
Paver	77	74

Equipment	Noise Level (dBA) at 50 feet from Source Center	
	L _{max}	L _{eq}
Pneumatic Tools	85	82
Tractor	84	80
Dump Truck	77	73

Based on measured equipment noise levels. Actual noise levels are typically lower, particularly if the equipment is fitted with exhaust mufflers and engine shrouds. Sources: FTA 2018, FHWA 2008

As shown in Table 4.4-8, maximum noise levels generated by individual pieces of construction equipment typically range from approximately 77 dBA L_{max} at 50 feet and average-hourly noise levels for individual construction equipment generally range from approximately 73 to 83 dBA L_{eq} (FTA 2018).

The nearest sensitive receptors to the project site are residential areas northwest 500 feet north of the project site across UPRR right-of-way and U.S. 101. A dozer and backhoe were analyzed together for construction noise impacts due to their likelihood of being used in conjunction with one another and therefore a reasonable scenario for the greatest noise generation during construction. At a distance of 500 feet, a dozer and a backhoe would generate a noise level of 59.1 dBA L_{eq}. Converting this noise level to CNEL would result in a lower estimate because construction noise would be restricted to an 8-hour day and would not occur during the evening and nighttime hours. Therefore, noise generated from construction would be below the threshold of 65 dBA CNEL for an 8-hour period. Additionally, noise levels at other nearby receivers would be lower than 59.1 dBA L_{eq} because they are farther away. In accordance with City of Goleta Noise Element Policy NE 6.5, Best Management Practices (BMPs) would also be implemented during the construction phase. Therefore, because construction would not occur outside of the allowed hours and noise levels would be below 65 dBA CNEL, impacts from construction equipment would be less than significant.

Mitigation Measures

No mitigation measures would be required.

Significance After Mitigation

Impacts would be less than significant without mitigation.

Threshold: Would the project generate a substantial permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies? (Operation)
--

Impact N-2 THE PROJECT WOULD INCLUDE STATIONARY SOURCES THAT WOULD INCREASE NOISE LEVELS. HOWEVER, NOISE LEVELS GENERATED BY THE PROJECT WOULD NOT EXCEED 60 DBA AT THE NEAREST PROPERTY LINE. IMPACTS WOULD BE LESS THAN SIGNIFICANT.

On-Site Operational Noise

On-site noise source would include general conversations, landscape maintenance, waste hauling, and heating, ventilation, air conditioning (HVAC) equipment. Due to the distances and low noise levels associated with general site activities, on-site traffic, and landscape maintenance, these sources are not considered substantial and are not analyzed further. The primary noise source of concern would be associated with the project's mechanical equipment.

Based on combined data from Trane, Carrier, and Rheem HVAC manufacturing companies, noise from HVAC equipment would typically generate a noise level of 70 dBA L_{eq} at a reference distance of three feet from the source (Carrier Corp 2010). The GMC states that sound over 60 dBA between the hours of 10:00 PM and 7:00 AM Sunday through Thursday and between 12:00 AM and 7:00 AM Friday and Saturday would be considered significant. The shortest distance between the project building and the property line is approximately 25 feet. At this distance, noise levels from HVAC equipment would be approximately 51.6 dBA. Additionally, rooftop HVAC units would be shielded from surrounding land uses with parapets and roofs that block line-of-sight to sensitive receivers would typically provide at least a 5-dBA noise reduction. Therefore, rooftop-mounted equipment would generate approximate noise levels of 46.6 dBA at the nearest property line. Therefore, operational noise impacts associated with HVAC equipment would be less than significant.

Mitigation Measures

No mitigation measures would be required.

Significance After Mitigation

Impacts would be less than significant without mitigation.

Threshold: Would the project generate a substantial permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies? (Operation)

Impact N-3 THE PROJECT WOULD GENERATE NEW VEHICLE TRIPS THAT WOULD INCREASE NOISE LEVELS ON NEARBY ROADWAYS. HOWEVER, AMBIENT NOISE WOULD NOT EXCEED THE CONDITIONAL NOISE LEVELS FOR THE SITE OR AFFECTED RECEPTORS, AND PROJECT-RELATED CHANGES IN NOISE LEVELS WOULD NOT EXCEED 5 DBA. IMPACTS WOULD BE LESS THAN SIGNIFICANT.

Off-Site Traffic Noise

The project would generate new vehicle trips that would increase noise levels on nearby roadways. These trips would occur on South La Patera Lane. As shown in Table 4.4-7, the proposed project would increase the number of trip ends on South La Patera Lane from 149 to 351, an increase of 202 daily trip ends. As shown in the Table 4.4-9, noise levels related to the additional trips would increase of 3.8 dBA.

Table 4.4-9 Predicted Increases in Traffic Noise Levels – Existing Conditions

Roadway Segment	Noise Level (dBA CNEL/L _{dn}) at 50 Feet from Near-Travel-Lane Centerline			Significant Impact? ¹
	Existing	Existing Plus Project	Change	
South La Patera Ln., Lindmar Dr. to Dead End	45.9	49.7	3.8	No

¹ A significant impact would occur if project-related traffic increases the ambient noise environment of noise-sensitive locations by 3 dBA or more if the locations are subject to noise levels in excess of 75 dBA, or by 5 dBA or more if the locations are not subject to noise levels in excess of 75 dBA.

Note: Traffic noise levels were calculated using the FHWA roadway noise prediction model based on traffic data obtained from the traffic analysis prepared by Linscott, Law & Greenspan Engineers.

The project site is not located near a noise-sensitive location. In addition, ambient noise measured on the project site does not exceed the City Noise Land Use Compatibility Criteria for conditionally compatible noise level of 75 dBA for commercial and industrial uses, as detailed in Table 4.4-2. Therefore, a noise increase of more than 5 dBA would be considered significant for the area. As shown in Table 4.4-9, the project would result in an increase of approximately 3.8 dBA, which would be less than significant.

Mitigation Measures

No mitigation measures would be required.

Significance After Mitigation

Impacts would be less than significant without mitigation.

Threshold: Would the project generate excessive groundborne vibration or groundborne noise levels?

Impact N-4 THE PROJECT WOULD RESULT IN GROUNDBORNE VIBRATION IN THE PROJECT AREA VICINITY, DURING THE CONSTRUCTION PHASE. VIBRATION LEVELS DURING PROJECT CONSTRUCTION WOULD NOT CAUSE DAMAGE TO NEARBY STRUCTURES OR SUBSTANTIALLY IMPACT RESIDENTS IN NEARBY DWELLINGS. THIS IMPACT WOULD BE LESS THAN SIGNIFICANT.

Construction activities known to generate excessive ground-borne vibration, such as pile driving, would not be conducted by the project. The greatest anticipated source of vibration during general project construction activities would be from a dozer which would be used as close as 150 feet during construction from nearby land uses and buildings, including the historic Daniel Hill Adobe. A dozer would create a vibration level of approximately 0.089 PPV in/sec. at a distance of 25 feet (Caltrans 2020). This would equal a vibration level of approximately 0.012 PPV in/sec. at a distance of 150 feet.¹ The nearest residential structures are located 500 feet north across U.S. 101 and would experience a lower vibration level, which would be lower than what is considered a distinctly perceptible impact for humans at 0.24 PPV in/sec. In addition, 0.012 PPV in/sec. would be lower than the structural damage impact to historic structures of 0.1 PPV in/sec. Therefore, temporary impacts associated with the dozer (and other potential equipment) would be less than significant.

Mitigation Measures

No mitigation measures would be required.

Significance After Mitigation

Impacts would be less than significant without mitigation.

4.4.4 Cumulative Impacts

Planned, proposed, and approved projects in and around the city would expose additional people and property to noise and groundborne vibration. Noise impacts from individual projects would depend upon the location, type, and size of development and the proposed uses, and would be primarily addressed through compliance with the City's land use compatibility requirements and enforcement of the city's maximum noise exposure standards for stationary noise sources. Cumulatively, increasing traffic noise is the primary noise concern associated with continued long-term development in Goleta. The project's contribution to cumulative traffic noise in the Project area vicinity is evaluated quantitatively in Impact N-3 above and has been determined to be less than significant. Therefore, the project's overall contribution to long-term cumulative noise impacts would not be cumulatively considerable.

Construction and operation of other projects in the vicinity of the project area would not generate noise levels in excess of existing measured noise levels and would not affect sensitive receptors in the Project area vicinity. As described in Impact N-1, the nearest residences are located 500 feet to the north of the project area. Construction and operational noise is localized and generally does not contribute to cumulative noise impacts. None of the projects in the cumulative project list in Section 3, *Environmental Setting*, are located adjacent to the project site and would lead to cumulative noise impacts.

¹ $PPV_{Equipment} = PPV_{Ref} (25/D)^n$ (in/sec), PPV_{Ref} = reference PPV at 25 feet, D = distance, and $n = 1.1$

4.5 Transportation

This section evaluates the potential transportation impacts of the project. The analysis in this section is based on the Transportation Impact Study (TIS) prepared by Linscott, Law, & Greenspan engineers (LLG) included as Appendix F. The analysis approach used in the TIS was developed based on the City of Goleta's City Council Resolution No. 20-44, which identifies vehicle miles traveled (VMT) as the primary metric for evaluating a project's transportation impacts in addition to a Level of Service (LOS) analysis at the local level. LOS analysis is provided for informational purposes only.

4.5.1 Setting

This section describes the existing transportation system and current operating conditions in the study area shown in Figure 4.5-1.

Regional Road Network

Regional access to the Project Site is provided by the State Route 217 (SR 217) and U.S. 101, which are detailed below:

- SR 217 is an east-west state highway connecting the U.S. 101 to UCSB. In the project vicinity, two mixed-flow lanes are generally provided in each direction on SR 217. Eastbound and westbound ramps are provided on SR 217 at Hollister Avenue in the and are located approximately 1.5 miles east of the project site.
- U.S. 101 is a north-south oriented freeway that extends across northern and southern California. In the project area, two to three mixed-flow lanes are generally provided in each direction on the U.S. 101 with auxiliary merge/weave lanes provided between some interchanges. Northbound and southbound ramps are provided on the U.S. 101 at Los Carneros Road and Fairview Avenue, and are located approximately 0.6 miles west and 0.7 miles east of the project site, respectively

Local Roadway Network

The project study area includes seven roadway facilities which have the potential to be impacted by the project. Three of the facilities are within the City of Goleta jurisdiction and four are within the California Department of Transportation (Caltrans) jurisdiction, as detailed below:

1. Los Carneros Road/Hollister Avenue (City of Goleta)
2. South La Patera Lane/Hollister Avenue (City of Goleta)
3. Fairview Avenue/Hollister Avenue (City of Goleta)
4. Los Carneros Road/U.S. 101 Northbound ramps (Caltrans)
5. Los Carneros Road/U.S. 101 Southbound ramps (Caltrans)
6. Fairview Avenue/U.S. 101 Northbound ramps (Caltrans)
7. Fairview Avenue/U.S. 101 Southbound ramps (Caltrans)

Figure 4.5-1 Project Study Area and Analysis Locations

Roadway Descriptions and Operations

The City of Goleta utilizes the roadway categories recognized by regional, state, and federal transportation agencies. There are four categories in the roadway hierarchy, ranging from freeways, with the highest capacity, to two-lane undivided roadways, with the lowest capacity. The roadway categories are summarized as follows:

- Freeways are limited-access and high-speed travel ways included in the state and federal highway systems. Their purpose is to carry regional through-traffic. Access is provided by interchanges with typical spacing of 1 mile or greater. No local access is provided to adjacent land uses.
- Arterial roadways are major streets that primarily serve through-traffic and provide access to abutting properties as a secondary function. Arterials are generally designed with two to six travel lanes and their major intersections are signalized. This roadway type is divided into two categories: major and minor arterials. Major arterials are typically four-or-more lane roadways and serve both local and regional through-traffic. Minor arterials are typically two to-four lane streets that service local and commuter traffic.
- Collector roadways are streets that provide access and traffic circulation within residential and non-residential (e.g., commercial and industrial) areas. Collector roadways connect local streets to arterials and are typically designed with two through-travel lanes (i.e., one through-travel lane in each direction) that may accommodate on-street parking. They may also provide access to abutting properties.
- Local roadways distribute traffic within a neighborhood, or similar adjacent neighborhoods, and are not intended for use as through-streets or as links between higher capacity facilities such as collector or arterial roadways. Local streets are fronted by residential uses and do not typically serve commercial uses.

Los Carneros Road is a north-south oriented roadway located west of the project site. Within the project study area, Los Carneros Road is designated as a Principal Arterial by the City of Goleta. Two through lanes are generally provided in each direction on Los Carneros Road. Separate exclusive left-turn lanes are provided in each direction on Los Carneros Road at the Hollister Avenue intersection, and a separate exclusive left-turn lane is provided in the northbound direction at the US 101 Northbound ramps intersection. Los Carneros Road is posted for a speed limit of 45 miles per hour within the project study area.

South La Patera Lane is a north-south oriented roadway that borders the project site to the east. Within the project area, South La Patera Lane is designated as a Major Collector by the City of Goleta. One through travel lane is provided in each direction on South La Patera Lane within the project area. A separate exclusive left-turn lane is provided in the southbound direction on South La Patera Lane at the Hollister Avenue intersection. There is no speed limit posted on South La Patera Lane within the project area, thus a prima facie speed limit of 25 miles per hour is assumed, consistent with the State of California Vehicle Code Section 22352(b)(1).

Fairview Avenue is a north-south oriented roadway located east of the project site. North of Hollister Avenue, Fairview Avenue is designated as Principal Arterial by the City of Goleta. South of Hollister Avenue, Fairview Avenue is designated as a Major Collector by the City of Goleta. Two through travel lanes are generally provided in each direction on Fairview Avenue within the project study area. Separate exclusive left-turn lanes are provided in each direction on Fairview Avenue at the Hollister Avenue intersection. Separate exclusive left-turn lanes are provided in the northbound

direction at the U.S. 101 Northbound ramps intersection and in the southbound direction at the U.S. 101 Southbound ramps intersection. Fairview Avenue is posted for a speed limit of 35 miles per hour within the project area.

Hollister Avenue is an east-west oriented roadway located south of the project site. Within the project area, Hollister Avenue is designated as a Principal Arterial by the City of Goleta. Two through travel lanes are generally provided in each direction on Hollister Avenue within the area. Separate exclusive left-turn lanes are provided in each direction on Hollister Avenue at the Los Carneros Road intersection and at the Fairview Avenue intersection. A separate exclusive left-turn lane is provided in the eastbound direction at the South La Patera Lane intersection. West of Fairview Avenue, Hollister Avenue is posted for a speed limit of 45 miles per hour within the project study area. East of Fairview Avenue, Hollister Avenue is posted for a speed limit of 25 miles per hour.

Pedestrian and Bicycle Facilities

Pedestrian facilities include sidewalks, crosswalks, multi-use paths, and pedestrian signals at signalized intersections. Bicycle facilities consist of Class I, II, and III bikeways. Class I shared-use paths or bike paths are facilities with a separate right-of-way with crossflows by vehicles minimized. Class II bike lanes provide a striped lane for one-way bicycle travel on the side of the street adjacent to vehicle traffic. Class III bike routes consist of a roadway that is shared between bicycle and vehicle traffic with supplemental bike signage. The pedestrian and bicycle facilities near the project site include:

- La Patera Lane: Intermittent sidewalk on the east and west side of this road and no bicycle facilities.
- Hollister Avenue: Continuous sidewalk on the north side of the road near South La Patera Lane with a signalized intersection and crosswalk at the Hollister Avenue/South La Patera Lane intersection. Class II bike lanes exist in each direction on Hollister Avenue.

Transit Services

The Santa Barbara Metropolitan Transit District (MTD) provides public bus transit services in the City and throughout Santa Barbara County. MTD operates 24 lines throughout the County with three of these lines being express lines. The nearest stop to the project site is located at Hollister Avenue and La Patera Lane, which is served by MTD Route 6 and Route 12x.

The Ventura County Transportation Commission (VCTC) also operates public transit services within the City through its Coastal Express service on Routes 85, 85C, 86, and 88. The nearest stops of these routes to the project site are located at Hollister Avenue/Nectarine Avenue and Hollister Avenue/Cremona Drive, located approximately one mile southeast and southwest respectively.

Vehicle Miles Traveled

“Vehicle miles traveled” refers to the amount and distance of automobile travel “attributable to a project.” VMT re-routed from other origins or destinations as the result of a project would not be attributable to a project except to the extent that the re-routing results in a net increase in VMT. Daily VMT per resident is the average number of vehicle miles that a resident in a given area travels per day. One factor that leads to a higher relative daily VMT per resident is an imbalance of jobs and housing availability in an area. Existing VMT in the project area was estimated in the City of Goleta VMT Threshold Study. On average, each resident near the project site drives 19.8 miles per day to

and from their home and each employee drives 16.8 miles per day to and from their work (Goleta 2020).

Existing Level of Service

Due to the COVID-19 pandemic, traffic count data could not be collected at the study intersections to determine existing traffic conditions at the study area roadway facilities. In consultation with City staff, historical data (2007 and 2019 data) at the study intersections was utilized to represent current (pre-pandemic) traffic volume conditions. Field observations were conducted to observe traffic operating conditions and signal timings. A detailed explanation of the traffic count methodology and the traffic count sheets are included in Appendix F.

The existing operation of the City intersections were measured based on methodologies established in the Intersection Capacity Utilization (ICU) method. The existing operations of the Caltrans intersections were established using the Highway Capacity Manual (HCM 6th Edition). Existing operations used the historical data to determine more accurate existing conditions than would be determined during the COVID-19 pandemic. LOS is a qualitative measure of traffic operating conditions ranging from LOS A to LOS F. LOS A is the highest functioning and LOS F is the lowest functioning. Existing traffic flow analyses focus on operating conditions of critical intersections and segments during peak travel periods, which are typically the AM and PM peak hours. The AM peak hour is defined as the highest one hour of traffic flow counted between 7:00 AM and 9:00 AM on a typical weekday, the PM peak hour is defined as the highest one hour of traffic flow counted between 4:00 PM and 6:00 PM on a typical weekday. Table 4.5-1 and Table 4.5-2 presents the existing study area intersection operations for the City and Caltrans study intersections, respectively.

Table 4.5-1 Existing City of Goleta Intersection Level of Service (LOS)

Intersection	Peak Hour	V/C ¹	Level of Service
1. Los Carneros Road/Hollister Avenue	AM	0.406	A
	PM	0.587	A
2. South La Patera Lane/Hollister Avenue	AM	0.441	A
	PM	0.599	A
3. Fairview Avenue/Hollister Avenue	AM	0.545	A
	PM	0.633	B

¹ Volume to Capacity ratio

Table 4.5-2 Existing Caltrans Intersection Level of Service (LOS)

Intersection	Peak Hour	Delay (sec/veh)	Level of Service
1. Los Carneros Road/U.S. 101 Northbound ramps	AM	18.0	B
	PM	20.3	C
2. Los Carneros Road/U.S. 101 Southbound ramps	AM	13.9	B
	PM	14.8	B
3. Fairview Avenue/U.S. 101 Northbound ramps	AM	10.0	A
	PM	13.4	B
4. Fairview Avenue/U.S. 101 Southbound ramps	AM	15.8	B
	PM	21.6	C

Source: TIS, Appendix F

As shown in Table 4.5-1, the three study intersections located within the City are presently operating at LOS B or better during the weekday AM and PM peak hours under existing conditions. As shown in Table 4.5-2, the four study intersections located within Caltrans jurisdiction are presently operating at LOS C or better during the weekday AM and PM peak hours under existing conditions.

4.5.2 Regulatory Setting

State Regulations

California Department of Transportation

Caltrans manages the operation of state highways, including U.S. 101 and SR 217, which pass through the City.

Senate Bill (SB) 743

To further the state’s commitment to the goals of SB 375, Assembly Bill (AB) 32, and AB 1358, SB 743 adds Chapter 2.7, Modernization of Transportation Analysis for Transit-Oriented Infill Projects, to Division 13 (Section 21099) of the Public Resources Code. Key provisions of SB 743 include reforming CEQA analysis for aesthetics and parking for urban infill projects and replacing the measurement of automobile delay with vehicle miles traveled (VMT) as a metric that can be used for measuring environmental impacts. Under SB 743, the focus of the environmental impacts of transportation shifts from driver delay to reduction of GHG emissions, creation of multimodal networks, and promotion of a mix of land uses, and LOS standards become local policy thresholds as adopted among individual agencies.

Regional

Santa Barbara County Association of Governments Regional Transportation Plan and Sustainable Community Strategy (SBCAG RTP and SCS)

The SBCAG RTP and SCS, titled Fast Forward 2040, is a long-range planning document for the region’s transportation system. The RTP analyzes the transportation needs of the region into the future and identifies project priorities in order to improve the transportation system. The Plan offers

a mix of mobility options and commits to a more sustainable transportation system through investments in public transportation, active transportation, highways, streets, and roads, and system efficiency. SBCAG is currently preparing its updated RTP/SCS Connected 2050 with anticipated completion August 2021.

Local Regulations

City of Goleta General Plan

The City of Goleta General Plan is intended to guide the land use and transportation networks by providing goals, policies, and action items to specify how the transportation system in the City will grow and improve into the future. Policies and Action Items that are applicable to the project in relation to transportation include:

Policy TE 1: Integrated Multi-Modal Transportation System

TE 1.1 Alternative Modes. The City's intent shall be to achieve a realistic and cost-effective balance between travel modes, including bikeways, pedestrian circulation, and bus transit. The City shall encourage the use of alternative modes of transportation, such as bus transit, bicycling, and walking, which have the additional beneficial effect of reducing consumption of non-renewable energy sources.

TE 1.2 Transportation and Land Use. The design of the City's transportation infrastructure and services, and investments in future improvements, shall be supportive of the land use plan set forth in the Land Use Element and responsive to the transportation impacts of development located in nearby areas outside the city boundary. The design of and improvements to the City's transportation system should accommodate not only existing conditions, but also projected growth based on the Land Use Element of this plan and planned growth in adjacent jurisdictions, including UCSB, the County, and the City of Santa Barbara.

TE 1.3 Improved Connectivity in Street, Pedestrian, and Bikeway Systems. In developing the future transportation system, the City will place priority on creating one or more additional non-interchange crossings of U.S. 101 to connect the community from north to south. The intent shall be to facilitate cross-town traffic, improve bicycle and pedestrian flow and safety, and to relieve traffic congestion on cross-routes with freeway interchanges.

TE 1.5 Multimodal Transportation Center. The City supports consideration of a multimodal transportation center in the city to facilitate interconnection and transfers between express bus routes, automobile, bicycle and pedestrian circulation, and potentially commuter and other passenger rail services. While a proposed area in the vicinity of the current Amtrak terminal should be studied, alternative sites should also be explored; the ultimate location will depend on the results of such study.

TE 2.2 Land Use Strategies to Reduce Automobile Travel Demand. The City supports the following land use strategies, as provided in the Land Use and Housing Elements, which may enable greater reliance by commuters, shoppers, and others, on alternative modes of travel:

- d. The provision of onsite commercial services for employees in new non-residential development, such as but not limited to cafeterias, childcare, financial services, convenience retail services, concierge services, and others as appropriate.

TE 2.3 Diversion of Automobile Trips to Alternative Modes. The City encourages investment in alternative modes of travel that will make those modes more competitive with auto travel in terms of convenience, accessibility, costs, and safety. These may include, but are not limited to, improvements in the bus transit system, the bikeway system, pedestrian circulation system, and potentially commuter rail services, if the region should determine to pursue this option.

Policy TE 4: Target Level of Service Standards

TE 4.1 General Level of Service Standard. A traffic LOS standard C shall apply citywide to major arterials, minor arterials, and collector roadways and signalized and unsignalized intersections, except as provided in TE 4.2. The standard shall apply to daily traffic volumes and both AM and PM peak hours for intersections, and to average daily traffic volumes (ADT) for roadway segments.

Policy TE 7: Public Transit (Bus Transportation)

TE 7.3 Intermodal Transportation Center/Bus Transfer Areas. There are significant opportunities for transfer from one route to another. Two bus transfer locations are identified:

- (1) Hollister Avenue in Old Town and
- (2) Adjacent to the Camino Real Marketplace.

The City, MTD, and other transit providers should identify and plan for facilities in these areas to facilitate and accommodate such transfers. In addition to these designated areas the City shall also consider potential opportunities for park-and-ride facilities, especially any opportunities that offer shared parking facilities with other uses. The public transportation plan map designates a generalized location for an intermodal transportation center near the existing Amtrak station. The purpose of the transportation center would be to provide a convenient and safe hub for transfers between bus, shuttle, train, automobile, bicycle, and pedestrian modes. The specific site selected for a transportation center should allow convenient and safe drop-off and pick-up areas without adversely affecting surrounding traffic flows.

TE 7.8 Hollister Avenue Transit Corridor. Hollister Avenue from the eastern city boundary west to Pacific Oaks Road is designated as the Hollister Avenue Transit Corridor. The highest concentration of transit routes and greatest frequency of service occur in this area. The land areas along this corridor include existing and planned future retail commercial and employment centers as well as higher-density housing. These higher-intensity uses are transit oriented; the City supports efforts by MTD and other providers to expand express and local bus services along this corridor as ridership levels warrant.

Policy TE 8: Rail Transportation

TE 8.1 Commuter Rail Service. If the region should determine that it is cost effective to implement commuter rail service along the UPRR corridor, the City shall consider new facilities, such as (but not limited to) track sidings or a turnaround, as may be appropriate to accommodate the service. Any improvements should be limited to areas within the existing railroad right-of-way to the extent feasible.

TE 8.2 Rail Terminal. Figure 7-4 identifies the location of the existing Amtrak terminal as of 2005. The City, in cooperation with Amtrak and any future commuter rail service provider, should actively explore and promote the development of an expanded multimodal transportation center that includes a rail station in the city as referenced in TE 7.3. As of 2005, facilities were limited to a passenger platform. The City supports regional funding and construction of a terminal facility that includes a building with an indoor waiting area, ticketing, information kiosks, restrooms, and other appropriate amenities; parking; and drop-off and pick-up areas. Small-scale ancillary commercial services, such as a small restaurant, may also be permitted as integral to the terminal facility.

TE 8.3 Coordination of Bus Service with Commuter Rail. If the region should determine to implement commuter rail service along the UPRR corridor, the City encourages MTD, private providers, and/or employers to consider scheduled and/or demand-responsive shuttle bus service between the train station and local employment centers, including but not limited to UCSB.

TE 8.4 Linkage of Land Use With Potential Commuter Rail. The land-use plan map designates land areas along and near the railroad corridor in the mid-Hollister area for business park and medium-density multi-family residential development. It is the intent that these higher-intensity uses support and not prevent potential passenger rail service as well as support existing and potential expanded bus commute services along the Hollister Corridor.

TE 8.5 Amtrak and Caltrans-Supported Passenger Rail Services. The City encourages that existing Amtrak services and Caltrans supported passenger rail services be maintained, with expansion or increased frequency of service when warranted by ridership levels.

TE 8.7 Retention of Railroad Right-of-Way. In the event that any portion of the existing railroad right-of-way is proposed to be abandoned by UPRR in the future, the City supports efforts to secure an ownership interest by a regional or local entity. The intent shall be to reserve the right-of-way for future use, including but not limited to commuter rail service, park-and-ride lots, or other appropriate transportation facilities.

4.5.3 Impact Analysis

a. Methodology and Significance Thresholds

To implement SB 743, the CEQA Guidelines have been updated to change the criteria for determining what constitutes a significant traffic-related environmental impact to rely upon quantification of vehicle miles traveled (VMT) instead of LOS. As of July 1, 2020, the VMT-based approach in Section 15064.3 of the CEQA Guidelines applies statewide for the purpose of assessing traffic-related impacts under CEQA. As a result, this analysis uses the metric of VMT to determine the project's traffic-related impact.

On July 7, 2020, the Goleta City Council adopted Resolution No. 20-44 which set locally applicable CEQA thresholds of significance for VMT (Goleta 2020). Under SB 743, cities can retain automobile LOS as a local policy, unrelated to CEQA, to measure a project's effect of local traffic operations. Pursuant to Resolution No. 20-44, the City continues to utilize LOS standards outlined in General Plan Policy TE 4 and the City's Environmental Review Guidelines, and will retain discretion to impose conditions of approval as necessary to bring a project into consistency with adopted LOS policies. However, exceedances of LOS standards are no longer considered an impact under CEQA.

Methodology

Project VMT

The VMT assessment criteria for the project were determined in consultation with City of Goleta staff, in accordance with the technical advisory issued by the Governor’s Office of Planning and Research, and the VMT thresholds and methodology adopted in Resolution No. 20-44.

Transit Facilities

The study area roadway facilities were evaluated under the following scenarios:

- Existing Conditions reflect recent traffic counts and the existing transportation network.
- Existing Condition plus Project adds project generated traffic to existing volumes.
- Future Cumulative Baseline.
- Future Cumulative Baseline plus Project.

Vehicle Trip Generation

The Institute of Transportation Engineers (ITE) Trip Generation Manual 10th Edition was used to estimate project trip generation. ITE Land Use Code 90 (Park-and-Ride Lot with Bus or Light Rail Service) trip generation average rates were used to forecast the traffic volumes expected to be generated by the project. An adjustment was made to the trip generation forecast based on the existing warehouse structure on-site. ITE Land Use Code 150 (Warehousing) and ITE Land Use Code 710 (General Office Building) trip generation average rates were used to estimate the trip reduction related to the removal of the existing structure from the project site. While the existing warehouse structure is only partially occupied, the analysis assumed typical capacity of the structure that could occur under the existing development conditions of the site. As shown in Table 4.5-3, the project is expected to generate 36 net new vehicle trips during AM and PM peak hour and 202 daily new trips.

Table 4.5-3 Goleta Train Depot Trip Generation

Land Use	Size	Unit ¹	Daily	AM			PM		
				In	Out	Total	In	Out	Total
Proposed Use									
Train Depot ²	125	spaces	351	42	11	53	14	40	54
Existing Uses									
Warehouse ³	30,000	sf	52	4	1	5	2	4	6
Office ⁴	10,000	sf	97	10	2	12	2	10	12
Total Net Increase Trips			202	28	8	36	10	26	36

¹ DU – dwelling unit; sf = square foot of gross leasable area.

² ITE Land Use Code #90

³ ITE Land Use Code #150

⁴ ITE Land Use Code #710

Source: TIS; Appendix F

Trip Distribution and Assignment

The project traffic volumes both entering and exiting the site have been distributed and assigned to the adjacent street system based on the following considerations:

- The site's proximity to major traffic corridors (i.e., Los Carneros Road, Fairview Avenue, Hollister Avenue, U.S. 101 Freeway, etc.);
- Expected localized traffic flow patterns based on adjacent roadway channelization and presence of traffic signals;
- Existing intersection traffic volumes;
- Ingress/egress availability at the Project Site assuming the site access and circulation scheme described in Section 3.0;
- The location of existing and proposed parking areas;
- Nearby population and employment centers as well as adjacent residential neighborhoods;
- Input from City staff

Future Cumulative Baseline

To forecast future cumulative conditions, City staff were consulted, and an ambient traffic growth factor was applied. The existing traffic volumes were increased at an annual rate of 2.0 percent per year to the year 2024, which is the anticipated year of project build-out. The ambient growth factor was estimated from existing 2019 peak hour traffic volumes and future 2022 peak hour traffic volumes for a related transportation project. The traffic growth projections are derived from the Goleta Travel Model, which forecasts future year 2042 traffic volumes based on build out of the Goleta General Plan, buildout of the County of Santa Barbara's adjacent specific and community plans, buildout of the UCSB Long Range Plan, and buildout of the Santa Barbara Airport Master Plan. The approximate annual traffic growth on the streets located in the project study area is expected to be one percent per year. Therefore, the use of a two percent annual traffic growth factor would be a conservative estimate.

Significance Thresholds

The following thresholds are based on Appendix G of the State CEQA Guidelines. Impacts would be significant if the project would:

- Conflict with program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities;
- Conflict or be inconsistent with CEQA Guidelines Section 15064.3, subdivision (b);
- Substantially increase hazards because of a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment); or
- Result in inadequate emergency access.

VMT

Based on the City's recently adopted VMT guidelines, the following are the recommended VMT thresholds for the City:

- Work daily VMT per employee: 14.3
- Residential daily VMT per capita: 16.8

In addition, the following development projects are presumed to have a less than significant impact on VMT:

- Small projects that are consistent with the Sustainable Communities Strategy (SCS) or General Plan and generate or attract fewer than 110 daily trips.
- Residential and office projects located in low VMT areas.
- Projects within ½ mile of an existing major transit stop or an existing stop along a high quality transit corridor, if they meet screening criteria standards.
- Affordable housing infill projects meeting screening criteria.
- Locally serving retail projects typically less than 10,000 square feet.
- Transportation project that would not likely lead to a measurable or substantial increase in VMT.

Transit Facilities

CITY OF GOLETA

For informational purposes, the potential effects of project-generated traffic on the City of Goleta intersections were evaluated using the traffic operations criteria set forth in the City of Goleta Environmental Review Guidelines. The operations criteria would be exceeded if the project-related increase in the v/c ratio or number of peak hour trips is equal to or exceeds the thresholds presented in Table 4.5-4 for intersections located within the City.

Table 4.5-4 City of Goleta Intersection Operations Criteria

Final v/c	LOS	Project-Related v/c Increase	Project-Related Peak Hour Trip Increase
<= 0.60	A	Equal to or greater than 0.20	–
0.61-0.70	B	Equal to or greater than 0.15	–
0.71-0.80	C	Equal to or greater than 0.10	–
0.81-0.90	D	–	Equal to or greater than 15 trips
0.91-1.00	E	–	Equal to or greater than 10 trips
> 1.00	F	–	Equal to or greater than 5 trips

STATE FACILITIES

For informational purposes, for intersections located within Caltrans jurisdiction, traffic effects were assessed based on the target LOS (i.e., the transition between stable and unstable flow) established by the Caltrans Guide for the Preparation of Traffic Impact Studies. Table 4.5-5 provides the LOS criteria, type of flow, and thresholds of significance for study intersections under Caltrans jurisdiction.

Table 4.5-5 Caltrans LOS and Intersection Operations Criteria

Control Delay (sec/veh)	Type of Flow	LOS	Project-Related Increase in Delay
<= 10	Stable Flow	A	–
10-20	Stable Flow	B	–
20-25	Stable Flow	C	–
35-55	Approaching Unstable Flow	D	–
55-80	Unstable Flow	E	Equal to or greater than 5 seconds
>80	Forced Flow	F	Equal to or greater than 5 seconds

b. Project Impacts and Mitigation Measures

Threshold 1: Would the project conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities?

Impact T-1 THE PROJECT’S TRAFFIC WOULD NOT AFFECT TRANSPORTATION FACILITIES IN A WAY WHICH WOULD CONFLICT WITH ANY CIRCULATION PLANS OR POLICIES. IMPACTS WOULD BE LESS THAN SIGNIFICANT.

Roadway Facilities

As discussed above under Methodology, pursuant to SB 743, automobile delay is no longer a metric that can be used for measuring environmental impacts under CEQA. However, for informational purposes and consistent with Resolution No. 20-44, a LOS analysis is included pursuant to Policy TE-4 of the City’s General Plan. The TIS estimated the effect of project-generated vehicle trips on traffic volumes and LOS at the study area intersections using the ICU method of analysis for intersections under City of Goleta jurisdiction. The analysis used the project’s trip generation shown in Table 4.5-3 and the City’s current policy for evaluating changes to intersection operations criteria discussed in Table 4.5-4. Table 4.5-6 summarize the vehicle AM and PM peak hour intersection operations for City of Goleta intersections with the addition of traffic generated by the proposed project. As shown, traffic from the project would not exceed City of Goleta intersection operation criteria and would not exceed LOS criteria at the three City of Goleta intersections.

Table 4.5-6 Existing Plus Project City of Goleta Intersection LOS

Intersection	Peak Hour	LOS	Change in V/C ¹	Criteria Exceeded?
1. Los Carneros Road/Hollister Avenue	AM	A	0.003	No
	PM	A	0.003	No
2. South La Patera Lane/Hollister Avenue	AM	A	0.016	No
	PM	B	0.014	No
3. Fairview Avenue/Hollister Avenue	AM	A	0.007	No
	PM	B	0.001	No

¹ Volume to Capacity ratio

Source: TIS, Appendix F

The TIS also estimated the effect of project-generated vehicle trips on traffic volumes and LOS at the study area intersections using the HCM 6th Edition for intersections under Caltrans jurisdiction. Table 4.5-7 summarizes the vehicle AM and PM peak hour intersection operations for Caltrans intersections with the addition of traffic generated by the proposed project.

Table 4.5-7 Existing Plus Project Caltrans Intersection LOS

Intersection	Peak Hour	LOS	Change in Delay	Criteria Exceeded?
4. Los Carneros Road/U.S. 101 Northbound ramps	AM	B	0.0	No
	PM	C	0.0	No
5. Los Carneros Road/U.S. 101 Southbound ramps	AM	B	0.0	No
	PM	B	0.0	No
6. Fairview Avenue/U.S. 101 Northbound ramps	AM	A	0.0	No
	PM	B	0.1	No
7. Fairview Avenue/U.S. 101 Southbound ramps	AM	B	0.0	No
	PM	C	0.1	No

Source: TIS, Appendix F

As shown in Table 4.5-7, traffic from the project would not exceed targeted LOS established by the Caltrans Guide for the Preparation of Traffic Impact Studies and would not exceed operational criteria for the four Caltrans intersections.

Transit Facilities

The project involves the construction of a train depot, which would be a new transit facility in the City. SBCAG RTP and SCS includes the Goleta Train Depot as a local project supported by SBCAG (SBCAG 2017). According to the RTP and SCS, the proposed project would enhance trail service as well as provide an improved means of ground connections for passengers flying from the Santa Barbara Airport. Construction of the project would not impact train schedule or stops at the adjacent Amtrak Station. Therefore, the project would not impact any plans related to transit facilities.

Bicycle and Pedestrian Facilities

There are no bicycle facilities located South La Patera Lane near the project site that would be impacted by the proposed project. In addition, South La Patera Lane has intermittent sidewalks from Hollister Avenue to the project site. According to the City’s Bicycle and Pedestrian Master Plan, Capital Improvement Project 9073 would include infilling missing sidewalk areas and implementing bicycle facilities on South La Patera Lane to the terminus near the project site (Goleta 2018). The project would replace existing sidewalks and driveways near the project site. In addition, the project would include a crosswalk near the relocated turnaround at the terminus of South La Patera Lane. The project would not inhibit the planned sidewalk and bicycle improvements from occurring along South La Patera Lane.

Therefore, the project would not conflict with a program, plan, ordinance, or policy addressing transit, roadway, bicycle, and pedestrian facilities.

Mitigation Measures

No mitigation measures would be required.

Significance After Mitigation

Impacts would be less than significant without mitigation.

Threshold 2: Would the project conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b)?

Impact T-2 THE PROJECT WOULD DEVELOP A NEW TRAIN DEPOT, A PRIMARY OBJECTIVE OF WHICH IS TO REDUCE REGIONAL VEHICLE MILES TRAVELED (VMT). IMPACTS WOULD BE LESS THAN SIGNIFICANT.

The project site currently generates VMT from the use of the existing warehouse. The proposed project may increase VMT over existing conditions. However, any VMT increase to the project site would be fully offset by the reduction of regional VMT by the project through increasing train ridership. According to SCBAG's Transit and Capital Rail Program application, it is estimated that approximately 5.8 million VMT will be displaced as a result of the proposed project (SBCAG 2018).

Also, in accordance with the City's adopted VMT guidelines and thresholds and OPR's Technical Advisory, certain projects would not result in a substantial VMT increase and may be screened from requiring a VMT analysis based on location, or other characteristics anticipated to result in low rates of VMT (OPR 2018). The City's VMT guidelines specifies that Transit and Active Transportation Projects would not likely lead to a measurable or substantial increase in VMT and therefore are presumed to cause a less than significant impact. The proposed project consists of the development of a train depot with a main objective of reducing regional GHG emissions through reducing VMT, as discussed above and in Section 2, *Project Description*. Therefore, in accordance with the State of California's technical advisory and the City of Goleta's VMT guidelines presented in Resolution No. 20-44, the project would not result in a substantial increase in VMT. Therefore, impacts would be less than significant.

Mitigation Measures

No mitigation measures would be required.

Significance After Mitigation

Impacts would be less than significant without mitigation.

Threshold 3: Would the project substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible use (e.g., farm equipment)?

Impact T-3 CONSTRUCTION OR OPERATION OF THE PROJECT WOULD NOT RESULT IN A SIGNIFICANT INCREASE IN TRANSPORTATION HAZARDS IN THE AREA OR ON THE PROJECT SITE. IMPACTS WOULD BE LESS THAN SIGNIFICANT.

Construction of the project would include construction-related traffic and equipment. The project could require up to 15,000 square-foot of material exported off-site, which would require large haul trucks traveling from the project site on City roadways. However, construction equipment and operations would be typical of construction projects throughout the City and would be temporary. In addition, the site is located at the terminus of South La Patera Lane and not near a major roadway or land use that could be in conflict with construction.

The project would relocate the existing turnaround at the northern terminus of South La Patera Lane southward out of UPRR right-of-way and into alignment with the entrance and exit driveways of the proposed Depot, as shown in Figure 2-5 in Section 2, *Project Description*. The turnaround would not increase hazards in the area and would be designed to accommodate the turnaround for large vehicles, buses, and trucks. In addition, crosswalks would be provided near the turnaround and throughout the Depot parking lot for train passengers accessing or leaving the Depot and Amtrak Station. All site plans, access points, parking areas, and roadway improvements would be developed in compliance with roadway standards and reviewed by the Public Works Department. Impacts would be less than significant.

Mitigation Measures

No mitigation measures would be required.

Significance After Mitigation

Impacts would be less than significant without mitigation.

Threshold 4: Would the project result in inadequate emergency access?

Impact T-4 IMPLEMENTATION OF THE PROJECT WOULD NOT RESULT IN INADEQUATE EMERGENCY ACCESS. THIS IMPACT WOULD BE LESS THAN SIGNIFICANT.

Construction of the project would not result in the closure of local roadways which would impede emergency access. A portion of South La Patera Lane would be reconfigured, but the area is at the terminus of the road and would not impact emergency access to other adjacent properties or areas of the City. The relocated turnaround at the northern terminus of South La Patera Lane would be designed to provide an adequate area for arriving emergency vehicles. Vehicle access to the project site would be reconfigured from its existing ingress/egress pattern and would include a one-way entrance driveway and a one-way exit driveway, which would be located off South La Patera Lane at the northeastern and southeastern corners of the site. The driveway widths and parking lot accessway would comply with emergency access standards and be reviewed by the Santa Barbara County Fire Department for consistency with applicable fire safety codes and emergency access requirements. Therefore, impacts would be less than significant.

Mitigation Measures

No mitigation measures would be required.

Significance After Mitigation

Impacts would be less than significant without mitigation.

4.5.4 Cumulative Impacts

VMT

As discussed in Impact T-2, the project would have a less than significant impact related to VMT because the project consists of the development of a train depot, which is a transit facility that would reduce VMT by discouraging regional trips by motor vehicles. Therefore, it would not have a considerable contribution to a cumulative VMT impact. In addition, cumulative VMT from projects listed in Table 3-1 in Section 3, *Environmental Setting*, would be reduced by the project because the project would reduce regional VMT by approximately 5.8 million VMT due to increases in train ridership.

Roadway Facilities

Pursuant to General Plan Policy TE 4 and the City’s Environmental Review Guidelines, the project’s impacts on roadway facilities were analyzed for informational purposes under Future Cumulative Plus Project conditions based on growth in traffic due to the combined effects of continuing development, intensification of existing developments, and ambient growth factors from the Goleta Travel Model. The TIS estimated the effect of project-generated vehicle trips on City of Goleta and Caltrans intersection under Future Cumulative Plus Project conditions, which are summarized in Table 4.5-8 and Table 4.5-9 below.

Table 4.5-8 Future Cumulative Plus Project City of Goleta Intersection LOS

Intersection	Peak Hour	LOS	Change in V/C ¹	Criteria Exceeded?
1. Los Carneros Road/Hollister Avenue	AM	A	0.003	No
	PM	B	0.003	No
2. South La Patera Lane/Hollister Avenue	AM	A	0.015	No
	PM	B	0.014	No
3. Fairview Avenue/Hollister Avenue	AM	A	0.007	No
	PM	B	0.001	No

¹ Volume to Capacity ratio

Source: TIS, Appendix F

Table 4.5-9 Future Cumulative Plus Project Caltrans Intersection LOS

Intersection	Peak Hour	LOS	Change in Delay	Criteria Exceeded?
1. Los Carneros Road/U.S. 101 Northbound ramps	AM	B	0.1	No
	PM	C	0.0	No
2. Los Carneros Road/U.S. 101 Southbound ramps	AM	B	0.1	No
	PM	C	0.0	No
3. Fairview Avenue/U.S. 101 Northbound ramps	AM	B	0.0	No
	PM	B	0.1	No
4. Fairview Avenue/U.S. 101 Southbound ramps	AM	B	0.0	No
	PM	C	0.2	No

Source: TIS, Appendix F

As shown in Table 4.5-8 and Table 4.5-9, traffic from the project would not exceed City of Goleta or Caltrans intersection operation criteria under Future Cumulative plus Project conditions. Also, the objective of the project is to increase train ridership and reduce regional VMT, which would improve cumulative traffic conditions in the City and region.

4.6 Tribal Cultural Resources

This section analyzes the effects of the proposed project on tribal cultural resources. The following discussion and analysis include findings about tribal cultural resources from the Initial Study, included in its entirety as Appendix A. This analysis is based on the Phase I Cultural Resources Assessment, which is appended to the Initial Study and included in Appendix A. Additionally, the discussion and analysis contained herein is informed by comments received during the NOP public review period and by Tribal discussions completed between the City and Native American tribes in the vicinity of the project site.

4.6.1 Setting

Existing Tribal Resource Setting

The project site lies within Chumash ethnographic territory, which extends from the current city of Malibu, north beyond San Luis Obispo, and inland as far as 68 kilometers (42 miles) (Glassow 1996). The Cultural Resources Assessment (Appendix A) provide an ethnographic overview of the Chumash.

Review of previously recorded resources and results of a pedestrian field survey by an archaeologist did not reveal findings of significant tribal cultural resources present on the project site (Appendix A). Though there are no known tribal cultural resources present on the project site, the project requires discretionary review by the City of Goleta and includes a request for a General Plan land use designation amendment. Therefore, notification of Native American tribes in the vicinity of the project site was required for this project under both Senate Bill (SB) 18 and Assembly Bill (AB) 52.

In present day, there are 7 Native American tribes in the vicinity of the project site, including:

- Barbareno/Ventureno Band of Mission Indians
- Chumash Council of Bakersfield
- Coastal Band of the Chumash Nation
- Northern Chumash Tribal Council
- San Luis Obispo County Chumash Council
- Santa Ynez Band of Chumash Indians
- Yak tityu tityu yak tilhini - Northern Chumash Tribe

4.6.2 Regulatory Setting

Federal

Native American Involvement

Several federal and state laws address Native American involvement in the development review process. The most notable of these are the federal Native American Graves Protection and Repatriation Act (1990) and the California Native American Graves Protection and Repatriation Act (2001). These acts ensure that Native American human remains and cultural items be treated with respect and dignity.

State

Senate Bill 18

Enacted on March 1, 2005, SB 18 (California Government Code Sections 65352.3 and 65352.4) requires cities and counties to notify and consult with California Native American tribal groups and individuals regarding proposed local land use planning decisions for the purpose of protecting traditional tribal cultural places (sacred sites), prior to adopting or amending a General Plan or designating land as open space. Tribal groups or individuals have 90 days to request consultation following the initial contact.

Assembly Bill 52

California AB 52 of 2014 was enacted in 2015, expanding the California Environmental Quality Act (CEQA) by defining a new resource category: "tribal cultural resources." AB 52 establishes that "a project with an effect that may cause a substantial adverse change in the significance of a tribal cultural resource is a project that may have a significant effect on the environment" (Public Resource Code [PRC] Section 21084.2). It further states the lead agency shall establish measures to avoid impacts that would alter the significant characteristics of a tribal cultural resource, when feasible (PRC Section 21084.3). PRC Section 21074 (a)(1)(A) and (B) defines tribal cultural resources as "sites, features, places, cultural landscapes, sacred places, and objects with cultural value to a California Native American tribe" and that are either:

- Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k)
- A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of PRC Section 5024.1. In applying the criteria set forth in subdivision (c) of PRC Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.

In recognition of California Native American tribal sovereignty and the unique relationship of California local governments and public agencies with California Native American tribal governments, and to respect the interests and roles of project proponents, it is the intent of AB 52 to:

- Recognize that California Native American prehistoric, historic, archaeological, cultural, and sacred places are essential elements in tribal cultural traditions, heritages, and identities.
- Establish a new category of resources in CEQA called "tribal cultural resources" that considers the tribal cultural values in addition to the scientific and archaeological values when determining impacts and mitigation.
- Establish examples of mitigation measures for tribal cultural resources that uphold the existing mitigation preference for historical and archaeological resources of preservation in place, if feasible.
- Recognize that California Native American tribes may have expertise with regard to their tribal history and practices, which concern the tribal cultural resources with which they are traditionally and culturally affiliated. Because CEQA calls for a sufficient degree of analysis, tribal knowledge about the land and tribal cultural resources at issue should be included in environmental assessments for projects that may have a significant impact on those resources.

- In recognition of their governmental status, establish a meaningful consultation process between California Native American tribal governments and lead agencies, respecting the interests and roles of all California Native American tribes and project proponents, and the level of required confidentiality concerning tribal cultural resources, at the earliest possible point in CEQA environmental review process, so that tribal cultural resources can be identified, and culturally appropriate mitigation and mitigation monitoring programs can be considered by the decision making body of the lead agency.
- Recognize the unique history of California Native American tribes and uphold existing rights of all California Native American tribes to participate in, and contribute their knowledge to, the environmental review process pursuant to CEQA.
- Ensure that local and tribal governments, public agencies, and project proponents have information available, early in CEQA environmental review process, for purposes of identifying and addressing potential adverse impacts to tribal cultural resources and to reduce the potential for delay and conflicts in the environmental review process.
- Enable California Native American tribes to manage and accept conveyances of, and act as caretakers of, tribal cultural resources.
- Establish that a substantial adverse change to a tribal cultural resource has a significant effect on the environment.

AB 52 also establishes a formal consultation process for California tribes regarding those resources. The consultation process must be completed before a CEQA document can be certified. AB 52 requires lead agencies to “begin consultation with a California Native American tribe that is traditionally and culturally affiliated with the geographic area of the proposed project.” Native American tribes to be included in the process are those that have requested notice of projects proposed within the jurisdiction of the lead agency.

Local

City of Goleta General Plan

The City of Goleta does not currently have a historic preservation/historic resources ordinance. The City of Goleta’s 2006 General Plan describes objectives pertaining to historic resources, lists current historic resources in the City, and describes the criteria which should be used to evaluate a resource for local significance.:

Policy VH 5.2 Locally Significant Historic Resources: Structures or sites, including landscaping, having special historic, aesthetic, or cultural value to Goleta shall be designated as *locally significant historic resources*. A locally significant historic resource may include those resources listed, or eligible for listing, in the National Register for Historic Places, State Historic Landmarks, or the Santa Barbara County Landmarks/Places of Historical Merit inventories, as well as resources designated by the City. The City shall use the following eligibility criteria when considering a site or structure, including landscaping, for designation as a locally significant historic resource:

- a. It exemplifies or reflects special elements of the city’s cultural, social, economic, political, aesthetic, architectural, landscape architectural, or natural history.
- b. It is identified with persons or events of local, state, or national history.

Goleta Train Depot Project

- c. It embodies distinctive characteristics of a style, type, period, or method of construction or is an example of the use of indigenous materials or craftsmanship.
- d. It represents works of a notable builder, designer, architect, or landscape architect.
- e. It includes a geographically definable area possessing a concentration of historic, prehistoric, or scenic properties that are unified aesthetically.
- f. It has a location with unique physical characteristics, including landscaping, or is a view or vista representing an established visual feature of a neighborhood or community.
- g. It embodies elements of design, detail, materials, or craftsmanship representing a significant structural, architectural, or landscape architectural achievement.
- h. It reflects significant geographical patterns associated with different eras of settlement and growth.
- i. It is one of a few remaining examples possessing distinguishing characteristics of an architectural, landscape architectural, or historical type.
- j. It includes rare or specimen plant materials associated with a particular period or style of landscape history

Policy VH 5.7 New Construction: Development approved in proximity to an identified historic resource shall respect and be aesthetically compatible with the structures or sites in terms of scale, materials, and character.

4.6.3 Impact Analysis

a. Methodology and Significance Thresholds

Methodology

Potential impacts on tribal cultural resources are analyzed based on the potential for the project to impact any tribal cultural resources during construction or operation. The significance of a tribal cultural resource and subsequent significance of any impact is determined by, among other things, consideration of whether or not that resource has heritage value to California Native Americans. Further, this impact analysis is also based on consultations with the interested tribe leaders.

Rincon Archaeologist Mary Pfeiffer, BA, contacted the Native American Heritage Commission (NAHC) on December 10, 2019, to request a search of the Sacred Lands File (SLF) and a contact list of Native Americans culturally affiliated with the project site. A response was received from the NAHC on December 17, 2019, stating the SLF search had been completed with “positive” results. The NAHC did not give a specific tribe to contact and recommended Rincon contact all the tribes on the list the NAHC provided. The NAHC identifies sacred lands by quadrangle and although the SLF results were positive, sacred lands could exist anywhere within the Goleta quadrangle. Sacred lands within the project site were not clarified by any of the listed tribal contacts.

On December 19, 2019, Rincon sent letters to the ten Native American contacts identified by the NAHC in the area to request information on potential cultural resources in the project vicinity that may be impacted by project development. This outreach was not intended to constitute formal Assembly Bill (AB) 52 consultation as required by CEQA. AB 52 consultation is performed between the lead government agency and California Native American tribes who have requested notification of projects in their traditional area. Appendix G provides the results of the outreach effort.

On January 9, 2020, Chairperson Freddie Romero of the Santa Ynez Band of Chumash Indians (on the behalf of Kenneth Kahn) stated the project site is located within an extremely sensitive archaeological area. Chairperson Romero requested construction plans for the project and recommended archaeological and Native American monitoring during ground disturbing activities.

On January 15, 2020, Ms. Pfeiffer replied to Chairperson Romero via email and stated that the construction plans had not yet been prepared and design options were still being considered.

In February 2020, the City of Goleta distributed AB 52 consultation letters for the proposed project, which included project information, a draft site plan, and a map, to seven tribes and tribal representatives listed by NAHC as having interest in the project area (Appendix G). During the 30-day period to request consultation, no tribes requested consultation.

On May 25, 2020, the City posted the Notice of Preparation to the Office of Planning and Research State Clearinghouse to notify the public and agencies on the scope and content of the EIR. During this time, a number of tribes or members of tribes reached out to the City asking about the project, expressed concerns, and provided recommendations to avoid impacting potential tribal resources. The tribal representatives or tribal members were from the following tribes:

- Santa Ynez Band of Chumash Indians
- Barbareno/Ventureno Band of Mission Indians

The information and recommendations which resulted from discussions from these tribes is included in the analysis below.

Significance Thresholds

In accordance with Appendix G of the *State CEQA Guidelines*, an impact to Tribal Cultural Resources from the proposed project would be significant if the project would:

1. Cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code Section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:
 - a. Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code Section 5020.1(k)
 - b. A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe

The Initial Study concluded there could be potentially significant impacts to tribal cultural resources because the origin of potential resources is unknown. Grading and ground-disturbing activity could impact currently unknown subsurface cultural resources of tribal or Native American importance. Therefore, impacts associated with the thresholds above are analyzed below.

b. Impacts and Mitigation Measures

Threshold 1: Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in PRC Section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:

Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in PRC Section 5020.1(k), or

A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of PRC Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.

Impact CR-1 GRADING AND OTHER GROUND-DISTURBING ACTIVITIES ON THE PROJECT SITE COULD RESULT IN IMPACTS TO PREVIOUSLY UNIDENTIFIED TRIBAL CULTURAL RESOURCES. THEREFORE, THIS IMPACT WOULD BE SIGNIFICANT BUT MITIGABLE.

The site has been previously developed and ground disturbing activities have already occurred. As of the date of this EIR, no tribal cultural resources have been identified on the project site. However, additional grading and other ground-disturbing activities on the project site may encounter previously undiscovered cultural resources of Native American origin that could be considered tribal cultural resources, which was identified as a major concern by tribal representatives. Ground disturbance activities during construction include demolition of the on-site warehouse, clearing and grubbing, grading and excavation of existing UST, revegetation, and installation of signs and other project features. These activities resulting from implementation of the project, including construction-related and earth-disturbing actions, could damage or destroy undiscovered tribal cultural resources on-site. As a result, impacts to tribal cultural resources would be potentially significant, requiring mitigation to ensure documentation of known archaeological sites, monitoring for unknown sites during construction, and continued consultation with local Native Americans if resources of Native American origin are unearthed during construction.

Mitigation Measures

The following measure would reduce potential impacts to tribal cultural resources to a less than significant level.

TCR-1 Archaeological and Native American Monitoring

Prior to the issuance of a Grading Permit, or ground-disturbing activities, the developer shall obtain a qualified archaeological and Native American monitor for the ground disturbing activities of the project. Archaeological monitoring should be performed under the direction of the qualified archaeologist, defined as an archaeologist meeting the Secretary of the Interior's Professional Qualifications Standards for archaeology (NPS 1983). The qualified archaeologist, in consultation with the City of Goleta and the Native American monitor, may recommend the reduction or termination of monitoring depending upon observed conditions (i.e., no resources encountered within the first 50 percent of ground disturbance).

TCR-2 Unanticipated Discovery of Tribal Cultural Resources

In the event that cultural resources of Native American origin are identified during construction activity all work shall be halted in the vicinity of the discovery until the significance of the resource can be assessed. The city shall begin or continue Native American consultation procedures, in coordination with a qualified archaeologist, if appropriate. If the city, in consultation with local Native Americans, determines that the resource is a tribal cultural resource and thus significant, a mitigation plan shall be prepared and implemented in accordance with state guidelines and in consultation with local Native American group(s). The mitigation plan may include but would not be limited to capping and avoidance, excavation and removal of the resource, interpretive displays, sensitive area signage, or other mutually agreed upon measure.

Significance After Mitigation

Implementation of Mitigation Measure TCR-1 and TCR-2 would reduce potential impacts to tribal cultural resources to a less than significant level.

4.6.4 Cumulative Impacts

Past, present, and reasonably foreseeable projects in and around the City would contribute to loss of tribal cultural resources. Impacts to tribal cultural resources are generally site-specific. For other projects in the vicinity of the project area that would impact tribal cultural resources, similar conditions and mitigation measures described herein would be required through site-specific investigations and surveys as well as the consultation with tribal groups, assessment of potential impacts, and prescription of appropriate mitigation. As with the project, other cumulative development that would result in potential impacts to tribal cultural resources would be subject to applicable federal and state laws, and local goals and policies. Accordingly, as required under applicable laws and regulations, potential impacts associated with cumulative developments would be addressed on a case-by-case basis.

As described in Section 4.6.3, the project would not result in the loss of any historic resources; however, the project could incrementally contribute to the cumulative loss of tribal cultural resources if resources are found on-site during construction. Implementation of Mitigation Measure TCR-1 and TCR-2 would reduce potential impacts if resources are discovered. With the implementation of these measures the project would not contribute substantially to the cumulative loss of tribal cultural resources in the vicinity. Therefore, the project would result in a less than significant cumulative impact to cultural resources.

4.7 Utilities and Service Systems

This section analyzes the proposed project's potential to impact water supplies as it relates to utilities and service systems. Water estimates are included in the Estimated Water Use Memorandum, included as Appendix H. Impacts related to stormwater and stormwater facilities, solid waste and wastewater were determined to be less than significant and are discussed in Section 1, *Introduction*, and in the Initial Study (Appendix A).

4.7.1 Setting

Water Supply

The Goleta Water District (GWD) provides water service in the south coast portion of Santa Barbara County. The service area encompasses approximately 29,000 acres, which includes the City of Goleta, University of California Santa Barbara, the Santa Barbara Airport, and unincorporated areas of Santa Barbara County. The GWD has approximately 16,125 municipal water connections throughout its service area, which services a population of 87,000 (GWD 2017a). GWD has multiple sources of water supply, which are detailed below.

Water Supply Sources

CACHUMA PROJECT (LAKE CACHUMA)

The Cachuma Project consists of Bradbury Dam, Tecolote Tunnel, South Coast Conduit, Lake Cachuma, and various water conveyance facilities. Lake Cachuma captures seasonal flows from the Upper Santa Ynez River system, which originates in the San Rafael Mountains in the Los Padres National Forest and is fed by local precipitation. Lake Cachuma has an estimated capacity of approximately 190,000 acre-feet (AF) and is operated by the Cachuma Operation and Maintenance Board (COMB) under contract with the United States Bureau of Reclamation (USBR) (GWD 2017a).

Water is provided to Cachuma Project Member Units for irrigation, domestic, and municipal and industrial water uses, which include the GWD, City of Santa Barbara, Montecito Water District, Carpinteria Valley Water District, and Santa Ynez River Water Conservation District Improvement District #1. There are three categories of Cachuma Project water: regular entitlement water, carryover water from unused entitlement water from the previous year, and spill water. GWD's regular entitlement water yield is 9,322 acre-feet per year (AFY) for the Cachuma Project. When Lake Cachuma spills, GWD can use as much water as it needs (GWD 2017b).

STATE WATER PROJECT

Treated water from the State Water Project (SWP) is delivered to GWD by the Central Coast Water Authority (CCWA) using the Coastal Branch of the California Aqueduct, which terminates into Lake Cachuma. GWD has an SWP allocation of 7,000 AFY and a drought buffer amount of 450 AFY for a total of 7,450 AF of SWP water entitlement available per year. However, the GWD only purchased 4,500 AFY of capacity in the Coastal Branch of the California Aqueduct and is limited to this amount in any given year.

The amount of SWP water delivered to the GWD in each year depends on several factors, including the demand for the supply, rainfall, snowpack, runoff, water in storage, pumping capacity from the Delta, and legal/regulatory constraints on SWP operation.

GROUNDWATER

The Goleta Groundwater Basin is divided into three sub-basins: the Central sub-basin, where the majority of the extractions occur; the West sub-basin, which is generally shallower and has the least extractions; and the North sub-basin (GWD 2016).

The GWD has a current adjudicated, appropriative right to extract and use up to 2,350 AFY of groundwater from the Goleta Groundwater Basin under the terms of a court judgment that determined the relative rights to the groundwater in the Basin known as the “Wright Judgment (GWD 2017a).” The Wright Judgment also provides the District with the right to inject surface water supplies and claim the recharged water as the District's stored water, in addition to its annual entitlement. GWD currently has eleven operational groundwater production wells located in the North and Central sub-basins, which can be used for extraction or injection.

RECYCLED WATER

The GWD provides recycled water to customers produced by the Goleta Wastewater Treatment Plant for landscape irrigation uses as well as a minor amount for toilet flushing. The recycled water production capacity at the plant operated by Goleta Sanitary District (GSD) is approximately 3,300 AFY based upon the tertiary treatment plant capacity of 3.0 million gallons per day (GWD 2017a). The ability to fully utilize recycled water is limited by outdoor irrigation recycled water demand patterns and infrastructure. Currently, GWD is delivering approximately 1,000 to 1,150 AFY to customers and would require additional infrastructure to deliver more.

Water Demand

Water use or demand in the GWD is characterized by deliveries made to each sector, which include single family residential, multifamily residential, commercial, institutional, landscape and agricultural irrigation. In addition, GWD has historically participated in the use of excess surface water from Lake Cachuma spill events by injecting and storing those wet year seasonal supplies in the Goleta Groundwater Basin for later use. In 2015 potable and raw water demand comprised of 46 percent residential, 30 percent agricultural irrigation, 22 percent commercial and institutional, and less than one percent landscape irrigation (GWD 2017a).

Water demand projections for the GWD were developed in the 2015 Urban Water Management Plan (UWMP) using population projections, long range plans for various jurisdictions, including the City of Goleta, commercial area specific plans, and University of California, Santa Barbara Long Range Development Plan. Normal baseline demand was determined using 2011 to 2013 totals because of significant demand reduction requirements in 2014 and 2015 due to drought conditions. The 2015 UWMP and the 2017 Water Supply Management Plan analyzed available supplies and water demand for GWD's service area under three scenarios: a normal water year, single-dry year, and multiple-dry years. Table 4.7-1 shows GWD's estimated water supply and demand under these three scenarios. The demand for groundwater and SWP water is lower in average years and increases in dry years to make up for reductions in Cachuma Project water. The normal year supply projections are based on annually available supplies while the single-dry year and multiple-dry year supply values are based on an optimized water supply strategy that meets dry year demand.

Table 4.7-1 GWD's Projected Demands and Supply Projections

	2020	2025	2030	2035
Normal Year				
Water Demand (AFY)	15,069	15,700	16,096	16,391
Water Supply (AFY) ^{1,2}	15,171	15,755	16,137	16,391
Difference	102	55	41	0
Single Dry Year				
Water Demand (AFY)	16,033	16,731	17,169	17,495
Water Supply (AFY)	16,033	16,731	17,169	17,495
Difference	0	0	0	0
Multiple Dry Year				
Year 1 Water Demand (AFY)	16,033	16,731	17,169	17,495
Year 1 Water Supply (AFY)	16,033	16,731	17,169	17,495
Difference	0	0	0	0
Year 1 Water Demand (AFY)	16,033	16,731	17,169	17,495
Year 2 Water Supply (AFY)	16,033	16,731	17,169	17,495
Difference	0	0	0	0
Year 3 Water Demand (AFY)	16,033	16,731	17,169	17,495
Year 3 Water Supply (AFY)	14,155	14,901	15,369	15,717
Difference	-1,878	-1,830	-1,800	-1,778

¹ While the GWD's annual entitlement to Cachuma Project Water is 9,322 AFY, the long-term average reflected in the water supply above includes unused carryover supplies from previous years and excess water that becomes available when Cachuma Reservoir spills.

² Total supplies projected for use in a normal year is lower than the average supply discussed under Water Supply above, since a portion of some supplies are reserved for dry years.

Source: GWD 2017a; 2017b

As shown in Table 4.7-1, the GWD is projecting a shortfall in water supply during the third year of a dry spell. GWD's 2015 UWMP contains demand reduction strategies and measures to be implemented to reduce demand and maintain adequate water supply during drought conditions. On August 13, 2019 the GWD terminated its Stage I Water Shortage Emergency and required reduction strategies in response to receiving their full allocation of surface water from Lake Cachuma (GWD 2019).

4.7.2 Regulatory Setting

State

Urban Water Management Planning Act (Water Code Section 10610 et seq.)

The Urban Water Management Planning Act was developed to address concerns regarding potential water supply shortages throughout California. It requires urban water suppliers (providing water for municipal purposes to more than 3,000 customers or supplying more than 3,000 AFY of water) to adopt and submit an UWMP at least once every five years to the Department of Water Resources. The city's most recent UWMP was adopted on June 14, 2016, to help guide the city's water management efforts for the following 20 years. The 2015 UWMP was prepared in accordance with

the requirements of the Urban Water Management Planning Act (California Water Code Sections 10608 – 10656) and the Water Conservation Act of 2009, commonly referred to as SB X7-7 (California Water Code Sections 10608 - 10608.64). The UWMP details the water provider's service area, demographics, multi-source water supply, water treatment, water conveyance and distribution facilities, as well as the GWD's historic and future water demand based on population projections and development and land use plans prepared by the City of Goleta, County of Santa Barbara, and University of California, Santa Barbara.

Senate Bill X7-7

California adopted Senate Bill (SB) X7-7, or the Water Conservation Act of 2009, in November 2009. The legislation requires urban water retailers to set urban water use targets to achieve a 20 percent reduction in per capita urban water use by December 31, 2020. Additionally, the law requires agricultural water suppliers to prepare, adopt, and regularly update agricultural water management plans. Agricultural and urban water providers are ineligible for certain state grants and loans if they do not adhere to water conservation requirements outlined in the law.

Senate Bills 610 and 221

In 2001, California adopted SB 610 and SB 221, thereby amending the California Water Code. Under these new laws, certain types of development projects are now required to provide detailed water supply assessments (WSAs) to planning agencies. Thresholds requiring the preparation of a WSA include residential developments of more than 500 dwelling units, shopping centers or business establishments employing more than 1,000 persons or having more than 500,000 square feet of floor space, commercial office buildings employing more than 1,000 persons or having more than 250,000 square feet of floor space, and projects that would demand an amount of water equivalent to, or greater than, the amount of water required by a 500 dwelling unit project. The proposed project does not meet these thresholds and is not required to prepare a WSA.

The primary purpose of a WSA is to determine if the identified water supply or water supplier will be able to meet projected demands for the project, in addition to existing and planned future uses, over a 20-year projection and with consideration to normal, dry, and multi-dry water years. A WSA was not required to be prepared for the project.

Regional Water Management Planning Act

Adopted by the state legislature in 2002, the Regional Water Management Planning Act, or SB 1672, authorizes preparation of integrated regional water management plans. Such plans are developed by regional water management groups, defined as three or more local public agencies, at least two of which have statutory authority over water supply. Integrated regional water management plans address qualified programs and projects relating to water supply, water quality, flood protection, or other water-related topics undertaken by the participating public agencies. Qualified projects, as detailed in the legislation, include but are not limited to groundwater, urban, and agricultural water management planning efforts, levee or flood control infrastructure maintenance or construction, water recycling projects, and water conservation programs. The City of Goleta and the GWD are both cooperating partners in the Santa Barbara County Regional Water Management Group and party to the Santa Barbara County Integrated Regional Water Management Plan (updated in 2019).

Sustainable Groundwater Management Act

During the 2014 drought the California Legislature passed the Sustainable Groundwater Management Act (SGMA). The primary function of this law was to establish a more uniform statewide program aimed at sustainable groundwater management. Provisions in the law to accomplish this goal included:

- Requiring the development and reporting of data necessary to support sustainable management
- Allowing the state to develop and implement an interim sustainable groundwater management plan until local agencies can assume management of a basin or sub-basin/subarea
- Granting the authority to local and regional agencies to develop and implement sustainable groundwater management plans

Specific deadlines for local agencies to manage groundwater basins under a groundwater sustainability plan (GSP) depend on the status of each basin, as defined in the prioritization by the DWR in Bulletin 118. For basins considered subject to critical overdraft, the plan adoption deadline is January 31, 2020. For basins designated as high or medium priority basins, the deadline is January 31, 2022. For other basins (low and very low priority), local agencies are encouraged to manage groundwater under a groundwater sustainability plan, but no specific mandate or deadline for management is established in the SGMA. Due to the Goleta Groundwater Basin's adjudication under the Wright Judgment described in Section 4.14.1a, *Water Supply*, the basin is identified as a very low priority basin by the Department of Water Resources (DWR 2020) and will not require preparation of a GSP pursuant to SGMA.

The SGMA did not alter existing proprietary rights to groundwater consistent with Section 1200 of the Water Code (addressing certain sub-surface flows associated with riparian waters) and did not affect groundwater in adjudicated basins. The SGMA also recognized the authority of local governments to manage groundwater consistent with their police powers (through local ordinances).

California Green Building Standards Code (2019) - California Code of Regulations Title 24, Part 11

California's Green Building Code, referred to as CALGreen, was developed to provide a consistent approach to green building in the state. The CEC adopted updates to the 2016 CALGreen Standards in 2019 that will take effect on January 1, 2020. These changes include indoor water conservation measures for fixtures.

Regional/Local

Santa Barbara County Integrated Water Management Plan (IWMP)

The IWMP for Santa Barbara County is a water management plan with cooperative partners of cities, special districts, and other entities, and is intended to increase the level of coordination among agencies and districts responsible for water resources planning, nongovernmental organizations, and interested members of the public to facilitate the optimal management of water resources within Santa Barbara County over the next 20 years.

GWD 2015 Urban Water Management Plan

The California Water Code requires any municipal water supplier serving over 3,000 connections or 3,000 AFY to prepare a UWMP. Water suppliers are required to update their UWMPs every five years. GWD's 2015 UWMP forecasts demand through 2035 and details normal, dry year, and multiple dry year supplies needed to meet demand. Additionally, the UWMP describes water supply reliability, conservation and demand management strategies, and GWD's current and anticipated water infrastructure projects.

GWD Goleta Groundwater Basin Groundwater Management Plan

The Groundwater Management Plan was adopted by the GWD and La Cumbre Water Company, which details current adjudication and voter-passed components of groundwater management, addresses Basin hydrogeography and groundwater elevation, and analyzes groundwater quality in the Basin. In addition, the Groundwater Management Plan outlines management strategies for the Basin, and recommends future strategies and timelines for implementation, which includes recommendations regarding GWD implementation of the SGMA.

GWD SAFE Water Supply Ordinance (SAFE Ordinance)

In 1991 voters of the GWD passed the SAFE Water Supplies Ordinance, which sets forth conditions the District must meet in order to approve new or additional water connections. The SAFE Ordinance directs how the GWD manages groundwater and specifies under what conditions groundwater is either pumped or stored. In addition, the SAFE Ordinance establishes an Annual Storage Commitment, which is a groundwater recharge requirement when the Central sub-basin of the Goleta Groundwater Basin drops below 1972 levels.

The SAFE Ordinance prohibits the District from releasing potable water to new or additional service connections except when all of the following conditions are met:

1. The District is receiving 100% of its deliveries normally allowed from the Cachuma Project
2. The District has met legal obligations in the Wright Judgment
3. There is no water rationing
4. The District has met its obligation to the Annual Storage Commitment to the Drought Buffer

Currently, the GWD is unable to make its annual commitment of water to the Drought Buffer in the groundwater basin. Therefore, the GWD remains prohibited from providing new or additional potable service connections under the SAFE Ordinance.

Pursuant to the SAFE Water Supplies Ordinance, the District was directed to deny applications for new water service allocations unless the project falls within one of the following exceptions:

1. Customers who are currently receiving water from the District and who are not seeking to expand or change the use or development on their property
2. Customers with preexisting water use history that is recognized in the District Code and that is equal to or greater than the water use that is needed for the Proposed Project
3. Customers who have already paid a new water supply charge for a Proposed Project
4. Customers with a pre-existing water service contract or agreement with the District.

Goleta General Plan

The Goleta General Plan guides land use, development, and strategic planning decision-making in the City. The Conservation Element includes goals policies intended to support water supply and water conservation in the City. Goals and policies applicable to water service and supply are presented below:

CE 15.3 Water Conservation for New Development: In order to minimize water use, all new development shall use low water use plumbing fixtures, water-conserving landscaping, low flow irrigation, and reclaimed water for exterior landscaping, where appropriate.

4.7.3 Impact Analysis

a. Significance Thresholds

In accordance with Appendix G of the CEQA Guidelines, the project would result in a significant impact to city utilities and/or service systems if it would result in any of the following conditions:

1. Require or result in the relocation or construction of new or expanded water, wastewater treatment or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?
2. Have insufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years?
3. Result in a determination by the wastewater treatment provider which serves or may serve the project that it has inadequate capacity to serve the project's projected demand in addition to the provider's existing commitments?
4. Generate solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?
5. Comply with federal, state, and local management and reduction statutes and regulations related to solid waste?

The Initial Study (Appendix A) determined the proposed project would have a less than significant impact on wastewater treatment and facilities, stormwater, and solid waste (Thresholds 1 and 3-5). The Initial Study concluded the project could result in potentially significant impacts related to Threshold 2. Impacts pertaining to water supplies (Threshold 2) are analyzed in this section of the EIR. All other thresholds are discussed in the Initial Study and summarized in Table 1-2 in Section 1, *Introduction*.

b. Project Impacts and Mitigation Measures

Threshold 2: Would the project have insufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years?

Impact U-1 THE GWD HAS ADEQUATE SUPPLIES AND WATER DEMAND REDUCTION STRATEGIES TO SERVE THE PROJECT AND FORESEEABLE DEVELOPMENT UNDER NORMAL AND DRY YEARS. THE WATER USE FROM THE DEPOT WOULD NOT EXCEED AVAILABLE ON-SITE CREDITS AND WOULD COMPLY WITH THE SAFE WATER SUPPLIES ORDINANCE. IMPACTS ON WATER SUPPLIES WOULD BE LESS THAN SIGNIFICANT.

The project site currently uses potable water for operations within the existing on-site warehouse. Because only a portion of the warehouse is occupied by low-demand uses such as the local food bank, the proposed project would increase potable water use on-site for restrooms, the on-site café area, and landscaping. All plants and landscaping would use drought-tolerant, low-water usage plant varieties, and restroom and café facilities would comply with California Code of Regulations, Title 24, Part 11, referred to as CALGreen, which would require water conservation fixtures for indoor water use.

