- D. Evaluation: At conclusion of each training module, assess and document each participant's mastery of module by use of oral, written, demonstration, or combination of oral, written, and demonstration based testing.
- E. Demonstration and Training Video: Record each training module separately. Include classroom instructions and demonstrations, board diagrams and other visual aids, excluding attendee practice or testing.
 - 1. Make demonstration and testing videos at Site to ensure video is representative of installed system. As part of training, devote one lesson plan to reviewing of video to allow new employees to view the video recordings at their own convenience and be able to operate the video system without need for instructor attendance.
 - 2. At the beginning of each video recording for the training module, incorporate a chart presenting the learning objective and lesson outline.
- F. In addition to technical training, attendees shall be trained on how to provide future training for new employees.
- G. Familiarize OWNER staff regarding CAL/OSHA Title 8, section 5142 Requirements.

- H. Cleanup: Collect excess copies of educational materials and give to OAR. Remove instruction equipment. Restore systems and equipment to condition existing just before commencing training.

1.07 OPERATIONS AND MAINTENANCE MANUALS

- A. CONTRACTOR shall direct Subcontractors to compile and prepare M&O Manuals and other required documentation for the equipment and systems that are provided and/or installed per their scope of work for submittal to OAR prior to project closeout.
- B. The OAR shall receive a copy of the Operations and Maintenance manuals prior to initiation of demonstration and training for review and acceptance or rejection.
- C. Operations and Maintenance manuals shall meet the respective requirements of Divisions 22,23 and Division 26, and Section 01 7700; and comply with the following:
 - 1. Quantity: Two.
 - 2. Format: 8 ½ by 11 loose leaf binders. Each binder shall be clearly labeled on the spine and meet the requirements of Section 01 7700. Dividers shall be made of card stock with permanently marked index tabs to separate each section and sub section. Tab labels shall not be handwritten. Binders will meet other formatting requirements as outlined in DIVISIONS 02 to 49, as applicable.
 - 3. Contents: There shall be a title page and table of contents at the beginning of each binder. The table of contents shall be an outline that identifies the equipment or systems documentation included in the binder and references the specification sections relating to the equipment and systems that are being included in each part of the binder. Each part of the binder shall contain the information described below, in the following order.
 - a. CONTRACTOR. The first page shall contain the name, address, and telephone number of the manufacturer and installing CONTRACTOR, as well as the 24-hour number for emergency service for each piece of equipment identified in this section.
 - b. Preventive Maintenance Instructions. This section shall list the location of preventative maintenance instructions. The list shall show the piece of equipment, the Operations and Maintenance document name, and the O&M document page number that contains the instructions.
 - c. Submittal and Product Data. This section shall include product data not covered by manufacturer's Operations and Maintenance instructions and associated shop drawings.

- d. Warranty and Service Contracts. This section shall include the following for each piece of equipment, as applicable:
 - 1) Copy of the equipment warranty information provided as part of Section 01 78 36.
 - 2) Additional Warranties in accordance with Warranty requirements in DIVISIONS 02 to 49, as applicable. Equipment Warranties shall clearly list requirements to maintain the Warranty in effect, conditions or acts that would invalidate or void the Warranty, and Warranty expiration date.
 - 3) Service contracts issued. Contracts shall clearly indicate contract dates and scope of work included.

- e. Operation and Maintenance Instructions. These shall be the written manufacturer's maintenance and operating instructions with the model number and features of the installed equipment or system clearly identified. This section shall include applicable data on the following:
 - 1) Installation, startup, and break-in instructions.
 - 2) Starting, normal shutdown, emergency shutdown, manual operation, seasonal changeover and normal operating procedures and data, including any special limitations.
 - 3) Operations and Maintenance and installation instructions that were shipped with the unit.
 - 4) Preventative maintenance and service procedures and schedules.
 - 5) Troubleshooting procedures.
 - 6) A parts list, edited to omit reference to items which do not apply to this installation.
 - 7) A list of any special tools required to service or maintain the equipment.
 - 8) Performance data, ratings, and curves.

- f. Control Drawings. This section contains controls drawings and the final sequence of operations, set points, and schedules as set during the Commissioning Process. If shop drawings, portions of the project manual, or record drawings clearly show this information, a copy of this information may be inserted. Otherwise, original drawings shall be generated and included in this section.

- D. Division 23 Special Air Balance Documentation. The Balancing Subcontractor will compile and submit the following with other documentation that may be specified elsewhere in the Project Specifications.
1. Final report containing an explanation of the methodology, assumptions, test conditions, and the results in a clear format with designations of all uncommon abbreviations and column headings.
 2. The Balancing Subcontractor shall mark on the drawings where all traverse and other critical measurements were taken and cross reference the location in the Test and Balance report.

1.08 DEMONSTRATION AND TRAINING SCHEDULE

- A. The following applies to the minimum duration of demonstration and training provided City Maintenance and Operations Personnel.
1. HVAC Systems:
 - a. Air-Conditioning System: Minimum 4 hours.
 2. HVAC Controls: Minimum 4 hours.
 3. Lighting Systems and Controls: Minimum 4 hours.

PART 2 – PRODUCTS – N/A

PART 3 – EXECUTION – N/A

END OF SECTION – 01 7900

SECTION 01 81 19 INDOOR AIR QUALITY PROCEDURES

Part 1 - GENERAL

1.01 SUMMARY

- A. Section includes administrative and procedural requirements governing protection of indoor air quality (IAQ), absorbent materials, and mechanical system from contamination during demolition and building flush out along with baseline indoor air quality testing prior to Owner occupancy.

1.02 REFERENCES

- A. ASHRAE Standard 52.2-Method of Testing General Ventilation Air-Cleaning Devices for Removal Efficiency by Particle Size; 1999.
- B. SMACNA (OCC) - IAQ Guideline for Occupied Buildings under Construction; 2nd Edition, 2007, ANSI/SMACNA 008-2008 (Chapter 3).
- C. EPA Compendium of Methods for the Determination of Air Pollutants in Indoor Air.

1.03 DEFINITIONS

- A. Absorptive Materials: Gypsum board, acoustical ceiling tile and panels, carpet and carpet tile, fabrics, fibrous insulation, and other similar products.
- B. Contaminants: Gases, vapors, regulated pollutants, airborne mold and mildew, and the like, as specified.
- C. Particulates: Dust, dirt, and other airborne solid matter.
- D. Wet Work: Concrete, plaster, coatings, and other products that emit water vapor or volatile organic compounds during installation, drying, or curing.

1.04 SUBMITTALS

- A. Action Submittals: Construction Indoor Air Quality Management (IAQ) Plan
 - 1. General: Develop an IAQ plan based upon SMACNA IAQ Guidelines. The plan shall describe in detail measures specific to this project to be taken during construction to promote adequate indoor air quality upon completion.
 - a. HVAC Protection: Describe steps to protect ductwork and HVAC equipment from dust and water damage.

- b. Source Control: Identify sources of VOCs and appropriate measures to mitigate their impacts.
 - c. Pathway Interruption: Manipulate air paths to reduce contaminants of finished spaces.
 - d. Housekeeping: Describe cleaning and dust control procedures.
 - e. Scheduling: Identify each interior finish that either generates odors, moisture, or vapors or is susceptible to adsorption of odors and vapors, and indicate air handling zone, sequence of application, and curing times.
 - f. Prohibit the use of tobacco products during construction inside the building and within 25 feet of building entrances.
2. Quality Assurance and IAQ Monitoring: Describe steps to ensure compliance by Contractor and subcontractors.
 3. Photograph Documentation – Submit six photographs of the 5 SMACNA measures taken throughout construction and submitted on a monthly basis. Identify date and SMACNA measure featured in each photograph.
 4. Indoor Air Quality Assessment: The IAQ plan shall describe in detail measures specific to this project to be taken before occupancy to promote adequate indoor air quality upon completion, following one of the following options.
 - a. Indoor Air Quality Flush-Out:
 - 1) Narrative describing the Project’s specific flush-out procedures.
 - b. Indoor Air Quality Testing
 - 2) Narrative describing IAQ testing process.
 5. Interior Finishes Installation Schedule: Identify each interior finish that either generates odors, moisture, or vapors or is susceptible to absorption of odors and vapors, and indicate air handling zone, sequence of application and curing times.

Part 2 - PRODUCTS (NOT USED)

Part 3 - EXECUTION

1.01 PLAN IMPLEMENTATION

- A. Refer to SMACNA IAQ Guideline for Occupied Buildings under Construction for avoiding unnecessary contamination due to construction procedures.
- B. Building HVAC system and supply air ductwork may be used for ventilation during construction:

1. Begin construction ventilation when building is substantially enclosed.
 2. Operate HVAC system with 100 percent outside air and with 1.5 air changes per hour, minimum.
 3. Ensure that air filters are correctly installed prior to starting use; replace filters when they lose efficiency.
 4. Do not use return air ductwork for ventilation unless absolutely necessary.
 5. Where return air ducts shall be used for ventilation, install MERV 8 filters at return inlets, sealed to ducts; replace filters when they lose efficiency.
- C. Prevent the absorption of moisture and humidity by adsorptive materials by:
1. Sequencing the delivery of such materials so that they are not present in the building until wet work is completed and dry.
 2. Delivery and storage of such materials in fully sealed moisture-impermeable packaging.
 3. Provide sufficient ventilation for drying within reasonable time frame.
- D. HVAC Protection:
1. Protect air handling and distribution equipment, and air supply and return ducting during demolition.
 2. Adequately cover and protect exposed air inlets and outlets, openings, grilles, ducts, plenums, as required to prevent water, moisture, and other contaminant intrusion.
 3. Apply protection immediately after installation of equipment and ducting.
 4. Do not store construction materials or waste in mechanical or electrical rooms.
 5. Prior to using return air ductwork without intake filters clean up and remove dust and debris generated by construction activities.
 6. Inspect duct intakes, return air grilles, and terminal units for dust.
 7. Clean plenum spaces, including top sides of lay-in ceilings, outsides of ducts, tops of pipes and conduit.
 8. Clean tops of doors and frames.

9. Clean mechanical and electrical rooms, including tops of pipes, ducts, and conduit, equipment, and supports.
10. Clean return air plenums of air handling units.
11. Remove air intake filters only after cleaning is complete.
12. Do not perform dust or dirt- producing work after starting use of return air ducts without intake filters on return air ducts.

E. Pathway Interruption:

1. Provide solid physical barriers to isolate areas of construction. Securely attach and seal at floor and structure above.
2. Openings within the designated work area shall be sealed.
3. Adequate exhaust ventilation equipment shall be installed to maintain a negative pressure differential between the work area and adjacent areas of the building.
4. Ventilation units shall be exhausted to the outside of the building.

F. Source Control:

1. Limit construction traffic and motor idling in the vicinity of air intake louvers when the HVAC systems are activated. Restrict motor vehicles to the loading dock area, well removed from air intakes and operable windows, preventing emissions from being drawn into the building.
2. Use electric or natural gas alternatives for gasoline and diesel equipment where possible and practical.
3. Cycle equipment off when not being used or needed.
4. Avoid the use of materials and products with high VOC and/or particulate levels. Use products and installation methods with low VOCs such as paints, sealers, sealants, filler materials, insulation, adhesives, caulking and cleaners. Comply with the requirements in other specification Sections.
5. Keep containers of wet products closed as much as possible. Cover and seal waste materials, which can release odor or dust.

6. Protect materials, especially absorbent materials such as insulated ductwork, against moisture during delivery to and storage at the job site. Store materials inside the structure in a dry and clean environment pending installation. Building materials shall be kept dry to avoid the introduction of moisture into the building interior.
 7. Avoid the use of moisture-damaged materials. Any porous materials that have been wetted shall be dried thoroughly before installation. Any porous materials that have been damaged remained wet longer than 48 hours, or show signs of visible mold shall be discarded.
 8. Ensure that the construction process will not result in moisture intrusion.
 9. Avoid tracking pollutants into work areas. Once the framing and mechanical system installation starts, access to the building interior shall be controlled to minimize the tracking in of contaminants. Material deliveries and construction waste removal shall be routed via the most direct route to the building exterior of the building rather than through the space.
 10. Provide rough track-off grates or matting at the entryway to remove moisture and containments from entering the building.
 11. Prevent the ingress of rodents and pests.
 12. Prohibit the use of tobacco products during construction inside the building and within 25 feet of building entrances.
- G. Housekeeping:
1. Provide temporary ventilation during demolition to minimize accumulation of dust fumes, vapors, or gases in the building.
 2. Suppress dust with wetting agents or sweeping compounds.
 3. Clean-up dust using a wet rag or damp mop.
 4. Increase the cleaning frequency when dust build-up is noted.
 5. Remove spills or excess applications of solvent-containing products as soon as possible.
 6. Remove accumulated water and keep work areas as dry as possible.
 7. Store volatile liquid containers closed when the container is inside of the building and not in use.

8. Keep volatile liquid containers closed when the container is inside of the building and not in use.
9. HEPA vacuuming and duct cleaning.
10. Use nontoxic cleaning materials and procedures.

H. Scheduling:

1. Comply with the scheduling requirements of Article, "Sequence of Finish Installation" of this Section.
2. To avoid potential contamination of porous or absorbent materials such as ceiling tiles, install furnishings after interior finishes (drywall, paint, and floor finishing) have cured.
3. Phased Completion: Implement IAQ control measures in each tenant area until construction in that area is complete. Do not allow contaminants from an area under construction to enter the HVAC ductwork systems or to migrate to completed areas.
4. Filters: Install new MERV 8 filters at the central fan system, immediately prior to the first phase of building occupancy. Install new MERV 8 filters at fan systems serving limited areas immediately prior to occupancy for each respective area.

1.02 CONSTRUCTION INDOOR AIR QUALITY ASSESSMENT

- A. Prior to flush-out or air testing, the building shall have interior finishes installed including, but not limited to, millwork, doors, paint, carpet, acoustic tiles and movable furnishings (e.g. workstations, partitions), and major VOC punch-list items must be finished.
- B. Option 1, Path 1: Flush-out, Before Occupancy
 1. After construction ends, prior to occupancy and with interior finishes and furniture installed, perform a building flush-out by supplying a total volume of 14000 cu. ft. of outdoor air per sq. ft. (sq. m) of floor area while maintaining an internal temperature of at least 60 degrees F (16 degrees C) and a relative humidity no higher than 60 percent. Indicate operating procedure for each HVAC system and piece of equipment and the operating duration required for flush-out.
 - a. Follow the manufacturer operating procedures for each HVAC system and piece of equipment and the operating duration required for flush out.
- C. Option 2: Air Testing:

1. Conduct baseline indoor-air-quality testing, after construction ends and prior to occupancy, using testing protocols consistent with the EPA's Compendium of Methods, or ISO Methods, as detailed in the USGBC's "Reference Guide for Building Design and Construction," version 4 (v4).
2. Demonstrate that the contaminant maximum concentrations listed below are not exceeded:
 - a. Formaldehyde: 27 ppb.
 - b. Particulates (PM10): 50 micrograms/cu. m.
 - c. Ozone: 0.075 ppm.
 - d. Total Volatile Organic Compounds (TVOCs): 500 micrograms/cu. m.
 - e. Target Chemicals listed in CDPH Standard Method v1.1, Table 4, except formaldehyde: CHPH Standard Method v1.1, Allowable Concentrations, Table 4-1.
 - f. Formaldehyde: 27 ppb.
 - g. Carbon Monoxide (CO): 9 ppm and no greater than 2 ppm above outdoor levels.
3. Measurements shall be conducted prior to occupancy but during normal occupied hours, and with building ventilation system starting at the normal daily start time and operated at the minimum outside air flow rate for the occupied mode throughout the duration of the air testing.
4. Prior to testing, the building shall have interior finishes installed including, but not limited to, millwork, doors, paint, carpet, acoustic tiles and movable furnishings (e.g. workstations, partitions), and major VOC punch-list items must be finished.
5. Test at least one location per ventilation system for each occupied space type. There must be a minimum of one test per floor. The locations selected for testing must represent the worst-case zones where the highest concentrations of contaminants of concern are likely to occur.
6. Test areas no larger than 5,000 square feet. If there is evidence that the air in the space is well mixed and sources of contaminants of concern are uniform, project teams may test a single location in that space.
7. For each sampling point where the maximum concentration limits are exceeded, take corrective action and retest for the noncompliant contaminants at the same sampling points. Repeat until all requirements are met.

1.03 SEQUENCE OF FINISH INSTALLATION

- A. Sequence of Finish Installation: Project schedule shall address construction scheduling/sequencing requirements and procedures necessary to optimize Indoor Air Quality (IAQ) levels for the completed Project.
1. Scheduling Contractor's Project Schedule for finish applications should allow for: Dissipation of high emissions from finishes that off-gas perceptible quantities of deleterious material during curing Separation of off-gassing effects from the installation of adsorptive materials that would act as a "sink" for storage and subsequent release of these unwanted substances into building spaces and mechanical systems after project occupancy.
 2. When Contractor's "Project Schedule" requires less than optimal sequencing of finish installation, related to IAQ, provide supplemental filtered "fresh air" ventilation of work areas during construction and restrict / control the use of permanent building mechanical systems prior to Owner's acceptance of building to prevent contamination of systems by construction wastes and other deleterious substances.
- B. Finish Types:
1. Type 1: Materials and finishes which have a potential for short-term levels of off-gassing from chemicals inherent in their manufacturing process, or which are applied in a form requiring vehicles or carriers for spreading which release a high level of particulate matter in the process of installation and/or curing. Type 1 Finishes include, but are not limited to the following:
 - a. Adhesives, sealants, and glazing compounds, specifically those with petrochemical vehicles or carriers.
 - b. Wood preservatives, finishes, and paint.
 - c. Control and/or expansion joint fillers.
 - d. All hard finishes requiring adhesive installation.
 - e. Gypsum board and associated finish processes.
 - f. Sealants and associated filler materials.
 2. Type 2: Finishes: Materials and finishes which are woven, fibrous, or porous in nature and tend to adsorb chemicals off-gassed by Type 1 finishes or may be adversely affected by particulates. These materials become "sinks" for deleterious substances, which may be released much later, or collectors of contaminants that may promote subsequent bacterial growth. Type 2 Finishes include, but are not limited to the following:
 - a. Carpet and padding.

Department of Neighborhood Services and Public Safety
GOLETA TRAIN DEPOT PROJECT

- b. Fabric wallcovering.
 - c. Insulation exposed to the airstream.
 - d. Acoustic ceiling materials.
 - e. Fabric covered acoustic wall panels.
 - f. Upholstered furnishings.
 - g. Materials that can be categorized as both Type 1 and Type 2 materials shall be considered to be Type 1 materials.
- C. Optimal Order of Installation: Apply Type 1 interior finishes throughout the entire controlled air zone of each enclosed building or building segment and allow such finishes to completely cure according to intervals and times stated in respective finish manufacturer's printed instructions before commencing installation of any Type 2 materials in the same area.
- 1. Do not store any Type 2 materials in areas where installation or curing of Type 1 materials is in progress.

END OF SECTION - 01 81 19

SECTION 02 26 00

ASSESSMENT

PART 1 – GENERAL

1.01 SUMMARY

- A. Description: This Section includes requirements regarding discovery of suspect or confirmed hazardous substances encountered on the Project and Contractor use of hazardous substances.
- B. Section Includes:
 - 1. Discovery
 - 2. Assessment
 - 3. Contractor Generated Waste
 - 4. Contractor Use of Hazardous Substances

1.02 REGULATORY REQUIREMENTS AND GOVERNMENTAL REFERENCES

- A. 29 Code of Federal Regulations 1910 Occupational Safety and Health Standards for General Industry
- B. 29 CFR 1926 Occupational Safety and Health Standards for the Construction Industry
- C. 40 CFR 260 Hazardous Waste Management Systems: General
- D. 40 CFR 261 Identification and Listing of Hazardous Waste
- E. 40 CFR 262 Standards Applicable to Generators of Hazardous Waste
- F. 40 CFR 263 Standards Applicable to Transporters of Hazardous Waste
- G. 40 CFR 264 Standards for Owners and Operators of Hazardous Waste Treatment, Storage and Disposal Facilities
- H. 40 CFR 265 Interim Status Standards for Owners and Operators of Hazardous Waste Treatment, Storage and Disposal Facilities
- I. 49 CFR 171.8 Department of Transportation Research & Special Programs Administration
- J. 49 CFR 172.101 Department of Transportation Hazardous Materials Table

1.03 RELATED CONTRACT DOCUMENTS

- A. Section 02 61 01 – Removal and Disposal of Hazardous Substances

- B. Section 02 41 16 – Demolition
- C. Section 02 82 00 – Asbestos Cement Pipe Removal & Disposal
- D. Asbestos Survey and Hazardous Materials Inspection Report for the Goleta Train Depot, prepared by All Phase Environmental, Inc., December 6, 2023.
- E. Lead-Based Paint Survey Report for the Goleta Train Depot, prepared by All Phase Environmental, Inc., November 30, 2023.
- F. Soil Management Plan for the Goleta Train Depot, prepared by All Phase Environmental, Inc., March 4, 2024.
- G. Santa Barbara Air Pollution Control District Form 07A if VOCs are detected in the soil.

1.04 DEFINITIONS

- A. Hazardous Substance means any substance designated or listed under paragraphs 1 through 4 of this definition, exposure to which results or may result in adverse affects on the health or safety of employees:
 - 1. Any substance defined under section 101(14) of CERCLA;
 - 2. Any biological agent and other disease-causing agent which after release into the environment and upon exposure, ingestion, inhalation, or assimilation into any person or organism, either directly from the environment or indirectly by ingestion through food chains, will or may reasonably be anticipated to cause death, disease, behavioral abnormalities, cancer, genetic mutation, physiological malfunctions (including malfunctions in reproduction) or physical deformations in such persons or their offspring;
 - 3. Any substance listed by the U.S. Department of Transportation as hazardous materials under 49 CFR 172.101 and appendices; and
 - 4. Hazardous waste as herein defined.
- B. Hazardous waste means -
 - 1. A waste or combination of wastes as defined in 40 CFR 261.3, or
 - 2. Those substances defined as hazardous wastes in 49 CFR 171.8.
 - 3. Hazardous waste having the characteristics identified under or listed pursuant to section 3001 of the Resource Conservation and Recovery Act of 1976 (RCRA), as amended, (42 U.S.C. § 6921) (but not including any waste the regulation of which under RCRA (42 U.S.C. § 6901 et seq.) has been suspended by Act of Congress), any toxic pollutant listed under section 1317(a) of Title 33, any hazardous air pollutant listed under section 112 of the Clean Air Act (42 U.S.C. § 7412), and any imminently hazardous chemical substance or mixture with respect to which the Administrator (of EPA) has taken action pursuant to section 2606 of Title 15.

1.05 SUBMITTALS

- A. Hazardous Substance Screening and Sampling Plan (HSSSP)
 - 1. Elements
 - a. Standard operating procedures (SOPs) for sample collection
 - b. Standard operating procedures for field screening and/or testing
 - c. Laboratory test methods
 - 2. Schedule of Submittals
 - a. Submit HSSSP to OWNER not more than 30 days after receipt of Notice to Proceed
 - b. Allow not less than 30 days for review by OWNER
 - c. No adjustment for time or money will be made if resubmittal of the HSSSP is required due to deficiencies.

- B. Hazardous Substances Health and Safety Plan (HSHSP)
 - 1. The HSHSP shall conform to guidance developed by the U.S. Environmental Protection Agency. It is noted that a Health and Safety Plan is provided in the appendix section of the Soil Management Plan (SMP) which may be utilized during excavation activities. For other hazardous substances encountered, at a minimum, the HSHSP shall include:
 - a. Schedule of activities.
 - b. The identity and locations of identified sites containing hazardous substances and procedures for handling materials encountered at these sites.
 - c. Methods and procedures to remove, stage, and store hazardous substances, and the equipment to be used for these activities.
 - d. Methods and procedures for the transport, disposal, and off-site treatment of regulated and non-regulated hazardous substances, in compliance with applicable federal, state, and local laws and regulations, including the identification of haul routes, disposal and treatment facilities, and the use of certified, licensed transporters.
 - e. Equipment decontamination procedures.
 - f. Worker decontamination procedures.
 - g. Contingency plans to address the removal or abandonment in place of an underground storage tank (UST) if one is encountered.
 - h. Contingency plans to address the procedures that will be followed if unknown contamination is encountered during the Work which conform with 3.01.
 - i. Sampling and analysis procedures that cover the Contractor's sampling responsibilities, including the characterization of tank contents and releases of hazardous and hazardous substances for which the Contractor is responsible under the Contract.
 - j. Spill prevention procedures and spill contingencies.

Department of Neighborhood Services and Public Safety
GOLETA TRAIN DEPOT PROJECT

- k. Sampling plan for determining the waste designation for materials identified as Lead containing.
 - l. Procedures for documenting and reporting to OWNER.
 2. Schedule
 - a. Submit HSHSP to OWNER not more than 30 days after receipt of Notice to Proceed
 - b. Allow not less than 30 days for review by OWNER
 - c. No adjustment for time or money will be made if resubmittal of the HSHSP is required due to deficiencies.
 3. Perform no work, with the exception of site inspections and surveys, until OWNER has accepted the HSHSP.
- C. Submit qualifications of the Task Supervisor and the person conducting environmental sampling.
- D. Storm Water Pollution Prevention Plan (SWPPP)
1. The SWPPP will include elements such as silt traps and hay bales to minimize surface water runoff from the site into storm drains. Berms will be used to control runoff, and soil stockpiles will be covered during the rainy season (November through March) to minimize sediment runoff.
- E. Submit copies of current certifications for training, medical surveillance, and respiratory fit test, as appropriate for workers.
- F. Submit surveys, cross-sections, and areas of excavation delineating areas of hazardous substances.
- G. Submit the Contractor's analytical testing documentation to OWNER within 24 hours of receipt.
- H. Submit evidence that a state-licensed transporter is being used to transport hazardous substances. If transport will occur across state boundaries, each transporter shall be licensed in the state through which the waste is transported.
- I. Submit evidence that all hazardous substances are disposed at appropriately licensed facilities.
- J. Closeout Submittals: Submit a closeout document at completion of the task, containing sample chains of custody, analytical laboratory test results, surveys, logs, waste manifests, and certificates of disposal/destruction.

1.06 GENERAL REQUIREMENTS

- A. To the fullest extent permitted by law, indemnify and hold harmless OWNER, its elected and appointed officials, agents, employees, volunteers, OWNER's consultant and the officers, directors, partners, employees, agents, other consultants and subcontractors of each and any of them from and against all claims, costs, losses, and damages (including but not limited to all fees and charges of engineers, architects, attorneys and other professionals and all court or arbitration or other dispute resolution costs) arising out of or resulting from such hazardous environmental condition created by Contractor or anyone for whom Contractor is responsible.
- B. Safeguards, signs, and notices: Erect and maintain, as required by existing conditions and performance of the Contract, reasonable safeguards for safety and protection, including posting danger signs and other warnings and notices against hazards, promulgating safety regulations and notifying owners and users of adjacent site and utilities.
- C. Follow the guidelines of the provided Soil Management Plan (SMP) during excavation and grading activities.

1.07 QUALITY ASSURANCE

- A. Qualifications
 - 1. Work shall be directed by a supervisor (Task Supervisor) trained and experienced in working with materials containing hazardous substances. The supervisor shall have completed Occupational Safety and Health Administration (OSHA) training requirements for working with hazardous substances including the 8-hour supervisory course. The supervisor shall have a minimum of 3 years of experience managing projects involving the removal, treatment or disposal of hazardous substances. Submit a copy of the supervisor's qualifications and experience for OWNER review.
 - 2. Personnel working with hazardous substances and waste shall have received training and have experience for the Work to be performed.
 - 3. Personnel taking and managing samples shall have the necessary OSHA training and have a minimum of 1 year of experience in environmental sampling.
- B. Certification:
 - 1. All safety personnel shall have current certifications in accordance with their required qualifications.
 - 2. Contractor's and subcontractors' personnel who perform or supervise hazardous materials work requiring Level C or Level D protection, as defined by the Hazard Communication Site Health and Safety Plan, shall have received appropriate safety training in compliance with 29 CFR 1910.120 and 29 CFR 1910.134. A minimum of 40 hours of health and safety training, 24 hours of on-the-job training, 8 hours of annual refresher training, and annual medical monitoring by an occupational physician

Department of Neighborhood Services and Public Safety
GOLETA TRAIN DEPOT PROJECT

is required. A minimum of 8 hours of additional specialized training in managing hazardous waste operations is required for supervisory personnel. Workers without current certification will not be allowed to enter an Exclusion Zone.

3. Contractor's and subcontractors' personnel who perform or supervise hazardous materials work requiring Level A or Level B protection, as defined by the Hazard Communication Site Health and Safety Plan, shall have received all appropriate safety training in compliance with 29 CFR 1910.120, 29 CFR 1910.134, needed for the hazardous environment in which they will be working.
 4. Comply with the medical surveillance program requirements of OSHA Standard 29 CFR 1910.120, 29 CFR 1910.134. Provide documentation that personnel have received medical examinations and are certified for respirator use (if necessary), within the last 12 months, and are cleared to work on hazardous sites before entering an Exclusion Zone or contacting hazardous substances.
 5. Contractor shall submit samples for analysis to an independent, third party laboratory with a current certification from governmental agency having jurisdiction.
 6. Required certifications, physicals, and fit test requirements for asbestos and lead-based paint personnel are detailed in Specification Section 02 26 01.
- C. Contractor may be asked to attend meetings to discuss sample results and the course of action.

PART 2 – PRODUCTS

NOT USED

PART 3 – EXECUTION

3.01 ASSESSMENT OF HAZARDOUS SUBSTANCES

A. Immediate Response

1. Discovery of Anticipated Hazardous Substances
 - a. Anticipated Hazardous Substances include any soil, water, liquid, gas or other hazardous substance.
 - b. If Contractor encounters hazardous substances identified in the Contract Documents, Contractor must immediately notify OWNER and then proceed with work activities needed to address the hazards associated with the material and the precautions to be taken when the materials are encountered.
2. Discovery of Unanticipated Hazardous Substances
 - a. Unanticipated Hazardous Substances include any soil, water, liquid, gas or other hazardous substance.

- b. If Contractor encounters unanticipated hazardous substances, Contractor must immediately:
 - 1) Secure or otherwise isolate such condition;
 - 2) Stop all construction that may encounter or disturb the discovered suspect hazardous substance (except in an emergency) and take appropriate steps for worker and public safety.
 - 3) Conduct a hazardous substance assessment in accordance with Section 3.01 B and consult the Soil Management Plan for guidance.
 - 4) Notify OWNER within 24 hours after discovering suspect hazardous substances and confirm such notice in writing. The notice shall include all available information regarding the site conditions, including, but not limited to (a) a written description of the media/material and the possible hazardous substance; (b) drawings illustrating the area where potentially hazardous substances were encountered and (c) photographs, if any.
 - 5) Submit one or more figures identifying the locations and depths from the ground surface at which samples were collected, a description of the physical characteristics of each sample, and the results of analytical testing to OWNER within 24 hours of receipt of the analytical data.

B. Hazardous Substance Assessment

1. Worker safety and health protective measures shall be appropriate for the exposure and in accordance with applicable U.S. Department of Labor, Occupational Safety & Health Administration (OSHA) regulations.
 - a. Worker safety exposure assessment shall comply with regulatory Action Levels (AL) and Permissible Exposure Limits (PEL) established by OSHA for the substance of concern.
 - b. For purposes of immediate worker safety, atmospheric analysis shall be conducted using the PID and Combustible Gas Indicator (CGI). Samples of the general atmosphere shall be measured on all four sides of the area where work is being conducted. Work shall continue based on the PID/CGI readings and by pre-determined action levels set by the Contractor.
2. Visually inspect soil samples for staining, debris, slag, or sheen. If unusual odors are noted, they shall also be used to identify the likely presence of contamination.
3. Field Screening Techniques
 - a. When soil samples are collected in areas with likely contamination caused by volatile organic carbon compounds, as indicated by the known historical uses of the site, or olfactory or visible evidence of volatile organic compounds is indicated, measure headspace to determine the presence for VOCs. Contractor is responsible for establishing action levels that correlate with current HDOH Office of Solid Waste Management soil reuse standards and the measurement properties of Contractor's test equipment.

Department of Neighborhood Services and Public Safety
GOLETA TRAIN DEPOT PROJECT

- b. Headspace Test
 - 1) Screen samples collected from the removed materials in the areas of possible contamination with a Photoionization Detectors (PID) for the presence of volatile organic compounds.
 - 2) Headspace analysis shall be conducted by placing suspect material into an inert sealable container (a glass jar or “ziploc” bag), allowing the material to equilibrate for several minutes, and collecting measurements of the air within the container.
 - 3) Field screening tests may be used to screen for potential for contamination.
4. Collection of Samples for Laboratory Analysis
 - a. Samples Used to Characterize the Site Conditions
 - 1) Collect all samples that will be used to identify the chemicals of concern and their concentrations.
 - b. Samples Used to Characterize whether the Material is Hazardous Waste
 - 1) Contractor is responsible for characterization sampling and analysis of the excavated materials.
 - 2) Collect and analyze all samples that will be used to characterize waste in accordance with U.S. EPA regulations, the requirements of the transporter and receiving disposal or treatment site, the requirements of the H.
 - 3) Sample and analyze all materials potentially containing hazardous substances generated during site investigation and abatement activities.
 - 4) Conduct confirmation sampling associated with Contractor’s generation, use, and/or release of hazardous or contaminated substances for which the Contractor is responsible under the General Conditions.
 - c. Collection of Unanticipated Suspect Hazardous Substance Samples
 - 1) Perform required sampling and chemical analyses relating to the Contractor’s generation, use, release, and/or disposal of hazardous substances in the course of the Contractor’s operation, for which the Contractor is responsible under the General Conditions. Provide OWNER with advance notice of such activities and provide OWNER with access to perform concurrent verification sampling.
 - 2) Perform required sampling and chemical analyses relating to existing potentially hazardous substances, unless this is otherwise provided herein or in the Contract. Such sampling shall include characterization sampling and sampling necessary to determine disposal methods. Disposal of material shall not occur until directed to do so by OWNER.
 - d. Collection of On-site Discharge Water
 - 1) Sample and analyze water that will be directly or indirectly discharged to rivers, streams, or other surface waters to ensure compliance with discharge or disposal requirements specified in the HSHSP and/or permits.