As shown in Table 4.7-1 above, the GWD has sufficient water supplies to meet existing and future water demands under normal and dry years but is projecting a shortfall in water supply during the third year of a dry spell. The GWD's 2015 UWMP contains demand reduction strategies and measures to be implemented to reduce demand and maintain adequate water supply during drought conditions (GWD 2017a). In addition, the GWD Drought Preparedness and Water Shortage Contingency Plan adds a stage of water shortage and demand reduction measures (GWD 2014). In addition to demand reduction strategies in the UWMP that would occur during a drought or water shortage, the SAFE Water Supplies Ordinance would prohibit allocating new or additional water connections if water supply conditions are not met. This would limit increases in water demand from new development or growth in addition to measures in the UWMP during a water shortage.

As discussed above under Water Demand setting, as of August 2019 the GWD is not under any stage of water shortage emergency. The GWD is currently not meeting all of the conditions needed in order to approve new or additional water connections, pursuant to the SAFE Water Supplies Ordinance. However, the project site has a preexisting water use history associated with the on-site warehouse and, therefore, would be allowed water service under Exception 2: customers with preexisting water use history that is recognized in the District Code and that is equal to or greater than the water use that is needed for the Proposed Project. According to the GWD, the available water credit for the project site per the District Code Section 5.16.041 is 0.96 AFY. The Estimated Water Use Memorandum prepared for the project determined the Depot building would require approximately 0.6 AFY, which is below the available water credit (Appendix H). The project would also require water for on-site landscaping, which is estimated to be approximately 0.3 AFY (Appendix H). Combined with the Depot water demand, overall water demand would not exceed 0.96 AFY. Additionally, water demand for on-site landscaping could be met by water trucks, which are available through the GWD Recycled Water Hauling Program. The recycled water would not impact available water supplies and would provide additional flexibility for water demand in the Depot building.

The project would also be required to submit an Application for Water Service with the GWD for the proposed new use on-site, which would be reviewed and approved by the GWD for compliance with their available water credit. Once the GWD is meeting all of the conditions under the SAFE Water

Supplies Ordinance, the GWD would have sustainable water supplies available for additional water credits for the project site if needed.

Because the GWD has sufficient water supplies and demand reduction measures to meet existing and projected growth under normal, dry, and multiple-dry years, the estimated water use for the Depot building would not exceed the existing water credits for the site under the SAFE Water Supplies Ordinance, and recycled water is available to supplement landscaping water demand, there are sufficient water supplies to serve the project and foreseeable development. Impacts would be less than significant.

Mitigation Measures

No mitigation measures are required.

Significance After Mitigation

Impacts would be less than significant without mitigation.

4.7.4 Cumulative Impacts

Planned and pending development would increase water demand in the City. As described in Table 3-1 of Section 3, *Environmental Setting*, planned and pending projects in the City would add residential units, commercial and industrial space, educational facilities, oil facilities, and hotels. Large-scale residential, commercial, office, industrial, and mixed-use developments subject to the requirements of SB 610 would be required to prepare project-specific WSAs to ensure adequate water availability. This level of project-specific analysis would be required prior to approval of the largest planned and pending projects described in Section 3, *Environmental Setting*, and would compare anticipated water demand to the most currently-available GWD supply and demand projections.

The GWD's UWMP shows a deficit in multiple-dry year 3, as shown in Table 4.7-1. However, the 2015 UWMP includes a water shortage contingency plan which includes stages of supply reduction, demand reduction measures, penalties, and financial actions that would be taken during a water shortage. The project and other planned and pending development would be subject to these measures if there is a water shortage or need. In addition, projects would be subject to GWD's SAFE Water Supplies Ordinance, which includes specific criteria for allocation of new water service to ensure GWD will maintain a drought buffer and ensure adequate available water supplies to meet projected demand prior to granting new water service. As discussed above, the GWD 2015 UWMP demonstrates there are adequate supplies to meet anticipated demand into the future and identifies specific supplies and strategies to meet existing and anticipated demand. In addition, the project site has existing water credits of 0.96 AFY available and would be required to remain within the existing credits.

Given the information in GWD's 2015 UWMP, the requirements of the SAFE Water Supplies Ordinance, and because there are sufficient water supplies available to serve the project, the project's contribution to cumulative impacts would be less than significant.

5 Other CEQA Required Discussions

This section discusses growth-inducing impacts, irreversible environmental impacts, and energy impacts that would be caused by the proposed project.

5.1 Growth Inducement

Section 15126(d) of the CEQA Guidelines requires a discussion of a proposed project's potential to foster economic or population growth, including ways in which a project could remove an obstacle to growth. Growth does not necessarily create significant physical changes to the environment. However, depending upon the type, magnitude, and location of growth, it can result in significant adverse environmental effects. The proposed project's growth inducing potential is therefore considered significant if project-induced growth could result in significant physical effects in one or more environmental issue areas.

5.1.1 Population Growth

As discussed in Section 13, Population and Housing, of the Initial Study (Appendix A), the proposed project would not directly generate population growth because it does not include residential uses. Also, the project would not indirectly generate population growth because the proposed train depot would serve existing residents in Goleta and residents throughout California that utilize Amtrak's Pacific Surfliner passenger rail service. Therefore, the project would not induce a substantial unplanned population growth in the area either directly or indirectly.

Moreover, as discussed in Section 4.1 and 4.2, *Air Quality* and *Greenhouse Gas Emissions*, of the EIR, development and operation of the project would not generate air quality or GHG emissions that would result in a significant impact. Additionally, the project involves redevelopment within a fully urbanized area that lacks significant scenic resources, native biological habitats, known cultural resource remains, surface water, or other environmental resources. Therefore, the project would not result in significant long-term physical environmental effects.

5.1.2 Economic Growth

The proposed project would generate temporary employment opportunities during construction. Because construction workers would be expected to be drawn from the existing regional work force, construction of the project would not be growth-inducing from a temporary employment standpoint. The operation of the proposed train depot would not create significant long-term employment growth. The Depot could require on-site Amtrak staff to assist with ticketing and passenger needs and would be maintained and upkept by either an Amtrak caretaker or City staff. A limited number of new employees may be needed for the required maintenance and to staff the on-site amenities, but these employees would also be expected to be drawn from the existing regional workforce and would not create a significant increase in jobs in the area.

The proposed project would not be expected to induce substantial economic expansion to the extent that direct physical environmental effects would result. Moreover, the environmental effects associated with any future development in or around Goleta and Santa Barbara County would be addressed as part of the CEQA environmental review for such development projects.

5.1.3 Removal of Obstacles to Growth

The proposed project is located in a fully urbanized area that is well served by existing infrastructure. As discussed in Section 18, *Utilities and Service Systems*, of the Initial Study (Appendix A) and Section 4.5, *Transportation* of this EIR, existing infrastructure in Goleta would be adequate to serve the project. Minor improvements to water, sewer, and drainage connection infrastructure could be needed, but would be sized to specifically serve the proposed project. Although the proposed project would relocate an existing turnaround at the end of South La Patera Lane to the south, as discussed in Section 2, *Project Description*, the new location would not present a significant change to existing circulation and is intended to relocate the turnaround outside UPRR right-of-way and provide site access for vehicles to the proposed train depot. No new roads would be required. Because the project constitutes redevelopment within an urbanized area and does not require the extension of new infrastructure through undeveloped areas, project implementation would not remove an obstacle to growth.

5.2 Irreversible Environmental Effects

The CEQA Guidelines require that EIRs contain a discussion of significant irreversible environmental changes. This section addresses non-renewable resources, the commitment of future generations to the proposed uses, and irreversible impacts associated with the proposed project.

The proposed project involves infill development on a currently developed lot in the City of Goleta. Construction and operation of the project would involve an irreversible commitment of construction materials and non-renewable energy resources. The project would involve the use of building materials and energy, some of which are non-renewable resources, to construct the approximately 9,000 square-foot Depot structure (not including parking areas or operating equipment or machinery). Consumption of these resources would occur with any development in the region and are not unique to the proposed project. In addition, the project be designed and constructed to meet LEED Silver standards, as discussion in Section 2.0, *Project Description*.

The proposed project would also irreversibly increase local demand for non-renewable energy resources such as petroleum products and natural gas. However, increasingly efficient building design would offset this demand to some degree by reducing energy demands of the project. As discussed in Section 2.0, *Project Description*, the proposed project's design features would meet LEED Silver or equivalent standards, using less water and energy and reducing greenhouse gas emissions when compared to a commercial building that is not built to LEED standards. In addition, the project would be subject to the energy conservation requirements of the California Energy Code (Title 24, Part 6, of the California Code of Regulations, *California's Energy Efficiency Standards for Residential and Nonresidential Buildings*) and the California Green Building Standards Code (Title 24, Part 11 of the California Code of Regulations). The California Energy Code provides energy conservation standards for all new and renovated commercial and residential buildings constructed in California, and the Green Building Standards Code requires solar access, natural ventilation, and stormwater capture. Consequently, the project would not use unusual amounts of energy or construction materials and impacts related to consumption of non-renewable and slowly renewable resources would be less than significant. Consumption of these resources would occur with any development in the region and is not unique to the proposed project.

Additional vehicle trips associated with the proposed project would incrementally increase local traffic and regional air pollutant and GHG emissions. However, as discussed in Section 4.1, *Air*

Quality, and Section 4.2, *Greenhouse Gas Emissions*, development and operation of the proposed Train Depot would not generate air quality or GHG emissions that would result in a significant impact. Additionally, one of the main objectives of the project is to reduce regional GHG emissions and vehicle miles traveled by increasing train ridership and the use of alternative transit.

The project would also require a commitment of law enforcement, fire protection, water supply, wastewater treatment, and solid waste disposal services. However, as discussed in *Public Services*, and *Utilities and Service Systems* in the Initial Study, impacts to these service systems would not be significant.

CEQA requires decision makers to balance the benefits of a proposed project against its unavoidable environmental risks in determining whether to approve a project. The analysis contained in this EIR concludes that the proposed project would not result in significant and unavoidable impacts. All project impacts were determined to be less than significant, or less than significant with mitigation.

5.3 Energy Effects

Public Resources Code Section 21100(b)(2) and Appendix F of the CEQA Guidelines require that EIRs include a discussion of the potential energy consumption and/or conservation impacts of proposed projects, with particular emphasis on avoiding or reducing inefficient, wasteful or unnecessary consumption of energy. The project's less than significant impacts on energy resources are discussed in Section 5, *Energy*, in the Initial Study included in Appendix A.

This page left intentionally blank

6 Alternatives

As required by Section 15126.6 of the *CEQA Guidelines*, this EIR examines a range of reasonable alternatives to the proposed project that would attain most of the basic project objectives (stated in Section 2.0 of this EIR) but would avoid or substantially lessen the significant adverse impacts.

As discussed in Section 2.0, *Project Description*, the objectives for the proposed project, are as follows:

- Build a full-service, multi-modal train depot for the Goleta Rail Station that provides sufficient amenities for train riders.
- Develop a Depot that creates civic pride and identity through design and community education.
- Increase train ridership along the Pacific Surfliner train corridor, especially during peak rail service, to help implement State and regional transit plans.
- Reduce regional greenhouse gas emissions from transportation sources by improving transit use and reducing vehicle miles travelled.
- Improve connectivity with the local transit system and the Depot to connect passengers with their destinations and create a regional transit hub.

Included in this analysis are two alternatives, including the CEQA-required “No Project” alternative, that involve changes to the project that may reduce the project-related environmental impacts as identified in this EIR. Alternatives have been developed to provide a reasonable range of options to consider that would help decision makers and the public understand the general implications of revising or eliminating certain components of the proposed project.

The following alternatives are evaluated in this EIR:

- Alternative 1: No Project/Existing Warehouse
- Alternative 2: Reduced Depot Footprint and On-site Amenities

Detailed descriptions of the alternatives are included in the impact analysis for each alternative. The potential environmental impacts of each alternative are analyzed in Sections 6.1 through 6.2.

6.1 Alternative 1: No Project/Existing Warehouse Alternative

6.1.1 Description

The No Project Alternative assumes that the proposed depot building with indoor waiting areas, café, and restroom facilities, parking lot area, and City and Amtrak signage are not constructed. Current uses on the project site consist of a mostly vacant warehouse structure, with only a portion occupied by a local food bank, a parking lot, and an outdoor storage area. The existing site and uses would remain under this alternative. However, the No Project Alternative would not fulfill any Project Objectives because the existing warehouse would not provide a train depot to improve train ridership or City identity, improve transit connectivity, or reduce greenhouse gas emissions. This Alternative is feasible as the existing structure has remained and the site has not been redeveloped since 1967.

6.1.2 Impact Analysis

a. Air Quality

As discussed in Section 4.1, Air Quality, the proposed project would generate emissions during construction and operational activities of the proposed project. Construction and operational emissions would not exceed established thresholds and would be less than significant. Under the No Project alternative, there would be no construction activities which would impact air quality or release toxic air contaminants (TACs). In addition, there would be no additional vehicle trips to the project site which would increase emissions in the area. Therefore, the No Project Alternative would impact air quality **less than** the proposed project.

b. Greenhouse Gas Emissions

As detailed in Section 4.2, Greenhouse Gas Emissions, construction of the proposed project would generate greenhouse gas (GHG) emissions during the construction and operation of the project. Construction and operational GHG emissions were determined to be less than significant as the project would not exceed the appropriate GHG thresholds and because the proposed project would reduce regional GHG emissions by encouraging and increasing train ridership and reducing passenger vehicle use. The proposed project was also determined to not impact policies or regulations established to reduced GHG emissions. The No Project Alternative would not generate any construction GHG emissions or increase operational GHG emissions over existing conditions. However, the No Project Alternative would not seek to increase train ridership. Impacts to GHG emissions under the No Project Alternative GHG emissions would be **greater than** those of the proposed project.

c. Hazards and Hazardous Materials

As discussed under Section 4.3, the project site has the potential to contain hazardous materials given its prior agricultural use, current and former onsite storage of hazardous materials in storage tanks and drums, past use as a bus transportation facility, adjacent railroad tracks, and hazardous building materials. Project construction could result in the release of these hazardous materials. Implementation of Mitigation Measures HAZ-1 and HAZ-2 would reduce potential impacts to less than significant.

Under the No Project Alternative, there would be no ground disturbance in the project site which would potentially uncover contaminated soils or hazardous material. Therefore, the No Project Alternative would have hazardous impacts that are **less than** the proposed project.

d. Noise

The No Project Alternative would not include any form of construction noise and would not increase operational noise associated with the use of the warehouse or traffic accessing the warehouse. Although the proposed project's impacts related to temporary construction and vibration and long-term operation would be less than significant, the No Project Alternative's noise impacts would be **less than** those of the proposed project.

e. Transportation

Under the No Project Alternative, transportation and traffic would remain at current conditions. Temporary traffic associated with construction activities and the increase in average daily trips from

the operation of the project would be eliminated. However, as discussed in Section 2, *Project Description*, and Section 4.5, *Transportation*, one of the main objectives of the project is to reduce regional VMT through increasing train ridership. The No Project Alternative would seek to reduce regional VMT. Therefore, overall traffic impacts under the No Project Alternative would be **greater than** under the proposed project

f. Tribal Cultural Resources

Construction of the proposed project would involve ground-disturbing activities with the potential to unearth or adversely impact previously unidentified tribal cultural resources. Implementation of Mitigation Measures TCR-1 and TCR-2 would reduce potential impacts to less than significant through construction monitoring and tribal resource treatment requirements. However, the No Project Alternative would have no ground-disturbing activities and there would be no potential for adversely impacting tribal cultural resources and implementation of mitigation measures would not be required. The No Project Alternative would have **less** impact than the proposed project.

g. Utilities

As discussed in Section 4.7, *Utilities and Service Systems*, the proposed project would increase water use on-site over the existing use from the on-site warehouse. However, the project site has an existing water credit of 0.96 AFY, which the project would be required to comply with. Under the No Project Alternative, there would be no increase in water use over existing water use from the on-site warehouse. Therefore, the No Project Alternative would have **less** impacts than to proposed project.

6.2 Alternative 2: Reduced Depot Footprint and On-site Amenities

6.2.1 Description

Similar to the proposed project, this alternative would involve demolition of the existing warehouse to develop the site with a train depot which would support the adjacent Amtrak passenger train platform. However, the depot under this alternative would be reduced in size to approximately 2,000 square feet and would not include a café or kitchen area, meeting room, or formal lobby. The size of the Depot under Alternative 2 was estimated using the waiting area space requirements in Amtrak's Station Programs and Planning Guidelines (Amtrak 2013). The alternative would still provide on-site parking, passenger drop-off areas, bicycle parking, and landscaping. Alternative 2 would meet most of the project objective, except for providing a full-service train depot since the amenities on site would be reduced and limited under this alternative. This Alternative is feasible as the existing Amtrak Train Station has no Depot structure and a 2,000 square-foot structure would improve on-site amenities and still meet most of the objectives of the project.

6.2.2 Impact Analysis

a. Air Quality

Construction air quality impacts would be similar to the proposed project during demolition, site preparation, grading and paving construction activities. Emissions related to building construction would be reduced due to the reduction in size of the depot structure and reduction of amenities

within the depot. Operational air quality impacts would also be similar to the proposed project as the number of train riders and vehicle trips to the station is not expected to be substantially reduced compared to the proposed project. Therefore, it is anticipated that air quality impacts under Alternative 2 would be **similar to** the proposed project.

b. Greenhouse Gas Emissions

Similar to the air quality discussion, construction GHG emissions would be similar to the proposed project because demolition, site preparation, grading and paving construction activities would be similar. GHG emissions related to building construction would be reduced due to the reduction in size of the depot structure and time it would take to building the depot. Therefore, construction GHG emissions would be less than significant, similar to the proposed project. Operational GHG emissions would also be similar to the proposed project as the number of train riders is not expected to be substantially reduced compared to the proposed project. Therefore, vehicle trip mobile emissions, which are the predominant emissions generated by the project, would be similar. In addition, development under Alternative 2 would also seek to improve train ridership and reduce regional GHG emissions, similar to the proposed project. Therefore, it is anticipated that GHG emission impacts under Alternative 2 would be **similar to** the proposed project.

c. Hazards and Hazardous Materials

Alternative 2 would involve the redevelopment of the same project site as the proposed project. Therefore, the potential hazardous materials on the proposed project site which consist of pesticides and heavy metals associated with the historic agriculture use of the site, remaining traces of chemicals from the previous and current use of the site, the presence of a historic underground storage tank (UST) along with the presence of an existing 1,800-gallon diesel UST, hazardous building materials in the existing warehouse structure, and chemicals or compounds along the adjacent railroad tracks, would also be a potential hazard under Alternative 2. Therefore, Mitigation Measures HAZ-1 and HAZ-2 would also be required for Alternative 2, which would reduce potential impacts to less than significant. Impacts would be **similar to** the proposed project.

d. Noise

Construction noise impacts would effectively be the same as the proposed project. The length of construction noise impacts may be reduced due to the smaller depot building under Alternative 2, but noise levels during construction would be similar. Noise on local roadways generated from traffic under Alternative 2 would also be similar to the proposed project because a smaller depot footprint and reduced amenities would not necessarily reduce people driving to the Amtrak station since Alternative 2 would still provide on-site parking and drop-off areas. Impacts would be **similar to** the proposed project.

e. Transportation

Alternative 2 would develop the project site with a similar site plan as the proposed project but with fewer on-site amenities. The reduction in amenities could reduce train ridership over the proposed project. This reduction in train riders would generate fewer daily trips to the project site as the proposed project because less passengers would be accessing the site. However, Alternative 2 would not reduce regional VTM to as great of an extent as the proposed project because it would generate fewer train riders. Overall, Alternative 2 would have no significant transportation impacts and transportation impacts would be **similar to** the proposed project.

f. Tribal Cultural Resources

Development under Alternative 2 would involve ground-disturbing activities, such as grading and surface excavation, with the potential to unearth or adversely impact unidentified tribal cultural resources. Similar to the proposed project, Alternative 2 would be subject to Assembly Bill 52. Therefore, because Alternative 2 is on the same project site and would involve similar amounts of ground disturbing activities, it is presumed that similar mitigation measures as the proposed project would arise from consulting with local tribes under Alternative 2. Impacts under Alternative 2 would be **similar to** the proposed project.

g. Utilities

As discussed in Section 4.7, Utilities and Service Systems, the proposed project would increase water demand on site but would not exceed the existing GWD credit of 0.96 AFY. Development under Alternative 2 would not include the development of a café or, meeting room, or formal lobby area. Therefore, Alternative 2 would have a reduced water demand than the proposed project and impacts would be **less than** the proposed project.

6.3 Alternatives Considered but Rejected

Other alternatives considered include the potential to relocate a train depot to another location in the City. However, a different train depot location was not feasible because the City had already purchased the project site and the depot should be adjacent to the Amtrak platform. Because the project does not include the Amtrak platform, which is in UPRR right-of-way, changes or new locations of the platform is not feasible. Therefore, this scenario was rejected from further consideration.

Redevelopment of the project site with a light industrial or research and development office use was also considered as an alternative to the proposed project. However, this alternative would likely worsen any environmental impacts compared to the proposed project and would not meet any of the project objectives which are tied to increasing train ridership and reducing greenhouse gas emissions. Therefore, this option was not included as an alternative in the analysis.

6.4 Environmentally Superior Alternative

CEQA requires the identification of the environmentally superior alternative among the options studied. The environmentally superior alternative must be an alternative to the proposed project that reduces some of the environmental impacts of the proposed project, regardless of the financial costs associated with that alternative. Identification of the environmentally superior alternative is an informational procedure and the alternative identified as environmentally superior may not be the one that best meets the goals or needs of the proposed project.

Table 6-1 indicates whether each alternative's environmental impact is greater than, less than, or similar to that of the proposed project for each of the issue areas studied. Based on the alternatives analysis provided above, Alternative 1: No Project Alternative, would be the environmentally superior alternative. The No Project Alternative would either lessen the severity of five out of seven environmental issue areas, while Alternative 2: Reduce Footprint and On-site Amenities would have similar impacts on all issue areas. However, the No Project Alternative would not fulfill the objectives of the proposed project.

When the “No Project” alternative is determined to be environmentally superior, State CEQA Guidelines also requires identification of the environmentally superior alternative among the development options. Since no significant and unavoidable impacts were identified in the proposed project or Alternative 2: Reduce Footprint and On-site Amenities, either the proposed project or alternative could be considered environmentally superior. In addition, Alternative 2 would have a reduced water demand and its impacts would be less than the proposed project. Therefore, Alternative 2: Reduce Footprint and On-site Amenities, is determined to be the environmentally superior alternative. However, this alternative would not meet all of the project objectives, including objectives established under SBCAG grant funding for the proposed project. Since Alternative 2 would not meet objectives needed to meet funding requirements of the project, Alternative 2 would likely not have the funds needed to complete the project and would not be feasible.

Table 6-1 Impact Comparison of Alternatives

Issue	Proposed Project Impact Classification	Alternative 1: No Project/Existing Warehouse	Alternative 2: Reduced Depot Footprint and On-site Amenities
Air Quality	Less than Significant	+	=
Greenhouse Gas Emissions	Less than Significant	-	=
Hazards and Hazardous Materials	Less than Significant with Mitigation Incorporated	+	=
Noise	Less than Significant	+	=
Transportation	Less than Significant	-	=
Tribal Cultural Resources	Less than Significant with Mitigation Incorporated	+	=
Utilities		+	+

+ Superior to the proposed project (reduced level of impact)
 - Inferior to the proposed project (increased level of impact)
 = Similar level of impact to the proposed project

7 Responses to Comments

This section includes responses to comments received during the circulation of the Draft Environmental Impact Report (Draft EIR) prepared for the Goleta Train Depot (project).

The Draft EIR was circulated for a 45-day public review period that began on June 3, 2021 and ended on July 19, 2021. In addition, the City held a public hearing by the Environmental Hearing Officer on June 30, 2021 to gather comments on the Draft EIR.

There were no comments provided by the public during the June 30, 2021 public hearing. The City of Goleta received one comment letter on the Draft EIR during the public review period. The commenter and the page number on which the commenter's letter appears is listed in Table 7-1.

Table 7-1 Comment Letters Received

Letter No. and Commenter	Page No.
1 Michael T. Bennett	7-2

The comment letter and responses follow. Each separate issue raised by the commenter, if more than one, has been assigned a number. The responses to each comment identify first the number of the comment letter, and then the number assigned to each issue (Response 1.2, for example, indicates that the response is for the second issue raised in comment Letter 1).

Revisions to the Draft EIR necessary in light of the comments received and responses provided, or necessary to amplify or clarify material in the Draft EIR, are included in the responses. Underlined text represents language that has been added to the Draft EIR; text with ~~strikeout~~ has been deleted from the Draft EIR. Page numbers cited in this section correspond to the page numbers of the Final EIR where the change was made.

Subject: [EXT] DEIR Comments received via phone

CAUTION: This email originated from outside of Rincon Consultants. Be cautious before clicking on any links, or opening any attachments, until you are confident that the content is safe .

Ryan,

I received the following comments from Michael T. Bennett, a retired Santa Barbara County Fire Department employee and former City of Goleta Council member and mayor. He provided the following via phone on 6/29/2021:

Page 1-5, "Hazards and Hazardous Materials" EIR indicates Fire Station 11 is the closest fire station to the Train Depot. He disagrees and believes it is Fire Station 14 on Los Carneros that is the closest fire station to the Train Depot. How is the determination made (as the crow fly's or expected drive time)?

Page 1-7, "Wildfire" EIR states "...with the nearest high fire zone being approximately 0.9 miles to the southwest. Therefore, there would be no potentially significant impact to the risk of wildfire." Southwest of the site would put the fire risk in the Santa Barbara airport. Did you mean 0.9 miles due north (north of Cathedral Oaks Road) which would make sense as that is where the wildland urban interface lands.

1.1

1.2

Figure 5 City of Goleta Wildland Urban Interface

1.2

Section 2.5.8 "Utilities". Why is Law Enforcement *and* Fire Services in the utilities section? Neither are a utility and both are listed under "Public Services" on page 1-7. Also, the City does not contract with SBCFD for fire services. Fire services are provided via Santa Barbara County Fire Department through the Santa Barbara County Fire Protection District which covers the City of Goleta—we do not "contract" for services it is provided through property taxes.

1.3

2.5.8 Utilities

Electricity to the project site would continue to be provided by Southern California Edison (SCE) and natural gas would continue to be provided by the Southern California Gas Company (SoCalGas). Potable water would be supplied by the GWD and sanitary sewer services would be provided by the Goleta Sanitary District (GSD). Law enforcement would be provided by the Santa Barbara County Sheriff's Department, which is contracted by the City to provide police services. Fire services would be provided by Santa Barbara County Fire Department (SBCFD), which is also contracted by the City to provide fire emergency services.

In general, the project would connect to and use all of the different existing utilities, infrastructure, and other facilities that are currently providing services to the project site and other surrounding development.

The project site and surrounding area are served by existing internet, telephone, and television providers operating in the City. Due to the nature of the proposed project, internet services would be the main need for the project. There are a number of internet providers that can serve the project site, including but not limited to Frontier, Spectrum, Cox Communications, and Viasat. The internet provider would be chosen at a later date.

1.3

Best,

Jaime A. Valdez

Letter 1

COMMENTER: Michael T. Bennett

DATE: June 29, 2021

Response 1.1

The commenter states that the Draft EIR incorrectly listed the closest fire station, which would be Fire Station 14 on Los Carneros.

In response to this comment, Table 1-2 on Page 1-5 in Section 1, *Introduction*, of the Draft EIR is revised as follows:

The project site is located within a 5-minute response time of Fire Station #~~1411~~. Additionally, the site is not located near areas designated to have risks to wildland fires. Therefore, there would be no impacts related to wildland fires.

This comment and the subsequent revision to the Draft EIR do not affect the analysis completed or conclusions provided in the Draft EIR.

Response 1.2

The commenter states that the Draft EIR incorrectly identified that nearest high fire zone to the southwest when it should be north.

In response to this comment, Table 1-2 on Page 1-7 in Section 1, *Introduction*, of the Draft EIR is revised as follows:

The proposed project site is located within an urbanized area of the City of Goleta and is surrounded by existing urban development, including industrial, commercial, interstate highway, and railway development. The project is not located within a high fire hazard severity zone with the nearest high fire zone being approximately 0.9 miles to the north ~~southwest~~. Therefore, there would be no potentially significant impact to the risk of wildfire.

This comment and the subsequent revision to the Draft EIR do not affect the analysis completed or conclusions provided in the Draft EIR.

Response 1.3

The commenter notes that law enforcement and fire services do not belong in the utilities section of the project description. The commenter also notes that the fire services discussion incorrectly lists services contracted with the County of Santa Barbara, when services are in fact provided by Santa Barbara County Fire Department through the Santa Barbara County Fire Protection District.

In response to this comment, Page 2-10 in Section 2, *Project Description*, of the Draft EIR is revised as follows:

2.5.4 Lighting and Safety Features

On-site lighting would be low intensity, hooded, directed downward, and fully cut-off. The proposed lighting would be installed throughout the project site within the parking lot, along pedestrian walkways, and outside the Train Depot building in order to improve on-site wayfinding and public safety. Lighting would be designed in compliance with the City's General Plan policies and development standards within Title 17, Zoning Ordinance relating to outdoor lighting. In addition to on-site lighting, the project would also provide designated crosswalk areas between the Depot's parking lot and the proposed Train Depot building, as shown in Figure 2-5.

Law enforcement would be provided by the Santa Barbara County Sheriff's Department, which is contracted by the City to provide police services. Fire services would be provided by Santa Barbara County Fire Department (SBCFD).

In addition, Page 2-11 in Section 2, *Project Description*, of the Draft EIR is revised as follows:

2.5.8 Utilities

Electricity to the project site would continue to be provided by Southern California Edison (SCE) and natural gas would continue to be provided by the Southern California Gas Company (SoCalGas). Potable water would be supplied by the GWD and sanitary sewer services would be provided by the Goleta Sanitary District (GSD). ~~Law enforcement would be provided by the Santa Barbara County Sheriff's Department, which is contracted by the City to provide police services. Fire services would be provided by Santa Barbara County Fire Department (SBCFD), which is also contracted by the City to provide fire emergency services.~~

Categorical Exemption Report

This report serves as the technical documentation of an environmental analysis performed by Rincon Consultants, Inc. for the South La Patera Lane Improvement Project in the City of Goleta. The intent of the analysis is to document whether the project is eligible for a Class 1 Categorical Exemption (CE). The report provides an introduction, project description, and evaluation of the project's consistency with the requirements for a Class 1 exemption. The report concludes that the project is eligible for a Class 1 CE.

Introduction

The City of Goleta proposes to adopt a Class 1 CE for a proposed project at South La Patera Lane. The State CEQA Guidelines Section 15301 states that a Class 1 CE applies to the operation, repair, maintenance, permitting, leasing, licensing, or minor alteration of existing public or private structures, facilities, mechanical equipment, or topographical features, involving negligible or no expansion of existing or former use. This includes the following:

Existing highways and streets, sidewalks, gutters, bicycle and pedestrian trails, and similar facilities (this includes road grading for the purpose of public safety), and other alterations such as the addition of bicycle facilities, including but not limited to bicycle parking, bicycle-share facilities and bicycle lanes, transit improvements such as bus lanes, pedestrian crossings, street trees, and other similar alterations that do not create additional automobile lanes)

Additionally, State CEQA Guidelines Section 15300.2 provides exceptions to a categorical exemption as follows:

- a. **Location.** Classes 3, 4, 5, 6, and 11 are qualified by consideration of where the project is to be located – a project that is ordinarily insignificant in its impact on the environment may in a particularly sensitive environment be significant. Therefore, these classes are considered to apply all instances, except where the project may impact on an environmental resource of hazardous or critical concern where designated, precisely mapped, and officially adopted pursuant to law by federal, state, or local agencies.
- b. **Cumulative Impact.** All exemptions for these classes are inapplicable when the cumulative impact of successive projects of the same type in the same place, over time is significant.
- c. **Significant Effect.** A categorical exemption shall not be used for an activity where there is a reasonable possibility that the activity will have a significant effect on the environment due to unusual circumstances.
- d. **Scenic Highways.** A categorical exemption shall not be used for a project which may result in damage to scenic resources, including but not limited to, trees, historic buildings, rock outcroppings, or similar resources, within a highway officially designated as a state scenic highway. This does not apply to improvements which are required as mitigation by an adopted negative declaration or certified EIR.
- e. **Hazardous Waste Sites.** A categorical exemption shall not be used for a project located on a site which is included on any list compiled pursuant to Section 65962.5 of the Government Code.

- f. **Historical Resources.** A categorical exemption shall not be used for a project which may cause a substantial adverse change in the significance of a historical resource.

Rincon Consultants, Inc. evaluated the project's consistency with the above requirements for the Class 1 CE and exceptions to the exemption to confirm the project's eligibility for the Class 1 exemption. None of the exceptions would apply to the project. Therefore, the project is eligible for a Class 1 CE.

Project Description

The project site is located at South La Patera Lane, between Hollister Avenue to the south and Union Pacific Railroad (UPRR) and U.S. 101 to the north, in the City of Goleta, Santa Barbara County. The project site includes an approximately 1,600-foot-long portion of South La Patera Lane, located within the public right-of-way of the City of Goleta. The project site is developed with an existing paved, two-lane road with partial sidewalks on west of the street and non-standard sidewalks on the east side. Figure 1 shows the location of the project site.

The proposed project consists of bicycle and sidewalk infrastructure improvements along portions of 1,600-foot-long South La Patera Lane to provide safer bicycle and pedestrian access from Hollister Avenue to the Goleta Train Depot. The improvements will enhance connectivity between the Metropolitan Transit District (MTD) bus stop on Hollister Avenue and the future Goleta Train Depot located at the northern terminus of South La Patera Lane. The proposed infrastructure improvements along South La Patera Lane include the addition of Class 2 bike lanes, which are lanes within the existing roadway defined by painted stripes, new/reconstructed sidewalk, installation of sidewalk-light pedestals, and landscaped parkway pockets with street trees along both sides of the street. The proposed sidewalk-light pedestals would be installed along the west side of the entirety of South La Patera Lane within the project site to provide energy efficient pedestrian and street lighting. The site plan for the proposed roadway improvements is shown in Figure 2.

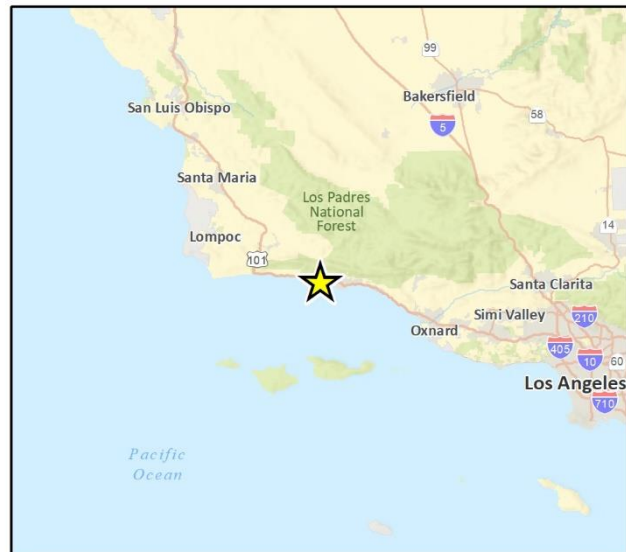

The proposed project would be considered minor alterations of existing facilities because the site consists of an existing street with partial sidewalks which will be altered with the addition of bicycle lanes, connected sidewalks, and landscaping and street trees. No additional automobile lanes will be created. Figure 3, Figure 4 , Figure 5 show the proposed site plan.

Figure 2 Project Site

Figure 3 Proposed Site Plan – Southernmost Portion of Project Site

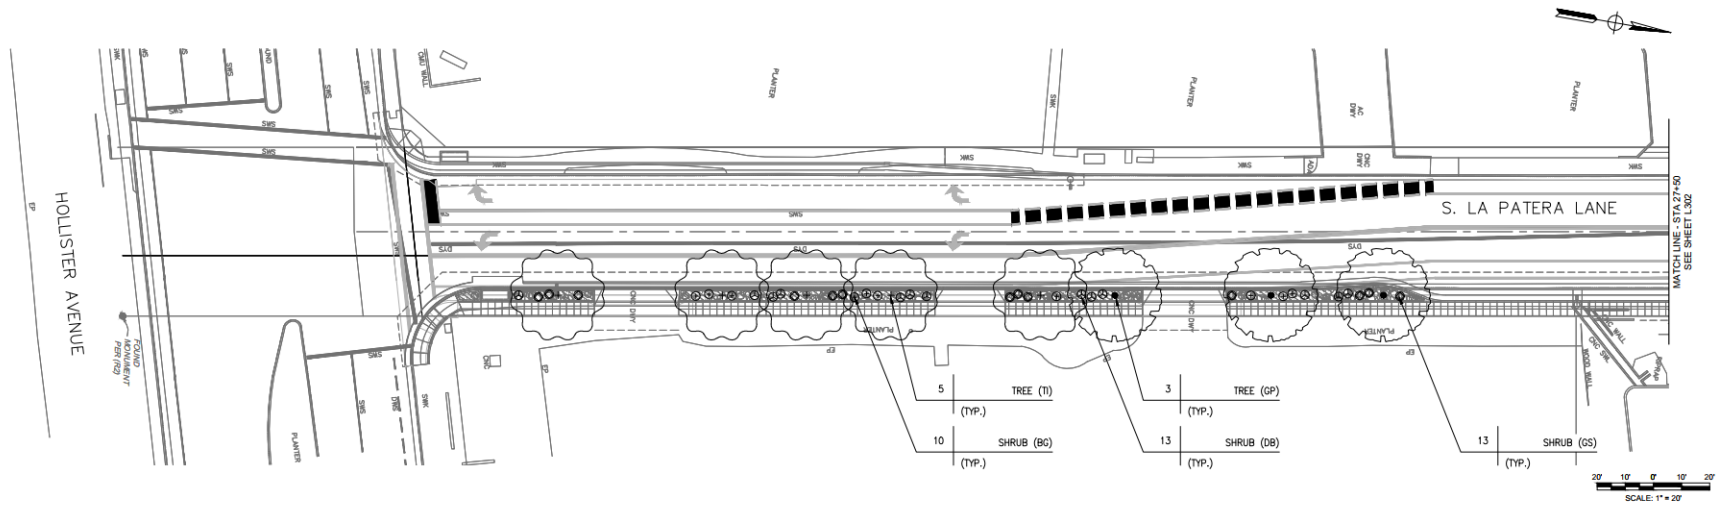

Figure 4 Proposed Site Plan – Middle portion of Project Site

Figure 5 Proposed Site Plan – Northmost Portion of Project Site

Existing Site Conditions

Figure 6 and Figure 7 include photos of the project site which show the existing site conditions. The project site is generally flat, consisting of a paved two-lane road with partial and non-standard sidewalks. The site is located adjacent to properties zoned business park with light industrial uses to the east and west, and the Santa Barbara Airport Industrial Area Specific Plan to the east, U.S. 101 and the UPRR tracks and station to the north, and Santa Barbara Municipal Airport to the south.

The project site is located in an urbanized area, surrounded by surface parking lots and commercial retail and light industrial uses. Table 1 provides a summary of existing land uses in the immediate vicinity of the project site.

Table 1 Existing Land Use

Location		Existing Use	Jurisdiction	Zoning District	General Plan Designation
Project Site		Paved, two lane road with partial and non-standard sidewalks	City of Goleta	N/A	N/A
Surrounding Properties	East	Light Industrial	City of Goleta City of Santa Barbara	Business Park Santa Barbara Airport Industrial Area Specific Plan	Business Park Airport
	West	Light Industrial	City of Goleta	Business Park	Business Park
	North	U.S. 101, proposed Goleta Train Depot, UPRR	City of Goleta, UPRR	Public/Quasi Public	Public/Quasi Public
	South	Santa Barbara Municipal Airport	City of Santa Barbara	N/A	N/A

Photograph 2. South La Patera Lane Looking North – Without Sidewalk

Consistency Analysis

Class 1 CE Applicability

Section 15301 of the CEQA Guidelines states that a Class 1 CE applies to the operation, repair, maintenance, permitting, leasing, licensing, or minor alteration of existing public or private structures, facilities, mechanical equipment, or topographical features, involving negligible or no expansion of existing or former use. CEQA Guidelines Section 15301(c) provides examples of Class 1 project types, which include “existing highways and streets, sidewalks, gutters, bicycle and pedestrian trails, and similar facilities, and other alterations such as the addition of bicycle facilities, including but not limited to bicycle parking, bicycle-share facilities and bicycle lanes, transit improvements such as bus lanes, pedestrian crossings, street trees, and other similar alterations that do not create additional automobile lanes.”

The project includes improvements to an approximately 1,600-foot-long portion of South La Patera Lane, a paved, two-lane road with partial and non-standard sidewalks. The proposed improvements consist of the addition of bike lanes, sidewalks, sidewalk-light pedestals, landscaped parkway pockets, and street trees. The project would enhance the safety and pedestrian and bicycle connectivity between Hollister Avenue and the future Goleta Train Depot.

The project site consists of an approximately 1,600-foot-long portion of South La Patera Lane roadway located within the public right-of-way, between Hollister Avenue and South La Patera Lane. The project site is generally flat and has been developed with a paved road, gutters, curbs, and sidewalks. The project site is located in an urbanized area and has no value as a habitat area for endangered, rare, or threatened species due to the small size and urban context. Additionally, based on aerial imagery and site visits (see Figure 2), there are no wetlands, streams, aquatic or riparian habitat, scenic vistas, or other environmentally sensitive resources on the project site. Therefore, the project site is not located in an environmentally sensitive area. The project site also does not contain any scenic resources and does not contain characteristics which would qualify as an unusual circumstance.

The key consideration for applicability of a Class 1 CE is whether the project involves negligible or no expansion of the use. The minor alterations to the existing street, sidewalks, and gutters would not expand the existing use of the road, which would remain a two-lane road. The project would replace or connect existing features, including sidewalks and curbs, to meet current ADA standards and increase accessibility to the future Goleta Train Depot. The project would also add bike lane striping along La Patera Lane, street trees, and sidewalk-light pedestals. Therefore, the additions and alterations to existing facilities would meet the applicability requirements for a Class 1 CE pursuant to Section 15301 of the CEQA Guidelines.

Exceptions to CE Applicability

The applicability of CEs is qualified by the exceptions listed in Section 15300.2(a) through (f) of the CEQA Guidelines. In the discussion below, each exception (in italics) is followed by an explanation of why the exception does not apply to the proposed project.

15300.2(a) Location. *Classes 3, 4, 5, 6, and 11 are qualified by consideration of where the project is to be located – a project that is ordinarily insignificant in its impact on the environment may in a particularly sensitive environment be significant. Therefore, these classes are considered to apply all instances, except where the project may impact on an environmental resource of hazardous or*

critical concern where designated, precisely mapped, and officially adopted pursuant to law by federal, state, or local agencies.

The proposed project does not include a Class 3, 4, 5, 6, or 11 CE. Therefore, this exception to a CE does not apply to the project.

15300.2(b) Cumulative Impact. *All exemptions for these classes are inapplicable when the cumulative impact of successive projects of the same type in the same place, over time is significant.*

There are no planned bike lane or pedestrian projects nearby. The Goleta Train Depot project could be under construction concurrently with this project. However, according to the Environmental Impact Report prepared for the project, there would be no significant environmental effects during construction. As discussed below, the proposed project would not result in significant environmental impacts. Therefore, the project would not result in a cumulatively considerable contribution to potential impacts.

In addition, cumulative projects in the city would similarly be subject to environmental review on a project-by-project basis. Therefore, exception criterion 'b' does not apply to this project.

15300.2(c) Significant Effect. *A categorical exemption shall not be used for an activity where there is a reasonable possibility that the activity will have a significant effect on the environment due to unusual circumstances.*

The project site is generally flat and has been developed with a paved road, gutters, curbs, and sidewalks. The project site is located in an urbanized area and has no value as a habitat area for endangered, rare, or threatened species due to the small size and urban context. The project site also does not contain any scenic resources and does not contain characteristics which would qualify as an unusual circumstance.

All construction activity would be required to incorporate the Santa Barbara County Air Pollution Control District requirements pertaining to standard dust control measures which would minimize construction-related emissions and demolition of existing structures. The City of Goleta also requires implementation of standard emission and dust control techniques for all construction. The project would not create new roadway lanes which would increase vehicle trips to the area. Therefore, the project would not result in significant impacts to air quality, greenhouse gas emissions, or vehicle miles traveled.

During construction, project would comply with the City of Goleta Municipal Code Section 15.09.290, which requires an Erosion and Sediment Control Plan which would outline project-specific Best Management Practices (BMPs) to control erosion, sediment release, and otherwise reduce the potential for discharge of pollutants in stormwater. The project would not create substantial new impervious surfaces, and new sidewalks and gutters would comply with City of Goleta standards. Therefore, the project would not result in significant water quality impacts. The project would involve temporary noise and vibration during construction; however, there are not adjacent sensitive uses, and these effects are localized, would comply with City of Goleta construction hours, and would cease after construction activities.

No known circumstances at the project site or related to project operations create a reasonable possibility of significant effects to the environment. Therefore, exception criterion 'c' would not apply to the project.

15300.2(d) Scenic Highways. *A categorical exemption shall not be used for a project which may result in damage to scenic resources, including but not limited to, trees, historic buildings, rock*

outcroppings, or similar resources, within a highway officially designated as a state scenic highway. This does not apply to improvements which are required as mitigation by an adopted negative declaration or certified EIR.

The project site is located approximately 150 feet south of U.S. 101, an eligible State scenic highway. The project site is relatively flat and is not visible from the U.S 101. The project would improve sidewalks and roadway infrastructure and would not impact views from U.S. 101. Furthermore, this portion of U.S. 101 is not an officially designated state scenic highway; therefore, exception criterion 'd' would not apply to the project.

15300.2 (e) Hazardous Waste Sites. *A categorical exemption shall not be used for a project located on a site which is included on any list compiled pursuant to Section 65962.5 of the Government Code.*

The project site is not listed as a hazardous waste site on a list compiled pursuant to Section 65962.5 of the Government Code, according to EnviroStor and GeoTracker databases. There are multiple hazardous waste sites in proximity to the project site. However, the project is located within the public right of way and will not impact any of those sites. Therefore, exception criterion 'e' does not apply to the project.

15300.2 (f) Historical Resources. *A categorical exemption shall not be used for a project which may cause a substantial adverse change in the significance of a historical resource.*

There are no buildings or structures of historic significance on the project site. There are several historic resources located in the vicinity of the project site according to General Plan Figure 6-2 Historic Resources, including Shrode Produce Company, Goleta lemon Association Packing House, Daniel Hill Adobe, and James G. Williams Tomato Packing Shed all located on South La Patera Lane. However, the project is located within the public right-of-way and no work would occur outside the public-right-way. Completion of the project would not impact views or access to these resources. Therefore, the project will not impact any historic structures or views of resources. Exception criterion 'e' does not apply to the project.

Summary

Based on this analysis, the proposed South La Patera Lane Improvement Project meets all criteria for a Class 1 Categorical Exemption pursuant to Section 153001 of the State CEQA Guidelines. Furthermore, exceptions to the applicability of a CE, as specified in Section 15300.2(a) through (f) of the CEQA Guidelines, do not apply to the project. Therefore, the proposed project is exempt from CEQA.

NOTICE

Each project applicant shall remit to the county clerk the environmental filing fee before or at the time of filing a Notice of Determination (Pub. Resources Code, § 21152; Fish & G. Code, § 711.4, subdivision (d); Cal. Code Regs., tit. 14, § 753.5). Without the appropriate fee, statutory or categorical exemption, or a valid No Effect Determination issued by the California Department of Fish and Wildlife (CDFW), the Notice of Determination is not operative, vested, or final, and shall not be accepted by the county clerk.

COUNTY DOCUMENTARY HANDLING FEE

The county clerk may charge a documentary handling fee of fifty dollars (\$50) per filing in addition to the environmental filing fee (Fish & G. Code, § 711.4, subd. (e); Cal. Code Regs., tit. 14, § 753.5, subd. (g)(1)). A county board of supervisors shall have the authority to increase or decrease the fee or charge, that is otherwise authorized to be levied by another provision of law, in the amount reasonably necessary to recover the cost of providing any product or service or the cost of enforcing any regulation for which the fee or charge is levied (Gov. Code, § 54985, subd. (a)).

COLLECTION PROCEDURES FOR COUNTY GOVERNMENTS

Filing Notice of Determination (NOD):

- Collect environmental filing fee or copy of previously issued cash receipt. *(Do not collect fee if project applicant presents a No Effect Determination signed by CDFW. An additional fee is required for each separate environmental document. An addendum is not considered a separate environmental document. Checks should be made payable to the county.)*
- Issue cash receipt to project applicant.
- Attach copy of cash receipt and, if applicable, previously issued cash receipt, to NOD.
- Mail filing fees for CRP document to CDFW prior to filing the NOD or equivalent final approval (Cal. Code Regs. Tit. 14, § 753.5 (b)(5)). The CRP should request receipt from CDFW to show proof of payment for filing the NOD or equivalent approval. Please mail payment to address below made attention to the Cash Receipts Unit of the Accounting Services Branch.

If the project applicant presents a **No Effect Determination** signed by CDFW, also:

- Attach No Effect Determination to NOD *(no environmental filing fee is due)*.

Filing Notice of Exemption (NOE) *(Statutorily or categorically exempt project (Cal. Code Regs., tit. 14, §§ 15260-15285, 15300-15333))*

- Issue cash receipt to project applicant.
- Attach copy of cash receipt to NOE *(no environmental filing fee is due)*.

Within 30 days after the end of each month in which the environmental filing fees are collected, each county shall summarize and record the amount collected on the monthly State of California Form No. CA25 (TC31) and remit the amount collected to the State Treasurer. Identify the remittance on Form No. CA25 as "Environmental Document Filing Fees" per Fish and Game Code section 711.4.

The county clerk shall mail the following documents to CDFW on a monthly basis:

- ✓ A photocopy of the monthly State of California Form No. CA25 (TC31)
- ✓ CDFW/ASB copies of all cash receipts (including all voided receipts)
- ✓ A copy of all CDFW No Effect Determinations filed in lieu of fee payment
- ✓ A copy of all NODs filed with the county during the preceding month
- ✓ A list of the name, address and telephone number of all project applicants for which an NOD has been filed. If this information is contained on the cash receipt filed with CDFW under California Code of Regulations, title 14, section 753.5, subdivision (e)(6), no additional information is required.

DOCUMENT RETENTION

The county shall retain two copies of the cash receipt (for lead agency and county clerk) and a copy of all documents described above for at least 12 months.

RECEIPT NUMBER

- # The first two digits automatically populate by making the appropriate selection in the County/State Agency of Filing drop down menu.
- # The next eight digits automatically populate when a date is entered.
- # The last three digits correspond with the sequential order of issuance for each calendar year. For example, the first receipt number issued on January 1 should end in 001. If a county issued 252 receipts for the year ending on December 31, the last receipt number should end in 252. CDFW recommends that counties and state agencies 1) save a local copy of this form, and 2) track receipt numbers on a spreadsheet tabbed by month to ensure accuracy.

DO NOT COMBINE THE ENVIRONMENTAL FEES WITH THE STATE SHARE OF FISH AND WILDLIFE FEES.

Project Title: South La Patera Lane Improvement Project

Project Applicant: City of Goleta

Project Location - Specific:

Entirety of South La Patera Lane between UPRR Right of Way and Hollister Avenue

Project Location - City: Goleta Project Location - County: Santa Barbara

Description of Nature, Purpose and Beneficiaries of Project:

The project will construct bike lanes, in-fill sidewalk and reconstruct non-standard sidewalk and curb ramps and will result in an ADA compliant sidewalk path of travel on the west side of South La Patera Lane; improvements to sidewalk on the east side of South La Patera Lane is also included. All of the changes would occur within the existing Right-Of-Way of La Patera Lane. The purpose of the project is to improve and enhance bicycle and pedestrian safety while improving the aesthetics of the La Patera Lane. The beneficiaries of the project are the residents of Goleta, the businesses along La Patera Lane, and the users of the Goleta Train Station.

Name of Public Agency Approving Project: City of Goleta

Name of Person or Agency Carrying Out Project: City of Goleta

Exempt Status: (check one):

- Ministerial (Sec. 21080(b)(1); 15268);
Declared Emergency (Sec. 21080(b)(3); 15269(a));
Emergency Project (Sec. 21080(b)(4); 15269(b)(c));
[X] Categorical Exemption. State type and section number: Class 1
Statutory Exemptions. State code number:

Reasons why project is exempt:

The minor alterations to the existing street, sidewalks, and gutters would not expand the existing use or dimensions of the Right-Of-Way, which would remain a two lane road for vehicles. Refer to the analysis contained with the Categorical Exemption Report dated March 2022 for additional justification.

Lead Agency Contact Person: Lisa Prasse Area Code/Telephone/Extension: 805 961 7542

If filed by applicant:

- 1. Attach certified document of exemption finding.
2. Has a Notice of Exemption been filed by the public agency approving the project? Yes No

EXHIBIT M

**CONCRETE PAVEMENT PRESERVATION RECOMMENDATIONS FOR GOLETA
TRANSIT CENTER**

PREPARED BY CALIFORNIA – NEVADA CEMENT ASSOCIATION.

DATED NOVEMBER 5, 2021

November 5th, 2021

Randy Hildebrant, PE, GE

Associate - Engeo

RE: Concrete Pavement Preservation Recommendations for Goleta Transit Center

Mr. Hildebrant,

Based on our email conversations and site visit to 27 S La Patera Lane in Goleta, the future site of the proposed Goleta Transit Center I have prepared the following recommendations for reusing the existing concrete parking lot to the west of the existing building for additional parking area.

The following recommendations are based on the Concrete Pavement Preservation Guide, Second Edition published by the National Concrete Pavement Technology Center of the Iowa State University, available for download at:

https://intrans.iastate.edu/app/uploads/2018/08/preservation_guide_2nd_ed_508_final.pdf

The recommendations given correspond to the numbered images found on the following pages:

1. The general site view looking north shows typical slab cracking found in throughout much of the site paving. Many of the slabs appeared to be roughly 50' in length/width and exhibit mid-slab cracking, likely as a result of drying shrinkage and excessive slab dimensions; slab dimensions should generally be 24x to 30x the pavement thickness, or 16' to 20' on this 8" pavement. These cracks appeared to be held together tightly and were not exhibiting spalling or other degradation. As such, I would recommend leaving them as-is for this project.
2. An underground fuel tank and associated filling ports were observed adjacent to a backup generator. It is recommended that the fuel tank either be removed or drained, cleaned, filled, and abandoned in place, and the concrete slab above the tank replaced following the recommendations found in Chapter 6, Full-Depth Repairs of the above-referenced document, excepting that dowel bars are not needed as this is understood to be an undowelled, unreinforced pavement.
3. In many locations, corner breaks were observed on slabs that were in otherwise good condition. In order to restore those slabs and avoid future spalling and loose concrete, the processes and procedures found in Chapter 5, Partial-Depth Repairs of the above-referenced document should be used. Although not pictured, some of the construction joints exhibited spalling, likely due to an accumulation of incompressible material. The procedures found in Chapter 5, Partial-Depth Repairs can also be used to address this deterioration.
4. The area drain at the northwest corner of the parking lot exhibited signs of plugging – dirt and debris accumulation on the pavement surface and on the adjacent retaining wall. This drainage concern, although not part of the actual pavement preservation recommendations, should be addressed as part of the revitalization strategy. Allowing water to pond for extended periods will lead to weakened subgrade, possible subgrade pumping, and ultimately, premature pavement failure if allowed to continue while the pavement is in use.
5. Throughout the pavement, the control joints (those sawcut at the time of paving in order to control the location of shrinkage cracks) appear to be in generally good condition. In order to keep these joints in good condition, they should be occasionally cleaned with compressed air, high-pressure water, or with a vacuum sweeper to reduce the accumulation of incompressible materials that can lead to joint spalling.
6. In several locations, the construction joints (those made at the time of construction, often at the end of a day's production, or between placements) have an accumulation of incompressible materials and, in some locations, are growing weeds. In order to preserve these joints and prevent future spalling, they should be cleaned out and resealed following the recommendations found in Chapter 10 Joint Resealing and Crack Sealing of the above-referenced document.

Once the repairs described above are complete, it is recommended that a topping material to provide an attractive, uniform appearance that will complement the appearance of the new transit facility. I have reached out to my industry contacts to get recommendations on products that would work well for this application. Here are those recommendations:

- a) From the Sika Corporation: Sikatop 122 Plus is recommended for overlays, with Sikadur 32 as the bonding agent (it is recommended to apply the Sikatop 122 Plus mortar onto the Sikadur 32 epoxy “wet on wet”.) For more information on these products, contact Kash Amin, Project sales rep at 949-610-2695 or via email at amin.kash@us.sika.com Please find the materials information sheets attached to this report.
- b) From Euclid Chemical: Repair the cracks with gravity feed material, the joints with Eucolastic SL, prime the surface with Euroweld 2.0 and resurface with Thin Top Supreme which will hold up to heavy vehicular traffic. For more information on these products, contact Carl Schmidt at (951) 520-5890 or via email at cschmidt@euclidchemical.com Please find the materials information sheets attached to this report.
- c) From Masterbuilders: Mr. Dustin Martin prepared an extensive set of recommended procedures and products for this work. These recommendations along with the related materials information sheets are attached to this report. For more information, contact Dustin Martin at 714-390-2535 or via email at dustin.martin@mbcc-group.com

Disclaimer

These recommendations have been made based on the information provided to me and should be evaluated for the significance and limitations that may apply to the physical site location. The Engineer of Record is responsible for the review and acceptance of these recommendations. These recommendations reflect my experience, judgment, and I believe the recommendations to be appropriate, based on the information provided to me. However, neither I nor the California Nevada Cement Association make any representations or warranties concerning the applicability or installation and disclaim any and all responsibility and liability for the accuracy of the application of this information provided to the full extent of the law.

Sincerely,
California Nevada Cement Association
Nathan Forrest, P.E.
Technical Director

PRODUCT DATA SHEET

SikaTop[®]-122 Plus

TWO-COMPONENT, POLYMER-MODIFIED, CEMENTITIOUS, TROWEL-GRADE MORTAR PLUS SIKAFERROGARD[®] 901 PENETRATING CORROSION INHIBITOR

PRODUCT DESCRIPTION

SikaTop[®]-122 Plus is a two-component, polymer-modified, portland cement based, fast-setting, trowel-grade mortar. It is a high performance repair mortar for horizontal and vertical surfaces and offers the additional benefit of Sika FerroGard[®] 901, a penetrating corrosion inhibitor.

USES

- On grade, above and below grade on concrete and mortar.
- On horizontal surfaces.
- As a structural repair material for parking structures, industrial plants, walkways, bridges, tunnels, dams, ramps, floods, etc.
- To level concrete surfaces.
- As an overlay system for topping/resurfacing concrete.

CHARACTERISTICS / ADVANTAGES

- Extremely low shrinkage **proven by four industry standard test methods**
- High compressive and flexural strengths
- High abrasion resistance
- Increased freeze/thaw durability and resistance to deicing salts
- Compatible with coefficient of thermal expansion of concrete - Passes ASTM C-884
- Increased density - improved carbon dioxide resistance (carbonation) without adversely affecting water vapor transmission (not a vapor barrier)
- Sika FerroGard[®] 901, a penetrating corrosion inhibitor - reduces corrosion even in the adjacent concrete

APPROVALS / STANDARDS

- USDA certifiable for the food industry
- ANSI/NSF Standard 61 potable water compliant
- Tested per ICRI guideline for inorganic repair material data sheet protocol guideline n°320.3R

PRODUCT INFORMATION

Packaging	Component A	Component B
	1 gal (3.78 L) jug 4/carton	61.5 lb (28.9 kg) bag
Appearance / Color	Concrete gray when mixed	
Shelf Life	12 months from date of production if stored properly in original, unopened and undamaged sealed packaging	
Storage Conditions	Store dry at 40–95 °F (4–35 °C) Protect Component A from freezing. If frozen, discard. Protect Component B from moisture. If damp, discard.	

Density	136 lbs/ft ³ (2.18 kg/L)	(ASTM C-138)
---------	-------------------------------------	--------------

Compressive Strength	1 day	2,500 psi (17.2 MPa)	(ASTM C-109)
	7 days	5,300 psi (36.5 MPa)	73 °F (23 °C)
	28 days	7,000 psi (48.3 MPa)	50 % R.H.
Modulus of Elasticity in Compression	28 days	3.0x10 ⁶ psi	(ASTM C-469) 73 °F (23 °C) 50 % R.H.
Flexural Strength	28 days	1,500 psi (10.3 MPa)	(ASTM C-293) 73 °F (23 °C) 50 % R.H.
Splitting Tensile Strength	28 days	500 psi (3.4 MPa)	(ASTM C-496) 73 °F (23 °C) 50 % R.H.
Tensile Strength	28 days	2,000 psi (13.8 MPa)	(ASTM C-882 modified)*
<small>* Mortar scrubbed into substrate at 73 °F (23 °C) and 50 % R.H.</small>			
Pull-Out Resistance	7 days	>300 psi (2.1 MPa)	(ASTM C-1583)
	28 days	400 psi (2.8 MPa)	73 °F (23 °C) 50 % R.H.
Shrinkage	28 days	1"x1"x11-1/4" specimen	<0.05 % (ASTM C-157 modified)
		3"x3"x11-1/4" specimen	<0.021 % (mod. ICRI 320.3R) 73 °F (23 °C) 50 % R.H.
Ring Test	Duration	>70 days	(ASTM C-1581)
	Average Max Strain	-9 µstrain	73 °F (23 °C)
	Average Stress Strain	0.49 psi/day	50 % R.H.
	Potential for Cracking	Low	
Baenziger Block	90 days	No cracking	
Freeze-Thaw Stability	300 cycles	98 %	(ASTM C-666)
Rapid Chloride Permeability	28 days	< 500 C	(ASTM C-1202 AASHOT T-277)

APPLICATION INFORMATION

Mixing Ratio	Plant-proportioned kit, mix entire unit.		
Fresh Mortar Density	136 lbs/ft ³ (2.18 kg/l)		(ASTM C-138)
Coverage	Neat	0.51 ft ³ (0.02 m ³) per unit	
	Extended with 42 lb (19 kg) of 3/8" (9.5 mm) gravel	0.75 ft ³ (0.03 m ³) per unit	
<small>(Coverage figures do not include allowance for surface profile and porosity or material waste)</small>			
Layer Thickness		Min.	Max. in one lift
	Neat	1/8" (3.2 mm)	1" (25 mm)
	Extended	1" (25.4 mm)	4" (101.6 mm)

Product Data Sheet
SikaTop®-122 Plus
September 2018, Version 01.02
020302040070000021

Product Temperature	65–75 °F (18–24 °C)
Ambient Air Temperature	> 45 °F (7 °C)
Substrate Temperature	> 45 °F (7 °C)
Application Time	~ 30 minutes As the temperature will affect the pot life, application temperature: <ul style="list-style-type: none"> ▪ Above 73 °F (23 °C) will reduce the pot life and workability ▪ Below 73 °F (23 °C) will extend the pot life and workability
Finishing Time	50–120 minutes Note: All times start after adding Component 'B' to Component 'A' and are highly affected by temperature, relative humidity, substrate temperature, wind, sun and other job site conditions.

APPLICATION INSTRUCTIONS

SURFACE PREPARATION

- Concrete, mortar, and masonry products must be clean and sound.
- Remove all deteriorated concrete, dirt, oil, grease, and other bond-inhibiting materials from the area to be repaired.
- Be sure repair area is not less than 1/8" (3.2mm) in depth.
- Preparation work should be done by high pressure water blast, scabbler or other appropriate mechanical means to obtain an exposed aggregate surface profile of ±1/16"-1/8" (1.6-3.2 mm) (CSP-5-6).
- To ensure optimum repair results, the effectiveness of decontamination and preparation should be assessed by a pull-off test.
- Saw cutting of edges is preferred and a dovetail is recommended.
- Substrate should be Saturated Surface Dry (SSD) with clean water prior to application. No standing water should remain during application.

PRIMING

- **Reinforcing steel:** Steel reinforcement should be thoroughly prepared by mechanical cleaning to remove all traces of rust. Where corrosion has occurred due to the presence of chlorides, the steel should be high pressure washed with clean water after mechanical cleaning. For priming of reinforcing steel use Sika® Armatec® 110 EpoCem (consult PDS).
- **Concrete Substrate:** Prime the prepared substrate with a brush or sprayed applied coat of Sika® Armatec® 110 EpoCem (consult PDS). Alternately, a scrub coat of SikaTop®-122 Plus can be applied prior to placement of the mortar. The repair mortar has to be applied into the wet scrub coat before it dries.

MIXING

- Pour approximately 7/8 of Component 'A' into the mixing container.
- Add Component 'B' (powder) while mixing continuously.
- Mix mechanically with a low-speed drill (400–600 rpm) and mixing paddle or mortar mixer.
- Add remaining Component 'A' (liquid) to mix if a more loose consistency is desired.
- Mix to a uniform consistency, maximum 3 minutes.
- Thorough mixing and proper proportioning of the two components is necessary.
- Refer to ACI 306 Guidelines when there is a need to place this product in cold & hot temperatures. Thinner application will be more sensitive to the temperature

EXTENSION WITH AGGREGATES

- For applications greater than 1" (25.4 mm) in depth, add 3/8" (9.5 mm) coarse aggregate.
- Pour all of Component 'A' into mixing container.
- Add all of Component 'B' while mixing, then introduce 3/8" (9.5 mm) coarse aggregate at desired quantity.
- Mix to uniform consistency, maximum 3 minutes.
- The aggregate must be non-reactive (reference ASTM C-1260, C-227 and C-289), clean, well graded, Saturated Surface Dry (SSD), have low absorption and high density, and comply with ASTM C-33 size number 8 per Table 2.
- Do not use limestone aggregate.
- Variations in the quality of the aggregate will affect the physical properties of SikaTop®-122 Plus and may result in different strengths.
- The addition rate is 42 lb (19 kg) of aggregate per bag. It is approximately 3.0-4.5 gallons (11.3-17.0 L) by loose volume of aggregate.

APPLICATION

- SikaTop®-122 Plus must be scrubbed into the substrate, filling all pores and voids.
- Force material against edge of repair, working toward center.
- After filling repair, consolidate, then screed.
- Allow mortar or concrete to set to desired stiffness, then finish with wood or sponge float for a smooth surface, or broom or burlap-drag for a rough finish.

CURING TREATMENT

- As per ACI recommendations for Portland cement concrete, curing is required.
- Moist cure with wet burlap and polyethylene, a fine mist of water or a water based* compatible curing compound meeting ASTM C-309.
- Curing compounds adversely affect the adhesion of following lifts of mortar, leveling mortar or protective coatings.
- Moist curing should commence immediately after finishing.
- Protect freshly applied mortar from direct sunlight, wind, rain and frost.
- To prevent from freezing, cover with insulating material.

* Pretesting of curing compound is recommended.

LIMITATIONS

- Do not use solvent-based curing compound.
- Size, shape and depth of repair must be carefully considered and consistent with practices recommended by ACI or ICRI. For additional information, contact Technical Service.
- For additional information on substrate preparation, refer to ICRI Guideline No.310.2R Coatings, Polymer Overlays, and Concrete Repair.
- If aggressive means of substrate preparation is employed, substrate strength should be tested in accordance with ACI 503 Appendix A prior to the repair application.
- As with all cement based materials, avoid contact with aluminum to prevent adverse chemical reaction and possible product failure. Insulate potential areas of contact by coating aluminum bars, rails, posts etc. with an appropriate epoxy such as Sikadur 32 Hi-Mod.

BASIS OF PRODUCT DATA

Results may differ based upon statistical variations depending upon mixing methods and equipment, temperature, application methods, test methods, actual site conditions and curing conditions.

LOCAL RESTRICTIONS

EXHIBIT "M" (Pavement Preservation Recommendations) **BUILDING TRUST** 

PRODUCT DATA SHEET

Sikadur[®]-32 Hi-Mod

HIGH-MODULUS, HIGH-STRENGTH, EPOXY BONDING/GROUTING ADHESIVE

PRODUCT DESCRIPTION

Sikadur[®]-32 Hi-Mod is a multi-purpose, 2-component, 100 % solids, moisture-tolerant structural epoxy adhesive. It conforms to the current ASTM C-881 Types I, II, and V, Grade 2, Class C and AASHTO M-235 specifications.

USES

Sikadur[®]-32 Hi-Mod may only be used by experienced professionals.

- Bond fresh, plastic concrete to hardened concrete and steel.
- Grout horizontal cracks in structural concrete and wood by gravity feed.
- Machinery and 'robotic' base-plate grout.
- Structural adhesive for concrete, masonry, metal, wood, etc.

CHARACTERISTICS / ADVANTAGES

- High-strength bonding/grouting adhesive.
- Tolerant to moisture before, during and after cure.
- Excellent adhesion to most structural materials.
- Convenient easy-to-mix ratio A:B = 1:1 by volume.
- Easy-to-use for bonding/grouting applications.
- Fast initial set; rapid gain to ultimate strengths.
- USDA-certified for use in food plants.

PRODUCT INFORMATION

Chemical Base	100 % epoxy	
Packaging	1, 2 and 4 gal. units	
Color	Concrete gray	
Shelf Life	2 years in original, unopened containers	
Storage Conditions	Store dry at 40–95 °F (4–35 °C). Condition material to 65–75 °F (18–24 °C) before using.	
Viscosity	Approximately 4–5,000 cps.	
Water Absorption	0.21 % (7 days, 24 h immersion)	(ASTM D-570) 73 °F (23 °C) 50 % R.H.

TECHNICAL INFORMATION

APPLICATION INFORMATION

Mixing Ratio	Component 'A': Component 'B' = 1:1 by volume
Coverage	Bonding Adhesive: 1 gal. covers approximately 80 ft ² on smooth surface. Base Plate Grout: 1 gal. mixed with 1.5 parts oven-dried aggregate by loose volume yields approximately 420 in ³ of grout. Anchoring Grout: 1 gal. yields 231 in ³ of grout.
Product Temperature	Condition material to 65°-75°F (18°-24°C) before using.
Ambient Air Temperature	Minimum ambient temperature 40°F (4°C).
Substrate Temperature	Minimum substrate temperature 40°F (4°C).
Pot Life	Approximately 30 minutes. (60 gram mass) Approximately 22 minutes. (350 gram mass)
Contact Time	40 °F (4 °C)*: 15–16 h 73 °F (23 °C)*: 2–2.5 h 90 °F (32 °C)*: 1.5–2 h <small>*Material cured and tested at the temperatures indicated.</small>

APPLICATION INSTRUCTIONS

SUBSTRATE QUALITY

Surface must be clean and sound. It may be dry or damp, but free of standing water. Remove dust, laitance, grease, curing compounds, impregnations, waxes and any other contaminants.

SUBSTRATE PREPARATION

Concrete - Should be cleaned and prepared to achieve a laitance and contaminant free, open textured surface by blast cleaning or other equivalent mechanical means.

Steel - Should be cleaned and prepared thoroughly by blast cleaning or other equivalent mechanical means.

MIXING

Pre-mix each component. Proportion equal parts by volume of Component 'A' and Component 'B' into clean pail. Mix thoroughly for 3 minutes with Sika paddle on low-speed (400-600 rpm) drill until blend is a uniform color. Mix only that quantity that can be applied within its pot life.

APPLICATION METHOD / TOOLS

To bond fresh concrete to hardened concrete - Apply by brush, roller, broom or spray. Place fresh concrete while Sikadur® 32, Hi-Mod, is still tacky. If coating becomes glossy and loses tackiness, remove any surface contaminants then recoat with additional Sikadur® 32 Hi-Mod, and proceed.

To grout baseplates - Add up to 1 1/2 parts of oven-dried aggregate to 1 part of mixed Sikadur® 32, Hi-Mod, by volume. Place grout under baseplate. Avoid contact with the underside of the plate. A 1/4 to 3/8 in. (6 to 10

mm) space should remain between the top of the grout and the bottom of the plate.

Maximum thickness of grout per lift is 1.5 in. (38 mm) If multiple lifts are needed, allow preceding layer to cool to touch before applying additional layer. The remaining 1/4 to 3/8 in. (6 to 10 mm) space should be filled with neat Sikadur® 32 Hi-Mod. Pour a sufficient quantity of neat epoxy to allow the level to rise slightly higher than the underside of the bearing plate.

To gravity feed cracks - Pour neat material into vee-notched crack. Continue placement until completely filled.

Seal underside of slab prior to filling if cracks reflect through.

LIMITATIONS

- For spray applications, consult Technical Service at 800-933-7452.
- Use only oven-dry aggregate.
- Material is a vapor barrier after cure.
- For applications on exterior, on-grade substrates, consult Technical Services at 800-933-7452.
- Do not apply over wet, glistening surface.
- Not an aesthetic product. Color may alter due to variations in lighting and/or UV exposure.

BASIS OF PRODUCT DATA

Results may differ based upon statistical variations depending upon mixing methods and equipment, temperature, application methods, test methods, actual site conditions and curing conditions.

OTHER RESTRICTIONS

See Legal Disclaimer.

ENVIRONMENTAL, HEALTH AND SAFETY

For further information and advice regarding transportation, handling, storage and disposal of chemical products, user should refer to the actual Safety Data Sheets containing physical, environmental, toxicological and other safety related data. User must read the current actual Safety Data Sheets before using any products. In case of an emergency, call CHEMTREC at 1-800-424-9300, International 703-527-3887.

LEGAL DISCLAIMER

- KEEP CONTAINER TIGHTLY CLOSED
- KEEP OUT OF REACH OF CHILDREN
- NOT FOR INTERNAL CONSUMPTION
- FOR INDUSTRIAL USE ONLY
- FOR PROFESSIONAL USE ONLY

Prior to each use of any product of Sika Corporation, its subsidiaries or affiliates ("SIKA"), the user must always read and follow the warnings and instructions on the product's most current product label, Product Data Sheet and Safety Data Sheet which are available at usa.sika.com or by calling SIKA's Technical Service Department at 1-800-933-7452. Nothing contained in any SIKA literature or materials relieves the user of the obligation to read and follow the warnings and instructions for each SIKA product as set forth in the current product label, Product Data Sheet and Safety Data Sheet prior to use of the SIKA product.

SIKA warrants this product for one year from date of installation to be free from manufacturing defects and to meet the technical properties on the current Product Data Sheet if used as directed within the product's shelf life. User determines suitability of product for intended use and assumes all risks. User's and/or buyer's sole remedy shall be limited to the purchase price or replacement of this product exclusive of any labor costs. **NO OTHER WARRANTIES EXPRESS OR IMPLIED SHALL APPLY INCLUDING ANY WARRANTY OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. SIKA SHALL NOT BE LIABLE UNDER ANY LEGAL THEORY FOR SPECIAL OR CONSEQUENTIAL DAMAGES. SIKA SHALL NOT BE RESPONSIBLE FOR THE USE OF THIS PRODUCT IN A MANNER TO INFRINGE ON ANY PATENT OR ANY OTHER INTELLECTUAL PROPERTY RIGHTS HELD BY OTHERS.**

SELLING BRIEF

Euroweld 2.0

Latex Bonding Agent for Concrete Repairs and Toppings

For Internal Use Only

General Description

EUCOWELD 2.0 is a non-rewettable, neat-applied liquid latex bonding agent for cement-based repair mortars and concrete.

Product Positioning

EUCOWELD 2.0 will help round out our bonding agent product line; here is a brief review of the positioning for our current products:

- **AKKRO-7T, FLEX-CON, and SBR LATEX:** non-rewettable latex products that are best used as admixtures in cementitious products. When used as topically applied bonding agents, they must be combined with sand and cement and essentially used as a scrub coat – where your repair mortar or topping is placed on the bonding slurry before it dries out. These products have zero bonding ability if they are applied to the surface neat and allowed to dry.
- **TAMMSWELD:** re-wettable, ethylene vinyl acetate (EVA) product that is best used as a primer coat under EucoFloor SL160, Flo-Top, and Super Flo-Top. We have accepted and used Tammsweld as a neat bonding agent for concrete repairs in the past, but it does have its limitations - as the “re-wetting” and bonding performance is dependent upon moisture content of the repair mortar or concrete being placed on it. EVA-based products are also easily outperformed by the latest technology in EUCOWELD 2.0. Moving forward, Tammsweld will remain in the position of a primer coat under our underlayments/overlayments that will not receive a grind and polish (EucoFloor Epoxy Primer is still the “go to” for polished toppings).
- **EUCOWELD 2.0:** a new, non-rewettable latex bonding agent that is best used as a neat-applied bonding agent for repairs with any of our cementitious repair mortars, or with ready-mix concrete. “Non-rewettable” and “neat-applied” together may sound strange at first – but it is not a typo! As you read on, you will find that the benefits of this product are numerous in comparison with our existing latex line-up. From bond strengths, ease of use, robustness, price, you name it – this product outperforms the rest.

Packaging & Availability

EUCOWELD 2.0 is immediately available for sale in 5 gallon (18.9 L) pails and in cases of 1 gallon (3.8 L) jugs (6 jugs per case). Initially, distribution will be from the Cleveland, OH facility. As demand increases, other warehousing locations will be added. **EUCOWELD 2.0** meets all local and national governmental guidelines for VOC emissions and can be sold anywhere in North America.

Product Overview/Value Statement

There are two main points to take away from this selling brief:

1. EUCOWELD 2.0 is nearly “dummy proof”.
2. EUCOWELD 2.0 exhibits bond strengths that almost rival Duralprep A.C.

To elaborate – the lab here in Cleveland put this product through the ringer during testing. It was tested “wet on wet” and after being allowed to dry for 3 hours, 24 hours, 3 days, and 7 days... it was tested after it was applied and got “rained on” (lab simulation)... it was applied, topped, and then put through freeze-thaw cycles before bond testing... it was applied, topped, and wet cured before bond testing... we thought of almost everything, and this product performed through it all. This only bodes well for us, and provides confidence for recommending this product as a neat bonding agent under our cementitious repair mortars, both interior and exterior.

On top of that, the direct tension bond pulls (C1583) and slant shear bond strengths (C882) were excellent all around, and nearly rival those of water-based epoxy bonding agents like Duralprep A.C. This is another confidence booster for both us and our customers, especially in comparison to the EVA-based products on the market (and our own Tammsweld). This also provides us and our customers a “solution” to our recent changes regarding not using Duralprep A.C. under thin toppings (less than 3.5” thick). This is a product that we can now confidently recommend under toppings of any thickness, and it’s even easier to use than Duralprep A.C. – no mixing.

Take this product to your customers and compare our testing with that of Larsen’s Weld-Crete (which seems to be the market leader in neat-applied latex bonding agents) – EUCOWELD 2.0 has testing that more directly relates to concrete and toppings, and the numbers will speak for themselves. Pricing is also very competitive on this product, even in comparison to our own Tammsweld.

EUCOWELD 2.0 represents a new generation of unique, non-EVA based latex that utilizes reactive chemistry for bonding, rather than depending on the moisture content of the repair material. For full details and instructions, please refer to the included TDS.

Competitive Products

- All EVA-based, neat-applied latex bonding agents (Larsen Weld-Crete, in particular)
- ChemMasters Cretelox (similar chemistry to Euoweld 2.0)
- Sika Latex R (similar chemistry to Euoweld 2.0)

Typical Customer Profile & Applications

Any repair and restoration contractor in search of a reliable, economical, easy-to-use/neat-applied latex bonding agent that outperforms the widely available EVA-based products

Pricing Guidelines

SAP# L6202 95	Case of (6) 1 gal. jugs	\$98.40
SAP# L6202 05	5 gal. pail	\$74.00

THIN-TOP SUPREME

Single Component Cementitious Topping & Repair Mortar for Thin Applications

Description

THIN-TOP SUPREME is a latex and microsilica modified cementitious mortar designed for use as a floor or deck topping at thicknesses of 1/16" to 3/8" (1.6 mm to 9.5 mm). This product is a single-component formula which incorporates a powder latex technology. It provides excellent durability under freeze-thaw cycling as well as reducing the ingress of water and de-icing salts. THIN-TOP SUPREME offers normal set times in a trowelable consistency for easy workability.

Primary Applications

- Parking decks
- Pavements
- Joints
- Marine structures
- Curbs and gutters
- Ramps
- Floors
- Walkways

Features/Benefits

- Provides a strong, wear resistant thin overlay
- Excellent durability in freeze-thaw cycles
- Contains an integral corrosion inhibitor
- Excellent bond to prepared concrete
- Reduces the penetration of water and de-icing salts for substrate protection
- Suitable for both interior and exterior use

Technical Information

The following are typical values obtained under laboratory conditions. Expect reasonable variation under field conditions.

Compressive Strength ASTM C109
2" (50 mm) cubes @ 2.9 qts (2.7 L)/50 lb (22.7 kg) bag.

Age	Strength
1 day.....	2,000 psi (13.8 MPa)
7 days.....	4,000 psi (27.6 MPa)
28 days.....	6,000 psi (41.3 MPa)

Linear Shrinkage ASTM C157
28 days.....-0.15%

Unit Weight.....approx. 130 lb/ft³ (2082 kg/m³)

Flexural Strength ASTM C348
7 days1,000 psi (6.9 MPa)
28 days.....1,200 psi (8.3 MPa)

Split Tensile Strength ASTM C496
7 days.....300 psi (2.1 MPa)
28 days.....400 psi (2.8 MPa)

Freeze/Thaw Resistance ASTM C666 Procedure A
300 cycles 89% relative dynamic modulus

Working Time 30 to 40 minutes

Initial Set 1 to 1.5 hours

Final Set approx. 3 hours

Appearance: THIN-TOP SUPREME is a free-flowing powder as packaged. After mixing and placing, the color may initially appear darker than the surrounding concrete. The color will lighten up substantially as it cures and dries out, though it may always appear somewhat darker than the surrounding concrete.

Packaging/yield

THIN-TOP SUPREME is packaged in 50 lb (22.7 kg) moisture resistant bags. Yield: 0.43 ft³/bag (0.012 m³) when mixed with 3 qt (2.8 L) of water. Typical water requirement is 2.75 to 3.25 qt (2.6 to 3.08 L)/bag.

Shelf Life

2 years in original, unopened package

Specifications/Compliances

Canadian Food Inspection Agency, MTQ and MTO

Directions for Use

Surface Preparation: Concrete surfaces must be structurally sound, free of loose or deteriorated concrete and free of dust, dirt, paint, efflorescence, oil and all other contaminants. Mechanically abrade the surface to achieve a surface profile equal to CSP 4-6 in accordance with ICRI Guideline 310.2. Properly clean profiled area.

Priming & Bonding (Horizontal Toppings): For the best adhesion to concrete, use EUCOFLOOR EPOXY PRIMER seeded with sand as the bonding coat. Refer to the EUCOFLOOR EPOXY PRIMER technical data sheet for full instructions. Alternatively, application of EUCOWELD 2.0 to a dry substrate or a scrub coat of THIN-TOP SUPREME to the saturated surface dry (SSD) concrete surface may be used for bonding. The topping material must be placed on the scrub coat before the scrub coat dries out.

Mixing: Single bags may be mixed with a drill and “jiffy” mixer. Use a paddle type mortar mixer for large jobs. All material should be in the proper temperature range of 60°F (15°C) to 90°F (32°C). Add the appropriate amount of water 2.75 to 3.25 qt (2.6 to 3.08 L) per bag for the batch size and then add the dry product. Mix for 3 to 5 minutes.

Placement: Discharge material from mixer immediately and place on to the repair area. For repairs, spread with a trowel, come-a-long, or square tipped shovel to a thickness that matches the surrounding concrete. Work material into place by floating or troweling. On large areas, use screed strips with a vibratory screeding to level.

Finishing: This product is designed for finishing with a float or broom appearance. Do not add additional water to the surface during the finishing operation; use EUCOBAR evaporation retarder. For a hard, flat troweled surface, delay finishing until the product is near final set (approx. 3 hours) to reduce the risk of blistering during troweling.

Curing and Sealing: Proper curing procedures are important to ensure the durability and quality of the repair. To prevent surface cracking, cure the material with a high solids curing compound, such as SUPER AQUA-CURE VOX or SUPER DIAMOND CLEAR VOX. Note: **Do not use a solvent based curing compound on this product.** If a curing compound is not desired, cover with polyethylene for a minimum of 3 days. **Do not wet cure.** Always re-establish floor and slab joints when using this product as an overlay.

Clean-Up

Clean tools and equipment with water before the material hardens. Hardened THIN-TOP SUPREME will require removal by mechanical means.

Precautions/Limitations

- Do not wet cure. Do not use a solvent based curing compound on this product.
- Do not allow repairs to freeze until the material has reached a minimum of 1,000 psi (7 MPa) compressive strength.
- Use only potable water for mixing.
- Do not add admixtures or sand.
- Do not use DURALPREP A.C. as a bonding agent for toppings and overlays done with THIN-TOP SUPREME.
- Do not use material at temperatures below 45°F (7°C) or above 100°F (38°C).
- When necessary, follow the recommendations in ACI 305R “Guide to Hot Weather Concreting” or ACI 306R “Guide to Cold Weather Concreting”.
- No heavy traffic until the product has cured.
- Mixing partial bags may yield variable results; always mix full units.
- Store product in a dry place.
- For repairs and toppings thicker than 3/8” (9.5 mm), use CONCRETE-TOP SUPREME.
- In all cases, consult the Safety Data Sheet before use.

Rev. 08.20

WARRANTY: The Euclid Chemical Company (“Euclid”) solely and expressly warrants that its products shall be free from defects in materials and workmanship for one (1) year from the date of purchase. Unless authorized in writing by an officer of Euclid, no other representations or statements made by Euclid or its representatives, in writing or orally, shall alter this warranty. EUCLID MAKES NO WARRANTIES, IMPLIED OR OTHERWISE, AS TO THE MERCHANTABILITY OR FITNESS FOR ORDINARY OR PARTICULAR PURPOSES OF ITS PRODUCTS AND EXCLUDES THE SAME. If any Euclid product fails to conform with this warranty, Euclid will replace the product at no cost to Buyer. Replacement of any product shall be the sole and exclusive remedy available and buyer shall have no claim for incidental or consequential damages. Any warranty claim must be made within one (1) year from the date of the claimed breach. Euclid does not authorize anyone on its behalf to make any written or oral statements which in any way alter Euclid’s installation information or instructions in its product literature or on its packaging labels. Any installation of Euclid products which fails to conform with such installation information or instructions shall void this warranty. Product demonstrations, if any, are done for illustrative purposes only and do not constitute a warranty or warranty alteration of any kind. Buyer shall be solely responsible for determining the suitability of Euclid’s products for the Buyer’s intended purposes.

EXHIBIT "M" (Pavement Preservation Recommendations)

October 27, 2021

Nathan Forrest
California Nevada Cement Association

RE:
City of Goleta – New Transit Center
Goleta, CA

Nathan,
Based on the information you provided about the City of Goleta transit center parking lot please consider using the MasterSeal Traffic 2500 system over the top of MasterSeal 350 moisture mitigation epoxy primer. Below is an overview of a typical Installation and rate of production.

Overview of install:

- Remove all concrete substrate areas which are not sound. Repair all voids, delaminated and spalled concrete areas with Master Builders Solutions cementitious (MasterEmaco 1061DR) and/or epoxy patching materials (MasterSeal 350). All concrete repairs should be performed prior to surface preparation.
- All concrete surfaces must be shot blasted to profile the surface of the concrete to ICRI CSP surface profile of 4 (similar to 100 grit sandpaper). For areas with limited space or access for shot-blasting, alternative mechanical methods can be used to achieve the recommended surface profile. All dust and debris or other contaminants should be removed prior to coating installation.
- Mix and apply MasterSeal NP2, a 50% movement joint sealant, to all joints, flashings and cant beads at horizontal to vertical transitions. Cracks exceeding 1/16" in width or moving cracks should be routed out to a minimum ¼" X ¼" and sealed with a MasterSeal® NP2, polyurethane sealant. Once the sealant is placed and struck flush, apply sand the top of the sealant (cracks only) to allow for better adhesion to the MasterSeal 350. For dynamic cracks and joints a bond breaker should be used to prevent adhesion to the bottom of the joint.

MasterSeal Traffic 2500 - Heavy Duty System w/ MasterSeal 350

1. MasterSeal 350– 100% moisture mitigation epoxy
 - o Apply at a rate of 25 wet mils or 60 s.f. per gal.
 - o Immediately backroll to evenly level
 - o While coating is still wet broadcast aggregate to refusal at the rate of 20-35 lbs / 100s.f.
 - o Allow base coat to cure 3-4 hours before applying midcoat.

Note: Do not coat expansion joints over 1" inch wide.

2. MasterSeal TC 275 midcoat – 2 component aromatic midcoat –

- Apply at a rate of 18 -20 wet mils or 90 s.f. per gal.
 - Immediately backroll to evenly level
 - Broadcast aggregate to refusal at the rate of 20-35 lbs / 100s.f.
 - Allow to cure for 3-4 hours before applying next midcoat.
3. MasterSeal TC 295 topcoat – 2 component aliphatic topcoat –
- Apply at 20 wet mils or 80 s.f. per gal.
 - Immediately backroll to evenly level
 - Broadcast 3-5 lbs/100s.f. and lightly backroll into top coat if additional slip resistance is needed.
 - Allow to cure for for minimum 48-72 hours before opening to vehicular traffic.

Master Builders Solutions will offer a standard 5 year warranty for this system.

Notes:

- 1) The aggregate outlined in this written specification and recommended for use on this structure is MasterSeal 941 or kiln dried sand 16/30 blend.
- 2) All coverage rates are approximate and may vary due to the application technique used. Actual coverage rate will depend on finish and porosity of the substrate.
- 3) Extend curing time at temperatures less than 75 degrees F and relative humidity less than 50 percent.

All repairs should be completed prior to coating placement and proper repair procedures should be followed. Please refer to the product technical data guides for surface preparation, mixing and application instructions which supercedes this letter.

We appreciate your support of Master Builders Solutions. If there is anything further I can help with please don't hesitate to contact me.

Sincerely,

Dustin Martin

MasterEmaco[®] T 1061

Rapid-setting cement-based concrete repair mortar with extended working time

FORMERLY 10-61 RAPID MORTAR

PACKAGING

MasterEmaco T 1061
50 lb (22.6 kg) polyethylene-lined bags
2,500 lb (1,134 kg) bulk bags

MasterEmaco T 1061DR
50 lb (22.6 kg) polyethylene-lined bags

YIELD

0.43 ft³ (0.012 m³) per 50 lb (22.6 kg)
- WHEN EXTENDED 50%:
0.57 ft³ (0.016 m³)
- WHEN EXTENDED 100%:
0.77 ft³ (0.022 m³)

STORAGE

Store in unopened containers in cool, clean, dry conditions

SHELF LIFE

- 50 LB BAGS:
1 year when properly stored
- 2,500 LB BULK BAGS:
6 months when properly stored

VOC CONTENT

0 g/L less water and exempt solvents

DESCRIPTION

MasterEmaco T 1061 is a one-component, shrinkage-compensated, cement-based mortar with an extended working time. It is designed for repairing horizontal concrete surfaces. MasterEmaco T 1061DR is a reduced dust version available separately.

PRODUCT HIGHLIGHTS

- Extended working time
- Extra low permeability helps minimize chloride intrusion
- Rapid-setting for quick turn-around repairs
- Low residual moisture, can be coated in as little as 6 hours
- Excellent resistance to freeze/thaw cycling
- Shrinkage compensated, minimizing cracking from drying shrinkage, reducing stress at the bond line
- Can be placed neat up to 2" (50 mm) thickness
- Can be extended up to 100% by weight, providing higher yields
- Proprietary cement blend bonds to carbonated and noncarbonated concrete substrates

APPLICATIONS

- Interior and exterior
- Horizontal surfaces
- Applications requiring high early-strength gain
- Structural concrete repairs
- Partial and full-depth repairs

SUBSTRATES

- Concrete

HOW TO APPLY

SURFACE PREPARATION CONCRETE

1. Substrate must be structurally sound and fully cured (28 days).
2. Saw cut the perimeter of the area being repaired into a square with a minimum depth of ½" (13 mm).
3. Refer to current ICRI Guideline no. 310.2R for surface prep requirements to permit proper bond.

REINFORCING STEEL

1. Remove all oxidation and scale from the exposed reinforcing steel in accordance with ICRI Technical Guideline No. 310.1R.
2. For additional protection from future corrosion, coat the prepared reinforcing steel with MasterProtect P 8100 AP.

Technical Data

Composition

MasterEmaco T 1061 is a proprietary blend of cement, graded aggregate, shrinkage-compensating agents, and set-control additives.

MasterEmaco T 1061DR is a proprietary blend of cement, graded aggregate, shrinkage-compensating agents, set-control and dust reducing additives.

Compliances

- ASTM C 928

Test Data

The following results were obtained with a water / powder ratio of 5.5 pints (2.6 L) of water to 50 lbs (22.7 kg) of MasterEmaco T 1061 and MasterEmaco T 1061DR at 73 °F (23 °C).

PROPERTY	RESULTS	TEST METHOD
Fresh wet density, lb/ft³ (kg/m³)	130 (2,082)	ASTM C 138
Set time, min, at 72 °F (22 °C)		ASTM C 191
Initial	50	
Final	80	
Working time, min	25	
Length change, % (µstrain)		ASTM C 928
Drying shrinkage	-0.05 (-500)	
Wetting expansion	+0.03 (+300)	
Coefficient of thermal expansion, in/in/°F (cm/cm/°C)	6.8 x 10 ⁻⁶ (12.6 x 10 ⁻⁶)	CRD C 39
Modulus of elasticity, psi (GPa)	4.6 x 10 ⁶ (32)	ASTM C 469
Rapid chloride permeability, coulombs	< 300	ASTM C 1202
Freeze/thaw resistance, % RDM, at 300 cycles	100	ASTM C 666, (Procedure A)
Scaling resistance, at 25 cycles	0 rating; no scaling	ASTM C 672

3 hr	3,000 (21)	
1 day	4,000 (28)	
28 days	8,000 (55)	
Compressive strength, psi (MPa), 3 by 6" cylinders, at 28 days	7,400 (51)	ASTM C 39
Dust Reduction, %		
MasterEmaco T 1061DR vs. control	75%	DIN 55992-2

¹No bonding agent used; mortar scrubbed into substrate.

All application and performance values are typical for the material, but may vary with test methods, conditions, and configurations

MIXING

1. Precondition material to 70 °F ±5° (21 °C ±3°) before mixing.
2. Add 5½ pints (2.6 L) of potable water to the mixing container for each bag of MasterEmaco T 1061. If required, add the correct amount of aggregate to the mixer. Add the powder to the water while continuously mixing with a slow-speed drill and paddle, mortar mixer, or other forced action mixer.
3. Mix for a minimum of 3 minutes until fully homogeneous.

AGGREGATE EXTENSION

1. For repair areas 2–4" (51–102 mm) in depth, the minimum recommended addition is 15–25 lbs (6.8–11.4 kg) of ¾" (10 mm) washed, graded, rounded, SSD, low-absorption, high-density aggregate per 50 lb (22.6 kg) bag.
2. For areas greater than 4" (102 mm) in depth, the minimum recommended addition is 25–50 lbs (11.4–22.6 kg) of ¾" (10 mm) washed, graded, rounded, SSD, low-absorption, high-density aggregate per 50 lb bag.
3. The maximum aggregate extension is 50 lbs (22.6 kg) of pea gravel per bag.
4. Aggregate must comply with the requirements of ASTM C 33.

APPLICATION

1. After removing all standing water, thoroughly scrub a thin layer of bond coat into the saturated surface with a stiff-bristled broom or brush. Do not dilute the bond coat with water. Do not apply more of this bond coat than can be covered with mortar before the bond coat dries. Do not retemper the bond coat.
2. Immediately place the repair mortar from one side of the prepared area to the other. Work the material firmly into the bottom and sides of the patch to ensure good bond. Level the MasterEmaco T 1061 and screed it to the elevation of the existing concrete. Apply the appropriate finish.
3. Finish the completed repair, as required, taking care not to overwork the surface.
4. The recommended application range of MasterEmaco T 1061 is from 50 to 85 °F (10 to 29 °C). Follow ACI 305 and 306 for hot or cold weather.
5. A maximum of 25 minutes should be allowed to mix, place, and finish MasterEmaco T 1061 at 70 °F (21 °C).

CURING

Cure with an approved curing compound compliant with ASTM C 309 or preferably ASTM C 1315. Alternative curing options include application of a fine mist of water, wet burlap, or polyethylene sheeting for a minimum of 2 days.

CLEAN UP

Clean tools and equipment with clean water immediately after use. Cured material must be removed mechanically.

FOR BEST PERFORMANCE

- Minimum ambient, surface, and material temperature is 50 °F (10 °C) and rising.
- Do not mix longer than 5 minutes.
- Minimum application thickness is ½" (13 mm).
- Neat MasterEmaco T 1061 can be applied to a minimum of ¼" (6 mm) if intended for use under deck membranes on balconies subject to pedestrian traffic.
- Consult coating supplier for overcoating requirements.
- Do not mix partial bags.
- Do not add plasticizers, accelerators, retarders, or other additives.
- For professional use only; not for sale to or use by the general public.
- Make certain the most current versions of product data sheet and SDS are being used; visit www.master-builders-solutions.com/en-us to verify the most current versions.
- Proper application is the responsibility of the user. Field visits by Master Builders Solutions personnel are for the purpose of making technical recommendations only and not for supervising or providing quality control on the jobsite.

HEALTH, SAFETY AND ENVIRONMENTAL

Read, understand and follow all Safety Data Sheets and product label information for this product prior to use. The SDS can be obtained by visiting www.master-builders-solutions.com/en-us, e-mailing your request to mbsbcst@mbcc-group.com or calling 1(800)433-9517. Use only as directed.

IN CASE OF EMERGENCY: Call CHEMTEL +1 (800) 255-3924 or if outside the US or Canada, +1 (813) 248-0585.

LIMITED WARRANTY NOTICE

Master Builders Solutions Construction Systems US, LLC ("Master Builders") warrants this product to be free from manufacturing defects and to meet the technical properties on the current Technical Data Guide, if used as directed within shelf life. Satisfactory results depend not only on quality products but also upon many factors beyond our control. MASTER BUILDERS MAKES NO OTHER WARRANTY OR GUARANTEE, EXPRESS OR IMPLIED, INCLUDING WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE WITH RESPECT TO ITS PRODUCTS. The sole and exclusive remedy of Purchaser for any claim concerning this product, including but not limited to, claims alleging breach of warranty, negligence, strict liability or otherwise, is shipment to purchaser of product equal to the amount of product that fails to meet this warranty or refund of the original purchase price of product that fails to meet this warranty, at the sole option of Master Builders. Any claims concerning this product must be received in writing within one (1) year from the date of shipment and any claims not presented within that period are waived by Purchaser. MASTER BUILDERS WILL NOT BE RESPONSIBLE FOR ANY SPECIAL, INCIDENTAL, CONSEQUENTIAL (INCLUDING LOST PROFITS) OR PUNITIVE DAMAGES OF ANY KIND.

Purchaser must determine the suitability of the products for the intended use and assumes all risks and liabilities in connection therewith. This information and all further technical advice are based on Master Builders' present knowledge and experience. However, Master Builders assumes no liability for providing such information and advice including the extent to which such information and advice may relate to existing third party intellectual property rights, especially patent rights, nor shall any legal relationship be created by or arise from the provision of such information and advice. Master Builders reserves the right to make any changes according to technological progress or further developments. The Purchaser of the Product(s) must test the product(s) for suitability for the intended application and purpose before proceeding with a full application of the product(s). Performance of the product described herein should be verified by testing and carried out by qualified experts.

FOR PROFESSIONAL USE ONLY. NOT FOR SALE TO OR USE BY THE GENERAL PUBLIC.

MasterSeal[®] Vehicular Traffic 2500

High-solids polyurethane waterproofing, traffic-bearing membrane systems for vehicular areas

FORMERLY CONIPUR[®] II

PACKAGING

- MasterSeal P 255
 - 3.4-gallon (12.9 L) pail
 - 55-gallon (208.2 L) drums
- MasterSeal M 265
 - 4.66-gallon (17.64 L) pail
- MasterSeal TC 275
 - 4.78-gallon (18.1 L) unitized kit
- MasterSeal TC 295
 - Part A: 1.75 gallons (6.62 L) in 6-gallon (22.71 L) pail
 - Part B: 3.5-gallon (13.25 L) pail
- MasterSeal 941 Aggregate
 - 50-lb (22.68 KG) bag
- MasterSeal 941DR Aggregate
 - 50-lb (22.72 KG) bag
- MasterSeal 945 Aggregate
 - 40-lb (18.14 KG) bag

SHELF LIFE

- MasterSeal P 255: 1.25 years
- MasterSeal M 265: 1 year
- MasterSeal TC 275: 1.25 years
- MasterSeal TC 295: 1 year
- MasterSeal 941: 5 years
- MasterSeal 941DR: 5 years
- MasterSeal 945: 5 years

STORAGE

Store in unopened containers in a cool, clean, dry area

YIELD

See preferred MasterSeal Deck Coating Solution for total system yield.

COLORS

- TC 275: Grey, Charcoal & Black
- TC 295: Grey, Charcoal & Tint Base

DESCRIPTION

MasterSeal Vehicular Traffic 2500 is a fluid-applied polyurethane waterproofing system using a fast-setting, two-component reactive curing mechanism. It has very low odor and is VOC compliant.

MasterSeal Vehicular Traffic 2500 is composed of:

- MasterSeal P 255, a two-component, polyurethane-based adhesive primer
- MasterSeal M 265, a two-component, fast-curing polyurethane base coat
- MasterSeal TC 275 – a two-component fast curing aromatic polyurethane top coat
- MasterSeal TC 295 – a high performance, two-component, aliphatic, polyaspartic-modified, high solids, polyurethane waterproofing coating

For projects requiring aggregate, three options are available:

- MasterSeal 941, a hard-wearing, angular aggregate
- MasterSeal 941DR, an aggregate free of respirable crystalline silica
- MasterSeal 945, an aggregate free of respirable crystalline silica for integrated top coats

PRODUCT HIGHLIGHTS

- Two-component system provides faster setting times, even in cooler climates, to help reduce facility downtime
- MasterSeal 945 aggregate is pre-mixed with MasterSeal top coats to reduce labor and material costs
- MasterSeal 941DR aggregate is free of respirable crystalline silica
- Low odor/high solids allow MasterSeal Vehicular Traffic 2500 to be used over or near inhabited structures; Non-flammable and solvent-free
- Seamless waterproof membrane helps protect concrete from freeze/thaw damage; protects occupied spaces below from water damage and has no seams that may result in leaks
- Excellent chloride resistance to protect against chloride intrusion, extending the life of reinforcing steel
- Excellent chemical and chloride resistance helps protect against common parking deck chemicals including gasoline, diesel fuel, oil, alcohol, ethylene glycol, de-icing salt, bleach and cleaning agents as well as chloride intrusion
- Provides skid resistance to increase safety and offers excellent durability and superior abrasion resistance

INDUSTRIES/SECTORS

- Stadiums
- Parking Garages
- Commercial Construction
- Building and Restoration
- Plywood Decks

VOC CONTENT

When components are mixed, MasterSeal components have the following g/L VOC contents less water and exempt solvents:

- MasterSeal P 255 Part A: 10 g/L
- MasterSeal P 255 Part B: 13 g/L
- MasterSeal M 265 Part A: 4 g/L
- MasterSeal M 265 Part B: 5 g/L
- MasterSeal TC 275 Part A: 71 g/L
- MasterSeal TC 275 Part B: 13 g/L
- MasterSeal TC 295 Part A: 20 g/L
- MasterSeal TC 295 Part B: 174 g/L

Technical Data

Composition

MasterSeal Vehicular Traffic 2500 is a two-component polyurethane membrane.

Compliances

- CSA S413
- ASTM C 957

Issued to: BASF Corporation
Product: MasterSeal Traffic 2500

ASTM D 412: Tensile Strength of Top Coat
MasterSeal TC 275 Top Coat: Tensile Strength: 2,600 psi;
Elongation: 26%
MasterSeal TC 295 Top Coat: Tensile Strength: 3,200 psi;
Elongation: 410% Pass ✓

ASTM D 4541: Adhesion of Base Coat
MasterSeal M 265 w/ Primer P 255
Pull-off Adhesion: 400 psi + Pass ✓

ASTM D 4060: Abrasion Resistance of Top Coat
MasterSeal TC 275 Top Coat: Abrasion Resistance:
135 mgms loss – mgms loss/1,000 cycles
MasterSeal TC 295 Top Coat: Abrasion Resistance:
57 mgms loss – mgms loss/1,000 cycles Pass ✓

HOW TO APPLY

SURFACE PREPARATION CONCRETE

1. Concrete must be fully cured (28 days), structurally sound, clean and dry (ASTM D 4263). All concrete surfaces (new and old) must be shot blasted to remove previous coatings, laitance and all miscellaneous surface contamination and to provide profile for proper adhesion. Abrasive shot blasting must occur after concrete repair has taken place. Acid-etching is not permitted. Proper profile should be a minimum of ICRI CSP-3 (as described in ICRI document 03732.) For balconies and other pedestrian areas with limited space or access for shot-blasting, alternative mechanical methods can be used to achieve the recommended surface profile.
2. Repair voids and delaminated areas with Master Builders Solutions branded cementitious and epoxy patching materials. For application when fastturn repairs are required, MasterSeal 350 can be used to repair patches up to 1.5" in depth when used in aggregate slurry mix. Please refer to the MasterSeal 350 Technical Data Guide for proper application techniques.
3. All units must be applied within the specified pot life.

SURFACE PRE-STRIPPING AND DETAILING

1. Pre-stripe with MasterSeal P 255 1" (25 mm) beyond all surfaces that require detail work, using a short-nap roller. Just before application of MasterSeal P 255, remove all dust, dirt and contaminants. Allow MasterSeal P 255 to dry tack-free. On the same day, coat primed surfaces with 25–30 wet mils (0.64–0.77 mm) of MasterSeal M 265. Feather the edges.
2. For non-moving joints and cracks less than 1/16" (1.6 mm) wide, apply 25–30" wet mils (0.64–0.77 mm) pre-stripping of MasterSeal M 265 over cured MasterSeal P 255. Apply the Base Coat to fill and overlap the joint or crack 3" (76 mm) on each side. Feather the edges.
3. Dynamic cracks and joints over 1/16" (1.6 mm) wide must be routed to a minimum of 1/4 by 1/4" (6 by 6 mm) and cleaned. Install bond breaker tape to prevent adhesion to bottom of joint.

Prime joint faces only with MasterSeal P 173 and fill with MasterSeal SL 1™, SL 2™, NP1™ or NP2™. For joints deeper than 1/4" (6 mm), use appropriate backer rod. For cracks, sealant should be flush with the adjacent surface. For expansion joints, sealant should be slightly concave. After the sealant has cured, prime the deck on either side of the sealant with MasterSeal P 255. After the P 255 primer is tack free, apply 25–30 wet mils (0.64–0.77 mm) of MasterSeal M 265 pre-stripping over the cured sealant and MasterSeal P 255, overlap the joint 3" (76 mm) on each side.

4. Sealed joints 1" (25 mm) wide or less can be coated over with the MasterSeal Traffic system. Expansion joints exceeding 1" (25 mm) wide, including the primary wide expansion-joint system, are not to be coated so they can perform independently of the deck coating system.
5. Form a sealant cant into the corner at the junction of all horizontal and vertical surfaces (wall sections, curbs, columns) by priming with MasterSeal P 173 and applying a 1" (25 mm) wide bead of MasterSeal NP 1 or MasterSeal NP 2. Tool to form a 45° cant. Apply masking tape to the vertical surfaces 4–5" (102–127 mm) above the sealant cant to provide a clean termination of the vertical detail coat. After the sealant has cured, prime the deck on either side of the sealant with MasterSeal P 255. Apply 25 wet mils (0.64 mm) of MasterSeal M 265 over the cured cant up to the masking tape and 4" (102 mm) onto deck surface.
6. Where the coating system will be terminated and no wall, joint, or other appropriate break exists, cut a 1/4 by 1/4" (6 by 6 mm) keyway into the concrete. Fill and coat keyway during application of MasterSeal M 265.

UNCOATED METAL SURFACES

Remove dust, debris, and any other contaminants from vent, drain pipe, and post penetrations, reglets and other metal surfaces. Clean surfaces to near white per SSPC-NACE2 and prime immediately with MasterSeal P 173. Provide appropriate cant with MasterSeal NP 1 or MasterSeal NP 2 sealants to eliminate 90° angles.

PLYWOOD

1. All plywood must be smooth-faced, APA-stamped, and exterior grade tongue and groove plywood. Construction must conform to code, but plywood must not be less than 23/32" (18 mm) thick. Plywood spacing and deck construction must follow APA guidelines.
2. Surfaces must be free of contaminants. Priming is not necessary on clean, dry plywood.
3. All seams must be caulked with MasterSeal NP 1 or MasterSeal NP 2 sealants (see Form Nos. 1017906 and 1017911). Prestripe 4–6" (102–152 mm) wide with 25 wet mils (0.6 mm) of Base Coat. Reinforce all seams between plywood sheets and between flashing and the plywood deck by embedding MasterSeal 995 into the pre-stripping.

HOW TO APPLY

COLOR – MasterSeal TC 295 Tint Base

1. All of the 40 standard colors from the MasterSeal Color Portfolio require the use of 2 MasterSeal 900 color packs per 5.25-gallon pail of MasterSeal TC 295 Tint Base.
2. A second aesthetic Top Coat of 10–15 wet mils (0.2–0.4 mm) is required with all Tint Base colors to achieve a uniform appearance.

MIXING – MasterSeal P 255

1. Precondition both A and B components to a temperature of approximately 70 °F (21 °C).
2. Add entire contents of Part A into Part B. Mix components with a slow-speed drill (400–600 rpm, for a minimum of 3 minutes. Scrape down sides and bottom of mixing vessel, then mix again for 2 minutes. Keep the mixing paddle submerged during mixing to avoid adding air into the mixture.

MIXING – MasterSeal M 265

1. Precondition both A and B components to a temperature of approximately 70 °F (21 °C).
2. Add entire contents of Part A into Part B. Mix components with a slow-speed drill (400–600 rpm, for a minimum of 3 minutes. Scrape down sides and bottom of mixing vessel, then mix again for 2 minutes. Keep the mixing paddle submerged during mixing to avoid adding air into the mixture.

MIXING – MasterSeal TC 275 / 295 (Pre-Pigmented)

1. Precondition both A and B components to a temperature of approximately 70 °F (21 °C).
2. Add entire contents of Part A into Part B. Mix components with a slow-speed drill (400–600) rpm, for a minimum of 3 minutes. Scrape down sides and bottom of mixing vessel, then mix again for 2 minutes. Keep the mixing paddle submerged during mixing to avoid adding air into the mixture.

MIXING – TC 295 Tint Base

1. Precondition both A and B components to a temperature of approximately 70 °F (21 °C).
2. Add entire contents of Part B into Part A. Mix components with a slow-speed drill (400–600) rpm, for a minimum of 3 minutes.
3. Transfer entire contents of two (2) pigment cans into MasterSeal TC 295 Tint Base mixed kit. Use a spatula or knife to remove all the pigment from the container. The TC 295 Tint Base Top Coat requires two (2) MasterSeal 900 color paks per 5.25-gallon pail.
4. Scrape down sides and bottom of mixing vessel, then mix again for 2–3 minutes. Keep the mixing paddle submerged during mixing to avoid adding air into the mixture.
5. To ensure consistent color throughout the pail, pour contents into separate container and continue mixing until all Tint Base has dispersed.
6. When using multiple units, all units must be boxed to ensure color consistency.

APPLICATION

MasterSeal Vehicular Traffic 2500 can be installed in several configurations, depending upon the degree of traffic to which the system is exposed. In areas of extreme traffic (turning lanes, pay booths, entrances and exits), apply the Extra Heavy-Duty Traffic System. The following summary briefly describes each configuration. All coverage rates are approximate.

LIGHT TO MEDIUM DUTY TRAFFIC AND PARKING STALLS

MasterSeal TC 275 or TC 295 (15–20 wet mils) with MasterSeal 941/941D or equivalent broadcast and backrolled into the wet top coat

LIGHT-MEDIUM TRAFFIC AND PARKING STALLS

1. Apply MasterSeal P 255 with paint roller or squeegee at a rate of 200–300 ft²/gal.
2. Apply 25 wet mils (0.64 mm) of MasterSeal M 265 with proper notched squeegee at the rate of approximately 55–60 ft²/gal (1.35–1.47 m²/L). Allow base coat to cure 3–4 hours.
3. Apply 15–20 wet mils (0.38–0.51 mm) of MasterSeal TC 275/TC 295 at the rate of 80–100 ft²/gal (1.96–2.45 m²/L).

4A. BROADCAST AND BACKROLL METHOD

Immediately broadcast MasterSeal 941/941DR aggregate or 16–30 mesh, rounded silica sand at the rate of 15–20 lbs/100 ft² (0.75–1.0 kg/m²) into TC275/TC295 and backroll to encapsulate.

4B. INTEGRATED AGGREGATE

After mixing the top coat per instructions, pour half of the mixed material into a second pail. Add 20 lbs of MasterSeal 945 aggregate to one half of the mixed material (2.4 gallons of TC 275 and 2.63 gallons of TC 295). Mix for an additional 3 minutes for uniform consistency. Apply the topcoat at 20 wet mils or 80 sf/gallon with 1/8" notch squeegee. Fully saturate the roller. Backroll with 3/8" nap roller, roll in a crosshatch pattern for equal distribution of aggregate. Repeat for second half of top coat. For vehicular use, a second coat is required. Pail will need to be remixed for 2 minutes after 10 minutes of idle sitting to redistribute the aggregate.

5. Allow minimum curing time of 24–48 hours before allowing vehicular traffic onto the coating. Existing environmental conditions effect the allowable time period.

HEAVY DUTY TRAFFIC SYSTEM

MasterSeal TC 275 or TC 295 at 15–20 wet mils

HEAVY DUTY TRAFFIC SYSTEM

1. Apply MasterSeal P 255 with paint roller or squeegee at a rate of 200–300 ft²/gal.
2. Apply 25 wet mils (0.64 mm) of MasterSeal M 265 with proper notched squeegee at the rate of approximately 55–60 ft²/gal (1.35–1.47 m²/L). Allow base coat to cure 3–4 hours.
3. Apply 12–20 wet mils (0.30–0.51 mm) of MasterSeal TC 275/TC 295 intermediate topcoat using a properly notched squeegee at the rate of approximately 80–130 ft²/gal (1.96–3.19 m²/L). Immediately back roll to evenly level Top Coat. The next step, #4, can utilize either method described in 4A or 4B.

4A. AGGREGATE TO REFUSAL METHOD

Immediately broadcast MasterSeal 941/941DR or equivalent 16–30 mesh, rounded silica sand into the wet coating at the rate of 20–30 lbs per 100 ft² (1.0–1.5 kg/m²). Immediately after the aggregate is broadcast and while the coating is still wet, blow any excess aggregate via a portable blower forward into the wet coating. Do not overapply aggregate; it is acceptable to have localized wet spots in the aggregate surface after completion of this method. This process requires coordination between all members in the work crew. The blower operator, wearing clean spiked shoes, should blow the excess aggregate forward towards the freshly applied and backrolled topcoat. In this method, the coating should not accept additional sand, minimal excess aggregate is on the surface, less aggregate is used and the textured appearance should be fairly uniform.

4B. BROADCAST AND BACKROLL METHOD

Immediately broadcast MasterSeal 941/941DR or equivalent 16–30 mesh, rounded silica sand into the wet coating and backroll to encapsulate the aggregate. Evenly broadcast aggregate at the rate of 15–20 lbs/100ft² (0.75–1.00 kg/m²).

4C. INTEGRATED AGGREGATE

The integrated MasterSeal 945 aggregate is NOT intended for use in heavy-duty traffic systems.

5. Remove all excess or loose aggregate by sweeping or vacuuming
6. Ensure there is no moisture on the surface of the aggregate/membrane before application of topcoat. Apply 15–25 wet mils (0.38–0.64 mm) of MasterSeal TC275/295 at the rate of 60–100 ft²/gal (1.47–2.21 m²/L) using a flat squeegee. Immediately back roll to evenly level topcoat.
7. Immediately broadcast MasterSeal 941/941DR or equivalent at the rate of 3–5 lbs/100 ft² (0.15–0.25 kg/m²). Lightly backroll into top coat.
8. Allow minimum curing time of 24–48 hours before allowing vehicular traffic onto the coating. Existing environmental conditions effect the allowable time period.

EXTRA HEAVY-DUTY TRAFFIC SYSTEM

EXTRA HEAVY TRAFFIC SYSTEM

1. Apply MasterSeal P 255 with paint roller or squeegee at a rate of 200–300 ft²/gal.
 2. Apply 25 wet mils (0.64 mm) of MasterSeal M 265 with a proper notched squeegee at the rate of approximately 55–60 ft²/gal (1.35–1.47 m²/L). Immediately backroll to level base coat. Allow base coat to cure 3–4 hours.
 3. Apply 25 wet mils (6.4 mm) of MasterSeal TC 275/TC 295 intermediate topcoat using a properly notched squeegee at the rate of approximately 55–60 ft²/gal (1.35–1.47 m²/L). Immediately backroll to evenly level topcoat. The next step, #4, can utilize either method described in 4A or 4B.
- 4A. AGGREGATE TO REFUSAL METHOD
Immediately broadcast MasterSeal 941/941DR or equivalent 16–30 mesh, rounded silica

sand into the wet coating at the rate of 20–35 lbs/100 ft² –1.0–1.75 kg/m²). Immediately after the aggregate broadcast and while the coating is still wet, blow any excess aggregate via a portable blower forward into the wet coating. Do not over apply aggregate; it is acceptable to have localized wet spots in the aggregate surface after completion of this method.

This process requires coordination between all members in the work crew. The blower operator, wearing clean spiked shoes, should blow the excess aggregate forward towards the freshly applied and backrolled topcoat. In this method, the coating should not accept additional sand, minimal excess aggregate is on the surface, less aggregate is used and the textured appearance should be fairly uniform.

4B. BROADCAST AND BACKROLL METHOD
Immediately broadcast MasterSeal 941/941DR or equivalent 16–30 mesh rounded silica sand into the wet coating and backroll to encapsulate the aggregate. Evenly broadcast aggregate at the rate of 15–25 lbs/100 ft²/gal (0.75–1.25 kg/m²).

4C. INTEGRATED AGGREGATE

The integrated MasterSeal 945 aggregate is NOT intended for use in extra heavy-duty traffic systems.

5. Remove all excess or loose aggregate by sweeping or vacuuming.
6. Ensure there is no moisture on the surface of the aggregate/membrane before application of topcoat. Apply 15–25 wet mils (0.38–0.64 mm) of MasterSeal TC275/295 at the rate of 60–100 ft²/gal (1.46–2.21 m²/L) using a flat squeegee. Immediately backroll to evenly level topcoat.
7. Immediately broadcast MasterSeal 941/941DR or equivalent at the rate of 3–5 lbs/100 ft² (0.15–0.25 kg/m²). Lightly backroll into top coat.
8. Allow minimum curing time of 24–48 hours before allowing vehicular traffic onto the coating. Existing environmental conditions effect the allowable time period.
9. CAD & PDF deck coatings details are available for download from our website, Master Builders Solutions Customer Support can direct you to the site.

IMPORTANT NOTE: All coverage rates are approximate and may vary due to the application technique used. Coverage rates are affected by substrate texture, choice and distribution of aggregate, intermediate

aggregate load and environmental conditions and application methods and are not under the control of Master Builders Solutions. Ensure that an adequate amount of aggregate is utilized to achieve required slip resistance. Exterior applications must utilize MasterSeal TC 295 at the specified coverage rate of 15–20 wet mils.

MOCKUP

1. Provide mockup of at least 100 ft² (9.3 m²) to include surface profile, sealant joint, crack, flashing and juncture details and allow for evaluation of slip resistance and appearance.
2. Install mockup with specified coating types and with other components noted.
3. Locate where directed by architect.
4. Mockup may remain as part of work if acceptable to architect.

CLEAN UP

Clean all tools and equipment immediately after use with MasterSeal 990 or xylene. Cured material must be removed mechanically.

CURING TIME

Allow curing time of 72 hours before vehicular use and 48 hours before pedestrian use. Extend the curing time in cool-weather conditions. To reduce the time period in which MasterSeal Traffic 2000 might be vulnerable to inclement weather or to reduce the time between coats, use MasterSeal 914.

MAINTENANCE

See MasterSeal Traffic maintenance technical bulletin.

FOR BEST PERFORMANCE

- MasterSeal NP 100 and MasterSeal NP150 should not be used in conjunction with this urethane deck coating system due to potential for curing issues.
- If vapor drive is present or suspected, please consult with your local Master Builders Solutions representative prior to system application.
- MasterSeal P 255, M 265 and TC 275 or TC 295 have very short working times (20 min ± 5) (at 70° F 50% RH). Once the material has been mixed, the coating must be poured onto the surface and applied immediately.

- MasterSeal TC 275 will discolor if exposed to UV light. Where UV resistance is required, the application of TC 295 is recommended.
- Minimum application temperature is 40 °F (4 °C).
- If areas of inadequate slip resistance exist, an additional top coat back rolled with aggregate is required.
- Do not apply to concrete that is outgassing.
- Warm temperatures will shorten working time; plan work accordingly.
- Concrete should have a minimum compressive strength of 3,000 psi (21 MPa) and be cured for a minimum of 28 days.
- Do not apply MasterSeal Vehicular Traffic 2500 to concrete slabs on grade, unvented metal pan decks or split slab applications with a waterproofing membrane between slabs. Contact Master Builders Solutions Technical Services.
- Be sure to allow for movement in the deck by the proper design and use of expansion and control joints.
- Select the proper type and amount of aggregate to achieve desired slip resistance.
- Contact Technical Service when substrates are over 90 °F (32 °C) or under 40 °F (4 °C) or when applying to decks containing between slab membranes.
- The best method to ensure the proper wet film thickness is the use of a grid system. Divide the surface to be coated into grids and calculate the square footage of each. Refer to the coverage chart to determine the quantity of coating needed for each grid to arrive at the required mil thicknesses. For example, one pail of MasterSeal M265 should cover approximately 255–280 ft² or a minimum grid of 16 x 16 ft at 25 wet mils. Verify via site mockup.
- Avoid application when inclement weather is present or imminent.
- Do not apply to damp, wet, or contaminated surfaces.
- Not suitable for use where chained or metalstudded tires will be used.
- Proper application is the responsibility of the user. Field visits by Master Builders Solutions personnel are for the purpose of making technical recommendations only and not for supervising or providing quality control on the jobsite.

- CAD & PDF deck coatings details are available for download from our website, Master Builders Solutions Customer Support can direct you to the site.
- On steep ramps in excess of 15%, contact your local Master Builders Solutions representative. Do not use self-leveling grade product on slopes greater than 15%. Do not coat expansion joints over 1" (25 mm) wide.
- Do not apply use pre-mixed, integrated MasterSeal 945 aggregate in heavy- or extra heavy-duty vehicular applications.

FOR BEST PERFORMANCE: TC 295 TINT BASE ONLY

- Avoid whipping air into Tint Base.
- Mix pigment cans thoroughly into Tint Base.
- Always do a test area to assure acceptable color appearance and slip resistance.
- Do not apply MasterSeal TC 295 Tint Base heavier than the recommended 15–20 mil (0.38–0.51 mm) application.
- Colors exposed to direct sunlight may fade over a period of time. Darker colors potentially fade at an increased rate.
- Aggregate and substrate conditions may affect color and appearance.

HEALTH, SAFETY AND ENVIRONMENTAL

Read, understand and follow all Safety Data Sheets and product label information for this product prior to use. The SDS can be obtained by visiting www.master-builders-solutions.com/en-us, e-mailing your request to mbsbcst@mbcc-group.com or calling 1(800)433-9517. Use only as directed.

IN CASE OF EMERGENCY: Call CHEMTEL +1 (800) 255-3924 or if outside the US or Canada, +1 (813) 248-0585.

LIMITED WARRANTY NOTICE

Master Builders Solutions Construction Systems US, LLC ("Master Builders") warrants this product to be free from manufacturing defects and to meet the technical properties on the current Technical Data Guide, if used as directed within shelf life. Satisfactory results depend not only on quality products but also upon many factors beyond our control.

MASTER BUILDERS MAKES NO OTHER WARRANTY OR GUARANTEE, EXPRESS OR IMPLIED, INCLUDING WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE WITH RESPECT TO ITS PRODUCTS. The sole and exclusive remedy of Purchaser for any claim concerning this product, including but not limited to, claims alleging breach of warranty, negligence, strict liability or otherwise, is shipment to purchaser of product equal to the amount of product that fails to meet this warranty or refund of the original purchase price of product that fails to meet this warranty, at the sole option of Master Builders. Any claims concerning this product must be received in writing within one (1) year from the date of shipment and any claims not presented within that period are waived by Purchaser. MASTER BUILDERS WILL NOT BE RESPONSIBLE FOR ANY SPECIAL, INCIDENTAL, CONSEQUENTIAL (INCLUDING LOST PROFITS) OR PUNITIVE DAMAGES OF ANY KIND.

Purchaser must determine the suitability of the products for the intended use and assumes all risks and liabilities in connection therewith. This information and all further technical advice are based on Master Builders' present knowledge and experience. However, Master Builders assumes no liability for providing such information and advice including the extent to which such information and advice may relate to existing third party intellectual property rights, especially patent rights, nor shall any legal relationship be created by or arise from the provision of such information and advice. Master Builders reserves the right to make any changes according to technological progress or further developments. The Purchaser of the Product(s) must test the product(s) for suitability for the intended application and purpose before proceeding with a full application of the product(s). Performance of the product described herein should be verified by testing and carried out by qualified experts.

FOR PROFESSIONAL USE ONLY. NOT FOR SALE TO OR USE BY THE GENERAL PUBLIC.

MasterSeal[®] 350

Rapid-setting, epoxy-based concrete overlay system

FORMERLY TRAFICGUARD[®] EP35

PACKAGING

- 10 gallon (38 L) kits
- 110 gallon (412 L) kits
- 530 gallon (2006 L) kits

YIELD

Parking Decks: 40 - 60 ft²/gallon
(1.0 - 1.5 m²/L), depending on porosity
and profile of substrate

Bridge Decks: 20 - 40 ft²/gallon
(0.5 - 1.0 m²/L), depending on porosity
and profile of substrate

80 ft²/gallon (1.96 m²/L) as a primer
for epoxy binder

Binder yield varies depending on mix
ratio (aggregate to epoxy) and
aggregate size and gradation.

Mortar Mix Yield: A ratio of
3 GAL Sand + 1 GAL mixed
MasterSeal 350 = 2.8 GAL
mortar mix (650 in³)

STORAGE

Store in unopened containers at 60–
80 °F (16–27 °C) in clean, dry conditions.

SHELF LIFE

2 years when properly stored

VOC CONTENT

0 g/L less water and exempt solvents
when components are mixed and
applied per Master Builders Solutions
instructions

DESCRIPTION

MasterSeal 350 is a rapid-curing, skid-resistant, epoxy-based concrete overlay system. When mixed with aggregate it can be used as a repair mortar.

PRODUCT HIGHLIGHTS

- MasterSeal 940 DR aggregate is free of respirable crystalline silica
- Rapid strength development helps minimize traffic disruption
- Waterproof to prevent chloride ion contamination, freeze-thaw damage and salt scaling
- 90% lighter than typical concrete overlays to limit dead load in suspended structures
- Excellent adhesion to the substrate to prevent delamination and extend surface life
- Skid resistant increasing safety for vehicles and pedestrians
- One to one mix ratio by volume simplifies application
- Durable surface extends service life
- No primer required for faster installation
- 100% solids

APPLICATIONS

- Horizontal surfaces
- Interior and exterior
- Bridge decks
- Steel decks
- Warehouse floors
- Elevated airport runways
- Balconies
- Concrete
- Steel

INDUSTRIES/SECTORS

- Parking structures

HOW TO APPLY

SURFACE PREPARATION

UNCOATED METAL SURFACES
Remove dust, debris and any other
contaminants from vent, drain pipe and post
penetrations, reglets and other metal surfaces.
Clean surfaces to near white per SSPC-NACE2.

CONCRETE

1. Concrete must be fully cured (28 days), structurally sound, clean and dry (ASTM D 4263). All concrete surfaces (new and old) must be shot blasted to remove previous coatings, laitance and all miscellaneous surface contamination and to provide profile for proper adhesion. Abrasive shot blasting must occur after concrete repair has taken place. Acid-etching is not permitted. Proper profile should be a minimum of ICRI CSP-5 (as described in ICRI document 03732.)
2. Repair voids and delaminated areas with Master Builders Solutions branded cementitious and epoxy patching materials. For application when fast-turn repairs are required, MasterSeal 350 can be used to repair patches up to 1.5" in depth when used in aggregate slurry mix. Please refer to the MasterSeal 350 Technical Data Guide for proper application techniques.
3. All units must be applied within the specified pot life.

Technical Data

Composition

MasterSeal 350 is a two component epoxy-based binder.

Compliances

- ASTM C 881

Test Data

PROPERTY	RESULTS	TEST METHOD
Mix ratio , by volume	1 to 1	
Viscosity, poise , at 75 °F (24 °C); #3 spindle at 20 rpm	20–25	ASTM D 2393
Gel time , min, at 72 °F (22 °C); (Modified to test 70 g sample)	15–20	ASTM C 881
Compressive strength , psi (MPa)		ASTM D 695
24 hrs	4,000–4,500	
7 days	6,500–7,000	
Compressive strength , psi (MPa) Mixed with aggregate		ASTM C 579
3 hrs	3,000–3,500	
24 hrs	5,000–5,500	
Modulus of Elasticity in Compression , psi (MPa)	1.21 x 10 ⁶ (834)	ASTM C 695
Tensile strength , psi (MPa), at 7 days	6,525	ASTM D 638
Tensile elongation , %, at 7 days	>30	ASTM D 638
Adhesion Pull Test 24 hrs	>536 psi (break in concrete)	ASTM D 7234 (ACI 503 Appendix A)
Hardness Shore D @ 7 days	62	ASTM D 2240
Abrasion - Taber 1000 cycles - CS 17 wheel	70 mg (neat) 77 mg (with aggregate)	ASTM D 4060
Thermal compatibility , 5 cycles Modified: 8 hours @ 60 °C plus 16 Hours @ -21 °C	Pass	ASTM C 884
Water absorption , % 24 hrs	0.02	ASTM D 570
Rapid Chloride Permeability Chloride ion penetration @ 28 days	0 negligible	ASTM C1202 (AASHTO T277)

All application and performance values are typical for the material, but may vary with test methods, conditions, and configurations.

MIXING

1. Thoroughly mix each separate component for 2–3 minutes.
2. Mix Part A (resin) and Part B (hardener) in the proper ratio (1:1 by volume), using a slow-speed drill (500 rpm) and paddle for 2–3 minutes.
3. Because of the quick cure rate of this product, do not mix more material than can be applied within the pot life of 15–25 minutes at 75°F (24°C). Elevated temperatures decrease pot life, and reduced temperatures increase pot life.
4. The maximum recoat window for additional coats of MasterSeal 350 is 24 hours.

BROADCAST-AGGREGATE METHOD PARKING DECKS

1. Spread the mixed MasterSeal 350 onto the substrate with a notched squeegee at a rate of 60 ft²/gallon (1.0 m²/L). Place the epoxy to permit a continuous operation by applying the second mix immediately behind the first mix.
2. Begin the aggregate broadcast immediately, but stop to maintain a wet edge. Broadcast MasterSeal 940 Aggregate #9 or 940 DR Aggregate to complete saturation (approximately 1.1 lb/ft² (5.4 kg/m²). If wet spots develop, immediately broadcast additional aggregate until a dry surface is reestablished.
3. Apply the second coat in the same manner described above at a rate of 40–60 ft²/gal. The maximum recoat window is 24 hours.

BRIDGE DECKS

1. Spread the mixed MasterSeal 350 onto the substrate with a notched squeegee at a rate of 40 ft²/gal (1.0 m²/L) or 2.5 gallons per 100 ft². Place the epoxy to permit a continuous operation by applying the second mix immediately behind the first mix.
2. Begin the aggregate broadcast immediately, but stop to maintain a wet edge. Broadcast MasterSeal 940 Aggregate #9 or 940 DR Aggregate to complete saturation (approximately 1.1 lb/ft² (5.4 kg/m²). If wet spots develop, immediately broadcast additional aggregate until a dry surface is reestablished.
3. Apply the second coat in the same matter but at a rate of 20 ft²/gal (.05 m²/L) or 80 mils. The maximum recoat window is 24 hours.

EPOXY MORTAR

1. Mix the two components of MasterSeal 350 using the recommended procedures under the Mixing section.
2. Slowly add up to five parts by volume of oven-dried sand to one part of mixed epoxy.
3. For larger applications, a paddle-type (mortar) mixer may be used. However, the A and B components must first be mixed together using a slow-speed drill as outlined previously.
4. Prime the area to receive the epoxy mortar using neat resin (parts A and B mixed but with no aggregate). Some applications, e.g., paving dams, will require forming to prevent the material from slumping into the joint.
5. Place the epoxy mortar into the repair area and level with a trowel or float. Excess working of the surface will bring resin to the top, which will create a slick finish when cured. To prevent this, broadcast aggregate to refusal onto leveled surface.
6. Allow time for sufficient curing before removing forms, if applicable.
7. When using the MasterSeal 350 as a binder in this method, the mortar should be placed at no more than 1½" maximum depth.
8. Allow a minimum cure time of 6 hrs at 70°F (21°C). for MasterSeal 350 before allowing vehicular traffic.

AGGREGATE

MasterSeal 940/940 DR Aggregate is recommended with MasterSeal 350 polymer concrete overlay. MasterSeal 940/940 DR Aggregate is a hard-wearing, angular, dark-gray aggregate.

MasterSeal 940 Aggregate #9 is a coarse aggregate.

Alternatively, an angular shaped silica or basalt aggregate may be used. The aggregate shall be an angular-shaped silica with Mohs scale hardness of 7 or greater or basalt with a hardness of 6 or greater. The alternate aggregate must be clean, dry (less than 0.2% moisture), and conform to the following gradation.

PERCENT, BY WEIGHT, PASSING IN INDICATED
U.S. STANDARD-SIEVE SERIES

COARSE AGGREGATE				
Sieve #	4	8	16	30
% Passing	100	30–75	0–5	0–1

CLEANUP

Cleanup tools with xylene immediately after use.

FOR BEST PERFORMANCE

- Minimum application temperature is 50 °F (10 °C) and rising. Contact Technical Service when temperatures are above 90 °F (32 °C)
- Precondition all components to 70 °F (21 °C) for 24 hours before using.
- Do not apply when rain is expected within 12 hours.
- Finished product is a vapor barrier and should not be applied to on-grade slabs subject to exterior service conditions or other structures where moisture-vapor transmission is a concern.
- Do not use neat (without aggregate).
- Proper application is the responsibility of the user. Field visits by Master Builders Solutions personnel are for the purpose of making technical recommendations only and not for supervising or providing quality control on the jobsite.
- The MasterSeal 350 topcoat is a rigid epoxy material and may crack due to substrate flex and movement under the membrane system. Do not install it over moving joints.

HEALTH, SAFETY AND ENVIRONMENTAL

Read, understand and follow all Safety Data Sheets and product label information for this product prior to use. The SDS can be obtained by visiting www.master-builders-solutions.com/en-us, e-mailing your request to mbsbscst@mbcc-group.com or calling 1(800)433-9517. Use only as directed.

IN CASE OF EMERGENCY: Call CHEMTEL +1 (800) 255-3924 or if outside the US or Canada, +1 (813) 248-0585.

LIMITED WARRANTY NOTICE

Master Builders Solutions Construction Systems US, LLC ("Master Builders") warrants this product to be free from manufacturing defects and to meet the technical properties on the current Technical Data Guide, if used as directed within shelf life. STORAGE

Store in unopened containers in a cool, clean, dry area. Do not open containers until ready for use.

SHELF LIFE

PARTS A AND B

1 year when properly stored

MASTERSEAL 900 COLOR PACKS

5.5 years

MIXED VOC CONTENT

When mixed, product contains less than 19 g/L less water and exempt solvents

DESCRIPTION

MasterSeal NP 2 is a multi-component, highly flexible, non-priming, high performance polyurethane sealant. It has been successfully tested for joint movement of 50%. It can be tinted to multiple colors.

PRODUCT HIGHLIGHTS

- Movement capability of 50% adds protection against unanticipated movement
- Weather resistant for long-lasting weathertight seals
- Easy to gun and tool to speed up application and make neater joints
- MasterSeal 905 accelerator available for use in cold climate applications to help speed initial cure
- No primer required for most construction materials, lowering installation costs
- Wide temperature application range makes MasterSeal NP 2 suitable for all climates
- UL listed; Passes 4-hour, 4-inch, fire and hose stream test when used with Ultra Block or mineral wool
- Suitable for water immersion with documented performance in wet areas
- Chemical cure allows for faster turnaround time
- Bulk packaging results in less waste
- Long pot life provides extended working time
- Formulated to withstand pedestrian and vehicular traffic

APPLICATIONS

- Interior and exterior
- Above and below grade
- Immersed in water
- Expansion joints
- Panel walls
- Precast units
- Aluminum and wood window frames
- Roofing
- Fascia
- Parapets
- Vinyl siding
- Store front assemblies
- Parking structures

HOW TO APPLY

JOINT PREPARATION

1. The product may be used in sealant joints designed in accordance with SWR Institute's Sealants - The Professional's Guide.
2. In optimal conditions, the depth of the sealant should be ½ the width of the joint. The sealant joint depth (measured at the center) should always fall between the maximum depth of ½" and the minimum depth of ¼". Maximum recommended joint width is 3". Refer to Table 1.

Technical Data

Composition

MasterSeal NP2 is a multi-component polyurethane product.

Compliances

- ASTM C 920, Type M, Grade NS, Class 25, use NT, T, A, M, O* and I
- Federal Specification TT-S-00227E, Type II, Class A
- Corps of Engineers CRD-C-506
- Canadian Standards Board CAN/CGSB-19.24-M90, Classification MCG-2-40-A-N, No. 81029
- CFI accepted
- Underwriters Laboratories Inc.® classified (fire resistance only).

* Refer to substrates in Where to Use.

13	–	–	–	–	4.1	3.5	3.0	2.2	1.5	0.7

- In deep joints, the sealant depth must be controlled by closed cell backer rod or soft backer rod. Where the joint depth does not permit the use of backer rod, a bond breaker (polyethylene strip) must be used to prevent three-point bonding.
- To maintain the recommended sealant depth, install backer rod by compressing and rolling it into the joint channel without stretching it lengthwise. Closed cell backer rod should be about 1/8" (3 mm) larger in diameter than the width of the joint to allow for compression. Soft backer rod should be approximately 25% larger in diameter than the joint width. The sealant does not adhere to it, and no separate bond breaker is required. Do not prime or puncture the backer rod.

SURFACE PREPARATION

Substrates must be structurally sound, fully cured, dry and clean. Substrates should always be free of the following: dirt, loose particles, oil, grease, asphalt, tar, paint, wax, rust, waterproofing or curing and parting compounds, membrane materials and sealant residue.

CONCRETE, STONE, AND OTHER MASONRY

Clean by grinding, sandblasting or wire brushing to expose a sound surface free of contamination and laitance.

WOOD

New and weathered wood must be clean, dry and sound. Scrape away loose paint to bare wood.

Any coatings on wood must be tested to verify adhesion of sealant or to determine an appropriate primer.

METAL

Remove scale, rust and loose coatings from metal to expose a bright white surface. Any coatings on metal must be tested to verify adhesion of sealant or to determine an appropriate primer.

PRIMING

- MasterSeal NP2 is considered a non-priming sealant, but special circumstances or substrates may require a primer. It is the user's responsibility to check the adhesion of the cured sealant on typical test joints at the project site before and during application. Refer to product data sheet on MasterSeal P173 and MasterSeal P176, and consult Technical Service for additional information.
- For immersion applications, MasterSeal P173 must be used.
- Apply primer full strength with a brush or clean cloth. A light, uniform coating is sufficient for most surfaces. Porous surfaces require more primer; however, do not over-apply.
- Allow primer to dry before applying MasterSeal

NP2. Depending on temperature and humidity, primer will be tack-free in 15–20 minutes. Priming and sealing must be done on the same day.

MIXING

- MasterSeal NP2 is a multi-component system with a configuration of Part A, Part B and a color pack.
- Transfer entire contents of Part B to Part A container using a spatula or margin trowel.
- Part B must be mixed thoroughly with Part A. Before adding pigment, scrape sides of container to ensure complete mixing of Parts A and B. With a slow-speed drill and a sealant mixing paddle, mix 4–6 minutes. Keep the paddle blade below the surface of the sealant to avoid whipping air into the sealant.
- Transfer the entire contents of one MasterSeal 900 pigment can into the mixed Part A and B. Use a spatula or knife to remove all the pigment from the container. Continue mixing with a slow-speed drill and slotted paddle until color is uniform. During the process, scrape the sides and bottom of the mixing container several times to obtain a complete mix.
- The pot life of mixed MasterSeal 905 accelerator is influenced by temperature. See Table 2 for specific data. MasterSeal 905 accelerator may be added to adjust the initial cure rate.

APPLICATION

1. Except when unusual job conditions dictate the use of knife or spatula, apply MasterSeal NP 2 by professional bulk gun loaded at the jobsite. Fill joints from the bottom up to the exterior face by holding a properly sized nozzle against the joint bottom.
2. Dry tooling is recommended. Proper tooling results in the correct bead shape, neat joints, and optimal adhesion.
3. Best practices dictate that all caulking and sealing be done when temperatures are above 40 °F (4 °C) to avoid application to moisture-laden surfaces. Moisture on substrates will adversely affect adhesion.
4. Application may proceed as low as 40 °F (4 °C) if there is certainty that substrates are completely dry, free of moisture and clean as described under Surface Preparation.

CURING

The cure of MasterSeal NP 2 varies with temperature and humidity. The following times assume 75 °F (24 °C), 50% relative humidity, and a joint 1/2" (13 mm) in width by 1/4" (6 mm) in depth.

- Skins: within 3–4 hours
- Full cure: approximately 1 week

See Table 2 for use of MasterSeal 905 accelerator.

CLEAN UP

Immediately after use and before sealant has cured, clean equipment with MasterSeal 990 or xylene. Cured sealant may be removed by cutting with a sharp-edged tool. Remove thin films by abrading.

FOR BEST PERFORMANCE

- Pursuant to accepted industry standards and practices, using rigid paints and/or coatings over flexible sealants can result in a loss of adhesion of the applied paint and/or coating, due to the potential movement of the sealant. However, should painting and/or coating be desired, it is required that the applicator of the paint and/or coating conduct on-site testing to determine compatibility and adhesion.

- Do not allow uncured MasterSeal NP 2 to come into contact with alcohol-based materials or solvents.
- Do not use as a cap, heel or toe bead for exterior glazing.
- Do not apply polyurethane sealants in the vicinity of uncured silicone sealants or uncured MasterSeal NP 150™.
- MasterSeal NP 2 should not come in contact with oil-based caulking, silicone sealants, polysulfides or fillers impregnated with oil, asphalt or tar.
- Do not apply epoxy-based coatings in the vicinity of uncured MasterSeal NP 2.
- Do not apply to freshly treated wood; treated wood must have weathered for at least 6 months.
- Do not open containers until ready for use.
- Units are premeasured; do not use partial units.
- MasterSeal NP 2 may yellow in the presence of unvented artificial heat; this is a surface phenomenon that does not affect sealant performance.
- When MasterSeal NP 2 is used in areas subject to continuous water immersion, cure for 14 days at 70 °F (23 °C). Allow longer cure times at lower temperatures. Always use Master Seal P 173.
- Do not use in swimming pools, or on other submerged conditions where the sealant will be exposed to strong oxidizers. Avoid submerged conditions where water temperatures will exceed 120 °F (50 °C).
- Horizontal joints subject to traffic or intermittent ponding of water require the use of primer. Call Technical Service for details.
- Substrates such as copper, stainless and galvanized steel typically require the use of a primer; MasterSeal P 173 or MasterSeal P 176 are acceptable. For Kynar coatings, use MasterSeal P 173 only. An adhesion test is recommended for any other questionable substrate.
- Use only MasterSeal 900 color packs designed for use with MasterSeal NP 2.
- Proper application is the responsibility of the user. Field visits by Master Builders Solutions personnel are for the purpose of making technical recommendations only and not for

supervising or providing quality control on the jobsite.

HEALTH, SAFETY AND ENVIRONMENTAL

Read, understand and follow all Safety Data Sheets and product label information for this product prior to use. The SDS can be obtained by visiting www.master-builders-solutions.com/en-us, e-mailing your request to mbsbscst@mbcc-group.com or calling 1(800)433-9517. Use only as directed.

IN CASE OF EMERGENCY: Call CHEMTEL +1 (800) 255-3924 or if outside the US or Canada, +1 (813) 248-0585.

LIMITED WARRANTY NOTICE

Master Builders Solutions Construction Systems US, LLC (“Master Builders”) warrants this product to be free from manufacturing defects and to meet the technical properties on the current Technical Data Guide, if used as directed within shelf life. Satisfactory results depend not only on quality products but also upon many factors beyond our control. MASTER BUILDERS MAKES NO OTHER WARRANTY OR GUARANTEE, EXPRESS OR IMPLIED, INCLUDING WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE WITH RESPECT TO ITS PRODUCTS. The sole and exclusive remedy of Purchaser for any claim concerning this product, including but not limited to, claims alleging breach of warranty, negligence, strict liability or otherwise, is shipment to purchaser of product equal to the amount of product that fails to meet this warranty or refund of the original purchase price of product that fails to meet this warranty, at the sole option of Master Builders. Any claims concerning this product must be received in writing within one (1) year from the date of shipment and any claims not presented within that period are waived by Purchaser. MASTER BUILDERS WILL NOT BE RESPONSIBLE FOR ANY SPECIAL, INCIDENTAL, CONSEQUENTIAL (INCLUDING LOST PROFITS) OR PUNITIVE DAMAGES OF ANY KIND.

Purchaser must determine the suitability of the products for the intended use and assumes all risks and liabilities in connection therewith. This information and all further technical advice are based on Master Builders’ present knowledge and experience. However, Master Builders assumes no liability for providing such information and advice including the extent to which such information and advice may relate to existing third party intellectual property rights, especially patent rights, nor shall any legal relationship be created by or arise from the provision of such information and advice. Master Builders reserves the right to make any changes according to technological progress or further developments. The Purchaser of the Product(s) must test the product(s) for suitability for the intended application and purpose before proceeding with a full application of the product(s). Performance of the product described herein should be verified by testing and carried out by qualified experts.

FOR PROFESSIONAL USE ONLY. NOT FOR SALE TO OR USE BY THE GENERAL PUBLIC.

**(PRIOR TO BID OPENING – MINIMUM OF (5) WORKING DAYS PRIOR TO RECEIPTS
OF BIDS)**

SECTION 00 63 25

SUBSTITUTION REQUEST FORM

(Prior to Bid Opening – minimum of (5) working days prior to receipts of Bids)

To:	City Project Manager, City of Goleta	
Project:		
Contractor		
Subcontractor/ Supplier		
Drawing Sheet Reference/ Detail No:		
The undersigned Contractor hereby submits for consideration the following equipment instead of the specified item for the above Project:		
Section	Paragraph	Specified Item
Proposed Substitution:		
The Contractor must include all information required under Section 01 60 00 (Products, Materials, Equipment & Substitutions).		
The undersigned has (a) attached manufacturer’s literature, including complete technical data and laboratory test results, if applicable, (b) attached an explanation of why proposed substitution is a true equivalent to specified item, (c) included complete information on changes to Contract Documents that the proposed substitution will require for its proper installation, and (d) filled in the blanks below:		
A. Does the substitution affect dimensions shown on Drawings?		
B. Are the manufacturer’s guarantees and warranties on the proposed substitution items identical to those on the specified items? If there are differences, please specify each and every difference in detail.		
C. What effect does the substitution have on other contractors, trades, or suppliers?		

D. What are the differences between the proposed substitution and the specified item? If proposed substitution has a color or pattern, provide a color board showing proposed substitution in relation to the other adjacent colors and patterns.	
E. Will granting the requested substitution cause any schedule delay? (If yes, please explain)	
Submitted By:	
The undersigned Contractor certifies that the function, appearance, and quality of the proposed substitution are equivalent or superior to those of the specified item.	
Contractor:	
Signature:	
Name:

Received to Late:	
By, City Representative:	
Remarks:	

END OF SECTION – 00 63 25

SECTION 01 10 00

GENERAL REQUIREMENTS

PART 1 – GENERAL

1.01 COORDINATION AND COOPERATION WITH OTHERS

- A. During the course of the work to be performed under this contract, it is expected that public agencies, utility companies, and other contractors will be performing work in the immediate vicinity. The Contractor shall notify the other public agencies, utilities, and contractors affected at least five (5) working days prior to beginning construction. The Contractor under this contract shall schedule his work and coordinate his operation with others so as to minimize conflicts and interference between his operations and those of other contractors.
- B. Agencies that may be performing work in the immediate vicinity may include, but are not limited to:
1. City of Goleta
 2. Goleta Water District
 3. Goleta Sanitary District
 4. Goleta West Sanitary District
 5. Southern California Edison
 6. Southern California Gas
 7. Frontier (Telephone)
 8. AT&T (Telephone)
 9. Mobil Oil Company
 10. Santa Barbara Flood Control District
 11. Cox Communications

1.02 QUALITY CONTROL

- A. The Contractor shall be responsible for verifying all dimensions in the field and shall check all field conditions continuously during construction.
- B. The Contractor shall inspect related and appurtenant work and shall report in writing to the OAR any conditions that may prevent proper completion of the work.
- C. The Work shall be conducted under the general observation of the OAR and shall be subject to intermittent or continuous inspection to assure strict compliance with the requirements of the Contract Documents.

- D. The work hereunder shall be under the general direction of the OAR, acting directly and through his or her authorized representatives. The presence of an inspector, however, shall not relieve the Contractor of the responsibility for the proper execution of the Work in accordance with all requirements of the Contract Documents. Compliance with Contract Documents is distinctly a duty of the Contractor and said duty shall not be avoided by any act or omission on the part of an inspector.
- E. All materials and articles furnished by the Contractor shall be subject to rigid inspection, and no material or articles shall be used in the Work until it has been inspected and accepted by the OAR.
- F. Unless otherwise specified, all sampling and testing shall be in accordance with the methods prescribed in the current standards of the ASTM or other specified published standards, as applicable to the class and nature of the article or materials considered.
- G. Samples and test specimens required under the Contract Documents shall be furnished by the Contractor and prepared for testing in ample time for the completion of the necessary tests and analyses before the subject materials or articles are to be used. The Contractor shall furnish all required test specimens at its own expense. The cost of any test which shows unsatisfactory results shall be borne by the Contractor.
- H. Whenever the Contractor is ready to backfill, bury, cast in concrete, hide, or otherwise cover or make inaccessible any work under the Contract, the Contractor shall notify the OAR not less than 24 hours in advance of beginning any such work so that the required inspections can be scheduled and performed. Failure of the Contractor to notify the OAR at least 24 hours in advance of any such work shall be reasonable cause for the OAR to require sufficient delay in the Contractor's schedule to allow time for such inspections and any remedial or corrective work required. All costs of such delays, including its impact or effect upon other portions of the Work shall be borne by the Contractor.

1.03 TEMPORARY UTILITIES

- A. The Contractor shall provide, at its own expense, all necessary power required for its operations under the Contract, and shall provide and maintain all temporary power lines required to perform the work in a safe and satisfactory manner. All temporary connections for electricity shall be subject to the approval of the OAR and the power company representative, and shall be removed in the like manner at the Contractor's expense prior to final acceptance of the work.
- B. The Contractor shall provide, at its own expense, all necessary water required for construction of the project, including disinfecting of the pipelines, valving, and appurtenances. The Contractor shall not make connection to, or draw water from any fire hydrant or pipeline without first making application for and obtaining a temporary water meter for construction from the Goleta Water District. For each such connection made,

the Contractor shall first attach to the fire hydrant or pipeline a valve, meter, and backflow prevention device of a size and type acceptable to the District. The backflow prevention device shall be tested and certified prior to use of the temporary meter with a copy of the certification provided to the District.