- 2) Provide OWNER with advance notice of all sampling activities
- 3) Provide OWNER with access to collect concurrent verification samples if it elects to do so.

5. Laboratory Analysis

a. Previously confirmed hazardous substances

- 1) Hazardous substances encountered by the Contractor within the sites identified in the Contract Documents will be the Contractor's responsibility to manage appropriately.
- 2) Contractor may use laboratory test data for waste characterization if it is acceptable to the receiving waste treatment or disposal facility and transporter. Contractor has the responsibility of confirming the adequacy of these data with the receiving waste treatment or disposal facility and transporter before work commences. OWNER is not responsible for delays or additional expenses if the transporter or receiving waste treatment or disposal facility is unwilling to accept the data for waste characterization.
- 3) The identification, testing, assessment, containment, removal, disposal and/or treatment of hazardous substances identified in the Contract Documents is considered to be included with the related item of work in the General Conditions, or incidental to the Work.

C. Long-term Response

1. If analytical testing shows that hazardous substance are present, Contractor shall provide information to OWNER in summary form with supporting documentation within 60 working days.
 - a. Identity of chemicals of concern (COCs).
 - b. Concentrations of COCs at each sampled locations.
 - c. Estimated extent of contamination.
 - d. Required construction work in the contaminated area.
 - e. Effect of the contamination on the work that will need to be done.
 - f. Adequacy of the data in identifying the nature and extent of contamination, and how limitations in the data might affect the selection of an abatement method.
 - g. Options for how contamination can be abated or otherwise addressed while performing needed construction work in the contaminated area
 - 1) Costs for each option, including the estimated probable value, the estimate low value, the estimated high value, and the limitations in the data that affect the adequacy of the cost estimates. The compensation for each abatement option shall be based upon the unit prices identified in the Construction Agreement. If an abatement activity requires the use of equipment, materials, or the performance of work not anticipated in the Construction Agreement, Contractor shall identify the unit cost of each, the number of units that are

- required, the method that should be used to identify each unit, and the total estimated cost for each item.
 - 2) Impact of each abatement option on the environment, including the movement or relocation of contamination.
 - 3) Impact of each abatement option on the construction schedule.
 - 4) Health and safety risks associated with each abatement option.
2. OWNER, with the advice of Contractor, shall select an abatement method to address the encountered contamination.
 3. OWNER shall have the option of seeking other technical advice and bids, and contracting with others to complete any and all abatement work not identified in the Construction Agreement.
 4. Upon selection of an abatement option and within 20 working days after an agreement with Contractor to conduct the abatement work has been authorized, Contractor shall modify and submit to OWNER the HSHSP to address the hazards associated with the condition and required work activities associated with the abatement methods.

3.02 CONTRACTOR GENERATED WASTE

- A. All waste material generated by the Contractor is to be tested as required by the accepting authority (i.e. landfill), and disposed of properly. The testing of the waste material (whether “clean” or containing hazardous substances) is considered to be included with the related item of work in the General Conditions, or incidental to the Work.
- B. Hazardous substance waste must be disposed per Section 02 61 01. All waste must be reused or disposed in accordance with all applicable Federal, State, and local regulations.

3.03 CONTRACTOR USE OF HAZARDOUS SUBSTANCES

- A. Contractor use of hazardous substances shall be in accordance with 29 CFR 1910.1200 Hazard Communication and the Contractor’s accepted Site Safety and Security Plan.
- B. Contractor is solely responsible for materials creating a hazardous substances condition brought to the Site by the Contractor, subcontractors, suppliers, or anyone else for whom Contractor is responsible.
- C. The use, generation, handling and disposal of hazardous substances shall be addressed in Contractor’s Hazardous Substances Health and Safety Plan (HSHSP).
- D. Contractor must comply with the requirements of all laws to ensure that Project personnel are informed and trained on the use of hazardous substances and know the possible health and safety risks.

- E. Contractor is responsible for proper transport, storage, handling and disposal of hazardous substances and wastes generated by or incidental to the Contractor's operations including lubricants, antifreeze, engine fluids, paints, and solvents.
- F. In addition to all other remedies provided by applicable laws or the Contract, OWNER may withhold from or recover from the Contractor any money that OWNER is required to expend, remediate, remove, or dispose of hazardous substances used by the Contractor, as well as the cost of any fines or impositions made by appropriate enforcement agencies from Contractor use of such items and material, whether or not the Contractor exercised due care.

END OF SECTION – 02 26 00

SECTION 02 26 01

REMOVAL AND DISPOSAL OF HAZARDOUS SUBSTANCES

PART 1 – GENERAL

1.01 SUMMARY

A. Description:

1. This Section includes excavating, dewatering, handling, stockpiling, temporarily storing, and/or disposing of existing hazardous and contaminated materials that are known or that may be encountered during the Work.
2. This Section includes preparation of plans to manage contaminated materials including those defined in General Conditions requirements.
3. This Section also includes procedures applicable to the Contractor's generation, use, and/or release of hazardous or contaminated substances in the course of the Contractor's operation, for which the Contractor is responsible under the General Conditions requirements. Complete the removal of lead-containing materials, asbestos, polychlorinated biphenyls (PCB) articles, and underground storage tanks.

B. Section Includes:

1. Contractor's Assistance
2. Existing Structures and Utilities
3. Contaminated Material Removal
4. Sampling and Analysis
5. Contaminated Material Staging
6. Spills
7. Backfill
8. Off-Site Disposal

- B. Section 31 22 00 - Grading

1.05 DEFINITIONS

- A. Hazardous substance- means any substance designated or listed under paragraphs 1 through 4 of this definition, exposure to which results or may result in adverse affects on the health or safety of employees:
 1. Any substance defined under CERCLA 42 U.S.C. § 9601(14);
 2. Any biological agent and other disease-causing agent which after release into the environment and upon exposure, ingestion, inhalation, or assimilation into any person, either directly from the environment or indirectly by ingestion through food chains, will or may reasonably be anticipated to cause death, disease, behavioral abnormalities, cancer, genetic mutation, physiological malfunctions (including malfunctions in reproduction) or physical deformations in such persons or their offspring;
 3. Any substance listed by the U.S. Department of Transportation as hazardous materials under 49 CFR 172.101 and appendices; and
 4. Hazardous waste as herein defined.
- B. Hazardous waste means -
 1. A waste or combination of wastes as defined in 40 CFR 261.3, or
 2. Those substances defined as hazardous wastes in 49 CFR 171.8.
 3. Hazardous waste having the characteristics identified under or listed pursuant to section 3001 of the Resource Conservation and Recovery Act of 1976 (RCRA), as

amended, (42 U.S.C. § 6921) (but not including any waste the regulation of which under RCRA (42 U.S.C. § 6901 et seq.) has been suspended by Act of Congress), any toxic pollutant listed under section 1317(a) of Title 33, any hazardous air pollutant listed under section 112 of the Clean Air Act (42 U.S.C. § 7412), and any imminently hazardous chemical substance or mixture with respect to which the Administrator (of EPA) has taken action pursuant to section 2606 of Title 15

1.06 GENERAL REQUIREMENTS

- A. During construction, existing potentially hazardous substances may be encountered. These conditions may require the excavation, handling, stockpiling, temporary storing, and disposal of hazardous substances. Perform remediation and other tasks of this Section at the direction of OWNER, in compliance with applicable statutes and regulations.
- B. Potential hazardous substances that may be encountered include, but are not limited to, asbestos, lead, total petroleum hydrocarbons (TPH), gasoline, diesel, and oil-range; metals; polynuclear aromatic hydrocarbons (PAHs); polychlorinated biphenyls (PCB); and volatile organic compounds (VOCs), such as benzene, toluene, ethylbenzene, xylenes (BTEX); perchloroethene (PCE), trichloroethene (TCE), and vinyl chloride. Some of these substances and locations where there is a greater likelihood of impacted materials are discussed in the Hazardous Materials Technical Report (DTS 2008).
- C. Conduct the work of this Section in accordance with Contract requirements; direction received from OWNER; the accepted plans for managing hazardous substances; and applicable federal, state, and local statutes, regulations, and standards.
- D. Obtain all required permits and notifications for removal (excavation/dewatering), storage, transportation, and disposal of hazardous substances. In furtherance of this requirement, OWNER will provide the Contractor with sampling results, if any, and other information developed by OWNER, if any. Permits shall be obtained at no additional cost to OWNER.
- E. Implement the water discharge requirements set forth in the General Conditions.

1.07 SUBMITTALS

- A. Refer to submittals in Section 01 33 00 – Submittal Procedures.

PART 2 – PRODUCTS

2.01 BACKFILL MATERIAL

- A. Obtain backfill material in accordance with Section 31 23 13 – Excavation and Fill.

2.02 SPILL RESPONSE MATERIALS

- A. Provide spill response materials, including but not limited to containers, adsorbents, shovels, and personnel protective equipment. Spill response materials shall be available at all times when hazardous materials/wastes are being handled or transported. Spill response materials shall be compatible with the type of materials and contaminants being handled.

2.03 STAGING MATERIAL

- A. Geomembranes to be used as liner or material cover shall be chemical resistant with minimum thickness of 10 mils.

PART 3 – EXECUTION

3.01 CONTRACTOR’S ASSISTANCE

- A. Assist OWNER in performing general excavation and site remediation activities. This includes providing access for OWNER to document site activities and collect soil and water samples. Such assistance may also include collecting soil samples with a backhoe at the direction of OWNER or an authorized representative. Be aware and anticipate that a reasonable time will elapse between collecting confirmation samples and completing chemical laboratory analyses, and secure and maintain excavation areas during that time. Such assistance may also include attendance at regular project meetings.
- B. Assist OWNER in the duties specified under the General Conditions. Such assistance includes providing access to sampling sites so that OWNER may monitor discharges. Monitoring may be required under applicable permits.
- C. Provide access for City representatives to conduct its own testing and monitoring at its sole discretion to satisfy itself regarding compliance with regulatory or permit requirements. Inspection, monitoring, and testing by OWNER does not relieve the Contractor of responsibility for compliance.

3.02 EXISTING STRUCTURES AND UTILITIES

- A. Take necessary precautions to avoid damage to existing structures, their appurtenances, monitoring wells, or utilities that may be affected by work activities. Coordinate with OWNER and/or property s to locate underground utilities prior to beginning construction. Utilities encountered that were not previously shown or otherwise located shall not be disturbed without approval from the property or OWNER.
- B. Repair damage to existing site features to be protected at no additional cost to OWNER.

3.03 HAZARDOUS SUBSTANCE REMOVAL

- A. Unless directed otherwise by OWNER, give notification at least 7 calendar days prior to the start of excavation of known contaminated material. Unless otherwise directed by OWNER, be responsible for contacting regulatory agencies in accordance with applicable reporting requirements. Notification is to include the type of materials being removed, the levels of contamination, and the destination/final disposal site of the material.
- B. Strip and stockpile “clean” material separately from contaminated material. Segregate potentially contaminated material into material that exceeds field screening levels and material that does not exceed these levels. Be responsible for protecting “clean” material from becoming contaminated. This may include covering the materials with plastic sheeting. Materials that become contaminated as a result of Contractor activities shall be disposed of at the Contractor’s expense.
 - 1. Excavate areas of contamination as directed by OWNER and in compliance with State and local jurisdiction landfill requirements. Perform excavation in a manner that will limit the potential for contaminated material to be mixed with uncontaminated material.
- C. Maintain a log of the materials and visible signs of hazardous substances encountered during excavation for each area of excavation. Prepare excavation logs in accordance with ASTM D5434.
- D. Divert surface water to prevent entry into the excavation. Limit dewatering to that necessary to ensure adequate access and a safe excavation, and to ensure that compaction requirements can be met.
- E. Perform field surveys immediately prior to and after excavations of contaminated material to determine the volume of contaminated material removed. Provide cross-sections on 10-foot intervals and at obvious break points for excavated areas. Survey the locations of confirmation samples. Perform surveys using tape and compass methods.
- F. Contain contaminated water and store on site in accordance with applicable federal, state, and local disposal regulations until analytical results are obtained. Analyses for contaminated water to be taken to an off-site treatment facility shall conform to the requirements of the treatment facility. Analyses for storm drain or sanitary sewers shall be as specified in the General Conditions.
- G. Provide the approved containers, vehicles, equipment, labor, signs, labels, placards and manifests, and associated disposal notices and notifications necessary for accomplishing the Work.
- H. Provide documentation of proper disposal or treatment to OWNER.

3.04 SAMPLING AND ANALYSIS

3.05 OWNER HAZARDOUS SUBSTANCE MATERIAL STAGING

- A. Place material containing hazardous substances (herein referred to as contaminated material) in a staging unit immediately after excavation while awaiting test results. This Article describes acceptable methods of material staging. Staging units shall be in good condition and constructed of materials that are compatible with the material or liquid to be staged. If multiple staging units are required, clearly label each unit with an identification number and keep a written log to track the source of contaminated material in each staging unit.
- B. Isolate confirmed and/or suspected contaminated material from the environment. The maximum stockpile size shall be 100 cubic yards. Stockpiles shall be constructed to include:
 - 1. A chemically resistant geomembrane liner. The ground surface on which the geomembrane is to be placed shall be free of rocks greater than 0.5 inch in diameter and other objects that could damage the membrane.
 - 2. Geomembrane cover to prevent precipitation from entering the stockpile. The cover material shall be anchored to prevent it from being removed by wind.
 - 3. Berms surrounding the stockpile shall be a minimum of 12 inches high. Vehicle access points shall also be bermed.
 - 4. Liquid collected from excavations and stockpiles shall be temporarily stored in 55-gallon barrels or portable tanks. Liquid storage containers shall be watertight.
- C. Watertight roll-off units lined with 10-mil plastic sheeting may be used to stage contaminated material. Place an impermeable cover over the units to prevent precipitation from contacting the stored material. Remove and store liquid that collects inside the units.

3.06 SPILLS

- A. In the event of a Contractor spill or release of a hazardous substance, as defined in the General Conditions requirements, notify OWNER immediately. If the spill exceeds the regulatory reporting threshold, follow the pre-established procedures described in the HSHSP (described in Section 01 74 20 - Discovery and Assessment of Suspect and Confirmed Hazardous Substances) for immediate reporting and containment. Take immediate containment actions to minimize the effect of spills or leaks. Perform cleanup in accordance with applicable federal, state, and local regulations. As directed by OWNER, perform additional sampling and testing to verify spills have been cleaned up. Perform cleanup and testing of spills resulting from the negligent actions of the Contractor at no additional cost to OWNER.

3.07 BACKFILL

- A. Backfill excavations only after confirmation sample test results have been received and/or upon OWNER's direction. Contaminated material removal shall be considered complete after the bottom of the excavation is determined to have soil contamination levels below applicable state cleanup standards, and/or at OWNER's direction. Excavation shall be dewatered if necessary. Stockpiled material that was sampled for testing shall be used as backfill if it is found to conform to the requirements of clean fill in accordance with Section 31 23 13 – Earth Moving. Place and compact backfill in accordance with Section 31 23 13 – Earth Moving.

3.08 OFF-SITE DISPOSAL

- A. Load contaminated material for off-site disposal. Costs associated with this task shall be included in the unit price for material handling and disposal.
- B. Provide transportation in accordance with hazardous substance regulations and federal, state, and local requirements, including obtaining necessary permits, licenses, and approvals. In submittals, include evidence that a state-licensed transporter is being used. The contaminated material may be shipped by truck, ship, or rail. Provide coordination of all activities. Double-line the bed of the truck or rail car with 6-mil plastic sheeting for each load. Subsequently, cover each load with plastic sheeting and tarpaulin prior to leaving the site.
- C. Treatment, Disposal, and Recycling:
 - 1. Perform treatment, disposal, and recycling of contaminated materials in accordance with all applicable laws, regulations, and conditions specified herein. This work shall include all necessary personnel, labor, transportation, packaging, equipment, and reports.
 - 2. Where approved by governmental requirements, contaminated material can be treated or landfilled.
 - 3. If treated, transport contaminated material to a local licensed facility in accordance with applicable requirements.
 - 4. If landfilled, dispose of contaminated materials in a landfill licensed to receive the material, in accordance with applicable requirements.
- D. Records: Maintain records of all waste determinations, including appropriate results of analyses performed, substances and sample location, the time of collection, and other pertinent data as required by 40 CFR 280 Section 74 and 40 CFR 262 Subpart D, and other applicable regulations. Record and make available for inspection the following: transportation, treatment, disposal methods and dates, quantities of waste, names and addresses of each transporter, and disposal or reclamation facility. Also make copies of the following documents available:

1. Manifests.
 2. Waste analyses or waste profile sheets.
 3. Certifications of final treatment/disposal signed by the responsible disposal facility official.
 4. Land disposal notification records required under 40 CFR 268 for hazardous wastes.
 5. Records shall be provided in accordance with applicable federal, state, and local regulations. Following Contract closeout, records shall become OWNER's property.
- E. Manifesting of hazardous waste shall conform to EPA, DOT, and all other applicable federal, state, and local regulations. For disposal of all hazardous waste (with the exception of wastes resulting from the release of hazardous or contaminated substances negligently disturbed, removed, or handled by the Contractor, its employees, agents, officers, or subcontractors, or any other persons for whom the Contractor may be contractually or legally responsible), the Generator's Certification portion of the Uniform Hazardous Waste Manifest shall be signed only by OWNER's Hazardous Materials Coordinator or by an individual delegated with such authority by OWNER (OWNER's Representative).
- F. Documentation of Treatment or Disposal:
1. Transfer wastes, other than recyclable or reclaimable product or metal, to a treatment, storage, or disposal facility which has EPA or appropriate state permits and hazardous or special waste identification numbers and complies with the provisions of the disposal regulations.
 2. Furnish to OWNER the original return copy of the hazardous waste manifest, signed by the operator of a facility legally permitted to treat or dispose of those materials furnished, not later than 5 working days following the delivery of those materials to the facility.
 3. Furnish a statement of agreement from the proposed treatment, storage or disposal facility and certified transporters to accept hazardous or special wastes.

3.09 ASBESTOS REMOVAL SUMMARY OF WORK

- A. Work Included:
1. The asbestos materials to be removed and disposed of are detailed in the asbestos survey entitled, "*Asbestos Survey and Hazardous Materials Inspection, Goleta Train Depot, 27 South La Patera Lane, Goleta, California, 93117*" by All Phase Environmental, Inc. dated December 6, 2023.

2. Contractor shall verify actual quantities present and shall not rely on the quantities described in the asbestos survey.
3. Contractor shall establish work area containment(s) and remove asbestos-containing materials utilizing the required engineering controls and personal protective equipment (PPE). The Contractor shall decontaminate work area containments and dispose of ACM waste.
4. Contractor shall be responsible for performing personnel air monitoring and analysis.
5. The Contractor is hereby advised that asbestos has been determined by the U.S. Government to be a CANCER CAUSING AGENT and Contractor shall provide workers with respirators which, at a minimum, shall meet the requirements of OSHA 29 CFR 1910.134 and protective clothing during establishment of work area containment, prior to commencing asbestos removal, during actual asbestos removal, and until results of satisfactory final air tests are accepted by OWNER'S Representative
6. Contractor shall leave the work area in a condition ready for renovation by others.

B. Work Not Included:

1. Daily and clearance ACM air monitoring will be performed by the OWNER'S Representative.
2. Replacement or reinstallation of materials removed during abatement.

C. Work Plan and Schedule:

1. The Contractor shall prepare a detailed plan of the work procedures to be used, the method(s) of area isolation and fiber control, locations of decontamination units and HEPA exhausts, and the storage of wastes. This plan shall also include a schedule of on-site activities indicating when asbestos removal will be conducted to include the start and completion dates. The schedule must state when each phase of work is anticipated to begin and end. The Contractor shall notify the OWNER'S Representative a minimum of 72 hours prior to changing the schedule.
2. Work shall be conducted in one 8 hour shift Monday through Friday between 6:00 am to 6:00 pm unless specifically authorized by the OWNER.

D. Notifications:

1. The Contractor shall prepare and submit in writing, on behalf of OWNER, a 10-working day notification of impending commencement of asbestos removal activities to the Santa Barbara County Air Pollution Control District (APCD) as required on the Notification Form ENF-28. The Contractor shall also provide the OWNER and the APCD at least 10 business days' notice prior to the start of work.

2. The Contractor shall be responsible for timely payment of the applicable abatement notification fees and all permits, as required; and, for timely revision of the notice as needed over the course of the Work

E. Submittals:

1. The Contractor shall provide required submittals in a timely manner and at appropriate times in the execution of the Work to allow for sufficient and prompt review by OWNER'S Representative, and revise and resubmit as necessary to establish or maintain compliance with the specified requirements.
2. The Contractor shall submit two complete sets of Pre Job Submittals to OWNER'S Representative for review, prior to the Work. Work may not proceed until the complete Pre Job Submittal package has been reviewed and accepted as complete by the OWNER'S Representative.
3. The Contractor shall submit documentation specified in this Section for individual workers to the Owner's Representative prior to using those employees on the Work. Workers without documentation shall not be allowed inside the regulated areas until such documentation has been reviewed and accepted by the OWNER'S Representative.
4. Pre Job Submittals must include the following:
 - a. Copy of the 10-working day notification of impending commencement of asbestos abatement work.
 - b. Copy of the Contractor's asbestos abatement contractor license valid for the period of time covered by the Work.
 - c. Copy of a work plan and schedule describing how the areas will be isolated and the methods that will be used to remove the ACMs. Plans showing bracing; hoists; scaffolding; temporary supports; and visual barriers, if needed.
 - d. Copy of Contractor's insurance certificate showing coverages and insureds as required by the Contract Documents (as provided by the OWNER).
 - e. All required licensure, permits, and arrangements for transport and disposal of waste materials, including without limitation:
 - 1) Location, including name and address of operator, of landfill proposed for disposal of asbestos wastes generated by the Work
 - 2) Evidence that the landfill proposed for disposal of asbestos waste generated by the Work is approved by applicable federal, state, and/or local regulatory agencies
 - 3) The name and address of the waste hauler to be used for transportation of asbestos wastes; and
 - 4) evidence that the waste hauler is experienced in the transportation of wastes and possesses applicable license(s) for transport.

- f. A list of the subcontractors to be utilized during the Work, including the subcontractor's name, address, contact name and phone number and the services they will provide during the Work. Provide copies of licenses for those subcontractors providing a service, which requires state or local licensure (e.g. personnel air monitoring).
- g. Written descriptions and shop drawings for proposed "non-standard" work practices or work practices that would vary from those specified in this document.
- h. Listing of the asbestos abatement employees proposed to be used for the Work, including list of supervisory personnel. Documentation for each and every worker and supervisor proposed for use during the Work. No worker shall be allowed into a controlled work area without complete and accepted documentation that shall include, without limitation, the following:
 - 1) Copy of California asbestos worker and supervisor certificates, valid for the period of time covered by the Work
 - 2) Copies of applicable fit-testing records, for each respirator to be worn, valid for the period of time covered by the Work, and;
 - 3) Copies of medical approval forms signed by a doctor for performing asbestos work using respiratory protection.
- i. Progressive Submittals - Provide at least two copies of the following to the OWNER'S Representative, for review on the Site, during the course of the Work:
 - 1) Revisions to the 10 working day notification
 - 2) required documentation, as specified previously, for additional workers, as needed, and;
 - 3) Revisions to the Project schedule, including working hours and days.
- j. Post-Job Submittals – Release of final payment will not be recommended until the complete Post-Job Submittals are reviewed and accepted. Provide at least two copies of the following to the OWNER'S Representative, for review on the Site, during the course of the Work:
 - 1) Documentation of waste disposal that includes manifests for transport, receipts from landfill operator acknowledging receipt of asbestos-containing waste. All documentation shall be dated and indicate the quantity of materials delivered, signed by an authorized representative of landfill.
 - 2) An listing of each asbestos abatement employee used on the Work and the exact dates on which he or she was present in the controlled work areas.
 - 3) Employee air monitoring results relative to OSHA exposure limits. Results shall at a minimum include the employee's full name and last four digits of their social security number, the activity monitored, respiratory protection employed, and location where the employee was monitored.

- 4) Where full containment work areas are employed, documentation recording continuous reduced air pressure maintained in contained work areas, compiled on a daily basis.

F. Utilities:

1. The OWNER shall provide water and electrical service as available within reasonable proximity to the Work areas. The Contractor will take precautions to not damage existing utilities and shall be responsible for the costs of replacing utilities damaged during abatement activities. The Contractor should presume that the site will have pressurized water supply and 110 / 115 VAC power source.
2. The Contractor shall provide lighting and extensions of utilities as required during the Work. The Contractor shall remove lighting and extension of utilities at the conclusion of the Work.
3. The Contractor shall provide a temporary fused disconnect switch at the power source and provide ground fault protection using portable multi-outlet units designed for construction project sites.
4. The Contractor shall install temporary piping and valves necessary to deliver water to the work areas. Source of water and pipe route shall be coordinated with the OWNER'S Representative. The Contractor shall provide back flow protection at source of connection satisfactory to the OWNER as necessary. The Contractor shall coordinate with the OWNER'S Representative for details of connection to existing source.
5. Work related to temporary lighting, utilities or the extension of existing utilities shall only be conducted by Contractor employees or sub-contractors who are trained and licensed as required for the work conducted.

3.10 ASBESTOS REMOVAL

A. Description

1. The Contractor shall perform the planning, administration, execution, and cleaning necessary to safely remove designated ACM.
2. Approval of or acceptance by OWNER or OWNER'S Representative of various construction activities or methods proposed by Contractor does not constitute an assumption of liability by OWNER, or OWNER'S Representative for inadequacy or adverse consequences of said activities or methods.

B. Work Included

1. The Contractor shall establish work area containments as required by federal, state, and local regulations. The Contractor shall conduct abatement activities in no more than two (2) areas at one time unless otherwise permitted by the OWNER'S

Representative. The Contractor is responsible for performing abatement work in the Phases established by the OWNER'S Representative.

2. The Contractor shall remove non-ACM interior finishes and fixtures as needed to access the Work. The Contractor shall alleviate unsafe conditions resulting from the Work by conducting additional removal or temporary improvements as needed.
3. The Contractor shall clean and decontaminate work area containments as described herein.
4. The Contractor is responsible for personnel air monitoring and analysis of personnel air samples to comply with applicable federal and state regulations.
5. The Contractor shall properly dispose of asbestos-containing waste off-site in accordance with applicable state and federal regulations, and as specified herein.
6. The Contractor shall:
 - a. Maintain an on-site supervisor who shall be able to speak, read, and write English and to effectively communicate with workers
 - b. Provide one experienced job foreman for every ten asbestos abatement workers utilized for the Work. Foreman shall remain inside the contaminated work areas while the Work is in progress, and;
 - c. Use only trained, licensed, and experienced asbestos removal workers to perform the Work.
7. Results of tests of suspect ACM taken from building surfaces within the scope of this Work have been provided to the Contractor in the aforementioned Asbestos Survey report. Contractor is cautioned that, should interpretations be made, opinions be formed, and conclusions be drawn as a result of examining the test results, those interpretations, opinions, and conclusions will be those made, formed, and drawn solely by Contractor. Inasmuch as randomly and/or arbitrarily selected areas were sampled, OWNER and OWNER'S Representative make no representation, warranty, or guaranty that the conditions indicated by the test reports either are representative of those conditions existing throughout the area, or that unforeseen developments may not occur, or that materials other than, or in proportions different from, those indicated may not exist.

C. Personnel Protection

1. The Contractor acknowledges and agrees that Contractor is responsible for enforcing worker protection requirements at least equal to those specified in this Section.
2. Compliance with Cal OSHA requirements, including, but not limited to the provision of a Competent Person and development of Negative Exposure Assessments are the sole responsibility of the Contractor.

3. The Contractor shall provide workers with personally issued and marked respiratory equipment approved by NIOSH for the type of work being performed. Each worker shall be able to show, upon request during the course of work, dated proof of fit testing performed by qualified personnel for each respirator worn.
4. Where respirators with disposable filters are used, the Contractor shall provide sufficient filters for replacement as necessary by the workers, or as required by applicable regulations. Filter cartridges to be used shall be N100, P100 or R100 HEPA filters approved by NIOSH for asbestos related work.
5. The Contractor shall provide respiratory protection as needed from the time of the first operation involving contact with ACM until notified by the OWNER'S Representative and the containment/work area removal is completed.
6. The Contractor shall provide at a minimum half-face respirators for workers during the phases of Work in which asbestos may be disturbed, including, but not limited to: preparation of work areas, removal, cleaning, teardown, and waste handling
7. Regarding personnel air monitoring, Contractor shall:
 - a. schedule air sampling necessary for demonstrating compliance of Contractor's respiratory protection program with OSHA regulations;
 - b. ensure that the personnel monitoring strategy employed will result in suitable samples for analysis;
 - c. post at Work Site daily results of personnel monitoring upon receipt; and
 - d. provide a copy of the results to Owner's Representative.
8. The Contractor shall permit no visitors in the work areas after commencement of ACM disturbance or removal, except for governmental inspectors having jurisdiction, or as authorized by OWNER or OWNER'S Representative.
9. The Contractor shall provide workers with sufficient sets of protective disposable clothing, consisting of full body coveralls, head covers, gloves, and foot covers, of sizes to properly fit individual workers.
10. The Contractor shall leave reusable equipment, apparel and protection devices (excluding respirators) in the contaminated equipment room until the end of the ACM removal work, at which time such items shall be disposed of as contaminated waste or decontaminated for reuse.
11. The Contractor shall provide authorized visitors and OWNER'S Representative with suitable protective disposable clothing, respiratory protection (including suitable replacement filters), headgear, eye protection, footwear and other protective equipment of sizes to properly fit visitors whenever they enter the work area.

D. Materials

1. The Contractor shall provide materials as required including but not limited to the following.
 - a. **Plastic Sheeting** Shall be flame retardant, of the thickness as specified, in sizes to minimize the frequency of joints. Sheeting used for visual barriers shall be entirely opaque.
 - b. **Tape** Shall be glass fiber reinforced or other type capable of sealing joints of adjacent sheets of plastic and for attachment of plastic sheet to finished or unfinished surfaces under both dry and wet conditions.
 - c. **Surfactant (wetting agent)** Shall consist of a mixture of commercial surfactant mixed with water according to manufacturer's specifications.
 - d. **Sealant (encapsulant)** Commercial encapsulant mixed according to manufacturer's specification and approved specifically for use in asbestos contaminated environments. It is the responsibility of Contractor to determine compatibility of the sealant with the materials and conditions.
 - e. **Impermeable Containers** Shall be suitable to receive and retain ACM or asbestos contaminated materials until disposal at an approved landfill and shall be labeled in accordance with applicable regulations. Containers shall be both air and water tight.
 - f. **Warning Labels and Signs** Shall be as required by the local regulations and OSHA 29 CFR 1926.1101 and posted in both English and Spanish.
 - g. **Other Materials** Provide other materials, such as lumber, nails and hardware, which may be required to construct and dismantle the decontamination systems and the barriers that isolate the work areas.

E. Tools and equipment

1. Contractor shall provide suitable tools for ACM removal including but not limited to the following:
 - a. Water sprayers - Utilize airless or other low pressure sprayers for amended water (wetting agent/surfactant) application. Pressure washers or sprayers may not be used.
 - b. Airless sprayer - Use airless sprayer of sufficient capacity to apply spray-applied encapsulant in accordance with manufacturer's recommendations.
 - c. Air purifying equipment (for maintaining negative air pressure within the work area if needed) - Shall include HEPA filtration systems. Ensure that no purification equipment exhausts contaminated air from inside the work area into uncontaminated areas.

- d. Air purifying equipment (for internal re-circulation in the work area) - Shall include HEPA filtration systems. Ensure that no internal air movement system or purification equipment exhausts contaminated air from inside the work area into uncontaminated areas.
- e. Vacuum equipment (for pre-cleaning and cleaning in the work area) - Shall include HEPA filtration systems for exhaust. The equipment shall be maintained and used in accordance with the manufacturer's specification and meet the requirements of applicable laws and regulations.
- f. Scaffolding and ladders - Shall be as required to accomplish the specified work and shall meet applicable safety regulations.
- g. Transportation - As required for loading, temporary storage, transit, and unloading of contaminated waste without exposure to persons or property. Use only enclosed dumpsters, trailers or other transports to haul waste containers to prevent loss or damage of containers in route to landfill.