- C. Before final acceptance of the work on the project, all temporary connections and piping installed by the Contractor shall be entirely removed, and all affected improvements shall be restored to their original condition, or better, to the satisfaction of the District and to the agency owning the affected utility

1.04 PROTECTION OF EXISTING FACILITIES

- A. All oil, gasoline, power, telephone, communication, gas, water, irrigation, sewer, and storm drain facilities, both underground and overhead, encountered along the line of the Work shall remain continuously in service during all the operations under the Contract, unless other arrangements satisfactory to the OAR are made with the owner of said facilities.
- B. Prior to any construction in the vicinity of existing underground facilities, the Contractor shall notify the Underground Service Alert agency and the authorized representatives of such utility owners or agencies not less than 3 days nor more than 7 days prior to construction so that a representative of said owners or agencies can be present during such work if they so desire.
- C. The right is reserved to the owners of public utilities and franchises to enter at any time upon any public street, alley, right-of-way, or easement for the purpose of making changes in their property made necessary by the Work of this Contract.
- D. The Contractor shall protect all existing utilities and improvements not designated for removal and shall restore damaged or temporarily relocated utilities and improvements to a condition equal to or better than they were prior to such damage or temporary relocation, all in accordance with requirements of the Contract Documents
- E. The Contractor shall not perform any work that would affect oil, gas, sewer, or water pipelines, telephone, communications, or electric lines, fences or other structures, nor shall the Contractor enter upon the right-of-way involved until notified by the OAR that the necessary authorization has been secured from the proper party. After authorization has been obtained, the Contractor shall give said party due notice of its intention to begin work, and shall give said party convenient access and every facility for removing, shoring, supporting, or otherwise protecting such pipeline, line, or structure, and for replacing same.
- F. Existing utility lines that are discovered during excavation operations shall be protected from damage during excavation and backfilling and, if damaged, shall be immediately repaired by the Contractor. The Contractor shall take all possible precautions for the

- protection of unforeseen utility lines to provide for uninterrupted service and to provide such special protection as may be necessary. When utility lines that are to be removed are encountered, the Contractor shall notify the OAR a sufficient time in advance for the necessary measures to be taken to prevent interruption of service.
- G. In the event that the Contractor damages any existing utility lines that are not shown or the locations of which are not made known to the Contractor prior to excavation, a written report thereof shall be made immediately to the OAR. If directed by the OAR, repairs shall be made by the Contractor under the provisions for changes and extra work contained in the General Provisions. All costs of locating, repairing damage not due to failure of the Contractor to exercise reasonable care, and removing or relocating such utility facilities not shown in the Contract Documents with reasonable accuracy, and for equipment on the project which was actually working on that portion of the work which was interrupted or idled by removal or relocation of such utility facilities, and which was necessarily idled during such work will be paid for as extra work in accordance with the provisions of the General Provisions.
- H. The Contractor shall be responsible for and shall repair all damage caused by its operations even in the event such damage occurs after backfilling or is not discovered until after completion of the backfilling. All repairs to a damaged improvement are subject to inspection and approval by an authorized representative of the improvement owner before being concealed by backfill or other work.
- I. Where the proper completion of the Work requires the temporary or permanent removal and/or relocation of an existing utility or other improvement which is shown, the Contractor, without unnecessary delay, shall temporarily replace or relocate such utility or the facility. Restoration to former location shall be accomplished by the Contractor in a manner that will restore or replace the utility or improvement as nearly as possible to its former locations and to as good or better condition than found prior to removal.
- J. The Contractor shall not destroy, remove, or otherwise disturb any existing survey markers or other existing street or roadway markers without proper authorization. No pavement breaking or excavation shall be started until all survey or other permanent marker points that will be disturbed by the construction operations have been properly referenced for easy and accurate restoration. All survey markers or points disturbed by the Contractor shall be accurately restored by the Contractor at the Contractor's expense after all street or roadway resurfacing has been completed.
- K. All paved areas, including curbs and berms, cut or damaged during construction shall be replaced with similar materials and of equal thickness to match the existing adjacent undisturbed areas, except where specific resurfacing requirements have been called for in the Contract Documents or in the permit of the governing agency. All pavement restoration and other facilities restoration shall be constructed to finish grades compatible with adjacent undisturbed pavement.

- L. Wherever sidewalks, driveways, or private roads have been removed for purposes of construction, the Contractor shall place suitable temporary sidewalks or roadways promptly after backfilling and shall maintain them in satisfactory condition for the period of time fixed by the governing agency before proceeding with the final restoration or, if no such period of times is so fixed, the Contractor shall maintain temporary sidewalks or roadways until the final restoration has been made.

1.05 POTHOLING AND LOCATING EXISTING UNDERGROUND FACILITIES

- A. The Contractor shall notify Underground Service Alert (USA) at least 48 hours in advance of any construction or potholing and make arrangements for the existing utilities to be marked by the affected utility companies.
- B. The Contractor shall verify the exact location, depth, alignment, and grade of all utilities shown on the construction drawings and marked as part of the USA procedure. The Contractor shall make exploratory excavations (potholing) of all utilities that may interfere with the Work. All such exploratory excavations shall be performed as soon as practicable after award of contract and, in any event, a sufficient time in advance of construction to avoid possible delays to the Contractor's work. When such exploratory excavations show the utility location as shown to be in error, the Contractor shall immediately notify the OAR.
- C. **The Contractor shall pothole and locate the existing underground utilities at locations where connections will be made to existing utilities or where proposed facilities cross existing utilities and as shown on the drawings prior to submitting shop drawings.** The Contractor shall submit the pothole data to the OAR for review. The OAR will not review any submittals by the Contractor until the potholing is completed and the pothole data has been submitted to the OAR for review. No extension of time or additional compensation will be made for delays caused by the failure of the Contractor to complete the potholing in a timely manner.
- D. All costs incurred in exposing and locating the existing utilities including all labor, tools, equipment for excavation, backfill and restoring existing surface improvements, shall be borne by the Contractor. The Contractor shall bear the cost of repairing or replacing any existing utility damaged by his potholing work.

1.06 TEMPORARY ENVIRONMENTAL CONTROLS

- A. The use of explosives on the Work will NOT be permitted.

- B. The Contractor shall furnish all labor, equipment, and means required and shall carry out effective measures wherever and as often as necessary to prevent its operation from producing dust in amounts damaging to property, cultivated vegetation, or domestic animals, or causing a nuisance to persons living in or occupying buildings in the vicinity. The Contractor shall be responsible for any damage resulting from any dust originating from its operations. The Contractor's dust abatement measures shall be in accordance with the Santa Barbara County Air Pollution Control District standard dust mitigation measures and any other appropriate agency's dust abatement measures.
- C. During the progress of the Work, the Contractor shall keep the site of the Work and other areas used by it in a neat and clean condition, and free from any accumulation of rubbish. The Contractor shall dispose of all rubbish and waste materials of any nature occurring at the Work site, and shall establish regular intervals of collection and disposal of such materials and waste. The Contractor shall also keep its haul roads free from dirt, rubbish, and unnecessary obstructions resulting from its operations. Disposal of all rubbish and surplus materials shall be off the site of construction in accordance with all applicable laws and regulations.
- D. Fixed or portable chemical toilets shall be provided by the Contractor wherever needed for the use of employees. The Contractor shall establish a regular daily collection of all sanitary and organic wastes. All wastes and refuse from sanitary facilities provided by the Contractor or organic material wastes from any other source related to the Contractor's operations shall be disposed of away from the site in a manner satisfactory to the OAR and in accordance with all applicable laws and regulations.
- E. The Contractor's attention is directed to the Federal Clean Water Act (1977) which requires a Corps of Engineers permit under Section 404 of the Act, for the discharge of one cubic yard or more of any dredged or fill material into "navigable waters" as defined in "Permits for Activities in Navigable Waters or Ocean Waters, Paragraph (d)(2), Federal Register of 25 July 1975, page 3134.
- F. All chemicals used during project construction or furnished for project operation, whether defoliant, soil sterilant, herbicide, pesticide, disinfectant, polymer, reactant or of other classification, shall show approval of either the U.S. Environmental Protection Agency or the U.S. Department of Agriculture. Use of all such chemicals and disposal of residues shall be in strict accordance with the printed instructions of the manufacturer.

1.07 PERMANENT UTILITY SERVICES

- A. Electrical power shall conform to the requirements of the serving utility companies and shall meet with the approval of local, state and national inspecting authorities. The

Contractor shall verify the location of services and the serving utility company requirements.

- B. The Contractor shall apply for permanent electrical service in the name of the City of Goleta, and forward the service application to the General Manager for execution on behalf of the City. The City will pay all connection and cable charges or other charges levied by the utility. The Contractor shall have the sole responsibility for coordinating the service installation to ensure that service is available as required by the Contractor's schedule.
- C. The Contractor shall be responsible for all service charges until the facility is placed into service and final acceptance of the work is made by the City. All service charges, paid by the City prior to acceptance of the facility, will be deducted from the Contractor's progress or final payment.

1.08 ELECTRICAL CONTINUITY TEST OF METAL PIPELINES

- A. All metallic pipelines requiring joint bonding, including mortar lined and coated steel pipe (CML&C), shall be tested for electrical continuity upon completion of construction and prior to acceptance by the Goleta Water District. The Contractor shall pay for retesting of work not conforming to the Specifications and the Contract Drawings.

1.09 COST OF OVERTIME INSPECTION AND OTHER SERVICES

- A. Inspection of the work as well as other required services will be provided between the hours of 7:30 a.m. and 4:00 p.m. on Monday through Friday only except holidays. Any inspections or other services requested by or made necessary as a result of the actions of the Contractor beyond the hours stated above shall be paid for by the Contractor at the prevailing rate of 1-1/2 times the regular hourly rate plus equipment charges.
- B. Inspections or other services requested by or made necessary as a result of the actions of the Contractor on Saturdays, Sundays, or holidays, must be scheduled and approved and paid for by the Contractor in advance, at the prevailing rate for overtime and/or holiday work. The following holidays are observed: New Year's Day, Presidents Day, Memorial Day, Independence Day, Labor Day, Thanksgiving and Christmas. Contact the city or agency for specific dates and days holidays will be observed prior to scheduling any construction operations.
- C. The need for overtime inspection or other services shall be determined by the OAR, and his decision shall be final.

PART 2 – PRODUCTS [NOT USED]

PART 3 – EXECUTION [NOT USED]

PART 4 – MEASUREMENT AND PAYMENT

4.01 MEASUREMENT

- A. All work performed under General Construction Requirements will not be measured for payment unless otherwise stated in the individual sections of these Technical Specifications.

4.02 PAYMENT

- A. Full compensation for work performed under General Requirements shall be considered as included in the contract price paid for the various other items of work and no additional compensation will be allowed therefore unless otherwise stated in the individual sections of these Technical Specifications.

END OF SECTION

SECTION 01 11 00

SUMMARY OF WORK

PART 1 - GENERAL

1.01 SECTION INCLUDES

- A. The furnishing of all labor, materials, equipment, services, and incidentals necessary for Work of the Goleta Train Depot, located at 27 South La Patera Lane Goleta, California 93117, as set forth in the Construction Documents which include, but are not limited to, the Drawings, Addenda and Specifications.

1.02 RELATED REQUIREMENTS:

1. Section 01 12 16: Phasing of the Work.
2. Section 01 23 00: Alternates (Bid Items).
3. Section 01 31 13: Project Coordination.
4. Section 01 32 29: Project Forms.
5. Section 01 32 13: Construction Schedule.
6. Section 01 45 25: Testing, Adjusting, and Balancing for HVAC.
7. Section 01 50 00: Construction Facilities and Temporary Controls.
8. Section 01 71 23: Field Engineering.

PART 2 - PRODUCTS (Not used)

PART 3 - EXECUTION

3.01 USE OF PREMISES

- A. CONTRACTOR shall coordinate Work of all trades, Subcontractors, utility service providers, with CITY and/or Separate Work Contract. CONTRACTOR shall sequence, coordinate, and perform the Work to impose minimum hardship on the operation and use of the existing facilities and/or Project site. CONTRACTOR shall install all necessary protection for existing improvements, Project site, property, and new Work against dust, dirt, weather, damage, vandalism, and maintain and relocate all protection to accommodate progression of the Work.

- B. CONTRACTOR shall confine entrance and exiting to the Project site and/or facilities to routes designated by the OAR.
 - C. CONTRACTOR is advised adjacent Amtrak Station may be in use during performance of the Work. CONTRACTOR shall utilize all available means to prevent generation of unnecessary noise and maintain noise levels to a minimum. When required by the OAR, CONTRACTOR shall immediately discontinue noise-generating activities and/or provide alternative methods to minimize noise generation. CONTRACTOR shall install and maintain air compressors, tractors, cranes, hoists, vehicles, and other internal combustion engine equipment with mufflers, including unloading cycle of compressors. CONTRACTOR shall discontinue operation of equipment producing objectionable noise as required by the OAR.
 - D. CONTRACTOR shall furnish, install, and maintain adequate supports, shoring, and bracing to preserve structural integrity and prevent collapse of existing improvements and/or Work modified and/or altered as part of the Work.
 - E. CONTRACTOR shall secure building entrances, exits, and Work areas with locking devices as required by the OAR.
 - F. CONTRACTOR assumes custody and control of CITY property, both fixed and portable, remaining in existing facilities vacated during the Work.
 - G. CONTRACTOR shall not use or allow anyone other than CITY employees to use facility telephones and/or other equipment, except in an emergency. CONTRACTOR shall reimburse CITY for telephone toll charges originating from the facility except those arising from emergencies or use by CITY employees.
 - H. CONTRACTOR shall protect all surfaces, coverings, materials, and finished Work from damage. Mobile equipment shall be provided with pneumatic tires.
 - I. CONTRACTOR is advised CITY may award Separate Work Contracts at this Project site.
 - J. CONTRACTOR shall not permit the use of portable and/or fixed radio's or other types of sound producing devices including Bluetooth speakers and similar devices.
- 3.02 FURNITURE, FIXTURES AND EQUIPMENT (MATERIALS) OWNER FURNISHED CONTRACTOR INSTALLED (OFCI)
- A. Certain materials identified in the Contract Documents as OWNER Furnished CONTRACTOR Installed, OFCI, will be delivered to the Project site by the CITY.
 - B. If designated in the Contract Documents to be OWNER furnished CONTRACTOR installed, (OFCI), CONTRACTOR shall unload, store, uncrate, assemble, install, and connect OWNER supplied materials.

- C. One-hundred fifty days before the date the CONTRACTOR needs to have the OFCI materials on site, CONTRACTOR shall notify CITY of the scheduled date for needed OFCI materials. Upon delivery to Project site, CONTRACTOR shall store OFCI materials inside rooms and/or protected spaces and will be responsible for security of OFCI materials until Substantial Completion. OAR will sign receipt or bill of lading as applicable.
 - D. CONTRACTOR shall, within ten days after delivery, uncrate and/or unpack OFCI materials in presence of CITY who shall inspect delivered items. CITY shall prepare an inspection report listing damaged or missing parts and accessories. CITY shall transmit one copy of the report to CONTRACTOR. CITY will procure and/or replace missing and or damaged OFCI materials, as indicated in inspection report.
 - E. CONTRACTOR shall install OFCI materials in the locations and orientation as indicated in the Contract Documents. CONTRACTOR shall verify exact locations with OAR before final installation of OFCI materials.
 - F. If required, OAR will furnish setting and or placement drawings for OFCI materials.
 - G. CONTRACTOR shall install OFCI materials by proper means and methods to ensure an installation as recommended by the manufacturer. CONTRACTOR shall furnish and install all necessary fasteners and required blocking to properly install OFCI materials.
 - H. CONTRACTOR shall install OFCI materials with manufacturer recommended fasteners for the type of construction to which the OFCI materials are being fastened and/or anchored.
 - I. CONTRACTOR shall provide final connections of any electrical, signal, gas, water, waste, venting and/or similar items to OFCI materials. CONTRACTOR shall, prior to final connection, verify the operating characteristics of OFCI materials are consistent with the designated supply.
- 3.03 FURNITURE, FIXTURES AND EQUIPMENT (Materials) - OWNER furnished, OWNER installed (OFOI)
- A. Certain materials are identified in the Contract Documents as OWNER Furnished, OWNER Installed (OFOI)
 - B. On dates and during times designated by CITY, CONTRACTOR shall provide clear off-loading, receiving, protected storage, and CITY'S dumpster space areas for the use of CITY or CITY'S third party OFOI installation contractors. At such times, CONTRACTOR shall also make clear routes and access available to all rooms and spaces to receive OFOI materials.

- C. On dates and during times designated by CITY, CONTRACTOR shall provide access to the elevators for use of CITY or CITY’S third party OFOI installation contractors.
- D. CONTRACTOR shall cooperate fully with CITY or CITY’S third part OFOI installation contractors.
- E. CONTRACTOR may be requested by CITY to provide supplemental labor and equipment to support OFOI activities. Such requests must be submitted in accordance with the change order clauses of Contract.
- F. Immediately prior to mobilization of CITY or CITY’S third party OFOI installation contractors, CITY shall document the condition of the Work in areas to be utilized for OFOI activities.
- G. CONTRACTOR shall not be responsible for damage caused by CITY or CITY’S forces. CITY shall document the condition of the Work and report to CONTRACTOR any damage in areas utilized for OFOI activities.

END OF SECTION – 01 11 00

SECTION 01 12 16 PHASING OF THE WORK

PART 1 - GENERAL

1.01 SECTION INCLUDES

- A. Requirements for phasing of Work include logistics, phasing, and completion of designated phases prior to commencement of subsequent phases.

1.02 RELATED REQUIREMENTS

- A. Section 01 11 00: Summary of Work.
- B. Section 01 33 00: Submittal Procedures.
- C. Section 01 31 13: Project Coordination.
- D. Section 01 32 13: Construction Schedule.
- E. Section 01 50 00: Construction Facilities and Temporary Controls.
- F. Section 01 77 00: Contract Closeout.

PART 2 - PRODUCTS (Not used)

PART 3 - EXECUTION

3.01 SUBMITTALS

- A. CONTRACTOR shall submit a Project site logistics plans in accordance with and as required by this Section.

3.02 LOGISTICS

- A. Prior to commencement of Work, CONTRACTOR shall prepare and submit to OAR, a detailed Project site logistic plan, in same size and scale of Drawings, setting forth CONTRACTOR plan of Work relative to following, but not limited to, items:
 - 1 Hauling route shall be in accordance with local ordinances a truck access route to and from Project site.
 - 2. The identification of any overhead wire restrictions for power, street lighting, signal or cable.

3. Local sidewalk access and street closure requirements.
 4. Protection of sidewalk pedestrians and vehicular traffic.
 5. Project site fencing and access gate locations.
 6. Construction parking.
 7. Material staging or delivery areas.
 8. Material storage areas.
 9. Temporary trailer locations.
 10. Temporary service location and proposed routing of all temporary utilities.
 11. Location of temporary or accessible fire protection.
 12. Trash removal and location of dumpsters.
 13. Concrete pumping locations.
 14. Crane locations.
 15. Location of portable sanitary facilities.
 16. Mixer truck wash out locations.
 17. Traffic control signage.
 18. Perimeter and site lighting.
 19. Storm Water Pollution Prevention Plan – SWPPP.
 20. Stockpile or lay down areas.
 21. Security lighting
- B. Revised Project site logistic plan may be required by OAR for separately identified phases of Work as set forth in this Section.
- C. CONTRACTOR is responsible for securing and/or obtaining all approvals and permits from authorities having jurisdiction relative to any activities set forth in Article 3.02.A.

3.03 PHASING OF THE WORK

- A. Project will be constructed in separate Milestone increments, as identified or as described in this Section or Contract Documents. Phasing will also delineate Work to be completed in

each designated phase. Unless otherwise approved or directed by OWNER, each phase shall be completed according to approved Baseline Schedule prior to commencement of next subsequent phase. CONTRACTOR shall incorporate and coordinate Work of Separate Work Contracts relative to this Project into the Phasing and Construction Schedule.

- B. CONTRACTOR shall install all necessary Work for, but not limited to, power, lighting, signal, HVAC, drainage, and plumbing systems in phased Work before completion of designated phase. All valves, pull boxes, stub outs, temporary capping, and other Work necessary for phased completion and operation of all necessary systems shall be provided whether or not such Work is specifically identified in Contract Documents.

3.04 PHASING OF THE WORK – GENERAL

- A. CONTRACTOR shall prepare Construction Schedule in order to complete Work and related activities in accordance with phasing plans on drawings and Amtrak Encroachment Diagram in Appendix “A”. CONTRACTOR shall include all costs to complete all Work within Milestones or Contract Time.
- B. OWNER will be seriously damaged by not having all Work completed within Milestones or Contract Time. It is mandatory Work be complete within Milestones or Contract Time.

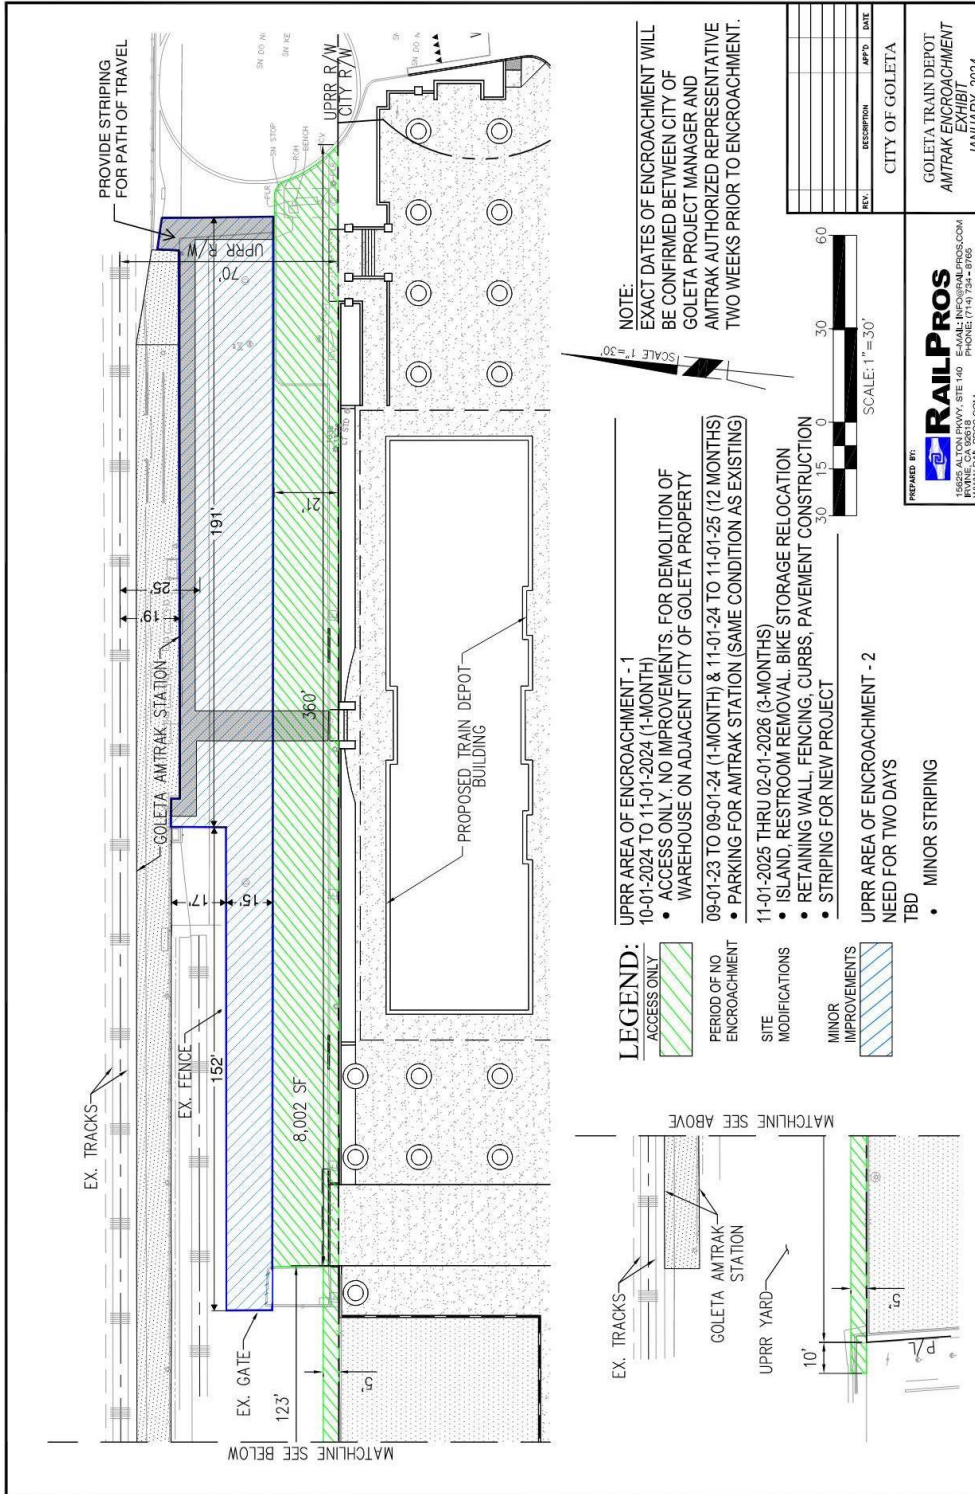

3.05 PHASING OF THE WORK – SPECIFIC

- A. CONTRACTOR shall prepare Construction Schedule, and shall complete following, but not limited to Milestones, as shown in construction phasing drawings (Sheets PH-001 and PH-002) and within designated phases in accordance with following:
1. Phase 0 Procurement – (# of days) calendar days: Offsite preconstruction activities
 - Onsite activities cannot commence until September 1, 2024.
 2. Phase 1 Mobilization – (# of days) calendar days: Milestones 1 & 3.
 - Includes Hazardous Material Mitigation.
 3. Phase 2 Demo and Construction through Substantial Completion – (#days) calendar days: Milestone 2, 4-28.
 - See drawings for Train Depot Sub-Phasing. Twenty-Seven (25 std & 2 ADA) parking stalls shall be maintained for use by Amtrak passengers as either existing or temporary stalls with an accessible path of travel to the existing Amtrak platform ramp for the duration of the project. To be coordinated based upon Amtrak Encroachment Exhibits attached herein as 01 12 16 - Appendix A.
 - South La Patera Lane Improvements
 4. Phase 3 Administrative Closeout – (# of days) calendar days: Milestone 29.
- B. The Contract Time shall be a total of (600 days) calendar days from date of commencement of Contract Time.

END OF SECTION - 01 12 16

APPENDIX A - AMTRAK ENROACHMENT DIAGRAM

SECTION 01 91 13 GENERAL COMMISSIONING REQUIREMENTS

PART 1 - GENERAL

1.01 SUMMARY

- A. General requirements that apply to implementation of commissioning without regard to systems, subsystems, and equipment being commissioned.
- B. Related Sections
 - 1. 23 08 00 HVAC Systems Commissioning
 - 2. 26 08 00 Electrical Systems Commissioning
 - 3. 26 31 00 Photovoltaic System
 - 4. 32 80 00 Planting Irrigation

1.02 DEFINITIONS

- A. BoD: Basis of Design
- B. CxA: Commissioning Authority.
- C. OPR: Owner's Project Requirements
- D. Cx Plan: Commissioning Plan
- E. Systems Subsystems, and Equipment: Where these terms are used together or separately, they shall mean "as-built" systems, subsystems, and equipment.
- F. TAB: Testing, Adjusting, and Balancing.

1.03 LEED ENHANCED AND MONITORING-BASED COMMISSIONING

- A. The project will comply with LEED v4/v4.1 Option 1, Path 2 Enhanced and Monitoring-Based Commissioning, which includes monitoring-based procedures and points to be measured and evaluated to assess performance of energy- and water-consuming systems.

1.04 PROCEDURES FOR COMMISSIONING

- A. Contractor shall provide labor, equipment, and services to place systems and equipment into service. Regular and overtime payrolls and all other contingencies in connection with the checkout and initial operation of equipment shall be included as part of Contractor's lump sum Contract price. Procedures for equipment startup shall conform to manufacturer's procedures submitted.
- B. Owner's representative may observe Contractor's personnel during startup, checkout, and initial operation. Contractor shall provide workers required to make adjustments and correct deficiencies during equipment commissioning and initial operation. It is anticipated that commissioning may be in progress continuously over extended periods of time.
- C. Contractor shall furnish and apply oils, greases, refrigerants, fuels and other lubricants and materials required to place equipment in condition ready for operation and acceptance. Contractor shall provide temporary gauging devices required during checkout and operation of equipment and systems.
- D. After systems have been Functionally Tested to the satisfaction of the CxA, Architect/Engineer, Contractor, and equipment manufacturers, the building will be considered commissioned and ready for operation.

1.05 COMMISSIONING TEAM

- A. Members Appointed by Contractor(s): Individuals, each having authority to act on behalf of the entity he or she represents, explicitly organized to implement the commissioning process through coordinated actions. The commissioning team shall consist of, but not be limited to, representatives of each Contractor, including Project superintendent and subcontractors, installers, suppliers, and specialists deemed appropriate by the CxA.
- B. Members Appointed by Owner:
 - 1. CxA: The designated person, company, or entity that plans, schedules, and coordinates the commissioning team to implement the commissioning process. Owner or Architect will engage the CxA under a separate contract.
 - 2. Representatives of the facility user and operation and maintenance personnel.
 - 3. Architect and engineering design professionals.

1.06 OWNER'S RESPONSIBILITIES

- A. Approve the OPR documentation. The OPR is developed with input from the Owner, Architect and CxA. When completed the OPR is provided to the CxA, Mechanical

- Engineer, Electrical Engineer and the Landscape Architect for use in developing the BoD and Commissioning plan.
- B. Assign operation and maintenance personnel and schedule them to participate in commissioning team activities including, but not limited to, the following:
1. Coordination meetings
 2. Training in operation and maintenance of systems, subsystems, and equipment.
 3. Testing meetings.
 4. Demonstration of operation of systems, subsystems, and equipment.
- C. Approves the BoD documents prepared by the Architect and AE team. Provide BoD to the CxA for use in developing the commissioning plan, Pre-functional checklists, Functional Tests, training documentation forms.

1.07 CONTRACTOR'S RESPONSIBILITIES

- A. Provide utility services required for the commissioning process.
- B. Each Contractor shall assign representatives with expertise and authority to act on behalf of the Contractor and schedule them to participate in and perform commissioning team activities including, but not limited to the following:
1. Participate in construction-phase coordination meetings.
 2. Participate in maintenance orientation and inspection.
 3. Participate in operation and maintenance training sessions.
 4. Participate in final review at acceptance meeting.
 5. Certify all Pre-Functional check lists and complete and provided to the CxA before Functional Testing starts.
 6. Certify that work is complete and systems are operational according to the Contract Documents, including calibration of instrumentation and controls.
 7. Evaluate performance deficiencies identified in test reports and, in collaboration with entity responsible for system and equipment installation, recommend and take corrective action.

8. Participate in Enhanced and Monitoring Based Commissioning, including participation of reviewing building operations 10 months after substantial completion.
- C. Subcontractors shall assign representatives with expertise and authority to act on behalf of subcontractors and schedule them to participate in and perform commissioning team activities including, but not limited to, the following:
1. Participate in construction phase coordination meetings.
 2. Participate in maintenance orientation and inspection.
 3. Participate in procedures meeting for testing if required by the CxA.
 4. Provide schedule for operation and maintenance data submittals, equipment startup, and testing to CxA for incorporation into the commissioning plan.
 5. Provide information to the CxA for developing construction-phase commissioning plan.
 6. Participate in training sessions for Owner’s operation and maintenance personnel.
 7. Provide updated Project Record Documents to the CxA as needed.
 8. Gather and submit operation and maintenance data for systems, subsystems, and equipment to the CxA, as specified in Division 01 Section “Operation and Maintenance Data.”
 9. Provide technicians who are familiar with the construction and operation of installed systems and who shall develop specific test procedures and participate in testing of installed systems, subsystems, and equipment.
 10. Videotape and edit training sessions.
 11. Participate in Enhanced and Monitoring Based Commissioning, including participation of reviewing building operations 10 months after substantial completion.
- D. Provide programming of the DDC control system to allow trending and monitoring of HVAC, lighting, and energy values as required for LEED Enhanced and Monitoring-Based Commissioning. Points to be trended and monitored may include, but not be limited to:
1. Temperatures
 2. Pressures

3. CO2 levels
4. Electrical current, voltage, and power to primary equipment
5. Operating status of primary equipment
6. Lighting levels
7. Air flow rates

1.08 CxA's RESPONSIBILITIES

- A. Organize and lead the commissioning team.
- B. Prepare a construction-phase commissioning plan. Collaborate with Contractor and with subcontractors to develop test and inspection procedures. Include design changes and scheduled commissioning activities coordinated with overall Project schedule. Identify commissioning team member responsibilities, by name, firm, and trade specialty, for performance of each commissioning task.
- C. Review and comment on submittals from each Contractor for compliance with the OPR, BoD, Contract Documents, and construction-phase commissioning plan.
- D. Convene commissioning team meetings for the purpose of coordination, communication, and conflict resolution. Discuss progress of the commissioning processes. Responsibilities include arranging for facilities, preparing agenda and attendance lists, and notifying participants. The CxA shall prepare and distribute minutes to commissioning team members and attendees within five workdays of the commissioning meeting.
- E. At the beginning of the construction phase, conduct an initial construction-phase coordination meeting for the purpose of reviewing the commissioning activities and establishing tentative schedules.
- F. Observe and inspect construction and report progress and deficiencies. In addition to compliance with the OPR, BoD, and Contract Documents, inspect systems and equipment installation for adequate accessibility for maintenance and component replacement or repair.
- G. Prepare Project-specific test and inspection procedures and checklists.
- H. Schedule, direct, witness, and document tests, inspections, and systems startup.
- I. Certify date of acceptance and startup for each item of equipment for start of warranty periods.
- J. Review Project Record Documents for accuracy. Request revisions from Contractor to achieve accuracy. Project Record Documents requirements are specified in Division 01 Section "Project Record Documents."

- K. Review and comment on operation and maintenance documentation and systems manual outline for compliance with the OPR, BoD, and Contract Documents. Operation and maintenance documentation requirement are specified in Division 01.
- L. Review operation and maintenance training program, prepared by the sub and approve qualified instructors to conduct operation and maintenance training. Operation and maintenance training is specified in Division 01 and the Cx Plan.
- M. Prepare commissioning reports.
- N. Oversight of Enhanced and Monitoring Based Commissioning.
- O. Assemble the final commissioning documentation as noted in the Cx Plan.

1.09 COMMISSIONING DOCUMENTATION

- A. Index of Commissioning Documents: CxA shall prepare and maintain a Commissioning Notebook as required in the Cx Plan.
- B. OPR: A written document, prepared by Owner, that details the functional requirements of Project and expectations of how it will be used and operated. This document includes Project and design goals, measurable performance criteria, schedules, success criteria, and supporting information.
- C. BoD Document: A document, prepared by Architect and Design team, that records concepts, calculations, decisions, and product selections used to meet the OPR and to satisfy applicable regulatory requirements, standards, and guidelines. The document includes both narrative descriptions and lists of individual items that support the design process.
- D. Commissioning Plan: A document, prepared by CxA, that outlines the documentation requirements of the commissioning process, and shall include, but is not limited to the following:
 - 1. Review of submittals, systems manuals, and other documents and reports. Submittal dates shall include the latest date approved submittals must be received without adversely affecting commissioning plan.
 - 2. Description of the organization and content of commissioning documentation (including systems manual) and a detailed description of documents to be provided along with identification of responsible parties.
 - 3. Identification of systems and equipment to be commissioned.
 - 4. Description of schedules for testing procedures along with identification of parties involved in performing and verifying tests.

Department of Neighborhood Services and Public Safety
GOLETA TRAIN DEPOT PROJECT

5. Identification of items that must be completed before the next operation can proceed.
 6. Description of responsibilities of commissioning team members
 7. Description of observations to be made.
 8. Description requirements for operation and maintenance training, including required training materials.
 9. Schedule for commissioning activities with specific dates coordinated with overall construction schedule.
 10. Identification of installed systems, subsystems, and equipment, including design changes that occurred during the construction phase.
 11. Process and schedule for documenting changes on a continuous basis to appear in Project Record Documents.
 12. Process and schedule for completing pre-start and startup checklists for systems, subsystems, and equipment to be verified and tested.
 13. Update the systems manual with any modifications or new settings, and give the reason for any modifications from the original design.
- E. Enhanced and Monitoring-Based Commissioning Plan: A document, prepared by CxA that shall include, but is not limited to the following:
1. Roles and responsibilities;
 2. Measurement requirements (meters, points, metering systems, data access);
 3. The points to be tracked, with frequency and duration for trend monitoring;
 4. The limits of acceptable values for tracked points and metered values (where appropriate, predictive algorithms may be used to compare ideal values with actual values);
 5. The elements used to evaluate performance, including conflict between systems, out-of-sequence operation of systems components, and energy and water usage profiles;
 6. An action plan for identifying and correcting operational errors and deficiencies;
 7. Training to prevent errors;

8. Planning for repairs needed to maintain performance; and
 9. The frequency of analyses in the first year of occupancy (at least quarterly).
- F. Test Checklists: The CxA, with assistance of Architect, shall develop test checklists for each system, subsystem, or equipment including interfaces and interlocks, and include a separate entry, with space for comments, for each item to be tested. Prepare separate checklists for each mode of operation and provide space to indicate whether the mode under test responded as required. Provide space for testing personnel to sign off on each checklist. Each checklist, regardless of system, subsystem, or equipment being tested, shall include, but not be limited to, the following:
1. Name and identification of tested item.
 2. Test number.
 3. Time and date of test.
 4. Dated signatures of the person performing test and of the witness, if applicable.
 5. Individuals present for test.
 6. Deficiencies, if any.
- G. Pre-Functional checklists shall be completed and signed by General Contractor, Subcontractor(s), Owners representative and provided to the CxA certifying that systems, subsystems, equipment, and associated controls are ready for Functional testing. Completed test checklists signed by the responsible parties shall be given to the CxA.
- H. Test and Inspection Reports: CxA shall record test data, observations, and measurements on test checklists. CxA shall compile test and inspection reports, Functional Tests Checklists and test and inspection certificates and include them in systems manual and commissioning report.
- I. Corrective Action Documents: CxA shall document corrective action taken for systems and equipment that fail tests. Include required modifications to systems and equipment and revisions to test procedures, if any. Retest systems and equipment requiring corrective action and document retest results.
- J. Project Log: CxA shall prepare and maintain a Project/issues log that describes design, installation, and performance issues that are at variance with the OPR, BoD, and Contract Documents. Identify and track issues as they are encountered, documenting the status of unresolved and resolved issues.

K. Commissioning Report: CxA shall document results of the commissioning process including Commissioning Report: CxA shall document results of the commissioning process including any unresolved issues and performance of systems, subsystems, and equipment. The commissioning report shall indicate systems, subsystems, and equipment have been completed and are performing according to the OPR, BoD, and Contract Documents. The commissioning report is described in the Cx Plan:

1. Project/Issues log.
2. Date of Pre-functional checklist completion and any appropriate issues
3. Date of Functional checklist completion and any appropriate issues.

1.10 SUBMITTALS

- A. Commissioning Plan Submittal: CxA shall submit an electronically formatted final commissioning plan to the Architect.
- B. Test Checklists and Report Forms: CxA shall submit sample checklists and forms to each Contractor quality-control manager and subcontractors for review.
- C. Test and Inspection Reports: CxA shall submit test and inspection reports.
- D. Corrective Action Documents: CxA shall submit corrective action documents if any.
- E. Final Commissioning Report Submittal: CxA shall submit electronically formatted final commissioning report to the owner and Architect.

1.11 COORDINATION

- A. Coordinating Meetings: CxA may conduct coordination meetings as needed, of the commissioning team to review progress on the commissioning plan, to discuss scheduling conflicts, and to discuss upcoming commissioning process activities.
- B. Pre-testing Meetings: CxA may conduct pretest meetings of the commissioning team, if necessary, to review startup reports, pretest inspection results, testing procedures, testing personnel and instrumentation requirements, and manufacturers' authorized service representative services for each system, subsystem, equipment, and component to be tested.
- C. Testing Coordination: CxA shall coordinate sequence of testing activities to accommodate required quality-assurance and -control services with a minimum of delay and to avoid necessity of removing and replacing construction to accommodate testing and inspecting.

PART 2 - PRODUCTS

2.01 NOT USED

PART 3 - EXECUTION

3.01 OPERATION AND MAINTENANCE TRAINING REQUIREMENTS

- A. Training Preparation Conference: The General Contractor is responsible to ensure all training of the Owners personnel is accomplished and documented. Before operation and maintenance training, CxA may convene a training preparation conference to include Owner's operation and maintenance personnel, each Contractor, and subcontractors:
1. Review installed systems, subsystems, and equipment.
 2. Review instructor qualifications.
 3. Review instructional methods and procedures.
 4. Review training module outlines and contents.
 5. Review course materials (including operation and maintenance manuals).
 6. Review and finalize training schedule and verify availability of educational materials, instructors, audiovisual equipment, and facilities needed to avoid delays.
 7. For instruction that must occur outside, review weather and forecasted weather conditions and procedures to follow if conditions are unfavorable.

3.02 TRAINING MODULES

- A. Develop an instruction program that includes individual training modules for each system, subsystem, and equipment as specified in the Cx Plan.
- B. Provide a written record of attendees at each training.
- C. Provide a video recording of all training sessions for Owner's Use.

END OF SECTION – 01 91 13

SECTION 01 23 00

ALTERNATES

(Bid Items)

PART 1 - GENERAL

1.01 SECTION INCLUDES:

- A. This Section specifies administrative and procedural requirements governing alternate bid items.

1.02 RELATED REQUIREMENTS:

- A. Section 00 21 13: Instructions to Bidders
- B. Section 00 41 00: Bid and Acceptance Form
- C. Section 01 11 00: Summary of Work.

PART 2 - PRODUCTS (Not applicable)

PART 3 - EXECUTION

3.01 SPECIFIC:

- A. Bid item is an amount proposed by bidder and stated on the Bid and Acceptance Form for certain Work defined in the Bidding Documents that may be added to or deducted from the base bid amount if OWNER decides to accept a corresponding change in either the amount of Work to be completed, the Contract Documents, or in the products, materials, equipment, systems, or installation methods described in the Contract Documents.
 - 1. The amount added or deducted from the base bid is the net addition to or deducted from the base bid to incorporate bid item Work into the Work. Unless noted otherwise, no other adjustments are made to the Contract Amount, Milestones or the Contract Time.

3.02 PROCEDURES:

- A. CONTRACTOR shall modify or adjust affected adjacent Work as necessary to completely and fully integrate OWNER accepted bid item Work.

1. Include as part of each bid item, miscellaneous devices, accessory objects, and similar items incidental to or required for a complete installation whether or not mentioned as part of the bid item.
- B. Accepted bid items are subject to the same terms and conditions as other Work of the Contract Documents.
- C. OWNER reserves the right to accept bid items for a period of ninety days after bid opening date.
- D. Schedule: A schedule of bid items is included at the end of this Section. The Contract Documents referenced in the schedule identify necessary requirements to complete the Work described as specified for each bid item.

3.03 SCHEDULE OF BID ITEMS: (See the Bidding Documents for Additional Information)

- A. Alternate Bid Item 1: Main Entry Paving: Installation of Unit Pavers in lieu of Asphaltic Concrete paving at La Patera Lane turnaround.
- B. Alternate Bid Item 2: Crosswalks Paving: Installation of Unit Pavers in lieu of Asphaltic Concrete paving and standard striping.
- C. Alternate Bid Item 3: Fire Lane Paving: Installation of Unit Pavers in lieu of Decorative Vehicular Concrete paving at west plaza area.
- D. Alternate Bid Item 4: La Patera Improvement Package: Entire South La Patera Lane Improvement Project package.
- E. Alternate Bid Deduct Item 5: La Patera Improvement Package / Deduct from Alternative Bid Item 4 above: Removal of installation of landscape related items identified on landscape (L) sheets and street pole lights identified on electrical (E) sheets. Wiring included but conduits and sleeved not a part of the Alternate Bid Deduct 5.

END OF SECTION – 01 23 00

SECTION 01 25 13

PRODUCT PROCEDURES FOR SUBSTITUTION AND “OR EQUAL”

PART 1 - GENERAL

1.01 SECTION INCLUDES

- A. This Section includes administrative and procedural requirements for handling requests for substitutions and “or equal” submitted pursuant to the General Provisions.

1.02 RELATED REQUIREMENTS

- A. Section 01 31 50: Project Management Control Systems
- B. Section 01 32 29: Project Forms.
- C. Section 01 33 00: Submittal Procedures.
- D. Section 01 60 00: Product Requirements.
- E. Section 01 77 00: Contract Closeout.

1.03 APPLICATION

- A. OAR will review CONTRACTOR proposed changes in products or materials required by the Contract Documents.
 - 1. Substitutions: OAR will consider requests for substitution if a product is no longer manufactured or the OAR and ARCHITECT, after a diligent search have verified that product or material is not available to CONTRACTOR. The following are not considered to be valid requests for substitutions:
 - a. Revisions to the Contract Documents requested by OAR or ARCHITECT.
 - b. Specified options of products included in the Contract Documents.
 - c. Substitutions requested on a “or equal” or “equivalent” basis. This is determined by OAR’s approval and their opinion of a substituted product being the same or better to the product originally specified.
 - 2. “Or Equal”: OAR will consider requests for “or equal” if submitted within the time indicated in Article 6.14 of the General Conditions.

1.04 SUBMITTALS

- A. Transmit submittals as described in related Sections for each request for substitution or “or equal”.

1. Identify the product to be replaced in each request. Include related Specification Section and Drawing number.
2. Provide complete documentation denoting compliance with the requirements for substitutions, and the following information, as appropriate.
 - a. A detailed comparison of significant qualities of the proposed substitution with those specified in the Contract Documents. Significant qualities may include elements, such as performance, weight, size, durability, and visual effect.
 - b. Product Data, including Drawings, descriptions of products, fabrication, and installation procedures.
 - c. Samples, where applicable or requested.
 - d. CONTRACTOR certification the proposed substitution or “or equal” conforms to requirements of the Contract Documents in every respect and is appropriate for the applications indicated.
 - e. CONTRACTOR waiver of rights to an increase in the Contract Amount, Milestones and/or Contract Time.
3. If required, OAR and ARCHITECT will request additional information or documentation for evaluation.
4. ARCHITECT will review requests for substitutions and “or equals” and provide a recommendation to OAR.
5. If ARCHITECT accepts proposed substitutions or “or equals” OAR will forward submittals to the OWNER’s Maintenance and Operations Technical Unit for review. OAR will notify CONTRACTOR of acceptance or rejection of the substitution.
6. Where a proposed substitution or “or equal” involves and/or affects more than one Subcontractor, CONTRACTOR shall ensure each Subcontractor cooperates with the other Subcontractor involved to coordinate the Work, provide uniformity and consistency, and assure compatibility of all products.
7. CONTRACTOR submittal and ARCHITECT review of Shop Drawings, Product Data, material lists or Samples do not constitute an acceptable or valid request for substitutions or “or equals”.

PART 2 - PRODUCTS (Not used)

PART 3 - EXECUTION

END OF SECTION – 01 25 13

SECTION 01 2613

REQUEST FOR CLARIFICATION

PART 1 - GENERAL

1.01 SECTION INCLUDES

- A. Procedure for requesting clarification of the intent of the Contract Documents.

1.02 RELATED REQUIREMENTS

- A. Section 01 11 00: Summary of Work.
- B. Section 01 31 13: Project Coordination.
- C. Section 01 3150: Project Management Control Systems
- D. Section 01 32 13: Construction Schedule.
- E. Section 01 32 29: Project Forms.
- F. Section 01 77 00: Contract Closeout.

PART 2 - PRODUCTS (Not used)

PART 3 - EXECUTION

3.01 PROCEDURE

- A. CONTRACTOR shall prepare a Request for Clarification through the Project Management Control System.
- B. ARCHITECT response is a clarification of the intent of the Contract Documents and does not authorize changes in the Contract Amount, Milestones and/or Contract Time.
- C. A Request for Clarification may be returned with a stamp or notation "Not Reviewed," if:
 - 1. The requested clarification is ambiguous or unclear.
 - 2. The requested clarification is equally available to the requesting party by researching and/or examining the Contract Documents.
 - 3. CONTRACTOR has not reviewed the Request for Clarification prior to submittal.

Department of Neighborhood Services and Public Safety
GOLETA TRAIN DEPOT PROJECT

- D. Allow a minimum of nine days for review and response time, after receipt by ARCHITECT and OAR. CONTRACTOR shall verify and is responsible in verifying ARCHITECT and OAR receipt of a Request for Clarification.
- E. Changes or alterations to the approved drawings or specifications shall be made by means of addenda or change orders as per section 4-338 of the California Building Standards Commission's, California Administrative Code.

END OF SECTION – 01 2613

SECTION 01 29 00

PAYMENT PROCEDURES

PART 1 - GENERAL

1.1 SUMMARY

- A. Section includes administrative and procedural requirements necessary to prepare and process Applications for Payment.
- B. Related Requirements:
 - 1. Document 004373 "Proposed Schedule of Values Form" for requirements for furnishing proposed schedule of values with bid.
 - 2. Section 012100 "Allowances" for procedural requirements governing the handling and processing of allowances.
 - 3. Section 012200 "Unit Prices" for administrative requirements governing the use of unit prices.
 - 4. Section 012600 "Contract Modification Procedures" for administrative procedures for handling changes to the Contract.
 - 5. Section 013200 "Construction Progress Documentation" for administrative requirements governing the preparation and submittal of the Contractor's construction schedule.
 - 6. Section 018113.13 "Sustainable Design Requirements - LEED 2009 for New Construction and Major Renovations" for administrative requirements governing submittal of cost breakdown information required for sustainable design documentation.
 - 7. Section 018113.16 "Sustainable Design Requirements - LEED 2009 for Commercial Interiors" for administrative requirements governing submittal of cost breakdown information required for sustainable design documentation.
 - 8. Section 018113.19 "Sustainable Design Requirements - LEED 2009 for Core and Shell Development" for administrative requirements governing submittal of cost breakdown information required for sustainable design documentation.
 - 9. Section 018113.23 "Sustainable Design Requirements - LEED 2009 for Schools" for administrative requirements governing submittal of cost breakdown information required for sustainable design documentation.
 - 10. Section 018113.14 "Sustainable Design Requirements - LEED v4 BD+C" for administrative requirements governing submittal of cost breakdown information required for sustainable design documentation.
 - 11. Section 018113.17 "Sustainable Design Requirements - LEED v4 ID+C" for administrative requirements governing submittal of cost breakdown information required for sustainable design documentation.

12. Section 018113.43 "Sustainable Design Requirements - ASHRAE 189.1" for administrative requirements governing submittal of cost breakdown information required for sustainable design documentation.
13. Section 018113.53 "Sustainable Design Requirements - Green Globes" for administrative requirements governing submittal of cost breakdown information required for sustainable design documentation.

1.2 DEFINITIONS

- A. Schedule of Values: A statement furnished by Contractor allocating portions of the Contract Sum to various portions of the Work and used as the basis for reviewing Contractor's Applications for Payment.

1.3 SCHEDULE OF VALUES

- A. Coordination: Coordinate preparation of the schedule of values with preparation of Contractor's construction schedule. Cost-loaded Critical Path Method Schedule may serve to satisfy requirements for the schedule of values.
 1. Coordinate line items in the schedule of values with items required to be indicated as separate activities in Contractor's construction schedule.
 2. Submit the schedule of values to Construction Manager at earliest possible date, but no later than seven days before the date scheduled for submittal of initial Applications for Payment.
- B. Format and Content: Use Project Manual table of contents as a guide to establish line items for the schedule of values. Provide at least one line item for each Specification Section.
 1. Identification: Include the following Project identification on the schedule of values:
 - a. Project name and location.
 - b. Owner's name.
 - c. Owner's Project number.
 - d. Name of Architect.
 - e. Architect's Project number.
 - f. Contractor's name and address.
 - g. Date of submittal.
 2. Arrange schedule of values consistent with format of AIA Document G703.
 3. Arrange the schedule of values in tabular form, with separate columns to indicate the following for each item listed:
 - a. Related Specification Section or division.
 - b. Description of the Work.

- c. Name of subcontractor.
 - d. Name of manufacturer or fabricator.
 - e. Name of supplier.
 - f. Change Orders (numbers) that affect value.
 - g. Dollar value of the following, as a percentage of the Contract Sum to nearest one-hundredth percent, adjusted to total 100 percent. Round dollar amounts to whole dollars, with total equal to Contract Sum.
 - 1) Labor.
 - 2) Materials.
 - 3) Equipment.
4. Provide a breakdown of the Contract Sum in enough detail to facilitate continued evaluation of Applications for Payment and progress reports. Provide multiple line items for principal subcontract amounts more than five percent of the Contract Sum.
 5. Provide a separate line item in the schedule of values for each part of the Work where Applications for Payment may include materials or equipment purchased or fabricated and stored, but not yet installed.
 - a. Differentiate between items stored on-site and items stored off-site.
 6. Allowances: Provide a separate line item in the schedule of values for each allowance. Show line-item value of unit-cost allowances, as a product of the unit cost, multiplied by measured quantity. Use information indicated in the Contract Documents to determine quantities.
 7. Purchase Contracts: Provide a separate line item in the schedule of values for each Purchase contract. Show line-item value of Purchase contract. Indicate Owner payments or deposits, if any, and balance to be paid by Contractor.
 8. Overhead Costs, Proportional Distribution: Include total cost and proportionate share of general overhead and profit for each line item.
 9. Overhead Costs, Separate Line Items: Show cost of temporary facilities and other major cost items that are not direct cost of actual work-in-place as separate line items.
 10. Temporary Facilities: Show cost of temporary facilities and other major cost items that are not direct cost of actual work-in-place as separate line items.
 11. Closeout Costs. Include separate line items under Contractor and principal subcontracts for Project closeout requirements in an amount totaling five percent of the Contract Sum and subcontract amount.
 12. Schedule of Values Revisions: Revise the schedule of values when Change Orders or Construction Change Directives result in a change in the Contract Sum. Include at least one separate line item for each Change Order and Construction Change Directive.

1.4 APPLICATIONS FOR PAYMENT

- A. Each Application for Payment following the initial Application for Payment shall be consistent with previous applications and payments, as certified by Construction Manager and paid for by Owner.
- B. Payment Application Times: The date for each progress payment is indicated in the Owner/Contractor Agreement. The period of construction work covered by each Application for Payment is the period indicated in the Agreement.
- C. Payment Application Times: Submit final Application for Payment to Construction Manager by the end of the month. The period covered by each Application for Payment is one month, ending on the last day of the month.
 - 1. Submit draft copy of Application for Payment [**five**] calendar days prior to due date for review by Construction Manager.
- D. Application for Payment Forms: Use AIA Document G702 and AIA Document G703 or as approved by Owner as form for Applications for Payment.
 - 1. Other Application for Payment forms proposed by the Contractor may be acceptable to Construction Manager and Owner. Submit forms for approval with initial submittal of schedule of values.
- E. Application Preparation: Complete every entry on form. Notarize and execute by a person authorized to sign legal documents on behalf of Contractor. Construction Manager will return incomplete applications without action.
 - 1. Entries shall match data on the schedule of values and Contractor's construction schedule. Use updated schedules if revisions were made.
 - 2. Include amounts for work completed following previous Application for Payment, whether or not payment has been received. Include only amounts for work completed at time of Application for Payment.
 - 3. Include amounts of Change Orders and Construction Change Directives issued before last day of construction period covered by application.
 - 4. Indicate separate amounts for work being carried out under Owner-requested project acceleration.
- F. Stored Materials: Include in Application for Payment amounts applied for materials or equipment purchased or fabricated and stored, but not yet installed. Differentiate between items stored on-site and items stored off-site.
 - 1. Provide certificate of insurance, evidence of transfer of title to Owner, and consent of surety to payment for stored materials.
 - 2. Provide supporting documentation that verifies amount requested, such as paid invoices. Match amount requested with amounts indicated on documentation; do

- not include overhead and profit on stored materials.
3. Provide summary documentation for stored materials indicating the following:
 - a. Value of materials previously stored and remaining stored as of date of previous Applications for Payment.
 - b. Value of previously stored materials put in place after date of previous Application for Payment and on or before date of current Application for Payment.
 - c. Value of materials stored since date of previous Application for Payment and remaining stored as of date of current Application for Payment.
- G. Transmittal: Submit, through Electronic Project Management System, signed and notarized original copies of each Application for Payment to Construction Manager. One copy shall include waivers of lien and similar attachments if required.
1. Transmit each copy with a transmittal form listing attachments and recording appropriate information about application.
- H. Waivers of Mechanic's Lien: With each Application for Payment, submit waivers of mechanic's lien from entities lawfully entitled to file a mechanic's lien arising out of the Contract and related to the Work covered by the payment for construction period covered by the previous application.
1. Submit partial waivers on each item for amount requested in previous application, after deduction for retainage, on each item.
 2. When an application shows completion of an item, submit conditional final or full waivers.
 3. Owner reserves the right to designate which entities involved in the Work must submit waivers.
 4. Submit final Application for Payment with or preceded by conditional final waivers from every entity involved with performance of the Work covered by the application who is lawfully entitled to a lien.
 5. Waiver Forms: Submit executed waivers of lien on forms acceptable to Owner.
- I. Initial Application for Payment: Administrative actions and submittals that must precede or coincide with submittal of first Application for Payment include the following:
1. List of subcontractors.
 2. Schedule of values.
 3. Contractor's construction schedule (preliminary if not final).
 4. Combined Contractor's construction schedule (preliminary if not final) incorporating Work of multiple contracts, with indication of acceptance of schedule by each Contractor.
 5. Products list (preliminary if not final).
 6. Sustainable design action plans, including preliminary project materials cost

- data.
 7. Schedule of unit prices.
 8. Submittal schedule (preliminary if not final).
 9. List of Contractor's staff assignments.
 10. List of Contractor's principal consultants.
 11. Copies of building permits.
 12. Copies of authorizations and licenses from authorities having jurisdiction for performance of the Work.
 13. Initial progress report.
 14. Report of preconstruction conference.
 15. Certificates of insurance and insurance policies.
 16. Performance and payment bonds.
 17. Data needed to acquire Owner's insurance.
- J. Application for Payment at Substantial Completion: After Architect issues the Certificate of Substantial Completion, submit an Application for Payment showing 100 percent completion for portion of the Work claimed as substantially complete.
1. Include documentation supporting claim that the Work is substantially complete and a statement showing an accounting of changes to the Contract Sum.
 - a. Complete administrative actions, submittals, and Work preceding this application, as described in Section 017700 "Closeout Procedures."
 2. This application shall reflect Certificate(s) of Substantial Completion issued previously for Owner occupancy of designated portions of the Work.
- K. Final Payment Application: After completing Project closeout requirements, submit final Application for Payment with releases and supporting documentation not previously submitted and accepted, including, but not limited, to the following:
1. Evidence of completion of Project closeout requirements.
 2. Certification of completion of final punch list items.
 3. Insurance certificates for products and completed operations where required and proof that taxes, fees, and similar obligations were paid.
 4. Updated final statement, accounting for final changes to the Contract Sum.
 5. AIA Document G706.
 6. AIA Document G706A.
 7. AIA Document G707.
 8. Evidence that claims have been settled.
 9. Final meter readings for utilities, a measured record of stored fuel, and similar data as of date of Substantial Completion or when Owner took possession of and assumed responsibility for corresponding elements of the Work.
 10. Final liquidated damages settlement statement.
 11. Proof that taxes, fees, and similar obligations are paid.
 12. Waivers and releases.

PART 2 - PRODUCTS (Not Used)

PART 3 - EXECUTION (Not Used)

END OF SECTION - 01 29 00

SECTION 01 29 73

SCHEDULE OF VALUES

PART 1 - GENERAL

1.01 SECTION INCLUDES

- A. Procedure for submission of a certified Schedule of Values for review and approval by the OAR.

1.02 RELATED REQUIREMENTS

- A. Section 01 21 00: Allowances.
- B. Section 01 23 00: Alternates (Bid Items).
- C. Section 01 29 76: Progress Payment Procedures.
- D. Section 01 31 13: Project Coordination.
- E. Section 01 32 13: Construction Schedule.
- F. Section 01 3150: Project Management Control System
- G. Section 01 32 29: Project Forms.
- H. Section 01 33 00: Submittal Procedures.

PART 2 - PRODUCTS (Not used)

PART 3 - EXECUTION

3.01 PREPARATION

- A. Upon receipt of the Notice of Intent to Award, CONTRACTOR shall commence preparation of a Schedule of Values in accordance with the form included in Section 01 3229.
- B. CONTRACTOR shall coordinate the preparation of a Schedule of Values with preparation of the Construction Schedule as set forth in Section 01 3213.
- C. Include the following Project identification on a certified Schedule of Values:
 - 1. Project name and location.

Department of Neighborhood Services and Public Safety
GOLETA TRAIN DEPOT PROJECT

2. Project Number.
 3. Contract #.
 4. CONTRACTOR name.
 5. Date of Submittal.
- D. The Schedule of Values shall be in tabular form with separate columns and shall include the following items:
1. Related Specification Section and Division.
 2. Description of Work.
 3. Name of Subcontractor, manufacturer or supplier.
 4. Dollar value, quantity and unit of measure of each line item.
 5. Percentage of Contract amount to nearest one-hundredth percent, adjusted to total 100 percent.
- E. Round amounts to the nearest whole dollar; the total shall equal the Contract Amount.
- F. Provide a breakdown of the Contract Amount in enough detail acceptable to OAR to facilitate continued evaluation of Application for Payment and progress reports. Coordinate with the Project Manual table of content and Schedule of Values form under Section 01 3229. Provide line items for subcontract amounts, where appropriate.
- G. Provide separate line items for items in the Schedule of Values for total installed value of that part of the Work.
- H. Provide separate line item for labor and material when required by the OAR.
- I. Each item in the Schedule of Values and Applications for Payment shall be complete. Include total cost and proportionate share of general overhead and profit for each item except the amounts shown as separate line items as indicated under Schedule of Values form under Section 01 3229.
- J. Temporary facilities and other cost items that are not direct cost of actual work-in-place shall be shown as separate line items as indicated under Schedule of Values form under Section 01 3229.
- K. An approved certified Schedule of Values shall serve as the basis for the monthly certified Application for Payment.
- L. If at any time, OWNER determines, in its reasonable discretion, that the schedule of Values does not approximate the actual cost being incurred by CONTRACTOR to perform the Work, CONTRACTOR shall prepare, for OAR approval, a revised Schedule of Values, which then shall be used as the basis for future progress

payments. Without changing the Contract Amount, OWNER reserves the right to require CONTRACTOR:

1. To increase or decrease amounts within the line items in the Schedule of Values; and,
2. To conform the price breakdown to OWNER accounting practice.

3.02 SUBMITTAL

- A. CONTRACTOR shall submit five certified copies of a Schedule of Values for review and approval by the OAR at least 14 days before the first Application for Payment.
- B. OAR will review and if necessary, return the submitted Schedule of Values with summary comments noting items not in compliance with the requirements of the Contract Documents. CONTRACTOR shall revise the submitted Schedule of Values and return five copies within three days of receipt of summary comments.
- C. Signature by OAR shall constitute acceptance of the submitted Schedule of Values.
- D. An approved copy of the Schedule of Values by OAR will be transmitted to CONTRACTOR, and Inspector.

END OF SECTION – 01 2973

SECTION 01 31 00

PROJECT MANAGEMENT AND COORDINATION

PART 1 - GENERAL

1.01 SUMMARY

- A. Section includes administrative provisions for coordinating construction operations on Project, including, but not limited to, the following:
 - 1. General coordination procedures.
 - 2. Coordination drawings.
 - 3. RFIs.
 - 4. Digital project management procedures.
 - 5. Web-based Project management software package.
 - 6. Project meetings.
- B. Each contractor shall participate in coordination requirements. Certain areas of responsibility are assigned to a specific contractor.
- C. Related Requirements:
 - 1. Section 011200 "Multiple Contract Summary" for a description of the division of work among separate contracts and responsibility for coordination activities not in this Section.
 - 2. Section 013200 "Construction Progress Documentation" for preparing and submitting Contractor's construction schedule.
 - 3. Section 017300 "Execution" for procedures for coordinating general installation and field-engineering services, including establishment of benchmarks and control points.
 - 4. Section 017700 "Closeout Procedures" for coordinating closeout of the Contract.
 - 5. Section 019113 "General Commissioning Requirements" for coordinating the Work with Owner's Commissioning Authority.

1.2 DEFINITIONS

- A. BIM: Building Information Modeling.
- B. RFC: Request for Clarification. Request from Contractor seeking information required by or clarifications of the Contract Documents.

1.3 INFORMATIONAL SUBMITTALS

- A. Subcontract List: Prepare a written summary identifying individuals or firms proposed for each portion of the Work, including those who are to furnish products or equipment fabricated to a special design. Include the following information in tabular form:
1. Name, address, telephone number, and email address of entity performing subcontract or supplying products.
 2. Number and title of related Specification Section(s) covered by subcontract.
 3. Drawing number and detail references, as appropriate, covered by subcontract.
- B. Key Personnel Names: Within 15 calendar days of starting construction operations, submit a list of key personnel assignments, including superintendent and other personnel in attendance at Project site. Identify individuals and their duties and responsibilities; list addresses, cellular telephone numbers, and e-mail addresses. Provide names, addresses, and telephone numbers of individuals assigned as alternates in the absence of individuals assigned to Project.
1. Post copies of list in Project meeting room, in temporary field office, in web-based Project software directory. Always keep list current.

1.4 GENERAL COORDINATION PROCEDURES

- A. Coordination: Coordinate construction operations included in different Sections of the Specifications to ensure efficient and orderly installation of each part of the Work. Coordinate construction operations included in different Sections that depend on each other for proper installation, connection, and operation.
1. Schedule construction operations in sequence required to obtain the best results, where installation of one part of the Work depends on installation of other components, before or after its own installation.
 2. Coordinate installation of different components to ensure maximum performance and accessibility for required maintenance, service, and repair.
 3. Make adequate provisions to accommodate items scheduled for later installation.
- B. Coordination of Multiple Contracts: Each contractor shall cooperate with project coordinator, who shall coordinate its construction operations with those of other contractors and entities to ensure efficient and orderly installation of each part of the Work. Each contractor shall coordinate its own operations with operations included in different Sections that depend on each other for proper installation, connection, and operation.
1. Schedule construction operations in sequence required to obtain the best results, where installation of one part of the Work depends on installation of other components, before or after its own installation.
 2. Coordinate installation of different components with other contractors to ensure

- maximum performance and accessibility for required maintenance, service, and repair.
 3. Make adequate provisions to accommodate items scheduled for later installation.
- C. Prepare memoranda for distribution to each party involved, outlining special procedures required for coordination. Include such items as required notices, reports, and list of attendees at meetings.
1. Prepare similar memoranda for Owner and separate contractors if coordination of their Work is required.
- D. Administrative Procedures: Coordinate scheduling and timing of required administrative procedures with other construction activities and scheduled activities of other contractors with Construction Manager to avoid conflicts and to ensure orderly progress of the Work. Such administrative activities include, but are not limited to, the following:
1. Preparation of Contractor's construction schedule.
 2. Preparation of the schedule of values.
 3. Installation and removal of temporary facilities and controls.
 4. Buy out of Subcontracts and Materials.
 5. Delivery and processing of submittals including durations for review.
 6. Progress meetings.
 7. Preinstallation conferences.
 8. Project closeout activities.
 9. Startup and adjustment of systems.

1.5 COORDINATION DRAWINGS

- A. Coordination Drawings, General: Prepare coordination drawings according to requirements in individual Sections, and additionally where installation is not completely indicated on Shop Drawings, where limited space availability necessitates coordination, or if coordination is required to facilitate integration of products and materials fabricated or installed by more than one entity.
1. Content: Project-specific information, drawn accurately to a scale large enough to indicate and resolve conflicts. Do not base coordination drawings on standard printed data. Include the following information, as applicable:
 - a. Use applicable Drawings as a basis for preparation of coordination drawings. Prepare sections, elevations, and details as needed to describe relationship of various systems and components.
 - b. Coordinate the addition of trade-specific information to coordination drawings in a sequence that best provides for coordination of the information and resolution of conflicts between installed components before submitting for review.

- c. Indicate functional and spatial relationships of components of architectural, structural, civil, mechanical, and electrical systems.
- d. Indicate space requirements for routine maintenance and for anticipated replacement of components during the life of the installation.
- e. Show location and size of access doors required for access to concealed dampers, valves, and other controls.
- f. Indicate required installation sequences.
- g. Indicate dimensions shown on Drawings. Specifically note dimensions that appear to be in conflict with submitted equipment and minimum clearance requirements. Provide alternative sketches to Architect indicating proposed resolution of such conflicts. Minor dimension changes and difficult installations will not be considered changes to the Contract.

B. Coordination Drawing Organization: Organize coordination drawings as follows:

1. **Floor Plans and Reflected Ceiling Plans:** Show architectural and structural elements, and mechanical, plumbing, fire-protection, fire-alarm, and electrical Work. Show locations of visible ceiling-mounted devices relative to acoustical ceiling grid. Supplement plan drawings with section drawings where required to adequately represent the Work.
2. **Plenum Space:** Indicate subframing for support of ceiling, and wall systems, mechanical and electrical equipment, and related Work. Locate components within plenums to accommodate layout of light fixtures and other components indicated on Drawings. Indicate areas of conflict between light fixtures and other components.
3. **Mechanical Rooms:** Provide coordination drawings for mechanical rooms, showing plans and elevations of mechanical, plumbing, fire-protection, fire-alarm, and electrical equipment.
4. **Structural Penetrations:** Indicate penetrations and openings required for all disciplines.
5. **Slab Edge and Embedded Items:** Indicate slab edge locations and sizes and locations of embedded items for metal fabrications, sleeves, anchor bolts, bearing plates, angles, door floor closers, slab depressions for floor finishes, curbs and housekeeping pads, and similar items.
6. **Mechanical and Plumbing Work:** Show the following:
 - a. Sizes and bottom elevations of ductwork, piping, and conduit runs, including insulation, bracing, flanges, and support systems.
 - b. Dimensions of major components, such as dampers, valves, diffusers, access doors, cleanouts and electrical distribution equipment.
 - c. Fire-rated enclosures around ductwork.
7. **Electrical Work:** Show the following:
 - a. Runs of vertical and horizontal conduit 1-1/4 inches in diameter and larger.
 - b. Light fixture, exit light, emergency battery pack, smoke detector, and other

- fire-alarm locations.
 - c. Panel board, switchboard, switchgear, transformer, busway, generator, and motor-control center locations.
 - d. Location of pull boxes and junction boxes, dimensioned from column center lines.
 - e. Low
8. Fire-Protection System: Show the following:
- a. Locations of standpipes, mains piping, branch lines, pipe drops, and sprinkler heads.
9. Review: Architect will review coordination drawings to confirm that, in general, the Work is being coordinated, but not for the details of the coordination, which are Contractor's responsibility. If Architect determines that coordination drawings are not being prepared in sufficient scope or detail, or are otherwise deficient, Architect will so inform Contractor, who shall make suitable modifications and resubmit.
10. Coordination Drawing Prints: Prepare coordination drawing prints according to requirements in Section 013300 "Submittal Procedures."
- C. Coordination Drawing Process: Prepare coordination drawings in the following manner:
- 1. Schedule submittal and review of Fire Sprinkler, Plumbing, HVAC, and Electrical Shop Drawings to make required changes prior to preparation of coordination drawings.
 - 2. Commence routing of coordination drawing files with HVAC Installer, who will provide drawing plan files denoting approved ductwork. HVAC Installer will locate ductwork and piping on a single layer, using orange color. Forward drawings to Plumbing Installer.
 - 3. Plumbing Installer will locate plumbing and equipment on a single layer, using blue color.
 - 4. Fire Sprinkler Installer will locate piping and equipment, using red color. Fire Sprinkler Installer shall forward drawing files to Electrical Installer.
 - 5. Electrical Installer will indicate service and feeder conduit runs and equipment in green color. Electrical Installer shall forward drawing files to Communications and Electronic Safety and Security Installer.
 - 6. Communications and Electronic Safety and Security Installer will indicate cable trays and cabling runs and equipment in purple color. Communications and Electronic Safety and Security Installer shall forward completed drawing files to Contractor.
 - 7. Contractor shall perform the final coordination review. As each coordination drawing is completed, Contractor will meet with Architect to review and resolve conflicts on the coordination drawings.
- D. Coordination Digital Data Files: Prepare coordination digital data files according to the following requirements:

1. File Preparation Format:
 - a. Same digital data software program, version, and operating system as original Drawings.
 - b. DWG Latest Version, operating in Microsoft Windows operating system.
2. File Submittal Format: Submit or post coordination drawing files using PDF format.
3. BIM File Incorporation: Develop and incorporate coordination drawing files into BIM established for Project.
 - a. Perform three-dimensional component conflict analysis as part of preparation of coordination drawings. Resolve component conflicts prior to submittal. Indicate where conflict resolution requires modification of design requirements by Architect.
4. Architect will furnish Contractor one set of digital data files of Drawings for use in preparing coordination digital data files.
 - a. Architect makes no representations as to the accuracy or completeness of digital data files as they relate to Drawings.
 - b. Contractor shall execute a data licensing agreement in the form acceptable to Owner and Architect.

1.6 REQUEST FOR CLARIFICATION(RFC)

- A. General: Immediately on discovery of the need for additional information, clarification, or interpretation of the Contract Documents, Contractor shall prepare and submit an RFC in the form specified.
 1. Architect will return without response those RFCs submitted to Architect by other entities controlled by Contractor.
 2. Coordinate and submit RFCs in a prompt manner to avoid delays in Contractor's work or work of subcontractors.
- B. Content of the RFC: Include a detailed, legible description of item needing information or interpretation and the following:
 1. Project name.
 2. Owner name.
 3. Owner's Project number.
 4. Name of Architect and Construction Manager.
 5. Architect's Project number.
 6. Date.
 7. Name of Contractor.
 8. RFC number, numbered sequentially.

9. RFC subject.
 10. Specification Section number and title and related paragraphs, as appropriate.
 11. Drawing number and detail references, as appropriate.
 12. Field dimensions and conditions, as appropriate.
 13. Contractor's suggested resolution. If Contractor's suggested resolution impacts the Contract Time or the Contract Sum, Contractor shall state impact in the RFC.
 14. Contractor's signature.
 15. Attachments: Include sketches, descriptions, measurements, photos, Product Data, Shop Drawings, coordination drawings, and other information necessary to fully describe items needing interpretation.
 - a. Include dimensions, thicknesses, structural grid references, and details of affected materials, assemblies, and attachments on attached sketches.
- C. RFC Forms: As provided or approved by Owner.
1. Attachments shall be electronic files in PDF format.
- D. Architect's and Construction Manager's Action: Architect and Construction Manager will review each RFC, determine action required, and respond. Allow fourteen calendar days for Architect's response for each RFC. RFCs received by Construction Manager after 1:00 p.m. will be considered as received the following working day.
1. The following Contractor-generated RFCs will be returned without action:
 - a. Requests for approval of submittals.
 - b. Requests for approval of substitutions.
 - c. Requests for approval of Contractor's means and methods.
 - d. Requests for coordination information already indicated in the Contract Documents.
 - e. Requests for adjustments in the Contract Time or the Contract Sum.
 - f. Requests for interpretation of Architect's actions on submittals.
 - g. Incomplete RFIs or inaccurately prepared RFCs.
 2. Architect's action may include a request for additional information, in which case Architect's time for response will date from time of receipt by Architect Construction Manager of additional information.
 3. Architect's action on RFCs that may result in a change to the Contract Time or the Contract Sum may be eligible for Contractor to submit Change Proposal according to Section 012600 "Contract Modification Procedures."
 - a. If Contractor believes the RFC response warrants change in the Contract Time or the Contract Sum, notify Construction Manager in writing within Three (3) Calendar days of receipt of the RFC response.
- E. RFC Log: Prepare, maintain, and submit a tabular log of RFCs organized by the RFC number. Submit log weekly. Use software log that is part of web-based Project

management software. Include the following.

1. Project name.
 2. Name and address of Contractor.
 3. Name and address of Architect and Construction Manager.
 4. RFI number, including RFCs that were returned without action or withdrawn.
 5. RFI description.
 6. Date the RFC was submitted.
 7. Date Architect's and Construction Manager's response was received.
 8. Identification of related Minor Change in the Work, Construction Change Directive, and Proposal Request, as appropriate.
 9. Identification of related Field Order, Work Change Directive, and Proposal Request, as appropriate.
- F. On receipt of Construction Manager's action, update the RFC log and immediately distribute the RFC response to affected parties. Review response and notify Construction Manager within three Calendar days if Contractor disagrees with response.

1.7 DIGITAL PROJECT MANAGEMENT PROCEDURES

- A. Use of Architect's Digital Data Files: Digital data files of Architect's CAD drawings will be provided by Architect for Contractor's use during construction.
1. Digital data files may be used by Contractor in preparing coordination drawings, Shop Drawings, and Project Record Drawings.
 2. Architect makes no representations as to the accuracy or completeness of digital data files as they relate to Contract Drawings.
 3. Contractor shall execute a data licensing agreement in the form acceptable to Owner and Architect.
 4. The following digital data files will be furnished for each appropriate discipline:
 - a. Floor plans.
 - b. Reflected ceiling plans.
 - c. Others as requested and approved by Owner.
- B. Web-Based Project Management Software Package: Provide and administer web-based Project management software package for purposes of hosting and managing Project communication and documentation until Final Completion.
1. Web-based Project management software includes, at a minimum, the following features:
 - a. Compilation of Project data, including Contractor, subcontractors, Architect, Architect's consultants, Owner, and other entities involved in Project. Include names of individuals and contact information.
 - b. Access control for each entity for each workflow process, to determine entity's digital rights to create, modify, view, and print documents.