F. Work Area Preparation by Contractor

- 1. Restrict access to Work Area.
- 2. Verify, lock out and seal HVAC equipment supplying or within work areas with a minimum of two layers of six-mil plastic sheeting, individually applied, during the abatement activities.
- 3. Verify and lockout electrical power to work areas, though lighting may be maintained where practical. Provide temporary power and lighting as necessary to maintain safe and comfortable work environment.
- 4. Seal work areas from those in which removal will not occur, with a critical barrier consisting of a minimum two-layers of six-mil plastic sheeting. Seal ceiling, roof, plenum, wall and floor penetrations with critical barriers.
- 5. Maintain emergency and fire exits from the work areas, or establish alternative exits satisfactory to local fire officials. Mark fire exits appropriately on work area side.
- 6. Construct a decontamination unit in compliance with EPA guidelines concerning number, size and placement of airlocks, etc. Shower in personnel decontamination unit shall open into airlock on both contaminated and uncontaminated sides and shall be equipped with running water. Construct decontamination units of appropriate materials (including plastic sheeting) to provide airtight barriers to allow continuous reduced air pressure to be maintained in work areas. Post OSHA decontamination procedures, in both English and Spanish, in clean room for duration of Project.
- 7. If the entry to the decontamination unit opens directly to the exterior of the building, it shall be made of durable materials and have a locking door at the entrance to facilitate securing the work area.

8. Trap shower waste water using filters having a final filter pore size of not larger than 5.0 micron, and drain into a sanitary sewer. Replace contaminated filters when they become clogged. Dispose of filters as asbestos-contaminated waste.
9. For full containment work areas, place work areas under reduced air pressure as specified, utilizing HEPA filtration systems which comply with ANSI Z9.2 79, local exhaust ventilation. Submit the proposed route of air filtration exhaust to OWNER'S Representative for review prior to initiating its use.
10. Cover floors within the containment where removal will not take place with (if applicable) a minimum of two layers of plastic sheeting.
11. Ensure that barriers and plastic sheeting enclosures remain effectively sealed and taped for duration of abatement and subsequent cleaning. Repair damaged barriers and remedy defects immediately upon discovery.
12. Visually inspect work areas at the beginning and end of each work period. Repair damaged barriers and remedy defects immediately upon discovery.
13. Maintain a sign in/out log, as specified, in the immediate area of the change room to be signed by every person each time upon entering and leaving the work areas.
14. Place in work areas at least one fire extinguisher with a minimum NFPA rating of 10BC (dry chemical) for every 1,000 square feet, or fraction, of work area.
15. Notify OWNER'S Representative for observation of the preparation of work areas prior to disturbance of asbestos-containing material. Prior to notification, complete plasticizing of work area, and construction of the decontamination unit. No removal work can begin until preparations have been observed and accepted by OWNER'S Representative.

G. Removal of Asbestos Containing Materials

1. The Contractor shall remove and properly dispose of asbestos-containing materials indicated to be removed in accordance with federal, state, and local laws and regulations or as more stringently specified herein.
2. For the removal of all the designated ACM, Contractor shall:
 - a. Prepare work area as specified;
 - b. thoroughly wet the ACM to be removed with amended water prior to handling, stripping or tooling to reduce fiber dispersal into the air;
 - 1) Accomplish wetting by a fine mist of amended water;
 - 2) Saturate materials sufficiently to wet the substrate without causing excess dripping. Allow time for water to penetrate materials thoroughly;
 - 3) Spray materials repeatedly during the work process to maintain a continuously wet condition throughout progress of the removal work; and,

- 4) Wetting agent shall be applied in such a manner so as to minimize drips and puddles.
- c. Contractor shall remove the saturated ACM in small sections. Do not allow materials to dry out. As they are removed, place the materials in sealable plastic bags of six mil minimum thickness.
- d. Bags containing ACM or asbestos-contaminated materials shall be placed by Contractor in plastic bags of six mil minimum thickness, sealed, and labeled with the appropriate wording per regulatory agencies having jurisdiction (EPA, OSHA, EPD, DOT).
- e. Contractor shall double-bag used protective clothing, cleaning tools, plastic sheeting and other secondary waste in six-mil plastic bags and for disposal.
- f. Contractor shall maintain general cleanup of work area concurrent with the removal of all ACM, and not permit accumulation of debris on work area floors.
- g. After removal of ACM, Contractor shall wet clean all hard surfaces in the work area to remove residual accumulated materials, and continue wet cleaning until all hard surfaces are free of visible debris.
- h. After removal of ACM, Contractor shall HEPA-vacuum all porous surfaces in the work area to remove residual accumulated materials until all porous surfaces are free of visible debris.

H. Asbestos Abatement Clean Up

1. The Contractor shall provide general cleanup of work areas concurrent with the removal of asbestos-containing materials. Do not permit accumulation of debris within work areas.
2. Containment clearance sequence for negative pressure work areas if needed, the Contractor shall:
 - a. Wet clean and HEPA-vacuum surfaces in the work areas.
 - b. Clean equipment (excluding that which will be needed for further cleaning phases) used in the work areas and remove from work areas via the equipment decontamination enclosure system.
 - c. Replace pre-filters in air filtration devices with clean filters. Clean air filtration devices.
 - d. Contractor shall maintain critical barriers.
 - e. HEPA-vacuum and wet clean surfaces in the work area.
 - f. Notify OWNER'S Representative for observation to determine completeness of cleaning. Work area will be observed for the presence of visible dust, dirt and debris. The Contractor shall re-clean, and continue to clean at Contractor's expense, areas with observed visible dust, dirt or debris
3. The Contractor shall consider work areas complete when:

- a. Surfaces are free from dust, dirt, residue, and debris from abatement operations or other activities subordinate to these operations.
- b. The level of cleanliness has been approved by OWNER'S Representative; and,
- c. Air testing performed by the OWNER'S Representative indicates that the air in the work area is acceptable, as specified.

I. Disposal of Asbestos Contaminated Waste

1. Asbestos-containing waste (including but not limited to: used cleaning tools, towels, protective suits, used plastic sheeting and spray-applied plastic sheeting shall be treated as non-friable waste materials) shall be transported to the authorized landfill double bagged.
2. Follow decontamination procedures as follows:
 - a. After double-bagged contaminated waste is moved out through the decon system, Contractor shall wet wipe bags to remove contamination from them before they are moved into uncontaminated space.
 - b. As each bag of waste is removed from the work area, Contractor shall note in the asbestos waste log as specified.
3. Contractor shall remove sealed and labeled containers of asbestos-containing material and waste and transport them for disposal to an approved sanitary landfill as follows.
 - a. Line dumpster, trailer or other waste transport with at least two layers of six-mil plastic sheeting.
 - b. Notify OWNER'S Representative prior to removing each trailer or other waste transport from the Site.
 - c. Notify OWNER or OWNER'S Representative not less than 48 hours prior to the proposed time of delivery of asbestos-containing waste to the landfill. The OWNER or OWNER'S Representative may elect to observe this operation.
 - d. Asbestos containing waste material shall be treated, packaged, labeled, transported, and disposed of in accordance with 29 CFR 1926.1101 (OSHA), 40 CFR 61.150 (EPA) and 49 CFR 107 et al., (DOT).
 - e. Allow only sealed plastic bags to be deposited in landfill. Place leaking or unsealed bags in a new bag and seal prior to deposition.
 - f. Ensure that there are no visible emissions to the outside air from Site where materials and waste are deposited.
4. Alternative methods of transporting asbestos-containing debris will be considered by OWNER'S Representative but must not be used until accepted by OWNER'S Representative.

J. Final Visual and Final PCM Clearance Testing

1. Once the work is complete and the area is free of all identified asbestos, asbestos contaminated materials, waste bags, equipment, and materials the OWNER'S Representative will perform a final visual inspection to ensure all visible asbestos has been removed.
2. The OWNER'S Representative will test for final air clearance when work area is observed by OWNER'S Representative to be visually decontaminated.
3. At least one sample per work area will be collected and analyzed. Each work area will be considered clean if samples indicate airborne fiber concentrations are 0.01 fibers per cubic centimeter (f/cc) or less of if the airborne fiber concentrations are below the ambient prevalent level.
4. The Contractor shall re-clean, and continue to clean at the Contractor's expense, areas which do not comply with the specified final clearance level.
5. The Contractor shall bear the cost of follow-up testing necessitated by failure of the air tests to meet the specified final clearance level.
6. Upon notification from the OWNER'S Representative that final clearance samples indicate acceptable airborne levels, the Contractor shall dismantle work area containment and thoroughly HEPA-vacuum and wet clean immediate areas.
7. The Contractor shall dispose of debris from removal operation, used cleaning materials, unsalvageable materials used for sturdy barriers, and other remaining materials. The Contractor shall consider the materials to be contaminated, and dispose of accordingly.

3.11 LEAD REMOVAL SUMMARY OF WORK

A. Work Included:

1. The lead containing materials to be removed and disposed of are detailed in the report entitled, "*Lead-Based Paint Survey, Goleta Train Depot, 27 South La Patera Lane, Goleta, California, 93117*" by All Phase Environmental, Inc. dated November 30, 2023.
2. Contractor shall verify actual quantities present and shall not rely on the quantities described in the report.
3. Contractor shall establish work area containment(s) and remove the lead containing components utilizing the required engineering controls and personal protective equipment (PPE). The Contractor shall decontaminate the work area containments and dispose of the lead waste.
4. The Contractor shall supply all labor, materials, equipment, services, insurance and incidentals, which are necessary or required to perform the Work. The Work shall be

performed in accordance with applicable governmental regulations and these Specifications.

5. The Contractor will be responsible for all medical monitoring before and after abatement in accordance with applicable laws and regulations including without limitation OSHA 29 CFR 1910.1025, 1926.62 and Title 8, CCR 1532.1.
6. The Contractor will be responsible for all environmental and health and safety monitoring including without limitation conducting personal breathing zone monitoring and the posting of results.
7. The Contractor will be responsible for conducting all lead waste characterization tests to determine the proper disposal of lead waste generated by lead related paint/component removal or paint stabilization activities. Testing conducted by the Contractor, the OWNER'S Representative will observe all sample collection and shall be provided copies of the sample analysis prior to disposal of the Lead waste. This may include but is not limited to Total Threshold Limit Concentration (TTLC), Soluble Threshold Limit Concentration (STLC) and Toxicity Characteristic Leaching Procedure (TCLP) (when applicable) testing.
8. The Contractor will be responsible for the removal, as specified, and proper packaging, labeling, storage, and transportation and disposal of all Lead-containing/lead based paint and lead materials removed from surfaces as well as all removed components in the affected area(s).
9. The Contractor is responsible for performing abatement work in the Phases established by the OWNER'S Representative.

B. Exposure Monitoring

1. Sample of breathing zone exposure as if no respirator were worn.
2. Sample for at least (7) hours of the 8-hour work shift.
3. Sample the most exposed employee for each job classification in each different work area.
4. Full shift samples must be representative of the employees' regular daily exposure to Lead.
5. The employer must determine by air sampling if employees are exposed to lead at or above the Action Level or above the Permissible Exposure Limit.
6. A final report of all records shall be submitted to the OWNER'S Representative.
7. Frequency: If initial monitoring results show that occupational exposure of workers is below the Action Level, then only periodic monitoring is required.

C. Housekeeping

1. Maintain the surfaces as free of Lead as practical.
2. Air cleaning with air hoses or blowers on surfaces is prohibited.
3. Shoveling, or gross removal may only be done in enclosed, ventilated areas and where employees are properly protected.
4. Where vacuuming is used, the vacuum must be fitted with a HEPA filter.
5. Hygiene Facility: The employer shall provide clean, adequate hygiene facilities to comply with 29 CFR 1926.62 and CCR Title 8, 1532.1. Washing facilities are required. Employees need to wash their hands and face before eating, drinking, chewing, or smoking.
6. Medical Surveillance: The employer shall make available initial medical surveillance to employees occupationally exposed on any day to lead at or above the action level. The employer shall also initiate a program of medical surveillance for all employees who are or may be exposed at or above the action level for more than 30 days in any consecutive 12 months. The medical surveillance shall be made by a licensed physician using the protocol defined in 29 CFR 1926.62 and CCR Title 8, 1532.1.
7. The safety of the Contractor's employee used under this contract specification and any visitors on the job site are the sole responsibility of the Contractor.
8. Maintain the surfaces as free of Lead as practical.

D. PERMITS AND NOTIFICATIONS. Secure all necessary permits in conjunction with the Lead related work and provide timely notification of such actions as may be required by Federal, State or Local authorities. Except, as negotiated, the Contractor shall procure and pay for all permits and inspections, except those performed by the OWNER or OWNER'S Representative. The Contractor will be responsible for the determination of required notifications and postings to the California Department of Public Health (Title 17, Div 1, Ch 8) and/or Cal-OSHA, for the lead work to be conducted.

E. Work Plan, Schedule, and Submittals:

1. The Contractor shall prepare a detailed plan of the work procedures to be used, the method(s) of area isolation and fiber control, locations of decontamination units, and the storage of wastes. This plan shall also include a schedule of on-site activities indicating when lead removal will be conducted to include the start and completion dates. The schedule must state when each phase of work is anticipated to begin and end. The Contractor shall notify the OWNER'S Representative a minimum of 72 hours prior to changing the schedule.
2. Work shall be conducted in one 8 hour shift Monday through Friday between 6:00 am to 6:00 pm unless specifically authorized by the OWNER.

3. Testing Laboratory: Submit the name, address and telephone number of the testing laboratory selected for any necessary monitoring of airborne concentrations of Lead as well as the lead waste characterization testing. The analytical laboratory shall be accredited by AIHA, ELLAP, or NLLAP and be a current participant in the AIHA, NIOSH, EPA Environmental Lead Proficiency Analytical Testing Program (ELPAT).
4. The results of air monitoring or blood Lead analyses shall be submitted to the OWNER'S Representative for review within 24 hours after the Contractor receives them.
5. Submit copies of any required permits as they pertain to the identified Lead related work as applies, and proof that all arrangements have been made for the transportation and disposal of the Lead bearing materials and refuse to a dumpsite approved by the EPA or local authorities.
6. Close Out Documentation: within 10 days of project completion Contractor must provide all documentation generated during the project. Documentation shall include but is not limited to: supervisors daily logs, signed daily personnel logs, visitor entry/exit logs, employee entry/exit logs for regulated areas, manometer print reports or logs (as applicable), filter change logs for all air filtration units, water, and respirators, air monitoring sample results for personnel, work areas, air monitoring sample results for air filtration (when required), safety meeting attendance and any other contractor generated documentation.

3.12 LEAD REMOVAL PRODUCTS

- A. Respirators: Select respirators from those currently approved by the National Institute for Occupational Safety & Health (NIOSH) as defined in the NIOSH Certified Equipment List (most current). Provide respirators of the type listed in the Tables of 29 CFR 1910.134 and CCR Title 8, 5144 for the airborne concentrations of Lead encountered for handling, removal, decontamination, packaging or disposal. If the lead related work to be conducted does not fall into one of the OSHA "Trigger Tasks," the Contractor must initially measure the airborne concentrations and select the appropriate respirator. Historical data may be relied upon for proper respirator selection if the data conforms with the OSHA, Cal-OSHA requirements including any exceptions.
- B. Plastic sheet used for Lead abatement shall be used in sufficient size and length to reduce the number of joints. Typically accepted is 4 mil for walls and 6 mil for floors.
- C. Any plastic bags used for containment of Lead bearing material refuse, contaminated clothing or tools, or other materials used in the work area shall be polyethylene and a minimum of 6 mil in thickness. The bags must be labeled with a proper warning/generator label, sealed and placed into a secure holding vessel.
- D. Protective Clothing: The Contractor must provide workers who may be exposed to Lead dust, or airborne concentrations above the OSHA PEL, protective clothing and work

clothing, such as coveralls, or similar full body clothing, head covers, gloves, hats, shoe covers, and face shield or goggles, where required.

- E. The Contractor shall post the following warning signs in each work area where the PEL could reasonably be exceeded:

DANGER

LEAD WORK AREA

MAY DAMAGE FERTILITY OR THE UNBORN CHILD

CAUSES DAMAGE TO THE CENTRAL NERVOUS SYSTEM

DO NOT EAT, DRINK OR SMOKE IN THIS AREA

3.13 LEAD REMOVAL WORK PROCEDURES

- A. All Lead related work must be performed in accordance with all applicable Federal, State and local regulations. At a minimum, the following procedures that are known to control the release and spreading of Lead dust must be utilized:
1. Wet removal procedures.
 2. Proper housekeeping (continual cleaning of work area) including the use of HEPA vacuums.
 3. Personal Protective Equipment must be worn where workers are in contact with Lead dust and use of hygiene facilities to prevent spread of contamination.
 4. Negative pressure enclosures to enclose Lead paint removal operations where mechanical sanding and abrasive blasting methods are used.
- B. Establish designated limits to the Lead work area by using Lead Warning tape and install hard barriers such as temporary fencing or temporary walls around the perimeter of the work area if necessary
- C. Properly demarcate with bilingual Lead Warning signs at all approaches to the regulated work areas to prevent unauthorized personnel entering the regulated work area(s).
- D. Install a Decontamination area.
- E. Continual misting (wet methods) shall be conducted prior to and during all demolition activities including segregation and loading of debris.
- F. Clean-up activities must be conducted by the Contractor on a continuous basis. If the OWNER'S Representative observes a large amount of accumulated lead debris the removal activities will cease, and clean-up activities will continue until approval by the OWNER'S Representative to resume the lead-related demolition activities.

- G. After thorough cleaning of the workspace, and satisfactory degree of cleanliness has been achieved, the Contractor shall notify the OWNER'S Representative that the workspace is ready for inspection. The OWNER'S Representative and the Contractor shall then visually inspect the workspace for the detection of any visible lead dust or lead contamination. If the visual inspection does not reveal any dust or other signs of contamination, final testing may commence.
- H. The Contractor will then perform lead dust wipe sampling on the floor and/or horizontal surfaces in accordance with the clearance sampling requirements specified in the HUD Guidelines at a minimum under the observation of the OWNER'S Representative. All fees associated with taking and analyzing clearance sampling shall be borne by the Contractor.
- I. Lead –Contaminated Dust is defined by the California Department of Public Health as dust that contains an amount of lead equal to, or in excess of, ten micrograms per square foot (10 $\mu\text{g}/\text{ft}^2$) for interior floor surfaces, 100 $\mu\text{g}/\text{ft}^2$ for interior horizontal surfaces, and 400 $\mu\text{g}/\text{ft}^2$ for exterior floor and exterior horizontal surfaces. The California Department of Public Health Standards for clearance shall apply.
- J. Areas exceeding the clearance level shall be re-cleaned, re-encapsulated and re-tested by the Contractor until acceptable clearance levels are obtained. All fees associated with taking and analyzing the re-testing clearance sampling shall be borne by the Contractor.
- K. Following the satisfactory completion of clearance lead dust wipe sampling testing, work area isolation barriers shall be removed by the abatement contractor and properly disposed of.

END OF SECTION – 02 26 01

SECTION 02 41 16

DEMOLITION

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes: Furnishing labor, materials and equipment necessary for demolition, dismantling, cutting and alterations as indicated, specified, or required for completion of the Work. Includes items such as the following:

1. Protection of existing improvements to remain.
2. Cleaning existing improvements to remain.
3. Disconnecting and capping utilities.
4. Removing debris, waste materials, and equipment.
5. Removal of items for performance of the Work.
6. Salvageable items to be retained by the Owner.

B. Related Requirements:

1. Division 01 - General Requirements.
2. Section 01 11 00 - Summary of Work.
3. Section 01 50 00 - Construction Facilities and Temporary Controls.
4. Section 01 73 29 - Cutting and Patching.
5. Section 01 74 19 - Construction and Demolition Waste Management.
6. Section 02 26 01 - Removal and Disposal of Hazardous Substances.
7. Division 22 — Plumbing.
8. Division 23 — HVAC.
9. Division 26 — Electrical.

1.02 SUBMITTALS

A. Shop Drawings: Submit Shop Drawings indicating the extent of items and systems to be removed. Indicate items to be salvaged or items to be protected during demolition. Indicate locations of utility terminations and the extent of abandoned lines to be removed. Include details indicating methods and location of utility terminations.

1.03 QUALITY ASSURANCE

- A. Perform the Work of this section by workers skilled in the demolition of buildings and structures. Perform the Work of this section under direct superintendence at all times.
- B. Prior to commencement of Work, schedule a walkthrough with the OAR, to confirm Owner property items have been removed from scheduled Work areas. Identify and mark remaining property items and schedule their removal.
- C. Coordinate demolition for the correct sequence, limits, and methods. Schedule demolition Work to create least possible inconvenience to the public and facility operations.
- D. Related Standard: ANSI/ASSE A10.6.

1.04 PROJECT CONDITIONS

- A. Drawings may not indicate in detail all demolition Work to be performed. Examine existing conditions to determine the full extent of required demolition.
- B. Repair damage to existing improvements or damage due to excessive demolition.
- C. Provide all measures to avoid excessive damage from inadequate or improper means and methods, improper shoring, bracing or support.
- D. If conditions are encountered that varies from those indicated, promptly notify the Architect for clarification before proceeding.

PART 2 - PRODUCTS

2.01 HANDLING OF MATERIALS

- A. Items scheduled for salvage by the Owner shall be delivered to a location designated by the OAR. Items shall be cleaned, packaged and labeled for storage.
- B. Items scheduled for reuse shall be stored on the Project site and protected from damage, theft and other deleterious conditions.

PART 3 - EXECUTION

3.01 GENERAL

- A. Protection:
 - 1. Do not commence demolition until safety partitions, barricades, warning signs and other forms of protection are installed. Refer to Section 01 5000 - Construction Facilities and Temporary Controls.

2. Provide safeguards, including warning signs, lights and barricades, for protection of workers, occupants, and the public.
 3. Do not commence demolition of the structure until asbestos containing materials, lead-based paint materials, hazardous materials, and universal wastes have been removed. Refer to Section 02 26 01 - Removal and Disposal of Hazardous Substances.
- B. If safety of existing construction appears to be endangered, take immediate measures to correct such conditions; cease operations and immediately notify the OAR.

3.02 DEMOLITION

- A. Do not throw or drop materials. Furnish ramps or chutes as required by the Work.
- B. Remove existing construction only to extent necessary for proper installation of Work and interfacing with existing construction. Cut back finished surfaces to straight, plumb or level lines as required for a smooth transition.
- C. Where openings are cut oversize or in improper locations, replace or repair to required condition.

3.03 CUTTING EXISTING CONCRETE

- A. Cutting of existing concrete shall be performed by skilled workers familiar with the requirements and space necessary for placing concrete. Perform concrete cutting with concrete cutting wheels and hand chisels. Do not damage concrete intended to remain.
- B. Extent of cutting of structural concrete shall be as indicated on Drawings. Cutting of non-structural concrete shall be as indicated on Drawings or as reviewed by the Architect or structural engineer. Replace concrete demolished in excess of amounts indicated.
- C. Prior to cutting or coring concrete, determine locations of hidden utilities or other existing improvements and provide necessary measures to protect them from damage.

3.04 REMOVAL OF EXISTING PLUMBING AND ELECTRICAL EQUIPMENT AND SERVICES

- A. Remove existing plumbing and electrical equipment fixtures and services not indicated for reuse and not necessary for completion of the Work. Remove abandoned lines and cap unused portions of existing lines.

3.05 REMOVAL OF OTHER MATERIALS

- A. Masonry: Cut back to joint lines and remove mortar without damaging units to remain. Allow space for repairs to backing where applicable.
- B. Woodwork: Cut or remove to a joint or panel line.

- C. Roofing: Remove as required, including accessory components such as insulation and flashings. At penetrations through existing roofing, trim cut edges back to sound roofing with openings restricted to the minimum size necessary to receive Work.
- D. Sheet Metal: Remove back to joint, lap, or connection. Secure loose and unfastened ends or edges and provide a watertight condition. Re-seal as required.
- E. Glass: Remove broken or damaged glass and clean rebates and stops of glazing channels.
- F. Modular materials such as acoustical ceiling panels, resilient tile, or ceramic tile: Remove to a natural joint without leaving damaged or defective Work where joining new Work. After flooring removal, clean substrates to remove setting materials and adhesives.
- G. Gypsum Board: Remove to a panel joint line on a stud or support line.
- H. Plaster: Saw cut plaster on straight lines, leaving a minimum 2-inch width of firmly attached metal lath for installing new lath and plaster.
- I. Remove existing improvements not specifically indicated or required but necessary to perform Work. Cut to clean lines, allowing for installation of Work.

3.06 PATCHING

- A. Patch or repair materials to remain when damaged by the performance of the Work of this section. Finish material and appearance of patch and/or repair Work shall match existing.

3.07 CLEANING

- A. Clean existing materials to remain with appropriate tools and equipment.
- B. Protect existing improvements during cleaning operations.
- C. Debris shall be dampened by fog water spray prior to transporting by truck.
- D. Debris pick-up area shall be kept broom-clean and shall be washed daily with clean water.
- E. Remove waste and debris, other than items to be salvaged. Turn over salvaged items to Owner, or store and protect for reuse where required. Continuously clean up and remove items as demolition Work progresses.
- F. Remove rubbish, debris, and waste materials and legally dispose of off the Project site.

END OF SECTION – 02 41 16

SECTION 02 82 00

ASBESTOS CEMENT PIPE REMOVAL & DISPOSAL

PART 1 – GENERAL

1.01 REQUIREMENTS

- A. The Contractor may encounter asbestos cement pipe (ACP) during the prosecution of this work. The Contractor shall remove and dispose of ACP in accordance with State of California requirements, and the Contract Documents. Removal of ACP shall be performed by a Contractor licensed and certified by Cal/OSHA for such removal.
- B. Where Asbestos Cement Transmission and Distribution Pipe are encountered, the Contractor shall follow the AWWA guidelines for handling, removing and disposing of ACP as stated in the applicable sections of AWWA Standards C400, C401, C402, and C403 covering Asbestos Cement Transmission and Distribution Pipe. Where conflict occurs between the two guidelines, the Contractor shall abide by the more stringent of the two.
- C. Section 02 26 01 - Removal and Disposal of Hazardous Substances provides requirements for training, certifications, notifications, and coordination with the OWNER that apply in the event ACP is encountered.

1.02 RELATED WORK SPECIFIED ELSEWHERE

- A. Section 31 23 16 – Trenching, Backfill and Compaction.

1.03 SUBMITTALS

- A. **Asbestos Cement Pipe Removal and Disposal Plan:** The Contractor shall complete and submit to the Goleta Water District Inspector an “Asbestos Cement Pipe Removal and Disposal Plan.” The Contractor shall clearly describe his proposed methods for the removal and disposal of ACP that ensures no exposure to airborne asbestos by the Contractor’s personnel. The written plan shall be submitted to the District Inspector for review and approval at least one week in advance of the proposed date of removal.
- B. Provide proof of licensing and certification for performing asbestos removal and disposal work.
- C. Provide chain of custody for removal and disposal of asbestos material removed from this site.

- D. If soil was impacted by asbestos and removed, submit a Non-Compliance Reporting Form, ENF-88, to the Santa Barbara County Air Pollution Control District.

PART 2 – PRODUCTS

2.01 EQUIPMENT

- A. Snap cutting tools shall be used for the removal of asbestos cement pipe whenever the removal of intact pipe sections is not possible. Power “Cut-Off” saws, hand-saws, and other devices and methods that result in the release of asbestos fibers into the air shall not be used for the removal of ACP.

2.02 ENCAPSULANT

- A. If during the removal of ACP broken edges occur, the broken edges shall be encapsulated with Certane 1000 Post Removal Encapsulant, or approved equal.

PART 3 – EXECUTION

3.01 GENERAL

- A. The Contractor shall perform all cutting and handling of asbestos cement pipe in accordance with State of California requirements. The Contractor shall provide sufficient supervision and perform monitoring to assure conformance with State requirements. Under no circumstances shall the Contractor utilize methods of removal that result in the release of asbestos fibers into the air.

3.02 REMOVAL

- A. The Contractor shall, whenever possible, accomplish the removal of ACP by removing intact pipe sections. Where connections are to be made to existing ACP waterlines, the ACP shall be removed in sections back to the nearest ACP coupling. The Contractor shall pothole and expose the pipe and ACP couplings prior to developing his proposed “Asbestos Cement Pipe Removal and Disposal Plan.”
- B. Where feasible, the Contractor shall take measures such as wrapping polyethylene sheeting around the ACP and placing sheeting below the pipe to prevent the inadvertent contamination of soil and other surfaces below the pipe when performing the removal.
- C. Snap cutting tools shall be used for the removal of asbestos cement pipes whenever the removal of intact pipe sections is not possible. The pipe shall be wetted prior to the snapping operation being performed. Use of a hammer and chisel to gradually split an

ACP coupling lengthwise may only be performed if the “Asbestos Cement Pipe Removal and Disposal Plan” developed by the Contractor incorporates measures to prevent the release of asbestos fibers into the air, and is approved by the District. Power “Cut-Off” saws, hand-saws, and other devices and methods that result in the release of asbestos fibers into the air shall not be used for the removal of ACP.

- D. The Contractor shall continuously wet the ACP around the snap cutting tool during the removal operation. All personnel handling the ACP shall wear properly fitted respirators during the removal and bagging operation, and shall be trained in the use of the respirator equipment. All pedestrian traffic shall be rerouted to maintain 30 feet clear of the ACP work area.
- E. All removed sections or pieces of ACP shall be bagged and prepared for disposal immediately after removal as described below. If during the removal of ACP broken edges occur, the broken edges shall be encapsulated with Certane 1000 Post Removal Encapsulant, prior to bagging, in accordance with the manufacturers’ recommendations.
- F. All asbestos material remaining in place shall be thoroughly covered immediately after all material to be removed has been completed. Where remaining asbestos material was broken during the removal process, the broken edges shall be encapsulated with Certane 1000 Post Removal Encapsulant, prior to back filling. Remaining asbestos material shall have a minimum one-foot cover.

3.03 DISPOSAL

- A. The Contractor shall transport all sections and pieces of ACP in accordance with State requirements and shall be delivered to the District yard for disposal. All sections or pieces of ACP shall be wetted and double wrapped or bagged with polyethylene wrap immediately after removal. The minimum thickness of polyethylene wrap shall be 6 mils. The outer wrap shall be securely held in place with tape in a manner to prevent the release of airborne asbestos fibers.
- B. At no time shall asbestos material be stored on-site. Once asbestos material has been bagged it shall be placed in the disposal transport unit and removed from the site at end of each day. The disposal transport unit shall be made secure at all times while on the site.

END OF SECTION – 02 82 00

SECTION 03 01 30

RESTORATION AND CLEANING OF CONCRETE

PART 1 - GENERAL

1.01 SUMMARY

- A. Section includes epoxy resin adhesive for:
 - 1. Epoxy injection of cracks.
 - 2. Grouting of cracks by gravity flow.
 - 3. Repair of spalling concrete.
- B. Related Requirements
 - 1. Division 01 - General Requirements.
 - 2. Division 07: Thermal and Moisture Protection.

1.02 SUBMITTALS

- A. Shop Drawings: Submit Shop Drawings indicating areas to receive restoration.
- B. Product Data:
 - 1. Submit manufacturer's product literature and installation procedures.
 - 2. Submit laboratory test reports indicating compliance with the Specifications.

1.03 QUALITY ASSURANCE

- A. Continuous inspection of epoxy repair procedures shall be performed by the Project Inspector in accordance with CBC.
- B. Inspection shall be performed by a representative of a testing laboratory selected by the Owner. The Owner will pay for inspection costs. Notify the laboratory 24 hours in advance of time concrete is to be mixed and notify the laboratory within 24 hours of postponement or cancellation of mixing.
- C. Installer of epoxy resin adhesive and concrete repair shall be certified by the manufacturer.
- D. Manufacturer: Regularly engaged in manufacture of epoxy resin products for at least 10 years. Provide references of at least five projects for which epoxy resin adhesive treatment was installed. ‘

1.04 PROJECT CONDITIONS

- A. Materials shall not be installed during existing or forecasted freezing or inclement weather.
- B. Protect adjacent surfaces from damage by equipment, tools, or materials.

1.05 DELIVERY, STORAGE, AND HANDLING

- A. Deliver materials to the Project site in manufacturer's unopened containers bearing manufacturer's name and product identification.
- B. Store and condition materials as recommended by product manufacturer.

PART 2 - PRODUCTS

2.01 MANUFACTURER

- A. Provide products by one of the following manufacturers:
 - 1. Sika Corporation.
 - 2. Fosroc Inc.
 - 3. The Euclid Chemical Co.
 - 4. Equal.

2.02 PERFORMANCE COMPLIANCE

- A. Core drill at least one test hole for every 100 feet of cracks, in accordance with CBC requirements. Refer to related Section 01 4523 - Testing and Inspection. Patch holes after core drilling samples.

2.03 MATERIALS

- A. Epoxy Resin Adhesive for Pressure Injection and Gravity Flow Grouting of Cracks:
 - 1. Modified epoxy resin containing suitable viscosity control agents and accelerators.
 - 2. Material shall not contain asbestos.
 - 3. Material shall be approved by the United States Department of Agriculture.
- B. Epoxy Resin Adhesives:
 - 1. Sikadur 35, Hi-Mod LV, by Sika Corporation.
 - 2. Nitofil LV, by Fosroc Inc.
 - 3. Euco #452 LV System, Euclid Chemical Company.

4. E-396 Series, by Micro Capsule Engineering.
 5. Equal.
- C. Materials for Repairing Spalling Concrete:
1. Surface Seal Paste: Sika Top/110 Armatec; Nitoprime Zincrich; Euco Zinc Prime, or equal.
 2. Patching Material: Sika Top 123 PLUS; Renderoc HB; Euco Verticoat, or equal.
- D. Materials for Patching Test Core Holes: One part Portland cement and three parts sand.

PART 3 - EXECUTION

3.01 PREPARATION

- A. Surfaces adjacent to cracks and spalled concrete shall be cleaned with all dust, grease, foreign particles and disintegrated materials removed by sandblasting, high-pressure water blasting, grinding, chipping or abrasive wheel. Cracks shall be free of standing water and/or frost.
- B. Installation of gravity flow grouting shall be performed by removing a V-notch portion of the crack to a maximum width of 1/4 inch and for the required length. Remove dust and loose debris. Where the underside of the concrete slab is accessible, seal visible cracks with epoxy resin adhesive paste or Portland cement based quick-setting compound to retain installed adhesive until cured.
- C. Remove broken and spalled concrete down to sound material and to a minimum depth of one inch around steel reinforcing bars. Clean steel bars by sand blasting.

3.02 APPLICATION OF EPOXY

- A. Manual application of epoxy resin shall be performed by mixing only that quantity of material that can be installed in 20 to 30 minutes at 73 degrees F. Automated application of high pressure injection shall be performed with a portable unit, equipped with positive displacement type pumps, air-powered or electric, with interlock for positive ratio control of exact material proportioning at the nozzle. Pumps shall provide in-line mixing and metering system and contain drain-back plugs.
- B. Placement Procedure:
 1. High Pressure Injection:
 - a. Provide porting devices as required by manufacturer, do not exceed maximum spacing. Spacing shall not exceed thickness of substrate and shall be calibrated to provide travel of material for grouting between ports. Fill cracks to maximum.

- b. On structures where both sides are accessible, provide porting devices on both sides at staggered elevations. Install mixed epoxy resin sealing adhesive over cracks and around each porting device, to provide an adequate adhesive seal during injection grouting.
 - c. Where required, install sealing adhesive to provide minimal defacing or discoloration of substrate.
 - d. Inject epoxy from bottom-most port. Install until epoxy appears out of next higher port. Plug lower port and start injecting into the port above. Repeat procedure until crack is grouted.
- 2. Low Pressure Injection: Material installation shall be performed by a manufacturer certified applicator in accordance with the manufacturer's written recommendations.
 - 3. Gravity Flow Grouting: Furnish mixed material into V-notches and install until cracks are completely filled.
- C. If penetration of a crack is not feasible, notify the Architect before discontinuing injection or grouting procedures. If modification of procedure is required to fill cracks, submit proposed modification to the Architect for review before proceeding.
 - D. Install materials for repair of spalling concrete in accordance with the manufacturer's written recommendations.

3.03 FILLING TEST HOLES

- A. Fill holes with mixture of sand, Portland cement, and water. Finish to match existing adjacent surface.

3.04 PROTECTION

- A. Protect the Work of this section until Substantial Completion.

3.05 CLEANING

- A. Remove rubbish, debris, and waste materials and legally dispose of off the Project site.

END OF SECTION – 03 01 30

SECTION 03 10 00

CONCRETE FORMING AND ACCESSORIES

PART 1 - GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Formwork for cast-in-place concrete as indicated.
 - 2. Installation of items to be embedded in concrete, such as anchor bolts, inserts, embeds, and sleeves.
- B. Related Requirements:
 - 1. Division 01 - General Requirements.
 - 2. Section 03 20 00: Concrete Reinforcing.
 - 3. Section 03 30 00: Cast-In-Place Concrete.

1.02 REFERENCES

- A. American Concrete Institute (ACI) Publication:
 - 1. ACI 318 – Building Code Requirements for Structural Concrete, Chapter 6, Formwork, Embedded Pipes, and Construction Joints.
 - 2. ACI 347 – Guide to Formwork for Concrete.
- B. American Plywood Association (APA):
 - 1. Form No. V345 - Concrete Forming Design/Construction Guide.
- C. National Institute of Standards and Technology (NIST):
 - 1. NIST Voluntary Product Standard PS 1.

1.03 SUBMITTALS

- A. Submit detailed structural calculations and drawings approved and signed by a California registered Civil Engineer where the height of the falsework or vertical shoring, as measured from the top of the sills to the soffit of the superstructure exceeds 14 feet, or where individual horizontal span lengths exceed 16 feet, or where provision for vehicular traffic through falsework or shoring occurs. For all other falsework and shoring submit layout signed by California registered Civil Engineer, manufacturer's authorized representative or a licensed contractor experienced in the usage and erection of falsework and vertical shoring. A copy of the plans and calculation shall be available at the jobsite at all times.
- B. Shop Drawings: Submit Shop Drawings indicating locations of forms, construction and expansion joints, embedded items, and accessories.
- C. Product Data: Submit manufacturer's Product Data for form materials and accessories.

- D. LEED Submittals: Complete the LEED Material Buyout Form (MBoF) with all materials provided to the project. A complete submittal includes providing all material costs in the MBoF and all of the supporting documentation for the following credits:
1. MRc2 - Environmental Product Declarations (EPD): Provide Industry-Wide or Product-Specific EPD.
 2. MRc3 - Sourcing of Raw Materials - Recycled Content: Provide product data for pre- and post- consumer recycled content.
 3. MRc3 - Sourcing of Raw Materials – Forestry Stewardship Council (FSC) Certified Wood: For all wood products designated in this specification as “FSC certified,” provide vendor invoices with the vendor’s Chain-of-Custody (COC) number and identify each FSC certified product on a line-item basis. If FSC wood products are modified off-site by an architectural woodworker or millworker, the woodworker must have an FSC COC number.
 4. MRc3 - Local/ Regional Material: Provide product data confirming product manufactured and extracted within 100 miles of the project site. Only applicable for products that also contain recycled content or FSC certified wood.
 5. MRc4 - Material Ingredients: Provide manufacturers Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, or Cradle to Cradle Health Product Certificate.
 6. IEQc2 - Low-Emitting Materials – Composite Woods: For composite woods, provide CARB Executive Order for the specific manufacturing location of the composite wood product confirming No Added Formaldehyde (NAF) resins or Ultra Low Emitting Formaldehyde (ULEF) resins. In addition, provide a statement from the manufacturer that reads "The XX product is a HWPW-CC/-VC/PB/MDF manufactured in our XX location which is authorized under CARB EO #XX."
 7. IEQc2 - Low-Emitting Materials – Interior Wet Applied Products: For paints, coatings, adhesives and sealants applied on site or used for laminating off-site, include product data indicating the VOC content (g/L) and testing certificates or third-party certification demonstrating compliance with California Department of Public Health (CDPH) v1.2-2017 emissions testing.

1.04 REGULATORY REQUIREMENTS

- A. California Building Code (CBC), Chapter 19A.
- B. California Code of Regulations, Title 8, Division 1, Chapter 4, Subchapter 4, Construction Safety Orders, Article 6, Excavations, Sections 1713 and 1717.

1.05 DELIVERY, STORAGE AND HANDLING

- A. Storage shall prevent damage and permit access to materials for inspection and identification.

PART 2 - PRODUCTS

2.01 GENERAL

- A. Form materials may be reused during progress of the Work provided they are completely cleaned and reconditioned, recoated for each use, capable of producing formwork of required quality, and are structurally sound.
- B. Form Lumber: WCLIB Construction Grade or Better, WWPA No. 1 or Better.
- C. Plywood: NIST Voluntary Product Standard PS 1, Group 1, Exterior Grade B-B Plyform or better, minimum 5-ply and 3/4 inch thick for exposed locations and at least 5/8 inch thick for unexposed locations, grade marked, not mill oiled. Furnished plywood with medium or high-density overlay is permitted.
- D. Coated Form Plywood: For exposed painted concrete, plastic overlaid plywood of grade specified above, factory coated with a form coating and release agent Nox-crete", or equal.
- E. Tube Forms: Sonoco "Seamless Sonotubes," Ceme-Tube, Quik-Tube, or equal, of the type leaving no marks in concrete, one-piece lengths for required heights.
- F. Joist Forms: Code recognized steel or molded plastic types as required.
- G. Special Forms: For exposed integrally-colored concrete, plywood as above with high density overlay, plywood with integral structural hardboard facing or fibrous glass reinforced plastic facing, providing specified finish.
- H. For Exposed Concrete Finish:
 - 1. Plywood: New, waterproof, synthetic resin bonded, exterior type Douglas fir or Southern pine plywood manufactured especially for concrete formwork and conforming to NIST Voluntary Product Standard PS 1, Grade B-B grade, Class I.
 - 2. Glass-Fiber-Fabric Reinforced Plastic Forms: Matched, tight fitting, stiffened to support weight of concrete without deflection detrimental to structural tolerances and appearance of finished concrete surfaces.
 - 3. Steel: Minimum 16 gage sheet, well matched, tight fitting, stiffened to support weight of concrete, without deflection detrimental to tolerances and appearances of finished concrete surfaces.
 - 4. Plywood: "Finland Form," "Combi Form" by North American Plywood Corporation, "Plyform" by Roy O. Martin, "ProForm" by Pacific Wood Laminates, or equal. The material shall be furnished with hard smooth birch face veneers with phenolic resin thermally fused onto panel sides. Edges shall be factory sealed.
- I. Form Ties: Prefabricated rod, flat band, wire, internally threaded disconnecting type, not leaving metal within 1 1/2-inch of concrete surface.
- J. Form Coating: Non-staining clear coating free from oil, silicone, wax, not grain-raising, "Formshield" by A.C. Horn, Inc., "Release" by Edoco/Dayton Superior, "Cast-Off" by Sonneborn/BASF Building Systems or equal. Where form liners are furnished, provide form coatings recommended by form liner manufacturer.

- K. Form Liner: Rigid or resilient type by L.M. Scofield, Symons, Greenstreak, or equal.
- L. Void Forms: Manufactured by SureVoid Products, Inc., Sonotube, Void Form International, or equal. Forms shall be "WallVoid" for temporary support of concrete walls and grade beams spanning between supports, and "SlabVoid" for creating gaps between concrete slabs or steps and underlying soils. Void forms shall be fabricated of corrugated paper with moisture resistant exterior, and shall be capable of withstanding working load of 1,500 psf. Provide accessories as required.

PART 3 - EXECUTION

3.01 GENERAL

- A. Forms shall be constructed so as to shape final concrete structure conforming to shape, lines and dimensions of members required by Drawings and Specifications, and shall be sufficiently tight to prevent leakage of mortar. They shall be properly braced or tied together to maintain position and shape. Forms and their supports shall be designed so that previously placed structures will not be damaged.
- B. Use form coating at all surfaces in contact with concrete.

3.02 TOLERANCES

- A. Permitted abrupt or gradual irregularities in formed surfaces as measured within a 5 feet length with a straightedge shall per ACI 347, Table 3.1:

Class of Surface			
A	B	C	D
1/8 inch	1/4 inch	1/2 inch	1 inch

1. Class A: Use for concrete surfaces prominently exposed to public view.
2. Class B: Use for coarse-textured concrete-formed surfaces intended to receive plaster, stucco or wainscoting.
3. Class C: Use as a general standard for permanently exposed surfaces where other finishes are not specified.
4. Class D: Use for surfaces where roughness is not objectionable and will be permanently concealed.

3.03 ERECTION

- A. Plywood shall be installed with horizontal joints level, vertical joints plumb and with joints tight. Back joints by studs or solid blocking, and fill where necessary for smoothness. Reused plywood shall be thoroughly cleaned, damaged edges or surfaces repaired and both sides and edges oiled with colorless form oil. Nail plywood along edges, and to intermediate supports, with common wire nails spaced as necessary to maintain alignment and prevent warping.

- B. Openings for Cleaning: Provide temporary openings at points in formwork to facilitate cleaning and inspection. At base of walls and wide piers, bottom form board on one face for entire length shall be omitted until form has been cleaned and inspected.
- C. Chamfers: Provide 3/4 inch by 3/4-inch chamfer strips for all exposed concrete corners and edges unless otherwise indicated.
- D. Reglets and Rebates: As specified in Section 03 30 00: Cast-In-Place Concrete.

3.04 REMOVAL OF FORMS

- A. Forms shall not be removed until concrete has sufficiently hydrated to maintain its integrity and not be damaged by form removal operations. Unless noted otherwise and/or permitted by the Architect, columns and wall forms shall not be removed in less than five days, floor slabs in less than seven days, beams and girders in less than 15 days, pan forms for joists may be removed after three days, but joist centering shall not be removed until after 15 days, and ramp, landing, steps and floor slabs shall not be removed in less than seven days. Shoring shall not be removed until member has acquired sufficient strength to support its weight, load upon it, and added load of construction.
- B. Compressive strength of in-place concrete shall be determined by testing field-cured specimens representative of concrete location or members, as specified in Section 03 30 00: Cast-In-Place Concrete.

3.05 PROTECTION

- A. Protect the Work of this section until Substantial Completion.

3.06 CLEAN UP

- A. Remove rubbish, debris and waste materials and legally dispose of off the Project site.

END OF SECTION

SECTION 03 20 00

CONCRETE REINFORCEMENT

PART 1 – GENERAL

1.01 DESCRIPTION

- A. This Section includes specifications for furnishing all labor, materials, tools and equipment for furnishing, detailing, fabricating and placing steel to support cast-in-place concrete.

1.02 RELATED SECTIONS

- A. DIVISION 01 – GENERAL REQUIREMENTS
- B. Section 03 10 00 – Concrete Forming and Accessories
- C. Section 32 30 00 – Cast-In-Place Concrete
- D. Section 04 22 00 – Concrete Unit masonry

1.03 REFERENCES

- A. Steel Reinforcement

1.04 SUBMITTALS

A. General

Submittals shall be made in accordance with “01 33 00 – Submittals” and shall include the following:

- 1. Shop Drawings:
Submit steel reinforcement Shop Drawings in accordance with ACI 315. Include assembly diagrams, bending charts and slab plans. Indicate lengths and location of splices, size and lengths of reinforcing steel.
- 2. Product Data:
Submit for review manufacturers' product data and installation instructions for proprietary manufactured materials and reinforcement accessories.
- 3. Certificates:
Contractor shall furnish mill affidavits or test reports of compliance or similar certification, certifying the grades and physical and chemical properties of the reinforcing steel and conformance with applicable ASTM Specifications, including ASTM A370, Method A9.
- 4. Test Reports: Submit manufacturer’s certified test reports for source quality control testing for material and mechanical properties.
 - Each bar size.
 - Each type of fiber reinforcement specified.
 - Each type of resin matrix specified.
- 5. Closeout Submittals: Record exact locations of reinforcing that vary from Shop Drawings.

- B. Contractor shall furnish a Certificate of Compliance for epoxy certifying compliance with requirements as set forth herein. In addition, a copy of the manufacturer's recommended installation procedure shall be provided to the Engineer at least 7 days prior to the start of work.

- C. LEED Submittals: Complete the LEED Material Buyout Form (MBoF) with all materials provided to the project. A complete submittal includes providing all material costs in the MBoF and all of the supporting documentation for the following credits:
1. MRc2 - Environmental Product Declarations (EPD): Provide Industry-Wide or Product-Specific EPD.
 2. MRc3 - Sourcing of Raw Materials - Recycled Content: Provide product data for pre- and post- consumer recycled content.
 3. MRc3 - Local/ Regional Material: Provide product data confirming product manufactured and extracted within 100 miles of the project site. Only applicable for products that also contain recycled content or FSC certified wood.
 4. MRc4 - Material Ingredients: Provide manufacturers Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, or Cradle to Cradle Health Product Certificate.
 5. IEQc2 - Low-Emitting Materials – Interior Wet Applied Products: For paints, coatings, adhesives and sealants applied on site or used for laminating off-site, include product data indicating the VOC content (g/L) and testing certificates or third-party certification demonstrating compliance with California Department of Public Health (CDPH) v1.2-2017 emissions testing

1.05 QUALITY ASSURANCE

- A. Comply with the following as a minimum requirement:
1. Concrete Reinforcing Steel Institute (CRSI) Manual of Standard Practice.
 2. American Welding Society (AWS).
 3. American Concrete Institute (ACI).
 4. CBC, Chapter 19A, Concrete.
- B. Tolerances
1. Fabrication shall comply with the applicable requirements of ACI 315.
 2. Adjustment:
Reinforcement and dowels may be moved as necessary to avoid interference with other conduits, or embedded items. Minimum spacing shall not be decreased, nor the required amount to be placed.
- C. Preplacement Meeting
1. Convene a preplacement meeting 2 weeks before the start of placing of FRP bars. Require attendance of parties directly affecting work of this section, including the Contractor, Engineer, concrete subcontractor, and FRP bar manufacturer's representative. Review placing of FRP bars and coordination with other work.

- D. Quality control for GFRP shall be carried out under the requirements of an ISO 9002 certified facility by testing GFRP bars before use, to ensure required performance. Test reports from testing conducted by an independent testing agency can be used when available. Perform following quality control tests in accordance with standard test methods. Testing shall include:
1. Guaranteed ultimate tensile strength, tensile modulus of elasticity, and ultimate strain.
 2. Bent bars tensile strength.
 3. Fatigue strength.
 4. Bond strength.
 5. Durability in alkaline environments.

1.06 DELIVERY, STORAGE AND HANDLING

- A. Deliver steel reinforcement to the job site, store, and cover in a manner that will ensure that no damage shall occur to it from moisture, dirt, grease, oil, or other cause that might impair bond with concrete.
- B. Deliver, store, and handle FRP bars in accordance with manufacturer's instructions to prevent damage.
- C. Storage:
1. Do not store FRP bars directly on ground. Place timber pallets under bars to keep them free from dirt and mud and to provide easy handling.
 2. Store FRP bars under covers to avoid direct sunlight and chemical substances if stored for extensive periods of time outdoors.

PART 2 – PRODUCTS

2.01 MATERIALS (STEEL)

- A. Reinforcement steel for cast-in-place reinforced concrete construction shall conform to the following requirements:
1. Bar reinforcement shall conform to the requirements of ASTM A 615 - Deformed and Plain Billet - Steel Bars, for Grade 60 reinforcement unless otherwise indicated.
 2. Welded wire fabric reinforcement shall conform to the requirements of ASTM A 1064 - Standard Specification for Carbon-Steel Wire and Welded Wire Reinforcement, Plain and Deformed, for Concrete, and the details indicated. Welded wire fabric with longitudinal wire of W4 size wire and smaller shall be in flat sheets or in rolls with a core diameter of not less than 10 inches. Welded wire fabric with longitudinal wires larger than W4 size shall be in flat sheets only.

3. Spiral reinforcement shall be cold-drawn steel wire conforming to the requirements of ASTM A 1064 - Standard Specification for Carbon-Steel Wire and Welded Wire Reinforcement, Plain and Deformed, for Concrete.

B. Accessories:

1. Accessories shall include all necessary chairs, slab bolsters, concrete blocks, tie wires, dips, supports, spacers, and other devices to position reinforcement during concrete placement. Bar supports shall meet the requirements of the CRSI Manual of Standard Practice including special requirements for supporting epoxy coated reinforcing bars. Wire bar supports shall be CRSI Class 1 for maximum protection with a 1/8-inch minimum thickness of plastic coating which extends at least 1/2-inch from the concrete surface. Plastic shall be gray in color.
2. Concrete blocks (dobies) used to support and position reinforcement steel shall have the same or higher compressive strength as required for the concrete in which they are located. Wire ties shall be embedded in concrete block bar supports.
3. Tie wire shall be No. 16 gauge or heavier, black or galvanized, soft or commercial grade steel. For galvanized reinforcement, provide zinc-coated wire.
4. Dowels shall be smooth round epoxy-coated steel conforming to the requirements of ASTM Designation: A 36M, and shall conform to the details shown on the Contractor's shop drawings and the provisions in Section 206-1, "Structural Steel, Rivets, Bolts, Pins, and Anchor Bolts," of the SSPWC, except galvanizing will not be required. Dowels shall be epoxy-coated and shall conform to the provisions in Section 52-2, "Epoxy-coated Reinforcement and Epoxy-coated Prefabricated Reinforcement," of the Standard Specifications, except that references made to ASTM Designation D 3963 shall be deemed to mean ASTM Designation A 934.

Dowels shall be to the length shown on the plans in ± 0.25 inch and shall be plain, smooth, round bars. Dowels shall be free from burrs or other deformations detrimental to free movement of the bars in the concrete.

5. Epoxy (Drill and Bond)

Epoxy for bonding dowels to Portland cement concrete shall be a two-component, epoxy-resin, conforming to the requirements of ASTM Designation: C 881, Type V, Grade 3 (Non-Sagging), Class A, B or C. The class used shall be dependent on the internal temperature of the hardened concrete at the time the epoxy is to be applied. Class A shall be used when the internal temperature is below 40°F, but not lower than recommended by the manufacturer. Class B shall be used when the internal temperature is from 40°F to 60°F. Class C shall be used when the internal temperature is above 60°F, but not higher than recommended by the manufacturer

6. Epoxy coating for reinforcing and accessories, where indicated, shall conform to ASTM A 775 - Epoxy - Coated Reinforcing Steel Bars

2.02 FABRICATION

- A. Fabrication of steel reinforcement and dowels shall be in accordance with the Plans and approved shop drawings. Where specific details are not indicated, comply with the applicable requirements ACI 318.
- B. Cutting and bending shall be performed at a central location, equipped and suitable for the purpose. Bars shall be accurately cut and bent as indicated on the shop drawings. Bars shall be bent cold. Heating of bars for bending or straightening will not be permitted. Bars shall not be bent or straightened in any manner that will injure the material.

2.02.1 BENDING

- A. Reinforcement bars shall only receive shop bending. Field bending is not allowed.

PART 3 – EXECUTION

3.01 REINFORCING STEEL BARS

- A. Reinforcing steel bars shall be placed in accordance with the approved shop drawings and with each section of the Technical Specifications where reinforcing steel bars are called for.
- B. Reinforcing steel shall be installed in place, and rigidly and securely tied or wired with tie wire at all splices and at crossing points and intersections in the positions indicated. Point ends of wire ties away from forms. All lateral and longitudinal reinforcing shall be placed in the lower half of the concrete slab unless otherwise indicated.
- C. Center-to-center distance between parallel bars shall be in accordance with the approved shop drawings. Where not indicated, the minimum clear spacing shall be two times the bar diameter but not less than 1-1/2 inches nor less than 1-1/3 times the maximum size aggregate.
- D. Longitudinal location of bar bends and ends may vary a maximum of plus or minus 3 inches from the indicated location provided that specified protective concrete cover at ends of members is not reduced by more than 1/2 inch.
- E. Lapped Splices shall be adequate to transfer stress by bond. Lap bars a minimum of 45 diameters. Wherever possible, splices of alternate bars shall be staggered a minimum clear offset of 4 feet between splices. Splices shall be tied with tie wire full length of lap.
- F. Welding of steel reinforcing bars shall not be allowed.

3.02 DOWELS

- A. Dowels shall be placed in accordance with the approved shop drawings and with each section of the Technical Specifications where dowels are called for.
- B. Dowels shall be placed by using mechanical insertion in existing adjacent concrete sections at spacing shown on Plans. Dowels shall be oriented at mid point of existing concrete section. Dowel alignment shall be plus or minus 0.25 inch per 12 inches of dowel length in both horizontal and vertical planes. Dowel core holes shall be filled with epoxy bonding agent. Core hole shall be filled fully to edge of concrete with no resulting voids.

3.03 CLEANING

- A. Steel reinforcement, at time of depositing concrete, shall be free of corrosion and coatings that may impair bond with concrete, such as form oil, mill scale, or loose deposits of rust and other corrosion.

3.04 FIELD QUALITY CONTROL

- A. The Contractor shall perform quality control inspections and tests including the following:
 - 1. Placement of reinforcement and dowels, including insertion depths, epoxy filling, spacing, alignment, splices, ties, and clearances.

END OF SECTION

SECTION 03 30 00

CAST-IN-PLACE CONCRETE

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Cast-in-place normal weight and lightweight concrete, placement and finishing.

B. Related Requirements:

1. Division 01 - General Requirements.
2. Section 03 10 00: Concrete Forming and Accessories.
3. Section 03 20 00: Concrete Reinforcing.
4. Section 07 26 00: Vapor Barriers.
5. Section 32 13 13: Portland Cement Concrete Paving.

1.03 SUBMITTALS

- A. Shop Drawings: Submit Shop Drawings indicating locations of cast-in-place concrete Work and accessory items such as vapor barriers. Include details and locations of reinforcing, embedded items, and interfacing with other Work.
- B. Mix Design Data: Submit concrete mix designs as specified herein and in Article 2.02.
 1. Submit name, address and telephone number of the concrete production facility which the contractor intends to engage to design the concrete mixes. Submit name and qualifications of the proposed concrete technologist.
 2. Mix Design: Submit a concrete mix design for each strength and type of concrete indicated in the drawings or specified. Include water/cement ratio, source, size and amount of coarse aggregate and admixtures. Predict minimum compressive strength, maximum slump and air content percentage. Clearly indicate locations where each mix design will be used.
 - a. Water/cement ration for concrete slabs on grade shall be 0.50 maximum.
 3. Test Reports: Submit copies of test reports showing that the proposed mixes produce concrete with the strengths and properties specified. Include tests for cement, aggregates and admixtures. Provide gradation analysis.
- C. Material Samples: Submit Samples illustrating concrete finishes and hardeners, minimum 12-inch by 12-inch.
- D. Certificates: Submit certification that each of the following conforms to the standards indicated:

1. Portland cement: ASTM C150.
 2. Normal weight concrete aggregates: ASTM C33.
 3. Lightweight concrete aggregates: ASTM C330.
 4. Aggregates: Submit evidence that the aggregate is not reactive in the presence of cement alkalis. In the absence of evidence, aggregate shall be tested by one of the methods in ASTM C33 Appendix XI, Methods for Evaluating Potential for Deleterious Expansion Due to Alkali Reactivity of an Aggregate. Aggregates deemed to be deleterious or potentially deleterious may be used with the addition of a material that has been shown to prevent harmful expansion in accordance with Appendix XI of ASTM C33, when approved by the building official, in accordance to CBC Section 1903A5A.
 5. Curing materials: ASTM C171.
- E. Admixtures: Submit product data for proposed concrete admixtures..

1.04 QUALITY ASSURANCE

A. Tolerances:

1. Concrete Tolerances: Comply with the requirements of ACI 117 as applicable. Coordinate with the requirements specified in Section 03 10 00, Concrete Forming.
 2. Tolerances for Slabs and Flatwork: Comply with the requirements specified under this section.
- B. Architectural Concrete: Where concrete is indicated as architectural concrete exposed to public view, such concrete shall be produced in accordance with applicable requirements of ACI 301.
- C. Monitoring of Formwork: Provide monitoring of forms and embedded items to detect movement, or forms and embedded items out-of-alignment, from pressure of concrete placement.
- D. Special Inspections and Tests shall be in accordance with CBC Chapter 17A, Reinforcement and Anchor testing per CBC Section 1910A.

1.05 DELIVERY, STORAGE AND HANDLING

- A. Store cement and aggregate materials so as to prevent their deterioration or intrusion by foreign matter. Deteriorated or contaminated materials shall not be furnished.

- B. Packaged materials shall bear the manufacturers and brand name label, and shall be stored in their original unbroken package in a weather tight place until ready for use in the work.

1.06 PROJECT CONDITIONS

- A. Cold Weather Requirements: Batching, mixing, delivering and placing of concrete in cold weather shall comply with the applicable requirements of ACI 306.1.
- B. Hot Weather Requirements: Batching, mixing, delivering and placing of concrete in hot weather shall comply with the applicable requirements of ACI 305R.
- C. Concrete temperature of freshly mixed concrete shall be determined per ASTM C1064.

PART 2 - PRODUCTS

2.01 MATERIALS

- A. Cement: ASTM C150. Portland Cement.
- B. Aggregates: Conform to the following standards:
 - 1. Normal weight concrete: ASTM C33.
 - 2. Lightweight concrete: ASTM C330, with fine aggregates per ASTM C33.
 - 3. Aggregate shall be tested for Potential Alkali Reactivity of Cement-Aggregate Combinations per ASTM C289.
 - 4. Nominal maximum size of coarse aggregate shall be no larger than:
 - a. $\frac{1}{5}$ the narrowest dimension between sides of forms, nor
 - b. $\frac{1}{3}$ the depth of slabs, nor
 - c. $\frac{3}{4}$ the clear spacing between individual reinforcing bars or wires, bundles of bars, individual tendons, or ducts.
 - d. CONTRACTOR may request the ARCHITECT waiver of the above limitations reported per ACI 318, provided that the workability and methods of consolidation are such that the concrete can be placed without honeycombs or voids.
- C. Water: Water for concrete mixes, curing and cleaning shall be potable and free from deleterious matter.

- D. Admixtures: Shall be shown capable of maintaining essentially the same composition and performance throughout the work as the product used in establishing concrete proportions in accordance with ACI 318, Section 3.6.
1. Admixtures containing chlorides or sulfides are not permitted.
 2. Air-entraining admixtures shall comply with ASTM C260. Air-entrained admixtures shall not be used for floor slabs to receive steel trowel finish.
 3. Admixtures for water reduction and setting time modification shall conform to ASTM C494.
 4. Admixtures for producing flowing concrete shall conform to ASTM C1017.
 5. Fly ash, pozzolan and ground granulated blast-furnace slag: Modify ACI 318 Sections 3.6.6 and 3.6.7 as follows:
 - a. Fly ash or other pozzolan used as a partial substitution for ASTM C150 Portland cement shall meet the following requirements:
 - 1) Shall conform to ASTM C618 for Class N or F materials (Class C is not permitted).
 - 2) 25 percent by weight of fly ash or other pozzolans shall substitute for ASTM C150 Portland cement provided the mix design is proportioned per ACI 318, Section 318 5.3.
 - b. Ground-granulated blast-furnace slag used as a partial substitution for ASTM C150 Portland cement shall meet the following requirements:
 - 1) Shall conform to ASTM C989.
 - 2) 25 percent by weight of ground-granulated blast-furnace slag shall substitute for ASTM C150 Portland cement provided the mix design is proportioned per ACI 318, Section 5.3.
 6. Admixtures containing ASTM C845 expansive cements shall be compatible with the cement and produce no deleterious effects.
 7. Silica fumes used as an admixture shall conform to ASTM C1240.
- E. Reinforcement Fibers: Chop strands of alkali-resistant polypropylene or nylon fibers added to the concrete mix for protection against shrinkage cracks.
- F. Expansion Joint Fillers: Preformed strips, non-extruding and resilient bituminous type, of thickness indicated, conforming to ASTM D1751.

G. Curing:

1. Curing Paper: Shall conform to ASTM C171 and consist of two sheets of kraft paper cemented together with a bituminous material in which are embedded cords or strands of fiber running in both directions. The paper shall be light in color, shall be free of visible defects, with uniform appearance.
2. Elevated slabs and slabs on grade may be cured at CONTRACTOR's option with curing and proactive water vapor emission and alkalinity control system. Products shall be approved by OWNER's Office of Environmental Health and Safety.
 - a. VaporSeal 309, by Floor Seal Technology, Inc., or equal.
 - 1) ASTM C156: 0.39 kg/m².
 - 2) ASTM C309: Exceeds requirements.
 - 3) ASTM C1315: Exceeds requirements.
 - 4) ACI 308R-01 Compliant.
 - b. Remedial Treatment: Water vapor emission and alkalinity control treatment, MES 100 by Floor Seal Technology, Inc. or equal.
 - 1) ASTM E96: <0.1 Perms.
 - 2) ASTM D1308: 14pH Resistant.
 - 3) ASTM D7234: 500+psi 100% concrete failure.
 - 4) ASTM F2170: 100%RH resistant.
 - 5) VOC Content: <100 g/L, meets SCAQMD Rule #1113.
 - 6) ASTM F3010: Meets Requirements.
 - c. Self-leveling Compounds: Ardex Engineered Cements, K15, or V1200, Schonox ZM Rapid, US Self Leveler Armstrong, S-194, or equal.

H. Floor Hardener: Water soluble, inorganic, silicate-based curing, hardening, sealing and dustproofing compound. Aquaseal W20 by Monopole Inc., Kure-N-Harden by BASF, Chem Hard by L&M, Liqui-Hard by W. R. Meadows, or equal.

I. Underlayment: Two component latex underlayment for filling low spots in concrete for both interior and exterior applications, from featheredge to a maximum of 3/8 inch in thickness. Underlayment shall be non-shrink and suitable for repairing exposed concrete

surfaces and for underlayment of carpet, resilient, tile and quarry floor coverings. La-O-Tex by TexRite, Underlay C, RS by Mer-Krete Systems, Underlayment 962 by C-Cure, or equal.

- J. Vapor Barrier: Refer to Section 07 26 00, Vapor Barriers.
- K. Stair Treads and Nosings: Two part stair tread and nosing with ribbed abrasive bars. Fabricated from 6063-T5 or 6063-T6 extruded aluminum, mill finish. Anti-slip abrasive filler consisting of aluminum oxide, silicon carbide, or a combination of both, in an epoxy-resin binder. Color shall extend uniformly throughout filler.
 - 1. American Safety Tread: TP-311R.
 - 2. Balco Inc.: DST-330.
 - 3. Nystrom: STTB-P3.375E.
 - 4. Wooster Products Inc.: WP-RN3SG.
 - 5. Equal.
- L. Grout: ASTM C1107, non-shrink type, pre-mixed compound consisting of non-metallic aggregate, cement, water reducing and plasticizing additives, capable of developing a minimum compressive strength of 7,000 psi at 7 days; of consistency suitable for application and a 30 minute working time.

2.02 CONCRETE MIX

- A. Mix shall be signed and sealed by a Civil or Structural Engineer currently registered in the State of California.
- B. Strength of Concrete: Strengths and types of concretes shall be as indicated in the Drawings. Unless otherwise indicated or specified, concrete shall be provided with minimum 28-day strength of 3000 psi (f'c).
- C. Concrete mix shall meet the durability requirements of ACI 318, Chapter 4.
- D. Concrete proportioning shall be determined on the basis of field experience and/or trial mixtures shall in accordance with ACI 318, Section 5.3. Proportions of materials shall provide workability and consistency to permit concrete to be placed readily into forms and around reinforcement under conditions of placement to be employed, without segregation or excessive bleeding.
- E. Ready-Mixed Concrete: Mix and deliver in accordance with requirements of ASTM C94.