- c. Document workflow planning, allowing customization of workflow between project entities.
 - d. Creation, logging, tracking, and notification for Project communications required in other Specification Sections, including, but not limited to, RFIs, submittals, Minor Changes in the Work, Construction Change Directives, and Change Orders.
 - e. Track status of each Project communication in real time, and log time and date when responses are provided.
 - f. Procedures for handling PDFs or similar file formats, allowing markups by each entity. Provide security features to lock markups against changes once submitted.
 - g. Processing and tracking of payment applications.
 - h. Processing and tracking of contract modifications.
 - i. Creating and distributing meeting minutes.
 - j. Document management for Drawings, Specifications, and coordination drawings, including revision control.
 - k. Management of construction progress photographs.
 - l. Mobile device compatibility, including smartphones and tablets.
2. Provide Project management software user licenses for use of Owner, Owner's Commissioning Authority, **Inspector(s)**, Construction Manager, Architect, and Architect's consultants. Provide four hours of software training at Architect's office for web-based Project software users.
 3. At completion of Project, provide digital archive in format that is readable by common desktop software applications in format acceptable to Architect. Provide data in locked format to prevent further changes.
 4. Manufacturers: Subject to compliance with requirements, provide products by available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Procore Technologies, Inc.
 - b. Autodesk, Inc.
 - c. Corecon Technologies, Inc.
 - d. Deltek Inc.
 - e. Meridian Systems, Inc.
 - f. Newforma, Inc.
 - g. Viewpoint, Inc.; a Trimble Company.
- C. PDF Document Preparation: Where PDFs are required to be submitted to Construction Manager, prepare as follows:
1. Assemble complete submittal package into a single indexed file, incorporating submittal requirements of a single Specification Section and transmittal form with links enabling navigation to each item.
 2. Name file with submittal number or other unique identifier, including revision identifier.

3. Certifications: Where digitally submitted certificates and certifications are required, provide a digital signature with digital certificate on where indicated.

1.8 PROJECT MEETINGS

- A. General: Construction Manager will schedule and conduct meetings and conferences at Project site unless otherwise indicated.
- B. Preconstruction Conference: Construction Manager will schedule and conduct a preconstruction conference before starting construction, at a time convenient to Owner, but no later than 15 calendar days after execution of the Agreement.
 1. Attendees: Authorized representatives of Owner, Owner's Commissioning Authority,, Construction Manager, Architect, their consultants; Contractor and its superintendent; major subcontractors; suppliers; and other concerned parties shall attend the conference. Participants at the conference shall be familiar with Project and authorized to conclude matters relating to the Work.
 2. Agenda: Discuss items of significance that could affect progress, including the following:
 - a. Responsibilities and personnel assignments.
 - b. Tentative construction schedule.
 - c. Phasing.
 - d. Critical work sequencing and long lead items.
 - e. Designation of key personnel and their duties.
 - f. Lines of communications.
 - g. Use of web-based Project software.
 - h. Procedures for processing field decisions and Change Orders.
 - i. Procedures for RFCs.
 - j. Procedures for testing and inspecting.
 - k. Procedures for processing Applications for Payment.
 - l. Distribution of the Contract Documents.
 - m. Submittal procedures.
 - n. Sustainable design requirements.
 - o. Preparation of Record Documents.
 - p. Use of the premises.
 - q. Work restrictions.
 - r. Working hours.
 - s. Owner's occupancy requirements.
 - t. Responsibility for temporary facilities and controls.
 - u. Procedures for moisture and mold control.
 - v. Procedures for disruptions and shutdowns.
 - w. Construction waste management and recycling.
 - x. Parking availability.
 - y. Office, work, and storage areas.
 - z. Equipment deliveries and priorities.

- aa. First aid.
 - bb. Security.
 - cc. Progress cleaning.
 3. Minutes: Entity responsible for conducting meeting will record and distribute meeting minutes.
- C. Sustainable Design Requirements Coordination Conference: Construction Manager will schedule and conduct a sustainable design coordination conference before starting construction, at a time convenient to Owner, Construction Manager, Architect, and Contractor.
 1. Attendees: Authorized representatives of Owner, Owner's Commissioning Authority, Construction Manager, Inspectors, Architect, and their consultants; Contractor and its superintendent and sustainable design coordinator; major subcontractors; suppliers; and other concerned parties shall attend the conference. Participants at the conference shall be familiar with Project and authorized to conclude matters relating to the Work.
 2. Agenda: Discuss items of significance that could affect meeting sustainable design requirements, including the following:
 - a. Sustainable design Project checklist.
 - b. General requirements for sustainable design-related procurement and documentation.
 - c. Project closeout requirements and sustainable design certification procedures.
 - d. Role of sustainable design coordinator.
 - e. Construction waste management.
 - f. Construction operations and sustainable design requirements and restrictions.
 3. Minutes: Entity responsible for conducting meeting will record and distribute meeting minutes.
- D. Preinstallation Conferences: Conduct a preinstallation conference at Project site before each construction activity when required by other Sections and when required for coordination with other construction.
 1. Attendees: Installer and representatives of manufacturers and fabricators involved in or affected by the installation and its coordination or integration with other materials and installations that have preceded or will follow, shall attend the meeting. Advise Architect, Construction Manager, Inspectors, and Owner's Commissioning Authority] of scheduled meeting dates.
 2. Agenda: Review progress of other construction activities and preparations for the particular activity under consideration, including requirements for the following:

- a. Contract Documents.
 - b. Options.
 - c. Related RFCs.
 - d. Related Change Orders.
 - e. Purchases.
 - f. Deliveries.
 - g. Submittals.
 - h. Sustainable design requirements.
 - i. Review of mockups.
 - j. Possible conflicts.
 - k. Compatibility requirements.
 - l. Time schedules.
 - m. Weather limitations.
 - n. Manufacturer's written instructions.
 - o. Warranty requirements.
 - p. Compatibility of materials.
 - q. Acceptability of substrates.
 - r. Temporary facilities and controls.
 - s. Space and access limitations.
 - t. Regulations of authorities having jurisdiction.
 - u. Testing and inspecting requirements.
 - v. Installation procedures.
 - w. Coordination with other work.
 - x. Required performance results.
 - y. Protection of adjacent work.
 - z. Protection of construction and personnel.
3. Record significant conference discussions, agreements, and disagreements, including required corrective measures and actions.
 4. Reporting: Distribute minutes of the meeting to each party present and to other parties requiring information.
 5. Do not proceed with installation if the conference cannot be successfully concluded. Initiate whatever actions are necessary to resolve impediments to performance of the Work and reconvene the conference at earliest feasible date.
- E. Project Closeout Conference: Construction Manager will schedule and conduct a project closeout conference, at a time convenient to Owner and Architect, but no later than 60 calendar days prior to the scheduled date of Substantial Completion.
1. Conduct the conference to review requirements and responsibilities related to Project closeout.
 2. Attendees: Authorized representatives of Owner, Owner's Commissioning Authority, Construction Manager, Inspectors, Architect, and their consultants; Contractor and its superintendent; major subcontractors; suppliers; and other concerned parties shall attend the meeting. Participants at the meeting shall be familiar with Project and authorized to conclude matters relating to the Work.

3. Agenda: Discuss items of significance that could affect or delay Project closeout, including the following:
 - a. Preparation of Record Documents.
 - b. Procedures required prior to inspection for Substantial Completion and for final inspection for acceptance.
 - c. Procedures for completing and archiving web-based Project software site data files.
 - d. Submittal of written warranties.
 - e. Requirements for completing sustainable design documentation.
 - f. Requirements for preparing operations and maintenance data.
 - g. Requirements for delivery of material samples, attic stock, and spare parts.
 - h. Requirements for demonstration and training.
 - i. Preparation of Contractor's punch list.
 - j. Procedures for processing Applications for Payment at Substantial Completion and for final payment.
 - k. Submittal procedures.
 - l. Coordination of separate contracts.
 - m. Owner's partial occupancy requirements.
 - n. Installation of Owner's furniture, fixtures, and equipment.
 - o. Responsibility for removing temporary facilities and controls.
 4. Minutes: Entity conducting meeting will record and distribute meeting minutes.
- F. Progress Meetings: Construction Manager will conduct progress meetings at regular intervals.
1. Coordinate dates of meetings with preparation of payment requests.
 2. Attendees: In addition to representatives of Owner, Owner's Commissioning Authority, Construction Manager, Inspectors, and Architect, each contractor, subcontractor, supplier, and other entity concerned with current progress or involved in planning, coordination, or performance of future activities shall be represented at these meetings. All participants at the meeting shall be familiar with Project and authorized to conclude matters relating to the Work.
 3. Agenda: Review and correct or approve minutes of previous progress meeting. Review other items of significance that could affect progress. Include topics for discussion as appropriate to status of Project.
 - a. Contractor's Construction Schedule: Review progress since the last meeting. Determine whether each activity is on time, ahead of schedule, or behind schedule, in relation to Contractor's construction schedule. Determine how construction behind schedule will be expedited; secure commitments from parties involved to do so. Discuss whether schedule revisions are required to ensure that current and subsequent activities will be completed within the Contract Time.
 - 1) Review schedule for next period.

- b. Review present and future needs of each entity present, including the following:
 - 1) Interface requirements.
 - 2) Sequence of operations.
 - 3) Resolution of BIM component conflicts.
 - 4) Status of submittals.
 - 5) Status of sustainable design documentation.
 - 6) Deliveries.
 - 7) Off-site fabrication.
 - 8) Access.
 - 9) Site use.
 - 10) Temporary facilities and controls.
 - 11) Progress cleaning.
 - 12) Quality and work standards.
 - 13) Status of correction of deficient items.
 - 14) Field observations.
 - 15) Status of RFIs.
 - 16) Status of Proposal Requests.
 - 17) Pending changes.
 - 18) Status of Change Orders.
 - 19) Pending claims and disputes.
 - 20) Documentation of information for payment requests.
4. Minutes: Entity responsible for conducting the meeting will record and distribute the meeting minutes to each party present and to parties requiring information.
 - a. Schedule Updating: Revise Contractor's construction schedule after each progress meeting, where revisions to the schedule have been made or recognized. Issue revised schedule concurrently with the report of each meeting.
- G. Coordination Meetings: Construction Manager will conduct] regular intervals. Project coordination meetings are in addition to specific meetings held for other purposes, such as progress meetings and preinstallation conferences.
 1. Attendees: In addition to representatives of Owner[, Owner's Commissioning Authority, Construction Manager, Inspectors, and Architect, each contractor, subcontractor, supplier, and other entity concerned with current progress or involved in planning, coordination, or performance of future activities shall be represented at these meetings. All participants at the meetings shall be familiar with Project and authorized to conclude matters relating to the Work.
 2. Agenda: Review and correct or approve minutes of the previous coordination meeting. Review other items of significance that could affect progress. Include topics for discussion as appropriate to status of Project.

- a. Combined Contractor's Construction Schedule: Review progress since the last coordination meeting. Determine whether each contract is on time, ahead of schedule, or behind schedule, in relation to combined Contractor's construction schedule. Determine how construction behind schedule will be expedited; secure commitments from parties involved to do so. Discuss whether schedule revisions are required to ensure that current and subsequent activities will be completed within the Contract Time.
 - b. Schedule Updating: Revise combined Contractor's construction schedule after each coordination meeting, where revisions to the schedule have been made or recognized. Issue revised schedule concurrently with report of each meeting.
 - c. Review present and future needs of each contractor present, including the following:
 - 1) Interface requirements.
 - 2) Sequence of operations.
 - 3) Resolution of BIM component conflicts.
 - 4) Status of submittals.
 - 5) Deliveries.
 - 6) Off-site fabrication.
 - 7) Access.
 - 8) Site use.
 - 9) Temporary facilities and controls.
 - 10) Work hours.
 - 11) Hazards and risks.
 - 12) Progress cleaning.
 - 13) Quality and work standards.
 - 14) Status of RFCs.
 - 15) Proposal Requests.
 - 16) Change Orders.
 - 17) Pending changes.
3. Reporting: Record meeting results and distribute copies to everyone in attendance and to others affected by decisions or actions resulting from each meeting.

PART 2 - PRODUCTS (Not Used)
PART 3 - EXECUTION (Not Used)

END OF SECTION - 01 31 00

SECTION 01 31 13

PROJECT COORDINATION

PART 1 - GENERAL

1.01 SECTION INCLUDES

- A. This Section specifies administrative and procedural requirements necessary for coordinating Work operations including, but not limited to, the following:
 - 1. General coordination procedures.
 - 2. Coordination drawings.

1.02. RELATED REQUIREMENTS

- A. Section 01 12 16: Phasing of the Work.
- B. Section 01 32 13: Construction Schedule.
- C. Section 01 33 00: Submittal Procedures.
- D. Section 01 45 23: Test and Inspection.
- E. Section 01 45 25: Testing, Adjusting, and Balancing for HVAC.
- F. Section 01 77 00: Contract Closeout.

PART 2 - PRODUCTS (Not used)

PART 3 - EXECUTION

3.01 COORDINATION

- A. CONTRACTOR shall coordinate operations included in various sections of Contract Documents to assure efficient and orderly installation of each part of Work. Coordinate Work operations included under related sections of Contract Documents that depend on each other for proper installation, connection, and operation of Work, including but not limited to:
 - 1. Schedule construction operations in sequence required where installation of one part of Work depends on installation of other components, before or after its own installation.
 - 2. Coordinate installation of different components to assure maximum accessibility for required maintenance, service, and repair.

3. Provide provisions to accommodate items scheduled for later installation.
 4. Prepare and administer provisions for coordination drawings.
- B. Where necessary, prepare memoranda for distribution to each party involved, outlining special procedures required for coordination. Include such items as required in notices, reports, attendance at meetings, and:
1. Prepare similar memoranda for OAR and Separate Work Contract where coordination of their Work is required.
- C. Administrative Procedures: Coordinate scheduling and timing of required administrative procedures with other construction activities to avoid conflicts and assure orderly progress of Work. Such administrative activities include, but are not limited to, following:
1. Preparation of schedules.
 2. Installation, relocation, and removal of temporary facilities.
 3. Delivery and processing of submittals.
 4. Progress meetings.
 5. Project closeout activities.
- D. Conservation: Coordinate Work operations to assure operations are carried out with consideration given to conservation of energy, water, materials, and:
1. Salvage materials and equipment involved in performance of, but not actually incorporated into Work.

3.02 SUBMITTALS

- A. Coordination Drawings: CONTRACTOR shall prepare coordination drawings to coordinate the installation of products and materials fabricated, furnished and installed by separate entities, under different parts of the Contract. CONTRACTOR shall notify OAR and ARCHITECT of all major conflicts in writing in a timely manner so that the design team can respond without construction delays. Coordination drawings shall address the following at a minimum:
1. Limitations in available space for installation or service. CONTRACTOR shall overlay plans of each trade and verify space requirements and conflicts between trades. Minor changes and adjustments that do not affect design intent shall be made by CONTRACTOR and shall be highlighted for ARCHITECT'S review.
 2. Incompatibility between items provided under different trades (such as difference in voltage between equipment specified under Divisions 22 and 23 and electrical power provided under Division 26.)
 3. Inconsistencies between drawings, specifications and codes (between trades and within each trade).

4. Additional items required for existing facilities construction projects shall be designed and prepared from available as-built drawings that are verified through non-invasive and non-destructive, visual observation only. CONTRACTOR shall field verify actual existing conditions during and upon completion of demolition work and incorporate findings into preparation of co-ordination drawings. Minor changes and adjustments that do not affect design intent shall be made by Sub-Contractor and shall be highlighted for OAR and ARCHITECT'S reviews.
- B. Prepare coordination drawings in CAD with each trade on a separate layer, in specified color and scale. CONTRACTOR and each Subcontractor shall provide and forward reproducible copies and CAD drawing files in the order described here:
1. Structural shop drawings shall indicate location and sizes of columns, beams and other structural members, as well as wall, roof and slab penetrations, and will be provided to mechanical, electrical, low voltage and plumbing Sub-contractors for co-ordination. Structural items shall be indicated using black lines.
 2. HVAC Subcontractor will indicate all ductwork, piping and equipment complete with installation and dimensioned service clearances, duct and pipe sizes, fitting types and sizes, top or bottom of duct and pipe elevations, distances of ducts, pipes and equipment from building reference points and hanger and support locations. Minor changes and adjustments that do not affect design intent shall be made by Subcontractor and shall be highlighted for OAR and ARCHITECT'S reviews. Forward drawings to plumbing Subcontractor for further co-ordination. HVAC items shall be indicated using orange lines.
 3. Plumbing Subcontractor will indicate all plumbing lines, and equipment complete with installation and dimensioned service clearances, pipe sizes, fitting types and sizes, top or bottom of pipe elevations, distances of pipes and equipment from building reference points and hanger/support locations Co-ordinate with HVAC Subcontractor. Minor changes and adjustments that do not affect design intent shall be made by Sub-contractor and shall be highlighted for OAR and ARCHITECT'S reviews Upon completion drawings shall be forwarded to Fire Sprinkler Subcontractor for further co-ordination. All Plumbing items shall be indicated using blue lines.
 4. Fire sprinkler Subcontractor will indicate fire sprinkler piping and equipment complete with installation and dimensioned service clearances, pipe sizes, fitting types and sizes, top or bottom of pipe elevations, distances of pipes and equipment from building reference points and hanger or support locations. Co-ordinate with Plumbing and HVAC Subcontractors. Minor changes and adjustments that do not affect design intent shall be made by sub-contractors and shall be highlighted for OAR and ARCHITECT'S reviews. Upon completion drawings shall be forwarded to Electrical CONTRACTOR for further co-ordination. Fire sprinkler equipment shall be indicated using red lines.

5. Electrical and Low Voltage Subcontractors will indicate service and feeder conduit runs and other electrical equipment complete, including low voltage with installation and dimensioned service clearances, sizes, top or bottom of conduit and rack elevations, distances of conduits and equipment from building reference points and hanger and support locations. Co-ordinate with Fire Sprinkler, Plumbing and HVAC Subcontractors. Minor changes and adjustments that do not affect design intent shall be made by sub-contractors and shall be highlighted for OAR and ARCHITECT'S reviews. Upon completion drawings shall be forwarded to CONTRACTOR for further co-ordination. Electrical work shall be indicated in dark green lines. Low voltage work shall be indicated in light green lines.
6. CONTRACTOR will be responsible for the overall coordination review. As each coordination drawing is completed, CONTRACTOR will meet with OAR to review and resolve all conflicts on coordination drawings.
7. Coordination meetings will be held in Project field office of CONTRACTOR. CONTRACTOR is required to distribute Shop Drawings, cut sheets and submittals to Subcontractors where appropriate. Reviewed coordination drawings will be maintained in Project field office of CONTRACTOR. Meeting minutes shall be developed by CONTRACTOR and submitted to OAR within 5 days.

END OF SECTION – 01 31 13

SECTION 01 31 19

PROJECT MEETINGS

PART 1 - GENERAL

1.01 SECTION INCLUDES

- A. This Section specifies administrative and procedural requirements for Project meetings, including but not limited to, the following:
 - 1. Preconstruction meeting.
 - 2. Pre-installation conferences.
 - 3. Progress meetings.
 - 4. Meetings as required by OAR.

1.02 RELATED REQUIREMENTS

- A. Section 01 12 16: Phasing of the Work.
- B. Section 01 31 13: Project Coordination.
- C. Section 01 32 13: Construction Schedule.
- D. Section 01 32 29: Project Forms.
- E. Section 01 33 00: Submittal Procedures.

PART 2 – PRODUCTS (Not used)

PART 3 - EXECUTION

3.01 PRECONSTRUCTION MEETING

- A. In accordance with General Provisions, OAR will schedule a preconstruction meeting before starting the Work, at a time and date determined by OAR. Meeting shall be held at the Project site or another location as determined by OAR. Meeting will be held in order to review responsibilities, procedures, and other administrative requirements contained within the Contract Documents.

Department of Neighborhood Services and Public Safety
GOLETA TRAIN DEPOT PROJECT

- B. Authorized representatives of OWNER, INSPECTOR, ARCHITECT, CONTRACTOR and other parties shall attend the meeting. All participants at the meeting shall be familiar with the Project and authorized to conclude matters relating to the Work.
- C. Agenda items shall include significant items which could affect progress of the Work, including, but not limited to the following:
1. Preliminary Construction Schedule.
 2. Critical work sequencing.
 3. Designation of responsible personnel.
 4. Identification of OAR.
 5. Procedures for processing field decisions.
 6. Request for Proposal.
 7. Request for Clarification.
 8. Construction Directive and Change Order.
 9. Procedures for processing Applications for Payment.
 10. Prevailing wages.
 11. Submittal and review of Shop Drawings, Product Data, material lists, and Samples.
 12. Preparation of project record documents.
 13. Use of the Project site and/or premises.
 14. Parking availability.
 15. Office, work, and storage areas.
 16. Equipment deliveries and priorities.
 17. Safety procedures.
 18. First Aid.
 19. Security.
 20. Housekeeping.
 21. Working hours.

22. Contract Compliance Officer.
 23. Insurance Services.
 24. Environmental Health and Safety.
 25. Substantial Completion, Administrative Closeout and Contract Completion requirements and procedures.
 26. Procedures for Mandatory Dispute and Claim Resolution.
 27. Storm Water Pollution Prevention Plan (SWPPP).
 28. CEQA Compliance.
- D. OAR shall prepare and issue meeting minutes to attendees and interested parties no later than five calendar days after the meeting date.

3.02 PRE-INSTALLATION CONFERENCES

- A. CONTRACTOR shall coordinate and conduct pre-installation conferences at the Project site before each construction activity that requires coordination with other construction and as required by related Sections of the Contract Documents.
- B. CONTRACTOR, manufacturers, and fabricators involved in or affected by the installation and its coordination or integration with other pre-ceding and/or subsequent installations of Work shall attend the meeting. CONTRACTOR shall advise OAR, INSPECTOR, and ARCHITECT of scheduled meeting dates in order to secure their attendance.
 1. CONTRACTOR shall review the progress of construction activities and preparations for the particular activity under consideration at each pre-installation conference, including requirements for the following:
 - a. Contract Documents.
 - b. Options.
 - c. Related Construction Directives and Change Orders.
 - d. Purchases.
 - e. Deliveries.
 - f. Shop Drawings, Product Data, and quality-control samples.
 - g. Review of mockups.
 - h. Possible conflicts.
 - i. Compatibility problems.
 - j. Time schedules.

- k. Weather limitations.
 - l. Manufacturer's recommendations.
 - m. Warranty requirements.
 - n. Compatibility of materials.
 - o. Acceptability of substrates.
 - p. Temporary facilities.
 - q. Space and access limitations.
 - r. Governing regulations.
 - s. Safety.
 - t. Inspecting and testing requirements.
 - u. Required performance results.
 - v. Recording requirements.
 - w. Protection.
2. CONTRACTOR shall record significant discussions and directives received from each conference. CONTRACTOR shall, within three (3) calendar days after the meeting date, distribute the minutes of the meeting to all concerned parties, including but not limited to, OAR, INSPECTOR, and ARCHITECT.

3.03 PROGRESS MEETINGS

- A. Progress meetings will be held at the Project site at regular intervals, typically weekly, as determined by the OAR.
- B. In addition to representatives of CONTRACTOR, OWNER, and ARCHITECT, each Subcontractor, supplier, or other entity concerned with current progress or involved in planning, coordination, or performance of the Work shall, if requested by OAR, be represented at these meetings. All participants at the conference shall be familiar with the Project and authorized to conclude all matters relating to the Work.
- C. Failure of CONTRACTOR to be so represented at any progress meeting which is held at a mutually agreed time or for which a written notice is given, shall not relieve CONTRACTOR from abiding by any and all OAR determinations or directives issued at such meeting.
- D. OAR will review and correct or approve minutes of the previous progress meeting and will review other significant items affecting progress. Topics for discussion as appropriate to the status of the Project include but are not limited to:
 1. Interface requirements.
 2. Construction Schedule.

3. Sequence and coordination.
 4. Status of submittals / RFCs.
 5. Deliveries.
 6. Off-site fabrication.
 7. Access.
 8. Site utilization.
 9. Temporary Construction Facilities and Controls.
 10. Hours of work.
 11. Hazards and risks.
 12. Housekeeping.
 13. Quality of materials, fabrication, and execution.
 14. Unforeseen conditions.
 15. Testing and Inspection.
 16. Defective Work.
 17. Construction Directive.
 18. Request for Proposal.
 19. Change Order Proposals and Change Orders.
 20. Documentation of information for payment requests.
 21. Application for Payment.
 22. Other items as required or as brought forth.
 23. Initial Notice of Start of Issue, Event, Condition, Circumstance, or Cause of Perceived Delay, Disruption, Interference, Hindrance, Acceleration. (Article 12.2.1 of the General Conditions).
 24. Final Notice of End of Issue, Event, Condition, Circumstance, or Cause of Perceived Delay, Disruption, Interference, Hindrance, Acceleration (Article 12.2.2 of the General Conditions).
 25. Storm Water Pollution Prevention.
 26. CEQA Compliance.
- E. No later than three (3) calendar days after each progress meeting, OAR will prepare and distribute minutes of the meeting to each present and absent party. Include a brief summary, in narrative form, of progress, decisions, directives, actions taken, and all other issues since the previous meeting and report.

1. Schedule Updating: CONTRACTOR shall revise the Construction Schedule after each progress meeting where revisions to the schedule have been made or recognized, and issue the revised schedule at the next scheduled progress meeting.

3.04 ADDITIONAL MEETINGS

- A. OAR, upon giving notice to the intended parties and without further obligation, may require additional meetings to discuss Work and/or Project related activities.

3.05 OWNER'S RIGHT TO RECORD

- A. CONTRACTOR agrees on behalf of itself and all its subcontractors that the OWNER may audiotape or videotape any meetings, training and any work at any time during the Project

END OF SECTION – 01 31 19

SECTION 01 32 13 CONSTRUCTION SCHEDULE

PART 1 - GENERAL

1.01 SECTION INCLUDES

- A. Required procedures, preparation, submittals, reviews, updates, and revisions to the cost/schedule integrated construction schedule. The purpose of this section is to:
1. Ensure adequate planning and execution of the Work by CONTRACTOR.
 2. Establish a standard against which satisfactory completion of the Project can be measured by OWNER.
 3. Assist CONTRACTOR and OAR in monitoring progress.
 4. Aid in assessing the impact of any changes to the Contract.
 5. Provide justification for progress payments.

1.02 RELATED REQUIREMENTS

- A. Section 01 11 00: Summary of Work.
- B. Section 01 12 16: Phasing of the Work.
- C. Section 01 23 00: Alternates (Bid Items).
- D. Section 01 29 73: Schedule of Values.
- E. Section 01 29 76: Progress Payment Procedures.
- F. Section 01 31 13: Project Coordination.
- G. Section 01 33 00: Submittal Procedures.
- H. Section 01 45 23: Testing and Inspection.
- I. Section 01 45 25: Testing, Adjusting, and Balancing for HVAC.
- J. Section 01 50 00: Construction Facilities and Temporary Controls.
- K. Section 01 77 00: Contract Closeout.
- L. Section 01 78 36: Warranties.

PART 2 – PRODUCTS

2.01 SCHEDULING SOFTWARE

- A. CONTRACTOR shall utilize Primavera Scheduling Software (P6) to employ the Critical Path Method (CPM) in the development and maintenance of the construction schedule. If the version of Primavera Scheduling Software (P6) used is greater than Version 15.1, the CONTRACTOR shall save & export schedules in Version 15.1 before submitting to

OWNER for review. The scheduling software shall be capable of being resource loaded with manpower, costs and materials. It shall also be capable of generating time-scaled logic diagrams, resource histograms and profiles, bar charts, layouts and reports with any and/or all activity detail.

- B. All schedule calculation rules, auto cost rules and resource calculation rules shall be in a format acceptable to OAR. When schedule calculations are performed, the “Retained Logic” setting shall be used. CONTRACTOR shall use the zero “Decimal Places” setting.

PART 3 – EXECUTION

3.01 SUBMITTALS

- A. CONTRACTOR shall retain a construction scheduler who has enough capacity to perform all of the requirements outlined in this Section. CONTRACTOR shall submit a resume of the proposed Scheduler for review and acceptance prior to the preparation of any Schedule. The resume shall demonstrate the proposed scheduler’s capability to plan, coordinate, execute, and monitor a cost/resource loaded CPM schedule as required for this Project and have a minimum of five years direct experience using Primavera Project Planner. Scheduler will cooperate with OAR and shall be available on site for monitoring, maintaining and updating schedules in a timely manner. OAR has the right to refuse to accept the Scheduler based upon a lack of experience as required by this Section or based on lack of on-site performance and timeliness of schedule submittals. If OAR does not accept the proposed Scheduler, CONTRACTOR shall within one week of disapproval, propose another scheduler who meets the experience requirements stated above.
- B. CONTRACTOR shall submit two color originals and three copies of all bar charts, reports and/or other required schedule data as outlined in this Section. CONTRACTOR shall electronically deliver the schedule file in its original format at the time of submittal.
- C. CONTRACTOR shall attend a pre-construction scheduling conference with OAR within 7 days after Notice to Proceed. Contractor shall then develop and submit the Preliminary Construction Schedule within 14 days after Notice to Proceed.
- D. CONTRACTOR shall submit the Proposed Baseline Schedule no later than thirty days from the Notice to Proceed (or as stipulated in the milestones under Section 01 1219 Phasing of the Work Appendix A).
- E. CONTRACTOR shall submit the Monthly Schedule Updates, Four-Week Rolling Schedules, and Recovery Schedules as required.

3.02 PRELIMINARY CONSTRUCTION SCHEDULE

- A. The purpose of the cost-loaded Preliminary Construction Schedule is to provide a interim mechanism in which to measure performance on individual activities and to validate the CONTRACTOR’S monthly Application for Payment on work performed (starting with month one) during the first three months of the job until the complete Baseline Schedule is approved by the OAR.

- B. CONTRACTOR shall develop and submit a cost loaded Preliminary Construction Schedule as required by this Section. It shall be submitted in computer generated network format and shall be organized by Activity Codes representing the CONTRACTOR'S intended sequencing of the Work. The Preliminary Construction Schedule shall include activities for the first 90 calendar days following the NTP such as mobilization, preparation of submittals, specified review periods, procurement items, fabrication items, milestones, and detailed construction activities.
- C. Upon OAR'S acceptance of the Preliminary Construction Schedule, CONTRACTOR shall update the accepted Preliminary Construction Schedule each month (beginning with month 1) and submit these updates until CONTRACTOR'S Baseline Schedule is fully developed and accepted.
- D. Provide a written narrative describing CONTRACTOR'S approach to mobilization, procurement, and construction during the first 90 calendar days including crew sizes, equipment and material delivery, site access, submittals, and permits.
- E. Submit Bar Charts, Tabular Reports, a Cost flow Histogram, Electronic Data, and Plots in accordance with Article 3.04-L.

3.03 SCHEDULE OF VALUES

- A. CONTRACTOR shall cost load activities in the Construction Baseline Schedule and allocate costs to the cost accounts of all activities. The cost accounts shall match the CSI sections listed in the Table Of Contents of the Specifications. The format shall be coordinated with Specification Section 01 2973 (Schedule of Values), Specification Section 01 3229 (Project Forms), and Specification Section 01 2976 (Progress Payment Procedures).
- B. Submit a computer generated report from the Construction Baseline Schedule using the P6 scheduling software. The report shall contain the following data for each activity: Cost Account Number (by CSI section), Cost Account Description, Cost Account Budget, Cost to Date, Cost this Period, and Cost to complete. Total costs shall be organized and totaled by CSI section. This report shall be the source of the data CONTRACTOR reports on the Schedule of Values.
- C. The cost loading associated with the activities shall be based on CONTRACTOR estimates of costs that CONTRACTOR will incur performing the specific activities. If OAR determines that the costs are front loaded and/or the distribution of costs is unreasonable, CONTRACTOR shall revise accordingly and resubmit the Schedule of Values within five (5) days for OAR review.

3.04 BASELINE SCHEDULE CPM NETWORK

- A. No later than thirty days from the Notice to Proceed (or as stipulated in the milestones under Section 01 1219 Phasing of the Work Appendix A), CONTRACTOR shall submit a detailed Proposed Baseline Schedule that covers the entire duration of the Project. This schedule shall convey CONTRACTOR'S plan for organizing, managing, and executing the Work.

- B. The Proposed Baseline Schedule shall include activity descriptions, sequencing, logic relationships, duration estimates, cost loading by CSI section in accordance with Article 3.03, resource loading of manpower, and other information as set forth in this Section.
1. The Proposed Baseline Schedule shall include all Milestones stipulated in Specification Section 01 1219, Phasing of the Work, Appendix A, as well as all activities required to achieve timely completion of the Milestones.
 2. The Proposed Baseline Schedule shall include activities for: all construction activities, the NTP, Milestones, submittals, coordination drawings, re-submittals, procurement of materials and equipment, manufacturing, fabrication & delivery, owner furnished contractor installed items (OFCD), access restrictions, work restrictions, phased occupancy, testing, start-up, and contract closeout activities. The Proposed Baseline Schedule shall allow a period for OAR and ARCHITECT to review each submittal, as required by Section 01 3300 and other sections which require additional time for OWNER reviews.
 3. The Proposed Baseline Schedule shall include start and completion dates for: temporary facilities, construction of mock-ups, prototypes, samples, punch list, OWNER interfaces and furnishing of items, separate work contracts, regulatory agency approvals, and permits required for performance of the Work.
 4. The Proposed Baseline Schedule shall allow for all foreseeable factors and risks which affect performance of the Work. Include allowances for weather conditions in accordance with Article 3.04-J, applicable laws, transportation, traffic, air quality, noise, or any other applicable regulatory requirements, regulations or collective bargaining agreements pertaining to labor.
 5. The Proposed Baseline Schedule shall include an activity with a minimum review period of one hundred days for all Deferred Approvals. In addition, as a predecessor to this activity, a separate 18 day OWNER review period shall be included in the Proposed Baseline Schedule.
 6. CONTRACTOR shall not use any float suppression techniques such as preferential sequencing or logic, special hidden lag time between activities or milestones, float absorption activities, or unjustifiable over-estimating of activity durations in preparing the Proposed Baseline Schedule. Finish Milestones should be constrained to a “Finish on or before” constraint. No “Zero Free Float” constraints, No “Early” Constraints, and No “Mandatory Finish” constraints shall be utilized.
 7. The Proposed Baseline Schedule shall include activity durations based on the crew sizes and equipment utilization that CONTRACTOR will maintain during the Project. No activity durations shall exceed fifteen (15) working days unless approved by the OAR. Non-construction activities such as procurement, delivery, or submittal activities are exempted. CONTRACTOR will need to perform their due-diligence to make sure that the activity man-power loading and activity durations are directly integrated.

- 8. CONTRACTOR shall include with the Proposed Baseline Schedule a written narrative report sufficiently comprehensive to explain the rationale behind CONTRACTOR’S approach to the Work including but not limited to: activity durations, manpower flow, average crew sizes (by trade), equipment requirements, anticipated production rates, constraints, holidays and other non-work days, potential problem areas, permits, coordination with regulatory authorities, utilities, separate work contracts and other parties, and long lead delivery items requiring more than thirty days from the date of order to delivery to the Project site.
- C. At the OAR’S request, furnish a detailed written explanation of CONTRACTOR’S basis for specific durations, logic, phasing, or other information. Such an explanation shall include CONTRACTOR’S rationale for selecting the number of crews, crew composition, number of shifts per day, number of hours in a shift, number of work days per week, construction equipment, and similar factors.
- D. The Proposed Baseline Schedule activities shall contain the following data:
 - 1. Activity ID numbers shall consist of a built-in intelligence scheme. Following OAR acceptance of the Baseline Schedule, Activity ID numbers shall not be changed.
 - 2. Activity Descriptions shall provide adequate information that readily identifies each activity, work scope, and location.
 - 3. At a minimum, activity codes specified in Article 3.04-G shall be applied to each activity. This is at the activity level and is different than WBS coding structure.
 - 4. Cost accounts (in CSI Master Format) and Resource accounts shall be applied to each activity. They shall include lump sum costs, and man-hours/man-days (where applicable).
- E. At OAR’S request, furnish a written explanation for each lead or lag relationship and each constrained date. Unjustifiable leads, lags, and constraints will result in OAR’S rejection of the Proposed Baseline Schedule.
- F. Calendar Identification: In the scheduling software, identify all activities that will require overtime shifts, double shifts, and work on weekends or holidays. Identify non-work days and holidays in the schedule calendar. All milestones stipulated in Specification Section 01 1219, Phasing of the Work, Appendix A, shall be placed on a calendar with seven days per week. No holiday or non work-day restrictions are permitted on this calendar. Within the schedule software, the CONTRACTOR shall not use Primavera Global Calendars from past projects, but rather shall use project specific calendars created for this specific contract. The Calendar coding shall be transferable and compatible with the OWNER calendars as to not distort any start/finish dates and “total float” values upon schedule re-calculation.
- G. Activity Codes: As a minimum, the Activity Codes shown in the Table 1 below shall be assigned to each activity.

Table 1

Name	Length	Description
------	--------	-------------

TYPE	2	Type of activity (for example: mobilization, submittals, procurement/fabrication, construction, milestones, etcetera.)
AREA	2	Area or Building (for example: Depot, Courtyard, Parking Lot, Street Work, etcetera.)
STAG	2	Stage (for example: Foundations, Superstructure, Exterior, Interior, Roof, etcetera.)
RESP	7	Responsible Party (subcontractor and/or trade)
DIV	2	CSI Division
SPEC	5	CSI Specification Section number

1. OAR may require additional coding of activities. The mandatory activity code requirements listed in Table 1 are not to be construed as setting limits on CONTRACTOR'S management and coordination responsibilities, but are intended to guide CONTRACTOR in the administration of its contractual responsibilities.
- H. Milestones: are designated dates as set forth in Specification Section 01 1219, Phasing of the Work, Appendix A, in which Work or portions thereof are required to start and complete in accordance with the Contract Documents.
1. Where the term completion or similar terms are used in regards to a Milestone, it shall be construed to mean all portions of the Work in the indicated phase, area, and zone are complete and acceptable to OAR. Where the term start or similar terms are used in the designation of a Milestone, it shall be construed to mean a portion of the Work in the indicated phase, area, or zone is required to be commenced.
 2. A Proposed Baseline Schedule extending beyond the Milestones or Contract Time will not be acceptable.
 3. Finish Milestones shall be constrained with "Finish on or before" type constraints in accordance with the dates stipulated in Specification Section 01 1219, Phasing of the Work, Appendix A.
 4. In the P6 scheduling software, prior to opening the project, click the "dates" tab and place a "must finish by" date to match the Contract Completion Milestone date stipulated in Specification Section 01 1219, Phasing of the Work, Appendix A.
 5. A Proposed Baseline Schedule indicating Work completed in less time than the Milestones and/or Contract Time will not be acceptable. Rather, CONTRACTOR shall show any unused contract time as float available to the project.
 6. Milestones shall be placed on a calendar with seven days per week. No Holiday or non work-day restrictions are permitted on this calendar.
- I. The Critical Path shall be clearly indicated on all schedules submitted. An activity is defined as critical when it is shown to be on the longest path from beginning to end.
- J. CONTRACTOR shall allow for inclement weather in the Proposed Baseline Schedule by incorporating an activity titled "Rain Day Impact Allowance" as the last activity prior to the Substantial Completion Milestone. No other activities may be concurrent with it. The

duration of the Rain Day Impact Allowance activity will be based on Table #2 below, and will be calculated from the Notice to Proceed until the original date of Substantial Completion.

Table 2: Cumulative Calendar Days “Rain Day Impact Allowance”:

January	6	July	0
February	5	August	0
March	5	September	1
April	4	October	1
May	1	November	3
June	0	December	5

1. When inclement weather at the Project site impacts Critical Path activities, CONTRACTOR may provide the OAR with a written request for a weather impact day describing the inclement weather delay on the Critical Path activities. The inclement weather delay must be clearly indicated by a 70 percent decrease in the field labor workforce hours on Critical Path activities on the day in question as indicated by CONTRACTOR’S Daily reports from the day in question and the scheduled work days prior to the day in question. Upon OAR’S independent confirmation of the amount of rainfall and impact, OAR will authorize CONTRACTOR to reduce the duration of the Rain Day Impact Allowance by one day.
2. Inclement weather on non-scheduled workdays shall not be granted as weather impact days. If CONTRACTOR asks to work a specific weekend or holiday and gives OAR advanced, written notification of critical path work to be performed and a substantial amount of precipitation occurs that prevents the work from being performed, then that day can be claimed as a weather impact day. If the effects of inclement weather from a non-scheduled work day carry forward to a scheduled work day and impacts the Critical Path as noted above, then the scheduled work day will be considered impacted by weather. Any unused rain day allowance at the end of the project will be shown as available float to the Substantial Completion Milestone. Excusable, non-compensable time extensions will be granted for inclement weather to Substantial Completion milestone only after the weather impact area affecting the critical path work has exhausted the allotted cumulative Rain Day Impact Allowance. On projects that have multiple phases with defined start & finish dates, the cumulative rain impact allowance may be split up (pro-rated) into their designated phases upon OAR Approval.

K. Cost loaded Activities:

1. Each activity included in the Proposed Baseline Schedule shall be assigned the cost CONTRACTOR estimates it will incur performing that activity. Each activity’s assigned cost will be inclusive of overhead and profit so CONTRACTOR’S total overhead and profit is distributed over all activities on a pro rata basis. The sum of

- the costs assigned to activities shall equal the total contract value. No activity costs shall be assigned to manufacturing or delivery activities unless approved by OAR. If OAR finds that the costs are front loaded and the distribution of costs is unreasonable, CONTRACTOR shall re-distribute the costs and resubmit the revised Schedule of Values within five days for OAR backcheck.
2. CONTRACTOR shall cost load activities in the Proposed Baseline Schedule and allocate costs to related resource/cost accounts associated with each activity. The cost accounts shall match the CSI sections listed in the Table of Contents of the Specifications. The format shall be coordinated with Specification Section 01 2973 (Schedule of Values), Specification Section 01 3229 (Project Forms), and Specification Section 01 2976 (Progress Payment Procedures). All cost-loaded activities shall roll-up to their designated CSI sections and shall be the basis for the data reported in the Schedule of Values (Section 01 2973), Project Forms (Section 01 3229), and Progress Payment Procedures (Section 01 2976).
 3. Submit computer generated reports using the scheduling software which will be the basis for the approved Schedule of Values. The reports shall contain the following data for each activity: Cost/Resource Account Number (by CSI section), Cost/Resource Account Description, Cost/Resource Account Budget, Cost to Date, Cost this Period, and Cost at Completion. Total Costs shall be organized and totaled by CSI section.
 4. Submit a Cost Flow Histogram in accordance with Article 3.04.L.3.
- L. CONTRACTOR shall submit computer generated reports and plots with the Proposed Baseline Schedule submittal package. Format shall display the following columns: Activity ID, Activity Description, Original Duration, Remaining Duration, Percent Complete, Early Start, Early Finish, Late Start, Late Finish, and Total Float. Unless otherwise noted, bar charts and reports shall be on 8 ½ by 11 paper and bound.
1. Color Bar charts shall be generated separately for:
 - a. Milestones only.
 - b. All Activities sorted by Early Start date and organized by Project, Area, Stage, and Substage. (The network shall be organized to show continuous flow of all activities from left to right). CONTRACTOR is reminded that during the monthly schedule update process, even the activities that have already been completed need to be shown in this “all activities” bar chart report.
 - c. Activities sorted by Responsibility.
 - d. Summary level of all activities sorted by craft/trade and area.
 - e. Critical Path (Longest Path). The network shall be organized to show continuous flow of all critical activities on the longest path from left to right (sorted by early start).
 2. Reports:

- a. Total Float sorted low to high.
 - b. Predecessors and Successors sorted by Activity ID.
3. Cost Flow Histogram
- a. Using the costs assigned to each activity, develop a Histogram that projects the estimated invoice amounts by month for the Project duration. The histogram shall be produced from the scheduling software on 11” by 17” paper (landscape mode). It shall contain both a monthly bar histogram and a cumulative cost curve on the same graph. The Total Costs shall be based on the Early Dates option.
4. Man Power Histogram
- a. Submit a planned man-power graphic bar histogram produced from the scheduling software on 11” by 17” paper (landscape mode) that displays total man-hours based on Early Dates. Show both a weekly bar histogram and a cumulative curve on same graph. In addition, provide a summary excel table of average crew sizes and peak crew sizes broken down by trade/subcontractor. CONTRACTOR will need to perform their due-diligence to make sure that the activity man-power loading is realistic and adequate based on material /labor cost estimates.
5. Provide a written narrative as required by Article 3.04.B.8.
6. Electronic data: Provide an electronic file in its original format of the Schedule. The electronic P6 files shall be saved in “XER” type format.(version 15.1)
7. Plots: Produce a color bar chart on E-size paper (30 by 42-inch) organized (at a minimum) by project, area, stage, and substage.
- M. OAR will notify CONTRACTOR of any adjustments that are required for the Proposed Baseline Schedule to be accepted. CONTRACTOR shall perform any required adjustments to the Proposed Baseline Schedule and resubmit it for acceptance certifying in writing that all information contained therein complies with the Contract Documents. OAR will review the Proposed Baseline Schedule for accuracy, reasonableness, and conformance with the Contract Documents and shall provide comments within ten days of receipt. Within five days after receiving OAR comments, CONTRACTOR shall both incorporate changes to address OAR concerns and resubmit the Proposed Baseline Schedule for OAR backcheck. This process will continue until the Proposed Baseline Schedule is accepted as the Baseline Schedule. Once accepted by OAR, the Baseline Schedule will be the basis upon which CONTRACTOR shall prepare updates that record and report actual performance and progress. The accepted Baseline Schedule and subsequent Monthly Updates (reference Articles 3.04 and 3.05 respectively) shall be the basis for consideration and analysis of requests for time extensions and CONTRACTOR progress payments.
- N. OAR acceptance of the Baseline Schedule or CONTRACTOR’S failure to identify or include an element of the Contract, shall not release CONTRACTOR’S obligation to complete all required Work in accordance with the Contract Documents.

3.05

REQUIREMENTS FOR MONTHLY/WEEKLY SCHEDULE UPDATING

- A. Once the Baseline Schedule is accepted by OAR, CONTRACTOR shall copy the Approved Baseline file to a new name, status the activities with actual as-built data through the end of the month & submit Monthly Schedule Updates beginning with month No. 1. The current month's schedule update cannot be accepted until the previous Monthly Schedule Update has been accepted by OAR. Each Monthly Schedule Update shall be submitted concurrently with the Monthly Pay Application no later than the fifth day of the succeeding month in accordance with Article 14 of the General Conditions.
- B. Monthly Schedule Update Format.
1. Initially, the contractor shall status a current Monthly Schedule Update with actual Work progress only. No logic ties shall be modified. Status all Actual Start and Finish dates, adjust Remaining Durations where needed, and update Percent Completion of cost and resource loaded activities. No activity Original Durations or Logic shall be changed unless authorized by OAR. No new activities shall be added (except for the addition of new activities for every re-submittal and re-review required) or unless authorized by the OAR.
 2. Once the schedule is statused in accordance with Article 3.05-B1, CONTRACTOR shall print (and submit with Monthly Schedule Update) a report of "out-of-sequence" logic that results from the updating process. CONTRACTOR shall then correct all "out-of-sequence" logic to reflect CONTRACTOR'S actual Work sequence. Prior to submission of the Monthly Schedule Update, CONTRACTOR shall review and validate that all remaining activities along with their schedule relationships are still accurate based on the actual work flow in the field. If CONTRACTOR chooses to modify logic or add activities (other than out-of-sequence corrections), it shall be done in accordance with Article 3.07 for OAR Review & Approval. CONTRACTOR shall also submit a comparison report between the previous monthly schedule update and the current monthly update that will document the overall changes (i.e. comparison software such as "Digger", or "Schedule Analyzer", etc.).
 3. During construction, CONTRACTOR may desire to break down specific activities into greater detail. If greater detail is necessary, then CONTRACTOR shall identify expanded activities such that the Baseline Schedule activities that the expanded activities originated from are readily apparent. CONTRACTOR shall not allow the aggregate duration of the expanded activities to exceed the duration assigned to the Baseline Schedule activity unless permitted by OAR in writing.
 4. Autocost rules and calculation rules shall link Remaining Duration and Percent Complete.
 5. The Data Date for the Monthly Schedule Updates shall be the first day of the succeeding month. At a minimum, three days prior to the submission of the Monthly Schedule Update, CONTRACTOR shall meet in person with OAR to present the proposed Percentages of Completion and Actual Start and Actual Finish dates. Once percentages of completion and actual dates have been agreed to, they shall be the basis of the Monthly Schedule Update.

6. CONTRACTOR shall submit a Cost Histogram that overlays the planned cost curve from the Baseline Schedule, against the monthly cumulative “cost to date” curve, and against the remaining activities planned curve from the current Monthly Schedule Update.
 7. Written Narrative Report: CONTRACTOR shall include a written report to explain the Monthly Schedule Update. The narrative shall, at a minimum include the following headings with appropriate discussions of each topic:
 - a. Introduction.
 - b. A Summary of Work which was on-going (This Pay Period).
 - c. Problem Areas and Proposed Solutions.
 - d. Critical Path.
 - e. Current and Anticipated Delays.
 - f. Coordination of Work with Others.
 - g. Milestone Status.
 - h. Revisions: the standard schedule comparison report that compares the current update to the previous update shall be submitted to help document any variances/changes. However this comparison report will not be accepted by OWNER in lieu of the above written narrative requirements outline above.
 8. In updating the Schedule, CONTRACTOR shall not modify Activity ID numbers, schedule calculation rules/criteria, or the Activity Coding Structure required.
 9. Submit bar charts, reports, a cost flow histogram, man-power histogram, written narrative, electronic data, and plots in accordance with Article 3.04-L.
 10. Submit a cost-loaded report (progressed monthly) produced from the scheduling software that displays all of the activities organized by the CSI section cost/resource accounts. This report shall be in compliance with Article 3.04-K, Section 01 2973 (Schedule of Values), Section 01 3229 (Project Forms), and Section 01 2976 (Progress Payment Procedures).
- C. Four-Week Rolling Schedule: At each Weekly Progress Meeting, CONTRACTOR shall present a Four-Week Schedule in Bar Chart format. It shall show one (1) week of actual and three (3) weeks of forecasted progress. The Four-Week Rolling Schedule shall be used as a basis for discussing progress and work planned during the three (3) weeks.
1. The Four-Week Rolling Schedule shall be based on the most recent OAR Accepted Monthly Schedule Update. It shall include weekly updates to all construction, submittal, fabrication and procurement, and separate work contract activities. CONTRACTOR shall ensure that it accurately reflects the current progress of the Work.
 2. CONTRACTOR shall discuss at the weekly Progress meeting the actual dates and any variances to critical or near critical activities.

3. Upon request by OAR, CONTRACTOR shall provide the Four-Week Rolling Schedule in electronic format.
4. If the Four-Week Rolling Schedule indicates activities are behind schedule, CONTRACTOR shall provide a Recovery Schedule in accordance with Article 3.06.
5. If the CONTRACTOR chooses to provide a Four-Week Rolling Schedule in a greater level of detail (by trade/subcontractor) outside of the monthly contractual P6 schedule database, then upon CONTRACTOR REQUEST and OAR written approval, the CONTRACTOR may proceed as long as the detailed activities roll-up to the contractual P6 monthly schedule updates. These detailed activities will need to be linked to the overall Substantial Completion date as to properly forecast whether the project is ahead or behind schedule during the weekly Progress Meetings. The Four-Week Rolling Schedule must accurately reflect the work that is going on during the current week and must accurately reflect what will happen in the next three weeks.

3.06 RECOVERY SCHEDULES

- A. If a Monthly Schedule Update indicates negative float greater than ten (10) days on a critical path as result of events not predicated by Articles 10 and 12 of the General Conditions CONTRACTOR shall prepare a Proposed Recovery Schedule demonstrating CONTRACTOR'S plan to regain the time lost. The Recovery Schedule shall be submitted either in advance of or concurrent with the Monthly Schedule Update and CONTRACTOR progress request. Both the Monthly Schedule Update and the Proposed Recovery Schedule shall be based on the same percentages of completion and actual dates accepted by OAR under Article 3.05 B.
- B. The Proposed Recovery Schedule shall be based on a copy of the Monthly Schedule Update for the calendar month during which the negative float first appears.
- C. The Proposed Recovery Schedule shall include a written narrative that identifies the causes of the negative float on the critical path and provides CONTRACTOR'S proposed corrective action to ensure timely completion of all Milestones and the Substantial Completion Date. CONTRACTOR'S corrective actions shall include but are not limited to increasing concurrent operations, increasing labor, adding multiple shifts in a 24-hour period, and adding overtime.
- D. During any period of time when CONTRACTOR is found to be behind schedule by OAR, the Monthly Schedule Update described above shall become a weekly requirement (at no additional cost to OWNER) to provide a greater degree of focus on the timely completion of the Work. These Updates shall be submitted to OAR every Monday morning. When CONTRACTOR is deemed by OAR to be back on schedule, CONTRACTOR may revert to submitting the schedule monthly.
- E. CONTRACTOR'S progress payment may not be processed until OAR accepts the Proposed Recovery Schedule. Following such an acceptance, the Proposed Recovery Schedule will be known as the Recovery Schedule and future Work will be performed by CONTRACTOR in accordance with it.

3.07 FRAGNETS AND TIME EXTENSION REQUESTS

- A. Float is not for exclusive use or benefit of either OWNER or CONTRACTOR but is an expiring resource available to both parties on a non-discriminatory basis. If required to meet specified Milestones, either party may utilize float. Adjustments to Milestones or Contract Time will only be authorized by Change Order and only to the extent the claimed adjustments exceed total float along the most critical path of the current Monthly Schedule Update in effect at the time of the claimed adjustments. The claimed adjustments to the Milestones and/or Contract Time must also cause the Substantial Completion Date to exceed that currently indicated in the Monthly Schedule Update. No time extensions will be granted nor delay damages paid under contract until all available float is used and the CONTRACTOR obtains a Time Extension Request approval from the OAR in accordance with Article 3.07 in its entirety. CONTRACTOR claimed adjustments to an existing negative float path will not receive consideration until the activity with the highest negative float is driven even further negative.
1. Claimed adjustments to the Milestones or Contract Time will be administered in conjunction with those set forth in the General Provisions.
- B. Pursuant to the float sharing requirements of this Section, the use of float suppression techniques such as preferential sequencing or logic, special lead or lag logic restraints, and extended activity times or durations are prohibited. The use of float time disclosed or implied by the use of alternate float suppression techniques shall be proportionally shared to benefit OWNER and CONTRACTOR. The use of any technique solely for the purpose of suppressing float will result in OWNER rejection of the submitted Monthly Schedule Update.
- C. In the event CONTRACTOR believes the Project has suffered an adverse impact arising from events predicated by the General Provisions, CONTRACTOR may prepare a Time Extension Request by submitting a Schedule Fragnet and a written narrative outlining the detail of the impact. A Schedule Fragnet must demonstrate a critical path delay. Such a delay must adversely impact the Substantial Completion Date for CONTRACTOR to receive a time extension. To demonstrate such an impact successfully, CONTRACTOR shall prepare a Schedule Fragnet based on a copy of OWNER accepted Monthly Schedule Update for the calendar month during which the adverse impact occurred. This “copy” of the OWNER accepted Monthly Schedule Update shall however first be updated (by OWNER and CONTRACTOR jointly) with both Percentages of Completion and Actual Dates up to the day the delay commenced. This process will provide the “pre-delay” project status. Once OWNER and CONTRACTOR have agreed to the “pre-delay” project status, CONTRACTOR should make a copy of this “pre-delay” schedule and this copy is to be the starting point for CONTRACTOR’S Schedule Fragnet development. OWNER will evaluate the activities, logic, durations, etcetera, in the Schedule Fragnet and will evaluate if the adverse impact arose from events described by the General Provisions. The Fragnet shall also include CONTRACTOR-caused delays that affect the critical or near critical path in the network and should be accounted for in the Time Impact Analysis if overlapped at any point in time with OWNER-caused delay. If rain impact days were granted between the Start and Finish of OWNER-caused delay period, they should be accounted for in the Time Impact

Analysis as well. Provided OWNER determines such an impact occurred, CONTRACTOR may be due a time extension equal to the number of proportioned days of variance/delay that resulted to the Substantial Completion Date.

- D. Activities added into a Schedule Fragnet to demonstrate the impact of adverse event shall be assigned a unique activity code. The Schedule shall be organized by this unique activity code.
- E. The Schedule Fragnet shall incorporate logic that accurately ties reflective of the adverse event to pre-event predecessor activities and post event successor activities.
- F. The format and components of a Schedule Fragnet submittal shall be in accordance with this Section and the General Provisions. It is crucial for the Fragnet to be submitted within the same month of discovery so it can be resolved during the monthly schedule update review. The notice shall be transmitted to OAR within the stipulations outlined in the General Provisions.
- G. If OWNER accepts CONTRACTOR'S Schedule Fragnet and an extension is granted, a Change Order will be prepared. OWNER will advise what change order number the time extension will become. When CONTRACTOR receives this Change Order number, all the activities added to the Schedule Fragnet shall be given Activity Identification Numbers that corresponds with the Change Order number. CONTRACTOR shall cost load and resource-load the activities if required by OWNER. If resource loading is required, the resource loading shall include a breakdown of labor, material, and equipment quantities.
- H. If OWNER rejects CONTRACTOR'S Schedule Fragnet in part based on improper forecast logic or activity tasks then it shall be revised accordingly to conform to OWNER'S review comments and resubmitted. If the forecast logic and activity tasks cannot be agreed to then the pre-delay schedule outlined in Article 3.07-C shall be compared to the actual as-built data in the succeeding month of the encountering issue, event, condition, circumstance, and/or cause. The variance to the project between the pre-delay and post delay schedules shall be discussed in CONTRACTOR'S written narrative and proportioned between the different parties involved in the delay.
- I. If OWNER rejects CONTRACTOR'S Schedule Fragnet in whole then CONTRACTOR may follow the procedures set forth in the General Provisions.

3.08 PAYMENT FOR SCHEDULING

- A. The Work of this Section will be included as part of the bid price.
- B. Preparation, revising, maintenance, and compliance with this Section and Section 01 2973 is an integral part of the Contract Documents and is specified to have a minimum value equal to 2 percent of the original Contract Amount or \$150,000, whichever is less. This amount shall be proportionally cost loaded into two activities in both the Proposed Baseline Schedule and the Schedule of Values described in Section 01 2973. One activity for the "Baseline Schedule" and the other activity for the "Monthly Schedule Update Process" as follows:

1. CONTRACTOR may allocate twenty percent (20 percent) of the total cost and place in the “Baseline Schedule” activity. It can then be billed against when the OAR accepts the Proposed Baseline Schedule as the Baseline Schedule.
2. The remaining eighty percent (80 percent) may be cost loaded into the “Monthly Schedule Update Process” activity. This amount may be billed in equal monthly increments. The amount of those increments is determined by dividing the remaining cost by the total number of months in the Contract Time. Payment of these incremental amounts is contingent upon OAR acceptance of CONTRACTOR Monthly Schedule Updates, Recovery Schedules, Four-Week Rolling Schedules, Fragnets, Time Impact Analysis, and the updated Log of Required Submittals.
3. The CONTRACTOR shall anticipate in their base contract scope that numerous Fragnets and written time impact analyses will be required during the duration of the project with the Monthly Schedule Updates. Requests for extra scheduling services will not be considered until the CONTRACTOR demonstrates that all of the costs stipulated in Article 3.08-B has been expended.

3.09 FAILURE TO COMPLY WITH REQUIREMENTS

- A. At any time during the project if CONTRACTOR fails to comply with the specified requirements, OWNER reserves the right to engage independent estimating and scheduling consultants to fulfill these requirements. Upon notice to CONTRACTOR, OWNER shall assess against CONTRACTOR, incurred costs for these additional services.
- B. In such an event, OWNER will require, and CONTRACTOR shall participate and provide requested information to ensure the resulting Milestones Schedule accurately reflects CONTRACTOR’s plan to execute the Work in compliance with the Contract Documents. If it becomes necessary for OWNER to recommend logic or duration revisions as a result of CONTRACTOR failure to furnish acceptable data, and if CONTRACTOR has objections to the recommendations, CONTRACTOR shall provide notice to OWNER within three days and CONTRACTOR shall provide an acceptable alternate plan. If CONTRACTOR fails to so note any objections and provide an acceptable alternate plan, or if CONTRACTOR implements the recommendations of OWNER without so noting any objections, CONTRACTOR will be deemed to have waived all objections and concurred with the recommended logic/duration revisions provided by ARCHITECT and/or OWNER.
- C. Submittal of any Monthly Schedule Updates are subject to review and acceptance by OWNER. OWNER retains the right, including, but not limited to the General Provisions, to withhold progress payments in whole or part until CONTRACTOR submits a Monthly Schedule Update acceptable to OWNER. If a Monthly Schedule Update is “Rejected” due to the OWNER not receiving a satisfactory schedule that accurately reflects the on-going work activities, the OWNER will mandate a separate meeting with the CONTRACTOR and approved Scheduler to remedy the non-conformance. If after the 2nd consecutive month the OWNER still has to “Reject” the monthly Schedule update due to non-conformance, then the CONTRACTOR’S Scheduler will need to be replaced at no additional cost to the OWNER. CONTRACTOR shall within one week of disapproval, propose another Scheduler who meets the experience requirements stated in this Section.

- 3.10 **CONTRACTOR RESPONSIBILITY**
- A. Nothing in this Section shall be construed to be a usurpation of CONTRACTOR authority, responsibility, and obligation to plan and schedule Work as CONTRACTOR deems necessary, subject to all other requirements of the Contract Documents.
 - B. CONTRACTOR shall involve the subcontractors, manufacturers, and suppliers in the development and periodic updating of the schedule.
- 3.11 **RECORD DOCUMENTS / FINAL AS-BUILT SCHEDULE**
- A. Prior to Contract Completion of the Work, CONTRACTOR shall submit a final as-built schedule, and a time-scaled network diagram reflecting the actual dates of all activities. This shall be submitted prior to the final application of payment and prior to the request to release retention.

END OF SECTION – 01 32 13

SECTION 01 32 29

PROJECT FORMS

PART 1 - GENERAL

1.01 SECTION INCLUDES

- A. The following, but not limited to, administrative forms and documents listed in this Section are to be utilized in the administration of the Work. Upon CONTRACTOR request, OAR may approve the use of alternate forms.
- B. From time to time, OWNER may release new revisions and new Project Forms. At any time during the Project, if requested by OAR, CONTRACTOR shall use the newly released Project Forms.

1.02 RELATED REQUIREMENTS

- A. Division 01: General Requirements.

PART 2 - PRODUCTS (Not used)

PART 3 - EXECUTION

3.01 FORMS

- A. The following examples of forms are contained within this Section:
 - 1. Allowance Disbursement Authorization.
 - 2. Application for Payment (2 pages) .
 - 3. Certification of Compliance with Project Stabilization Agreement and Labor Compliance.
 - 4. Certificate of Substantial Completion.
 - 5. Change Order.
 - 6. Change Order Proposal.
 - 7. Change Order Proposal – Compensable Delay Costs.
 - 8. Change Order Proposal Detail Sheet.

9. Change Order Proposal Guidelines.
10. Change Order Proposal – Labor Rate Calculation Form (Request for Rate Higher Than Fully burdened Labor Rates).
11. Conditional Waiver and Release – Final Payment.
12. Construction Directive.
13. Correction Notice.
14. Daily Construction Report.
15. Daily Time and Material Record.
16. Initial Notice of start of Issue, Event, Condition, Circumstance, or Cause of Perceived or Actual Delay, Disruption, Interference, Condition, Circumstance, or Cause of Perceived Delay, Disruption, Interference, Hindrance, Acceleration.
17. Final Notice of End of Issue, Event, Condition, Circumstance, or Cause of Perceived or Actual Delay, Disruption, Interference, Condition, Circumstance, or Cause of Perceived Delay, Disruption, Interference, Hindrance, Acceleration.
18. Five Day Notice.
19. List of Subcontractors.
20. Notice of Completion.
21. Notice of Partial Use or Occupancy.
23. Notice to Proceed.
24. “Or Equal” Request.
25. OWNER Assessment Summary.
26. Property Inventory.
27. Request for Certification of Substantial Completion.
28. Request for Clarification.
29. Request for Proposal.
30. Request for Reduction of Retention.
32. Schedule of Values.

33. Storm Water Pollution Prevention – Site Monitoring Report.
34. Submittal Log.
35. Substitution Request.
36. Transmittal.

3.02 PROCEDURES

- A. Allowance Disbursement Authorization: This form is used for the request and approval of Contract allowances.
- B. Application for Payment: This form is used in requesting a progress payment.
- C. Application for Payment (Multiple Projects): Alternate progress payment request form for contracts comprising more than one project.
- D. Certification of Compliance with Project Stabilization Agreement and Labor Compliance Code Section 1776: This form is used to certify that all contributions due and owing to appropriate trust funds have been paid by CONTRACTOR and all Subcontractors, as specified by the Project Stabilization Agreement (PSA) and General Conditions Article 6.49. This form is also used to certify that CONTRACTOR has submitted all certified payroll records mandated by Labor Code 1776, and General Conditions Article 6.49.
- F. Certificate of Substantial Completion: This form is used according to Article 14 of the General Conditions.
- G. Change Order: This form is used to adjust the Contract Amount, Milestones or Contract Time.
- H. Change Order Proposal: This form is used to communicate proposed adjustments to the Contract Amount, Milestones or Contract Time.
- I. Construction Directive: This form is used to issue a Construction Directive.
- J. Correction Notice: This form is used to provide notice of defective Work.
- K. Daily Construction Report: This form is used to report daily Work activities and manpower levels of CONTRACTOR or Subcontractor.
- L. Daily Time and Material Record: This form is used to provide daily records as set forth in Article 11.11 of the General Conditions.
- M. Initial Notice of Start of Issue, Event, Condition, Circumstance, or Cause of Perceived Delay, Disruption, Interference, Hindrance, Acceleration: This form is used to provide notice as set forth in Article 12.2.1 of the General Conditions.

- N. Final Notice of End of Issue, Event, Condition, Circumstance, or Cause of Perceived Delay, Disruption, Interference, Hindrance, Acceleration: This form is used to provide notice as set forth in Article 12.2.2 of the General Conditions.
- O. Five Day Notice: This notice is used according to Article 15.3.2 of the General Conditions.
- P. List of Subcontractors: This form is used according to Article 14.2 of the General Conditions.
- Q. Notice of Completion: This form is used according to Article 14.17 of the General Conditions.
- R. Notice of Partial Use or Occupancy: This form is used according to Article 14.15 of General Conditions.
- S. Notice To Proceed: This form is used to establish the date of Contract Time commencement and the date Contractor is authorized to commence performance of Contractor obligations.
- T. “Or Equal” Request: This form is used to submit a list of proposed “or equal” substitutions.
- U. Owner Assessment Summary: This form is used for all assessments or withholds by the Owner, permitted under the Contract or required by law, including without limitation, stop notices, prevailing wage violations, liquidated damages, additional consultant services, OCIP premiums, etc.
- V. Property Inventory: This form is used to establish Owner property in a space.
- W. “Request for Certification of Substantial Completion”: This form is used according to Article 14 of the General Conditions
- X. Request for Clarification: This form is to be used for clarification of the intent of the Contract Documents.
- Y. Request for Proposal: This form is used to request a proposed adjustment in the Contract Amount, Milestones or Contract Time in response to the Work contained within the Request for Proposal.
- Z. Request of Reduction of Retention: This form is used according to Article 14.8 of the General Conditions.
- AA. Schedule of Values: This form is used to establish the basis of the certified Application for Payment.

Department of Neighborhood Services and Public Safety
GOLETA TRAIN DEPOT PROJECT

- BB. Storm Water Pollution Prevention Plan (SWPPP): Site Monitoring Reports: These forms are used to certify that construction activities are in compliance with SWPPP (see Section 01 7416).
- CC. Submittal Log: This form is a format for the listing of the required submittals.
- DD. Substitution Request: This form is used to submit proposed substitutions of materials or equipment no longer manufactured or which cannot be acquired from existing inventories.
- EE. Transmittal: This form is used for transmission of items related to the Contract.

END OF SECTION – 01 32 29

SECTION 01 32 33

PHOTOGRAPHIC DOCUMENTATION

PART 1 - GENERAL

1.01 SUMMARY

- A. Section Includes:
1. Preconstruction photography.
 2. Construction photography and time-lapse photography of work-in-progress.

1.02 GENERAL

- A. Provide photographs at locations designated by ARCHITECT, including aerial views.
- B. Photographer: Specialist, experienced in taking construction photography and time-lapse photography.
- C. Equipment:
1. As necessary to photograph both interior and exterior exposures.
 2. Utilize full range of lenses, including wide angle, telephoto and 360 degree.
 3. If drones are used for aerial views, provide proof of FAA Certificated Drone Pilot and Drone Insurance.

1.03 SUBMITTAL REQUIREMENTS

- A. Make photo submittals, to CITY OF GOLETA and ARCHITECT, along with each monthly Application for Payment.
- B. Electronic Format:
1. Submit electronic files in jpeg format produced by digital camera with minimum resolution of not less than 3200 by 2400 pixels with minimum sensor size of 8 megapixels.
 2. Submit without alteration, manipulation, editing, or modifications using image-editing software.
 3. Date and Time: Include date and time in file name for each image.
- C. Cloud based web application for 360-degree images shared with CITY OF GOLETA, ARCHITECT and CONTRACTOR.

1.04 PRECONSTRUCTION PHOTOGRAPHS

- A. Take photographs prior to beginning Work of this Contract.
- B. Provide 20 Project Site photographs, including one aerial view.

1.05 CONSTRUCTION PHOTOGRAPHS

- A. Construction progress photography shall use both still and 360-degree photography to photo document work progress and site conditions. 360-degree photography shall use a cloud-based web application or program that allows photos to be organized and displayed on plan view drawings and accessed real time by the COUNTY OF SANTA BARBARA, ARCHITECT and project team. At project closeout, deliver to the CITY OF GOLETA and ARCHITECT a stand-alone PDF export of the entire project photo documentation.
 - 1. Take construction photographs, beginning two weeks after last preconstruction photograph, and continuing every other week for duration of the Work.
 - 2. Take a minimum of one photo per area within the structure. For areas greater than 500 square feet, take one photo for every 250 square feet of area. Take additional photographs as needed to fully document Project.
 - 3. Take one exterior photo every 300 feet of building perimeter. Take additional photographs as needed to fully document Project.
- B. Provide three (3) independent single point stationary time-lapse photography cameras. The stationary time-lapse cameras shall be mounted to allow a wide range of view of the entire project. The location of stationary time-lapse cameras shall be approved by the CITY OF GOLETA and ARCHITECT. Time-lapse photos shall be taken every 10 minutes 24 hours per day seven days per week through the course of construction. Time-lapse photos shall be accessible real-time on the web and integrated as part of the Electronic Project Management System. At project closeout, time-lapse photos shall be permanently archived and remain viewable by the CITY OF GOLETA and ARCHITECT.
- C. Provide bi-monthly ariel view photos of the project site.

PART 2 PRODUCTS (Not Used)

PART 3 EXECUTION (Not Used)

END OF SECTION – 01 32 33

SECTION 01 33 00

SUBMITTAL PROCEDURES

PART 1 – GENERAL

1.01 GENERAL

- A. Submittals are required for all materials called for in the Technical specifications, including tapping sleeves, vaults, vault lids, combination air valve covers, and where called for in the GOLETA WATER DISTRICT Technical Specifications. Submittals are also required for all materials not otherwise specified in the Technical Specifications, or whenever an “or equal” item is requested for use by the Contractor.
- B. Related Sections:
 - 1. Division 00 - Procurement and Contracting Requirements
 - 2. Division 01 - General Requirements
 - 3. Technical Specification Sections identifying required submittals

1.02 PRECONSTRUCTION CONFERENCE SUBMITTALS

- A. At the preconstruction conference, the Contractor shall submit the following items for review:
 - 1. A preliminary schedule of Shop Drawing, Sample, and proposed Substitute ("Or-Equal") submittals.
 - 2. A list of all required submittals for the project from Contractor and all subcontractors and suppliers, including delivery and sample review and approval form if sample is not provided by Engineer.
 - 3. A list of all permits and licenses the Contractor shall obtain indicating the agency required to grant the permit, the expected date of submittal for the permit, and required date for receipt of the permit.
 - 4. A project overview bar chart.

1.03 SHOP DRAWINGS

- A. Wherever called for in the Contract Documents, the Contractor shall furnish for review, two (2) physical copies of each Shop Drawing submittal and one (1) electronic copy. The term "Shop Drawings" as used herein shall be understood to include detail design calculations, shop-prepared drawings, fabrication and installation drawings, erection drawings, lists, graphs, catalog sheets, data sheets, and similar items. Whenever the Contractor is required to submit design calculations as part of a submittal, such

calculations shall bear the signature and seal of an engineer registered in the State of California in the appropriate area of expertise.

B. Organization

1. A single submittal transmittal form shall be used for each technical specification section or item or class of material or equipment for which a submittal is required. A single submittal covering multiple sections will not be acceptable unless the primary specification references other sections for components.
2. On the transmittal form, index the components of the submittal and insert tabs in the submittal to match the components. Relate the submittal components to Technical Specification paragraph and subparagraph, Drawing number, detail number, schedule title, as applicable.
3. Unless indicated otherwise, terminology and equipment names and numbers used in submittals shall match the Contract Documents.

C. Format

1. Minimum sheet size shall be 8.5 inches by 11 inches. Maximum sheet size shall be 24 inches by 36 inches. Every page in a submittal shall be numbered in sequence. Each copy of a submittal shall be collated and stapled or bound, as appropriate.
2. Where product data from a manufacturer is submitted, clearly mark which model is proposed, with all pertinent data, capacities, dimensions, clearances, diagrams, controls, connections, anchorage, and supports. Sufficient level of detail shall be presented for assessment of compliance with the Contract Documents.
3. Each submittal shall be assigned a unique number. Submittals shall be numbered sequentially. The submittal numbers shall be clearly noted on the transmittal. Original submittals shall be assigned a numeric submittal number. Resubmittals shall bear an alpha-numeric system which consists of the number assigned to the original submittal for that item followed by a letter of the alphabet to represent that it is a subsequent submittal of the original. For example, if submittal 25 requires a resubmittal, the first resubmittal will bear the designation "25-A" and the second resubmittal will bear the designation "25-B" and so on.
4. A submittal log will be maintained by the Contractor and submitted to the City or agency that includes, at a minimum, the unique number, subject, anticipated date of submittal, date submitted, date returned, and City or agency response.

- D. Disorganized submittals that do not meet the requirements above will be returned without review.**

- E. Except as may otherwise be indicated herein, the City will return prints of each submittal to the Contractor with its comments noted thereon, within 14 calendar days following receipt. It is considered reasonable that the Contractor shall make a complete and acceptable submittal by the second submission of a submittal item.
- F. If a submittal is returned to the Contractor marked "NO EXCEPTIONS TAKEN," formal revision and resubmission of said submittal is not required.
- G. If a submittal is returned marked "MAKE CORRECTIONS NOTED," Contractor shall make the corrections on the submittal, but formal revision and resubmission of said submittal is not required.
- H. If a submittal is returned marked "AMEND-RESUBMIT," the Contractor shall revise said submittal and shall resubmit the required number of copies of said revised submittal for review.
- I. If a submittal is returned marked "REJECTED-RESUBMIT," it shall mean that the submitted material or product does not satisfy the specification, the submittal is so incomplete that it cannot be reviewed, or is a substitution request not submitted in accordance with Section 016000 - Products, Materials, Equipment, and Substitutions. The Contractor shall prepare a new submittal and shall resubmit the required number of copies of said revised submittal for review.
- J. Fabrication of an item shall be commenced only after the City or agency has reviewed the pertinent submittals and returned copies to the Contractor marked either "NO EXCEPTIONS TAKEN" or "MAKE CORRECTIONS NOTED." Corrections indicated on submittals shall be considered as changes necessary to meet the requirements of the Contract Documents and shall not be taken as changes to the contract requirements.
- K. The review of submittals shall not relieve the Contractor of the entire responsibility for the correctness of details and dimensions. The Contractor shall assume all responsibility and risk for any misfits due to any errors in submittals. The Contractor shall be responsible for the dimensions and the design of adequate connections and details.

1.04 SAMPLES

- A. Whenever in the Specifications samples are required, the Contractor shall submit not less than two samples of each item or material for acceptance. Unless otherwise indicated, samples, shall be submitted a minimum of 14 days prior to ordering such material.
- B. Samples shall be individually and indelibly labeled or tagged, indicating thereon all specified physical characteristics and Manufacturer's name. Upon receiving acceptance of the City or agency, one set of the samples will be stamped and dated by the City or agency and returned to the Contractor, and one set of samples will be retained by the City or agency.