PART 3 - EXECUTION

3.01 GENERAL

- A. Surfaces to receive concrete shall be free of debris, standing water, and any other deleterious substances before start of concrete placing.
- B. Time of Placing: Do not place concrete until reinforcement, conduits, outlet boxes, anchors, hangers, sleeves, bolts, and other embedded materials are securely fastened in place. Contact the Inspector at least 24 hours before placing concrete; do not place concrete until inspected by the Project Inspector.
- C. Pouring Record: A record shall be kept on the Project site of time and date of placing concrete in each portion of structure. Such record shall be maintained on the Project site until Substantial Completion and shall be available for examination by the ARCHITECT.

3.02 TOLERANCES

- A. Concrete construction tolerances shall be as specified in ACI 117 and as modified herein.
- B. Floor Flatness (F_F) and Floor Levelness (F_L) shall be as indicated below:

	Specified Overall Value		Minimum Local Value	
	F _F	F _L	F _F	F _L
Slabs on ground: mechanical and electrical rooms, parking structures and mortar bed set tile and quarry flooring.	20	15	15	10
Slab on ground: carpet.	25	20	17	15
Slab on ground: thinset tile and resilient flooring.	35	25	24	17
Suspended slabs: mechanical and electrical rooms, parking structures and mortar bed set tile and quarry flooring.	20	15	N/A	N/A
Suspended slabs: carpet.	25	20	N/A	N/A
Suspended slabs: thinset tile and resilient flooring.	35	20	N/A	N/A

- C. Refer to ACI 302.1R, Tables 8.1 and 8.2 Slab on Ground and Suspended Flatness/Levelness Construction Guide, for recommended concrete placing and finishing methods.
- D. Floor Flatness and Floor Levelness shall be tested in accordance to ASTM E1155. Floor measurements shall be made within 48 hours after slab installation, and shall precede removal of shores and forms.

3.03 PREPARATION

- A. For installation of vapor barrier refer to Section 07 2600, Vapor Barriers.
- B. Reglets and Rebates:
 - 1. Form reglets and rebates in concrete to receive flashing, frames and other equipment as detailed and required. Coordinate dimensions and locations required with other related Work.
 - 2. If concrete slabs on grade adjoin a wall or other perpendicular concrete surface, form a reglet in wall to receive and carry horizontal concrete Work. Reglet shall be full thickness of the slab and shall be 3/4 inch wide, unless otherwise indicated. Requirement does not apply to exterior walks, unless specifically indicated.
- C. Screeds: Install screeds accurately and maintain at required grade or slab elevations after steel reinforcement has been installed, but before starting to place concrete. Install screeds adjacent to walls and in parallel rows not to exceed 8 feet on centers.

3.04 INSTALLATION

- A. Conveying and Placing:
 - 1. Concrete shall be placed only under direct observation of the Project Inspector. Do not place concrete outside of regular working hours, unless the Inspector has been notified at least 48 hours in advance.
 - 2. Concrete shall be conveyed from mixer to location of final placement by methods that will prevent separation or loss of materials.
 - 3. Concrete shall be placed as nearly as practicable to its final position to avoid segregation due to re-handling or flowing. No concrete that has partially hydrated or has been contaminated by foreign materials shall be placed, nor shall re-tempered concrete or concrete which has been remixed after initial set be placed.

4. In placing concrete in columns, walls or thin sections, provide openings in forms, elephant trunks, tremies or other recognized devices, to prevent segregation and accumulation of partially hydrated concrete on forms or metal reinforcement above level of concrete being placed. Such devices shall be installed so that concrete will be dropped vertically. Unconfined vertical drop of concrete from end of such devices to final placement surface shall not exceed 6 feet.
5. Concrete shall be placed as a continuous operation until placing of panel or section is completed. Top surfaces of vertically formed lifts shall be level.
6. Concrete shall be thoroughly consolidated by suitable means during placement, and shall be thoroughly worked around reinforcement and embedded fixtures and into corners of forms.
7. Where conditions make consolidation difficult or where reinforcement is congested, batches of mortar containing same proportions of cement, sand, and water as provided in the concrete, shall first be deposited in the forms to a depth of at least one inch.

B. Cold Weather:

1. Provide adequate equipment for heating concrete materials and protecting concrete during freezing or near-freezing weather. All ground with which concrete is to come in contact shall be free from frost. No frozen materials or materials containing ice shall be used.
2. The temperature of concrete at the time of placement shall not be below the minimum temperatures given in Table 3.1 of ACI 306.1.
3. Concrete shall be maintained at a temperature of at least 50° F. for not less than 72 hours after placing or until it has thoroughly hardened. Cover concrete and provide sufficient heat as required. When necessary, aggregates shall be heated before mixing. Special precautions shall be taken for protection of transit-mixed concrete.

C. Hot Weather:

1. Concrete to be placed during hot weather shall comply with the requirements of ACI 318, Section 5.13.
2. Maintain concrete temperatures indicated in Table 2.1.5 of ACI 305R to prevent the evaporation rate from exceeding 0.2 pound of water per square feet of exposed concrete per hour.
3. Cool concrete using methods indicated in ACI 305R Appendix B.

4. Place and cure concrete as specified in ACI 305R Chapter 4.

D. Compaction and Screeding:

1. Tamp freshly placed concrete with a heavy tamper until at least 3/8 inch of mortar is brought to surface. Concrete shall then be tamped with a light tamper and screeded with a heavy straightedge until depressions and irregularities are eliminated, and surface is true to finish grades or elevations. Remove excess water and debris.
2. Where slabs are to receive separate cement finish or mortar setting bed, continued tamping to raise mortar to surface is not performed. Laitance shall be removed by brushing with a stiff brush or by light sandblasting to expose clean top surface of coarse aggregate.

E. Floating and Troweling:

1. When concrete has hydrated sufficiently, it shall be floated to a compact and smooth surface. After floating, wait until concrete has reached proper consistency before troweling. Top surfaces shall receive at least 2 troweling operations with steel hand trowel. Prior to and during final troweling, apply a fine mist of water frequently with an atomizing type fog sprayer. Omit troweling for slabs to receive a separate cement finish.
2. For interior finish slabs, final troweling shall provide a hard, impervious, and non-slip surfaces, free from defects and blemishes. Finished surface shall be within tolerances indicated in Article 3.02. Avoid burnishing. Do not add cement or sand to absorb excess moisture.
 - a. Floor of Walk-In Refrigerator: Finish as specified above, to a smooth finish.
 - b. Floor of Gymnasium Locker Rooms: After floating, and while the surface is still plastic, provide a fine textured finish by drawing a fine fiber bristle broom uniformly over the surface in one direction only. Floors sloped for drainage should be brushed in the direction of flow.
3. Vertical concrete surfaces shall be finished smooth and free from marks or other surface defects.

3.05 CURING

- A. Length of time, temperature and moisture conditions for curing concrete shall be in accordance with ACI 318, Section 5.11.

- B. Forms containing concrete, top of concrete between forms, and exposed concrete surfaces after removal of forms shall be maintained in a thoroughly wet condition for at least 7 consecutive days after placing.
- C. If weather is hot or surface has dried out, spray surface of concrete slabs and paving with fine mist of water, starting not later than 2 hours after final troweling and continuing until sunset. Surface of finish shall be kept continuously wet until curing medium has been installed.
- D. Immediately after finishing, monolithic floor slabs shall be covered with curing paper. Paper shall be lapped 4 inches at joints and sealed with waterproof sealer. Edges shall be cemented to finish. Repair or replace paper damaged during construction operations.
- E. When curing slabs with proactive water vapor emission and alkalinity control system:
 - 1. Coordinate and schedule application of curing compound with concrete pour schedule, while conforming to manufacturer's application instructions.
 - 2. When the surface of the concrete has hardened sufficiently to sustain foot traffic pre-cure slabs with liquefied product application following manufacturer's written instructions. Application shall be by trained applicators.
 - 3. Monitor Environmental Conditions: Set up weather station 20 to 30 inches above freshly placed concrete. Record temperature, humidity and wind velocity measurements at 15 minute maximum intervals.
 - 4. Calculate Evaporation Rate: Use recorded weather information in combination with nomograph per ACI 308R, Figure 4.1, Guide to Curing Concrete, to evaluate relevant evaporation rate.
 - 5. When the bleed water rate of the concrete is approximately equal to the surface water evaporation rate, spray curing compound material throughout surface of slabs and decks, following manufacturer's written instructions. Application shall be by trained applicators.
 - 6. Perform the following tests at least 28 days after placement of concrete and prior to floor covering installation. Submit to OAR test results indicating locations that do not comply with scheduled flooring installation requirements.
 - a. Calcium chloride testing per ASTM F1869.
 - b. Relative humidity testing per ASTM F2170.
 - c. Alkalinity testing per ASTM F710.

- d. Perform concrete bond layer humidity meter testing to determine substrate surface acceptability.
7. Areas emitting moisture and alkalinity at rates exceeding floor covering manufacturer's published ASTM F1869 limits, shall receive a corrective coating, at no cost to the OWNER, as follows:
- a) Mask and protect adjacent walls and floor surfaces from effects of scarification and application of remedial treatment.
 - b) Scarify slab surface in area of application by shot blasting or other method acceptable to corrective coating manufacturer.
 - c) Prepare and fill cracks, control joints and cold joints.
 - d) Apply two-component modified epoxy penetrant and coating with roller and squeegee over required treatment area; saturate surfaces to ensure a through mechanical bond.
 - e) Clean and fill divots, chips, voids and other surface irregularities with one hundred percent Portland cement based patching compound or cementitious fill.
 - f) Apply cementitious surfacing over coating in areas to receive resilient and wood floor coverings to facilitate adhesion; apply to a thickness of 1/8 inch.

3.06 FILLING, LEVELING AND PATCHING

- A. Concrete slabs exhibiting high or low spots and indicated to receive resilient floor covering or soft floor covering, shall have surfaces repaired. High spots shall be honed, or ground with power-driven machines to required tolerances. Low spots shall be filled with latex underlayment, installed in strict accordance with manufacturer's written recommendations.
- B. Holes resulting from form ties or sleeve nuts shall be solidly packed, through exterior walls, by pressure grouting with cement grout, as specified. Grouted holes on exposed surfaces shall be screeded flush and finished to match adjoining surfaces.
- C. Cement Base: Cement base shall be of the height, thickness, and shape detailed. Base shall be reinforced with one inch mesh, 18 gage, zinc-coated wire fabric. Base finish mixture shall be one part Portland cement, 2 parts of fine aggregate and one part pea gravel. Colored cement base shall include a chemically inert mineral oxide pigment in the mix.

3.07 FINISHING

- A. Soda and Acid Wash: Concrete surfaces to receive plaster, paint or other finish, and which have been formed by oil coated forms, shall be scrubbed with a solution of 1-1/2 pounds of caustic soda to one gallon of water. Surfaces where smooth wood or waste molds have been furnished shall be scrubbed with a solution of 20 percent muriatic acid. Wash with clean water after scrubbing.
- B. Sacking: Exposed concrete curbs, walls, and other surfaces shall be sacked by an application of Portland cement grout, floated, and rubbed. Sacking shall not be performed until patching and filling of holes has been completed. Entire sacking operation for any continuous area shall be started and completed within the same day.
 - 1. Mix one part Portland cement and 1-1/2 parts fine sand with sufficient water to produce a grout having consistency of thick paint. Wet surface of concrete sufficiently to prevent absorption of water from grout. Apply grout uniformly with a brush or spray gun, then immediately float surface with a cork or other suitable float, scouring wall vigorously.
 - 2. While grout is still plastic, finish surface with a sponge-rubber float, removing excess grout. Allow surface to dry thoroughly, then rub vigorously with dry burlap to completely remove dried grout. No visible film or grout shall remain after rubbing with burlap.
- C. Sandblasting: Exterior concrete surfaces to receive stucco dash coat finish, where plywood or other smooth forms have been furnished, shall be uniformly sand-blasted with sharp quartz sand under sufficient air pressure to remove dirt, form oil and other foreign materials, and roughen surface to provide a proper bond. Such surfaces shall be thoroughly washed with clean water after sandblasting.
- D. Abrasive: Concrete stair treads, landings, ramps and steps on interior and exterior of buildings, and interior exposed concrete floors in shop buildings shall receive an abrasive finish.
- E. Floor Hardener: Exposed interior concrete floors throughout shall be treated with floor hardener.
 - 1. Protect adjacent surfaces. Clean surfaces to receive treatment in accordance with manufacturer's instructions, ensuring that all stains, oil, grease, form release agents, laitance, dust and dirt are removed prior to application.
 - 2. Apply hardener in accordance with manufacturer's instructions as soon as concrete is firm enough to work on after final troweling.
- F. Cement Grout and Dry-Pack Concrete: Cement grout shall be mixed at the Project site and shall be composed of one volume of Portland cement and 2-1/2 volumes of fine

aggregate. Materials shall be mixed dry with sufficient water added to make mixture flow under its own weight. When grout is used as a dry pack concrete, add sufficient water to provide a stiff mixture, which can be molded into a sphere.

- G. Broom Finish: Exterior stair treads and landings shall be provided with a non-slip broom finish in addition to abrasive finish specified.
- H. Abrasive Stair Nosing: Nosing shall be installed according to manufacturers written recommendations.

3.08 EXPANSION AND CONSTRUCTION JOINTS

- A. Construction Joints: Details and proposed location of construction joints shall be as indicated on the Drawings, located to least impair strength of structure, in accordance with the following:
 - 1. Thoroughly clean contact surface by sand blasting entire surface not earlier than 5 days after initial placement.
 - 2. A mix containing same proportion of sand and cement provided in concrete plus a maximum of 50 percent of coarse aggregate shall be placed to a depth of at least one inch on horizontal joints. Vertical joints shall be wetted and coated with a neat cement grout immediately before placing of new concrete.
 - 3. Should contact surface become coated with earth, sawdust, or deleterious material of any kind after being cleaned, entire surface shall be re-cleaned before applying mix.
- B. Expansion Joints: Provide expansion joints where indicated in walks and exterior slabs. Space approximately 20 feet apart, unless otherwise indicated. Joints shall extend entirely through slab with joint filler in one piece for width of walk or slab. Joint filler shall be 3/8 inch thick, unless otherwise indicated.
- C. Tooled Joints: Slabs, walks and paving shall be marked into areas as indicated with markings made with a V-grooving tool. Marks shall be round-edged, free from burrs or obstructions, with clean cut angles and shall be straight and true. Walks, if not indicated, shall be marked off into rectangles of not more than 12 square feet and shall have a center marking where more than 5 feet wide.

3.09 TESTING

- A. Molded Cylinder Tests:
 - 1. Inspector or testing lab personnel will prepare cylinders and perform slump tests. Samples for concrete strength shall be taken in accordance to ASTM C172. Each

- cylinder shall be dated, given a number, point in structure from which sample was obtained, mix design number, mix design strength and result of accompanying slump test noted.
2. Separate tests of molded concrete cylinders obtained at same place and time shall be made at age of three days, seven days, and 28 days. A strength test shall be the average of the compressive strength of two cylinders, obtained from the same sample of concrete and tested at 28 days or at test age designated for determination of f_c .
 3. Test cylinders shall be prepared at the Project site and stored in testing laboratory in accordance with ASTM C31, and tested in accordance with ASTM C39.
- B. Core Test: At request of the ARCHITECT, cores of hardened concrete shall be cut from portions of hydrated structures for testing, in accordance with CBC and ASTM C42.
1. Provide 4 inch diameter cores at representative places throughout the structure as designated by the ARCHITECT.
 2. In general, provide sufficient cores to represent concrete placed with at least one core for each 4,000 square feet of building area, and at least 3 cores total for each Project.
 3. Where cores have been removed, fill voids with drypack, and patch the finish to match the adjacent existing surfaces.
- C. Concrete Consistency: Measure consistency according to ASTM C143. Test twice each day or partial day's run of the mixer.
- D. Adjustment of Mix: If the strength of any grade of concrete for any portion of Work, as indicated by molded test cylinders, falls below minimum 28 days compressive strength specified or indicated, adjust mix design for remaining portion of construction so that resulting concrete meets minimum strength requirements.
- E. Air Content Testing: Measure in accordance to ASTM C173 or ASTM C231, for each composite sample taken in accordance to ASTM C172.
- F. Defective Concrete:
1. Should strength of any grade of concrete, for any portion of Work indicated by tests of molded cylinders and core tests, fall below minimum 28 days strength specified or indicated, concrete will be deemed defective Work and shall be replaced or adequately strengthened in a manner acceptable to the ARCHITECT.
 2. Concrete Work that is not formed as indicated, is not true within 1/250 of span, not true to intended alignment, not plumb or level where so intended, not true to

intended grades and levels, contains sawdust shavings, wood or embedded debris, or does not fully conform to Contract provisions, shall be deemed to be defective Work and shall be removed and replaced.

- G. Concrete for Equipment Pads, Mechanical and Electrical Work: Unless otherwise indicated, strength shall have a minimum $f'c = 3,000$ psi. Exposed concrete shall be provided with a hand trowel finish with radius corners and edges. Form and place concrete where necessary as described in Section 03 10 00 Concrete Forming and Accessories, and reinforced as described in Section 03 20 00 Concrete Reinforcing. Calcium chloride shall not be furnished in any concrete mix provided for the installation of underground electrical conduits. For concrete encasement of more than one conduit, furnish 3/4 inch maximum aggregate.

3.10 CLEAN UP

- A. Remove rubbish, debris and waste materials and legally dispose of off the Project site.

3.11 PROTECTION

- A. Protect the Work of this section until Substantial Completion.

END OF SECTION

SECTION 03 48 00
PRECAST CONCRETE WALL CAPS

PART 1 - GENERAL

1.01 SUMMARY

- A. Section Includes: Concrete wall caps
- B. Related sections:
 - 1. Section 04 22 00 – Concrete Unit Masonry
 - 2. Section 04 73 00 – Manufactured Masonry Veneer

1.02 REFERENCES

- A. American Society of Testing and Materials (ASTM International)
 - ASTM C33 Concrete Aggregates
 - ASTM C39 Concrete Compressive Strength
 - ASTM C144 Aggregate for Masonry Mortar
 - ASTM C150 Portland cement
 - ASTM C595 Standard Specification for Blended Hydraulic Cements
 - ASTM C642 Water Absorption, Density, Voids in Hardened Conc
 - ASTM C666 Rapid Freeze/Thaw Resistance of Conc
 - ASTM C979 Pigments for Integrally Colored Concrete

1.03 SUBMITTALS

- A. Samples: Submit two full-sized samples of each type of precast concrete unit to show the full range of color and texture of unit for selection and approval. If sealer is to be applied to precast concrete slab, apply sealer on one sample.
- B. Product Data: Submit product data for specified products.
- C. Warranty: Provide certified copies of manufacturer's product warranties.
- D. Shop Drawings (Optional)
 - 1. Indicate layout, corners, terminals, radius sizes, junctions with dissimilar materials, accessories and setting details.

1.04 QUALITY ASSURANCE

- A. Qualifications of Manufacturer: Company specializing in manufacture of precast concrete wall cap units with a minimum of 10 continuous years of documented experience.
- B. Qualifications of Subcontractor: Subcontractor shall submit evidence of skill and not less than 5 years of experience in this product type.
- C. Pre-installation Conference: As directed by OAR.
- D. Precast concrete units shall have a compressive strength of 5,000 PSI minimum.

1.05 DELIVERY, STORAGE AND HANDLING

- A. Deliver all materials to the installation site in the manufacturer's original packaging. Packaging shall contain manufacturer's name, customer name, order, identification number, and other related information.
- B. Handle and store precast concrete units in accordance with manufacturer's recommendations.

1.06 ENVIRONMENTAL REQUIREMENTS

- A. Install mortar, set caps and grout when surface temperature is a minimum of 50 degrees F (10 degrees C) and rising but no greater than 90 degrees F (32 degrees C).
- B. Do not install mortar, set caps or grout when inclement weather conditions are expected within 48 hours of completion.

1.07 EXTRA MATERIALS

- A. Extra materials: Provide _ pcs of each size, color and accessories specified.

1.08 WARRANTY

- A. Provide warranty covering precast concrete wall cap units against defects in material and workmanship for a period of 5 years. Unusual abuse and neglect are excepted.
- B. Ordering: Comply with manufacturer's ordering instructions and lead time requirements to avoid construction delays.

PART 2 - PRODUCTS

2.01 MANUFACTURER

A. Basis of Design:

Stepstone, Inc.
17025 South Main Street
Gardena, CA 90248
(310) 327-7474
(800) 572-9029
FAX (310) 217-1424
www.stepstoneinc.com

B. Or approved equal

2.02 MATERIALS

A. Precast concrete wall cap units shall be precast concrete, consisting of Portland cement, aggregate, and color admixtures.

1. Portland cement: ASTM C 150, Type III, high early strength.
2. Aggregate: ASTM C 33.
3. Color Admixture: By Davis Colors, or equal, as required to achieve color as selected.
4. Aggregate for exposed aggregate surface: As selected.
5. Portland Cement Mortar that meets or exceeds ANSI A118.4 requirements when mixed with water or a latex admixture, and is designed for installation of large format tile – Pedestrian Installation.
6. Grout that meets or exceeds ANSI A118.7 when mixed with water or a latex admixture.

B. Precast concrete wall cap unit size and shape: As indicated in drawings

2.03 COLORS AND FINISHES

A. Colors: Davis Colors (or equal), integral color admixture. Integral color shall be throughout entire product. Color shall be as selected by Architect from manufacturer's color chart.

B. Finish: Smooth

C. Factory Application of Sealer: Factory apply one coat of penetrating sealer to all surfaces of wall cap units. Sealer shall be non-staining, penetrating material, suitable

for exterior or interior use, type which does not discolor or darken the surface.

2.04 PHYSICAL PROPERTIES:

- A. Compressive strength: Minimum 5,000 PSI.
- B. All wall cap styles have straight, end and corner pieces. Select wall cap styles have coordinating standard radius pieces where occurs.
- C. Unit size: Within 1/8" of designated length, width and thickness.
- D. Weight: 133 lbs/ft³
- E. Water absorption: Not more than 6.0 % average, not more than 7.0 % for any individual unit for standard colors.
- F. Wall Cap units will contain on average 6% entrained air, with no individual piece under 5%.

2.05 FABRICATION

- A. Wall Cap units shall be hand-made, wet-cast of cement conforming to ASTM C 150, Type III, aggregates conforming to ASTM C 33, and pigments for integrally colored concrete conforming to ASTM C979.

2.06 SOURCE QUALITY CONTROL

- A. Concrete for Wall Cap units shall be tested frequently to assure that mixes provide units having not less than 5,000 psi compressive strength at 28 days (average test strength not less than 4,500 psi).
- B. Minor chips, hairline cracks, air voids and slight variations in color and finish are normal in precast concrete. When viewed in typical daylight illumination from a distance of 20 feet, minor chips, hairline cracks and air voids that cannot be seen with the naked eye are not grounds for rejection.

PART 3 – EXECUTION

3.01 EXAMINATION

- A. Examine all surfaces.

- B. Verify all dimensions of in-place and subsequent construction.
- C. Notify the Contractor in writing of conditions detrimental to the proper and timely completion of the work.
- D. Do not proceed with the work until unsatisfactory conditions have been corrected.
- E. Installation of precast concrete wall caps, and associated construction, constitutes acceptance of the adjacent and underlying construction.

3.02 PREPARATION

- A. Prepare surfaces using the methods recommended by the manufacturer for achieving the best result for the substrate under the project conditions.
 - 1. Ensure all substrates are clean and free of contaminants and have a roughened surface to encourage bonding.

3.03 CLEANING

- A. Clean exposed surfaces of precast concrete units. Use cleaners appropriate for precast concrete finishes and colors. Acid based cleaners will permanently alter finish and color.

3.04 SEALING

- A. Field-applied sealer for the prevention of freeze-thaw is optional in mild climates. If precast concrete units are factory sealed, test for compatibility before applying additional sealer.
- B. In geographic regions exposed to freeze-thaw conditions field-applied sealing the entire area, including joints, after installation is mandatory in order to maintain Stepstone's warranty. Follow sealer manufacturer's instructions for application and maintenance of the sealer.

3.05 COMPLETION

- A. Protect precast concrete units from damage due to subsequent building operations.
- B. After installation and before completion, inspect precast concrete units for construction damage and obtain new precast concrete units if required.
- C. Immediately prior to final acceptance of project, clean precast concrete units.

SECTION 03 61 11

NON-SHRINK GROUT

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Cementitious Grout.
- B. Epoxy Grout.
- C. Epoxy Adhesive.

1.02 RELATED SECTIONS

- A. Section 03 30 00 - Cast-in-Place Concrete.
- B. Section 04 22 00 - Concrete Unit Masonry.
- C. Section 05 12 00 – Structural Steel Framing
- D. Section 05 12 13 – Architectural Exposed Steel Framing
- E. Division 9 – Finishes.

1.03 DEFINITION:

- A. For the purpose of these Specifications, “non-shrink grout” shall be defined as a high-strength mortar or grout which does not shrink in the plastic state, is dimensionally stable in the hardened state, and bonds permanently to clean metal surfaces and concrete substrate.

1.04 REFERENCES

- A. American Concrete Institute (ACI):

7. ASTM C1090/
C1090M Standard Test Method for Measuring Changes in Height of Cylindrical Specimens of Hydraulic-Cement Grout
8. ASTM C1107/
C1107M Standard Specification for Packaged Dry, Hydraulic-Cement Grout (Nonshrink)

C. U. S. Army Corps of Engineers, Concrete Research Division (CRD):

1. CRD-C620 Standard Method of Sampling Fresh Grout
2. CRD C621 Corps of Engineers Specification for Non-shrink Grout

1.05 SUBMITTALS

- A. General: Refer to Section 01 33 00, Submittal Procedures.
- B. Product Data: Submit manufacturer's product data and installation instructions.
- C. Certification: Submit certificates of compliance or laboratory test reports which indicate the following:
 1. Materials used in the grout are free from metallic components and corrosion-producing elements.
 2. Materials meet specified shrinkage and compressive strength requirements

1.06 ENVIRONMENTAL REQUIREMENTS

- A. Handle grout the same as concrete with regard to temperature and curing, as specified in Section 03 30 00, Cast-In-Place Concrete.

PART 2 – PRODUCTS

2.01 MATERIALS

- A. Cementitious Grout: Provide non-shrink, non-metallic, non-corrosive cement-based grout conforming to the following requirements:
 - 1. Applicable Standards: ASTM C1107/C1107M and CRD-C621.
 - 2. Grout shall be manufactured specifically for use in supporting heavy loads (loads in excess of 300 pounds per square foot concentrated load or 100 pounds per square foot uniform load). Grout: ASTM C1107/C1107M, Grade A, B, or C, as appropriate for the condition or circumstance.
 - 3. Shrinkage at 28 Days: No shrinkage before hardening (0.00 shrinkage when tested in accordance with ASTM C827/C827M and ASTM C1090/C1090M); no shrinkage after hardening (0.00 shrinkage when tested in accordance with CRD-C621).
 - 4. Compressive strength, minimum as specified in ASTM C1107/C1107M, Table 1:
 - a. At one Day: 1000 psi
 - b. At three Days: 2500 psi
 - c. At seven Days: 3500 psi
 - d. At 28 Days: 5000 psi
 - 5. Initial setting time, after addition of water: approximately one hour at 70 degrees Fahrenheit.
 - 6. Provide non-sag trowelability or flowability as necessary for the particular application.
- B. Water: Clean and potable, free of impurities detrimental to grout.
- C. Epoxy Grout: Provide non-shrink, non-metallic, non-corrosive epoxy grout conforming to the following requirements:
 - 1. Grout shall be manufactured specifically for use in supporting heavy loads.
 - 2. Shrinkage at 28 Days: None (0.00 shrinkage when tested in accordance with ASTM C827/C827M modified procedure) with a minimum effective bearing area (EBA) of 95 percent coverage of the tested base plate.
 - 3. Compressive strength, minimum: 10,000 psi at seven Days, when tested in accordance with ASTM C579.
 - 4. Initial setting time: Approximately one hour at 70 degrees Fahrenheit.

5. Provide flowable consistency as necessary for the particular application.
 6. Epoxy grouts which are volatile and which give off noxious fumes are not acceptable.
- D. Epoxy Adhesive: ASTM C881/C881M, Type V, epoxy-based bonding agent.

2.02 MIXING

- A. Mix grout ingredients for both cementitious grout and epoxy grout in accordance with the respective manufacturer's mixing instructions and recommendations. Mix grout materials in proper mechanical mixers.
- B. Mix grout as close to work area as possible.

2.03 SOURCE QUALITY CONTROL

- A. Inspections and Tests: Perform visual inspections and shrinkage tests using an appropriate independent testing laboratory, and strength tests as necessary to verify performance requirements of grout. Sampling and testing of grout shall conform with applicable ASTM or CRD-C620 requirements. The independent testing laboratory shall perform sampling, testing, and inspection in accordance with the provisions herein. The Contractor shall cooperate with and notify District at least 48 hours in advance of sampling, tests, and inspections being performed by the independent testing laboratory. District may elect to observe these procedures.
- B. Visual Inspections: Perform visual inspection of the grout mixing and placement to determine and verify that grout consistency, slump, and stiffness are appropriate and proper for the location and type of installation.
- C. Shrinkage Tests:
 1. Cementitious Grout: Grout shall meet the following performance requirements:
 - a. Expansion: 0.4 percent maximum at three, 14, and 28 Days. Grout shall exhibit no displacement when tested in accordance with ASTM C157/C157M.
 - b. Shrinkage: None (0.00 shrinkage at 28 Days when tested in accordance with ASTM C827/C827M and ASTM C1090/1090M). There shall be no vertical volume shrinkage of grout in the plastic or hardened stage at any time.
 2. Epoxy Grout: Grout shall meet the following performance requirements:
 - a. Expansion: Grout shall exhibit no displacement when tested in accordance with ASTM C827/C827M and ASTM C157/C157M, modified procedures.

- b. Shrinkage: None (0.00 shrinkage when tested in accordance with ASTM C827/C827M, modified procedure; specific gravity of indicator ball will be changed to approximately 1.0).
 - c. Effective Bearing Area: 95 percent minimum coverage of the tested base plate.
- D. Strength Tests: Compressive strength of grout shall meet the following requirements:
- 1. Cementitious Grout: 5,000 psi minimum at 28 Days when tested in accordance with ASTM C109/C109M.
 - 2. Epoxy Grout: 10,000 psi minimum at seven Days when tested in accordance with ASTM C579.

PART 3 – EXECUTION

3.01 SURFACE PREPARATION

- A. Concrete surfaces to receive grout shall be prepared by chipping, sandblasting, water blasting, or other accepted methods to remove defective concrete, laitance, dirt, oil, grease, and other foreign matter to achieve sound, clean concrete surfaces. Lightly roughen concrete for bond, but not enough to interfere with proper placement of grout.
- B. Cover concrete areas with protective waterproof covering until ready to place grout.
- C. Remove foreign matter from steel surfaces to be in contact with grout. Clean contact steel surfaces as necessary by wire brushing and wiping dust clean.
- D. Align and level components to be grouted, and maintain in final position until grout placement is complete and accepted.
- E. Install forms for grout around the column base plates and other spaces to be grouted. The tops of such forms shall be one inch above the surfaces to be grouted.
- F. Remove protective waterproof covering and clean contaminated surfaces immediately before grouting.
- G. Provide air-relief holes in large baseplates and in baseplates where underneath obstructions may cause air entrapment.
- H. Saturate concrete surfaces with clean water, and remove excess water immediately before grouting.

- I. Where necessary or appropriate for better bond, epoxy adhesive may be applied to clean, dry substrate surfaces in accordance with applicable requirements of ACI 503.2.

3.02 PLACING GROUT

- A. Place grout in accordance with the respective manufacturer's installation instructions and recommendations. Pour grout from one side only until grout rises at least one inch above the plate on opposite side of said plate. Strapping and plunging or other recommended method may be used to force grout to flow under the entire area.
- B. Neatly trowel edges of grout base, tapered at an angle of 60 degrees when measured from the horizontal, or as indicated. Provide dry-pack cementitious grout where additional grout is required for shoulders.
- C. Do not remove leveling shims for at least 48 hours after grout has been placed.
- D. After shims have been removed, if used, fill voids with grout, packing the material with a suitable tool.
- E. Do not use grout which has begun to set or if more than one hour has elapsed after initial mixing.

3.03 CURING

- A. Cementitious grout shall be cured the same as specified for concrete in Section 03 35 00, Concrete Finishing.
- B. Epoxy grout shall be cured as recommended by the grout manufacturer.

END OF SECTION

SECTION 04 01 20

MASONRY RESTORATION AND CLEANING

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Pressure injection of epoxy resin and cleaning of existing masonry and stone work.
2. Repointing and caulking of cracks.
3. Removal of plant growth.

B. Related Requirements:

1. Division 01 - General Requirements.
2. Section 04 2200 - Concrete Unit Masonry.
3. Section 09 9000 - Painting and Coatings.

1.02 REGULATORY REQUIREMENTS

- A. State or municipal regulations governing sandblasting, cleaning, scaffolding, and protection of adjacent properties.
- B. Drawings detailing temporary support of structure shall be prepared, signed, and sealed by a structural engineer registered in the State of California.

1.03 SUBMITTALS

A. Shop Drawings: Submit Shop Drawings indicating areas to receive restoration.

B. Product Data:

1. Submit manufacturer's product literature and application procedures.
2. Submit laboratory test reports or approvals indicating conformance with the Specifications.

1.04 QUALITY ASSURANCE

A. Comply with the following as a minimum requirement:

1. ASTM C881 – Standard Specification for Epoxy-Resin-Base Bonding Systems for Concrete.
2. ASTM D638 – Standard Test Method for Tensile Properties of Plastics.

3. ASTM D695 - Standard Test Method for Compressive Properties of Rigid Plastics.
 4. ASTM D790 - Standard Test Methods for Flexural Properties of Unreinforced and Reinforced Plastics and Electrical Insulating Materials.
- B. Continuous inspection of epoxy repair procedures shall be performed by the Project Inspector.
 - C. Inspection shall be performed by a representative of a testing laboratory selected by the City. Notify the laboratory 24 hours in advance of time epoxy is to be mixed, and promptly notify the laboratory of postponement or cancellation of mixing.
 - D. Applicator of epoxy resin adhesive and concrete repair shall be certified by the manufacturer.
 - E. Manufacturer: Regularly engaged in manufacture of epoxy resin products for at least 10 years. Provide references of at least five projects for which epoxy resin adhesive treatment was installed.
 - F. Immediately report any damage of existing masonry such as spalling, rust, structural movement, cracking, water stains, or loose units. Do not begin repair or restoration until City's structural engineer has inspected damage.
 - G. Tuck pointing requiring more than 3/4-inch removal of existing mortar shall be reviewed by City's Structural Engineer prior to replacement.
 - H. Comply with relevant code sections and standards on tucking pointing application.

1.05 PROJECT CONDITIONS

- A. Materials shall not be applied during existing or forecasted freezing or inclement weather.
- B. Adjacent surfaces, to the areas receiving treatment, shall be protected from damage from equipment, tools or materials.

1.06 DELIVERY, STORAGE, AND HANDLING

- A. Deliver materials to the Project site in manufacturer's unopened containers bearing manufacturer's name and product identification.
- B. Store and condition materials as recommended by product manufacturer.

PART 2 - PRODUCTS

2.01 MANUFACTURER

A. Manufacturers:

1. Sika Corporation.
2. Fosroc Inc.
3. The Euclid Chemical Company.
4. Equal.

2.02 MATERIALS

A. Epoxy Resin Adhesive:

1. New material within the shelf life recommended by manufacturer.
2. Two-part material made from 100 percent solids of modified epoxy resin containing suitable viscosity control agents and accelerators.
3. Mix components in ratio recommended by product manufacturer.
4. Material shall not contain butyl glycidyl ether or asbestos.
5. Epoxy resin adhesive shall be approved by the United States Department of Agriculture.

B. Materials for Masonry Restoration:

1. Sikadur 35, Hi-Mod LV, by Sika Corporation.
2. Nitobond LV, by Fosroc Inc.
3. Euco #452 LV System, by the Euclid Chemical Company.
4. Equal.

C. Materials for Cleaning Masonry:

1. Acid Solution: Clean, stain free, commercial hydrochloric (muriatic) acid mixed with potable water:
 - a. Use 10 parts water for dark colored brick.
 - b. Use 15 parts water for light colored brick.

- D. Mortar: ASTM C387, Type N or M, using gray or white cement, commercially prepared type.
- E. Hydrated Lime: ASTM C207.
- F. Quicklime: ASTM C5, non-hydraulic type.
- G. Sand (for sandblasting): Quartz type, sharp edged.
 - H. Masonry Anchors:
 - 1. DA 213 Seismic as fabricated by DUR-O-WAL, when brick is removed and installed.
 - 2. Masonry anchors shall be D 5300 series for brick veneer around wood framing when brick is left in place.

PART 3 - EXECUTION

3.01 GENERAL

- A. Sample Test Area for Cleaning: Before commencement of Work, cleaning procedures and solutions shall be applied to a sample test area of approximately 20 square feet. The effectiveness of the cleaning method will be determined by inspection of the test area at least one week after application.

3.02 PREPARATION

- A. Remove and store items such as finish hardware, fixtures, fittings, and accessories.
- B. Construct dustproof partitions to close off occupied areas from this Work. Protect adjacent materials from damage by the Work of this section.
- C. Surface adjacent to cracks must be clean and sound; cracks shall be free of standing water and frost. Remove dust, grease, foreign particles, and disintegrated materials on surface adjacent to cracks by sandblasting, high-pressure water blasting or high-pressure steam cleaning.
- D. For gravity flow grouting, V-notch surface of crack, to a maximum width of 1/4 inch and remove loose debris.

3.03 APPLICATION

- A. For manual application of epoxy resin adhesive, mix only that quantity of material that can be used in 20 to 30 minutes at 73 degrees F.
- B. For pressure injection, portable unit shall be provided with positive displacement type pumps, air-powered or electric, with interlock for positive ratio control of exact

proportions of material at nozzle. Pumps shall provide in-line mixing and metering system and contain drain-back plugs.

C. Placement Procedures:

1. Pressure Injection: To seal cracks, set porting devices as required by manufacturer. Spacing shall not exceed thickness of substrate and shall be accomplished to achieve travel of material for grouting between ports; fill grouts to maximum. On structures accessible on both sides, provide grouting devices on opposite sides at staggered elevations. Apply mixed epoxy resin adhesive for sealing, over cracks and around each porting device, to provide adequate seal to prevent escape of adhesive for injection grouting. Where required, apply adhesive for sealing in a manner to provide minimal defacing discoloration.

2. Gravity Flow Grouting: Place mixed material into V-notches and replenish reservoir with material until cracks are completely filled.

D. If penetration of crack is not possible, notify Architect before stopping the Work. If modification of procedure is required to fill cracks, submit proposed modifications for review prior to proceeding.

E. Provide masonry restoration materials in accordance with manufacturer's written recommendations.

3.04 CLEANING EXISTING MASONRY

A. Where serious staining is indicated, provide the following:

1. Apply high pressure (700 psi or greater) steam cleaning to masonry surfaces with detergent in accordance with manufacturer's directions.

2. If existing coating is lead-based paint, notify the Architect before proceeding.

B. Sandblasting: Do not sandblast brick or mortar.

3.05 CLEANING NEW MASONRY

A. Ensure that mortar is thoroughly set and cured.

B. Clean surfaces and remove large particles with wood scrapers, wire brushes, or chisels.

C. Saturate masonry with clean water and flush off loose mortar and dirt.

D. Scrub walls with detergent solution using stiff brush.

E. Thoroughly rinse and wash off cleaning solution, dirt, and mortar crumbs using clean, pressurized water.

3.06 RESTORATION CLEANING

- A. Clean surfaces and remove large particles of excess mortar with wood scrapers or wire brush.
- B. Apply masonry restoration cleaner, mixed into solution in strict accordance with manufacturer's instructions.
- C. Apply a second coat if required by preliminary test of a sample area.
- D. Allow sufficient time for solution to remain on masonry, agitate with soft fiber brush or sponge.
- E. Rinse from bottom up with potable water at high pressure.

3.07 TUCK POINTING

- A. Cut out loose or disintegrated mortar in joints, without damage to masonry units.
- B. Tuck pointing mortar shall not be denser than original mortar. In absence of information on the original mortar, provide pre-hydrated mortar.

3.08 AGING MASONRY

- A. Perform an aging process, if required to match existing Work by rubbing and then removing excess carbon black into mortar surface. Repeat process until new Work matches existing. Prepare a Sample panel for Architect review before performing the Work.
 - 1. Rub carbon black with burlap rags or medium bristle brush.
 - 2. After each installation, dust off surplus and wash down with medium pressure hose. Allow to thoroughly dry before proceeding with succeeding installations.

3.09 CLEANUP

- A. Remove rubbish, debris, and waste materials and legally dispose of off the Project site.

3.10 PROTECTION

- A. Protect the Work of this section until Substantial Completion.

END OF SECTION – 04 01 20

SECTION 04 22 00

CONCRETE UNIT MASONRY

PART 1 – GENERAL

1.01 SUMMARY

A. Section Includes:

1. Concrete masonry units.
2. Reinforcing steel.
3. Mortar, grout and grouting.
4. Bolts, anchors, hardware, metal frames, and other insert items.

B. Related Requirements:

1. Division 01 - General Requirements.
2. Section 01 45 23 - Testing and Inspection.
3. Section 03 10 00 - Concrete Forming and Accessories.
4. Section 03 20 00 - Concrete Reinforcing.
5. Section 03 30 00 - Cast-In-Place Concrete.
6. Section 05 12 00 - Structural Steel Framing.
7. Section 08 11 13 - Hollow Metal Doors and Frames.

1.02 REFERENCES

A. American Society for Testing and Materials International (ASTM):

1. ASTM A307 - Standard Specification for Carbon Steel Bolts and Studs, 60 000 PSI Tensile Strength.

1. TMS 602/ACI 530.1/ASCE 6 – Specification for Masonry Structures.
 2. TMS 402/ACI 530/ASCE 5 – Building Code Requirements for Masonry Structures.

1.03 SUBMITTALS

- A. Mix Design: Submit grout and mortar mix designs. Mix designs shall be signed and sealed by a Civil or Structural Engineer registered in the State of California.
- B. Product Data: Submit manufacturer's Product Data for assembly components, materials, and accessories. Submit certificates and data assuring that the proposed materials meet the specified ASTM standards.
- C. Samples: Submit Samples for each type of required masonry unit, including reinforcement and accessories.
- D. Shop Drawings: Indicate wall reinforcement, splice locations and bending diagrams.
- E. Admixtures: Additives and admixtures to mortar and grout shall not be used unless approved by the enforcing agency. Submit product data for any proposed admixture.
- F. LEED Submittals: Complete the LEED Material Buyout Form (MBoF) with all materials provided to the project. A complete submittal includes providing all material costs in the MBoF and all of the supporting documentation for the following credits:
 1. MRc2 - Environmental Product Declarations (EPD): Provide Industry-Wide or Product-Specific EPD.
 2. MRc3 - Sourcing of Raw Materials - Recycled Content: Provide product data for pre- and post- consumer recycled content.
 3. MRc4 - Material Ingredients: Provide manufacturers Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, or Cradle to Cradle Health Product Certificate.
 4. IEQc2 - Low-Emitting Materials – Interior Wet Applied Products: For paints, coatings, adhesives and sealants applied on site or used for laminating off-site,

include product data indicating the VOC content (g/L) and testing certificates or third-party certification demonstrating compliance with California Department of Public Health (CDPH) v1.2-2017 emissions testing.

1.04 REGULATORY REQUIREMENTS

- A. Perform the Work in accordance with CBC, Chapter 21A.
- B. Comply with requirements of TMS 602.

1.05 QUALITY ASSURANCE

- A. Comply with the requirements of Section 01 4523 - Testing and Inspection.
- B. Concrete Masonry Units:
 - 1. Notify the testing laboratory a minimum of 45 days in advance of installing concrete unit masonry, to allow for preconstruction testing of the units.
 - a. Units will be sampled and tested in accordance with ASTM C140 for compressive strength, absorption and moisture content.
 - b. Units will be sampled and tested in accordance with ASTM C426 for linear drying shrinkage.
 - 2. The material testing laboratory shall receive concrete masonry unit specimens for testing from masonry unit manufacturer. Number of specimens shall be as indicated in referenced ASTM standard tests. Testing laboratory will perform and send test results to the ARCHITECT and Project Inspector.
- C. Portland Cement: Submit certification from the cement manufacturer that the cement proposed for use on the project has been manufactured in accordance with ASTM C150. Certification shall include test results made on cement samples during production.
- D. Mortar and Grout Tests: Prior to the beginning of masonry work, mortar and grout will be tested, unless prism tests will be performed as indicated below.
 - 1. Mortar: Shall conform to ASTM C270 Table 2 for Type S mortar.
 - a. Provide qualifications of mortar as meeting ASTM C270 at the beginning of the job and whenever mix design is changed.
 - b. Mortars will be evaluated during preconstruction and tested during construction for proportioning or compressive strength in accordance to ASTM C780.
 - 2. Grout: Shall conform to ASTM C476, and will be tested in accordance with ASTM C1019. Compressive strength shall equal or exceed specified compressive strength ($f'm$) at 28 days, but not less than 2,000 psi.
 - a. Ready-Mix Grout: Grout manufacturer shall furnish batch ticket information in accordance to ASTM C94.

- E. Prism Test: The compressive strength of concrete masonry will be determined by the prism test method prior to the start of construction and during construction.
- F. Masonry Core Testing: Core testing will be performed in accordance with CBC, Section 2105A.4.
- G. Inspection During Installation: A special inspector will continuously observe the installation of reinforced masonry. The Project Inspector shall be responsible for monitoring the work of the special inspector and testing laboratories to ensure that the testing program is satisfactorily completed.
- H. OWNER will be responsible for the costs of original tests and inspection.

1.06 DELIVERY, STORAGE AND HANDLING

- A. Store units above grade on level platforms or pallets, in a dry location.
- B. Store cementitious materials and aggregates in such a manner as to prevent deterioration or intrusion of foreign matter or moisture.
- C. Handle units on pallets or flat bed barrows. Free discharge from conveyor units or transportation in mortar trays is not permitted.

PART 2 - PRODUCTS

2.01 MATERIALS

- A. Concrete Unit Masonry: Modular normal weight conforming to ASTM C90, hollow load-bearing concrete unit masonry. Masonry units shall meet the minimum compressive strength requirements of ASTM C90, or as indicated on project drawings, whichever is greater.
 - 1. Concrete masonry unit sizes, types, texture and finishes shall be as indicated on the drawings.
 - 2. Provide open-end units at walls to be fully grouted.
 - 3. Provide closed-end units at walls and at openings where ends will be exposed in finish Work; provide bond beam blocks where horizontal reinforcement is indicated.
 - 4. Provide special shapes and accessory units at locations indicated on Drawings.
 - 5. Provide units in colors and textures as indicated in the drawings.
 - 6. Masonry unit shall have been cured for a minimum of 28 days.
 - 7. Masonry unit shall have maximum liner shrinkage of 0.065 percent from saturated to oven dry.
- B. Portland Cement: ASTM C150, Type II, from one source.
- C. Hydrated Lime: ASTM C207, Type S.
- D. Aggregates: ASTM C144 for mortar and ASTM C404 for grout.

- E. Mortar: ASTM C270, Type S, conforming to the property specifications of CBC Table 2103A.8 (2).
- F. Grout: ASTM C476.
- G. Admixture for Grout: Grout Aid, as manufactured by Sika Chemical Corp., or equal.
- H. Water: Clean, potable, free from substances deleterious to mortar, grout or reinforcement.
- I. Reinforcing Steel: Provide and install reinforcing steel in accordance with Section 03 2000 - Concrete Reinforcing.
- J. Cleaning Materials: Sure Klean No. 600 detergent by ProSoCo.
- K. Miscellaneous Materials: As required to complete the Work.
- L. Anchor Bolts: Shall be hex headed bolts conforming to ASTM A307 Grade A with the dimensions of the hex head conforming to ANSI/ASME B18.2.1.

2.02 LEED REQUIREMENTS

- A. IW/PS EDP: Products specified under this section must have a Type III Product Specific EPD or the company must be listed in the industry group responsible for the Industry Wide Externally Verified EPD.
- B. PS EPD: Products specified under this section must have a Type III Product Specific EPD.
- C. HPDs: Products specified under this section must have one of the following unexpired material ingredient reports compliant with LEEDv4.1 requirements and declared to 1000 ppm or less: Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, Cradle to Cradle Health Product Certificate, or UL Product Lens Certification.
- D. Interior Wet Applied Products: All wet-applied on-site paints, coatings, adhesives, and sealants products provided under Part 2 of this specification section must be compliant with the VOC limits outlined under IEQc2: Low Emitting Materials in 01 81 13 Sustainable Design Requirements. In addition, all paints and coatings must be compliant with CDPH Standard Method v1.2-2017 emissions testing with proper unexpired CDPH testing certificates or acceptable third-party certification.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Discard units with cracks or other defects not complying with requirements of ASTM C 90.

3.02 CONSTRUCTION

- A. Construct per applicable provisions of CBC and TMS 602.
- B. Conform to TMS 602 for hot and cold weather masonry construction.

3.03 MORTAR AND GROUT MIXING

- A. Mortar: Shall provide a minimum strength of 1,800 psi.
- B. Grout: Shall provide a minimum strength of 2,000 psi or as indicated in the drawings, whichever is higher. Grout space requirements for coarse and fine grouts shall be per Table 7 of TMS 602. Add Sika Chemical Corp. Grout Aid per manufacturer's instructions.
- C. Measurements: Measure in calibrated devices that can be checked at any time.
 - 1. Add water for workable consistency.
 - 2. Shovel measurements are not permitted.
- D. Mixing: Mix in accordance to TMS 602.
 - 1. Mortar: Mix cementitious materials and aggregates between three and five minutes in a mechanically operated mixer. Mix dry ingredients with a sufficient amount of water to provide a workable mix. Batches of less than one sack of cement, and fractional sack batches are not permitted.
 - 2. Factory Blended Mortar: Mix in accordance with manufacturer's recommendations.
 - 3. Grout: Add sufficient water for a workable mix that will flow into all voids of the masonry without separation or segregation. Grout slump shall be between 8 and 11 inches.
- E. Re-tempering Time Limit: Use mortar within 2 ½ hours after mixing. Discard any mortar that has been mixed longer or that has begun to set. If necessary re-temper within this time limit, by replacing only water lost due to evaporation and by thoroughly remixing.

3.04 INSTALLATION OF MASONRY UNITS

- A. Workmanship: Install masonry plumb and true to line with straight level joints of uniform thickness. Comply with TMS 602 tolerances. Maintain masonry clean during and after installation.
 - 1. Lay-out and incorporate embedded hardware items.
 - 2. Assist other trades with built-in items, which require cutting and fitting of masonry.
 - 3. Cut block units with a diamond saw or carborundum wheel. Trowel or chisel cutting is not permitted.
 - 4. Keep cavities clear of droppings and debris. Remove droppings prior to grouting.
- B. Reinforcing Steel: Install as indicated on Drawings. Except as otherwise indicated, install reinforcement in accordance with standards of Concrete Reinforcing Steel

Institute and to requirements specified in Section 03 2000 - Concrete Reinforcing. Do not splice vertical reinforcement except where indicated on the Drawings.

- C. Shoring: Provide temporary shoring for lintels with sufficient strength to carry load without deflecting. Remove temporary shoring not less than 28 days after masonry has been installed.
- D. Block Installation: Clean dirt and dust from surfaces before installation. Do not wet masonry units.
 - 1. Foundation preparation: Clean top surface of concrete foundation of dirt, projections and laitance before starting masonry construction. Wet saw cutting of units immediately prior to laying is permitted.
 - 2. Install masonry with mortar to required joint thickness. Install blocks with 3/8-inch mortar bed. Fill head joints solid, install tightly to adjoining units. Provide 3/8-inch joint thickness.
 - a. Hold racking to a minimum.
 - b. No toothing is permitted.
 - c. If it becomes necessary to move a unit after it has been installed, remove the unit, discard the mortar, and install the unit in fresh mortar.
 - 3. Anchor Bolts: Provide 1/2-inch minimum grout space between bolts and masonry.
 - 4. Bond: Unless otherwise indicated, install units in common running bond.
 - 5. Finish Joint Treatment: Unless otherwise indicated, cut both interior and exterior joints flush, and tool slightly concave to a dense, uniform surface.
 - 6. Grouting: Unless noted otherwise on Drawings, completely fill cells with grout.
- E. Steel Door Frames:
 - 1. Locate door frames accurately, install plumb, Set frames to floor with powder driven or expansion anchors to floor surface and brace in position before start of masonry installation.
 - a. Frames are specified to be furnished with adjustable anchors.
 - b. Fill interior of frames solid with mortar or grout as walls are constructed.
 - 2. Provide temporary wood spreaders from jamb to jamb and from head to floor to ensure that jambs do not bow-in, distort from a straight line, or deflect from superimposed loads during construction.

3.05 GROUTING

- A. Prior to grouting all cells shall be cleaned so that all spaces to be filled with grout do not contain mortar projections greater than 1/4 inch, loose mortar or foreign material.

- B. Grout materials and water contents shall be controlled to provide adequate fluidity for placement without segregation of the constituents, and shall be mixed thoroughly. Reinforcement shall be properly positioned and solidly embedded in the grout.
- C. The grouting of any section of wall shall be completed in one day with no interruptions greater than one hour.
- D. Between grout pours, a horizontal control joint shall be formed by stopping all wythes at the same elevation and with the grout stopping at 1 ½ inches below a mortar joint, except at the top of the wall. Where bond beams occur, the grout pour shall be stopped a minimum of ½ inch below the top of the masonry.

3.06 LOW-LIFT GROUTING FOR HOLLOW MASONRY UNITS

- A. Grouting shall meet the requirements of CBC Section 2104A.1.3.
- B. After mortar joints have set, cells are cleaned of mortar and debris, and reinforcement is installed and inspected, grout cells in 4-foot maximum lifts. Horizontal and vertical reinforcement shall be held in place within permitted tolerances by suitable devices.
- C. Grout may be installed by pump, tremie or bucket, using hoppers to avoid spilling on exposed surfaces.
- D. All grout shall be consolidated and reconsolidated with a mechanical vibrator after placing so as to completely fill all voids and to consolidate the grout. Grouted walls shall be solid and without voids.

3.07 HIGH-LIFT GROUTING OPTION FOR HOLLOW MASONRY UNITS

- A. Grouting shall meet the requirements of CBC Section 2104A.1.3.
- B. High-lift grouting shall apply only to cell sizes available with 8 inch and wider block units.
- C. Provide bond beam units, inverted for start course, and omit alternate blocks or remove entire face shell of every other unit to allow access to all cells on bottom course for cleanouts.
- D. Plug each cleanout by setting a face shell in mortar into opening and securely bracing it in place to prevent displacement. If masonry is not exposed in finish Work, cleanouts may be formed.
- E. Grouting: Grouting shall be done in a continuous pour in lifts not exceeding 5-foot in height. The grouting of any section of a wall between control barriers shall be completed in one day, with no interruptions greater than one hour.
- F. Consolidating: Grout shall be consolidated by mechanical vibration only, and shall be reconsolidated after excess moisture has been absorbed, but before plasticity is lost. Vibrating of reinforcing steel is not permitted.

3.08 CURING

- A. Remove efflorescence, stains, debris, excess grout, and foreign matter.

- B. During curing, or for any other purpose, do not saturate masonry with water.

3.09 PARGE COAT

- A. Apply parge coat to the earth side of surfaces that are to receive waterproofing.
- B. A Portland cement and sand mix (1:3.5 by volume) or Type S mortar may be used for the parge coat.
- C. Parging should be applied to damp (not saturated) concrete masonry in two 1/4 inch thick layers. The first coat should be roughened when partially set, hardened for 24 hours, and then moistened before second coat is applied. The second coat should be trowelled to a smooth, dense surface.
- D. The parge coat should be beveled at the top to form a wash, and thickened at the bottom to form a cove between the base of the wall and the top of footing.

3.10 CLEANING

- A. At completion of masonry Work, remove misplaced mortar, grout or other foreign substances, and clean surfaces which will be exposed in finish Work with specified cleaner, or with clean water and stiff fiber brushes.
- B. Remove rubbish, debris, and waste materials and legally dispose of off the Project site.

3.11 PROTECTION

- A. Protect the Work of this section until Substantial Completion.

END OF SECTION

SECTION 04 73 00

MANUFACTURED MASONRY VENEER

PART 1 - GENERAL

1.01 SUMMARY

- A. Section Includes: Providing labor, materials, tools and equipment to furnish and install cultured stone veneer, subbase preparation, and mortar bed installation.

1.02 RELATED DOCUMENTS

- A. Related Sections:

1. 05 41 00 - Cold Formed Framing.
2. 07 60 00 – Flashing and Sheet Metal.
3. 07 92 00 – Joint Sealants.
4. 09 24 00 – Portland Cement Plastering.

1.03 REFERENCES

- A. The specifications and recommended practices of the American Concrete Institute (ACI), American Society for Testing and Materials (ASTM), the California Department of Transportation (CalTrans) Standard Specifications, the Construction Specification Institute (CSI), the Standard Specifications for Public Works (Greenbook), and the California Building Code (CBC) referred to in this Specification with their individual designations are to be considered part of this Specification. The latest revision of each recommended practice or specification shall apply.

1.04 SUBMITTALS

- A. Reference - Submittal Procedures; submit following items:

1. Product Data.
2. Samples:
 - a. Standard sample board consisting of small-scale pieces of veneer units showing full range of textures and colors.
 - b. Full range of mortar colors.
3. Verification Samples: Following initial sample selection submit “laid-up” sample board using the selected stone and mortar materials and showing the full range of colors expected in the finished Work; minimum sample size: 3 by 3 feet (1 by 1 m).
4. Quality Assurance/Control Submittals:
 - a. Qualifications:

- 1) Proof of manufacturer qualifications.
- 2) Proof of installer qualifications.
- b. Regulatory Requirements: Evaluation reports.
- c. Veneer manufacturer's installation instructions.
- d. Installation instructions for other materials.

B. Closeout Submittals: Reference Section 01 78 00-Closeout Submittals; submit following items:

1. Maintenance Instructions.
2. Special Warranties.

1.05 QUALITY ASSURANCE

A. Qualifications:

1. Manufacturer Qualifications: Eldorado Stone, LLC.
2. Installer Qualifications: Experienced mason familiar with installation procedures and related local, state and federal codes masonry.

B. Certifications:

1. ICC Evaluation Service - Evaluation Report ESR-1215
2. ASTM C1670
3. UL - Classification listing in Building Materials Directory: UL 546T (F8002)

C. Field Sample:

1. Prepare 4 by 4 foot sample at a location on the structure as selected by the Architect. Use approved selection sample materials and colors.
2. Obtain Architect's approval.
3. Protect and retain sample as a basis for approval of completed manufactured stone work. Approved sample may be incorporated into completed work.

1.06 DELIVERY, STORAGE, AND HANDLING

- A. Reference - Product Storage and Handling Requirements.
- B. Follow manufacturer's instructions.

1.07 PROJECT/SITE CONDITIONS

- A. Environmental Requirements: When air temperature is 40 degrees F (4.5 degrees C)

or below, consult local building code for Cold-Weather Construction requirements.

1.08 WARRANTY

Special Warranty: Manufacturer's standard warranty coverage against defects in materials when installed in accordance with manufacturer's installation instructions.

PART 2 - PRODUCTS

2.01 MANUFACTURER

- A. Basis of Design: Eldorado Stone, LLC
1370 Grand Ave., Bldg. B
San Marcos, CA 92069
- Tel: (800) 925-1491
Fax: (760) 736-3840
E-Mail: customerservice@eldoradostone.com
Website: www.eldoradostone.com

- B. Product: Veneer types as shown on Drawings

2.02 MATERIALS

A. Stone Veneer:

1. Profile: As indicated in drawings. Include matching corner pieces.
2. Stone Accents: As indicated in drawings.
 - a. Color: As shown on Drawings.
 - b. Texture: As indicated in drawings.

B. Veneer Unit properties: Precast veneer units consisting of portland cement, lightweight aggregates, and mineral oxide pigments.

1. Compressive Strength: ASTM C 192 and ASTM C 39, 5 sample average: greater than 1,800 psi (12.4MPa).
2. Shear Bond: ASTM C 482: 50 psi (345kPa), minimum.
3. Freeze-Thaw Test: ASTM C 67: Less than 3 percent weight loss and no disintegration.
4. Thermal Resistance: ASTM C 177: 0.473 at 1.387 inches thick
5. Weight per square foot: 2012 IBC and 2012 IRC, ASTM C1670, 15 pounds, saturated.

C. Weather Barrier: [ASTM D 226, Type 1, No. 15, non-perforated asphalt-saturated felt paper] [UBC Standard 14-1, kraft waterproof building paper] or [UBC Standard No.

14-1, Kraft Waterproof Building Paper] or [ICC AC-38, synthetic house wrap]

D. Reinforcing: [ASTM C 847, 2.5lb/yd² (1.4kg/m²) galvanized expanded metal lath]
[ASTM C 847, 3.4lb (1.8 kg/m²) galvanized 3/8" rib lath] [ASTM C 1032, 17
gauge (1.3 mm) woven wire mesh] [ASTM C933 Welded Wire Lath] complying
with code agency requirements for the type of substrate over which stone veneer is
installed.

E. Mortar:

1. Cement: Portland cement complying with ASTM C 1329.
2. Lime: ASTM C 207.
3. Sand: ASTM C 144, natural or manufactured sand.
4. Color Pigment: ASTM C 979, mineral oxide pigments.
5. Water: Potable.
6. Pre-Packaged Latex-Portland Cement Mortar: ANSI A118.4.

F. Bonding Agent: Exterior integral bonding agent meeting [ASTM C 932] [ASTM C 1059 Type
II]

G. Water Repellent: Water based silane or siloxane masonry water repellent

2.03 MORTAR MIXES

A. Standard Installation (Grouted Joints):

1. Mix mortar in accordance with ASTM C 270,
2. Polymer modified mortar complying with ANSI A118.4
 - a. Add color pigment in grout joint mortar in accordance with pigment
manufacturer's instructions not to exceed 10% by weight of cement.

B. Jointless/Dry-Stacked Installation:

1. Polymer modified mortar complying with ANSI A118.4
2. Mortar prepared to comply with ASTM C270. Type S mortar.
 - a. Add color pigment in accordance with pigment manufacturer's instructions

PART 3 - EXECUTION

3.01 EXAMINATION

A. Examine substrates upon which work will be installed.

B. Coordinate with responsible entity to perform corrective work on unsatisfactory substrates.

C. Commencement of work by installer is acceptance of substrate.

3.02 PREPARATION

A. Protection: Protect adjacent work from contact with mortar.

B. Surface Preparation: Prepare substrate in accordance with manufacturer's installation instructions for the type of substrate being covered.

3.03 INSTALLATION

A. Install and clean stone in accordance with manufacturer's installation instructions for Standard Installation (Grouted Joint) or Jointless/Dry-Stacked installation as specified above.

B. Apply repellent in accordance with repellent manufacturer's application instructions.

3.04 CLEANING

A. Reference Section 01 74 00 □ Cleaning and Waste Management.

B. Remove protective coverings from adjacent work.

C. Cleaning Veneer Units:

1. Wash with soft bristle brush and water/granulated detergent solution
2. Rinse immediately with clean water

D. Removing Efflorescence:

1. Allow veneer to dry thoroughly
2. Scrub with soft bristle brush and clean water
3. Rinse immediately with clean water; allow to dry
4. If efflorescence is still visible, contact ES Customer Service for assistance

END OF SECTION

SECTION 05 05 13

HOT-DIP GALVANIZING

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Hot-dip galvanizing of structural steel articles.
2. Hot-dip galvanizing of fabricated steel assemblies.
3. Preparation of galvanized steel assemblies for painting.

B. Related Sections:

1. Division 01 - General Requirements.
2. Section 05 12 00: Structural Steel Framing.
3. Section 05 50 00: Metal Fabrications.
4. Section 05 51 00: Metal Stairs and Railings.
5. Section 09 90 00: Painting and Coating.

1.02 REFERENCES

A. American Galvanizers Association (AGA):

6. SSPC-SP10 – Near White Blast Cleaning.
7. SSPC-SP11 – Power Tool Cleaning to Bare Metal.
8. SSPC-SP16 - Brush-Off Blast Cleaning of Coated and Uncoated Galvanized Steel, Stainless Steels, and Non-Ferrous Metals.

1.03 COORDINATION WITH STEEL FABRICATOR

- A. Prior to fabrication, steel fabricators shall submit approved fabrication shop drawings to the galvanizer. The Galvanizer shall review fabricator shop drawings for suitability of materials for galvanizing and coatings and coordinate any required fabrication modifications.

- B. Steel Fabricator shall notify the galvanizer of steel fabrications that exceed the ASTM A385 recommended percentages for carbon, phosphorus, manganese and silicon, so special galvanizing processing techniques are used.
- C. Coordinate with steel fabricator appropriate marking and masking materials.

1.04 QUALITY ASSURANCE

- A. Coating Applicator: Company specializing in hot-dip galvanizing after fabrication following the procedures in the Quality Assurance Manual of the American Galvanizers Association.
- B. Galvanizer shall have an in-plant inspection program designed to maintain the coating thickness, finish, and appearance within the requirements of this Section.

1.05 SUBMITTALS

- A. Galvanizing Certificate of Compliance: Provide notarized Certificate of Compliance with ASTM standards and specifications herein listed. The Certificate shall be signed by the galvanizer and contain a detailed description of the material processed. The Certificate shall include information as to the ASTM standard used for the coating.

1.06 DELIVERY, STORAGE AND HANDLING

- A. Package and handle galvanized material in a manner which will avoid damage to the zinc coating.
- B. Store in dry, well-ventilated conditions until shipping.

PART 2 - PRODUCTS

2.01 MATERIALS

- A. Steel for Galvanizing: As specified in Sections:
 - 1. Section 05 12 00: Structural Steel Framing.
 - 2. Section 05 50 00: Metal Fabrications.
 - 3. Section 05 51 00: Metal Stairs and Railings.
- B. Zinc for Galvanizing: Conform to ASTM B6, as specified in ASTM A123.

PART 3 – EXECUTION

3.01 PREPARATION

- A. Remove welding slag, splatter, anti-splatter compounds and burrs remaining in steel articles.
- B. Provide drainage and venting holes in tubular assemblies. In thicker material drill holes in place of punching. Holes shall have a relatively uniform circumference. Punched holes or burned holes with a plasma torch shall be treated with a drill to even the diameter to appropriate size.
- C. Masking installed by steel fabricator shall remain in place through galvanizing process completion.
- D. Provide lifting lugs to allow for handling during galvanizing. Avoid the use of chains or wires directly connected to steel articles.
- E. Safeguard against warpage or distortion of steel members in accordance with ASTM A384.
- F. Pre-clean steel work in accordance with accepted methods to produce an acceptable surface for quality hot-dip galvanizing. Remove surface contaminants and coatings that are not removable by the normal chemical cleaning process in the galvanizing operation by grit-blasting, sand-blasting, or other mechanical means.
- G. Follow the degreasing, pickling and fluxing steps to remove remaining oxides and to deposit a protective layer on the steel to prevent any further oxides from forming on the surface prior to immersion in the molten zinc.