- C. Colors and textures of items presented in sample submittals shall be as indicated on the plans or described in the specifications for that particular item. Unless indicated otherwise, samples shall be provided from the manufacturer's standard colors and standard materials, products, or equipment lines.

1.05 OPERATIONS & MAINTENANCE MANUAL

- A. When so specified in the Contract documents, the Contractor shall submit technical operation and maintenance information for each item of mechanical and electrical equipment in an organized manner in the Operations & Maintenance (O&M) Manual. Additional instructions above and beyond that provided by the manufacturer shall be provided as indicated below and written in a clear and concise manner.
- B. The O&M Manual shall be subdivided first by specification section number; second, by equipment item; and last, by "Category" with the following information provided for each item of equipment (as applicable):
1. Category 1 - Equipment Summary: A summary table shall indicate the equipment name, equipment number, and location in which the equipment is installed.
 2. Category 2 - Operational Procedures: Manufacturer-recommended procedures shall be included covering: Installation, Adjustment, Operation procedures, Troubleshooting, Disassembly, Re-assembly; and Tabulation of proper settings for all pressure relief valves, low and high pressure switches, and other protection devices.
 3. Category 3 - Preventative Maintenance Procedures: Preventative maintenance procedures shall include all manufacturer-recommended procedures to be performed and recommended frequency of preventative maintenance procedures shall be included.
 4. Category 4 - Parts List and Drawings: A complete parts list shall be furnished, including a generic description and manufacturer's identification number for each part. Addresses and telephone numbers of the nearest supplier and parts warehouse shall be included. Cross-sectional or exploded view drawings shall accompany the parts list.
 5. Category 5 – Safety Procedures: Engineering, industry, and manufacturer-recommended safety procedures shall be provided covering the safety precautions to be taken when operating and maintaining the equipment or working near it.
 6. Category 6 - Documentation: All equipment warranties, affidavits, and certifications required by the Technical Specifications shall be placed in this category.
 7. Spare Parts List: The spare parts list shall include those spare parts which each manufacturer recommends be maintained in inventory at the project site. The Contractor shall cross-reference all spare parts lists to the equipment numbers

designated in the Contract Documents. Each manufacturer or supplier shall indicate the name, address, and telephone number of its nearest outlet of spare parts to assist the City in ordering spare parts. The list shall include the current list price of each spare part.

- C. The Contractor shall furnish to the City or agency 3 identical physical O&M Manuals and one (1) electronic copy. Each set shall consist of one or more volumes, each of which shall be bound in a standard size, 3-ring, loose leaf, vinyl plastic hard cover binder suitable for bookshelf storage. Binder ring size shall not exceed 2.5 inches. A table of contents indicating all equipment in the manuals shall be included.
- D. Manuals shall be submitted in final form not later than the 75 percent of construction completion date. All discrepancies found by the City or agency shall be corrected within 30 days from the date of written notification by the City or agency.

1.06 RECORD DRAWINGS

- A. The Contractor shall maintain one record set of Drawings at the Site. On these, it shall mark all project conditions, locations, configurations, and any other changes or deviations which may vary from the information represented on the original Contract Drawings, including buried or concealed construction and utility features which are revealed during the course of construction. Special attention shall be given to recording the horizontal and vertical location of all buried utilities that differ from the locations indicated, or which were not indicated on the Contract Drawings. The Contractor shall provide supplemental detailed sketches as necessary or directed to fully indicate the work as actually constructed. These master record drawings of the Contractor's representation of record drawing conditions, including all revisions made necessary by addenda and change orders shall be maintained up-to-date during the progress of the work. Red ink shall be used for alterations and notes.
- B. In the case of those drawings which depict the detail requirement for equipment to be assembled and wired in the factory, such as motor control centers and the like, the record drawings shall be updated by indicating those portions which are superseded by change order drawings or final Shop Drawings, and by including appropriate reference information describing the change orders by number and the Shop Drawings by manufacturer, drawing, and revision numbers.
- C. Record drawings shall be accessible at all times during the construction period. Said up-to-date record drawings shall be in the form of a set of prints with carefully plotted information overlaid.
- D. Upon Substantial Completion of the work and prior to final acceptance, the Contractor shall finalize and deliver a complete set of record drawings to the Project Engineer, City or agency as applicable. This set of drawings shall consist of corrected Drawings showing the reported location of the work. The information submitted by the Contractor and incorporated by the Project Engineer into the record drawings will be assumed to be correct, and the Contractor shall be responsible for the accuracy of such information, and for any errors or omissions which may appear on the record drawings as a result.

Department of Neighborhood Services and Public Safety
GOLETA TRAIN DEPOT PROJECT

PART 2 – PRODUCTS [NOT USED]

PART 3 – EXECUTION

END OF SECTION – 01 3300

SECTION 01 35 70 ENVIRONMENTAL REQUIREMENTS

PART 1 - GENERAL

1.01 SUMMARY

- A. Section Includes: General requirements and procedures for compliance with certain prerequisites and credits needed for Project to obtain the targeted LEED Silver certification under the LEED for New Construction and Major Renovations (LEED-NC) version 4 (v4) as administered by the U.S. Green Building Council (USGBC).
1. Some LEED prerequisites and credits needed to obtain LEED certification depend on product selections and may not be specifically identified as LEED requirements. Compliance with requirements needed to obtain LEED prerequisites and credits may be used as one criterion to evaluate substitution requests and comparable product requests.
 2. A copy of the LEED Project checklist is attached at the end of this Section for information only.
 - a. Some LEED prerequisites and credits needed to obtain the indicated LEED certification depend on aspects of Project that are not part of the Work of the Contract.
 3. Definitions included in the "LEED Version 4 for Building Design and Construction" (LEED v4 BD+C) Reference Guide and online amendments apply to this Section.
- B. Related Specification Sections include but are not necessarily limited to:
1. Division 00 - Bidding Requirements, Contract Forms, and Conditions of the Contract.
 2. Division 01 - General Requirements.
 3. Section 01 74 19 Construction Waste Management and Disposal
 4. Section 01 81 19 Indoor Air Quality Procedures.

1.02 DEFINITIONS

- A. **Bio-Based Materials:** Materials that meet the Sustainable Agriculture Network's Sustainable Agriculture Standard. Bio-based raw materials shall be tested using ASTM D 6866 and be legally harvested, as defined by the exporting and receiving country.
- B. **CDPH Standard Method v1.2:** California Department of Public Health (CDPH) Standard Method for the Testing and Evaluation of Volatile Organic Chemical Emissions from Indoor Sources Using Environmental Chambers, v. 1.2–2017, for the emissions testing and requirements of products and materials.
- C. **Chain-of-Custody Certificates:** Certificates signed by manufacturers and fabricators certifying that wood used to make products was obtained from forests certified by an FSC-accredited certification body to comply with FSC STD-01-001.
- D. **Environmental Product Declaration (EPD):** An independently verified report based on life-cycle assessment studies that have been conducted according to a set of common rules for each product category and peer-reviewed.
 - 1. **Product-Specific Declaration:** A product with a publicly available, critically reviewed life-cycle assessment conforming to ISO 14044 that has at least a cradle to gate scope.
 - 2. **Industry-Wide (Generic) EPD:** Provide products with third-party certification (Type III), including external verification, in which the manufacturer is explicitly recognized as a participant by the program operator. EPD must conform to ISO 14025, 14040, 14044, and EN 15804 or ISO 21930 and have at least a cradle to gate scope.
 - 3. **Product-Specific Type III EPD:** A product with a third-party certification, including external verification, in which the manufacturer is explicitly recognized by the program operator. EPD must conform to ISO 14025, 14040, 14044, and EN 15804 or ISO 21930 and have at least a cradle to gate scope.
- E. **Extended Producer Responsibility (EPR):** Measures undertaken by the maker of a product to accept its own and sometimes other manufacturers' products as postconsumer waste at the end of the products' useful life.
- F. **Health Product Declaration Open Standard (HPD):** A standard format for reporting product content and associated health information for building products and materials.

- G. **Material Cost:** The dollar value of materials being provided to the site, after Contractor mark-ups, including transportation costs, taxes, fees, and shop labor, but excluding field equipment and field labor costs.
- H. **Recycled Content:** Recycled content is the sum of postconsumer recycled content plus one-half the preconsumer recycled content, based on cost.
 - 1. "Postconsumer" material is defined as waste material generated by households or by commercial, industrial, and institutional facilities in their role as end users of the product, which can no longer be used for its intended purpose.
 - 2. "Preconsumer" material is defined as material diverted from the waste stream during the manufacturing process. Excluded is reutilization of materials, such as rework, regrind, or scrap, generated in a process and capable of being reclaimed within the same process that generated it.
- I. **Regional Materials:** Materials that are extracted, harvested, recovered, and manufactured within a radius of 100 miles from the Project site.
- J. **Volatile Organic Compounds (VOC) Emissions Test:** Refer to CDPH Standard Method v1.2 definition.
- K. Additional definitions are listed in "Glossary of Terms" in the USGBC Reference Guide.

1.03 ADMINISTRATIVE REQUIREMENTS

- A. Work of this project includes completed building and application for LEED certification. Work is not complete until Owner has accepted LEED's final review of LEED certification.
- B. Provide documentation required by LEED and LEED review.
- C. Comply with LEED requirements and requirements specified in other Sections.
 - 1. Refer any discrepancy to the Architect for clarification.
 - 2. Coordinate the Work specified in This Section and the requirements applicable and effecting Work in other Sections.
- D. Provide materials and procedures necessary to obtain LEED prerequisites and credits required in this Section. Other Sections may specify requirements that contribute to LEED prerequisites and credits. Refer to other sections for

additional materials and procedures necessary to obtain LEED prerequisites and credits.

- E. Respond to questions and requests for additional information from Architect and the LEED regarding LEED credits until the LEED has made its determination on the project's LEED certification application.
- F. LEED Online Submittals: Upload LEED documentation submittal data directly to LEED project "LEED Online" website. Complete online forms at least monthly and as necessary to document LEED credits for submittals required in this Section.
- G. LEED Conference: Schedule and conduct a conference at a time convenient to Owner and Architect within 21 days prior to commencement of the work. Advise Architect, Engineer, and Owner's Commissioning Authority of scheduled meeting dates.
 - 1. Attendees: Authorized representatives of Owner, Owner's Commissioning Authority, Architect, and their consultants; Contractor and its superintendent; major subcontractors; suppliers; and other concerned parties shall attend the conference. Participants at the conference shall be familiar with Project and authorized to conclude matters relating to the Work.
 - 2. Agenda: LEED goals for the project, Contractor's action plans, and discussion of targeted LEED Prerequisites and Credits.
 - 3. Minutes: Record and distribute minutes to attendees and other entities with responsibilities for obtaining LEED Credits.
- H. LEED Coordination Meetings: Contractor shall schedule and conduct LEED Certification coordination meetings, held every four to six weeks. At the Owner Representative's discretion, the LEED Certification meetings may be combined with other Project meetings. Meeting attendees shall include:
 - 1. Contractor's Project Manager
 - 2. Contractor's LEED Coordinator
 - 3. All other attendees designated by the Owner
 - 4. Sub-Contractor Representatives as appropriate to stage of work

1.04 SUBMITTALS

- A. Action Submittals:
1. Submit each LEED submittal simultaneously with applicable product submittal.
- B. Project Materials Cost Data: Deliver the necessary material and cost data required for credit calculations on the LEED Material Buyout Form. Include total cost and shop labor for project materials and itemized costs of specific materials being tracked for LEED credits. Material costs exclude site labor, overhead, profit and construction equipment. Include Divisions 03-10 and 12, if applicable to the Project scope of work (the total materials cost is exclusive of specialties: Conveying Systems and Mechanical and Electrical components).
- C. LEED Action Plans: Within 30 days of Notice to Proceed submit the following action plans to the Owner's Representative:
1. Prerequisite SS 1, Construction Activity Pollution Prevention: Erosion and Sedimentation Control plan.
 2. Prerequisite MR 2 and Credit 5, Construction and Demolition Waste Management: Construction Waste Management Plan complying with Section 017419 "Construction Waste Management".
 3. Credit EQ 2, Low-Emitting Materials: Low Emitting Materials Tracking Sheet indicating all adhesives, sealants, paints, coatings, composite wood, flooring, insulation, wall and ceiling products anticipated to be used on the project.
- D. LEED Documentation Submittals:
1. General, Sustainable Materials Attributes Form: Project submittals must be accompanied by a completed Sustainable Materials Attributes Form (Material Buyout Form). Submittal packages must also include highlighted documentation supporting the sustainability claims made on the Sustainable Materials Attributes Form.
 2. Provide declarations complying with LEED requirements, as identified in the product specification section, including:
 - a. Credit MR 2, Environmental Environmental Product Declarations, Option 1, Environmental Product Declarations (EPD's):

- 1) Manufacturers Life Cycle Analysis conforming to ISO 14044, Industry-wide (generic) EPD with third-party Type III certification, or Product-specific Type III EPD.
- b. Credit MR 3, Sourcing of Raw Materials:
 - 1) Recycled Content: Product data and certification letter from product manufacturers, indicating percentages by weight of postconsumer and preconsumer recycled content for products having recycled content. Include statement of costs
 - 2) Bio-Based Materials: Product data and certification for bio-based materials, indicating that they comply with requirements. Include statement of costs.
 - 3) FSC Certified Wood: Product data and chain-of-custody certificates for products containing certified wood. Include statement indicating cost for each certified wood product.
 - 4) Materials Reuse: Receipts for salvaged and refurbished materials used for Project, indicating sources and costs.
 - 5) Local/Regional Material: For any materials contributing to MRc3 that are manufactured and extracted within 100 miles of the project site, submit cutsheet, product literature or letter from manufacturer indicating the location of harvest, processing and manufacturer and proximity from the project site.
- c. MR credit 4, Material Ingredients: Material ingredient reports for products that comply with LEED requirements for material ingredient reporting, including but not limited to the following:
 - 1) Manufacturer Inventory.
 - 2) Health Product Declaration.
 - 3) Cradle to Cradle certifications.
 - 4) Declare product labels.
 - 5) ANSI/BIFMA e3 Furniture Sustainability Standard.
- d. Low-Emitting Materials: Product data, indicating VOC content and emissions testing documents showing compliance with requirements for low-emitting materials, for the following materials:
 - 1) Adhesives, Sealants, Paints and Coatings:
 - a) Submit product MSDS, SDS or other documentation confirming the VOC emission information for on-site wet applied products.
 - b) Submit volume of all products used in Liters or Gallons.
 - 2) Adhesives, Sealants, Paints, Coatings, Flooring, Ceilings, Walls, Thermal, and Acoustic Insulation:
 - a) Submit manufacturers VOC Emissions Evaluation verification in accordance with California Department of Public Health (CDPH) Standard Method v1.2–2017 or equivalent verification method.

- 3) Composite Wood Products:
 - a) Submit CARB Executive Order for the specific manufacturing location of the composite wood product confirming No Added Formaldehyde (NAF) resins or Ultra Low Emitting Formaldehyde (ULEF) resins. In addition, provide a statement from the manufacturer that reads "The XX product is a HWPW-CC/-VC/PB/MDF manufactured in our XX location which is authorized under CARB EO #XX."
 - b) Wood structural panel manufactured according to PS 1-09 or PS 2-10 (or one of the standards considered by CARB to be equivalent to PS 1 or PS 2) and labeled bond classification Exposure 1 or Exterior
 - c) Structural wood product manufactured according to ASTM D 5456 (for structural composite lumber), ANSI A190.1 (for glued laminated timber), ASTM D 5055 (for I-joists), ANSI PRG 320 (for cross-laminated timber), or PS 20-15 (for finger-jointed lumber).

1.05 QUALITY ASSURANCE

- A. LEED Coordinator: Assign an individual knowledgeable of certification to coordinate LEED requirements with Project's LEED Consultant. The LEED Coordinator must have documented LEED experience on at least two building projects with a similar scope of work. The experience must include construction activities. LEED coordinator may also serve as waste management coordinator in Section 01 74 19. LEED coordinator shall attend all LEED certification meetings and shall be available as needed in the field for LEED-related site walks and inspections and to answer questions that may arise and as otherwise requested.

PART 2 - PRODUCTS

2.01 MATERIALS, GENERAL

- A. Provide products and procedures necessary to obtain LEED credits required in this Section. Although other Sections may specify some requirements that contribute to LEED credits, the Contractor shall determine additional materials and procedures necessary to obtain LEED credits indicated. Contractor to determine a combination of credit options best suited for achieving credits required.
1. Exclusions: Special equipment, such as elevators, escalators, process equipment, and fire suppression systems, is excluded from the credit calculations. Also excluded are products purchased for temporary use on the project, like formwork for concrete.

2.02 BUILDING PRODUCT DISCLOSURE AND OPTIMIZATION

- A. Credit MR 2, Environmental Product Declarations (EPD): Option 1. Provide at least 20 permanently installed products (sourced from at least 5 different manufacturers) which meet one of the disclosure criteria:
1. Product-Specific Declaration: Valued as one product.
 2. Industry-Wide (Generic) EPD: Valued as one product.
 3. Product-Specific Type III EPD: Valued as one product.
 4. Product-Specific Type III EPD with external verification and critical review: Valued as one and one-half product.
- B. Credit MR 3, Sourcing of Raw Materials: Provide products that meet at least one of the responsible extraction criteria below for at least 15%, by cost, of the total value of permanently installed building products in the project:
1. Recycled content.
 2. Extended producer responsibility program.
 3. Bio-based materials.
 4. Certified Wood: Wood-based materials include, but are not limited to, the following materials when made from wood, engineered wood products, or wood-based panel products

- C. Credit MR 4, Material Ingredients: Option 1, Material Ingredient Reporting. Provide at least 20 different permanently installed products from at least five different manufacturers that use any of the following programs to demonstrate the chemical inventory of the product to at least 0.1% (1000 ppm), which meet one of the following disclosure criteria:
1. Manufacturer Inventory.
 2. Health Product Declarations (HPDs).
 3. Cradle to Cradle (C2C) certifications.
 4. Declare product labels.
 5. ANSI/BIFMA e3 Furniture Sustainability Standard.

2.03 LOW-EMITTING MATERIALS

- A. Low-Emitting Materials, Paints and Coatings – VOC Content Evaluation: For field applications use paints and coatings that comply with the limits for VOC content when calculated according to the California Air Resources Board (CARB) 2007, Suggested Control Measure (SCM) for Architectural Coatings, or the South Coast Air Quality Management District (SCAQMD) Rule 1113, effective February 5, 2016.

Product Type:	Allowable VOC Content (g/L):
Bond Breaker	350
Clear wood finishes - Varnish	275
Clear wood finishes – Sanding Sealer	275
Clear wood finishes - Lacquer	275
Colorant – Architectural Coatings, excluding IM coatings	50
Colorant – Solvent Based IM	600
Colorant - Waterborne IM	50
Concrete – Curing compounds	100
Concrete – Curing compounds for roadways & bridges	350
Concrete surface retarder	50
Driveway Sealer	50
Dry-fog coatings	50
Faux finishing coatings - Clear topcoat	100
Faux finishing coatings – Decorative Coatings	350

Faux finishing coatings - Glazes	350
Faux finishing coatings – Trowel applied coatings	50
Fire-proof coatings	150
Flats	50
Floor coatings	50
Form release compounds	100
Graphic arts (sign) coatings	150
Industrial maintenance coatings	100
Industrial maintenance coatings – High temperature IM coatings	420
Industrial maintenance coatings – Non-sacrificial anti-graffiti coatings	100
Industrial maintenance coatings – Zinc rich IM primers	100
Mastic coatings	100
Metallic pigmented coatings	150
Multi-color coatings	250
Non-flat coatings	50
Pre-treatment wash primers	420
Primers, sealers and undercoaters	100
Reactive penetrating sealers	350
Recycled coatings	250
Roof coatings	50
Roof coatings, aluminum	100
Roof primers, bituminous	350
Rust preventative coatings	100
Stone consolidant	450
Sacrificial anti-graffiti coatings	50
Shellac- Clear	730
Shellac – Pigmented	550
Specialty primers	100
Stains	100
Stains, interior	250
Traffic Coatings	100
Waterproofing sealers	100
Waterproofing concrete/masonry sealers	100
Wood preservatives	350
Low solids coatings	120

- a. Low-Emitting Materials, Adhesives and Sealants – VOC Content Evaluation: For field applications that are inside the weatherproofing system, use adhesives and sealants that comply with the limits for VOC content when calculated according

to South Coast Air Quality Management District (SCAQMD) Rule #1168, requirements in effect on October 6, 2017:

Architectural Applications:	Allowable VOC Content (g/L):
Indoor carpet adhesives	50
Carpet pad adhesives	50
Outdoor carpet adhesives	150
Wood flooring adhesives	100
Rubber floor adhesives	60
Subfloor adhesives	50
Ceramic tile adhesives	65
VCT and asphalt tile adhesives	50
Dry wall and panel adhesives	50
Cove base adhesives	50
Multipurpose construction adhesives	70
Structural glazing adhesives	100
Single ply roof membrane adhesives	250
Specialty Applications:	
PVC welding	510
CPVC welding	490
ABS welding	325
Plastic cement welding	250
Adhesive primer for plastic	550
Computer diskette manufacturing	350
Contact adhesive	80
Special purpose contact adhesive	250
Tire retread	100
Adhesive primer for traffic marking tape	150
Structural wood member adhesive	140
Sheet applied rubber lining operations specialty	250
Top and Trim adhesive	250
Substrate Specific Applications:	
Metal to metal substrate specific adhesives	30
Plastic foam substrate specific adhesives	50
Porous material (except wood) substrate specific adhesives	50
Wood substrate specific adhesives	30
Fiberglass substrate specific adhesives	80
Sealants:	
Architectural sealant	250
Marine deck sealant	760
Nonmember roof sealant	300

Architectural Applications:	Allowable VOC Content (g/L):
Roadway sealant	250
Single-ply roof membrane sealant	450
Other sealant	420
Sealant Primers:	
Architectural non-porous sealant primer	250
Architectural porous sealant primer	775
Modified bituminous sealant primer	500
Marine deck sealant primer	760
Other sealant primer	750
Other:	
Other adhesives, adhesive bonding primers, adhesive primers or any other primers	250

- D. Low-Emitting Materials, VOC Emissions Evaluation: Products must demonstrate they have been tested and determined compliant in accordance with California Department of Public Health, (CDHP), Standard Method v1.2-2017, using the applicable exposure scenario. Manufacturer’s documentation demonstrating compliance must state the range of total VOCs (tVOC) after 14 days measured as specified in the CDPH Standard Method v1.2 (0.5mg/m³ or less; between 0.5 and 5.0 mg/m³; or 0.50 mg/m³ or more).
1. Paints and Coatings – VOC Emissions Evaluation: For field applications that are inside the weatherproofing system, 75 percent of paints and coatings shall comply with the VOC Emissions Evaluation. Acceptable third party verified labels confirming compliance include but are not limited to:
 - a. Greenguard Gold
 - b. MAS Certified Green
 - c. Intertek ETL Environmental VOC+
 2. Adhesives and Sealants – VOC Emissions Evaluation: For field applications that are inside the weatherproofing system, 75 percent of adhesives and sealants shall comply with the VOC Emissions Evaluation. Acceptable third party verified labels confirming compliance include but are not limited to:
 - a. Greenguard Gold
 - b. MAS Certified Green
 - c. Intertek ETL Environmental VOC+
 3. Flooring – VOC Emissions Evaluation: 90 percent of floorings shall comply with the VOC Emissions Evaluation. Acceptable third party verified labels confirming compliance include but are not limited to:

Department of Neighborhood Services and Public Safety
GOLETA TRAIN DEPOT PROJECT

- a. FloorScore
 - b. CRI Green Label Plus
 - c. Greenguard Gold
 - d. SCS Indoor Advantage Gold
 - e. MAS Certified Green
 - f. Intertek ETL Environmental VOC+
 - g. NSF/ ANSI 332
4. Composite Wood – Formaldehyde Emissions Evaluation: All interior grade plywood, composite hardwood, and agrifiber products that are architecturally rated shall meet EPA TSCA Title VI or California Air Resources Board (CARB) ATCM for formaldehyde requirements for ultra-low-emitting formaldehyde (ULEF) resins or no added formaldehyde (NAF).
5. Structural composite wood must meet one of the following:
- a. Manufactured according to PS 1-09 or PS 2-10 (or one of the standards considered by CARB to be equivalent to PS 1 or PS 2) and labeled bond classification Exposure 1 or Exterior
 - b. Manufactured according to ASTM D 5456 (for structural composite lumber), ANSI A190.1 (for glued laminated timber), ASTM D 5055 (for I-joists), ANSI PRG 320 (for cross-laminated timber), or PS 20-15 (for finger-jointed lumber).
6. Ceilings – VOC Emissions Evaluation: 90% of ceilings, by cost or surface area, comply with the requirements of the VOC Emissions Evaluation. Acceptable third party verified labels confirming compliance include but are not limited to:
- a. Greenguard Gold
 - b. SCS Indoor Advantage Gold
7. Walls Panels – VOC Emissions Evaluation: 75% of all wall panels, by cost or surface area, shall comply with the requirements of the VOC Emissions Evaluation. Wall panel product category included all finish wall treatments (wall coverings, wall paneling, wall, tile), surface wall structures such as gypsum or plaster, cubicle/ curtain/ partition walls, doors, frames, windows and window treatments. Acceptable third party verified labels confirming compliance include but are not limited to:
- a. Greenguard Gold
 - b. SCS Indoor Advantage Gold
8. Insulation – VOC Emissions Evaluation: 75% of all insulation shall comply with the requirements of the VOC Emissions Evaluation. The insulation material category includes all thermal and acoustic boards, batts, rolls, blankets, sound attention, foamed-in place, loose-fill, blown

and sprayed insulation. Acceptable third party verified labels confirming compliance include but are not limited to:

- a. Greenguard Gold
- b. SCS Indoor Advantage Gold

2.04 WATER USE REDUCTION

- A. Water Use Reduction, Irrigation: Do not exceed water flow requirements indicated on drawings.
- B. Water Use Reduction, Plumbing Fixtures: Do not exceed water flow requirements indicated in Division 22 - PLUMBING.

PART 3 - EXECUTION

3.01 NONSMOKING SITE AND BUILDING

- A. Construction Indoor Air Quality Management: Smoking is not permitted within the platform area or within 25 feet of entrances.

3.02 CONSTRUCTION WASTE MANAGEMENT

- A. Construction and Demolition Waste Management: Comply with requirements within Section 01 74 19 Construction Waste Management.

PART 4 - MEASUREMENT AND PAYMENT

Work of this Section is considered incidental to work under other payment items and no separate measurement and payment will be made to the Contractor for Work of this Section. Work of this section shall include furnishing all labor, materials, tools, equipment, supplies, supervision, and incidentals, and doing all work, as shown on the Plans, and as specified in these Specifications, and as directed by the OAR.

END OF SECTION – 01 35 70

SECTION 01 35 92

MITIGATION AND MONITORING PROCEDURES FOR ARCHAEOLOGICAL FINDINGS

PART 1 - GENERAL

1.01 SECTION INCLUDES

- A. Mitigation procedures for the unanticipated discovery of archaeological or paleontological remains not identified by research or other investigations during pre-construction.
- B. Mitigation procedures for the unanticipated discovery of human remains and associated cultural materials.

1.02 REGULATORY REQUIREMENTS

- A. State of California Health and Safety Code Section 7050.5.
- B. Public Resources Code, Sections 5097.94, 5097.98, 5097.99.
- C. Secretary of the Interior's Standards and Guidelines.
- D. Professional Qualifications Standards (48 Federal Register 44738–39).
- E. South Central Coastal Information Center at the California State University, Fullerton.
- F. Native American Heritage Commission (NAHC).
- G. Archaeological Resource Management Reports (ARMR).
- H. ARMR Guidelines.

1.03 ARCHAEOLOGICAL FINDINGS

- A. Upon archaeological discoveries the CONTRACTOR shall stop construction activities in the immediate area and notify the OAR. OWNER will retain a qualified archeologist meeting the Secretary of the Interior's Professional Qualifications Standards (48 Federal Register 44738–39), to make an immediate evaluation of significance and appropriate treatment of the resource.
- B. To complete this assessment, CONTRACTOR shall allow the Archeologist shall the necessary time and access to the Site to recover, analyze, and curate the find. The Archeologist will recommend the extent of archeological monitoring necessary to ensure the protection of resources that may be in the area. Construction activities may continue on other parts of the site while evaluation and treatment of historical or unique archaeological resources takes place.
- C. OWNER will implement an archaeological monitoring program for the construction activities at the site prepared by the Archaeologist under the following conditions:
 - 1. When a Phase I Site Investigation shows a strong possibility that unique archaeological resources are buried on the site.

2. When unique architectural resources have been identified on a site, but OWNER does not implement a Phase III Data Recovery/Mitigation Program because the resources can be recovered through the archaeological monitoring program.
- D. Work shall stop within a 30-foot radius of the discovery. Work shall not continue until the discovery has been evaluated by the Archaeologist. The Archaeologist will assess the find and, if determined to be of value, will draft a monitoring program and oversee the remainder of the grading work. Archaeologist will monitor the project ground-disturbing activities if there is evidence that prehistoric or historic cultural resources may be found. Significant archaeological resources found will be preserved as determined necessary by the Archaeologist and offered to a local museum or repository. Resulting reports will be forwarded to the South Central Coastal Information Center at the California State University, Fullerton.
- E. Cultural resources sensitivity training will be conducted by the Archaeologist for the construction workers involved in moving soil or working near soil disturbance. This training will review the types of archaeological resources that might be found, along with laws for the protection of resources.
- F. OWNER will determine whether it is feasible to prepare and implement a Phase III Data Recovery/Mitigation Program. A Phase III Data Recovery/Mitigation Program would be designed by the Archaeologist to recover a statistically valid sample of the archaeological remains and to document the site to a level where the impacts can be determined to be less than significant. Documentation will be prepared in the standard format of the ARMR Guidelines, as prepared by the OHP. Once a Phase III Data Recovery/Mitigation Program is completed, an archaeological monitor will be present on site to oversee the grading, demolition activities, and/or initial construction activities to ensure that construction proceeds in accordance with the adopted Phase III Data Recovery/Mitigation Program. The extent of the Phase III Data Recovery/Mitigation Program and the extent and duration of the archaeological monitoring program depend on site-specific factors.
- G. Work shall stop within a 30-foot radius of the discovery. Work shall not continue until the discovery has been evaluated by a qualified Archaeologist and the local Native American representative has been contacted and consulted to assist in the accurate recordation and recovery of the resources.

1.04 PALEONTOLOGICAL FINDINGS

- A. Upon paleontological discoveries the CONTRACTOR shall stop construction activities in the immediate area and notify the OAR. OWNER will have a paleontological monitor on-call during construction activities. This monitor will provide the construction crew with a brief summary of the sensitivity, the rationale behind the need for protection of these resources, and information on the initial identification of paleontological resources. If paleontological resources are uncovered during construction, the on-call paleontologist shall be notified and afforded the necessary time to recover, analyze, and curate the find. Subsequently, the monitor will remain on site for the duration of the ground disturbances to ensure the protection of any other resources that may be in the area.

- B. The paleontological monitor will be on site for ground altering activities and will advise OWNER as to necessary means of protecting potentially significant paleontological resources, including, but not limited to, possible cessation of construction activities in the immediate area of a find. If resources are identified during the monitoring program, the CONTRACTOR shall provide the paleontologist the necessary time to recover, analyze, and curate the find. Subsequently, the monitor will remain on site for the duration of the ground disturbances to insure the protection of any other resources that may be in the area.

1.05 HUMAN REMAINS FINDINGS

- A. The State of California Health and Safety Code Section 7050.5 states that in the event that human remains are discovered during construction activities, the following procedure shall be observed:
1. All construction activity shall stop immediately and the Archaeologist will contact the Santa Barbara County Coroner. The Coroner has two working days to examine human remains after being notified by the OAR.
 2. If the coroner determines the remains to be Native American, the Coroner will contact the Native American Heritage Commission (NAHC) within 24 hours. The NAHC will immediately notify the person it believes to be the Most Likely Descendent (MLD) of the deceased Native American.
 3. The MLD has 48 hours to make recommendations to the OWNER for the treatment or disposition, with proper dignity, of the human remains and grave goods. If the MLD does not make recommendations within 48 hours the OWNER will reinter the remains in an area of the property secure from further disturbance following procedures required by the Public Resources Code, Sections 5097.94, 5097.98, 5097.99, and Health and Safety Code, Section 7050.5.
 4. If the County does not accept the descendant's recommendations, the OWNER or the descendent may request mediation by the NAHC.

PART 2 – PRODUCTS – Not Used

PART 3 – EXECUTION – Not Used

END OF SECTION – 01 3592

SECTION 01 35 93

OFF-SITE IMPROVEMENT PROCEDURES

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Surface improvements including street, sidewalks, curbs and gutters.
2. Tree planting.
3. Utilities: Underground utilities, fire hydrants, streetlights, catch basins, parkway drains, and culverts.

B. Related Requirements:

1. Division 01 - General Requirements.
2. Division 31 – Earthwork.
3. Division 32 - Exterior Improvements.
4. Division 33 – Utilities.

1.02 SYSTEM DESCRIPTION

A. Regulatory Requirements:

1. Comply with requirements of authorities having jurisdiction over the area.
2. Obtain and pay for permits, licenses and inspections required by authorities having jurisdiction over the area.
3. Bonds: Post as required by authorities having jurisdiction over the area.

1.03 SUBMITTALS

- ###### A. Shop Drawings: Submit plans, sections and details of concrete Work. Submit design drawings and calculations signed and stamped by a civil and/or structural engineer licensed in the State of California.

1.04 QUALITY ASSURANCE

- ###### A. Comply with Standard Specifications for Public Works Construction, current edition.

PART 2 - PRODUCTS

2.01 MATERIALS

- A. Materials shall meet the requirements of the authorities having jurisdiction over the Work. (City of Goleta Department of Public Works)

PART 3 - EXECUTION

3.01 GENERAL

- A. Perform the Work in accordance with the requirements of the authorities having jurisdiction over the area.
- B. Match adjoining improvements, such as construction and expansion joints, sidewalk marking patterns, and trees.
- C. Foundry or other identifying stamps or markers are not permitted to be installed on exposed portions of the Work.

3.02 PROTECTION

- A. Protect the Work of this section until Substantial Completion.

3.03 CLEANUP

- A. Remove rubbish, debris, and waste materials and legally dispose of off the Project site.

END OF SECTION – 01 3593

SECTION 01 42 00

REFERENCE STANDARDS

PART 1 – GENERAL

1.01 GENERAL

- A. **Titles of Sections and Paragraphs:** Titles and subtitles accompanying specification sections and paragraphs are for convenience and reference only, and do not form a part of the Specifications.
- B. **Applicable Publications:** Whenever in these Specifications references are made to published specifications, codes, standards, or other requirements, it shall be understood that wherever no date is specified, only the latest specifications, standards, or requirements of the respective issuing agencies which have been published as of the date that construction is started shall apply; except to the extent that said standards or requirements may be in conflict with applicable laws, ordinances, or governing codes. No requirements set forth in the Standards & Specifications or shown on the Construction Drawings will be waived because of any provision of, or omission from, said standards or requirements.
- C. **Specialists, Assignments:** In certain instances, specification text requires (or implies) that specific work is to be assigned to specialists or expert entities, who must be engaged for the performance of that work. Such assignments shall be recognized as special requirements over which the Contractor has no choice or option. These requirements shall not be interpreted so as to conflict with the enforcement of building codes and similar regulations governing the work; also they are not intended to interfere with local union jurisdiction settlements and similar conventions. Such assignments are intended to establish which party or entity involved in a specific unit of work is recognized as "expert" for the indicated construction processes or operations. Nevertheless, the final responsibility for fulfillment of the entire set of contract requirements remains with the Contractor.

1.02 REFERENCE SPECIFICATIONS, CODES, AND STANDARDS

- A. The Contractor shall construct the work in accordance with the Contract Documents and the referenced portions of those referenced codes, standards, and specifications.
- B. References herein to "Building Code" or "Uniform Building Code" shall mean Uniform Building Code of the International Conference of Building Officials (ICBO). Similarly, references to "Mechanical Code" or "Uniform Mechanical Code," "Plumbing Code" or "Uniform Plumbing Code," "Fire Code" or "Uniform Fire Code," shall mean Uniform

Mechanical Code, Uniform Plumbing Code and Uniform Fire Code of the International Conference of the Building Officials (ICBO). "Electric Code" or "National Electrical Code (NEC)" shall mean the National Electric Code of the National Fire Protection Association (NFPA). Unless otherwise indicated the latest edition of the codes as approved by the Municipal Code and used by the local agency as of the date that the work is advertised for bids, as adopted by the agency having jurisdiction, shall apply to the work herein, including all addenda, modifications, amendments, or other lawful changes thereto.

- C. In case of conflict between codes, reference standards, drawings, and the other Contract Documents, the most stringent requirements shall govern. All conflicts shall be brought to the attention of the City of Goleta for clarification and directions prior to ordering or providing any materials or furnishing labor. The Contractor shall bid for the most stringent requirements.
- D. References herein to "OSHA Regulations for Construction" shall mean Title 29, Part 1926, Construction Safety and Health Regulations, Code of Federal Regulations (OSHA), including all changes and amendments thereto.
- E. References herein to "OSHA Standards" shall mean Title 29, Part 1910, Occupational Safety and Health Standards, Code of Federal Regulations (OSHA), including all changes and amendments thereto.
- F. References herein to Caltrans Standards and Specifications Shall mean State of California Department of Transportation Standards and Specifications.
- G. **Applicable Safety Standards:** References herein to "Cal-OSHA" shall mean State of California, Department of Industrial Relations, Construction Safety Orders, as amended to date, and all changes and amendments thereto.
- H. References herein to ASTM shall mean American Society for Testing and Materials.
- I. References herein to "Greenbook" or "SSPWC" shall mean the Standard Specifications for Public Works Construction.
- J. References herein to County Standards and Specifications Shall mean County of Santa Barbara, Department of Public Works, Standards and Specifications.
- K. References herein to City of Goleta Standards and Specifications Shall mean City of Goleta, Department of Public Works, Standards and Specifications

1.03 REGULATIONS RELATED TO HAZARDOUS MATERIALS

- A. The Contractor shall be responsible that all work included in the Contract Documents, regardless if shown or not, shall comply with all EPA, OSHA, RCRA, NFPA, and any other Federal, State, and Local Regulations governing the storage and conveyance of hazardous materials, including petroleum products.

END OF SECTION – 01 4213

SECTION 01 45 16

CONTRACTOR CONSTRUCTION QUALITY CONTROL

PART 1 – GENERAL

1.01 SUMMARY

- A. The intent of this specification is to delineate a plan and procedure to be used by CONTRACTOR, working in partnership with OWNER and its agents, to assure the quality control necessary to provide for a complete, fully functional, high-quality facility in accordance with the intent and meaning of the Contract Documents.
- B. CONTRACTOR shall be totally responsible for Contractor Construction Quality Control (CQC) – which is verification by CONTRACTOR that work performed by CONTRACTOR forces is in compliance with the Contract Documents.
- C. OWNER shall be responsible for Construction Quality Assurance (CQA) – which is the verification by Owner Authorized Representative (OAR), Architect Of Record (AOR), Project Inspector (PI), and Deputy Inspectors that CONTRACTOR has taken the actions and steps defined in the Construction Documents and Contractor Construction Quality Control Plan accepted by OWNER. Verification shall consist of the Inspection of the Work in place by the OAR, AOR, PI, and Deputy Inspectors using established inspection, sampling, testing, and observational techniques.
- D. Section Includes:
 - 1. CONTRACTOR requirements for establishing, administering and maintaining Quality Control (QC) over the Work and ancillary functions through Contract Closeout.
 - 2. Required elements of a Construction Quality Control program.
- E. Related Requirements:
 - 1. Section 00 70 00 - General Conditions.
 - 2. Section 00 73 00 - Supplementary Conditions.
 - 3. Section 01 11 00 - Summary of Work.
 - 4. Section 01 31 29 - Partnering.
 - 5. Section 01 12 16 - Phasing of the Work.
 - 6. Section 01 31 13 - Project Coordination.
 - 7. Section 01 31 19 - Project Meetings.
 - 8. Section 01 33 00 - Submittal Procedures.

9. Section 01 74 16 - Storm Water Pollution Prevention.
10. Section 01 74 19 - Construction & Demolition Waste Management.
11. Section 01 32 13 - Construction Schedule.
12. Section 01 35 46 - Indoor Air Quality Procedures.
13. Section 01 45 23 - Testing and Inspection.
14. Section 01 45 24 - Environmental Import/Export Materials Testing.
15. Section 01 45 25- Testing, Adjusting, and Balancing for HVAC.
16. Section 01 25 13 - Product Substitution Procedures.
17. Section 01 77 00 - Contract Closeout.
18. Section 01 78 36 - Warranties.
19. Section 01 91 13 - General Commissioning Requirements.

1.02 OBJECTIVES

- A. Require CONTRACTOR to establish and maintain a CQC program as described in this section.
- B. Require CONTRACTOR to provide a qualified, full-time Construction Quality Control Manager to direct, manage, control and document a CQC Program for the Project that includes a:
 1. CQC Manager reporting directly to the person authorized to sign the Contract or an Officer of CONTRACTOR's firm and not be subordinate to CONTRACTOR's Project Superintendent or Project Manager.
 2. CQC plan for the project (keyed to the work sequence) addressing site logistics, planning, submittals, design (architectural/engineering) issue and interpretation coordination, and on-site and off-site Work.
 3. Procedure:
 - a. To ensure no construction work or testing is performed unless CQC Manager is on the work site unless otherwise approved by OWNER.
 - b. By which the CQC Manager certifies that submittals, i.e., RFCs, shop drawings, etcetera for project materials, equipment, fabrication, construction and construction operations provided by CONTRACTOR comply with the requirements of the CONTRACT.

- c. By which the CQC Manager certifies that project materials, equipment, fabrication, construction and construction operations provided by CONTRACTOR comply with the requirements of this CONTRACT.
 - d. To ensure coordination drawings have been prepared and reviewed by impacted subcontractors and trades.
 - e. To ensure an activity hazard analysis is conducted for operations specifically identified as having special.
 - f. Safety considerations.
 - g. For quality control during project commissioning (if applicable).
 - h. For expediting project closeout.
4. Schedule and format/agenda for CQC review meetings.
 5. Site specific Safety Plan/Injury and Illness Prevention Plan (IIPP) reviewed and accepted by OWNER.
 6. System to report on the CONTRACTOR's Quality Control activities.
- C. Ensure that Work is performed in accordance with the approved Construction Documents at the specified construction quality level.

1.03

SUBMITTALS

- A. For the purposes of the CQC Plan, the term "Submittals" shall include, but not be limited to, required engineering, administrative and material submittals, inspection requests, Requests for Clarification (RFCs), Change Order Proposals (COPs), Requests for Proposals (RFPs) and other project documents. The CQC Manager is responsible for the timelines of each submittal, and shall certify in writing the quality, accuracy and completeness of submittals. CONTRACTOR shall submit the resume' of the proposed CQC Manager to OWNER upon receiving Notice of Award. The proposed CQC Manager shall be approved in writing by OWNER. The CQC Manager shall be assigned to work on the project full-time through the completion of the Contract Administrative Closeout period and be available at the project site location whenever construction work occurs.
- B. CONTRACTOR's CQC Manager shall have significant, relevant documentable training and field experience on building construction projects of a similar scale and be one of the following:
1. Engineer or Architect currently licensed in the State of California with a minimum of ten years of relevant, documentable training and field experience on building construction projects of a similar scale.
 2. Inspector with a current California State Certification.
 3. Construction CONTRACTOR or superintendent (or similar position/function) with a minimum of ten years of relevant, documentable training and field experience on building construction projects.

- C. CQC Assistant Manager. CONTRACTOR shall submit the resume' of a proposed CQC Assistant Manager to OWNER prior to receiving Notice to Proceed 1. The proposed CONTRACTOR's CQC Manager shall have significant, relevant documentable training and field experience on building construction projects of a similar scale and be one of the following:
1. Engineer or Architect currently licensed in the State of California with a minimum of five years of relevant, documentable training and field experience on building construction projects.
 2. Construction CONTRACTOR or superintendent (or similar position/function) with a minimum of five years of relevant, documentable training and field experience on building construction projects.
- D. CONTRACTOR shall submit a draft Construction Quality Control (CQC) Plan to OWNER within fifteen days after issuance of Notice to Proceed 1. The CQC plan shall include, but not be limited to:
1. A letter from the person authorized to sign the Contract or an Officer of CONTRACTOR's firm clearly identifying:
 - a. CONTRACTOR's CQC Manager.
 - b. CQC Manager as having responsibility and authority to implement and manage CONTRACTOR's CQC Program.
 - c. Lines of authority and reporting for the CQC Manager. (Note: The CQC Manager shall report directly to the person authorized to sign the Contract or an Officer of the CONTRACTOR's firm. The person signing the letter shall not be the Project Manager or the Superintendent for the project nor report to the Project Manager, Superintendent or persons other than those defined heretofore.)
 - d. CQC Manager's authority to direct stoppage, removal and/or replacement of non-conforming Work.
 - e. CQC Manager or CQC Assistant Manager as the direct and only line of contact with OWNER's Project Inspector (PI) with sole responsibility for submitting and documenting Inspection Requests (IRs) to the Project Inspector.
 2. Proposed formats for meeting agendas, minutes and required reports.
 3. Procedures for managing the submittal process, as described in Section 01 3300 - Submittal Procedures, including:
 - a. Reviews and approvals.
 - b. List of required submittals and certifications cross-referenced to the construction drawings and specifications.
 - c. Scheduled date of submittals.

- d. Certification that submittals will have been reviewed prior to submission and found ready, as described in Section 01 3300, for ARCHITECT/ENGINEER review.
4. Procedure for ensuring that Construction Coordination Drawings are coordinated with and reflect the Contract's Construction Drawings and Specifications.
5. Procedure for preparing an Activity Hazard Analysis (AHA) Plan identifying operations requiring special safety considerations and defining the policy, procedure and administrative steps to be taken to ensure the preparation and submittal of an AHA during each of the three phases of Construction Quality Control.
6. Testing Plan and Log that identifies tests required (referencing the specification section and/or drawing requiring the test), subcontractor responsible for each test, scheduled date of test and actual date performed and approved.
7. A plan for coordinating with OWNER's designated commissioning agent, if applicable, to ensure that documentation, measurements and calibration of systems necessary to complete the Commissioning Plan defined in Section 01 91 13 are performed prior to requesting OWNER's designated commissioning agent to verify and observe CONTRACTOR and subcontractor demonstration of operations and testing. Owner or Architect of Record may act as Commissioning Agent for this project as allowed in Section 01 91 13.
8. Procedure and documentation required to ensure CONTRACTOR compliance with sustainable building practices during construction per Section 01 35 46 Indoor Air Quality Procedures.
9. Contract Closeout Plan compliant with requirements of Section 01 77 00, Contract Closeout.
10. Procedures and requirements for above-ceiling coordination and installation.
11. Procedures to identify, record and track completion and clearing of rework items (including deviations and corrections to deviations).
12. List of outside firms CONTRACTOR may employ in executing CONTRACTOR responsibilities identified in the CQC Plan and a description of their respective services to be provided.
- E. CONTRACTOR shall submit the final Construction Quality Control (CQC) Plan to OWNER within forty-five days following issuance of Notice to Proceed 1 for review and acceptance.
- F. CQC Manager Responsibilities shall be clearly defined in the CQC Plan which shall commit that:
 1. CQC Manager shall be designated as person responsible for directing, managing, coordinating, documenting and reporting CONTRACTOR quality

control activities in accordance with CONTRACTOR's CQC Plan including, if applicable, required CONTRACTOR materials testing and certifications.

2. The approved CQC Manager and CQC Assistant Manager shall be assigned to work on the project and at the project site full-time through completion of the Contract Administrative Closeout period and be available at the project site location whenever construction work occurs. OWNER shall assess scheduled payment amounts for the CQC Manager and/or CQC Assistant Manager position for any period when the position is not staffed for more than two (2) days consecutively when Work is performed at the site against the invoiced Contract amount for the corresponding month.

1.04 APPROVALS

- A. OWNER shall approve in writing the proposed CONTRACTOR CQC Manager prior to start of any Work requiring quality control.
- B. OWNER shall review and respond to CONTRACTOR's draft and final CQC Plan within fifteen days of receipt.
 1. Response shall be in writing.
 2. Approval shall be in writing.
 3. OWNER reserves the right to require changes in the approved CQC Plan and operations as necessary to ensure quality of the Work.
 4. CONTRACTOR shall submit a written request to OAR for approval of any proposed change in the CQC Manager, CQC staff or CQC Plan or Procedures a minimum of seven days prior to the proposed change. CONTRACTOR shall receive OAR's written approval of any proposed changes to the CQC Plan prior to implementing any changes.
 5. CONTRACTOR shall be assessed OWNER's actual incurred costs to provide quality control services by OWNER should CONTRACTOR fail to have an accepted CQC Plan within ninety days of Notice to Proceed 1.
- C. OWNER shall have the right to require the removal and replacement of the CQC Manager or CQC Assistant Manager after providing a minimum of seven (7) days written notice.

PART 2 – PRODUCTS (Not used)

PART 3 – EXECUTION

3.01 QUALITY CONTROL RESPONSIBILITY

- A. The CONTRACTOR's CQC Manager, Project Superintendent and Project Manager and City OAR and PROJECT INSPECTOR must work together effectively. While the

CQC Manager shall be the primary individual responsible for quality control, CONTRACTOR personnel, subcontractor personnel and material suppliers shall be responsible for the quality of their work and products used on the project.

- B. No Work of the CONTRACT shall commence prior to OWNER approval of CQC Manager and acceptance of CQC Plan unless otherwise specifically authorized in writing by OAR.

3.02 MEETINGS

- A. Weekly CQC Meetings: The CQC Manager shall conduct weekly CQC meetings at the Project Site with the Project Superintendent, Safety Officer and pertinent subcontractors starting with the Preconstruction Phase and continuing through completion of the construction. The OAR, PI, and AOR may attend these meetings.

1. The CQC Manager shall prepare minutes of the meeting and provide a copy to OAR and PI within two working days after the meeting.
2. As a minimum, the meetings will address the following:
 - a. Minutes of the previous meeting.
 - b. Status of submittals.
 - c. Work scheduled during the next fourteen days and status of related documentation, namely: submittals, RFCs, Change Orders, etcetera.
 - d. Status of inspection requests and identification of pre-inspection requirements.
 - e. Current and upcoming activities requiring special safety training, resources and Activity Hazard Analyses including:
 - i. Preparation and submittal of Activity Hazard Analyses.
 - ii. Fourteen day safety look-ahead schedule.
 - f. Safety audit findings.
 - g. Safety deficiency/corrective action log.
 - h. Resolving CQC and construction Work problems including open deviations and rework items.
 - i. Items that may require revisions in the CQC Plan.

- B. Preconstruction Submittal Phase

1. OAR shall schedule a Pre-submittal Meeting within twenty-one days following Notice of Award. The Pre-submittal Meeting will include key representatives of OWNER (OAR, Project Inspector, key specialty inspectors, Material Testing Lab and other key testing agency representatives), CQC Manager, CONTRACTOR (and its key subcontractors), and ARCHITECT/ENGINEER (and its key sub consultants).
2. Purpose of this meeting is to:

- a. Develop a mutual understanding of the Contract and the City's CQC Plan requirements prior to Plan development and submittal.
- b. Establish the Project Quality approach.
- c. Define the scope, content and documentation required for submittals.
- d. Establish the quality requirements for submittals, with a goal of no "Revise and Resubmit" responses to submittals.
- e. Define review criteria for each of the submittals.
- f. Set timeframes for the preparation, transmittal and review of the submittals.
- g. Establish the framework for a Project Quality Assurance/Quality Control Team and the associated quality culture for the life of the project.
- h. Foster teamwork between OAR, CONTRACTOR (including CQC Manager and subcontractors), INSPECTOR (and subordinate specialty inspectors and Material Testing Labs), and ARCHITECT/ENGINEER (and its sub consultants) and function as an initial teambuilding intervention.
- i. Schedule follow-on meetings between each of the subcontractors and their respective counterpart sub consultants for the purpose of defining in detail the scope, content and documentation required for submittals.
- j. The results of this meeting shall be incorporated into the CONTRACTOR's Construction Quality Control Plan.

3.03 Partnering Meetings:

- A. CQC Manager shall schedule, coordinate attendance of required CONTRACTOR and subcontractor personnel, and participate in "Partnering" sessions as required by Section 01 31 29 or by OAR.

3.04 THREE-PHASE CONSTRUCTION QUALITY CONTROL PROCESS

- A. For each project component or activity and each trade associated with executing or performing that component or activity, CONTRACTOR shall apply a three phase construction quality control process to that activity to ensure each trade's Work complies with CONTRACT requirements and is coordinated with other trades. The three phase quality control process shall address both on-site and off-site Work and include:
 - B. Preparatory Phase: CONTRACTOR or CQC Manager shall conduct a Preparatory Phase meeting with the Project Superintendent, CONTRACTOR's Safety Officer, subcontractor(s) and foremen responsible for that portion of Work.

1. A Preparatory Phase meeting shall be conducted a minimum of five working days and maximum of ten working days prior to the scheduled start of the Work.
 2. OAR and PI shall be notified at least two working days prior to each Preparatory Phase meeting.
 3. The CQC Manager shall prepare and distribute an agenda to attendees at least two working days prior to each Preparatory Phase meeting.
 4. At each Preparatory Phase meeting, the following tasks shall be performed:
 - a. Review the applicable Contract Document specification sections.
 - b. Review the applicable Contract Document and trade coordination drawings.
 - c. Review codes, jurisdictional requirements and City specifications relative to execution of the applicable portion of the Work.
 - d. Verify that appropriate shop drawings and submittals for materials and equipment have been submitted, reviewed and returned with no outstanding revisions required.
 - e. Verify, when required, the receipt of approved factory test results
 - f. Review the testing plan and testing schedule to ensure that provisions have been made to provide the required QC testing.
 - g. Review the safety plan and appropriate Activity Hazard Analysis to ensure applicable safety requirements are met.
 - h. Examine the work areas to ensure the required preliminary Work has been completed.
 - i. Discuss, as necessary, construction methods.
 - j. Confirm coordination with other trades.
 - k. Confirm completion of above-ceiling coordination.
 - l. Confirm service accessibility for installed systems.
 - m. Confirm inspection requirements of the Work and Inspection Request timing and submittal requirements.
 5. The CQC Manager shall prepare and distribute minutes of Preparatory Phase meetings to attendees of the meeting within two working days after each meeting.
 6. Results of the most recent preparatory phase meeting and actions shall be documented in the bi-weekly CONTRACTOR Quality Control Report.
- C. Initial Phase: When construction crews are ready to start work, the CQC Manager shall coordinate with the Project Superintendent, CONTRACTOR's Safety Officer and foreman responsible for the Work and:

1. Notify OAR and PI at least two working days in advance of starting the Work.
 2. Observe the initial Work activities to ensure compliance with Contract requirements including Safety.
 3. Perform the following:
 - a. Confirm that the quality of materials, fabrication, and execution provided meets requirements.
 - b. Resolve potential conflicts.
 - c. Review the Safety Plan and appropriate Activity Hazard Analysis and verify that applicable safety requirements are met and followed.
 - d. Ensure that testing is performed by the approved laboratory.
 4. Repeat the Initial Phase for each new crew assigned to work on the activity on-site or when compliance falls below acceptable levels when so notified by OAR.
 5. Document observations and results of Initial Phase coordination and most recent activities in the bi-weekly CONTRACTOR Quality Control Report.
- D. Follow-Up Phase: After the work has begun, perform the following:
1. Document the results and observations in the biweekly CONTRACTOR Quality Control Report.
 2. Daily, or more frequently as necessary, until completion of Work:
 - a. Ensure the Work is in compliance with Contract requirements.
 - b. Identify and document CONTRACTOR and subcontractor Work requiring rework or correction.
 - c. Ensure documented rework items are corrected.
 - d. Ensure that the quality materials, fabrication, and execution provided complies with the requirements of the Contract Documents.
 - e. Review and sign off on Inspection Requests prior to issuance to PI.
 - f. Ensure testing is performed by the approved laboratory.
 - g. Ensure safety requirements and practices are observed.
- E. Notify OAR, Project Inspector and involved local regulatory agencies or utilities at least fourteen days prior to the start of Preparatory and Start-Up Phases for Off-Site Work.

3.05 ACTIVITY HAZARD ANALYSIS – CONTRACTOR SAFETY PROGRAM

- A. Before beginning each Work component or activity, CQC Manager shall ensure CONTRACTOR prepares and utilizes an Activity Hazard Analysis (AHA)/Job Safety Analysis (JSA) for each task identified. The AHA/JSA shall be reviewed by each

work crew prior to starting the activity and re-addressed any time there are changes in that activity.

1. Activity Hazard Analyses will define the activities being performed and identify the sequences of work, specific hazards anticipated, site conditions, materials and control measures to be implemented to eliminate or reduce each hazard.
 2. Work shall not begin until the AHA for the work activity has been accepted by OWNER and discussed with parties engaged in the work activity (CONTRACTOR, subcontractors, OWNER representatives) at the preparatory and initial phase meetings required by the Construction Quality Control process.
 3. The names of the competent/qualified person(s) required to be present during particular activities (for example: excavations, fall protection, other activities required by OSHA or similar jurisdictions) shall be identified and included in the AHA. Proof of their competency shall be submitted to the OWNER for acceptance prior to start of that work activity.
 - a. If more than one competent/qualified person will be used on the AHA activity, a list of names and proof of their competency shall be submitted as an attachment to the AHA form. Those listed shall be competent and qualified for the type of work addressed in the AHA and familiar with current site safety policies, procedures and issues.
 - b. If a new competent and qualified person is added to the staff, the original list attached to the AHA form shall be updated and include proof of the new person's competency. The new person shall acknowledge in writing that they have reviewed the AHA and is familiar with the current site safety issues.
 4. The AHA shall be reviewed and modified as necessary to address changing site conditions, operations, or changes of competent/qualified person(s).
- B. An AHA shall be prepared and documented for each project work activity as warranted by the hazards associated with the activity. Generally, an AHA shall be prepared for field work activities.

3.06 MOCKUPS

- A. Purpose: It is the intent of OWNER that achievement of Project Quality Assurance/Quality Control goals and objectives be supported by use of mockup assemblies and spaces prior to installation and/or the Substantial Completion Inspection.
- B. CQC Manager shall ensure that CONTRACTOR prepares, as required by the technical specifications (Divisions 02-49), mockups of construction assemblies and systems using specified materials for review and approval of OWNER before proceeding with installation.

- C. The scope of Work and schedule for preparing the required mockups, including associated submittals, shall be included in the CONTRACTOR CQC Plan and construction schedule. Written approval of the Mockup element of the CQC Plan is required prior to CONTRACTOR commencing with preparation of required mockups.
- D. In addition to the material and systems mockups required under the technical specifications, CONTRACTOR shall prepare, at a minimum, mockups of the following typical rooms and/or other areas identified in writing by OWNER. CONTRACTOR shall install approved construction assemblies and systems at the level of quality and completion CONTRACTOR considers typical of, and in compliance with, the approved plans and technical specifications a minimum of 60 days prior to Substantial Completion:
 - 1. Depot
 - 2. Restroom.
 - 3. Site Improvements.
- E. OWNER shall inspect the completed mockups of the typical rooms and/or other areas and provide CONTRACTOR's CQC Manager with a listing of typical deficiencies and/or non-compliant Work observed in the mockups no more than 14 days following notification by CONTRACTOR the mockup has been completed.
- F. CONTRACTOR's CQC Manager shall have Work inspected and any occurrence of the deficiencies and non-compliant Work, observed and listed by OWNER in the mockups of the typical rooms and/or other areas that are found in other areas and aspects of the Work, corrected prior to requesting Substantial Completion.

3.07 PROJECT CLOSEOUT

- A. The CQC Manager shall be responsible for ensuring the quality and completeness of CONTRACTOR closeout activities as they relate to the Work of the Contract including, but not limited to, remedial work, final submittals, as-built drawings, maintenance and operations manuals and training, spare parts and materials, etcetera.
- B. Prior to CONTRACTOR submission of the Request for Certificate of Substantial Completion, CQC Manager shall:
 - 1. Inspect Work and have any occurrence of deficiencies and/or non-compliant Work that were found and listed by OWNER in the mockups of typical rooms and/or other areas and have any similar deficiencies and/or non-compliant Work found in the remaining portions of the Work corrected.
 - 2. Ensure completion of Work except those minor items identified on CONTRACTOR's Punch List.
 - 3. Conduct a CONTRACTOR Pre-Substantial Completion Inspection of the entire Work to:
 - a. Identify any additional items of construction requiring correction to comply with the project documents.

- b. Cause trades to promptly correct identified defects in their respective Work.
 - c. Re-inspect any identified defects in the Work to ensure their compliance with project documents.
- 4. Certify that items, except those minor Work items identified on CONTRACTOR's Punch List, have been completed in accordance with the contract plans and specifications.
- 5. Ensure required closeout documents, as outlined in Section 01700, have been submitted to OWNER.
- C. CQC Manager shall have the Punch List prepared by CONTRACTOR attached to the CONTRACTOR's Request for Certificate of Substantial Completion and certify that items known to require correction are listed.
- D. CONTRACTOR's Request for Certificate of Substantial Completion shall have attached certification by the CQC Manager that items listed on the "Rework Items List", the Inspector's List and with a Deviation/Corrective Notice as needing rework or correction have been corrected in accordance with the plans and specifications
- E. Upon determination by OAR that the Work is Substantially Complete and ready for inspection, the Project Inspector shall conduct a Substantial Completion Inspection, that shall be attended by the CQC Manager and other CONTRACTOR and subcontractor representatives identified by CQC Manager, and prepare an Inspector List (Working Copy) incorporating input from the AOR, its subconsultants and other OWNER representatives.
- F. OAR will provide the CQC Manager with a copy of the Certificate of Substantial Completion with Inspector List (Working Copy) attached upon completion of the Substantial Completion Inspection and a copy of the Inspector Punch List (Master Copy) within five days of OWNER's issuing of the Certificate of Substantial Completion.
- G. CQC Manager shall ensure that, within the time allowed for Administrative Closeout of the contract, CONTRACTOR and subcontractors correct the deficient Work indicated on the Inspector Punch List (Master Copy). Upon completion of corrections, the CQC Manager shall certify that the Work of the Inspector Punch List (Master Copy) has been completed and ask for a Final Inspection of the Work. OWNER will re-inspect the Work and identify to the CQC Manager any items still requiring correction.

3.08 DOCUMENTATION

- A. CQC Manager shall maintain current and complete records of on-site and off-site construction and CQC program operations and activities including, but not limited to:
- B. CONTRACTOR Daily Construction Report

1. The CONTRACTOR Daily Construction Report shall be generated as required in Section 01 5000, Construction Facilities and Temporary Controls, and shall include the following information:
 - a. Date of report, name of CONTRACTOR, and superintendent present.
 - b. Weather conditions in the morning and in the afternoon including maximum and minimum temperatures.
 - c. List of CONTRACTOR and subcontractor personnel on the Project site, their trades, employer, Work location, description of Work performed and materials used and hours worked.
 - d. List of job safety actions taken and safety inspections conducted. Indicate identified safety deficiencies that have been corrected, that remain uncorrected, and provide related documentation of the following:
 - 1) Job safety meetings held (including sign-in sheets).
 - 2) Lost time accidents/incidents (including witness statements and photographs).
 - 3) Daily written safety inspections conducted including as a minimum when applicable:
 - a) Fire extinguishers.
 - b) Crane certification/equipment operator licenses.
 - c) Trenching/shoring/scaffold/high voltage electrical/elevated work.
 - d) Personal Fall Arrest System (PFAS) equipment/harnesses, spider boxes.
 - 4) Hazardous material/waste released into the environment.
 - 5) Meetings held, including CQC preparatory and initial phase meetings.
 - e. List of equipment/material received and incorporated into the project that day.
 - f. List of construction and plant equipment on the Project site including number of hours used, idle and/or down for repair. Identify whether equipment is rented or CONTRACTOR-owned.
 - g. Include a “remarks” section in this report for directions received and identify from whom received, problems and delays, drawing coordination and conflicts, field changes, record of visitors, and any other relevant issues.
 - h. List of items, generated by CQC staff, observed as requiring correction or having been corrected.

2. Terminology used for reporting of Work in the CONTRACTOR Daily Construction Report shall be consistent with terminology in the construction schedule and Contract Documents.
3. Reports shall be prepared, signed and dated by CONTRACTOR's project superintendent. CQC Manager shall review, initial and date CONTRACTOR Daily Construction Reports, add comments as necessary and submit to OAR within two days of the Daily Construction Report reporting date.

C. CONTRACTOR QUALITY CONTROL REPORT

1. Bi-weekly CONTRACTOR Quality Control Reports shall be prepared, certified and submitted to OAR and PI on the first Monday following the reporting period end date.
2. Terminology used for reporting of Work shall be consistent with terminology in the construction schedule or contract documents.
3. Reports shall be prepared, signed and dated by the CQC Manager and include the following information:
 - a. Identification of the Work performed and its associated Construction Quality Control phase (Preparatory, Initial, Follow-up) including:
 - 1) Results of Preparatory Phase meetings held during the reporting period, including location of the Work and list of personnel present at the meeting and verifying that tasks listed in 3.03.A.4 were addressed and performed.
 - 2) Results from Initial Phase meetings held since submittal of the last CONTRACTOR Quality Control Report, including location of the Work, list of trades involved, and personnel present at the meeting. Verify in the report that:
 - a) Preliminary Work was done correctly.
 - b) Work is in compliance with CONTRACT and jurisdictional agency requirements.
 - c) Materials, fabrication, and execution are satisfactory.
 - d) Safety requirements were met.
 - e) Samples have been prepared and approved. Required testing to be performed, by whom and verify that the results are in compliance with requirements.
 - f) Required tests were performed by the approved testing laboratory.
 - 3) Results of Follow-Up Phase observations and inspections conducted during the week including verifying:
 - a) Location of the Work.

- b) Work was done correctly.
 - c) Work complies with CONTRACT requirements.
 - d) Materials, fabrication, and execution are satisfactory.
 - e) Required testing has been performed, by whom and verify that the results are in compliance with requirements.
 - f) Required tests were performed by the approved testing laboratory and identifying individual(s) responsible for performing the tests.
- b. Safety-related activities including operations, incidents, analyses, and “lessons learned”.
 - c. Status of submittals, namely: RFCs, materials, project schedules, Activity Hazard Analyses, etcetera.
 - d. Status of Change Order Proposals – pending and submitted.
 - e. “Lessons learned” from the identification and resolution of issues during the reporting week.
 - f. Results of the three phases of construction quality control meetings for off-site Work (if applicable) including actions taken.
 - g. An updated “Rework Items List”:
 - 1) Identifying items/Work observed by the CQC Manager and/or CQC Assistant Manager that do not comply with CONTRACT requirements and still require correction (or completion) or that were corrected (or completed) during the last 30 days.
 - 2) Incorporating those items identified by the OAR, AOR or Field Engineer that do not comply with CONTRACT requirements and still require correction (or completion) or that were corrected (or completed) during the last 30 days.
 - 3) Incorporating items on the PI’s List or having a Deviation/Corrective Notice and still require correction (or completion) or that were corrected (or completed) during the last 30 days. Clearly identify on the “Rework Items List” which are items from the Inspector List or have been issued a Deviation/Corrective Notice.
 - 4) With corrected items sorted by date completed first and with uncorrected items sorted by date the items were initially identified and/or listed. Items corrected more than 30 days prior to the Bi-weekly CONTRACTOR Quality Control Report issuance date need not be listed.

- 5) Including, for each item on the “Rework Items List”:
 - a) Date the item was originally identified.
 - b) Name of party observing and/or reporting the item.
 - c) Date the item was corrected and corrective action taken.
 - d) Date the PI was notified the when an item on the Inspector List or Deviation/Corrective Notice was corrected.
 4. Include a “remarks” section for listing any directions received and identifying from whom received, problem areas, any deviation from the CQC Plan, other meetings, As-Built drawing update reports, corrective direction and action, and other relevant information.
- D. Testing Plan and Log
- 1 As tests are performed, the CQC Manager shall record in the “Testing Plan and Log”:
 - a. Date the test was conducted and recorded results.
 - b. Date the test results were received by CONTRACTOR.
 - c. Date the test results were received by the Project Inspector.
 - d. Verification and identification of the approved testing laboratory that was used.
 2. Attach a current, updated copy of the “Testing Plan and Log” to the bi-weekly CONTRACTOR Quality Control Report.
- E. Storm Water Pollution Prevention Plan (SWPPP): CQC Manager is required to:
1. Review the SWPPP for compliance in accordance with Section 01 7416 prior to submission.
 2. Prepare and submit to OAR in accordance with the date established in the Notice to Proceed 1 (as outlined in Section 01 12 16).
 3. Review and ensure timely submission of required monitoring and final reports and payments as required in Section 01 74 16.
- F. Construction and Demolition (C&D) Waste Management: The CQC Manager is required to:
1. Review the C&D Waste Management plan for compliance with Section 01 7419 prior to submission.
 2. Within fifteen days after Notice to Proceed 1, and prior to any waste removal, submit the plan to the OAR for review and approval.
 3. Review and ensure timely submission of required monitoring and final reports as required in Section 01 74 19.
- H. Environmental Import/Export Materials: The CQC Manager is required to:

1. Review the import/export Sampling Strategy Plan (SSP) prepared by the CONTRACTOR's licensed environmental professional as outlined in Section 01 4524.
 2. Review the Draft Certification Report prepared by the CONTRACTOR's licensed environmental professional as outlined in Section 01 45 24.
 3. Provide OWNER with required certifications and manifests as required in Section 01 45 24.
- I. Test and Balance: The CQC Manager is required to:
1. Review the qualifications of the Test and Balance agency directly subcontracted by CONTRACTOR to ensure compliance with requirements of Section 01 45 25.
 2. Review the Work of the Test and Balance agency as part of the CQC program.
 3. Review and ensure timely submission of Test and Balance Reports as required by Section 01 45 25.
- J. "Trade" Coordination Drawings: The CQC Manager shall:
1. Facilitate the preparation and utilization of trade coordination drawings as required under Section 01 31 13.3.02.A.
 2. Ensure and certify that the trade coordination drawings are complete and continuously updated to reflect changes in the Work.
 3. Ensure that the trade coordination drawings are used during the Preparatory Phase for each scheduled construction operation such that the Work of trades is properly coordinated and free from interference and conflict.
 4. Ensure field changes arising from coordination of the respective trades will be reflected in revised trade coordination drawings.
 5. Certify monthly as to the accuracy and completeness of trade coordination drawings prior to review by OWNER.
- K. As-Built Drawings: CQC Manager shall review the as-built drawings required by Section 01 77 00, CONTRACTOR's AS-BUILT DOCUMENTS, to ensure as-built drawings are:
1. Kept current on a daily basis.
 2. Marked to show precisely dimensioned and referenced locations of any deviations made from the Contract Document drawings or specifications.
 3. Attest to the accuracy of the current As-Built drawings when submitting any Application for Payment.
 4. Submit the As-Built drawings to the OAR, along with a certificate attesting to the accuracy of the As-Built drawings, with the Request for Substantial Completion.

3.09 REQUIRED CONTRACTOR QUALITY CONTROL CERTIFICATIONS

- A. Submittal Certification: The CQC Manager shall certify in writing as to the adequacy and completeness of any and submittals with each submittal.
- B. CONTRACTOR Quality Control Report Certification: Furnish bi-weekly CONTRACTOR Quality Control Reports, signed by the CQC Manager, containing the following statement: “On behalf of CONTRACTOR, I certify that this report is complete, correct and equipment and material used and work performed during this reporting period is in compliance with the Contract Documents to the best of my knowledge, except as noted in this report.”
- C. Invoice Certification: Include a certificate with each payment request, signed by CQC Manager, attesting that record drawings are current and the Work for which payment is requested, including stored material, is in compliance with Contract requirements.
- D. Completion Certification: Upon completion of designated portion of the Work, furnish a certificate to Owner, signed by the CQC Manager, attesting that “...the Work has been completed, inspected, tested and is in compliance with the Contract requirements.”
- E. Commissioning Certification. If applicable, coordinate with OWNER’s designated Commissioning Agent by furnishing a certification to OWNER, signed by the CQC Manager, attesting that the Work of CONTRACTOR, in support of the project commissioning activities, “...has been completed in compliance with the approved Project Commissioning Plan and Contract requirements.”
- F. Submittals: CQC Manager shall attest in writing as to the adequacy and completeness of submittals.
- G. Drawing Certification: The CQC Manager shall certify, in writing, as to the accuracy and completeness of CONTRACTOR “As-Built” and trade coordination drawings – whether submitted or in use on-site for construction or installation.
- H. Punch List Certification: The CQC Manager shall attest, in writing, as to the accuracy and completeness of rework and punch list corrective activities reported.

END OF SECTION – 01 4516

SECTION 01 45 23

TESTING AND INSPECTION

PART 1 - GENERAL

1.01 SECTION INCLUDES

- A. Testing and inspection services to meet requirements of the California Building Code (CBC).
- B. Related Requirements:
 - 1. Section 03 20 00 – Concrete Reinforcing.
 - 2. Section 03 30 00 – Cast-in-Place Concrete.
 - 3. Section 04 22 00 – Concrete Unit Masonry.
 - 4. Section 05 12 00 – Structural Steel Framing.
 - 5. Section 06 10 00 – Rough Carpentry.
 - 6. Section 06 17 33 – Wood I Joist.
 - 7. Section 31 - Excavation Fill for Structures.

1.02 REFERENCES

- A. American Concrete Institute (ACI):
 - 1. ACI 318 – Building Code Requirements for Structural Concrete and Commentary.
- B. American Institute of Steel Construction (AISC):
 - 1. AISC 360 – Specification for Structural Steel Buildings.
 - 2. AISC 341 – Seismic Provisions for Structural Steel Buildings.
- C. ASTM International (ASTM):
 - 1. ASTM A108 – Standard Specification for Steel Bar, Carbon and Alloy, Cold-Finished.

2. ASTM A370 – Standard Test Methods and Definitions for Mechanical Testing of Steel Products.
 3. ASTM A706 – Standard Specification for Deformed and Plain Low-Alloy Steel Bars for Concrete Reinforcement.
 4. ASTM C31 - Standard Practice for Making and Curing Concrete Test Specimens in the Field.
 5. ASTM C172 - Standard Practice for Sampling Freshly Mixed Concrete.
 6. ASTM C780 - Standard Test Method for Preconstruction and Construction Evaluation of Mortars for Plain and Reinforced Unit Masonry.
 7. ASTM C1314 - Standard Test Method for Compressive Strength of Masonry Prisms.
 8. ASTM E164 - Standard Practice for Contact Ultrasonic Testing of Weldments.
 9. ASTM E488 - Standard Test Methods for Strength of Anchors in Concrete Elements.
 10. ASTM E543 - Standard Specification for Agencies Performing Nondestructive Testing.
 11. ASTM E605 - Standard Test Methods for Thickness and Density of Sprayed Fire-Resistive Material (SFRM) Applied to Structural Members.
 12. ASTM E1444 - Standard Practice for Magnetic Particle Testing.
 13. ASTM F606 - Standard Test Methods for Determining the Mechanical Properties of Externally and Internally Threaded Fasteners, Washers, Direct Tension Indicators, and Rivets.

1. AWS D1.1 – Structural Welding Code.
 2. AWS D1.4 – Structural Welding Code – Reinforcing Steel.
 3. AWS D1.8 – Structural Welding Code – Seismic Supplement.

1.03 REGULATORY REQUIREMENTS

- A. Laboratories performing testing shall have City’s Laboratory Evaluation and Acceptance Program approval prior to providing material testing or special inspection services.
- B. Tests of materials and inspections shall be in accordance to Section 4-213 through 4-219 of the California Building Standards Commission’s, California Administrative Code.

1.04 TESTS

- A. OWNER will contract with a City approved testing laboratory to perform the testing indicated on the Contract Documents, including the Tests and Special Inspections (T&I) list.
- B. Selection of material to be tested shall be by the Testing Laboratory and not by CONTRACTOR.
- C. Any material shipped from the source of supply prior to having satisfactorily passed such testing and inspection, or prior to the receipt of notice from Project Inspector such testing and inspection is not required, shall not be incorporated into the Work.
- D. The Testing Laboratory is not authorized to release, revoke, alter, or enlarge requirements of the Contract Documents or approve or accept any portion of the Work.
- E. The Testing Laboratory shall not perform any duties of CONTRACTOR.
- F. CONTRACTOR shall provide an insulated curing box with the capacity for twenty concrete cylinders and will relocate said box and cylinders as rapidly as required in order to provide for progress of the Work.

1.05 TEST REPORTS

- A. Test reports shall include all tests performed, regardless of whether such tests indicate the material is satisfactory or unsatisfactory. Samples taken but not tested shall also be reported. Records of special sampling operations, when and as required, shall also be reported. Reports shall indicate the material (or materials) was sampled and tested in accordance with requirements of CBC, Title 24, Parts 1 and 2, as indicated on the Contract Documents. Test reports shall indicate specified design strength and specifically state whether or not the material (or materials) tested comply with the specified requirements.

1.06 VERIFICATION OF TEST REPORTS

- A. Each Testing Laboratory shall submit to the City, in duplicate, a verified report covering all tests required to be performed by that agency during the progress of the Work. Such report, covering all required tests, shall be furnished prior to Substantial Completion and/or, when construction on the Work is suspended, covering all tests up to the time of Work suspension.

1.07 INSPECTION BY OWNER

- A. OWNER, and its representatives, shall have access, for purposes of inspection, at all times to all parts of the Work and to all shops wherein the Work is in preparation. CONTRACTOR shall, at all times, maintain proper facilities and provide safe access for such inspection.
- B. OAR shall have the right to reject materials and/or workmanship deemed defective Work and to require correction. Defective workmanship shall be corrected in a satisfactory manner and defective materials shall be removed from the premises and legally disposed of without charge to OWNER. If CONTRACTOR does not correct such defective Work within a reasonable time, fixed by written notice and in accordance with the terms and conditions of the Contract Documents, OWNER may correct such defective Work and proceed in accordance with related Articles of the Contract Documents.
- C. CONTRACTOR is responsible for compliance to all applicable local, state, and federal regulations regarding codes, regulations, ordinances, restrictions, and requirements.

1.08 PROJECT INSPECTOR

- A. A Project Inspector will be employed by OWNER in accordance with requirements of Title 24 of the California Code of Regulations with their duties specifically defined therein.
- B. Inspection of Work shall not relieve CONTRACTOR from any obligation to fulfill all terms and conditions of the Contract Documents.
- C. CONTRACTOR shall be responsible for scheduling times of inspection, tests, sample taking, and similar activities of the Work.

1.09 STRUCTURAL TESTS AND SPECIAL INSPECTIONS

- A. Soils:
 - 1. General: Periodic inspection by Geotechnical Engineer for verification of the following construction activities in conformance to CBC Table 1705A.6:

- a. Site has been prepared properly prior to placement of controlled fill and/or excavations for foundations.
 - b. Foundation excavations are extended to proper depth and have reached proper material.
 - c. Materials below footings are adequate to achieve the design bearing capacity.
2. Compacted Fills: Testing and inspections shall be in conformance to Table 1705A.6:
- a. Geotechnical Engineer will continuously verify the use of proper materials and inspect lift thicknesses, placement, and compaction during placement of fill.
 - b. Testing Laboratory under the supervision of the Geotechnical Engineer will:
 - 1) Perform qualification testing of fill materials.
 - 2) Test the compaction of fill.
3. Retaining Walls:
- a. Continuous inspections by Geotechnical Engineer:
 - 1) Placement, compaction and inspection of soil per CBC Section 1705A.6.1 for fills supporting foundations.
 - 2) Segmental retaining walls; inspect placement of units, dowels, connectors, etc.
 - b. Concrete Retaining Walls: Provide tests and inspections as indicated on paragraphs below for concrete.
 - c. Masonry Retaining Walls: Provide tests and inspections as indicated on paragraphs below for masonry.
- B. Concrete:
1. Cast in Place Concrete: Inspection and testing in conformance to CBC Table 1705A.3:
 - a. Inspection of reinforcement, including prestressing tendons and verification of placement, per ACI 318, sections 25.2, 25.2, 25.5.1 through 26.5.3.

- b. Reinforcing bar welding: Inspect per AWS D1.4, ACI 318 26.5.4.
 - 1) Verification of weldability of reinforcing bars other than ASTM A706.
 - 2) Inspect single-pass fillet welds, maximum 5/16”.
 - 3) Inspect all other welds.
- c. Inspect anchors cast in concrete per ACI 318, section 17.8.2.
- d. Inspect anchors post-installed in hardened concrete members:
 - 1) Continuous inspection of adhesive anchors installed in horizontally or upwardly inclined orientations to resist sustained tension loads, per ACI 318, section 17.8.2.4.
 - 2) Mechanical anchors and adhesive anchors, not defined in previous paragraph, per ACI 318, section 17.8.2.
- e. Design Mix:
 - 1) Verify use of required mix, per ACI 318, chapter 19 and sections 26.4.3 and 26.4.4.
 - 2) Batch Plant Inspection: The quality and quantity of materials used in transit-mixed concrete and in batched aggregates shall be continuously inspected as required by CBC section 1705A.3.2. If approved by City, batch plant inspection may be reduced to periodic if plant complies with CBC section 1705A3.3.1, item 1, and requires first batch inspection, weightmaster, and batch tickets.
- f. Prior to concrete placement, fabricate specimens for strength tests, perform slump and air content tests, and determine the temperature of the concrete, per ASTM C172, ASTM C31, ACI 318, sections 26.4.5 and 26.12.
- g. Inspect concrete placement for proper application techniques, per ACI 318, section 26.4.5.
- h. Verify maintenance of specified curing temperature and techniques per ACI 318 sections 26.4.7 through 26.4.9 and CBC section 1908.9.
- i. Inspect prestressed concrete for:
 - 1) Application of prestressing forces, per ACI 318 section 26.9.2.1

- 2) Grouting of bonded prestressing tendons per ACI 318 section 26.9.2.3.
 - j. Inspection of erection of precast concrete members per ACI 318 chapter 26.8.
 - k. Verify in-situ concrete strength, prior to stressing of tendons in post-tensioned concrete and prior to removal of shores and forms from beams and structural slabs per ACI 318 section 26.10.1.b.
 - l. Sampling and testing of reinforcing steel per ASTM A370, CBC section 1910A.2. CONTRACTOR shall submit mill certificate indicating compliance with requirements for reinforcement, anchors, ties, and metal accessories.
2. Prestressed Concrete: In addition to the tests and inspections required for concrete listed above, the following tests and inspections will performed:
- a. Testing Laboratory will test prestressing tendons and anchorages per CBC section 1910A.3 and ASTM A370.
 - b. Special Inspector will check the materials, equipment, tensioning procedure and inspect placement of prestressing tendons and construction, per CBC section 1705A.3.4.
 - c. Special Inspector will verify in-situ adequate concrete strength prior to stressing tendons.
 - d. Continuous inspection by Special Inspector of application of prestressing forces and grouting of bonded prestressing tendons, per CBC section 1705A.3.4.
3. Precast Concrete: In addition to the tests and inspections required for concrete listed above, the following tests and inspections will performed:
- a. Continuous inspection by Special Inspector of fabrication of precast concrete members.
 - b. Inspection of erection of precast concrete members per ACI 318, chapter 26.8.
4. Post-installed Anchors:
- a. Special Inspector will inspect installation of post-installed anchors in hardened concrete members as required by CBC table 1705A.3, item 4.

- 1) Adhesive anchors installed in horizontally or upwardly inclined orientations to resist sustained tension loads, per ACI 318, section 17.8.2.4.
 - 2) Mechanical anchors and adhesive anchors not defined above, per ACI 318, section 17.8.2.
- b. Testing Laboratory will test post-installed anchors in conformance to CBC section 1905A and ASTM E488.
- C. Structural Masonry:
1. Material Verification and Testing:
 - a. Sampling and testing of reinforcing steel per ASTM A370, CBC section 1910A.2. CONTRACTOR shall submit mill certificate indicating compliance with requirements for reinforcement, anchors, ties, and metal accessories.
 - b. Submit manufacturer's certificate of compliance for masonry units, mortar and grout materials. Test masonry units, mortar and grout (unit strength method).
 - c. Testing Laboratory will test masonry prisms in conformance with ASTM C1314.
 - d. Special Inspector will verify proportions of site-prepared, premixed or preblended mortar and grout, per ASTM C780.
 - e. Testing Laboratory will test core-drilled samples in conformance with CBC 2114.6.2.
 2. Inspection:
 - a. Special Inspector will continuously inspect preparation of prisms per ASTM C1314.
 - b. Special inspector will verify size, location and condition of dowels and construction supporting masonry.
 - c. Special inspector will verify size specified size, grade and type of reinforcement.
 - d. Special inspector will verify weldability of reinforcing bars other than ASTM A706. Special inspector to inspect reinforcing bar welding: Inspection to be in conformance with AWS D1.4, ACI 318 26.5.4.

- e. Special inspector will inspect placement of reinforcement, connectors, masonry units and construction of mortar joints.
 - f. Special inspector will verify protection of masonry during cold weather temperature (temperature below 40° F) or hot weather (temperature above 90° F).
 - g. Special inspector will inspect type, size and location of anchors and all other items to be embedded in masonry, including other details of anchorage of masonry to structural members, frames and other construction.
 - h. Special inspector will inspect grout space prior to grouting and placement of grout.
3. Post-installed Anchors in Masonry:
- a. Special inspector will inspect anchors cast in concrete per ACI 318, section 17.8.2.
 - b. Special inspector will inspect anchors post-installed in hardened concrete members:
 - 1) Continuous inspection of adhesive anchors installed in horizontally or upwardly inclined orientations to resist sustained tension loads, per ACI 318, section 17.8.2.4.
 - 2) Mechanical anchors and adhesive anchors, not defined in previous paragraph, per ACI 318, section 17.8.2.
 - c. Testing Laboratory will test post-installed anchors in conformance to CBC section 1905A and ASTM E488.

D. Structural Steel:

- 1. Special inspector will verify that all materials are properly marked in conformance with AISC 360, Section 3.3 and applicable ASTM standards.
 - a. Mill certificates indicating material properties that comply with requirements.
 - b. Materials, sizes, types and grades complying with requirements.
- 2. Testing Laboratory will test unidentified materials in conformance with ASTM A370.

3. Special inspector will examine seam welds of HSS shapes in conformance with ASTM.
 4. Special inspections and non-destructive testing of structural steel elements shall be in conformance to CBC section 1705A.2.1.
- E. High Strength Bolts:
1. Special inspector will verify identification markings and manufacturer's certificates of compliance conform to ASTM standards specified in the Contract Documents, per ASTM.
 2. Testing Laboratory will test high-strength bolts, nuts and washers in conformance with ASTM F606, ASTM A370.
 3. Special inspector will inspect bearing-type ("snug tight") bolt connections in conformance with AISC 360, section M2.5.
 4. Special inspector will inspect slip-critical bolt connections in conformance with AISC 360, section M2.5.
- F. Welding:
1. Verification of Materials, Equipment and Welders:
 - a. Special inspector will verify weld filler material identification markings per AWS designation listed on the Contract Documents and the WPS.
 - b. Special inspector will verify material manufacturer's certificate of compliance.
 - c. Special inspector will verify WPS, welder qualifications and equipment in conformance to CBC.
 2. Shop Welding: Special inspector will inspect the following, per CBC 1705A.2.1, AISC 360 (and AISC 341, as applicable).
 - a. Groove, multi-pass fillet welds larger than 5/16", plug and slot welds.
 - b. Single-pass fillet welds equal or less than 5/16".
 - c. Inspect welding of stairs and railing systems.
 - d. Verification of reinforcing steel weldability.
 - e. Welding of reinforcing steel, per AWS D1.4.

3. Field Welding: Special inspector will inspect the following, per CBC 1705A.2.1, AISC 360 (and AISC 341, as applicable):
 - a. Groove, multi-pass fillet welds larger than 5/16", plug and slot welds.
 - b. Single-pass fillet welds equal or less than 5/16".
 - c. End welded studs (ASTM A108) installation, including bend test.
 - d. Floor and roof deck welds.
 - e. Welding of structural cold-formed steel.
 - f. Welding of stairs and railing systems.
 - g. Verification of reinforcing steel weldability.
 - h. Inspect welding of reinforcing steel.
 4. Non-Destructive Testing: Testing Laboratory will test perform ultrasonic and magnetic particle testing in conformance to AISC 360 section N5.5, AISC 341 appendix Q5.2, AWS D1.1, AWS D1.8, ASTM E543, ASTM E1444, ASTM E164.
- G. Steel Joists and Trusses: Continuous inspection, special inspector will verify size, type and grade for all chord and web members as well as connectors and weld filler material, verify joist profile, dimensions and chamber (if applicable); verify all weld locations, lengths and profiles; mark or tag each joist, in conformance with CBC section 2207.1.
- H. Fire-Proofing:
1. Spray Applied:
 - a. Project inspector will examine structural steel surface conditions, inspect application, take samples, measure thickness, and verify compliance of all aspects of application with Construction Documents, in conformance with CBC sections and ASTM E.605.
 - b. Testing Laboratory will test bond strength in conformance with ASTM E605, per CBC section 1705A.14.6.
 - c. Testing Laboratory will test density in accordance with ASTM E605, per CBC section 1705A.14.5.
 2. Intumescent Fire-Resistant Coatings: Special inspector will inspect and test in accordance with AWCI 12-B, per CBC section 1705A.15.

- I. Anchor Bolts, Anchor Rods and Other Steel:
 - 1. Testing Laboratory will sample and test not readily identifiable anchor bolts and anchor rods in accordance with CBC.
 - 2. Testing Laboratory will sample and test not readily identifiable threaded rod not used for foundation anchorage per procedures noted in CBC.

- J. Prefabricated Wood Structural Elements:
 - 1. Special inspector will continuously inspect fabrication of glued-laminated timber in accordance with CBC section 1704A2.5.
 - 2. Special inspector will continuously inspect fabrication of manufactured open-web trusses in accordance with CBC 1704A2.5.
 - 3. Special inspector will continuously inspect fabrication of manufactured metal plate connected trusses in accordance with CBC 1704A2.5.

PART 2 – PRODUCTS (Not used).

PART 3 – EXECUTION (Not used).

END OF SECTION – 01 4523

SECTION 01 45 25

TESTING, ADJUSTING, AND BALANCING FOR HVAC

PART 1 – GENERAL

1.01 SUMMARY

A. SECTION INCLUDES

1. This Section specifies the requirements for test and balance of HVAC and related systems.

B. RELATED REQUIREMENTS

1. Section 01 11 00: Summary of Work.
2. Section 01 31 13: Project Coordination.
3. Section 01 32 13: Construction Schedule.
4. Section 01 33 00: Submittal Procedures.
5. Section 01 77 00: Contract Closeout.
6. Section 23 05 00: Common Work Results for HVAC.
7. Section 23 07 00: HVAC Insulation.
8. Section 23 08 00: HVAC Systems Commissioning.
9. Section 23 09 00: HVAC Controls.
12. Section 23 30 00: Air Distribution.
21. Section 23 80 00: Heating, Ventilating and Air Conditioning Equipment.
22. Section 28 31 49: Carbon Monoxide Detection and Alarm Systems.

PART 2 – PRODUCTS (Not used)

PART 3 – EXECUTION

3.01 DEFINITIONS AND APPLICABLE PUBLICATIONS

- A. For the purposes of this Section definitions are as indicated in applicable publications of AABC, NEBB, TABB, ASHRAE, ANSI and SMACNA.
1. TAB: Testing, Adjusting and Balancing.
 2. TABB: Testing, Adjusting and Balancing Bureau.
 3. AABC: Associated Air Balance Council.
 4. NEBB: National Environmental Balancing Bureau.
 5. ASHRAE: American Society of Heating, Refrigerating and Air-Conditioning Engineers.
 6. ANSI: American National Standards Institute.
 7. SMACNA: Sheet Metal and Air Conditioning Contractors' National Association.
 8. OAR: OWNER'S Authorized Representative

3.02 QUALITY ASSURANCE

- A. The General Contractor shall contract directly with the test and balance agency. Tests performed by testing agencies contracted with the system's subcontractor will not be accepted. The qualifications of the agency shall comply with Article 3.02, Quality Assurance. The agency shall be responsible for furnishing labor, instruments, and tools required to test, adjust, and balance the heating, ventilating, and air conditioning (HVAC) systems and related plumbing systems, as described and/or as indicated in the Contract Documents.
- B. CONTRACTOR shall obtain services of an independent, qualified testing agency acceptable to Architect to perform testing and balancing Work as specified and as follows:
1. Agency shall be currently certified by either the Associated Air Balance Council (AABC), the National Environmental Balancing Bureau (NEBB), or the Testing, Adjusting and Balancing Bureau (TABB). NEBB or TABB certification shall be for Air and Hydronic Testing, Adjusting and Balancing and Sound and Vibration Measurement.
 2. Work shall be in accordance with the latest edition of the AABC, NEBB, or TABB National Standards. Where the requirements of the two standards are different, the more stringent requirements shall prevail. Also, if the Contract Documents impose a more stringent standard, then the Contract Documents shall prevail.

- C. Performance Criteria: Work of this Section shall be performed in accordance with approved Testing, Adjusting, and Balancing agenda.
- D. Test Equipment Criteria: Basic instrumentation requirements and accuracy/calibration required by Section Two of the AABC, Section II of the NEBB, or TABB Procedural Standards for Testing, Adjusting and Balancing of Environmental Systems.
- E. Verification: The Test and Balance Agency shall recheck 10 percent (minimum 10) of the measurements listed in the report. The locations shall be selected by PROJECT INSPECTOR or OAR. The recheck will be witnessed by PROJECT INSPECTOR or OAR. If 20 percent of the measurements that are retested differ from the report and are also out of the specified range, an additional 10 percent will be tested. If 20 percent fall outside the specified range, the report will be considered invalid and all test and balance work shall be repeated.
- F. Due to more stringent acoustical requirements in the educational environment, the Test and Balance Agency shall recheck the air systems where the sound level is higher than the specified requirements and demonstrate compliance with the methodology specified in this document with emphasis on fan speed adjustment and balancing for optimum acoustical performance. The recheck will be witnessed by PROJECT INSPECTOR or OAR. When there are multiple air systems, a system selected by PROJECT INSPECTOR or OAR shall be rechecked. If this system is found to be not in compliance, a second system shall be checked. If the second system is also found to be not in compliance, the report will be considered invalid, and all test and balance work shall be repeated.

3.03 SUBMITTALS

- A. Submit name of agency to perform the Work. Include in the submittal the certified qualifications of all persons responsible for supervising and performing actual Work of this Section. Agency shall submit a minimum of five commercial or industrial HVAC system TAB projects of similar type, size, and degree of difficulty completed within the last two years. Agency shall provide name and telephone number of contact person for each listed project.
- B. Submit, for approval, 6 copies of the Agenda as indicated in Article 3.06 to test and balance all mechanical and relevant plumbing systems.
- C. Preliminary Report: Review the Contract Documents, examine Work installations and submit a written report to ARCHITECT, PROJECT INSPECTOR and OAR indicating deficiencies in Work precluding proper testing and balancing of the Work.
- D. Final TAB Report: Submit the final TAB report for review by ARCHITECT, PROJECT INSPECTOR, and OAR outlining the conditions and Work completed on each HVAC system. All outlets, devices, HVAC equipment, etc. shall be identified, along with a numbering system corresponding to report unit identification.

- E. Submit an AABC “National Project Performance Guaranty” or “NEBB Quality Assurance Certification”, assuring the Project systems were tested, adjusted, and balanced in accordance with the Specifications and AABC, NEBB, or TABB National Standards.
- F. CAD drawings: Submit single line, multi-color CAD drawings indicating outside return and supply air, volume control boxes, each outlet and inlet, room numbers, duct sizes at traverse locations, temperatures and pressures, systems balanced, components changed, and CONTRACTOR installed access points. In addition, drawings shall identify controls, equipment settings, including manual damper quadrant positions, manual valve indicators, fan speed control levers, and similar controls, and devices shall be marked on the drawings to show final settings. CAD files shall be submitted on CD-ROM upon final submittal of TAB report. Reports shall identify discrepancies between completed Work and the Contract Documents affecting the performance and longevity of the system.

3.04 GENERAL SCOPE OF WORK

- A. The general scope of Work shall include but not be limited to the following:
 - 1. Measure airflow rates of HVAC systems and make adjustments to achieve design airflow rates, tabulate results, and submit reports.
 - 2. Measure water-flow rates of HVAC systems and make adjustments to achieve design water flow rates, tabulate results, and submit reports.
 - 3. Measure flow velocities, temperatures, static pressures or head, rotational speed, and electrical power demand of fans, pumps, and other related HVAC system components, tabulate results, and submit reports.
 - 4. Measure sound levels in each conditioned space, tabulate results, and submit reports.
 - 5. Measure ambient sound levels of outdoor HVAC units and system components such as chillers and cooling towers, tabulate results, and submit reports.
 - 6. Reports shall contain sufficient data for the system designer to evaluate system performance and solve installation problems such as system pressure profiles and pressure drops across system components

3.05 SPECIFIC SCOPE OF WORK

- A. The specific scope of Work shall include the following HVAC system components as indicated on the Drawings:
 - 1. Air Conditioning Units.

2. Heating and Ventilating Units.
3. Supply, Return, Relief and Exhaust Fans.
4. Outside Air and Return Air Plenums.
5. Outside Air Intakes.
6. All Supply and Return Ductwork.
7. All associated Air Terminal Devices, i.e. Supply Diffusers, Return Registers, etc.
8. Exhaust Duct Systems.
9. Fire and Fire/Smoke Dampers.

3.06 TESTING, ADJUSTING, AND BALANCING AGENDA

- A. Provide proposed materials, methods, procedures, forms, diagrams, and reports for test and balance Work.
- B. Agenda to be completed by the test and balance agency and submitted to ARCHITECT, PROJECT INSPECTOR, and OAR for review and approval.
- C. Agenda shall include one complete set of AABC, NEBB, or TABB publications listed in Sub-paragraph 3.02.B.2, applicable publications, or, in case of other test and balance agencies and or organizations, comparable publications to establish an approved, systematic, and uniform set of procedures.
- D. Agenda shall also include the following detailed narrative procedures, system diagrams, and forms for test results:
 1. Specific standard procedures required and proposed for each system of the Work.
 2. Specified test forms for recording each procedure and for recording sound and vibration measurements.
 3. Systems diagrams for each air, water, and steam system. Diagrams may be single line.
- E. In addition to information recorded for standard AABC, NEBB, or TABB procedures, the following information is required:
 1. Fan data.

2. System number, location, manufacturer, model, and serial number.
 3. Fan wheel type and size.
 4. Motor horse power, type, and rpm.
 5. Sheave size, type, number of grooves, and open turns on Variable Pitch Sheave.
 6. Number and size of belts, motor and fan shaft sizes, center-to-center of shafts in inches, and adjustment available motor data, including nameplate data, actual amps, rated, and actual motor rpm, volts, phase, hp, kW, starter heater size, and capacity.
 7. Fan design airflow and service (supply, return, outdoor air or exhaust).
 8. Fan static pressure, suction/discharge, static profile, and static control point.
- F. The following traverse data is required:
1. Traverse location, size of duct (inside dimensions), and area of duct in square feet.
 2. Column for each hole traversed/lines for each reading.
 3. Barometric pressure.
 4. Temperature/Static pressure in the duct.
 5. Actual CFM corrected to SCFM.
 6. Notes.
- G. The following air distribution data is required:
1. Room identification.
 2. Outlet or intake balance sequence number.
 3. Size of outlet or inlet.
 4. AK Factor.
 5. Design and Actual FPM and CFM.
 6. Notes.
- H. The following hydronic coil data is required:

1. Air flow through the coil in CFM.
 2. Dry bulb and wet bulb temperatures entering/leaving coil.
 3. Enthalpy or total heat differences in BTU/pound.
 4. Capacity in BTU/hour at time of test.
 5. Water temperature and pressure entering/leaving coil.
 6. Flow (in GPM) through coil.
 7. Air pressure drop across coil.
 8. Water head drop across coil.
 9. Notes.
- I. The following DX coil data is required:
1. Air flow through the coil in CFM.
 2. Dry and wet bulb temperatures entering/leaving coil.
 3. Enthalpy or total heat difference across coil in BTU/ pound.
 4. Capacity in BTU/hour at time of test.
 5. Air pressure drop across coil.
 6. Notes.
- J. The following electric heating coil data is required:
1. Heating coil identification number.
 2. Nameplate data; manufacturer, model and serial number.
 3. Amperage/Voltage on each phase.
 4. Phase, kW, and Stages.
 5. Safety device installed.
 6. Air pressure drop across coil.
 7. Notes.

- K. The following boiler and domestic water heater data is required:
1. Performance test results for rated capacity.
 2. Boiler identification number.
 3. Nameplate data; manufacturer, model, and serial number.
 4. Water temperature entering/leaving the boiler.
 5. Outside conditions: temperature, humidity, general cloud cover.
 6. Barometric pressure.
- L. The following sound test data is required:
1. Area or location.
 2. Sound level in dB(A) as specified in Article 3.19.
 3. Sound level at the center band frequencies of eight non-weighted octaves with equipment on and off for 5 rooms selected by the OAR/PROJECT INSPECTOR.
 4. Plot of corrected sound-level reading on Noise Criteria (NC) curve for the measurements in Q 3 above.
- M. The following vibration test data is required:
1. Equipment identification number.
 2. Vibration levels at all accessible bearings, motors, fans, pumps, casings, and isolators.
 3. Measurements in mils deflection and velocity in inches per second.
 4. Each measurement taken in horizontal, vertical, and axial planes as accessible.
- N. The following mixing damper leakage test data is required:
1. Equipment identification number (unit, box, zone, etc.).
 2. Dry bulb temperature in the cold/hot (or bypass) deck.
 3. Dry bulb temperature in the mixed air stream.
 4. Calculated percent leakage.

5. Data above taken in the full cool and full heat (or bypass) mode.
 6. Notes.
- O. The following airflow station data is required:
1. Station identification number.
 2. Nameplate data including effective area.
 3. Differential test pressure or velocity.
 4. Calculated CFM.
 5. Actual CFM (from Pitot-tube traverse form).
 6. Read out CFM.
 7. Notes
- P. The following unit heater data is required:
1. Equipment identification number.
 2. Nameplate data; manufacturer, model, and serial number.
 3. Test CFM (use manufacturer rated CFM if not ducted).
 4. Heat test data per applicable procedure (hot water, electric, etc.).
 5. Notes.
- Q. The following fan coil and unit ventilator data is required:
1. Equipment identification number.
 2. Nameplate data; manufacturer, model, and serial number.
 3. Tested supply CFM or manufacturer rated CFM if not ducted.
 4. Tested outside air in CFM.
 5. Motor data and actual amps and volts.
 6. Cooling/Heating test data.
 7. Static pressure.

8. Notes.

U. The following terminal box data is required:

1. Box identification number.
2. Node, address, or designation on system.
3. Box size.
4. Cooling CFM.
5. Minimum CFM (if applicable).
6. Heating CFM (if applicable).
7. Box fan amps and volts (if applicable).
8. For DDC controlled boxes, record computer readout maximum, minimum, and heat, along with box correction factor for calibrating to true CFM.
9. Notes.

3.07 PROCEDURES

- A. Schedule the Work of this Section in order for test and balance activities to be completed prior to the date of Substantial Completion. CONTRACTOR shall place all heating, ventilating, and air conditioning equipment into operation during each day and until all HVAC adjusting, balancing, testing, demonstrations, and instructions on systems are completed. Agency shall prepare and submit reports within ten (10) days from completion of the Work of this Section to allow sufficient time for corrective measures to be completed before Substantial Completion of the Work. When an individual building or portion thereof is ready for occupancy, all equipment relative to such portion of Work shall be put into service, tested, and balanced.
- B. Prior to the date of Substantial Completion, and upon completion of test and balance Work, place all exhaust fans in operation, force all air handling units, and air conditioning units into a 100 percent outdoor air economizer mode with heating and cooling locked out and flush the building continuously for a period of fourteen (14) days.
- C. Coordinate test and balance procedures with any phased Project requirements so test and balance procedures on each phased portion of the Work will be completed prior to completion of said designated phase.

3.08 FIELD EXAMINATION

- A. Before the commencement of test and balance Work, CONTRACTOR shall ascertain that following conditions are fulfilled:
1. Ensure that all water heating and water cooling systems have been flushed, cleaned, and filled and high points vented.
 2. Refrigerant systems are fully charged with specified refrigerant.
 3. Over-voltage and current protection have been provided for motors.
 4. Equipment has been labeled as required.
 5. Curves and descriptive data on each piece of equipment to be tested and adjusted are available as required.
 6. Operations and maintenance manuals have been supplied.
 7. Controls manufacturer and boiler-burner representatives shall be available for consultation and supervision of adjustments during tests.
 8. Verify that heating and cooling coil fins are cleaned, combed and air filters clean, and installed.
 9. Verify that duct systems are clean of debris and leakage is minimized, access doors are closed and duct end caps are in place, and fire and volume dampers are in place and open.
 10. Automatic control systems are completed and operating.
 11. Start up and initial commissioning of all HVAC equipment except fans shall be by the manufacturer.
- B. In addition to the above, CONTRACTOR shall establish a specific, coordinated plan which details how each area of existing building will be balanced during the various phases of the Work. The evaluation shall address, at a minimum, the following concerns:
1. OWNER operations.
 2. Building safety and security policies. Prior to any fire safety or security systems shutdown at any time during the Work, CONTRACTOR shall first advise and coordinate with OWNER to ensure all concerned parties are notified.
 3. Protecting furniture, computers, photocopiers, and other office equipment.
 4. Concerns specific and unique to building related issues.

5. Downtime required for each Air Handling Unit including projected time to return each portion of the building back to its normal occupancy temperature and humidity.
6. Shutdown and reactivation of the fire alarm system to avoid accidental alarms during test and balance and related Work.

3.09 TEST AND BALANCE

A. For each heating, ventilating, or air conditioning system the following shall be performed, recorded, and submitted in an approved format for review. Make, type, and model of unit, and location of each piece of equipment shall be included in the report. Readings shall include but not be limited to following:

1. Air Systems:
 - a. General
 - 1) Verify all ductwork, dampers, grilles, registers, and diffusers have been installed per design and set in the full open position. Agency shall perform the following TAB procedures in accordance with AABC or NEBB National Standards. Where the requirements of the two standards are different, the more stringent requirements shall prevail. Also, if the Contract Documents impose a more stringent standard then the Contract Documents shall prevail.
 - b. Zone, Branch, and Main Ducts:
 - 1) Adjust ducts to within design CFM requirements by means of Pitot-tube duct traverse.
 - c. Supply Fans:
 - 1) Fan Speeds: Test and adjust fan RPM to achieve maximum or design CFM. CONTRACTOR shall provide new belt pulleys when required.
 - 2) Current and Voltage: Test and record motor voltage and amperage, and compare data with the nameplate limits. Ensure fan motor is not in or above the service factor as published by the motor manufacturer.
 - 3) Pitot-Tube Traverse: Perform a Pitot-tube traverse of main supply and return ducts, record total CFM.

- 4) Outside Air: Test and adjust the outside air using Pitot-tube traverse.
 - 5) Static Pressure: Test and record system static profile of each supply fan.
 - 6) Current and Voltage: Test and record motor voltage and amperage, and compare data with the nameplate limits. Ensure fan motor is not in or above the service factor as published by the motor manufacturer.
- d. Return, Relief, and Exhaust Fans:
- 1) Fan Speeds: Test and adjust fan RPM to achieve maximum or design CFM. CONTRACTOR shall provide new belt pulleys where required.
 - 2) Pitot-Tube Traverse: Perform a Pitot-tube traverse of the main return ducts to obtain total CFM.
 3. Static Pressure: Test and record system static profile of each fan.
- e. VAV Systems:
- 1) Set volume regulators on all terminal boxes to meet design maximum and minimum CFM requirements.
 - 2) Identification: Identify the type, location, and size of each terminal box. This information shall be recorded on terminal box data sheets.
- f. Diffusers, Registers and Grilles:
- 1) Tolerances: Test and balance each diffuser, grille, and register to within 5 percent of design requirements.
 - 2) Identification: Identify the type, location, and size of each grille, diffuser, and register. This information shall be recorded on air outlet data sheets.
- g. Coils: Air Temperature: Once airflow is set to acceptable limits, agency shall take wet bulb and dry bulb air temperatures on the entering and leaving side of each cooling coil. Dry-bulb temperature shall be taken on the entering and leaving side of each heating coil.
- h. Duct Leakage Testing:

- 1) On existing ductwork, agency shall calculate duct leakage by traversing the unit and reading associated diffusers.
 - 2) On new installations each and every section of the entire air distribution system (all supply, return, exhaust, and relief ductwork) shall be tested at 1.5 times design static pressure. All ducts shall demonstrate 5 percent leakage maximum (per CBC).
- i. Air Handling Units:
- 1) Prepare pressure profile and show design and actual CFM (outside air, return air, and supply air).
 - 2) Measure and record each mode (minimum OA and 100 percent OA) where economizer cycle is specified.
 - 3) Record pressure drops of all components (coils, filters, sound attenuators, louvers, dampers, and fans) and compare with design values.
 - 4) Pressure profile and component pressure drops are performance indicators and are not to be used for flow measurements.
- j. System Pressure Profiles:
- 1) Prepare pressure profiles from fan (supply, return, and exhaust) or air handling unit to extremities of system.
 - 2) As a minimum, show pressure at each floor, main branch, and airflow measuring device.
 - 3) Make pitot-tube traverses of all trunk lines and major branch lines where required for analysis of distribution system. Airflow measuring devices installed in ductwork, if available, may be utilized.
 - 4) Record residual pressures at inlets of volume controlled terminals at ends of system.
 - 5) Show actual pressures at all static pressure control points utilized for constant or variable flow systems.
- k. Fan speed adjustments and balancing for optimum acoustical performance:
- 1) As the very first step, the speed of all fans (supply, return, and exhaust inside packaged equipment or air handling units) shall

be adjusted to deliver the required fan total air quantity with all volume dampers and other flow rate control devices fully open. Adjustments shall be made with the outdoor air intake dampers, return air dampers, and relief air dampers in the minimum outdoor air position. The adjustments shall be made again in the 100 percent outdoor air position in systems with 100 percent outdoor air economizers.

- 2) The above adjustment shall be done with wet cooling coils, where cooling coils are provided.
- 3) The airflow rates at each branch duct shall be adjusted as the second step with air with all volume dampers and other flow rate control devices fully open.
- 4) The airflow rates at each air inlet and outlet shall be adjusted as the final step. The volume damper in the branch duct shall be used for balancing. Opposed blade dampers at air inlets and outlets where provided shall only be used for fine adjustments and shall not be closed beyond 60 percent open or when the dampers start to generate audible noise.
- 5) CONTRACTOR shall provide the labor and materials for all dampers, pulleys, and belt changes required for balancing. The design documents indicate the worst-case scenario with safety factors in fan static pressures for contingency. Properly coordinated and installed air systems may require a lower static pressure and a reduction in fan speed.

B. Pumps:

1. Test and adjust chilled water, hot water, and condenser water pumps to achieve maximum or design GPM.
2. Measure and record suction and discharge pressures.
3. Check pumps for proper operation. Pumps shall be free of vibration and cavitation.
4. Current and Voltage: Agency shall test and record motor voltage and amperage and compare data with the nameplate limits. Ensure pump motor is not in or above the service factor as published by the motor manufacturer.
5. Adjust pump flow by adjusting and setting balancing valves to obtain amperage reading on a clamp-on ammeter that corresponds to amperage indicated on pump's curves for required flow.

6. Verify that the motor is not drawing more current than indicated on motor plate rating. When actual flows of primary pumps are found by test to vary more than 5 percent from specified amount, system shall be re-balanced to regulate flow within this tolerance. When a flow indicating device(s) is in circuit, it shall be used to verify pump flows.
7. When testing is completed, a pump capacity chart with pump number and location indicated shall be marked indicating operating point of pump on the curve. Chart shall then be included in the report.

3.10 VERIFICATION OF HVAC CONTROLS

- A. Agency shall verify in conjunction with CONTRACTOR all control components are installed in accordance with the intent of the Contract Documents and are functioning according to the design intent, including all electrical interlocks, damper sequences, air and water resets, fire stats, and other safety devices.
- B. CONTRACTOR shall verify all control components are calibrated and set for design operating conditions and intent.

3.11 TEMPERATURE TESTING

- A. To verify system control and operation, agency shall perform a series of three temperature tests taken at approximately two hour intervals in each separately controlled zone. The resulting temperatures shall not vary more than two degrees Fahrenheit from the thermostat or control set point during the tests. Outside temperature and humidity shall also be recorded during the testing periods.

3.14 BUILDING/ZONE PRESSURIZATION

- A. Agency shall test and adjust building/zone pressurization by setting the design flows to meet the required flow direction and pressure differentials. Positive/Negative area(s) supply air shall be set to design flow and exhaust air rates adjusted to obtain the required pressure differential(s).

3.15 FIRE AND SMOKE DAMPER TESTING

- A. This work is to be performed by OWNER and State Fire Marshall. Do not include in agency scope of work.

3.16 LIFE SAFETY CONTROLS TESTING

- A. This work is to be performed by OWNER and State Fire Marshall. Do not include in agency scope of Work.

3.17 FINAL TABULATION

- A. After heating, ventilating, and air conditioning components are satisfactorily tested and balanced, entire system shall be put into operation and all pressures, temperatures, gpm, cfm, velocities, etc., shall be recorded and checked against design schedules. Design requirements shall be listed on reports and final tabulation shall be within a tolerance of plus or minus five percent of design requirements.
- B. Readings at various locations as described herein will be made every hour for four (4) hours, during normal working hours for three (3) days. Boilers, forced air furnaces, and chillers shall be started up far enough in advance to meet design conditions during period of testing.

3.18 VIBRATION TESTING

- A. Furnish instruments and perform vibration measurements if specified in Division 23. Provide measurements for all rotating HVAC equipment half horsepower and larger, including reciprocating/centrifugal/screw/scroll compressors, pumps, fans, and motors.
- B. Record initial and final measurements for each unit of equipment on test forms. Where vibration readings exceed allowable tolerance and efforts to make corrections have proved unsuccessful, forward a separate report to ARCHITECT.

3.19 SOUND TESTING

- A. Perform and record sound measurements as specified in this Section and in Section 23 0548: HVAC Sound, Vibration and Seismic Control. Take additional readings if required by ARCHITECT.
- B. Measuring equipment and methods shall comply with the current requirements of the AABC, NEBB, TABB and ANSI S12.60. Take measurements with a calibrated Type 1 sound level meter and octave band analyzer.
- C. Sound reference levels, formulae, and coefficients shall be according to ASHRAE Handbook: HVAC Applications, Chapter on Sound and Vibration Control.
- D. Where sound pressure levels are specified as noise criteria or room criteria in Section 23 0548: HVAC Sound, Vibration and Seismic Control determine compliance with the Contract Documents as follows:
 - 1. Reduce background noise as much as possible by shutting off unrelated audible equipment.
 - 2. Measure octave band sound pressure levels with specified equipment "off".
 - 3. Measure octave band sound pressure levels with specified equipment "on".

4. Use difference in corresponding readings to determine sound pressure due to equipment. Sound pressure level, due to equipment equals sound pressure level with equipment "on" minus factor.

DIFF.:	0	1	2	3	4	5	9-10 or More
FACTOR:	10	7	4	3	2	1	0

5. Plot octave bands of sound pressure level due to equipment for typical rooms, on a graph, which also shows, noise criteria (NC) curves.
- E. Where sound levels are required in dbA, measure sound levels using the A-frequency-weighting of meter. Single value readings will be used instead of octave band analysis.
- F. Measure sound levels at each octave band as NC or RC (room criteria) if indicated in the Drawings or other Spec Sections. Where measured sound levels exceed specified level, CONTRACTOR shall take all remedial action and necessary sound tests shall be repeated. Sound tests after remedial action shall be in octave band in NC or RC for the room and also at each diffuser, grille, or register in occupied areas. Sound levels shall be measured approximately five feet above floor on a line approximately 45 degrees to center of opening, on the A- and C-frequency-weighting of the measuring instrument.
- G. Measure and record sound levels in decibels for each room per current ANSI S12.60.
- H. Report shall include ambient sound levels, taken without air-handling equipment operating, of rooms in which above openings are located. A report shall also be made of any noise caused by mechanical vibration.

END OF SECTION – 01 4525

SECTION 01 50 00

CONSTRUCTION FACILITIES AND TEMPORARY CONTROLS

PART 1 - GENERAL

1.01 SECTION INCLUDES

- A. Temporary utilities, construction facilities and temporary controls to be provided, maintained, relocated, and removed by CONTRACTOR.
- B. Temporary office furnishings and office equipment.
- C. Project signage.

1.02 QUALITY ASSURANCE

- A. CONTRACTOR shall comply with applicable laws and regulations of authorities having jurisdiction including, but not limited to, the following:
 - 1. Building Code requirements.
 - 2. Health and safety regulations.
 - 3. Utility company regulations.
 - 4. Police, fire department and rescue squad requirements.
 - 5. Environmental protection regulations.
- B. CONTRACTOR shall arrange for the inspection and testing of each temporary utility prior to use. Obtain required certifications and permits and transmit to OAR.
- C. CONTRACTOR provided facilities are to be in place and available for OWNER use and occupancy within (Insert Number of Days) calendar days following the date of issue of the Notice to Proceed and shall remain in place and available for OWNER use and occupancy throughout the full term of the Contract.

1.03 SUBMITTALS

- A. Temporary Utilities: Submit to OAR reports of tests, inspections, meter readings, certifications, permits and similar procedures performed on temporary utilities.
- B. Project Signage / Banner: Submit to OAR for review and approval.

1. Shop Drawings: Elevation showing the text, OWNER sign and color of project signage, jointing, fittings and location of grommets.
2. Certification: Submit certification attesting fabric is certified as flame retardant, in accordance to NFPA 701, Standard Methods of Fire Tests for Flame Propagation of Textiles and Films.

1.04 PROJECT IDENTIFICATION SIGNAGE AND BANNERS

A. Provide the following project identification information:

1. “Construction Anticipated to Start in XXXX”.
2. \$XXX Million Investment.
3. “Creates an Estimated XXX Jobs.
4. City of Goleta
5. Name of the Architect/Engineer.
 - i. Architect: Anil Verma Associates, Inc.
 - ii. Mechanical / Electrical Engineer: Anil Verma Associates, Inc.
 - iii. Civil Engineer: RailPros, Inc. & MNS Engineers, Inc.
 - iv. Structural Engineer: SE Solutions, Inc.
 - v. Geotechnical Engineer: ENGEO, Inc.
6. Name of CONTRACTOR.

B. Project Sign:

1. CONTRACTOR shall furnish and install 1 Project Signs on the Project site at a location established by OAR. For graphical layout refer to Appendix A. OAR will provide the information to be posted on the sign. A draft of the proposed sign shall be submitted to OAR for review and approval before fabrication.
2. Sign shall be direct printed on an aluminum sheet 0.08 thick, adhered to a 3/4 inch thick exterior grade plywood. Electronic file of graphic shall have a minimum resolution of 150 dpi at two feet by four feet. Provide posts, bracing and perimeter framing with intermediate backing not to exceed two feet on center. Size: eight feet wide by four feet high. Size of building rendering shall be approximately six feet wide by three feet high.

C. Banners:

1. CONTRACTOR shall furnish and install Two (2) Banners on the Project site at a location established by OAR. For graphical layout refer to Appendix A. OAR will provide the information to be posted on the sign. A draft of the proposed sign shall be submitted to OAR for review and approval before fabrication.
2. Products of the following manufacturers form the basis for design and quality intended: 3M, MACtac North America, or equal, and shall meet the following requirements:
 - a. Flame retardant, heavy duty durable vinyl material, super smooth, minimum 16 ounces per layer.
 - b. Banners shall be cut with accurate angles and straight edges. Edges of banner shall be heat welded on four sides without causing fabric separation or otherwise damaging the work.
 - c. Banners shall have on both sides a clear, permanent, anti-graffiti coating that shall be durable and last a minimum of two years. Cleaning or removal of graffiti shall not cause damage to the anti-graffiti coating or image, or cause it to flake, yellow, bubble, peel or fade.
 - d. Ink used in the printing process shall be of the highest quality OEM inks and have integral UV protective components.
 - e. Banners shall be provided with ½ inch diameter grommets along the top and the bottom edges, spaced not more than 30 inches on center. Grommets shall be 4 inches, minimum, from the edges of the banner. Tie wire to fence / barricade.

D. No other signs shall be displayed without approval of OAR. At CONTRACTOR'S expense and without limitation remove and/or relocate Project signage and related facilities as rapidly as required in order to provide for progress of the Work.

E. CONTRACTOR shall remove Project Identification Signage at Substantial Completion of the Work.

1.05 TEMPORARY UTILITIES

A. CONTRACTOR shall coordinate with the appropriate utility company to install temporary services. Where the utility company provides only partial service, CONTRACTOR shall provide and install the remainder with matching compatible materials and equipment.

B. CONTRACTOR shall furnish, install and pay for all necessary permits, inspections, move ins/out, temporary lines, connections and fees, extensions and distribution, metering

devices and use charges, deliveries/pickups, rentals, storage, transportation, taxes, labor, insurance, bonds, material, equipment and all other miscellaneous items for the temporary utility systems. CONTRACTOR shall pay to utility companies for the consumption of the following temporary utility services:

1. Temporary Water service.
 2. Temporary Electrical service.
 3. Temporary Gas service.
 4. Temporary Telephone and Data.
- C. Maintain, extend and/or relocate temporary utility systems as rapidly as required in order to provide for progress of the Work.
1. Water distribution piping and outlet devices shall be of the size and required flow rates in order to provide service to all areas of the Project site.
 2. Furnish, install, maintain, extend and distribute temporary electric area distribution boxes, so located that individual trades can obtain adequate power and artificial lighting, at all points required for the Work, for inspection and for safety.
 3. Provide temporary phone, data service and distribution to Project site temporary offices.
- D. Upon Substantial Completion of the Work, remove temporary systems, devices and appurtenances.

1.06 TEMPORARY OFFICES

- A. CONTRACTOR shall provide Project Site temporary office facilities for his own use, and in addition shall provide and maintain a minimum of one construction trailer on the Project site for use by OWNER for the duration of the Work. Construction trailer shall be accessible by OWNER and/or INSPECTOR on a 7 day a week 24-hour basis. CONTRACTOR shall provide the necessary materials and labor to provide the trailer with access for disabled persons on request by the OAR. Trailer shall include, at a minimum, the following:
1. Conference room with a table and adequate seating for twelve.
 2. One bathroom.
 3. An open work area with devising partitions as required by OWNER.
 4. Two enclosed, separate offices with windows and lockable doors.

- B. Trailer shall be furnished with two exterior entrance doors with one located in a separate office. Each door shall be furnished with ‘Smart Key’ technology on both the dead bolt and cylinder lock. Provide six keys for each locking device. Exterior doors and windows shall be provided with exterior mounted burglar bars. Windows shall be provided with operable window shades. Security of trailer and contents is a continuous obligation of CONTRACTOR and shall be equipped with local sounding security system.
- C. Trailer shall have ample headroom, 8-foot minimum, and shall be lighted, heated, ventilated, and air-conditioned. Provide an electrically chilled bottled water fountain of 5-gallon capacity. Purified water shall be supplied in 5-gallon containers, delivered weekly, with four spares on hand after each re-supply visit. As an option, CONTRACTOR may maintain a minimum of two 24 500ml bottles cases of purified water in owner trailer throughout the duration of the project.
- D. The separate offices shall each be approximately 120 square feet in size and shall be furnished with a minimum of four 120 volt single phase convenience outlets with one 4’ long multi-outlet power strip (such as Legrand Model #PM48C) at each outlet location as well as one telephone jack and one data/LAN outlet. The conference room shall be approximately 200 square feet in size and shall be furnished with a minimum of eight 120 Volt single phase convenience outlets with one telephone jack and one data/LAN outlet.
- E. CONTRACTOR shall coordinate floor plan and location of electrical, telephone, data outlets with OAR prior to ordering and delivering the trailer.
- F. At CONTRACTOR’S expense and without limitation remove and/or relocate temporary office(s) and related facilities as rapidly as required in order to provide for progress of the Work.
- G. CONTRACTOR shall remove waste bin trash from OAR’S trailer, vacuum OAR’S trailer floors and/or mop OAR’S trailer floors once per week. Provide trailer with bathroom paper goods, soap, broom, mop and doormats.
- H. Trailer shall remain property of CONTRACTOR. CONTRACTOR shall remove such property upon Substantial Completion of Work or as otherwise determined in writing by OAR.

1.07 FURNISHINGS

- A. CONTRACTOR shall provide furnishings in the following quantities, shall set in rooms and shall position as directed by OAR upon delivery:
 - 1. **Two (2)** rolling mid-back task chairs, with arms, Allseating Inertia Mesh Back Basic Synchro Tilt 77089-T2-FM-NSBL-LH-BKN-OG17 Gray Mesh, Gray Matters Enviroleather, warranty 24/7 lifetime, or equal, shall be provided new and shall remain as OWNER’S property.

2. **Ten (10)** padded meeting chairs, Allseating 77054-NA-GM-FM-NGRY-FV-ARIVR, Gray Matters Enviroleather, warranty 24/7 lifetime, or equal shall be provided new and shall remain as OWNER's property.
 3. **Two (2)** desks, 30 by 66 by 30 inches: Haworth Adaptables WURA-3066-LJSC H-AE Graphite worksurface, Haworth Reside Adjustable Hoop Leg ZKH2-3000-PNFD TR-J Graphite (2 per desk), Haworth X Series Pedestal JPMH-24-SJ B/B/F TR-J Graphite (2 per desk), lifetime warranty, or equal, shall be provided new and shall remain as OWNER's property.
 4. **Two (2)** metal bookcases, three shelf, 41 by 34 by 12 inches; HON Brigade or equal (Similar to Staples Cat.# 793638; Item: 1598509/ Model: HS42ABCL).
 5. **Two (2)** resin folding tables, 29 by 30 by 72 National Public Seating BT3072, 10 year warranty, or equal, shall be provided new and shall remain as OWNER's property.
 6. **Two (2)** four drawer, legal size lateral filing cabinet. HON 500 series or equal. (Similar to Staples Item: 342892/Model: HON584L).
 7. **Two (2)** four drawer, legal size lateral filing cabinet. HON 320 series or equal. (Similar to Staples Item: 904583/Model: HH324CPP).
 8. **Two (2)** five (5) shelf storage/supply cabinet of approximately 78-inch high by 36-inch wide by 24-inch deep, furnished with locking doors, Sandusky or equal. (Similar to Staples Cat. # 880049/Model: SA4R362478-07).
 9. Provide and install one **(1)** "Plan-Hold" wall-mounted 42-inch wide plan racks with 36 individual plan holders each.
 10. Provide and install **one (1)** large white board in one conference room, 48 by 72 inches, Quartet melamine dry-erase board or equal. (Similar to Staples Cat. # 789834/Model: S538).
 11. Provide and install **one (1)** combination tack/white boards, 36 by 48 inches, one in each office, Quartet or equal. (Similar to Staples Cat. # 518886/Model: S554).
- B. Unless otherwise noted in this Section, temporary furniture shall remain property of CONTRACTOR. CONTRACTOR shall remove such property upon Substantial Completion of Work or as otherwise determined in writing by OAR.

1.08 TELEPHONE & DATA AND TRANSMISSION LINES

- A. Provide LAN and phone connectivity to all equipment specified below from the point of connection (POC) to equipment, including, but not limited to all cabling, jacks, patch

panel, and patch cables as required to connect all of the equipment listed in this section to the LAN. Cabling shall be CAT 6 or better.

- B. Provide **two (2)** separate phone lines, one dedicated fax line and **three (3)** phone instruments each with speakerphone, intercom, conference call, flash, redial, call hold and voice mail. Each phone instruments shall have a 4-line or more capacity/selectivity. Provide supporting terminal blocks and any required switch, router, power supplies, and amplifiers.
- C. Provide business class Broadband data service. Broadband data service is defined as a minimum of 200 Mbps download.
- D. Provide, install, and maintain the following specified equipment:
 - 1. Cisco ISR 4331 capable of providing wireless Internet access. Smartnet will be provided for the entirety of the project to cover the networking equipment.
 - 2. Cisco Small Business unmanaged switch with enough capacity to provide a wired Ethernet connection to each device in the office capable of using one.
- E. Provide, install, configure and maintain **five (5)** laptop docking station.
- F. Printer/Copier/Scanner/Fax: Provide, install, configure and maintain for network connectivity one HP LaserJet MFP M880z+ (or latest HP equivalent model at time of bid) with the following features and accessories:
 - 1. B/W and Color.
 - 2. Speed:
 - a. Copy: 46 ppm.
 - b. Scan: 70 ppm.
 - c. Print: 46 ppm.
 - 3. Network capable.
 - 4. Finisher with collation and one position stapling (minimum A2W80A HP LaserJet Stapler/Stacker).
 - 5. Three paper trays integral with the equipment including 8 ½ by 11, 8 ½ by 14 and 11 by 17.
 - 6. Additional 3500 sheet paper feed pedestal or drawer.
 - 7. 600 by 600 dpi.

8. Zoom, Reduction and enlargement from 25 percent to 400 percent.
 9. Embedded Print Controller with minimum 166 Mhz processor and 10/100 BaseT Network Interface Card.
 10. 1Fax specifications: See standard for MFP model.
 11. Maintenance: CONTRACTOR shall repair and service machine as necessary. Repair calls shall be responded to within 24 hours of placement.
 12. Supplies: CONTRACTOR shall provide THE FOLLOWING:
 - a. All toner supplies and consumables, including enough supplies to maintain two spares of each color toner.
 - b. All staples and other printer-related consumables, including enough supplies to maintain one spare staple cartridge.
- G. CONTRACTOR shall be responsible for maintaining all transmission lines, equipment and related devices. If equipment and/or transmission equipment becomes inoperable and downtime exceeds two days, CONTRACTOR shall replace and/or provide equivalent interim equipment.
- H. CONTRACTOR shall employ an experienced and qualified MCSE certified Network Administrator, who shall be responsible to set up and service the LAN equipment and appurtenances provided in OWNER trailer, so as to maintain the equipment in continuous operation. Service response shall be within one day of incident.
- I. Electronic/office equipment shall be new at the commencement of the project.

1.09 TEMPORARY STORAGE UNITS

- A. CONTRACTOR shall provide secure and waterproof storage units for the temporary storage of furniture, equipment and other items requiring protection.
- B. Walls, roof and doors shall be a minimum of 16-gauge steel with floors of 1 inch tongue and groove hardwood or $\frac{3}{4}$ inch minimum exterior type plywood. The undercarriage shall be designed to accommodate forklift blades 42-inch to 60-inch long. There shall be doublewide swing out lockable doors at one end equipped with waterproof gaskets.
- C. CONTRACTOR shall be responsible for delivery charges and will install the storage unit in an appropriate area.
- D. CONTRACTOR shall remove the storage unit from the Project site when the storage unit is no longer required for the Work or upon Substantial Completion of the Work.

- E. CONTRACTOR shall at their expense and without limitation remove and/ or relocate storage units as rapidly as required in order to provide for progress of the Work.

1.10 TEMPORARY SANITARY FACILITIES

- A. CONTRACTOR shall provide portable chemical toilet facilities. Quantity of portable chemical toilet facilities shall be based on total number of workers and shall be in accordance with CAL/OSHA standards.
- B. Portable chemical toilet facilities shall be maintained with adequate supplies and in a clean and sanitary condition and shall be removed from the Project site upon Substantial Completion of the Work. CONTRACTOR shall keep both OWNER chemical toilet facilities and OWNER trailer restroom clean and operational at all times.
- C. At CONTRACTOR'S expense and without limitation remove and/or relocate portable chemical toilet facilities as rapidly as required in order to provide for progress of the Work.
- D. CONTRACTOR will contain their breaks and lunch periods to the areas designated by OAR or any public area outside the Project site. CONTRACTOR shall provide a suitable container within the break/lunch area for the placement of trash. Areas used for break/lunch must be maintained clean and orderly. Once finish flooring has been installed in a particular area, no food or beverages will be permitted in that area.

1.11 TEMPORARY SECURITY FENCE / BARRICADE

- A. CONTRACTOR shall install temporary Project site security barricade(s) indicated on Drawings or as required for safety and as specified herein. New or used material may be furnished. Security of Project site and contents is a continuous obligation of CONTRACTOR.
- B. Unless otherwise indicated or specified, security fence shall be constructed of 8-foot high chain link fencing with an 8-foot high windscreen. Space posts not to exceed ten feet on centers. Posts shall be of following nominal pipe dimensions: terminal, corner, and gatepost 2 ½-inch, line posts 2-inch. Chain link fence shall be not less than #13 gauge, 2-inch mesh, and in one width. Posts, fence and accessories shall be galvanized and as follows:
 - 1. Shall be set in the earth a depth of 24-inch with soil firmly compacted around post, unless required otherwise in writing by OAR.
 - 2. Fence fabric shall be attached to posts with #14 gauge tie wire at 16 inches on center. A #6 gauge steel tension wire with turnbuckles shall be installed at top and bottom of barricade fencing. Wire tie fabric to tension wires at 18" centers.

3. Windscreen shall be attached to fence fabric and steel tension wires at 18-inch centers with a minimum of #14 gauge tie wire. Windscreen shall be maintained and all rips, tears, missing sections shall be corrected upon notification by OAR.
4. Chain link fencing shall be free from barbs, icicles or other projections resulting from galvanizing process. Fence having such defects will be replaced even if it has been installed.
5. Gates shall be fabricated of steel pipe with welded corners and bracing as required. Fence and fabric to be attached to frame at 12-inch centers. Provide all gate hardware of a strength and quality to perform satisfactorily until barricade is removed upon Substantial Completion of the Work. Each gate shall have a chain and padlock. Provide two gate keys to OAR. At Substantial Completion of the Work, remove barricade from Project site, backfill and compact fence footing holes. Existing surface paving that is cut into or removed shall be patched and sealed to match surrounding areas.
6. At CONTRACTOR'S expense and without limitation remove or relocate fencing, fabric and barricades or other security and protection facilities as rapidly as required in order to provide for progress of the Work.

1.12 OTHER TEMPORARY ENCLOSURES AND BARRICADES

- A. Provide lockable, temporary weather-tight enclosures at openings in exterior walls to create acceptable working conditions, to allow for temporary heating and for security.
- B. Provide protective barriers around trees, plants and other improvements designated to remain.
- C. Since the Work of this Project may be immediately adjacent to existing occupied structures, an Amtrak platform, and vehicular and pedestrian right of ways, CONTRACTOR shall, in his sole judgment and in accordance with applicable safety standards, provide temporary facilities, additional barricades, protection and care to protect existing structures, occupants, property, pedestrians and vehicular traffic. CONTRACTOR is responsible for any damage, which may occur to the property and occupants of the property of OWNER or adjacent private or public properties which in any way results from the acts or neglect of CONTRACTOR.
- D. CONTRACTOR shall be responsible for cleaning up all areas adjacent to the construction site which have been affected by the construction; and for restoring them to at least their original condition- including landscaping; planting of trees, and shrubs damaged by construction; and raking and disposal of debris such as roofing shingles, paper, nails, glass sheet metal, bricks, and waste concrete. Construction debris shall be removed and properly disposed of. Culverts and drainage ditches with sediment from the construction area shall be cleared routinely to maintain proper drainage and re-cleaned prior to completion of the contract.

- E. CONTRACTOR shall ensure sediment does not block storm drains. CONTRACTOR shall be responsible for cleaning storm drains blocked due to erosion or sediment from the work area.

1.13 TEMPORARY STORAGE YARDS

- A. CONTRACTOR shall fence and maintain storage yards in an orderly manner.
- B. Provide storage units for materials that cannot be stored outside.
- C. At CONTRACTOR'S expense and without limitation remove and/or relocate storage yards and units as rapidly as required in order to provide for progress of the Work.

1.14 TEMPORARY DE-WATERING FACILITIES AND DRAINAGE

- A. For temporary drainage and de-watering facilities and operations not directly associated with construction activities included under individual sections, comply with de-watering requirements of applicable Division 01 sections. CONTRACTOR shall maintain the Work, Project site and related areas free of water.
- B. For temporary drainage and de-watering facilities and operations directly associated with new buildings, additions or other construction activities, comply with Divisions 01 and 33 Sections. CONTRACTOR shall be responsible for, but not limited to, de-watering of excavations, trenches and below grade areas of buildings, structures, the Project site and related areas.

1.15 TEMPORARY PROTECTION FACILITIES INSTALLATION

- A. CONTRACTOR shall not change over from using temporary facilities and controls to permanent facilities until Substantial Completion, except as permitted by OAR.
- B. Until permanent fire protection needs are supplied and approved by authorities having jurisdiction, CONTRACTOR shall provide, install and maintain temporary fire protection facilities of the types needed in order to adequately protect against fire loss. CONTRACTOR shall adequately supervise welding operations, combustion type temporary heating and similar sources of fire ignition.
- C. CONTRACTOR shall provide, install and maintain substantial temporary enclosures of partially completed areas of construction. Provide locking entrances to prevent unauthorized entrance, vandalism, theft and similar violations of security. Where materials, tools and equipment are stored within the Work area, CONTRACTOR shall provide secure lock up to protect against vandalism, theft and similar violations of security. OWNER accepts no financial responsibility for loss, damage, vandalism or theft.

- D. CONTRACTOR operations shall not block, hinder, impede or otherwise inhibit the use of required exits and/or emergency exits to the public way, except as approved by OAR. CONTRACTOR shall maintain unobstructed access to fire extinguishers, fire hydrants, temporary fire protection facilities, stairways and other access routes for firefighting equipment and/or personnel.
- E. With approval of OAR and at the earliest feasible date in each area of the Work, complete installation of the permanent fire protection facilities including connected services and place into operation and use. Instruct OWNER personnel in use of permanent fire protection facilities.
- F. In the event of an emergency drill or an actual emergency, designated by the sounding of the fire alarm and/or other sounding device, all construction activities must cease. CONTRACTOR shall evacuate the Work area and remain outside the Work area until permitted to return. No Work shall be conducted during the evacuation of a building or during an emergency.

1.16 TEMPORARY SECURITY AND SAFETY MEASURES

- A. CONTRACTOR shall employ and maintain sufficient security and safety measures to effectively prevent vandalism, vagrancy, theft, arson, and all other such negative impacts to the Work. Any impacts to the progress of the Work of CONTRACTOR, OWNER, or OWNER'S forces, due to loss from inadequate security, will be the responsibility of CONTRACTOR.
- B. Until Substantial Completion of the Work, CONTRACTOR shall employ appropriate means to remove all graffiti from buildings, equipment, fences and all other temporary and/or permanent improvements on the Project site within twenty-four (24) hours from the date of report or forty-eight (48) hours of each occurrence.

1.17 TEMPORARY ACCESS AND STAGING AREAS

- A. Due to the limited amount of on and off Project site space for the parking of visitor's vehicles there will be no parking of CONTRACTOR vehicles in areas designated for Amtrak Parking use only. CONTRACTOR shall provide legal access to and maintain CONTRACTOR designated areas for the legal parking, loading, off-loading and delivery of all vehicles associated with the Work. CONTRACTOR shall be solely responsible for providing and maintaining these requirements whether on or off the Project site. CONTRACTOR shall provide and maintain ample on-site parking spaces designated for the exclusive use of OWNER. CONTRACTOR shall erect signs as required by OWNER each of these spaces and prevent all unauthorized vehicles from parking in the OWNER-reserved spaces.
- B. Temporary access roads are to be installed and maintained by CONTRACTOR to all areas of the Project site.

- C. CONTRACTOR shall maintain roads and walkways in a clean condition including removal of debris and/or other deleterious material on a daily basis.

1.18 DIRECTIONAL SIGNAGE AND ADVERTISEMENT POSTING

- A. CONTRACTOR shall provide and install signage to provide directional, identification, and contact information to construction personnel and visitors as follows and as reviewed by OAR.

1. For construction traffic control/flow at entrances/exits, and as designated by OAR.
2. To direct visitors.
3. For construction parking.
4. To direct deliveries.
5. For Warning Signs as required.
6. In accordance with CAL/OSHA standards as necessary.
7. For trailer identification and Project site address.
8. For “No Smoking” safe work site at designated locations.
9. Emergency contact information and phone number of CONTRACTOR.
10. Emergency contact information and phone number of local police, fire, and emergency personnel.
11. For Labor Compliance Program (LCP) as required under the General Conditions (Prevailing wage rates and Notice of LCP)
12. Employee benefits payments paid to trust funds are required under the General Conditions.

- B. OWNER has established a program authorizing vendors to post advertisements and billboards along the perimeter of project site. CONTRACTOR shall provide access and shall allow advertising signage to be placed on top of temporary, perimeter, security barricade and/or fences.

1.19 TRENCHES

- A. Open trenches for installation of utility lines (water, gas, electrical and similar utilities) and open pits outside barricaded working areas shall be barricaded at all times in a legal manner determined by CONTRACTOR. Trenches shall be backfilled and patch-paved

within twenty-four (24) hours after approval of installation by authorities having jurisdiction or shall have "trench plates" installed. Required access to buildings shall be provided and maintained. CONTRACTOR shall comply with all applicable statutes, codes and regulations regarding trenching and trenching operations. Open trenches deeper than 3'-6", and not located within a public street access, shall be enclosed within an 8'-0" high chain-link fence.

1.20 DUST CONTROL

- A. CONTRACTOR is responsible for dust control on and off the Project site. When Work operations produce dust the Project site and/or streets shall be sprinkled with water to minimize the generation of dust. CONTRACTOR shall clean all soils and debris from construction vehicles and cover both earth and debris loads prior to leaving the Project site. CONTRACTOR shall, on a daily basis, clean all streets and/or public improvements within the right of way of any and all debris, dirt, mud and/or other materials attributable to operations of CONTRACTOR.

1.21 WASH OUT

- A. CONTRACTOR shall provide and maintain a minimum of four (4) wash out boxes of sufficient size and strength to provide for concrete mixer wash out. CONTRACTOR shall locate and relocate both the wash out boxes and wash out areas in order to accommodate the progression of the Work. The wash out area shall be located as to minimize the amount of potential run off onto adjacent private and/or public property. CONTRACTOR shall legally dispose of the contents of the wash out boxes and area on an as needed basis or as required by OAR.

1.22 WASTE DISPOSAL

- A. CONTRACTOR shall provide and maintain trash bins on the Project site. Trash bins shall be serviced on an as needed basis and CONTRACTOR is responsible for the transportation of and the legal disposal of all contents.

1.23 ADVERSE WEATHER CONDITIONS

- A. Should warnings of adverse weather conditions such as heavy rain and/or high winds be forecasted, CONTRACTOR shall provide every practical precaution to prevent damage to the Work, Project site and adjacent property. CONTRACTOR precautions shall include, but not be limited to, enclosing all openings, removing and/or securing loose materials, tools, equipment and scaffolding.
- B. CONTRACTOR shall provide and maintain drainage away from buildings and structures.
- C. CONTRACTOR shall implement all required storm water mitigation measures as required under related Division 01 Sections.

1.24 DAILY AND MONTHLY REPORTS

- A. CONTRACTOR shall provide and maintain in the Project site office of CONTRACTOR, a daily sign in sheet for use by all employees of CONTRACTOR and all Subcontractors at whatever tier. At the beginning of each workday, the foreman, project manager, superintendent of CONTRACTOR and/or Subcontractors shall visit the site office of CONTRACTOR and shall enter onto the daily sign in sheet: all employee names; trade classification; and represented company. The completed sign in sheet shall serve as the basis of and shall be submitted with the daily construction report as set forth in Paragraph B below.
- B. By the end of each workday, CONTRACTOR shall submit to OAR and INSPECTOR a daily construction report denoting the daily manpower counts and a brief description/location of the workday activities. Manpower shall be broken down by trade classification such as foreman, journeyman or apprentice. The report shall also note the date, day of the week, weather conditions, deliveries, equipment on the Project site whether active and/or idle, visitors, inspections, accidents and unusual events, meetings, stoppages, losses, delays, shortages, strikes, orders and requests of governing agencies, Construction Directive and/or Change Orders received and implemented, services disconnected and/or connected, equipment start up or tests and partial use and/or occupancies. CONTRACTOR shall also include on the daily construction report the above information for all Subcontractors at whatever tier.
- C. CONTRACTOR shall submit on a monthly basis the forms found in Sections 01 3229 and 01 7416 certifying CEQA Mitigations and Storm Water Pollution Prevention (SWPP) compliances.

1.25 FIELD OFFICE SUPPLIES

- A. CONTRACTOR shall provide the initial supply of field office supplies to OAR in the quantities listed as set forth below in Table A. If specified in Section 01 2100 – Allowances, CONTRACTOR shall provide additional supplies as required by OAR. CONTRACTOR shall not deduct the costs of the Initial Field Office Supplies (as shown in Table A) from the Allowance for the monthly replenishment of OWNER field office supplies listed in Section 01 2100 – Allowances. CONTRACTOR shall deliver all of the initial field office supplies to OWNER Field Offices within fourteen days from the date established in the Notice to Proceed.
- B. CONTRACTOR may utilize different suppliers as the specified information is only to establish the required quantities and minimum levels of quality.
- C. Replenishment of Field Office Supplies: If an Allowance is identified in Section 01 2100 – Allowances for the periodic replenishment of OWNER field office supplies. OWNER shall submit requests for replenishment of field office supplies to CONTRACTOR from those listed in Table ‘A’ below. CONTRACTOR shall provide a monthly accounting of

items being requested, cumulative cost of replenishment of Field Office supplies previously ordered, and balance of allowance remaining. Upon Substantial Completion of the Work, CONTRACTOR shall file a Change Order Proposal crediting OWNER for any remaining balance or unspent portion of the Allowance. This Allowance specifically excludes the initial supplies listed in Table ‘A’ below and is to be used exclusively for the monthly replenishment of OWNER field office supplies. Supplies are to be delivered to OWNER’S trailer within twenty-four hours of OWNER’S request.

- D. Postage and Delivery Costs: CONTRACTOR shall provide postage and delivery services for OWNER generated materials in quantities and/or frequencies as requested by OWNER. The cost for these services shall be deducted from the Allowance identified in Section 01 2100 – Allowances for the periodic replenishment of OWNER field office supplies. This allowance is for the OWNER’S use only. Postage and delivery costs for CONTRACTOR generated materials are the responsibility of the CONTRACTOR and shall not be charged to this allowance, regardless of whether the postage and/or delivery of CONTRACTOR generated materials resulted from a request and/or direction from OWNER.
- E. Other expendable field office support items specified elsewhere, including, but not limited to, furnishing toner cartridges, equipment maintenance, and bottled water, are to be supplied and paid for by CONTRACTOR. These costs are not to be deducted from the Allowance for the periodic replenishment of OWNER field office supplies identified in Section 01 2100.

PART 3 – EXECUTION – Not Used

END OF SECTION – 01 50 00

SECTION 01 55 26

TRAFFIC CONTROL AND ACCESS

PART 1 – GENERAL

1.01 GENERAL

- A. The Contractor shall provide traffic control and access in accordance with these Specifications, Caltrans Standard Specifications and Plans, and the standards contained in the “Work Area Traffic Control Handbook” (WATCH) published by Building News, Inc. The Contractor shall take all necessary precautions for the protection of the Work and the safety of the public. All barricades and obstructions shall be illuminated at night, and all lights shall be kept burning from sunset until sunrise. The Contractor shall prepare and submit Traffic Control plans and comply with special safety regulations relating to traffic control as may be required by the County of Santa Barbara or other public authorities within their respective jurisdiction.

PART 2 – PRODUCTS [NOT USED]

PART 3 – EXECUTION

3.01 EQUIPMENT TRAVEL ROUTE

- A. The Contractor shall make its own investigation of the condition of available access routes to and from the work site. If suitable access is not available, it shall be the Contractor’s responsibility to construct and maintain any access or haul roads required for its construction operations. The travel route for the Contractor’s equipment shall follow the safest route possible and minimize inconvenience to motorists and pedestrians.

3.02 TEMPORARY STREET USE

- A. Nothing herein shall be construed to entitle the Contractor to the exclusive use of any public street, alley, way, or parking area during the performance of the Work hereunder. The Contractor shall conduct its operations as not to interfere unnecessarily with the authorized work of the City, utility companies, or other agencies in such streets, alleys, ways, or parking areas.
- B. No street shall be closed to the public without first obtaining the permission of the County of Santa Barbara, the City of Goleta, and other proper governmental authority, where applicable. Where excavation is being performed in primary streets or highways, at least one lane of traffic shall be kept open in each direction at all times unless otherwise provided in the

Contract Documents or under the terms of the permits issued by the County of Santa Barbara, State, District or other public agencies, as required.

- C. Toe boards shall be provided to restrict movement of excavated material if required by the County, the City of Goleta, or other agency having jurisdiction over the affected street or highway. Temporary provisions shall be made by the Contractor to assure the use of sidewalks and the proper functioning of all gutters, drainage inlets, and other drainage facilities.

3.03 TRAFFIC CONTROL

- A. For the protection of traffic in public or private streets and ways, the Contractor shall provide, place, and maintain all necessary barricades, traffic cones, warning signs, lights, and other safety devices in accordance with the requirements of Caltrans "Manual of Traffic Controls - Warning Signs, Lights, and Devices for Use in Performance of Work Upon Highways."
- B. Provide, place and maintain all necessary barricades, traffic cones, warning signs, lights and other safety devices. Post and maintain adequate detour signs at all applicable approaches to forewarn and direct traffic. Use illuminated and/or reflective warning/construction signs at appropriate locations for the project. Use solar powered flashing arrow boards for each lane closure taper in addition to other delineation. Provide safe and effective work areas and warn, control, protect and expedite vehicular and pedestrian traffic through the construction project.
- C. Provide temporary traffic re-striping at the conclusion of any working day for any centerline or lane line which is obliterated by construction. Use temporary asphalt surfacing at the Contractor's own expense as required to maintain traffic in a safe and non-disruptive manner. Provide temporary delineation as required which includes sandblasting of conflicting markings, installation and removal of temporary centerlines or lane lines, detour signing, barricading, and replacement of traffic lines, and markings in their proper locations upon termination of the detour. Provide any temporary pavement marking. Provide for removal of existing markings and the later removal of temporary markings to restore the permanent markings.
- D. Through traffic shall be maintained in both directions during working hours. Reopen all traffic lanes for the traffic circulation at the end of each working day, and during non-working hours including holidays, Saturdays, and Sundays. Provide traffic re-striping and markings prior to opening street traffic.
- E. Where required, the Contractor shall furnish, install, and maintain in-place "No Parking – Tow Away" signs (even if streets have posted "No Parking" signs) which shall be posted at least two (2) working days prior to commencement of work. On the sign, Contractor shall print the hours, day(s) and date of closure in two-inch-high letters and numbers. The signs shall be spaced at a maximum of 50 feet from street intersection and/or from each adjacent sign.

- F. The Contractor shall be responsible for the project safety on a 24-hours basis each calendar day for the entire duration of the project.

3.04 ACCESS

- A. Wherever necessary or required for the convenience of the public or individual residents or business places at street or highway crossings, private driveways, or elsewhere, the Contractor shall provide suitable temporary bridges or steel plates over unfilled excavations, except in such cases as the Contractor shall secure the written consent of the individuals or authorities concerned to omit such temporary bridges or steel plates. Such written consent shall be delivered to the City of Goleta prior to beginning the excavation. All such bridges or steel plates shall be maintained in service until access is provided across the backfilled excavation.
- B. Temporary bridges or steel plates for street and highway crossings shall conform to the requirements of the County of Santa Barbara or authority having jurisdiction in each case. The Contractor shall adopt designs furnished by said authority for such bridges or steel plates, or shall submit designs to said authority for approval, as may be required.
- C. Maintain adjacent streets open for ingress and egress and for parking; Provide emergency access for fire trucks, police cars, and other emergency vehicles at all times. The Contractor shall notify each agency in writing at least three (3) working days prior to work, and submit a copy of notice to the City of Goleta. Fire hydrants on or adjacent to the work shall be kept accessible to fire-fighting equipment at all times.
- D. Construct temporary AC ramps to provide safe and drivable access to residents and businesses and safe pedestrian crossing paths at all times. Provide alternate crossing areas with appropriate signing and other devices where construction prohibits pedestrian and bicycle access. Provide safe and adequate pedestrian zones and public transportation stops, as well as reasonable pedestrian crossings of the work at frequent intervals. Notify local/regional transit agency of potential impact to bus routes and interference with bus stops. There may be a need for temporary bus stop relocations if required. Keep the areas through and adjacent to the construction site clear of any objects that may be hazardous to pedestrians.

3.05 WORKING HOURS

- A. Construction work operations shall be performed Monday through Friday except City observed holidays unless otherwise noted. The Contractor work hours shall be at City discretion Monday through Friday except that work within the street right-of-way that effects the flow of traffic shall only be allowed in accordance with the issued encroachment permit.