3.02 COATING APPLICATION

- A. Galvanize steel articles, fabrications and assemblies by the hot-dip process in accordance with ASTM A123. The bath chemistry shall be as specified by ASTM B6, and requires at least 98% pure zinc maintained at approximately 840 F.
- B. Galvanize bolts, nuts, washers and iron and steel hardware components in accordance with ASTM A153.
- C. Safeguard products against steel embrittlement in conformance with ASTM A143.
- D. Once the fabricated items' coating growth is complete, withdraw slowly from the galvanizing bath, and remove the excess zinc by draining, vibrating, and/or centrifuging.
- E. Prepare galvanized products for powder coating in accordance to ASTM D7803. Prepare galvanized products for painting in accordance to ASTM D6386.
- F. Handle articles to be galvanized in such a manner as to avoid mechanical damage and to minimize distortion.
- G. Apply a chromate passivation treatment to fabrications that will not be painted after galvanizing to minimize the wet storage staining which may occur on articles unable to be stored in dry, well-ventilated conditions.

3.03 COATING REQUIREMENTS

- A. Conform to paragraph 6.1 of ASTM A123, or Table 1 of ASTM A153, as applicable.
- B. Surface Finish: Continuous, adherent, as smooth and evenly distributed as possible and free from any defect detrimental to the stated end use of the coated article
- C. Adhesion: Withstand normal handling consistent with the nature and thickness of the coating and normal use of the article.

3.04 TESTS

- A. Inspection and testing of hot-dip galvanized coatings shall be done under the guidelines provided in the AGA publication Inspection of Products Hot-dip Galvanized after Fabrication. Tests and inspections shall be performed immediately after the coating is applied and has cooled to ambient temperature, and before it leaves the galvanizing facility.
- B. Include visual examination and test methods in accordance with ASTM A123, or A153, as applicable, to determine the thickness of the zinc coating on the metal surface.
- C. During the visual inspection, if adhesion concerns are suspected, such as peeling or flaking of the galvanized coating, then adhesion testing using the stout knife method shall be conducted. Embrittlement testing is required when there is evidence of embrittlement and shall be conducted per the requirements of ASTM A143.
- D. Upon completion of tests furnish notarized Certificate of Compliance with ASTM standards and specifications herein listed.

3.05 REPAIR OF DAMAGED COATINGS

- A. Smooth out rough surfaces, bumpy or high spots and icicles by hand filing or power sanding the area without removing any more zinc coating than necessary. Repair damaged galvanized surface with a zinc rich coating.
- B. Repair areas damaged during galvanizing process or handling by one of the approved methods in accordance with ASTM A780 whenever damage exceeds 3/16" in width. Minimum thickness requirements for the repair shall be per ASTM A123, Section 6.2.
- C. Remove lifting lugs and repair coating with a zinc rich coating.
- D. Surface preparation for application of zinc rich coating shall be in accordance to ASTM A780.
 - 1. Clean areas in accordance to SSPC-SP2.

2. Prepare surface for zinc spray in accordance to SSPC-SP5, or zinc rich paint repair in accordance to SSPC-SP10.

3.06 PREPARATION FOR TOP COATING

- A. Galvanized fabrications indicated on the drawings to be painted shall be prepared in accordance to ASTM D6836.
 1. Surface cleaning prior to surface preparation in accordance to SSPC-SP1.
 2. Removal of zinc high spots and cleaning of light deposits of zinc reaction products in accordance to SSPC-SP2 or SSPC-SP3.
 3. Profile surface in accordance to SSPC-SP7 or SSPC-SP11.
- B. Galvanized fabrications indicated on the drawings to be powder coated shall be prepared in accordance to ASTM D7803.
 1. Surface cleaning and removal of oil and grease in accordance to SSPC-1.
 2. Surface smoothing and removal of loose particles in accordance to SSPC-SP-2 or SSPC-SP3.
 3. Sweep blasting and surface profiling in accordance to SSPC-SP16.

END OF SECTION

SECTION 05 05 22

METAL WELDING

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Welding Rod/Electrodes
2. Stud Shear Connectors
3. Shop and Field Welding
4. Inspections and Tests by the Contractor
5. Inspections and Tests by the Engineer

B. Related Requirements:

1. Section 05 05 13 – Hot-Dip Galvanizing.
2. Section 05 10 00 – Metal Stairs and Railings.
3. Section 05 30 00 - Metal Decking.
4. Section 05 50 00 - Metal Fabrications..
5. Section 09 90 00 - Paints and Coatings.

E. SSPC – Steel Structures Painting Council:

1. SSPC-SP2 - Hand Tool Cleaning.
2. SSPC-PA-1 - Shop, Field and Maintenance Coating of Metals.

1.03 REGULATORY REQUIREMENTS

A. In addition to the foregoing referenced standards, the regulatory requirements that govern the work of this Section include the following code:

1. SSPC-SP2 - Hand Tool Cleaning. California Code of Regulations, Title 24, Part 2, California Building Code
2. California Occupational Safety and Health Administration (Cal/OSHA)

1.04 SUBMITTALS

A. General: Refer to Submittal Procedures, and for Shop Drawings, Product Data, and Samples, for submittal requirements and procedures. For Shop Drawings and other submittals, employ the standard welding symbols of AWS A2.4 and the standard welding terms of AWS A3.0M/A3.0.

B. Welder Qualifications: Submit copies of qualification test records for each welder, welding operator, and tack welder to be employed in the work. Comply with

requirements of AWS D1.1/D1.1M. For bridgework, comply with requirements of AWS D1.5M/D1.5. For seismic provisions, comply with requirement of AWS D1.8/D1.8M. For aluminum welders, comply with AWS D1.2/D1.2M. For pipe and tube, comply with requirements of AWS B2.1/B2.1M.

1. Submit welders identification marks (I.D.) for each welder along with qualifications.
- C. Welding Procedure Specifications (WPS): Prior to commencement of welding, submit the procedure specifications that will be used for welding. The WPS shall contain all data indicated in AWS D1.1/D1.1M Annex P, and any other information necessary to produce welded joints in compliance with this specification. For procedures other than those prequalified in accordance with AWS D1.1/D1.1M, D1.2/D1.2M, D1.5M/D1.5, and D1.8/D1.8M, submit a copy of procedure qualification test records in accordance with the qualification requirements of AWS D1.1/D1.1M, AWS D1.2/D1.2M, AWS D1.5M/D1.5, and AWS D1.8/D1.8M as applicable. WPS shall also include the mitigation of corrosion of welds, including heat treatment and chemical compatibility, as applicable.
- D. Welding Records and Data:
1. Submit all radiographs upon completion of fabrication.
 2. Submit certifications that magnetic particle and dye-penetrant inspections have been satisfactorily completed.
 3. Submit records of ultrasonic testing upon completion.
 4. If field welding is permitted, submit descriptive data for field welding equipment.
- E. Mill Certificates: Submit mill certificates and certified copy of reports for analyses and tests required by referenced ASTM and AWS specifications

1.05 QUALITY ASSURANCE

- A. Qualification of Welders and Welding Procedures: Welders, welding operators, tack welders, and welding procedures shall be prequalified or qualified in accordance with the following AWS Welding Codes and Standards:
1. Structural Steel: AWS D1.1/D1.1M, Section 4, Qualification. Includes steel for miscellaneous metalwork, steel stairs, and railings.
 2. Stud Welding: AWS D1.1/D1.1M, Section 7.6, Stud Application Qualification Requirements.
 3. Structural Aluminum: AWS D1.2/D1.2M, Section 3, Qualification.
 4. Sheet Steel (Structural): AWS D1.3/D1.3M, Section 4, Qualification. Prequalification is not applicable to sheet steel.
 5. Concrete Reinforcing Steel: AWS D1.4/D1.4M, Section 4, Qualification.
 6. Seismic Supplement: AWS D1.8/D1.8M, Section 5, Welder Qualification.

7. Sheet Metal:
 - a. Welders: AWS D9.1M/D9.1, Section 6, Qualification of Arc Welders and Arc Welding Operators, and Section 11, Qualification of Braze Welders and Braze Welding Operators.
 - b. Welding Procedures: AWS D9.1M/D9.1, Section 5, Arc Welding Procedure Qualification, and Section 10, Braze Welding Procedure Qualification.
8. Pipe and Tube: AWS B2.1/B2.1M
- B. Qualification of Welding Inspector: Welds to be inspected by the Contractor shall be inspected and certified by a Contractor-employed AWS Certified Welding Inspector (CWI), certified in accordance with AWS QC1.
- C. Qualification of Personnel Performing Nondestructive Testing: Personnel performing nondestructive testing, who are Contractor-employed, shall be qualified and certified in accordance with SNT-TC-1A. Only persons certified for NDT Level I and working under a NDT Level II or III person or persons certified for NDT Level II or III may perform nondestructive testing.
- D. Weldability of Steel: For structural steel requiring impact test qualification and for corrosion-resistant structural steel, the weldability of the steel and the procedures for welding it shall be established by qualification in accordance with AWS D1.1/D1.1M, Section 4.
- E. Qualification of Stud-Connector Manufacturer: Stud shear connector manufacturer shall be qualified in accordance with AWS D1.1/D1.1M, Section 7.9, Manufacturers Stud Base Qualification Requirements.
- F. Stud Welding Standards: For stud welding, comply with applicable requirements of AWS C5.4 for steel and stainless steel, and AWS D1.2/D1.2M, Section 6, for aluminum.
- G. Moment-Resisting Frames: Welding of beam-to-column joint connections in moment-resisting frames shall conform with ANSI/AISC 341, ANSI/AISC 360, and AWS D1.8/D1.8M.
- H. Iron Contamination of Stainless Steel: Iron contamination of stainless steel will not be accepted. Welds shall be ground smooth and polished at the factory to blend in with the surrounding finish surfaces. Refer also to Section 05 70 00, Decorative Metal, for requirements..

PART 2 - PRODUCTS

2.01 WELDING ROD/ELECTRODES

- A. Electrodes for structural plate, shapes, pipe, tubes, and bars shall conform with AWS A5 Series Standards and shall be coated rods or wire of size and classification number as recommended by their manufacturers for the positions and other conditions of actual use.

Matching filler metal requirements shall conform with AWS D1.1/D1.1M, AWS D1.5M/D1.5 and AWS D1.8/D1.8M, as applicable.

- B. Electrodes for sheet steel shall conform with AWS A5 Series Standards and shall be coated rods or wire of size and classification number as recommended by their manufacturers for the positions and other conditions of actual use. Matching filler metal requirements shall conform with AWS D1.3/D1.3M.
- C. Welding electrodes and welding rods for stainless steel shall conform with AWS A5.4 and AWS A5.9 as recommended by their manufacturers for the positions and other conditions of actual use. Matching filler metals shall be compatible with the Type 316 or Type 304 stainless steel, as applicable.
- D. Electrodes for aluminum shall conform with AWS A5.10 and AWS A5 Series Standards and shall be coated rods or wire of size and classification number as recommended by their manufacturers for the positions and other conditions of actual use. Matching filler metal requirements shall conform with AWS D1.2/D1.2M.

2.02 STUD SHEAR CONNECTORS

- A. Only products of manufacturers qualified in accordance with AWS D1.1/D1.1M, will be accepted for this work.

2.03 SHOP WELDING

- A. Perform shop welding as indicated in accordance with the California Building Code, AWS D1.1/D1.1M, AWS D1.2/D1.2M, AWS D1.3/D1.3M, AWS D1.5M/D1.5, AWS D1.8/D1.8M and AWS D9.1M/D9.1, as applicable to the work.
- B. Welders shall mark adjacent to completed welds their welder I.D., using metal stamp, metal engraving, keel, paint stick, or other appropriate marking material.
- C. Welding of stud shear connectors shall conform with AWS D1.1/D1.1M, Section 7, Stud Welding, AWS C5.4, Practices for stud welding and the stud manufacturer's instructions.
- D. Welding of stainless steel pipe and tube shall conform with applicable requirements of AWS D10.4. E. All groove welds shall be complete penetration welds unless otherwise indicated.

2.04 INSPECTIONS AND TESTS BY THE CONTRACTOR

- A. Testing and Inspection: Testing and Inspection of welds shall proceed 24 hours after the completion of welding unless the Engineer has approved for a later time.
- B. B. Visual Inspection: All welds shall be visibly examined in accordance with AWS D1.1/D1.1M, AWS D1.5M/D1.5, and AWS D1.8/D1.8M, as applicable. Quality of welds and standards of acceptance shall be in accordance with AWS D1.1/D1.1M and AWS D1.5M/D1.5.
- C. C. Nondestructive Testing: Nondestructive testing shall conform with AWS B1.10M/B1.10.

- D. D. Radiographic Testing: Radiographic testing of welds shall conform with AWS D1.1/D1.1M, AWS D1.5M/D1.5 and ASTM E94, and ASTM E1032, as applicable. Complete joint penetration groove welds shall be tested as follows: 1. 10 percent with thickness equal to or less than 3/4 inch. 2. 50 percent with thickness greater than 3/4 inch and equal to or less than 1-1/2 inches. 3. 100 percent for thickness greater than 1-1/2 inches.
- E. E. Ultrasonic Testing: Ultrasonic testing of welds shall conform with AWS D1.1/D1.1M, AWS D1.5M/D1.5 and ASTM E164, as applicable. Complete joint penetration groove welds not accessible for radiographic testing shall, with Engineer's approval, be subjected to ultrasonic testing.
- F. F. Magnetic Particle Inspection: Magnetic particle inspection of welds shall conform with ASTM E709. Complete and partial joint penetration groove welds and fillet welds shall be inspected as follows: 1. 20 percent of complete joint penetration groove welds of tee and corner joints. 2. 10 percent of partial joint penetration groove welds and fillet welds.
- G. G. Liquid Penetrant Inspection: Liquid dye penetrant inspection of welds shall conform with ASTM E165/E165M. Liquid penetrant inspection shall be used for detecting discontinuities that are open to the surface.
- H. H. Test Results: Test result information shall be forwarded to the Engineer immediately after test results are available, stating the acceptance or rejection of fabricated components, so that repairs and reinspection or testing may be performed as soon as possible.
- I. I. Testing for Unacceptable Welds: If the herein specified testing or inspection indicated any failure weld or resulted in any unacceptable weld, the Contractor has to perform the same testing or inspection on a separate batch of welds other than the batches that were tested. This process shall be repeated until all welds in the same batch have passed the testing or inspection and are acceptable by the Engineer.
- J. J. Repairs: Unacceptable welds shall be repaired in accordance with AWS D1.1/D1.1M, AWS D1.5M/D1.5, and AWS D1.8/D1.8M, as applicable. Repaired or corrected welds shall be reinspected or retested as specified for the original weld.

2.05 INSPECTIONS AND TESTS BY THE ENGINEER

- A. All welds are subject to inspections and tests by the Engineer as specified herein. Welds to be inspected and tested by the Engineer will be selected at random.
- B. The Engineer will make test results available to the Contractor.

PART 3 - EXECUTION

3.01 FIELD WELDING

- A. Field welding, where indicated or permitted by the Engineer, shall be performed as herein specified for shop welding and comply with CAL/OSHA requirements. The Contractor shall identify a risk for fire damage and maintain a fire watch during the work as approved by the Engineer.

3.02 INSPECTIONS AND TESTS

- A. The Contractor shall perform inspections and tests of field welds as herein specified for shop welds.
- B. The Engineer reserves the right to perform inspections and tests of field welds as herein specified for shop welds.

3.03 CLEANING

- A. Welds shall be cleaned in accordance with AWS D1.1/D1.1M.
- B. Welds of stainless steel shall be cleaned in accordance with Section 05 70 00, Decorative Metal, Article 3.02, Cleaning of Stainless Steel, and shall be protected from damage and corrosion at the factory, during shipping, and at the jobsite until acceptance of the work by the Engineer.

 21. ASTM F1852 – Standard Specification for Twist Off Type Tension Control Structural Bolt/Nut/Washer Assemblies, Steel, Heat Treated, 120/105 ksi Minimum Tensile Strength.
- D. American Welding Society (AWS):
1. AWS D1.1 – Structural Welding Code - Steel.
 2. AWS D1.8 – Structural Welding Code – Seismic Supplement.
 3. AWS A2.4 – Standard Symbols for Welding, Brazing, and Nondestructive Examination.
 4. AWS B2.1 – Base Metal Grouping for Welding Procedure and Performance Qualification.
- E. SSPC – Steel Structures Painting Council:
1. SSPC-SP2 - Hand Tool Cleaning.
 2. SSPC-PA-1 - Shop, Field and Maintenance Coating of Metals.
- 1.03 REGULATORY REQUIREMENTS
- A. Structural steel shall conform to CBC requirements, except that steel manufactured by acid Bessemer process is not permitted for structural purposes.
 - B. Sheet and strip steel other than those listed in CBC, if provided for structural purpose, shall comply with the code requirements.
- 1.04 SUBMITTALS
- A. Shop Drawings: Submit Shop Drawings, including complete details and schedules for fabrication and shop assembly of members, and details, schedules, procedures and diagrams showing the sequence of erection. Fully detail minor connections and fastenings not shown or specified in the Contract Documents to meet required conditions using similar detailing as shown in the Contract Documents. Include a fully detailed, well controlled sequence and technique plan for shop and field welding that minimizes locked in stresses and distortion; submit sequence and technique plan for review by the ARCHITECT.
 1. Include details of cuts, connections, camber, and holes in accordance with Figure 4.5 of AWS D1.1 or AISC Chapter J, weld position plan and other pertinent data. Indicate welds by standard AWS symbols, and show size, length and type of each weld.
 2. Provide setting drawings, templates, and directions for installation of anchor bolts and other anchorages to be installed for Work specified in other sections.

3. Erection and Bracing Plan and Erection Procedure: Submit an erection and framing plan, including columns, beams, and girders, signed and sealed by a Structural or Civil Engineer registered in the State of California in accordance with Title 8 California Code of Regulations, Section 1710, Structural Steel Erection. Maintain a copy at the Project site as required by the California Division of Industrial Safety.
 4. Submit a list of steel items to be galvanized.
 5. Include identification and details of Architecturally Exposed Structural Steel (AESS) members, if applicable.
- B. Product Data: Submit copies of fabricator's specifications and installation instructions for the following products. Include laboratory test reports and other data required demonstrating compliance with these Specifications:
1. Structural steel, each type; including certified copies of mill reports covering chemical and physical properties.
 2. Welding electrodes.
 3. Welding gas.
 4. Unfinished bolts and nuts.
 5. Structural steel primer paint.
 6. High-strength bolts, including nuts and washers.
- C. Manufacturer's Mill Certificate: Submit, certifying that products meet or exceed specified requirements.
- D. Mill Test Reports: Submit manufacturer's certificates, indicating structural yield and tensile strength, destructive and non-destructive test analysis.
- E. Charpy-V-Notch (CVN) Impact Test: Submit certified copies of Charpy-V-Notch (CVN) Impact Test by the manufacturer for applicable steel members and components.
1. Charpy-V-Notch (CVN) Impact Test for Base Metal: Moment frame columns and girders subjected to Charpy-V-Notch impact test in accordance with "Seismic Provisions for Structural Steel Buildings", Part I, Section 6.3, as modified by Supplement 1.
 2. Charpy-V-Notch test shall be performed by the manufacturer employing Test Frequency (P) in accordance with ASTM A673 and utilizing standard specimen sizes shown in Figure 6 of ASTM E23.
- F. Submit certified copies of tests by manufacturer for fine grain practice. Structural steel base material, as described above, shall be manufactured to be fully killed and fine grained having grain size number 5 or better as determined by ASTM E112.
- G. Welding Procedure Specifications (WPS): Submit weld procedures for all welding on project to OWNER's testing laboratory for approval. After approval by testing

laboratory, submit to ARCHITECT for Record. Weld procedures shall be qualified as described in AWS D1.5, AISC 341 and AISC 358, as applicable. Weld procedures shall indicate joints details and tolerances, preheat and interpass temperature, post-heat treatment, single or multiple stringer passes, peening of stringer passes for groove welds except for the first and the last pass, electrode type and size, welding current, polarity and amperes and root treatment. The welding variables for each stringer pass shall be recorded and averaged; from these averages the weld heat input shall be calculated. Submit the manufacturer's product data sheet for all welding material used.

- H. Welder's Certificates: Field welders shall be Project certified in accordance with AWS D1.1. Shop welders shall be Project certified for FCAW in accordance with AWS D1.1.
- I. Test Reports: Submit reports of tests conducted on shop and field welded and bolted connections. Include data on type of test conducted and test results.
- J. Welding Material Certification: Provide certificate that welding material complies with specifications. Submit to OWNER's testing laboratory.

1.05 QUALITY ASSURANCE

- A. Comply with the following as a minimum requirement, except as otherwise indicated:
 - 1. American Institute of Steel Construction (AISC) "Code of Standard Practice for Steel Buildings and Bridges, modified as follows:
 - a. Replace "Structural Design Drawings" with "Contract Documents" throughout the document.
 - b. Paragraph 3.2 is hereby modified in its entirety as follows: "Contract Documents including but not limited to architectural, mechanical, plumbing, electrical, civil and kitchen design drawings and specifications shall be used as supplement to the structural plans to define configurations and construction information."
 - c. Delete Paragraph 3.3.
 - d. In Paragraph 4.4, delete the following sentence: "These drawings shall be returned to the Fabricator within 14 calendar days."
 - e. Delete Paragraph 4.4.1.(a) in its entirety.
 - f. Paragraph 4.4.2 is hereby modified in its entirety as follows: "No review action, implicit or explicit, shall be interpreted to authorize changes in the Contract Documents."
 - 2. Perform welding in accordance with AWS Standards, AWS D1.1, and California Building Code Section 2204A.1 and approved Weld Procedure Specifications (WPS).

3. Welding for moment frames shall be in compliance with AISC 341 and AISC 358.

B. Shop fabrication shall be inspected in accordance with CBC.

C. Erect mock-up panel of fabricated structural steel meeting Architecturally Exposed Structural Steel (AESS) tolerances for exposed areas. Approval by ARCHITECT is required. Mock-up to remain for comparison but may not be left as part of the work.

1.06 DELIVERY, STORAGE AND HANDLING

A. Store structural steel above grade on platforms, skids or other supports.

B. Protect steel from corrosion.

C. Store welding electrodes in accordance with AWS D 12.1.

D. Store other materials in a weather-tight and dry place until installed into the Work.

PART 2 - PRODUCTS

2.01 GENERAL

A. Stock Materials: Provide exact materials, sections, shapes, thickness, sizes, weights, and details of construction indicated on Drawings. Changes because of material stock or shop practices will be considered if net area of shape or section is not reduced thereby, if material and structural properties are at least equivalent, and if overall dimensions are not exceeded.

B. Shapes, bars, plates, tubes and pipes shall be made of materials with at least 16 percent recycled content if produced from Basic Oxygen Furnace (BOF) or at least 67 percent recycled content if produced from Electric Arc Furnace (EAF).

2.02 MATERIALS

A. Structural Steel: Wide flange shapes shall conform to ASTM A992 grade 50. Other steel shall conform to ASTM A36.

B. Unfinished Threaded Fasteners: ASTM A307, Grade A, regular low carbon bolts and nuts.

C. High-Strength Threaded Fasteners: ASTM F3125 or ASTM F959 quenched and tempered, steel bolts, nuts and washers.

D. Primers: Lead-free metal primer:

1. SSPC-Paint 20, Zinc-Rich Coating Inorganic and Organic.

2. SSPC-Paint 23, Latex Primer for Steel Surfaces.

- E. Steel Pipe: ASTM A53, Type E or S, Grade B.
- F. Structural Tubing:
 - 1. Hot-formed, ASTM A501.
 - 2. Cold-formed, ASTM A500, Grade B.
- G. Galvanizing: ASTM A123.
- H. Welding Electrodes: Provide electrodes recommended by manufacturer for seismic connections. Comply with AISC 341.
- I. Shear stud connectors: ASTM A108, Grade 1015 forged steel, headed, uncoated, granular flux filled shear connector or anchor studs by Nelson Stud Welding Division, or equal.
- J. Grout: ASTM C1107, non-shrink type, pre-mixed compound consisting of non-metallic aggregate, cement, water reducing and plasticizing additives, capable of developing a minimum compressive strength of 7,000 psi at seven days; of consistency suitable for application and a 30 minute working time.

2.03 FABRICATION

- A. Fabricate in accordance to AISC Code of Standard Practice for Steel Buildings and Bridges and AISC 360.
- B. Cleaning and Straightening Materials: Materials being fabricated shall be thoroughly cleaned of scale and rust, and straightened before fabrication. Cleaning and straightening methods shall not damage material. After punching or fabrication of component parts of a member, twists or bends shall be removed before parts are assembled.
- C. Cutting, Punching, Drilling and Tapping: Unless otherwise indicated or specified, structural steel fabricator shall perform the cutting, punching, drilling and tapping of Work so that Work of other trades will properly connect to steel Work.
- D. Milling: Compression joints depending on contact bearing shall be furnished with bearing surfaces prepared to a common plane by milling.
- E. Use of Burning Torch: Oxygen cutting of members shall be performed by machine. Gouges greater than 3/16 inch that remain from cutting shall be removed by grinding. Reentrant corners shall be shaped notch free to a radius of at least 1/2 inch. Gas cutting of holes for bolts or rivets is not permitted.
- F. Galvanizing: After fabrication, items indicated or specified to be galvanized shall be galvanized per Section 05 50 13, Hot-Dip Galvanizing.
- G. Welding:
 - 1. Type of steel furnished in welded structures shall provide chemical properties suitable for welding as determined by chemical analysis. Welds shall conform

- to the verification and inspection requirements of CBC Chapter 17A. Conform to AWS D1.1, and CBC Chapter 22A.
2. Materials and workmanship shall conform to the requirements specified herein and to CBC requirements, modified as follows:
 - a. No welded splices shall be permitted except those indicated on Drawings unless specifically reviewed by the ARCHITECT.
 - b. Drawings will designate joints in which it is important that welding sequence and technique be controlled to minimize shrinkage stresses and distortion.
 3. Welding shall be performed in accordance with requirements of the AWS Structural Welding Code.
 - a. Welded Joint Details: Comply with AISC 341, AISC 358 and drawing details.
 4. Architecturally Exposed Structural Steel: Verify that weld sizes, fabrication sequence, and equipment used for Architecturally Exposed Structural Steel will limit distortions to allowable tolerances. Prevent surface bleeding of back-side welding on exposed steel surfaces. Grind smooth exposed fillet welds ½ inch and larger. Grind flush butt welds. Dress exposed welds.
 5. Remove erection bolts on welded, Architecturally Exposed Structural Steel; fill holes with plug welds; and grind smooth at exposed surfaces.
- H. Shop Finish:
1. Notify the Project Inspector when Work is ready to receive shop prime coat. Work shall be inspected by the Project Inspector before installation of primer.
 2. Structural steel and fittings shall receive a coat of primer, except:
 - a. Surfaces that will be galvanized.
 - b. Surfaces that will be fireproofed.
 - c. Surfaces that will be field welded.
 - d. Surfaces in contact with concrete.
 - e. Surfaces high strength bolted.
 3. The primer specified shall be spray applied, filling joints and corners and covering surfaces with a smooth unbroken film. The minimum dry film thickness of the primer shall be 2.0 mils.
- I. Comply with fabrication tolerance limits of AISC’s “Code of Standard Practice for Steel Buildings and Bridges” for structural steel.
- J. Fabricate Architecturally Exposed Structural Steel with exposed surfaces smooth, square, and free of surfaces blemishes, including pitting, rust and scale seam marks, roller marks, rolled trade names, and roughness.

1. Remove blemishes by filling, grinding, or by welding and grinding, prior to cleaning, treating and shop priming.
 2. Comply with fabrication requirements, including tolerance limits of AISC's "Code of Standard Practice for Steel Buildings and Bridges" for Architecturally Exposed Structural Steel.
- K. Architecturally Exposed Structural Steel: use special care in unloading, handling and erecting the steel to avoid marking or distorting the steel members. Minimize damage to any shop paint when temporary braces or erection clips are used. Avoid unsightly surfaces upon removal. Grind smooth tack welds and holes filled with weld metal or body solder. Plan and execute all operations in such a manner that the close fit and neat appearance of the structure will not be impaired.
- L. Reduced Beam Sections (RBS's): Fabrication of RBS's as defined in AISC 341 and AISC 358.

2.04 SHOP AND FIELD QUALITY CONTROL

- A. A special inspector, approved by the city to inspect the Work of this section, shall inspect high-strength bolted connections. OWNER will provide an approved independent testing laboratory to perform tests and prepare test reports in accordance with CBC 1704A. The Project Inspector shall be responsible for monitoring the work of the special inspector and testing laboratories to ensure that the testing program is satisfactorily completed.
- B. An AWS certified welding inspector (CWI), approved by the city to inspect the Work of this section, shall inspect welded connections in accordance with CBC 1705A.2.5. The OWNER will provide an approved independent testing laboratory to perform tests and prepare test reports. The Project Inspector shall be responsible for monitoring the work of the special inspector and testing laboratories to ensure that the testing program is satisfactorily completed.
- C. The independent testing laboratory shall conduct and interpret test and state in each report whether test specimens comply with requirements, and specifically state any deviations there from.
- D. Provide access to all places where structural steel Work is being fabricated or produced so required inspection and testing can be performed.
- E. The independent testing laboratory may inspect or test structural steel at plant before shipment; however, ARCHITECT reserves the right at any time before Contract Completion to deem materials not in compliance with the specified requirements as defective Work.
- F. Correct defects in structural Work when inspections and laboratory test reports indicate noncompliance with specified requirements. Perform additional tests as may be required to reconfirm noncompliance of original Work, and as may be required to show demonstrate compliance of corrected Work.

- G. Inspection of Structural Tube Steel/Hollow Structural Sections (HSS): Structural tube steel members (round, square, rectangular), disregarding steel origin, will be inspected during shop fabrication. Inspector will perform a visual examination of the seam weld area for visible discontinuities. When defects are suspected, non-destructive testing will be considered.
- H. Welding: Inspect and test during fabrication and erection of structural steel assemblies as follows:
1. Certify welders and conduct inspections and tests as required. Record types and locations of defects found in the Work. Record Work required and performed to correct deficiencies.
 2. Inspect welds. Welds shall be visually inspected before performing any non-destructive testing. Groove weld shall be inspected by ultrasonic or other approved non-destructive test methods. Testing shall be performed to AWS D1.1 Table 6.3 cyclically loaded non-tubular connections.
 3. Ultrasonic testing shall be performed by a specially trained and qualified technician who shall operate the equipment, examine welds, and maintain a record of welds examined, defects found, and disposition of each defect. Repair and test defective welds.
 4. Rate of Testing: Completed welds contained in joints and splices shall be tested 100 percent either by ultrasonic testing or by radiography.
 5. Welds, when installed in column splices, shall be tested by either ultrasonic testing or radiography.
 6. Base metal thicker than 1 ½-inch, when subjected to through-thickness weld shrinkage strains, shall be ultrasonically inspected by shear wave methods for discontinuities directly behind such welds. Tests shall be performed at least 48 hours after completed joint has cooled down to ambient air temperature.
 7. Material discontinuities shall be reviewed based on the defect rating in accordance with the criteria of AWS D1.1 table 6.3 by the ARCHITECT.
 8. Other method of non-destructive testing and inspection, for example, liquid dye penetrate testing, magnetic particle inspection or radiographic inspection may be performed on weld if required.
 9. Lamellar Tearing: Lamellar-tearing resulting from welding is a crack (with zero tolerance) and shall be repaired in accordance with AWS D1.1.
 10. Lamination: The rejection criteria shall be based on ASTM A435.
 11. Where testing reveals lamination or conditions of lamellar tearing in base metal, the steel fabricator shall submit a proposed method of repair for review by the ARCHITECT. Test repaired areas as required.
 12. Magnetic Particle Testing: Magnetic particle testing when required shall be provided in accordance with AWS D1.1 for procedure and technique. The

standards of acceptance shall be in accordance with AWS D1.1 – Qualification.

- I. Lamellar Tearing: Prior to welding plates 1 to 1-½ inch thick and greater and rolled shapes within the distance from 6 inches above the top of the joint to 6 inches below the bottom of the joint shall be checked by ultrasonic testing for laminations in base metal which may interfere with the inspection of the completed joint. Should these defects occur, members will be reviewed by the ARCHITECT. Welding procedure specifications in paragraph 1.04.G specify welding practices to minimize lamellar tearing.
- J. Prior Testing of Base Material: Test material before fabrication.
- K. Lines and levels of erected steel shall be certified by a State of California licensed surveyor as set forth in related Division 01 section.
- L. Welded studs shall be tested and inspected by the special inspector in accordance with requirements of AWS D1.1 – Stud Welding.
- M. Record Drawings: After steel has been erected, correct or revise Shop Drawings and erection diagrams to correspond with reviewed changes performed in the field.

PART 3 - EXECUTION

3.01 PREPARATION

- A. Verify governing dimensions and conditions of the Work before commencing erection Work.
 - 1. Report discrepancies between drawings and field dimensions to ARCHITECT before commencing work.
 - 2. Beginning of installation means erector accepts existing conditions and surfaces underlying or adjacent to work of this section.
- B. Provide temporary shoring and bracing, and other support during performance of the Work. Remove after steel is in place and connected, and after cast-in-place concrete has reached its design strength.
- C. Coordinate prime coat repair and application with requirements of Section 09 9000.