3.06 NOTIFICATION

- A. The Contractor shall provide notification in writing to affected residences, schools, churches, and businesses informing them of the pending project. A draft notification letter shall be submitted to the City of Goleta five working days in advance of required notification date for

verification and approval. The Contractor shall hand deliver copies of the approved notification letter to the affected residences, school, churches, and businesses at least 14 days prior to the scheduled construction on each block. The notification letter shall state the project name, scope of work, date and time of restricted travel on the affected streets, and the Contractor's and City's contact persons and phone numbers. Failure to meet the approved schedule requires that the Contractor immediately notify residents of the cancellation for that day's work and reschedule construction of the affected area at a later date. Notification of rescheduled work shall follow this same procedure.

3.07 TRAFFIC CONTROL PLANS

- A. Traffic control plans shall be provided by the Contractor and submitted to the County of Santa Barbara, Caltrans or other agencies having jurisdiction as may be required. Traffic control plans shall conform to the requirements of the County of Santa Barbara or Caltrans as applicable and shall include the location and wording of all signs, barricades, delineators, lights, warning devices, and temporary parking restrictions; separate plan for each stage of construction; and separate detour routing plan.

3.08 TEMPORARY STREET CLOSURE

- A. If closure of any street is required during construction, a formal application for a street closure shall be made to the County of Santa Barbara or other authority having jurisdiction at least 30 days prior to the required street closure to allow them to determine the necessary signing and detour requirements to be provided by the Contractor.

END OF SECTION – 01 55 26

SECTION 01 57 19 CEQA MITIGATIONS

PART 1 - GENERAL

- 1.01 SECTION INCLUDES
- A. Mitigation procedures to minimize environmental impact.
- 1.02 RELATED SECTIONS
- A. Section 01 81 19 – Indoor Air Quality Procedures.
 - B. Section 01 35 92 – Mitigation and Monitoring Procedures for Archaeological Findings.
 - C. Section 01 74 16 – Storm Water Pollution Prevention Plan.
 - D. Section 01 45 23 – Testing and Inspections
 - E. Section 01 50 00 - Construction Facilities and Temporary Controls.
 - F. Section 01 74 19 - Construction Demolition and Waste Management.
- 1.03 SUBMITTALS
- A. CONTRACTOR shall submit on a monthly basis the form “Certification of Compliance with CEQA Mitigations”, found in Section 01 3229, certifying compliance to CEQA mitigations.
- 1.04 CEQA MITIGATIONS
- A. Following installation of exterior lighting CONTRACTOR shall adjust light fixtures to reduce the lighting intensity from the new sources on adjacent residences to no more than two foot-candles, measured at the property line.
 - B. CONTRACTOR shall ensure that construction equipment is properly tuned and maintained in accordance with manufacturer’s specifications, to ensure that excessive emissions are not generated by unmaintained equipment.
 - C. CONTRACTOR shall comply with the following requirements:
 - 1. Maintain slow speeds with all vehicles.
 - 2. Load impacted soil directly into transportation trucks to minimize soil handling.
 - 3. Water/mist soil as it is being excavated and loaded onto the transportation trucks.
 - 4. Water/mist and/or apply surfactants to soil placed in transportation trucks prior to exiting the site.
 - 5. Minimize soil drop height into transportation trucks or stockpiles during dumping.

6. During transport, cover or enclose trucks transporting soils, increase freeboard requirements, and repair trucks exhibiting spillage due to leaks.
 7. Cover the bottom of the excavated area with polyethylene sheeting when work is not being performed.
 8. Place stockpiled soil on polyethylene sheeting and cover with similar material.
 9. Place stockpiled soil in areas shielded from prevailing winds.
- D. When using large, heavy or noisy construction equipment CONTRACTOR shall implement all feasible measures to reduce air emissions below the Air Quality Management District's regional and localized significance thresholds
1. Exhaust Emissions:
 - a. Schedule construction activities that affect traffic flow to off-peak hours (e.g. between 10:00 AM and 3:00 PM).
 - b. Consolidate truck deliveries and/or limit the number of haul trips per day.
 - c. Route construction trucks off congested streets.
 - d. Employ high pressure fuel injection systems or engine timing retardation.
 - e. Utilize ultra-low sulfur diesel fuel, containing 15 ppm sulfur or less (ULSD) in all diesel construction equipment.
 - f. Use construction equipment rated by the United States Environmental Protection Agency as having Tier 3 (model year 2006 or newer) or Tier 4 (model year 2008 or newer) emission limits for engines between 50 and 750 horsepower.
 - g. Restrict non-essential diesel engine idle time, to not more than five consecutive minutes.
 - h. Utilize electrical power rather than internal combustion engine power generators as soon as feasible during construction.
 - i. Utilize electric or alternatively fueled equipment, if feasible.
 - j. Utilize construction equipment with the minimum practical engine size.
 - k. Utilize low-emission on-road construction fleet vehicles.
 - l. Ensure construction equipment is properly serviced and maintained to the manufacturer's standards.
 2. Fugitive Dust:
 - a. Apply non-toxic soil stabilizers according to manufacturers' specification to all inactive construction areas (previously graded areas inactive for ten days or more).

- b. Replace ground cover in disturbed areas as quickly as possible.
 - c. Sweep streets at the end of the day if visible soil material is carried onto adjacent public paved roads (recommend water sweepers with reclaimed water).
 - d. Install wheel washers where vehicles enter and exit unpaved roads onto paved roads, or wash off trucks and any equipment leaving the site each trip.
 - e. Pave construction roads that have a traffic volume of more than 50 daily trips by construction equipment, and/or 150 daily trips for all vehicles.
 - f. Water the disturbed areas of the active construction site at least three times per day, except during periods of rainfall.
 - g. Enclose, cover, water twice daily, or apply non-toxic soil binders according to manufacturers' specifications to exposed piles (i.e., gravel, dirt, and sand) with a five percent or greater silt content.
 - h. Suspend all excavating and grading operations when wind speeds (as instantaneous gusts) exceed 25 miles per hour (mph).
 - i. Apply water at least three times daily, except during periods of rainfall, to all unpaved road surfaces.
 - j. Limit traffic speeds on unpaved road to 15 mph or less.
 - k. Prohibit high emission causing fugitive dust activities on days where violations of the ambient air quality standard have been forecast.
 - l. Tarp and/or maintain a minimum of 24 inches of freeboard on trucks hauling dirt, sand, soil, or other loose materials.
 - m. Limit the amount of daily soil and/or demolition debris loaded and hauled per day.
3. General Construction:
- a. Utilize ultra-low VOC or zero-VOC surface coatings.
 - b. Phase construction activities to minimize maximum daily emissions.
 - c. Configure construction parking to minimize traffic interference.
 - d. Provide temporary traffic control during construction activities to improve traffic flow (e.g., flag person).
 - e. Develop a trip reduction plan for construction employees.
 - f. Implement a shuttle service to and from retail services and food establishments during lunch hours.
 - g. Increase distance between emission sources to reduce near-field emission impacts.

- h. Require construction contractors to document compliance with the identified mitigation measures.
- E. CONTRACTOR shall consult and coordinate with the OAR prior to construction to schedule high noise or vibration producing activities to minimize disruption. Coordination shall continue on an as-needed basis throughout the construction phase of the project to reduce school and other noise sensitive land use disruptions.
- F. CONTRACTOR shall minimize blasting for all construction and demolition activities, where feasible. If demolition is necessary adjacent to residential uses or fragile structures, the OAR will require the CONTRACTOR to avoid using impact tools. Alternatives that shall be considered include mechanical methods using hydraulic crushers or deconstruction techniques.
- G. Specific noise reduction measures include, but are not limited to, those listed below.
 1. Source Controls:
 - a. Time Constraints: It is prohibited work during nighttime hours.
 - b. Scheduling: Perform noisy work during less sensitive time periods.
 - c. Equipment Restrictions: Restrict the type of equipment used.
 - d. Noise Restrictions: Specifying stringent noise limits.
 - e. Substitute Methods: Use quieter methods and/or equipment.
 - f. Exhaust Mufflers: Ensure equipment have quality mufflers installed.
 - g. Lubrication & Maintenance: Well-maintained equipment is quieter.
 - h. Reduced Power Operation: Use only necessary size and power.
 - i. Limit Equipment On-Site: Only have necessary equipment on-site.
 - j. Noise Compliance Monitoring: Technician on site shall ensure compliance.
 - k. Quieter Backup Alarms: Manually-adjustable or ambient sensitive types.
 2. Path Controls:
 - a. Noise Barriers: Semi-permanent or portable wooden or concrete barriers.
 - b. Noise Curtains: Flexible intervening curtain systems hung from supports.
 - c. Enclosures: Encase localized and stationary noise sources.
 - d. Increased Distance: Perform noisy activities farther away from receptors, including operation of portable equipment, storage and maintenance of equipment.
 3. Receptor Controls:
 - a. Community Participation – open dialog to involve affected residents

- b. Noise Complaint Process: CONTRACTOR shall log and respond to noise complaints. Advance notice of the start of construction shall be delivered to all noise sensitive receptors adjacent to the project area. The notice shall state specifically where and when construction activities will occur, and provide contact information for filing noise complaints with the CONTRACTOR and the OWNER. In the event of noise complaints, the OWNER will monitor noise from the construction activity to ensure that construction noise does not exceed limits specified in the noise ordinance.

- H. Construction Equipment for Use on Public Roadways: CONTRACTOR shall submit a construction worksite traffic control plan to City of Goleta Public Works for review prior to construction. The plan shall show the location of haul routes, hours of operation, protective devices, warning signs, and access to abutting properties OWNER encourages CONTRACTOR to limit construction-related trucks to off-peak commute periods. As required by Caltrans, applicable transportation related safety measures shall be implemented during construction.

PART 2 – PRODUCTS – Not Used

PART 3 – EXECUTION – Not Used

END OF SECTION – 01 5719

SECTION 01 60 00

PRODUCTS, MATERIALS, EQUIPMENT & SUBSTITUTIONS

PART 1 – GENERAL

1.01 DEFINITIONS

- A. The word "Products," as used in the Contract Documents, is defined to include purchased items for incorporation into the work, regardless of whether specifically purchased for the project or taken from Contractor's stock of previously purchased products. The word "Materials," is defined as products which must be substantially cut, shaped, worked, mixed, finished, refined, or otherwise fabricated, processed, installed, or applied to form work. The word "Equipment" is defined as products with operational parts, regardless of whether motorized or manually operated, and particularly including products with service connections (wiring, piping, and other like items). Definitions in this paragraph are not intended to negate the meaning of other terms used in the Contract Documents, including "specialties," "systems," "structure," "finishes," "accessories," "furnishings," "special construction," and similar terms, which are self-explanatory and have recognized meanings in the construction industry.
- B. Neither "Products" nor "Materials" nor "Equipment" includes machinery and equipment used for preparation, fabrication, conveying, and erection of the work.

1.02 QUALITY ASSURANCE

- A. **Source Limitations:** To the greatest extent possible for each unit of work, the Contractor shall provide products, materials, and equipment of a singular generic kind from a single source.
- B. **Compatibility of Options:** Where more than one choice is available as options for Contractor's selection of a product, material, or equipment, the Contractor shall select an option which is compatible with other products, materials, or equipment. Compatibility is a basic general requirement of product, material and equipment selections.

1.03 SUBSTITUTIONS

- A. The Contractor shall, to the greatest extent possible, provide the materials as specified in these Contract Documents. Where procurement of the material as specified is not possible or the Contractor would like to submit for consideration an alternative, the Contractor shall submit shop drawings in accordance with Section 013300 and shall clearly indicate the product being substituted.

1.04 PRODUCT DELIVERY AND STORAGE

- A. The Contractor shall deliver and store the products, materials and equipment in accordance with manufacturer's written recommendations and by methods and means which will prevent damage, deterioration, and loss including theft. Delivery schedules shall be controlled to minimize long-term storage of products at the Site and overcrowding of construction spaces. In particular, the Contractor shall ensure coordination to ensure minimum holding or storage times for flammable, hazardous, easily damaged, or sensitive materials to deterioration, theft, and other sources of loss.

1.05 TRANSPORTATION AND HANDLING

- A. Products shall be transported by methods to avoid damage and shall be delivered in undamaged condition in manufacturer's unopened containers and packaging.
- B. Products may be inspected prior to off-loading. Any materials found damaged shall be rejected and removed from the site.
- C. The Contractor shall provide equipment and personnel to handle products, materials, and equipment including those furnished by Goleta Water District, by methods to prevent soiling and damage.
- D. The Contractor shall provide additional protection during handling to prevent marring and otherwise damaging products, packaging, and surrounding surfaces.

1.06 STORAGE AND PROTECTION

- A. Products shall be stored in accordance with manufacturer's written instructions and with seals and labels intact and legible. Sensitive products shall be stored in weather-tight climate controlled enclosures and temperature.
- B. Loose granular materials shall be stored on solid flat surfaces in a well-drained area and shall be prevented from mixing with foreign matter.
- C. Storage shall be arranged in a manner to provide access for maintenance of stored items and for inspection.

1.07 MAINTENANCE OF PRODUCTS IN STORAGE

- A. The Contractor shall comply with manufacturer's product storage requirements and recommendations. The Contractor shall maintain a log of inspections and shall make the log available on request. The Contractor shall periodically inspect products to assure they are

undamaged and are maintained under required conditions. The Contractor shall maintain manufacturer-required environmental conditions continuously.

- B. The Contractor shall ensure that surfaces of products exposed to the elements are not adversely affected and that weathering of finishes does not occur.
- C. For mechanical and electrical equipment, the Contractor shall provide a copy of the manufacturer's service instructions with each item and the exterior of the package shall contain notice that instructions are included.
- D. Products shall be serviced on a regularly scheduled basis, and a log of services shall be maintained and submitted as a record document prior to final acceptance.

PART 2 – PRODUCTS [NOT USED]

PART 3 – EXECUTION [NOT USED]

END OF SECTION – 01 6000

SECTION 01 71 23

FIELD ENGINEERING

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Layout of the work
2. Verification of work
 - a. OWNER reserves the right to verify any work that INSPECTOR deems necessary.
 - b. Other sections that require Surveyor to verify or measure installed work and related item. Surveyor shall perform such verifications or measurements at CONTRACTOR'S expense. CONTRACTOR shall furnish a certification, signed by both Surveyor and CONTRACTOR, to INSPECTOR.

B. Related Requirements:

1. Section 01 11 00 - Summary of Work.
2. Section 01 31 13 - Project Coordination.
3. Section 01 32 13 - Construction Schedule.
4. Section 01 33 00 - Submittal Procedures.
5. Section 01 77 00 - Contract Closeout.

1.02 SURVEY CONTROLS

- A. Vertical Control shall use same benchmark used in the preparation of topographic survey. When Work consists of both on-site and off-site and benchmarks differ, an equation shall be indicated on Drawings.
- B. Horizontal control for existing structures shall be the property line.

1.03 LAYOUT OF WORK

- A. All work related to staking shall be by a Land Surveyor, or Civil engineer, registered with the State of California to perform land surveying and employed by CONTRACTOR.
- B. Before commencement of Work, surveyor shall locate all reference points and benchmarks to be used for vertical and horizontal control.
- C. Surveyor shall lay out entire Work, set grades, lines, levels, control points, elevations, grids and positions.

1.04 RECORD DOCUMENTS

- A. Maintain complete and accurate log of all control and survey documentation as work progresses.
- B. Record, by coordinates, all utilities onsite with top of pipe elevations, at major grade and alignment changes, rim, grate or top of curb and flow line elevations of all drainage structures and sewer manholes.
- C. Indicate reference and control points on record drawings. The basis of elevation shall be one of the established benchmarks.
- D. Upon Substantial Completion, obtain and pay for reproducible plans. Deliver plans to OAR. Clearly indicate all differences between original drawings and completed work within specified tolerances.

1.05 SUBMITTALS

- A. Surveyor: Shall submit name, address and license number to OWNER, including any changes as they occur.
- B. Field notes: Upon request by OAR, submit copies of cut sheets, coordinate plots, data collector printouts, marked-up construction staking plans and other documentation as available to verify accuracy of field engineering work during and at completion of project. Submittals to OWNER must be signed and sealed by Surveyor and counter-signed by CONTRACTOR
- C. Statement of Compliance: CONTRACTOR shall submit a statement of certification signed and sealed by Surveyor, counter-signed by CONTRACTOR indicating compliance with grades and alignment of construction plans at rough grade, fine grade and top of rock stages. INSPECTOR shall approve survey submittals for each stage of construction prior to proceeding with work
- D. Upon Substantial Completion, CONTRACTOR shall obtain and pay for reproducible survey drawings (or “As Built”).

- E. Completed record drawings shall be signed and certified as correct and within specified tolerances by licensed surveyor. Originals and two sets of blueprints shall be submitted to OWNER.

PART 2-PRODUCTS – NOT USED

PART 3-EXECUTION

3.01 PREPARATION

- A. Pre-mark areas of excavation in accordance with the requirements of “Dig-Alert”. Request locators 2 days before commencing excavation.
- B. Before commencing Work, establish all horizontal and vertical reference points used in Contract Documents according to existing field conditions.
- C. Preserve established reference lines and benchmarks.
- D. Differentiate UPRR and city datum as applicable.
- E. Relocate bench marks that may interfere with Work.
- F. Reset and re-establish reference marks damaged or lost during construction.

3.02 SURVEY REQUIREMENTS GENERAL

- A. Establish a minimum of two permanent horizontal and vertical control points on Project site, remote from construction area, referenced to data established by control points.
- B. Indicate reference points, relative to benchmark elevation, on record drawings.
- C. Provide grade stakes and elevations to construct over excavation and re-compaction, rough and final grades, paved areas, curbs, gutters, sidewalks, building pads, landscaped areas, and other areas as required.
- D. Calculate and layout proposed finished elevations and intermediate controls as required to provide smooth transitions between spot elevations indicated on Drawings.
- E. Provide stakes and elevations for grading, fill, and topsoil placement.
- F. Provide adequate horizontal and vertical control to locate utility lines, including but not limited to, storm, sewers, water mains, gas, electric and signal and provide vertical control in proportion to the slope of the line as required for accurate construction. Dry utilities will be based upon adequate horizontal and vertical control layout. Prior to

trench closure, survey and record invert and flow line elevations. Survey and record top of curb and flow line elevations on finished concrete or asphaltic concrete (AC) surfaces at key locations such as beginning-of-curve (BC), end-of-curve (EC), grade breaks, corners or angle points in sufficient number to demonstrate the Work complies with the intent of the Contract Documents.

- G. Provide horizontal and vertical control for batter boards for drainage, utility, and other on-site structures as required.
- H. Furnish building corner offsets as required to adequately locate building pads. Provide cut and fill stakes within the building pad perimeter adequate to control both over excavation and re-compaction and the final sub-grade elevation of the building pad.
- I. Submit a certification signed by the surveyor confirming the elevations and locations of improvements are in conformance with the Contract Documents. The statement shall include survey notes for the finish floor and building pad, showing the actual measured elevations on the completed sub-grade, recorded to the nearest 0.01 of a foot. Building pad tolerance will be plus or minus 0.1 of a foot.
- J. Establish a minimum of two permanent horizontal and vertical control points on Project site, remote from building area, referenced to data established by survey control points.
- K. Mark boundaries for rights-of-way dedications and easements for utilities prior to making location of buildings and utilities.
- L. Layout all lines, elevations and measurements needed for construction or installation of buildings, grading, paving utilities according to the following:
 - 1. Identify site boundary, property lines.
 - 2. Provide working benchmarks.
 - 3. Set stakes for Bottom of Excavated Plane (B.E.P.).
 - 4. Set gridlines, radii, working points etcetera, for foundation.
 - 5. Set and verify building pad elevations.
 - 6. Set finish floor elevations.
 - 7. Stake location and elevations for exterior ramps and stairs.
 - 8. Set gridlines, radii, working points, etcetera, for all floors of multi-story buildings.

9. Set storm drain and sanitary sewer inverts and other utilities as needed at 5-foot off-set from building lines.
10. For new facilities, establish permanent onsite Benchmark with 2-inch diameter brass disk. Location of Benchmark to be determined by OWNER.

3.03 SURVEY REQUIREMENTS FOR GRADING

- A. Provide grade stakes and elevations as follows:
 1. Removal limits (cut lines).
 2. Rough grade staking: 60-foot maximum grid plus additional stakes at grade changes and pertinent locations. Flag all grade changes including ridges, flow lines and grade breaks.
 3. Fine grade for top of dirt: 30-foot maximum grid plus additional stakes at grade changes and pertinent locations. Flag all grade changes including ridges, flow lines and grade breaks.
 4. Verify fine grade for top of rock: 30-foot maximum grid plus additional stakes at grade changes and pertinent locations. Flag all grade changes including ridges, flow lines and grade breaks.
 5. Finish grade marks on all buildings, structures and at pertinent locations
 6. Finish grades and offsets for all concrete work, utilities, landscape areas, and structures.
 8. Offsite improvements: set grades and provide grade sheets as required by local authorities.
- B. Provide a minimum of two permanent horizontal and vertical control points onsite, remote from building area, referenced to data established by survey control points.

3.04 SURVEY REQUIREMENTS FOR UTILITIES

- A. Locate “wet” utility lines and provide vertical control proportionate to slope of line as required for accurate construction. “Dry” utilities shall have adequate horizontal and vertical control layout supplied by others.
- B. Prior to back-filling trench, survey and record invert and flow line elevations. Survey and record top of curb and flow line elevations on finished surfaces at key locations (such as Back of Curbs, grade breaks, corners or angle points) in sufficient number to demonstrate Work complies with intent of Contract Documents.

- C. Provide horizontal and vertical control for batter boards for drainage, utility, and other on-site structures as required.
 - 1. Set grades for vaults one inch higher than adjacent surrounding design grades, unless noted otherwise.
- D. Leave all trenches open until required inspection is completed.

3.05 SURVEY REQUIREMENTS FOR STRUCTURES

- A. Furnish building corner offsets as required to adequately locate building pads. Provide cut and fill stakes within building pad perimeter adequate to control both over excavation and re-compaction and final sub-grade elevation of building pad.
- B. Submit a certification signed by surveyor confirming elevations and locations of improvements are in conformance with Contract Documents. Statement shall include survey notes for finish floor and building pad, showing actual measured elevations on completed sub-grade, recorded to nearest 0.01 of a foot. Building pad tolerance will be plus or minus 0.1 of a foot.

END OF SECTION – 01 7123

SECTION 01 73 29

CUTTING AND PATCHING

PART 1 - GENERAL

1.01 SECTION INCLUDES

- A. This Section specifies procedural requirements for cutting and patching.

1.02 RELATED REQUIREMENTS

- A. Section 01 29 73 - Schedule of Values.
- B. Section 01 31 13 - Project Coordination.
- C. Section 01 31 19 - Project Meetings.
- D. Section 01 32 13 - Construction Schedule.
- E. Section 01 33 00 - Submittal Procedures.
- F. Section 01 71 23 - Field Engineering.
- G. Section 01 78 36 - Warranties.
- H. Section 01 45 25 - Testing, Adjusting, and Balancing of HVAC.

1.03 SUBMITTALS

- A. The word “cutting” as used in the Contract Documents includes, but is not limited to, cutting, drilling, chopping, and other similar operations and the word “patching” includes, but is not limited to, patching, rebuilding, reinforcing, repairing, refurbishing, restoring, replacing, or other similar operations.
- B. Cutting and Patching Proposal: CONTRACTOR shall submit a proposal describing procedures well in advance of the time cutting and patching will be performed if the Contract Documents requires approval of these procedures before proceeding. Include the following information, as applicable, in the proposal:
 - 1. Describe the extent of cutting and patching required. Denote how it will be performed and indicate why it cannot be avoided.

2. Describe anticipated results in terms of changes to existing construction. Include changes to structural elements and operating components as well as changes in the building's appearance or other significant visual elements.
3. List products to be used and firms or entities that will perform this Work.
4. Indicate dates when cutting and patching will be performed.
5. Utilities: List utilities that cutting and patching operations will disturb or affect. List utilities to be relocated and those that will be temporarily out-of-service. Indicate how long service will be disrupted.
6. Where cutting and patching involves adding reinforcement to structural elements, submit details and engineering calculations showing integration of reinforcement with the original structure.
7. Review by ARCHITECT prior to proceeding with cutting and patching does not waive ARCHITECT right to later require complete removal and replacement of defective Work.

1.04 QUALITY ASSURANCE

- A. Requirements for structural Work: Do not cut and patch structural elements in a manner that would change their load-carrying capacity or load-deflection ratio.
 1. Obtain approval from ARCHITECT of the cutting and patching proposal before cutting and patching the following structural elements:
 - a. Foundation construction.
 - b. Bearing and retaining walls.
 - c. Structural concrete.
 - d. Structural steel.
 - e. Structural decking.
 - f. Miscellaneous structural metals.
 - g. Equipment supports.
 - h. Piping, ductwork, vessels, and equipment.

- B. **Operational Limitations:** Do not cut and patch operating elements or related components in a manner that would result in reducing their capacity to perform as intended. Do not cut and patch operating elements or related components in a manner that would result in increased maintenance or decreased operational life or safety.
1. Obtain review of the cutting and patching proposal before cutting and patching the following operating elements or safety related systems:
 - a. Primary operational systems and equipment.
 - b. Air or smoke barriers.
 - c. Water, moisture, or vapor barriers.
 - d. Membranes and flashings.
 - e. Fire protection systems.
 - f. Control systems.
 - g. Communication and/or data systems.
 - h. Conveying systems.
 - i. Electrical wiring systems.
- C. **Visual Requirements:** Do not cut and patch construction exposed on the exterior or in occupied spaces in a manner that would, in the opinion of ARCHITECT, reduce the building's aesthetic qualities. Do not cut and patch construction in a manner that would result in visual evidence of cutting and patching. Remove and replace Work cut and patched in a visually unsatisfactory manner.
1. If possible, retain the original installer or fabricator to cut and patch the exposed Work listed below. If it is impossible to engage the original installer or fabricator, engage another recognized experienced and specialized firm.
 - a. Firestopping.
 - b. Acoustical ceilings.
 - c. Acoustical panels.
 - d. Finished wood flooring.
 - e. HVAC enclosures, cabinets, or covers.
 - f. Ceramic and quarry tile.

- g. Gypsum board.
- h. Masonry (exterior and interior where exposed).

1.05 WARRANTY

- A. Warranties: Replace, patch, and repair material and surfaces cut or damaged by methods and with materials in such a manner as not to void any warranties required or existing.

PART 2 - PRODUCTS (Not applicable)

PART 3 - EXECUTION

3.01 INSPECTION

- A. Examine surfaces to be cut and patched and conditions under which cutting and patching is to be performed before cutting. If unsafe or unsatisfactory conditions are encountered, take corrective action before proceeding.
 - 1. Before proceeding, meet at the Project site with parties involved in cutting and patching, including mechanical and electrical trades. Review areas of potential interference and conflict. Coordinate procedures and resolve potential conflicts before proceeding.

3.02 PREPARATION

- A. Protection: Protect existing improvements and Work during cutting and patching to prevent damage. Provide protection from adverse weather conditions for portions of existing improvements or Work that might be exposed during cutting and patching operations.
- B. Avoid interference with use of adjoining areas or interruption of free passage to adjoining areas.
- C. Where the Work requires sandblasting of existing surfaces in order to receive new materials secured by cementitious, adhesive or chemical bond, completely remove existing finishes, stains, oil, grease, bitumen, mastic and adhesives or other substances deleterious to the new bonding or fastening of new Work. Utilize wet sand blasting for interior surfaces and for exterior surfaces where necessary to prevent objectionable production of dust.

3.03 PERFORMANCE

- A. General: Employ skilled workmen to perform cutting and patching. Proceed with cutting and patching at the earliest feasible time and complete without delay. Carefully remove existing Work to be salvaged and/or reinstalled. Protect and store for reuse into the Work.
- B. Cutting: Cut existing construction using methods least likely to damage elements retained or adjoining Work. Where possible, review proposed procedures with the original installer; comply with the original installer's recommendations.
 - 1. In general, where cutting, use hand or small power tools designed for sawing or grinding, not hammering and chopping. Cut holes and slots as small as possible, neatly to size required, and with minimum disturbance of adjacent surfaces. Temporarily cover openings when not in use.
 - 2. To avoid marring existing finished surfaces, cut or drill from the exposed or finished side into concealed surfaces.
 - 3. Cut through concrete and masonry using a cutting machine, such as a carborundum saw or a diamond-core drill. Saw cut reinforcing bars and paint ends with bituminous paint except where bonded into new concrete or masonry.
 - 4. Comply with requirements of applicable Sections of Divisions 31, 32, and 33 where cutting and patching requires excavating, backfill, and recompaction.
 - 5. Sheet Metal: Remove back to joint, lap, or connection. Secure loose or unfastened ends or edges and seal watertight.
 - 6. Plaster: Cut back to sound plaster on straight lines, and back bevel edges of remaining plaster. Trim existing lath and prepare for new lath.
 - 7. Gypsum Wallboard: Cut back on straight lines to undamaged surfaces with at least two opposite cut edges centered on supports.
 - 8. Tile: Cut back to sound tile and backing on joint lines.
- C. Patching: Patch with durable seams that are as invisible as possible. Comply with required tolerances.
 - 1. Where feasible, inspect and test patched areas to demonstrate integrity of the installation. Verify conditions of existing substrates prior to executing Work.
 - 2. Restore exposed finishes of patched areas and extend finish restoration into retaining adjoining construction in a manner that will eliminate all evidence of patching and refinishing.

3. Concrete: Maintain cut edges in a moist condition for twenty four hours prior to the placement of new concrete. In lieu of this an epoxy adhesive may be provided. Finish placed concrete to match existing unless noted otherwise. Concrete shall have a compressive strength of 3,000 psi where installed to repair and match existing improvements, unless noted otherwise.
4. Metal Fabrications: Items to remain exposed shall have their edges cut and ground smooth and rounded.
5. Gypsum Wallboard: Fasten cut edges of wallboard. Install patches with at least two opposite edges centered on supports and secure at 6-inch centers. Tape and finish joints and fastener heads. Patching shall be non-apparent when painted or finished.
6. Acoustical Ceilings: Comply with the requirements for new Work specified in related sections of the Contract Documents.
7. Painting: Prepare areas to be patched, patch and paint as specified under related sections of the Contract Documents.

3.04 CLEANING

- A. Clean areas and spaces where cutting and patching are performed. Completely remove paint, mortar, oils, putty, and similar items. Thoroughly clean piping, conduit, and similar features before applying paint or other finishing materials. Restore damaged coverings to their original condition.

END OF SECTION – 01 7329

SECTION 01 74 16

STORM WATER POLLUTION PREVENTION PLAN

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Storm water permitting and certification in compliance with state and local regulations, including payment of application and annual fees and electronic filing, through SMARTS website.
2. Preparation, implementation, upkeep and monitoring of Storm Water Pollution Prevention Plan (SWPPP).
3. Control runoff and pollutants from the site during construction activities.
4. Reference to SWPPP prepared for Train Depot Site by ENGEIO, Inc. on 10/26/2023.

B. Related Requirements:

1. Division 01 – General Requirements.
2. Section 32 13 43 – Pervious Concrete Pavement.
3. Section 32 14 15 – Permeable Interlocking Concrete Pavers.
4. Section 33 40 00 – Storm Drainage Utilities.

1.02 ACRONYMS AND DEFINITIONS

BMP	Best Management Practice.
CAN	Corrective Action Notice.
CASQA	California Stormwater Quality Association.
COI	Change of Information.
DWQ	Division of Water Quality.
CGP	NPDES General Permit for Storm Water Discharges Associated with Construction Activities.
ELAP	Environmental Laboratory Accreditation Program.
RWQCB	Regional Water Quality Control Board.
LRP	Legally Responsible Person (OWNER).
NOI	Notice of Intent.
NOT	Notice of Termination.

NPDES	National Pollutant Discharge Elimination System.
PRDs	Permit Registration Documents, including NOI, Risk Assessment, Site Map, SWPPP, Annual Fee, Signed Certification Statements.
RISK LEVEL	As defined by CGP.
QSD	Qualified SWPPP Developer.
QSP	Qualified SWPPP Practitioner.
QPE	Qualifying Precipitation Event, is any weather pattern that is forecast to have a 50% or greater Probability of Precipitation (PoP) and a Quantitative Precipitation Forecast (QPF) of 0.5-in or more within a 24-hr period.
SMARTS	Storm Water Multiple Application and Report Tracking System (smarts.waterboard.ca.gov).
SWPPP	Storm Water Pollution Prevention Plan.
SWRCB	State Water Resources Control Board.
TMDL	Total Maximum Daily Load, calculation of pollutant allowable for site specific water bodies.
WPCD	Water Pollution Control Drawings.
WDID	Waste Discharge Identification Number.

1.03

SWPPP REQUIREMENTS

- A. CONTRACTOR shall assign a QSD and QSP, who shall be in responsible charge of Work of this Section.
- B. Prior to start of Construction, CONTRACTOR shall:
 1. Submit QSD and QSP qualifications.
 2. Incorporate SWPPP activities into the Project Schedule.
 3. Update SWPPP provided by City to reflect CONTRACTOR's proposed construction staging, phasing, schedule and other construction activities. SWPPP shall be certified by QSD.
 4. Complete the following on the SMARTS website under project application started by OWNER LRP. CONTRACTOR shall provide SMARTS user name to OAR/LRP in order to be linked to the application.
 - a. NOI forms.
 - b. Upload SWPPP certified by QSD.
 - c. Risk Level Calculation.
 - d. Post Construction Water Balance Calculation provided by ARCHITECT (Attachment "B" Section 33 4000).

5. Inform OAR/LRP to review and certify the NOI application and PRDs on SMARTS at least 10 days prior to soils disturbance.
 6. Submit NOI fee statement along with payment to SWRCB at least 7 days prior to start of construction to obtain a WDID number.
 7. Secure and pay for deposits, permits and inspection fees to local jurisdiction, if required.
 8. Inform CONTRACTOR and Subcontractors personnel on the BMP procedures to prevent pollutants from entering the storm drain system, before they start construction activities.
- C. During Construction:
1. Implement, install and maintain BMPs. Ensure that BMPs are designed to protect all exposed portions of the site.
 2. Retain copy of the SWPPP, monitoring records, and PRD on site until Substantial Completion.
 3. Conduct and document storm water pollution prevention training of CONTRACTOR site personnel and provide records of training to OAR. See Attachment "D" for sample training log. Keep personnel informed of the SWPPP changes.
 4. Monitor the Project Site per the CGP requirements.
 - a. Conduct site inspection of pollution prevention controls and provide Site Monitoring Reports per the CGP and SWPPP. Prepare and maintain, at the Project site, a log of each inspection using Site Monitoring Report forms (Attachment "A", at the end of this Section. Inspections shall include, at a minimum:
 - 1) At least weekly.
 - 2) Within 72 to 120 hours prior to a QPE.
 - 3) Within 96 hours after the last 24 hour period with 0.25 inches or more precipitation.
 - 4) At least once each 24 hours during extended storm events.
 - 5) Conduct quarterly non-storm water inspections (Attachment "C").
 - b. Conduct sampling and reporting as directed by CGP and outlined in the SWPPP Construction Site Monitoring Plan.
 - c. Precipitation forecast information shall be obtained from the National Weather Service Forecast Office (<http://www.srh.noaa.gov/>).
 5. Participate in quarterly SWPPP inspections with representative from OWNER's representative. Correct CAN items.
 6. Non-compliance with the CGP and Unauthorized Discharges shall be reported to OAR immediately.

7. Provide verification annually that construction activities are in compliance with SWPPP. Submit Annual Report Compliance Certification (Attachment “B”) to OAR and complete Annual Report on SMARTS by July 15 of each year, for review and certification. Annual Report will be certified by OWNER’s LRP.
 8. Maintain, Report, and update SWPPP and PRDs on the SMARTS website, including items listed below.
 - a. Upload SWPPP amendments.
 - b. Complete Ad-Hoc Reports for all sampling events. Non-Visible, Effluent Monitoring, TMDL updates and Exceedance Results must be reported electronically by deadlines per CGP.
 - c. Provide COI in SMARTS to reflect changes to construction site area, schedule, and risk level. COI shall be submitted to OAR/LRP for certification.
 9. Pay annual fees related to the CGP up until the date of Substantial Completion.
 10. Pay fines and penalties from regulatory agencies against OWNER due to CONTRACTOR’S non-compliance with storm water regulations. OWNER shall recover costs of fines and penalties by appropriate OWNER assessment. Review of the SWPPP and inspection log by OAR shall not relieve CONTRACTOR from liabilities arising from non-compliance of storm water pollution regulations.
 11. Update Post Construction BMP Installation and Maintenance Log and complete Maintenance Plan, provided by ARCHITECT, to reflect ‘actual products installed (See Attachment "A" Section 33 4000 Storm Drainage Utilities). Markup Site Plan, Appendix 2 of Attachment “A” of Section 33 4000 to reflect ‘As-Built’ conditions.
- D. At Substantial Completion:
1. Provide SWPPP, Site Monitoring Reports, and record documents to OAR.
 2. Handover the maintenance log and maintenance plan to OAR. OWNER will maintain prevention controls left in place.
 3. Conduct Post-Construction BMP training of OWNER personnel.
 4. Notify OAR to schedule a meeting to confirm Substantial Completion of SWPPP.
 5. Submit to OAR Substantial Completion Certification that the Project has met all of the conditions of the CGP (Attachment “B”). Post-construction storm water operation and management plan as mentioned in the compliance certifications shall be in place at Substantial Completion.
 6. Prepare the final Annual Report and NOT to terminate permit coverage. Submit NOT electronically with required attachments through the SMARTS system. NOT will be certified by the OWNER’s LRP.
 7. OWNER Maintenance and Operations will maintain prevention controls left in place after CONTRACTOR receives Substantial Completion.
- E. Project Inspector will conduct inspection and examination of the SWPPP.

1.04 SUBMITTALS

- A. Submit the following:
1. Qualifications and experience of QSD and QSP for OWNER's review and acceptance.
 2. Electronic files of SWPPP updated and certified by QSD.
 3. NOI application to OAR/LRP for review and certification through SMARTS.
 4. NOI fee statement along with payment to SWRCB.
 5. Documentation in accordance with CGP requirements for SWPPP, including:
 - a. BMP material quality, grade, type as specified in the CASQA BMP Handbook.
 - b. Electronic Copies of weekly and quarterly inspections, annual reports, compliance certifications, and test results.
 - c. Proof of filing with the Water Board; copies of PRDs and all attachments.
 - d. Training records of CONTRACTOR site personnel.
 - e. BMP implementation schedule.
 - f. WPCD revisions.
- B. SWPPP Closeout Documents: At Substantial Completion provide one hard copy and electronic files of the documents listed below to OAR. OAR will forward records electronically to OWNER Supervising Civil Engineer for retention period of three years.
1. Copy of SWPPP and PRDs, including NOI, Monitoring Program, Inspection Records, Annual Reports, Compliance Certifications, and supporting documents.
 2. Updated and signed SWPPP amendments and amendment log.
 3. Storm and non-storm water sampling records and test results, including Noncompliance Reports, when limits are exceeded.
 4. Training Records for CONTRACTOR and OWNER personnel.
 5. Maintenance records for post construction BMP, per Appendix 4 of Attachment "A" of Section 33 4000.
 6. Updated Post-Construction Storm Water Management Plan to reflect 'As-Built' conditions.
 7. Notice of Termination.
 8. Signed Substantial Completion Certification that the Project has met all of the conditions of the CGP.

1.05 QUALITY ASSURANCE

- A. Comply with the following regulatory requirements:
1. National Pollutant Discharge Elimination System (NPDES) General Permit for Storm Water Discharges Associated with Construction and Lands Disturbance Activities;

ORDER NO. 2022-0057-DWQ; NPDES NO. CAS000002, adopted by the State Water Resources Control Board.

2. Regulations of the California Environmental Protection Agency, State Water Resources Control Board; Regional Water Control Board, and local ordinances.
 3. CASQA Stormwater Best Management Practice Handbook for Construction Activity (BMP Handbook), current adopted edition.
 4. Local jurisdiction stormwater management (SWPPP) and erosion control ordinances.
- B. Qualifications: CONTRACTOR's QSP/QSD shall meet the following qualifications:
1. Current certification as a CASQA Qualified SWPPP Practitioner/Developer.
 2. Two years minimum experience in erosion and sediment control and knowledgeable in the requirements of SWPPP, Best Management Practices and GCP.

1.06 STORAGE AND PROTECTION

- A. Provide proper storage of materials and equipment to prevent rain and storm water runoff to come in contact with pollutants, such as soil stabilizers, paint or fluids from vehicles.

1.07 TRAINING OF OWNER PERSONNEL

- A. Training of Owner's personnel shall include 8 hours of on-site overview and maintenance of the following Post Construction BMPs:
1. Bioretention Facilities, Planter Boxes and Proprietary Biotreatment Devices.
 2. Vegetated Swales, Vegetated Filter Strips and Green Roofs.
- B. Training of Owner's personnel on the Post Construction BMPs shall be per Section 33 4000, Storm Drainage Utilities.

1.08 FORMS

- A. Provide forms compliant with State and local requirements as follows:
1. Site Monitoring Report.
 2. Compliance Certification and Checklist.
 3. Quarterly Non-Storm Water Form.
- B. The following attachments are included at the end of Section 33 4000:
1. Attachment "A" - Post-Construction Storm Water Management Plan.
 2. Attachment "B" – Post-Construction Water Balance Calculator.

PART 2 - PRODUCTS

2.01 MATERIALS

- A. Provide quality, grade and type of materials as specified in the CASQA BMP Handbook.

- B. Provide and have available on-site during construction activities a non-stormwater sampling kit suitable for obtaining storm water and non-stormwater quality grab samples. Kit shall include containers and preservatives appropriate for the pollutants known or expected to be in the stormwater. Required sampling equipment shall be adequate to capture and transport samples to a local ELAP State certified water testing lab.
- C. Provide a rain gauge on site to record readings during site inspections.

PART 3 – EXECUTION

3.01 IMPLEMENTATION

- A. Install perimeter controls prior to starting work at the Project site.
- B. Implement BMPs as specified in the SWPPP to contain on-site storm water on the Project site. Provide storm drain inlet protection. Do not drain on-site water directly into the storm drain without proper BMPs in place. If an Active Treatment System (ATS) is used, comply with the design storm specified in the CGP (10-year, 24-hour event)
- C. Prevent pollutant discharges into the storm drain system. Prevent storm water from coming into contact with pollutants, such as material spills, or leakage from storage tanks, waste containers or transfer areas. In the event contamination is found CONTRACTOR shall immediately notify OAR.
- D. Protect exposed dirt, such as stockpiles, landscaping areas, and hillsides.
- E. Properly manage non-storm water discharges such as ground water, broken utility lines and fire hydrant testing per CGP requirements.
- F. Adjust BMP's locations and layouts in accordance to construction progress to assure compliance to regulations.
- G. Conduct inspections of pollution prevention controls and provide Site Monitoring Report to OAR immediately if pollutants are discharged into the site runoffs. CONTRACTOR shall sample and remediate contaminated water.
- H. Upon Substantial Completion: Maintain and leave post-construction storm water pollution prevention controls in place and remove those that are not needed as determined by the QSD and OAR.

3.02 SWPPP CLOSEOUT

- A. Verify the following prior to Substantial Completion of SWPPP:
 - 1. Elements of the SWPPP have been completed.
 - 2. Final stabilization of site, as defined by the GCP, has been demonstrated.
 - 3. There is no potential for construction related storm water pollutants to be discharged into site runoff.

Department of Neighborhood Services and Public Safety
GOLETA TRAIN DEPOT PROJECT

4. Construction related equipment and temporary BMPs have been removed from site.
5. Rubbish, debris, and waste materials have been removed and legally disposed of off the Project site.
6. CAN items have been closed and signed-off.
7. Post-Construction BMP Maintenance Plan has been established.

END OF SECTION - 01 7416

SECTION 01 74 19

CONSTRUCTION AND DEMOLITION WASTE MANAGEMENT

Part 1 - GENERAL

1.01 SUMMARY

- A. Section Includes: administrative and procedural requirements for the following:
 - 1. Salvaging nonhazardous construction and demolition waste.
 - 2. Recycling nonhazardous construction and demolition waste.
 - 3. Disposing of nonhazardous construction and demolition waste

1.02 DEFINITIONS

- A. Alternative daily cover: Cover material other than earthen material placed on the surface of the active face of a municipal solid waste landfill at the end of each operating day to control vectors, fires, odors, blowing litter, and scavenging.
- B. Construction Waste: Building and site improvement materials and other solid waste resulting from construction, remodeling, renovation, or repair operations. Construction waste includes packaging.
- C. Demolition Waste: Building and site improvement materials resulting from demolition or selective demolition operations
- D. Disposal: Removal off-site of demolition and construction waste and subsequent sale, recycling, reuse, or deposit in landfill or incinerator acceptable to authorities having jurisdiction.
- E. Extended Producer Responsibility: Closed-loop program, aka product take-back, are measures undertaken by a producer to accept its own and sometimes other manufacturers' products as post-consumer waste at the end of the product's useful life to recover and recycle the materials for use in new products of the same type.
- F. Material Stream: A material flow coming from a jobsite into markets for building materials including a specific material category that is diverted in a specific way or a mixture of several material categories that are diverted in a specific way.
- G. On site Waste Diversion: On site reuse including crushing asphalt, concrete, and masonry for infill or aggregate.

- H. Recycle: Recovery of demolition or construction waste for subsequent processing in preparation for reuse.
- I. Salvage: Recovery of demolition or construction waste and subsequent sale or reuse in another facility.
- J. Salvage and Reuse: Recovery of demolition or construction waste and subsequent incorporation into the Work.

1.03 PERFORMANCE REQUIREMENTS

- A. General: Develop waste management plan that results in end-of-Project rates for salvage/recycling of at least 50% by weight (minimum allowable) of total waste generated by the Work. Target end-of-Project rates for salvage/recycling of at least 75% by weight of total waste generated by the Work with a minimum of four separate diverted material streams. Practice efficient waste management in the use of materials in the course of the Work. Use all reasonable means to divert construction and demolition waste from landfills and incinerators. Facilitate recycling and salvage of materials.

1.04 SUBMITTALS

- A. Action Submittals: Construction and Demolition Waste Management Plan
 - 1. General: Develop a waste management plan according to ASTM E 1609 and requirements in this Section. The Plan must include the following information and directives:
 - a. Must be customized for each project.
 - b. Must include an overall project waste diversion goal and identify at least three kinds of materials that will be diverted from landfills or incineration.
 - c. Must account for all materials, including land-clearing debris, materials to be used for alternative daily cover (ADC), and other materials not contributing to diversion but not included in the diverted waste total.
 - d. Must include the strategy for the safe removal and disposal of hazardous materials. Hazardous materials must be tracked separately and not be included in the project's total waste.

2. **Waste Identification:** Indicate anticipated types and quantities of site-clearing, demolition and construction waste generated by the Work. Identify at least two kinds of materials that will be diverted from landfills or incineration. Include estimated quantities and assumptions for estimates. Specify the means and methods of diversion for each of the selected material streams.
3. **Waste Reduction Work Plan:** List each type of waste and whether it will be salvaged, recycled, or disposed of in landfill or incinerator. Include points of waste generation, total quantity of each type of waste, quantity for each means of recovery, and handling and transportation procedures.
 - a. **Salvaged Materials for Reuse:** For materials that will be salvaged and reused in this Project, describe methods for preparing salvaged materials before incorporation into the Work. Include on site reuse such as crushing asphalt, concrete, and masonry for infill or aggregate.
 - b. **Salvaged Materials for Sale:** For materials that will be sold to individuals and organizations, include list of their names, addresses, and telephone numbers.
 - c. **Salvaged Materials for Donation:** For materials that will be donated to individuals and organizations, include list of their names, addresses, and telephone numbers.
 - d. **Recycled Materials:** Include list of local receivers and processors and type of recycled materials each will accept. Include names, addresses, and telephone numbers.
 - 1) **Extended Producer Responsibility:** Include list of manufacturers that may accept materials as part of a take-back program.
 - 2) **Disposed Materials:** Indicate how and where materials will be disposed of. Include name, address, and telephone number of each landfill and incinerator facility.
 - 3) **Handling and Transportation Procedures:** Include method that will be used for separating recyclable waste including sizes of containers, container labeling, and designated location where materials separation will be performed.

B. Informational Submittals: Waste Reduction Progress Reports

1. **Concurrent with each Application for Payment, submit report. Include the following information, through the submission of waste hauling tickets, recycling receipts, or other forms of documentation:**
 - a. **Material category.**
 - b. **Total quantity of waste in tons.**

- c. Quantity of waste salvaged, in tons.
- d. Quantity of waste recycled, in tons.
- e. Quantity of waste diverted on site, in tons.
- f. Total quantity of waste diverted (salvaged, recycled, and on-site diversion) in tons.
- g. Total quantity of waste diverted salvaged, recycled, and on-site diversion) as a percentage of total waste.
- h. Location and name of facilities, organizations or landfills receiving waste.
- i. For commingled materials, provide the annual reporting rate for that facility. To count toward the corresponding credit (MR Credit Construction and Demolition Waste Management), commingled recycling facilities must be able to provide diversion rates either specific to the project, or an average diversion rate for the facility that is regulated by the local or state authority. The average recycling rate for the facility must exclude alternative daily cover (ADC).
- j. Records of Donations: Indicate receipt and acceptance of salvageable waste donated to individuals and organizations. Indicate whether organization is tax exempt.

1.02 QUALITY ASSURANCE

- A. Waste Management Coordinator Qualifications: Experienced firm, with a record of successful waste management coordination of projects with similar requirements, that employs a LEED-Accredited Professional, certified by the USGBC, as waste management coordinator. Waste management coordinator may also serve as LEED coordinator.
- B. Regulatory Requirements: Comply with hauling and disposal regulations of authorities having jurisdiction.
- C. Waste Management Conference: Conduct conference at Project site to comply with requirements in Section 01 31 00 "Project Management and Coordination." Review methods and procedures related to waste management including, but not limited to, the following:
 1. Review and discuss waste management plan including responsibilities of waste management coordinator.
 2. Review requirements for documenting quantities of each type of waste and its disposition.

3. Review and finalize procedures for materials separation and verify availability of containers and bins needed to avoid delays.
4. Review procedures for periodic waste collection and transportation to recycling and disposal facilities.
5. Review waste management requirements for each trade.

Part 2 - PRODUCTS (NOT USED)

Part 3 - EXECUTION

1.01 PLAN IMPLEMENTATION

- A. General: Implement approved waste management plan. Provide handling, containers, storage, signage, transportation, and other items as required to implement waste management plan during the entire duration of the Contract.
 1. Comply with operation, termination, and removal requirements in Section 01 50 00 "Temporary Facilities and Controls."
- B. Training: Train workers, subcontractors, and suppliers on proper waste management procedures, as appropriate for the Work.
 1. Distribute waste management plan to everyone concerned within three days of submittal return.
 2. Distribute waste management plan to entities when they first begin work on-site. Review plan procedures and locations established for salvage, recycling, and disposal.

1.02 RECYCLING CONSTRUCTION WASTE, GENERAL

- A. General: Recycle paper and beverage containers used by on-site workers.
- B. Recycling Incentives: Revenues, savings, rebates, tax credits, and other incentives received for recycling waste materials shall be shared equally by Owner and Contractor.
- C. Preparation of Waste: Prepare and maintain recyclable waste materials according to recycling or reuse facility requirements. Maintain materials free of dirt, adhesives, solvents, petroleum contamination, and other substances deleterious to the recycling process.

- D. Procedures: Separate recyclable waste from other waste materials, trash, and debris. Separate recyclable waste by type at Project site to the maximum extent practical according to approved construction waste management plan.
1. Provide appropriately marked containers or bins for controlling recyclable waste until removed from Project site. Include list of acceptable and unacceptable materials at each container and bin.
 - a. Inspect containers and bins for contamination and remove contaminated materials if found.
 2. Stockpile processed materials on-site without intermixing with other materials. Place, grade, and shape stockpiles to drain surface water. Cover to prevent windblown dust.
 3. Stockpile materials away from construction area. Do not store within drip line of remaining trees.
 4. Store components off the ground and protect from the weather.
 5. Remove recyclable waste from Owner's property and transport to recycling receiver or processor.

1.03 RECYCLING CONSTRUCTION WASTE, BEST PRACTICES

A. Packaging:

1. Cardboard and Boxes: Break down packaging into flat sheets. Bundle and store in a dry location.
2. Polystyrene Packaging: Separate and bag materials.
3. Pallets: As much as possible, require deliveries using pallets to remove pallets from Project site. For pallets that remain on-site, break down pallets into component wood pieces and comply with requirements for recycling wood.
4. Crates: Break down crates into component wood pieces and comply with requirements for recycling wood.

B. Commingled Waste Recycling:

1. If utilizing commingled waste strategy, the General Contractor shall select a facility that meets ONE of the following:
 - a. Facility has an average diversion rate and is regulated by the local or state authority and must exclude alternative daily cover (ADC). This

system must be a closed system; shipping waste to another municipality to manage, thus burdening another system, does not count as diverting the waste.

- b. The waste-sorting facility shall provide a waste diversion percentage specific to the project's waste based on measurement of each component waste material. Visual inspection is not an acceptable method of evaluation for documenting this percentage.

C. Source Separated Waste Recycling:

1. If utilizing a source separation waste strategy, the Construction Waste Management Plan shall include a list of anticipated types and quantities of waste materials generated from the Project site and proposed siting locations (including map) for waste/recycling containers. The plan shall identify materials to be recycled, re-used or salvaged. It shall include efforts at source reduction, material handling procedures and collection of weight and hauling destination information.
2. Source Reduction: List processes that minimize waste such as working with suppliers to take back or buy back substandard, rejected or unused items and to deliver supplies using returnable pallets and containers. Also include procedures to minimize breakage, mishandling, contamination, and other factors that reduce job site waste.
3. Material Handling Procedures: List means by which source separated waste materials will be protected from contamination, and the means for recycling them consistent with requirements for acceptance by designated facilities
4. Implement recycling program that includes separate collection of waste materials of following types as applicable to Project:
 - a. Asphalt.
 - b. Land clearing debris.
 - c. Soil.
 - d. Trees and shrubs.
 - e. Concrete and concrete blocks.
 - f. Brick and masonry materials.
 - g. Wood.
 - h. Cardboard and paper packaging materials.
 - i. Plastics.
 - j. Ferrous metal.

- k. Non-ferrous metals (e.g. copper, aluminum, etc.).
 - l. Glass.
 - m. Food and beverage containers.
 - n. Electrical fixtures and wires.
 - o. Other (where applicable)
- D. Gypsum Board: Stack large clean pieces on wood pallets or in container and store in a dry location.

1.04 DISPOSAL OF WASTE

- A. General: Except for items or materials to be salvaged, recycled, or otherwise reused, remove waste materials from Project site and legally dispose of them in a landfill or incinerator acceptable to authorities having jurisdiction.
- 1. Except as otherwise specified, do not allow waste materials that are to be disposed of accumulate on-site.
 - 2. Remove and transport debris in a manner that will prevent spillage on adjacent surfaces and areas.
- B. Burning: Do not burn waste materials.
- C. Disposal: Remove waste materials from Owner's property and legally dispose of them.

END OF SECTION – 01 7419

SECTION 01 77 00

CONTRACT CLOSEOUT

PART 1 - GENERAL

1.01 SECTION INCLUDES

- A. This Section includes administrative and procedural requirements for Contract Closeout, including but not limited to, the following:
1. Inspection procedures.
 2. Project record documents submittal.
 3. Operation and maintenance manual submittal.
 4. OWNER orientation and instruction.
 5. Final cleaning.

1.02 RELATED REQUIREMENTS:

1. Section 01 29 76 - Progress Payment Procedures.
2. Section 01 32 13 - Construction Schedule.
3. Section 01 32 29 - Project Forms.
4. Section 01 33 00 - Submittal Procedures.
5. Section 01 45 25- Testing, Adjusting, and Balancing of HVAC.
6. Section 01 50 00 - Construction Facilities and Temporary Controls.
7. Section 01 78 36 - Warranties.

PART 2 – PRODUCTS (Not used)

PART 3 - EXECUTION

3.01 SUBSTANTIAL COMPLETION

- A. Inspection Procedures: On receipt of the Request For Certificate of Substantial Completion, OAR will authorize commencement of inspection. INSPECTOR, OAR, CONTRACTOR and ARCHITECT will inspect the Work.
1. If after inspection of the Work, OAR does not consider the Work substantially complete, OAR will notify CONTRACTOR.
 2. If after inspection, OAR considers the Work substantially complete, INSPECTOR shall prepare a comprehensive Punch List of items to be corrected.
 - a. INSPECTOR may repeat inspection to assure the Work is corrected.
 - b. Results of the completed inspection will form a partial basis of the requirements for Release of Retention.

3.02 ADMINISTRATIVE CLOSEOUT

- A. Re-inspection Procedures: INSPECTOR, OAR, CONTRACTOR and ARCHITECT may inspect the Work upon notice, including final inspection of Punch List items from earlier inspections, has been corrected, except for items whose completion is delayed under circumstances acceptable to OAR.
1. OWNER has the right to preclude CONTRACTOR from Punch List correction and documents submittals after the Contract Completion date; unless OWNER elects to authorize CONTRACTOR to extend Administrative Contract duration. CONTRACTOR will be assessed actual cost for the unsettled items. Withholds amounts exceeding actual costs to correct or to obtain deliverable will be released.
 2. If allowed by the OAR, re-inspection will be repeated, but may be assessed against CONTRACTOR if OWNER is subject to additional professional service and or additional costs of inspection.

3.03 PROJECT RECORD DOCUMENT SUBMITTAL

- A. General: Do not use project record documents for construction purposes. Protect record documents from deterioration and loss. Provide access to record documents for ARCHITECT, INSPECTOR and OAR reference during normal working hours. Project record document shall be updated on a weekly basis. Prior to submitting each application for payment, secure INSPECTOR and ARCHITECT approval of project record documents.
- B. Record Drawings: Maintain a clean, undamaged set of prints of Drawings and Shop Drawings. Mark the set to show the actual installation where the installation varies substantially from the Work as originally shown. Mark the Drawing that is most

capable of showing conditions fully and accurately. Where Shop Drawings are used, record a cross-reference at the corresponding location on the Drawings. Provide detailed and accurate field dimensions for concealed elements that would be difficult to measure and record at a later date.

1. Mark record sets with red erasable pencil. Use other colors to distinguish between variations in separate categories of the Work. Date and number entries in the same format as submitted. Call attention to entry by a “cloud” around the affected areas.
 2. Mark new information important to OWNER but was not shown on Drawings or Shop Drawings.
 3. Utility location and depth below finished grade and above ceilings and attic spaces shall be fully dimensioned and indicated on record drawings. Dimensions shall be measured from building lines or permanent landmarks and shall be triangulated to those features.
 4. Note related Change Order or Construction Directive numbers where applicable. RFC submissions shall be referenced on each affected sheet, Drawing and Shop Drawing.
 5. Organize record drawing sheets into manageable sets. Bind sets with durable-paper cover sheets; print suitable titles, dates, and other identification on the cover of each set.
 6. Prior to Contract Completion of the Work, review of the project record drawings by ARCHITECT; prepare a final set of project record drawings using reproducible vellum. Submit final set of transparencies to ARCHITECT.
- C. Record Specifications: Maintain two complete copies of the Specifications, including Addenda. Include with the Specifications two copies of other written Contract Documents, such as Change Orders or Construction Directives issued during construction.
1. Mark these record documents to show substantial variations in actual Work performed in comparison with the text of the Specifications and modifications.
 2. Give particular attention to substitutions and selection of options and information on concealed Work that cannot otherwise be readily discerned later by direct observation.
 3. Note related record document information with Product Data.
 4. Prior to Contract Completion of the Work, submit record Specifications to ARCHITECT for OWNER records.

- D. Record Product Data: Maintain two copies of each Product Data submittal. Note related Change Orders and Construction Directives and mark-up of record drawings and Specifications.
1. Mark these documents to illustrate significant variations in actual Work performed in comparison with information submitted. Include variations in products delivered to the Project site and from the manufacturer's installation instructions and recommendations.
 2. Provide detailed and accurate information regarding concealed products and portions of Work that cannot otherwise be readily discerned later by direct observation.
 3. Prior to Contract Completion, submit complete set of record Product Data to ARCHITECT for OWNER records.
- E. Record Samples: Immediately prior to Substantial Completion, CONTRACTOR shall meet with ARCHITECT and OAR at the Project site to determine which Samples are to be transmitted to OWNER for record purposes. Comply with OAR instructions regarding delivery to OWNER storage area.
- F. Miscellaneous Records: Refer to other Specification sections for requirements of miscellaneous record keeping and submittals in connection with actual performance of the Work. Prior to the date of Contract Completion, complete and compile miscellaneous records and place in good order. Identify miscellaneous records properly and bind or file, ready for continued use and reference. Submit to Architect for OWNER records.
- G. Maintenance Manuals: Prior to Substantial Completion, organize operation and maintenance data into suitable two sets of manageable size. Bind properly indexed data in individual, heavy-duty, two to three-inch 3-ring, vinyl-covered binders, with pocket folders for folded sheet information. Mark appropriate identification on front and spine of each binder. Submit to ARCHITECT for OWNER records. Include the following types of information.
1. Emergency instructions.
 2. Spare parts list.
 3. Copies of warranties.
 4. Wiring diagrams.
 5. Recommended "turn-around" cycles.
 6. Inspection procedures.

7. Shop Drawings and Product Data.
8. Fixture lamping schedule.

3.04 OPERATION AND MAINTENANCE:

- A. Operation and Maintenance Instructions: Prior to Substantial Completion, arrange for each installer of equipment that requires regular operation and maintenance to meet with designated OWNER personnel to provide instruction in proper operation and maintenance. Provide instruction by manufacturer's representatives if installers are not experienced in operation and maintenance procedures. Include a detailed review of the following items:
 1. Maintenance manuals.
 2. Spare parts and materials.
 3. Tools.
 4. Lubricants.
 5. Fuels.
 6. Identification systems.
 7. Control sequences.
 8. Hazards.
 9. Cleaning.
 10. Warranties and bonds.
 11. Maintenance agreements and similar continuing commitments.
- B. As part of instruction for operating equipment, demonstrate the following procedures:
 1. Start-up.
 2. Shutdown.
 3. Emergency operations.
 4. Noise and vibration adjustments.
 5. Safety procedures.
 6. Economy and efficiency adjustments.

7. Effective energy utilization.

C. Notice Of Termination: CONTRACTOR shall submit a Notice of Termination (NOT) to the local Regional Water Quality Control Board, RWQCB. Provide a copy of NOT to OAR.

3.05 FINAL CLEANING

A. General: Related sections of the Contract Documents specify general cleaning during performance of the Work. General cleaning is included in Division 01 Section “Construction Facilities and Temporary Controls”.

B. Cleaning: Employ experienced workers or professional cleaners for final cleaning. Clean each surface or unit to the condition expected in a normal, commercial building cleaning and maintenance program. Comply with manufacturer’s instructions.

1. Complete the following cleaning operations before requesting inspection for a certificate of Substantial Completion.

a. Remove labels that are not permanent labels.

b. Clean transparent materials, including mirrors and glass in doors and windows. Remove glazing compounds and other substances that are noticeable vision-obscuring materials. Replace chipped or broken glass and other damaged transparent materials.

c. Clean exposed exterior and interior hard-surfaced finished to a dust-free condition, free of stains, films, and similar foreign substances. Restore reflective surfaces to their original condition. Leave concrete floors broom clean. Vacuum carpeted surfaces.

d. Wipe surfaces of mechanical and electrical equipment. Remove excess lubrication and other substances. Clean plumbing fixtures to a sanitary condition. Clean light fixtures and lamps.

e. Clean the Project site, including landscape development areas, of rubbish, litter, and other foreign substances. Sweep paved areas broom clean; remove stains, spills, and other foreign deposits. Rake grounds that are neither paved nor planted to a smooth, even-textured surface.

END OF SECTION – 01 7700

SECTION 01 78 36

WARRANTIES

PART 1 - GENERAL

1.01 SECTION INCLUDES

- A. This Section includes administrative and procedural requirements for warranties, including manufacturers and installer's standard warranties on products and special product warranties.
 - 1. Refer to the General Conditions for terms of the guarantee period for the Work.

1.02 RELATED REQUIREMENTS

- A. Section 01 60 00 - Product Requirements.
- B. Section 01 73 29 - Cutting and Patching.
- C. Section 01 77 00 - Contract Closeout.

PART 2 - PRODUCTS (Not applicable)

PART 3 - EXECUTION

3.01 WARRANTY REQUIREMENTS

- A. Disclaimers and Limitations: Manufacturer's disclaimers and limitations on product warranties shall not relieve CONTACTOR of the warranty of the Work incorporating such materials, products, and equipment. Manufacturer's disclaimers and limitations on warranties do not relieve suppliers, manufacturers, installers, and Subcontractors of the requirement to countersign special warranties with CONTRACTOR.
- B. Standard warranties are preprinted written warranties published by individual manufacturers for particular products and are specifically endorsed by the manufacturer to OWNER.
- C. Special warranties are written warranties required by or incorporated in the Contract Documents, either to extend time limits provided by standard warranties or to provide greater rights for OWNER.

- D. Related Damages and Losses: When correcting failed or defective warranted Work, remove and replace Work that has been damaged as a result of such failure or which must be removed and replaced to provide access for correction of warranted Work.
- E. Reinstatement of Warranty: When Work covered by a warranty has failed and been corrected by replacement or rebuilding, reinstate the warranty by written endorsement with the reinstated warranty equal to the original warranty.
- F. Replacement Cost: Upon determination the Work covered by a warranty has failed and/or is defective, replace or rebuild the Work to an acceptable condition complying with requirements of the Contract Documents. CONTRACTOR is responsible for the cost of replacing or rebuilding defective Work regardless of whether OWNER has benefited from use of the Work through a portion of its anticipated useful service life.
- G. OWNER Recourse: Expressed warranties made to OWNER are in addition to implied warranties and shall not limit the duties, obligations, rights, and remedies otherwise available under the law. Expressed warranty periods shall not be interpreted as limitations on the time in which OWNER can enforce such other duties, obligations, rights, or remedies.
- H. Rejection of Warranties: OAR reserves the right to reject warranties and to limit selection to products with warranties not in conflict with requirements of the Contract Documents.
- I. Where the Contract Documents require a special warranty, or similar commitment on the Work or part of the Work, OAR reserves the right to refuse to accept the Work until CONTRACTOR presents evidence the entities required to countersign such commitments have done so.

3.02 SUBMITTALS

- A. Submit written preliminary warranties prior to Substantial Completion and final warranties prior to Contract Completion. If the certificate of Substantial Completion designates a commencement date for warranties other than the date of Substantial Completion for the Work, submit written warranties as set forth in the certificate of Substantial Completion.
 - 1. When a designated portion of the Work is partially used and/or occupied by OWNER, submit properly executed warranties to ARCHITECT within fifteen days of the Partial Use or Occupancy of the designated portion of the Work.
- B. When the Contract Documents require CONTRACTOR, or CONTRACTOR and a Subcontractor, installer, supplier or manufacturer to execute a special warranty, prepare a written document containing appropriate terms and identification, ready for execution by the required parties. Submit a draft to OAR, through the ARCHITECT, for approval prior to final execution.

1. Refer to Divisions 02 through 49 for specific content requirements and particular requirements for submitting special warranties.
- C. Form of Submittal: Prior to Contract Completion, compile two copies of each required final warranty properly executed by CONTRACTOR, or by CONTRACTOR and Subcontractor, installer, supplier, or manufacturer. Organize the warranty documents into an orderly sequence based on the Specifications.
- D. Bind warranties and bonds in heavy-duty, commercial-quality, durable three ring, vinyl-covered loose-leaf binders, thickness as necessary to accommodate contents, and sized to receive 8½ by 11 paper.
1. Provide heavy paper dividers with celluloid covered tabs for each separate warranty. Mark the tab to identify the item or installation. Provide a typed description of the product or installation, including the name of the product, and the name, address, and telephone number of the installer.
 2. Identify each binder on the front and spine with the typed or printed title “WARRANTIES,” Project title and/or name, and name of CONTRACTOR.
 3. When warranted Work requires operation and maintenance manuals, provide additional copies of each required warranty, as necessary, for inclusion in each required manual.

END OF SECTION – 01 7836

SECTION 01 79 00

MAINTENANCE AND OPERATIONS (M&O) STAFF DEMONSTRATION AND TRAINING

PART 1 – GENERAL

1.01 SECTION INCLUDES

- A. Administrative and procedural requirements for training OWNER’s personnel.
 - 1. Demonstration of operations of systems, subsystems and equipment.
 - 2. Training in operation and maintenance of systems, subsystems, and equipment.

1.02 RELATED REQUIREMENTS

- A. Project Commissioning Plan (CxP).
- B. CHPS Best Practices Manual.
- C. CAL/OSHA Minimum Ventilation Standard, Title 8, Section 5142.
- D. California Building Code, Chapter 12.
- E. Division 01 - General Requirements.
- F. Division 22 - Plumbing.
- G. Division 23 – Heating Ventilating and Air Conditioning.
- H. Division 26 - Electrical.
- I. Division 27 – Communications.

1.03 SUBMITTALS

- A. Submittals, including training modules, require the Commissioning Services Provider’s (CxSP) review and OAR acceptance prior to implementation.
- B. Instruction Program:
 - 1. Ninety days prior to Startup and Testing, submit a draft outline of the instructional program for demonstration and training, including the training module objectives and outline for each training module, schedule of proposed

- training dates, training times, length of instruction time and instructors' names for each training module. Submittal(s) shall be on a CD-ROM in a MS Word 2013 format file. CxSP, OAR and Project Inspector will review and OAR accept, based on their recommendation, CONTRACTOR's proposed Instruction Program or comment and return to CONTRACTOR for revision and incorporation of comments within 30 days of receipt.
2. Revise and resubmit finalized Instruction Program 45 days prior to Startup and Testing. CxSP, OAR and Project Inspector will review CONTRACTOR's revised Instruction Program and OAR, based on their recommendation, accept or return for further revision and incorporation of unaddressed revisions and/or comments or unacceptable revisions within five days of receipt.
 3. Revise and incorporate comments and resubmit to OAR within five days of receipt. CxSP, OAR and Project Inspector will review CONTRACTOR's revised Instruction Program and OAR, based on their recommendation, accept the revised Instruction Program within five days of receipt or require CONTRACTOR to meet with OAR and CxSP within five days of receipt to revise and incorporate unaddressed revisions and/or comments. CONTRACTOR shall be assessed reasonable fees and expenses incurred by CxSP for these meetings.
- C. Upon completion of training, submit two complete training manuals for OWNER's use and one CD-ROM including materials in the complete training manual in the Adobe PDF format. Each manual shall contain specific training and instruction manuals and hand-outs for the following designated end-users:
1. Administration.
 2. OWNER Maintenance and Operations (M&O) Personnel.
- D. Qualification Data: Three weeks prior to start of training, CONTRACTOR shall submit Letters of Qualifications and Project Lists for persons and firms providing instruction including:
1. Training Facilitator Qualifications: A firm or individual experienced in training or educating maintenance personnel and end-users in training program similar to that required for this Project, and who has a record of successful training performance.
 2. Training Instructor Qualifications: Instructor shall be factory-authorized service representative, experienced in operation and maintenance procedures and training for each system, subsystem or piece of equipment.

3. References: The name of owner and the name and telephone number of the plant manager and maintenance supervisor on three similar projects for reference.
- E. Attendance Record: For each training module, submit the proposed list of participants, sign in sheets and length of instruction time a minimum of 15 days prior to start of training of the module.
- F. Evaluations: For each participant and for each training module, submit results and documentation of performance-based tests a minimum of seven days following completion of training of each module.
- G. Demonstration and Training Video: CONTRACTOR shall video record each classroom training and demonstration session and submit a copy on CD-ROM or DVD in a format compatible with MS Windows Media Player at end of each training module. CONTRACTOR shall include a copy of manufacturer training video materials presented during training and demonstration session.

1.04 COORDINATION

- A. Coordinate instruction schedule with the OAR, CxSP, and OWNER's M&O personnel. Adjust schedule as required to reasonably accommodate the schedules of participants and to minimize disrupting OWNER operations.
- B. Coordinate with instructors, including providing notification of scheduled dates, times, length of instruction time and course content.
- C. Coordinate content of training modules with content of approved Emergency Manual and Operations and Maintenance Manual. Do not submit instruction program until manual has been reviewed and accepted by the OAR.

1.05 INSTRUCTION PROGRAM

- A. Program Structure: Develop instruction program that includes individual demonstration and training modules for the operation, maintenance, minor repair (completion in under two hours) and calibration of systems and components in the system as required by Section 01 91 13, Divisions 22, 23 and Division 26 and as specified in Part 3 of this Section, "DEMONSTRATION AND TRAINING".
- B. Training Modules: Develop learning objective and teaching outline for each module, specific and as applicable, for the following OWNER personnel:
 1. Administration.
 2. Operations and Maintenance.

- C. Include description of specific skills and knowledge that participant is expected to master.
- D. For each module, include instruction for the following:
 - 1. Basis of System Design (for OWNER Operations and Maintenance Personnel), Operational Requirements and Criteria, including, but not limited to:
 - a. System, subsystem and equipment descriptions.
 - b. Performance and design criteria if CONTRACTOR is delegated design responsibility.
 - c. Operating standards.
 - d. Regulatory requirements.
 - e. Equipment function.
 - f. Operating characteristics.
 - g. Limiting conditions.
 - h. Performance curves.
 - 2. Documentation (for OWNER Operations and Maintenance Personnel): Review in detail the following documentation:
 - a. Emergency manuals.
 - b. Operations manuals.
 - c. Maintenance manuals.
 - d. Project Record Documents.
 - e. Identification systems.
 - f. Warranties.
 - g. Maintenance service agreements and similar continuing commitments.
 - 3. Emergencies (for OWNER Operations and Maintenance Personnel): Review, without limitation, the following, as applicable:
 - a. Instructions on meaning of warnings, trouble indications, and error messages.

- b. Instructions on stopping.
 - c. Shutdown instructions for each type of emergency.
 - d. Operating instructions for conditions outside of normal operating limits.
 - e. Sequences for electric or electronic systems.
 - f. Special operating instructions and procedures.
4. Operations (for OWNER Operations and Maintenance Personnel): Review, without limitation, the following as applicable:
- a. Startup procedures.
 - b. Equipment or system break-in procedures.
 - c. Routine and normal operating instructions.
 - d. Regulation and control procedures.
 - e. Control sequences.
 - f. Safety procedures.
 - g. Instructions on stopping.
 - h. Normal shutdown instructions.
 - i. Operating procedures for system, subsystem or equipment failure.
 - j. Seasonal and weekend operating instructions.
 - k. Required sequences for electric or electronic systems.
 - l. Special operating instructions and procedures.
5. Adjustments (for OWNER M&O Personnel): Review, without limitation, the following as applicable:
- a. Alignments.
 - b. Checking adjustments.
 - c. Noise and vibration adjustments.
 - d. Economy and efficiency adjustments.

6. Troubleshooting (for OWNER M&O Personnel): Review, without limitation, the following as applicable:
 - a. Diagnostic instructions.
 - b. Test and inspection procedures.
7. Maintenance (for OWNER M&O Personnel): Review, without limitation, the following, as applicable:
 - a. Inspection procedures.
 - b. Types of cleaning agents to be used and methods of cleaning.
 - c. List of cleaning agents and methods of cleaning detrimental to product.
 - d. Procedures for routine cleaning.
 - e. Procedures for preventative maintenance.
 - f. Procedures for routine maintenance.
 - g. Instruction on use of special tools.
8. Repairs (for OWNER M&O Personnel): Review, without limitation, the following as applicable:
 - a. Diagnostic instructions.
 - b. Repair instructions.
 - c. Disassembly; component removal, repair and replacement and reassembly instructions.
 - d. Instructions for identifying parts and components.
 - e. Review of parts needed for operation and maintenance.
9. Facility Training:
 - a. Manual for the basic operation/control of the HVAC room sensor/thermostat and lighting controls.
 - b. Organizational chart structure, to be completed by OWNER, for repair or emergency requests for the systems including contact information of the Plant Manager.

1.06 PREPARATION

- A. Training Facilitator: Engage qualified training facilitator no later than 120 days prior to start of training to prepare instruction program and training modules, to coordinate instructors, and to coordinate between CONTRACTOR, OAR and CxSP for number of participants, instruction times and location.
- B. Training Instructor: Engage qualified training instructors to instruct OWNER's personnel to adjust, operate and maintain systems, subsystems and equipment not part of a system no later than 30 days prior to start of training of assigned modules.
- C. Scheduling: Provide instruction at mutually agreed on times.
 - 1. Schedule training with OWNER, through OAR, with at least two weeks advance notice.
 - 2. Schedule training to conform to personnel availability at Site.
 - 3. Conduct training(s) after the execution of commissioning Pre-functional and Functional Tests are completed.
 - 4. Base duration of training on hours specified in the applicable specifications or minimums defined in Article 1.08.