3.02 ERECTION

- A. Install structural steel accurately in locations, to elevations indicated, and according to AISC specifications and CBC requirements.
- B. Clean surfaces of base plates and bearing plates.
 - 1. Install base and bearing plates for structural members on wedges, shims, or setting nuts as required.

2. Tighten anchor bolts after supported members have been positioned and plumbed. Do not remove wedges or shims; cut off flush with edge of base or bearing plate before packing with grout.
- C. Maintain erection tolerances of structural steel within AISC Code of Standard Practice for Steel Buildings and Bridges.
1. Architecturally Exposed Structural Steel members and components, plumbed, leveled and aligned to a tolerance not to exceed one-half the amount permitted for structural steel. CONTRACTOR to provide adjustable connections between Architecturally Exposed Structural Steel and the structural steel frame or the masonry or concrete supports, in order to provide the erector with means for adjustment.
- D. Align and adjust various members forming part of complete frame or structure before permanently fastening. Before assembly, clean bearing surfaces and other surfaces that will be in permanent contact after assembly. Perform necessary adjustments to compensate for discrepancies in elevations and alignment.
1. Level and plumb individual members of structure.
- E. Do not permit thermal cutting during erection of structural steel.
- F. Where indicated for field connections, provide standard bolts complying with ASTM A307.
- G. Install high strength steel bolts at locations indicated. Assembly and installation shall be in accordance with CBC requirements and AISC specifications.
1. Allowable hole sizes: 1/16 inch larger than bolt size.
 2. Use friction type connection with standard hardened steel circular, square or rectangular washer under bolt nut.
 3. Thoroughly clean area under bolt head, nut and washer. Remove all paint, lacquer, oil or other coatings except organic zinc-rich paints in accordance with SSPC, SP-2.
 4. Tighten bolts by power torque wrench or hand wrench until twist-off.
- H. CONTRACTOR shall be responsible for correcting detailing and fabrication errors and for correct fitting of all members and components.
- I. Erect structural steel plumb and level and to proper tolerances as set forth in the AISC Manual. Provide temporary bracing, supports or connections required for complete safety of structure until final permanent connections are installed.
- J. Install column bases within a tolerance of 1/8 inch of detailed centerlines, level at proper elevations. Support bases on double nuts and solidly fill spaces under bases with cement grout.

- K. Provide anchor bolts with templates and diagrams. CONTRACTOR shall be responsible for proper location and installation of bolts. Correct deficiencies and errors.

3.03 FITTING

- A. Closely fit members, finished true to line and in precise position required to allow accurate erection and proper joining in the field.
- B. Drilling to enlarge unfair holes will not be allowed. Allow only enough drifting during assembly to bring parts into position, but not enough to enlarge holes or distort the metal. Do not heat rolled sections, unless approved by ARCHITECT.

3.04 PUNCHING AND DRILLING

- A. Punch material 1/16 inch larger than nominal diameter of bolt, wherever thickness of metal is equal to or less than the diameter of the bolt plus 1/8 inch.
- B. Drill or sub-punch and ream where metal is equal to or more than the diameter of the bolt plus 1/8 inch. Make diameter for sub-punched and sub-drilled holes 1/16 inch larger than nominal diameter of bolt.
- C. Precisely locate holes to ensure passage of bolt through assembled materials without drifting. Enlarge holes when necessary to receive bolts by reaming; flame cutting to enlarge holes is not acceptable. Structural Steel members with poorly matched holes will be rejected.

3.05 FINISHING

- A. After erection, spots or surfaces where paint has been removed, damaged, or burned off, and field rivets, bolts, and other field connections shall be cleaned of dirt, oil, grease, and burned paint and furnished with a spot coat of the same primer installed during shop priming.
- B. Touchup:
 - 1. Painting: Immediately after erection, clean field welds, bolted connections, and abraded areas of shop paint. Install paint to exposed areas with the same material installed during shop painting. Install by brush or spray to provide a minimum dry film thickness of 1.5 mils.
 - 2. Galvanized Surfaces: Clean field welds, connections and damaged areas. Apply two coats of Carbomastic 15, by Carboline or equal approved product. Brush or roll to a 4 to 6 mil thickness.

3.06 FIELD QUALITY CONTROL

- A. OWNER will provide a special inspector and independent testing laboratory to perform field inspections and tests and to prepare test reports.
- B. Correct deficiencies in or remove and replace structural steel that inspections and test reports indicate do not comply with specified requirements.

3.07 CLEAN UP

- A. Remove rubbish, debris and waste materials and legally dispose of off the Project Site.

3.08 PROTECTION

- A. Protect the Work of this section until Substantial Completion.

3.09 HANDLING

- A. Both in shop and in the field, transport, handle and erect to prevent damage or overstressing of any component.

END OF SECTION

SECTION 05 12 13

ARCHITECTURALLY EXPOSED STEEL FRAMING

PART 1 – GENERAL

1.01 SUMMARY

- A. Description: This section includes the Work for architecturally exposed steel framing and exposed steel elements, inside and outside of the building. It also includes fabrication, shop connection, galvanizing and shop priming.
- B. Section includes:
 - 1. Examination
 - 2. Preparation
 - 3. Erection
 - 4. Field Connections
 - 5. Field Quality Control
 - 6. Repairs and Protection
- C. Related requirements:
 - 1. Section 05 12 00 – Structural Steel Framing (for additional requirements applicable to AESS).
 - 2. Section 05 50 01 – Metal Fabrications (for miscellaneous steel fabrications and other metal items not defined as structural steel).
 - 3. Section 09 91 00 – Painting (for steel coatings with surface preparation and priming requirements).
 - 4. Section 09 96 23 – Graffiti-resistant Coatings.
- D. Definitions
 - 1. AESS: Structural steel designated as "architecturally exposed structural steel" or "AESS" in the Contract Documents.
 - 2. Category 1 AESS: AESS that is within 96 inches vertically and 36 inches horizontally of a walking surface and that is visible to a person standing on that walking surface or is designated as "Category 1 architecturally exposed structural steel" or "AESS-1" in the Contract Documents.

3. Category 2 AESS: AESS that is within 20 feet vertically and horizontally of a walking surface and that is visible to a person standing on that walking surface or is designated as "Category 2 architecturally exposed structural steel" or "AESS-2" in the Contract Documents.
4. Category 3 AESS: AESS that is not defined as Category 1 or Category 2 or that is designated as "Category 3 architecturally exposed structural steel" or "AESS-3" in the Contract Documents.

5. SSPC-QP 3 Standard Procedure for Evaluating Qualifications of Shop Painting Applicators
6. SSPC-SP 6/NACE No. 3 Commercial Blast Cleaning

1.03 SUBMITTALS

- A. Shop Drawings: Show fabrication of AESS components. Shop Drawings for structural steel may be used for AESS provided items of AESS are specifically identified and requirements below are met for AESS.
 1. Include details of cuts, connections, splices, camber, holes, and other pertinent data.
 2. Include embedment Drawings.

3. Indicate welds by standard AWS symbols, distinguishing between shop and field welds, and show size, length, and type of each weld. Show backing bars that are to be removed and supplemental fillet welds where backing bars are to remain. Indicate grinding, finish, and profile of welds.
 4. Indicate type, size, and length of bolts, distinguishing between shop and field bolts. Identify pretensioned and slip-critical, high-strength bolted connections.
 5. Indicate exposed surfaces and edges and surface preparation being used.
 6. Indicate special tolerances and erection requirements.
- B. Samples: Submit Samples of AESS to set quality standards for exposed welds for Category 1 AESS.
1. Two steel plates, 3/8 by 8 by 4 inches, with long edges joined by a groove weld and with weld ground smooth.
 2. Steel plate, 3/8 by 8 by 8 inches, with one end of a short length of rectangular steel tube, 4 by 6 by 3/8 inches, welded to plate with a continuous fillet weld and with weld ground smooth and blended.

1.04 QUALITY ASSURANCE

- A. Fabricator qualifications: A qualified fabricator that participates in the AISC Quality Certification Program and is designated an AISC-Certified Plant, Category STD, or is accredited by the IAS Fabricator Inspection Program for Structural Steel (AC 172).
- B. Installer qualifications: A qualified installer who participates in the AISC Quality Certification Program and is designated an AISC-Certified Erector, Category ACSE or Category CSE.
- C. Shop-painting applicators: Qualified according to SSPC-QP 3, "Standard Procedure for Evaluating Qualifications of Shop Painting Applicators."

1.05 DELIVERY, STORAGE, AND HANDLING

- A. Use special care in handling to prevent twisting, warping, nicking, and other damage. Store materials to permit easy access for inspection and identification. Keep steel members off ground and spaced by using pallets, dunnage, or other supports and spacers. Protect steel members and packaged materials from corrosion and deterioration.
 1. Do not store materials on structure in a manner that might cause distortion, damage, or overload to members or supporting structures. Repair or replace damaged materials or structures as directed.

1.06 PROJECT CONDITIONS

- A. Field measurements: Where AESS is indicated to fit against other construction, verify actual dimensions by field measurements before fabrication.

1.07 COORDINATION

- A. Coordinate selection of shop primers with topcoats to be applied over them. Comply with Technical Specification 09 91 00, Painting.

PART 2 – PRODUCTS

2.01 FILLER

- A. Filler: Polyester filler intended for use in repairing dents.

2.02 PRIMER

- A. A prime in accordance with 09 91 00 Painting.

2.03 FABRICATION

- A. Shop fabricate and assemble AESS to the maximum extent possible. Locate field joints at concealed locations if possible. Detail assemblies to minimize handling and to expedite erection.
- B. In addition to special care used to handle and fabricate AESS, comply with the following:
 - 1. Fabricate with exposed surfaces smooth, square, and free of surface blemishes including pitting, rust, scale, and roughness.
 - 2. Grind sheared, punched, and flame-cut edges of Category 1 AESS to remove burrs and provide smooth surfaces and edges.
 - 3. Fabricate Category 1 AESS with exposed surfaces free of mill marks, including rolled trade names and stamped or raised identification.
 - 4. Fabricate Category 1 and Category 2 AESS with exposed surfaces free of seams to maximum extent possible.
 - 5. Remove blemishes by filling or grinding or by welding and grinding, before cleaning, treating, and shop priming.
 - 6. Fabricate with piece marks fully hidden in the completed structure or made with media that permits full removal after erection.
 - 7. Fabricate Category 1 AESS to the tolerances specified in AISC 303 for steel that is designated AESS.
 - 8. Fabricate Category 2 and Category 3 AESS to the tolerances specified in AISC 303 for steel that is not designated AESS.
 - 9. Seal-weld open ends of hollow structural sections with 3/8-inch closure plates for Category 1 AESS.
- C. Coping, blocking, and joint gaps: Maintain uniform gaps of 1/8 inch with a tolerance of 1/32 inch for Category 1 AESS.
- D. Bolt holes: Cut, drill, or punch standard bolt holes perpendicular to metal surfaces.

- E. Cleaning corrosion-resisting structural steel: Clean and prepare steel surfaces that are to remain unpainted according to SSPC-SP 6/NACE No. 3, "Commercial Blast Cleaning."
- F. Holes: Provide holes required for securing other work to structural steel and for other work to pass through steel members.
 - 1. Cut, drill, or punch holes perpendicular to steel surfaces. Do not thermally cut bolt holes or enlarge holes by burning. Do not enlarge holes unless indicated.
 - 2. Baseplate holes: Cut, drill, mechanically thermal cut, or punch holes perpendicular to steel surfaces.
 - 3. Weld threaded nuts to framing and other specialty items indicated to receive other work.

2.04 SHOP CONNECTIONS

- A. Weld connections: Comply with AWS D1.1/D1.1M for tolerances, appearances, welding procedure specifications, weld quality, and methods used in correcting welding work, and comply with the following:
 - 1. Assemble and weld built-up sections by methods that will maintain true alignment of axes without exceeding specified tolerances.
 - 2. Use weld sizes, fabrication sequence, and equipment for AESS that limit distortions to allowable tolerances.
 - 3. Provide continuous, sealed welds at angle to gusset-plate connections and similar locations where Category 1 AESS is exposed to weather.
 - 4. Provide continuous welds of uniform size and profile where Category 1 AESS is welded.
 - 5. Grind butt and groove welds flush to adjacent surfaces within tolerance of plus 1/16 inch, minus zero inch for Category 1 and Category 2 AESS.
 - 6. Remove backing bars or runoff tabs; back-gouge and grind steel smooth for Category 1 and Category 2 AESS.
 - 7. At locations where welding on the far side of an exposed connection of Category 1 and Category 2 AESS occurs, grind distortions and marking of the steel to a smooth profile aligned with adjacent material.
 - 8. Make fillet welds for Category 1 and Category 2 AESS oversize and grind to uniform profile with smooth face and transition.

2.05 GALVANIZING

- A. Galvanize exposed steel located at exterior of building/s.
- B. Hot-dip galvanized finish: Apply zinc coating by the hot-dip process to all structural steel according to ASTM A123/A123M.

1. Do not quench or apply post-galvanizing treatments that might interfere with paint adhesion.
2. Fill vent and drain holes that are exposed in the finished work, unless indicated to remain as weep holes, by plugging with zinc solder and filing off smooth.

2.06 SHOP PRIMING

- A. Shop prime steel surfaces except the following:
 1. Surfaces embedded in concrete or mortar. Extend priming of partially embedded members to a depth of 2 inches.
 2. Surfaces to be field welded.
- B. Preparing galvanized steel for shop priming: After galvanizing, thoroughly clean steel of grease, dirt, oil, flux, and other foreign matter, and treat in accordance with 09 91 00 Priming.
- C. Priming: Immediately after surface preparation, apply primer according to manufacturer's written instructions and at rate recommended by SSPC to provide a minimum dry film thickness of 1.5 mils. Use priming methods that result in full coverage of joints, corners, edges, and exposed surfaces.
 1. Stripe paint corners, crevices, bolts, welds, and sharp edges.
 2. Apply two coats of shop paint to surfaces that are inaccessible after assembly or erection. Change color of second coat to distinguish it from first.

PART 3 – EXECUTION

3.01 EXAMINATION

- A. Verify, with steel erector present, elevations of concrete- and masonry-bearing surfaces and locations of anchor rods, bearing plates, and other embedments for compliance with requirements.
 1. Prepare a certified survey of bearing surfaces, anchor rods, bearing plates, and other embedments showing dimensions, locations, angles, and elevations.
- B. Examine AECS for twists, kinks, warping, gouges, and other imperfections before erecting.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION

- A. Provide temporary shores, guys, braces, and other supports during erection to keep AECS secure, plumb, and in alignment against temporary construction or erection loads and loads equal in intensity to design loads. Remove temporary supports when permanent structure and its connections are in place unless otherwise indicated.
 1. If possible, locate welded tabs for attaching temporary bracing and safety cabling where they will be concealed from view in the completed Work.

2. Do not remove temporary shoring supporting composite deck construction until cast-in-place concrete has attained its design compressive strength.

3.03 ERECTION

- A. Set AESS accurately in locations and to elevations indicated and according to AISC 303 and AISC 360.
 1. Erect Category 1 AESS to the tolerances specified in AISC 303 for steel that is designated AESS. This includes tolerances due to rotation.
 2. Erect Category 2 and Category 3 AESS to the tolerances specified in AISC 303 for steel that is not designated AESS.
- B. Do not use thermal cutting during erection.

3.04 FIELD CONNECTIONS

- A. Weld connections: Comply with requirements in "Weld Connections" Paragraph in "Shop Connections" Article.
 1. Remove backing bars or runoff tabs; back-gouge and grind steel smooth for Category 1 and Category 2 AESS.
 2. Remove erection bolts in Category 1 and Category 2 AESS, fill holes, and grind smooth.
 3. Fill weld access holes in Category 1 and Category 2 AESS and grind smooth.

3.05 FIELD QUALITY CONTROL

- A. Testing agency: The Contractor shall engage a qualified independent testing and inspecting agency to inspect AESS as specified in Section 05 12 00 – Structural Steel Framing. The testing agency is not responsible for enforcing requirements relating to aesthetic effect.
- B. OWNER will observe AESS in place to determine acceptability relating to aesthetic effect.

3.06 REPAIRS AND PROTECTION

- A. Welded tabs shall not be used for attaching temporary bracing or safety cabling.
- B. Galvanized surfaces: Clean field welds, bolted connections, and abraded areas and repair galvanizing to comply with ASTM A780/A780M.
- C. Touchup painting: Immediately after erection, clean field welds, bolted connections, and abraded areas of shop paint, and paint exposed areas with the same material as used for shop painting to comply with SSPC-PA 1 for touching up shop-painted surfaces.
 1. Clean and prepare surfaces by SSPC-SP 2 hand-tool cleaning or SSPC-SP 3 power-tool cleaning.

Department of Neighborhood Services and Public Safety
GOLETA TRAIN DEPOT PROJECT

- D. Touchup painting: Cleaning and touchup painting are specified in Section 09 91 13 – Exterior Painting.
- E. Touchup priming: Cleaning and touchup priming are specified in Section 09 96 00 – High-Performance Coatings.

END OF SECTION

SECTION 05 30 00
METAL DECKING

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Floor and roof metal decking.
2. Edge strips, closure strips and decking accessories.

B. Related Requirements:

1. Division 01 - General Requirements.
2. Section 01 45 23 - Testing and Inspection.
3. Section 03 30 00 – Cast-In-Place Concrete.
4. Section 05 12 00 - Structural Steel Framing.
5. Section 07 60 00 - Flashing and Sheet Metal.

1.02 REFERENCES

A. ASTM International (ASTM):

1. ASTM A108 – Standard Specification for Steel Bar, Carbon and Alloy, Cold-Finished.
2. ASTM A653 - Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.
3. ASTM A780 – Standard Practice for Repair of Damaged and Uncoated Areas of Hot-Dip Galvanized Coatings.
4. ASTM D746 - Standard Test Method for Brittleness Temperature of Plastics and Elastomers by Impact.
5. ASTM D1056 - Standard Specification for Flexible Cellular Materials—Sponge or Expanded Rubber.

B. American Welding Society (AWS):

1. AWS D1.1 - Structural Welding Code Sheet – Steel.
2. AWS D1.3 – Structural Welding Code Sheet – Sheet Steel.

C. American Iron and Steel Construction (AISI):

1. AISI – Specifications for the Design of Cold-Formed Steel Structural Members.

- D. Underwriters Laboratory (UL):
 - 1. UL – Fire Resistance Directory.

1.03 PERFORMANCE REQUIREMENTS

- A. Compute properties of deck sections on basis of effective design width as limited by provisions of the AISI specifications. Provide no less than deck section properties specified, including section modulus and moment of inertia per foot of width.
- B. Regulatory Requirements:
 - 1. Decking installed as part of a fire rated assembly shall meet the requirements of the applicable UL Fire Resistance Directory design number.
 - 2. Work of this section shall be in accordance with CBC.

1.04 SUBMITTALS

- A. Shop Drawings: Drawings, sections and details indicate type of decking, location, finish, gage of metal, arrangement of sheets, necessary fabrication to incorporate decking into the Work, and relationship to openings and flashing.
- B. Product Data: For each type of decking specified, including structural properties, dimensions, profiles and finishes.
- C. Welder Certificates: Signed by CONTRACTOR certifying that welders comply with the requirements specified under Article “Quality Assurance”.

1.05 QUALITY ASSURANCE

- A. General: Metal decking steel shall conform to requirements of strengths and properties of standards specified.
- B. Qualifications of Welders: Properly certified for the type of Work involved in compliance with CBC requirements.
- C. Continuous inspection of welding will be performed by a special inspector, approved by the city to inspect the Work of this section. Refer to Section 01 45 23 - Testing and Inspection. The Project Inspector will be responsible for monitoring the work of the special inspector to ensure that the inspection program is satisfactorily completed.
- D. Identification of metal decking steel shall conform to the standards specified in this section and the Drawings.
 - 1. Fabricator shall furnish sufficient evidence to the ARCHITECT attesting compliance with specified requirements.
 - 2. Conform to CBC requirements. Unclassified or unidentified decking is not permitted. Furnish deck manufacturer's certified mill analyses and test reports for each heat covering decking having a minimum F_y of 33 Ksi. In addition, for decking having F_y greater than 33 Ksi, testing laboratory shall perform one tension and elongation test and one bend or flattening test for each gage.

- E. Unidentifiable Steel: Steel which is not readily identifiable as to grade from markings and test records is not permitted to be provided as part of the Work of this section.
- F. Manufacturers shall be members of Steel Deck Institute (SDI).

1.06 DELIVERY, STORAGE AND HANDLING

- A. Protect steel deck from corrosion, deformation and other damage during delivery, storage and handling.
- B. Deck bundles shall be stored off the ground, with one end elevated to provide drainage. Bundles shall be protected against condensation with a ventilated waterproof covering.

PART 2 - PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS

- A. ASC Steel Deck.
- B. Verco Manufacturing Co.
- C. Epic Metals Corporation.
- D. Equal.

2.02 MATERIALS

- A. Metal Decking:
 - 1. Roll-formed sheets conforming to ASTM A653, with G90 zinc coating.
 - 2. Section properties conforming to applicable provisions of latest edition of AISI - Specification for the Design of Cold-Formed Steel Structural Members.
- B. Flexible Closure Strips for Deck: Vulcanized, closed-cell, expanded chloroprene elastomer, complying with ASTM D1056, Grade SCE #41.
 - 1. Brittleness Temperature: Minus 40 degrees F, ASTM D746.
 - 2. Flammability Resistance: Self-extinguishing,
- C. Decking Accessories: Metal cover plates, sheet metal edging, metal closure strips, valley and ridge strips, seat angles, sump pans, flashings: 22 gage minimum, with ASTM A653, G90 zinc coating.
- D. Shear Connectors: Headed stud type, ASTM A108 Grade 1015, cold-finished carbon steel complying with AISC specifications.
- E. Galvanizing Repair Paint: Mil. Spec. MIL-P-21035B.

2.03 FABRICATION

- A. Corrugated sheets or sections shall be designed to support required live load between supporting members.

- B. Provide decking in lengths to span over three or more supports.
- C. Except as detailed otherwise, provide decking with interlocking side laps, 2 ½-inch minimum end bearing, and 1 ½-inch minimum side bearing.
- D. Welding: Provide materials and methods in accordance with recommendations of steel decking manufacturer and reviewed submittals. Hold decking tight to the supporting elements with screws or other means for proper welding or crimping of the decking edges. Conform to AWS D1.3, and to the patterns and weld types indicated, with welds free from sharp edges and protrusions. Field coat welds and abraded surfaces at completion with an anodic type galvanizing repair paint. Omit the field paint coating where welds or abrasions are covered by concrete fill or sprayed fireproofing.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Verify supporting structure and existing conditions prior to starting work.
- B. Remove oil, dirt, paint, and rust from steel surfaces to which metal decking will be welded.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 OPENINGS

- A. Cut and reinforce units to provide openings which are located and dimensioned on the structural and mechanical Drawings.
- B. Provide openings, or other Work not indicated on the Drawings.

3.03 INSTALLATION

- A. Install metal decking in accordance with decking manufacturers' recommendations, requirements of Drawings, Shop Drawings, and Specifications.
- B. Install metal decking on supporting steel framework and adjust to final position before permanently fastening in place.
 - 1. Install each unit to proper bearing on supports.
 - 2. Install units in straight alignment for entire length of run of cells with close registration of cells of one unit with those of abutting unit.
- C. Fasten decking to steel framework at ends of units and at intermediate supports. Welding shall be as indicated on Drawings.
- D. Fasten side laps between supports as indicated on Drawings.
- E. Perform field cutting parallel with cells in area between cells, leaving sufficient horizontal material to permit welding to support steel.

- F. Weld shear connectors to supports thru decking units as required by Drawings. Weld only on clean, dry surfaces. Do not weld shear connectors thru two layers of decking units.
- 3.04 METAL FLASHINGS AND CLOSURES
- A. Furnish, install, and weld in position, sheet metal closure flashing, closure angles, closure plates, profile plates, and shear plates.
 - B. Close open ends of cell runs at columns, openings, walls, similar interruptions and termination.
- 3.05 FIELD QUALITY CONTROL
- A. Install steel decking under continuous inspection according to CBC Section 1704A.
 - B. Welding inspection for steel deck diaphragms shall conform to CBC Section 2204A.1.
- 3.06 CLEAN UP
- A. Remove rubbish, debris, and waste materials and legally dispose of off the Project site.
- 3.07 PROTECTION
- A. Protect the Work of this section until Substantial Completion.

END OF SECTION

SECTION 05 31 13

ROOF DECK CEILING SYSTEM

PART 1 - GENERAL

1.01 SUMMARY

- A. The requirements of this specification section include all materials, equipment, and labor necessary to furnish and install a Roof Deck Ceiling System.
- B. Related Requirements:
 - 1. Section 05 12 00 - Structural Steel Framing.
 - 2. Section 09 90 00 - Painting.

1.02 SUBMITTALS

- A. Product Data: Submit manufacturer's specifications, section properties, load tables, dimensions, finishes, fire rating and acoustic coefficients if applicable.
- B. Erection drawings for Roof Deck Ceiling system and related accessory items showing profiles and material thicknesses, layout, anchorage, openings as dimensioned on the structural drawings and shoring requirements.
- C. LEED Submittals: Complete the LEED Material Buyout Form (MBoF) with all materials provided to the project. A complete submittal includes providing all material costs in the MBoF and all of the supporting documentation for the following credits:
 - 1. MRc2 - Environmental Product Declarations (EPD): Provide Industry-Wide or Product-Specific EPD.
 - 2. MRc3 - Sourcing of Raw Materials - Recycled Content: Provide product data for pre- and post- consumer recycled content.
 - 3. MRc4 - Material Ingredients: Provide manufacturers Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, or Cradle to Cradle Health Product Certificate.
 - 4. IEQc2 - Low-Emitting Materials – Interior Wet Applied Products: For paints, coatings, adhesives and sealants applied on site or used for laminating off-site, include product data indicating the VOC content (g/L) and testing certificates or third party certification demonstrating compliance with California Department of Public Health (CDPH) v1.2-2017 emissions testing.

1.03 REFERENCE STANDARDS

- A. Section Properties: Shall be computed in accordance with the American Iron and Steel Institute (AISI) Specification for Design of Cold-Formed Steel Structural Members.

- B. Composite Slabs load capacities shall be computed in accordance with the ANSI/SDI Standard for Composite Steel Floor Deck-Slabs and shall be verified by full scale testing.
- C. Welding: Shall comply with applicable provisions of the American Welding Society (AWS) D1.3 Structural Welding Code—Sheet Steel.
- D. Fire Resistance Classification: Shall be acceptable for use in Underwriters Laboratories Fire Resistance Index. All panels used in rated fire resistance designs shall bear the appropriate U.L. Classification marking.
- E. Noise Reduction Coefficients: Shall be verified by the results of sound absorption tests conducted in accordance with ASTM C423 and E795.
- F. Manufacturer shall have been regularly engaged in the production of the specified roof deck ceiling systems for a period of at least ten years.

1.05 DELIVERY, STORAGE AND HANDLING

- A. Panels shall be protected from damage during delivery, storage, and handling.
- B. If storage at the jobsite is required, panels shall be elevated above the ground, sloped to provide drainage, and protected from weather with a ventilated covering.

1.06 COORDINATION

- A. Coordinate length of fasteners for roofing and thermal insulation to avoid penetrating the finished bottom surface of the panels.
- B. Coordinate location and size of shop-cut access openings in bottom of panels with affected trades.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

- A. Basis of Design: In accordance with the requirements of this specification section, provide products manufactured by EPIC Metals, Rankin, PA.
- B. Or approved equal.

2.02 MATERIALS

- A. Basis of Design: Envista "FA" Roof Deck Ceiling system; panels shall be cold-formed from steel coils conforming to ASTM A653, Structural Quality, Grade 40 with minimum yield strength of 40 ksi..
- B. Thickness and section properties: As indicated in Structural drawings.

- C. Before forming, the steel coils shall have received a hot-dip protective coating of zinc conforming to ASTM A924, Class G60 or G90, as defined in ASTM A653.
- D. The minimum uncoated thickness of materials furnished shall be within 5% of the design thickness.
- E. Finish: Natacoat over prime paint.

2.03 FABRICATION

- A. Panels shall be cold-formed by the continuous roll forming process and attached together to form an integral cellular panel.
- B. Panels shall have interlocking type sidelaps suitable for screw or weld fastening.
- C. Envista panels shall have roll-formed embossments located between the longitudinal stiffening ribs in the top flanges.
- D. For Acoustic Roof Deck Ceiling panels with flat sections, these areas shall be perforated for enhanced acoustic performance. Acoustical elements shall be factory installed in the cells of the panels in a manner that prevents them from being dislocated, or blown out of the cells during shipping, erection and until the finished roofing is installed. Acoustic insulation batts shall be provided. These shall be field-installed by the roofing contractor. The acoustical elements shall be supported above the perforated surface to avoid plugging the holes during field painting. An NRC of 1.00 shall be provided.

2.03 ACCESSORIES

- A. Where panels continue from the interior of the building through to the exterior of the building (for example as a cantilever canopy): the panels will be perforated on the interior and not perforated on the exterior, air dams will be provided to block the movement of conditioned air from the interior of the building to the exterior.
- B. Manufacturer's standard ridge plates, valley plates, transition plates, and closures shall be provided as indicated on the structural drawings.
- C. Openings and reinforcement for openings in the structural element noted specifically by the deck manufacturer on the structural drawings shall be provided.

PART 3 - EXECUTION

3.01 PREPARATION

- A. Panels and accessories shall be installed in strict accordance with the manufacturer's instructions, approved erection drawings and all applicable safety regulations.

3.02 EXAMINATION

- A. The supporting frame or other related work shall be inspected and accepted by the deck erector before the start of installation.
- B. The need for temporary shoring shall be investigated. Shoring tables furnished by the manufacturer and shown on the approved erection drawings shall be consulted. Allowable unshored spans shall be reduced if greater construction loads are anticipated or if less deflection is allowable.
- C. Temporary shoring, if required, shall be in-place prior to installation of Roof Deck Ceiling system panels and shall remain in-place until the concrete attains the required strength and stiffness.

3.03 PREPARATION

- A. Bundles of materials shall be located on the supporting frame in such a manner that overloading of any of the individual members or panels does not occur. Panels shall not be placed on concrete supporting members until after the members have adequately cured or properly designed formwork is in place.

3.04 INSTALLATION

- A. Panels and related accessories shall be installed in accordance with manufacturer's approved erection drawings, SDI Manual of Construction with Steel Deck and all federal and state regulations
- B. Before being permanently fastened, panels shall be placed on the supporting frame and adjusted to final position with ends accurately aligned and adequately bearing on the supporting frame. Consistent coverage shall be maintained so that panels located in adjacent bays will be properly aligned.
- C. Cutting of panels to suit jobsite conditions shall be performed in a neat and professional manner. Only those openings indicated on the structural drawings shall be cut. Other openings shall be cut and reinforced by those requiring the opening as approved by the structural engineer.
- D. Panels shall be fastened to all supporting members with two $\frac{3}{4}$ " diameter puddle welds per 18" or 16" wide panel or as indicated on the manufacturer's erection drawings.
- E. The sidelaps of panels shall be fastened together with #12 x $\frac{3}{4}$ " maximum length screws at a maximum of 36" on center or less as indicated on the manufacturer's erection drawings. Sides of the panels located at perimeter edges of the building shall be fastened to supporting members at a spacing of 36" on center or less as indicated on the manufacturer's erection drawings.
- F. Construction loads shall not be applied to panels until after panels are permanently fastened to supporting members and sidelaps have been attached and shall not exceed the load carrying capacity of the panels.

- G. Items such as light fixtures, conduit, pipe, and ductwork shall not be suspended from Envista panels without specific approval of the structural engineer.

3.05 AFTER INSTALLATION

- A. Construction loads that could damage the Roof Deck Ceiling system such as heavy concentrated loads and impact loads shall be avoided. Planking shall be used in all high traffic areas.
- B. Galvanized coatings that are significantly damaged shall be repaired. Appropriate galvanized repair paint shall be used and the paint manufacturer's application instructions shall be followed.

END OF SECTION

SECTION 05 41 00

COLD FORMED METAL FRAMING

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Load-bearing metal stud systems.

B. Related Requirements:

1. Division 01 - General Requirements.
2. Section 01 45 23 - Testing and Inspection.
3. Section 05 12 00 - Structural Steel Framing.
4. Section 09 22 16 - Non-Structural Metal Framing.

1.02 SUBMITTALS

- A. Shop Drawings: Submit drawings showing framing, connection details, accessories and anchorage. Indicate location of assemblies, size and spacing of framing components.
- B. Product Data: Submit manufacturer's catalog data for each item proposed for installation.
- C. Certificates: Furnish manufacturer's certification that materials meet or exceed Specification requirements.

1.03 QUALITY ASSURANCE

A. Comply with following as a minimum requirement:

1. AISI - Specifications for Design of Cold Formed Steel Structural Members.
2. Welds shall be performed by AWS certified welders. Welding shall be performed in accordance with requirements of American Welding Society (AWS) Structural Welding Code-Steel D1.1 and D1.3. Structural welding Code-Sheet Steel.
3. Welding shall be inspected by a special inspector, approved by the city to inspect Work of this section. The Project Inspector shall be responsible for

monitoring work of special inspector to ensure that inspection program is satisfactorily completed.

4. ASTM A653 – Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy Coated (Galvannealed) by Hot Dip Process.
5. ASTM A924 – Standard Specification for General Requirements for Steel Sheet Metallic-Coated by Hot-Dip Process.
6. ASTM A1003 – Standard Specification for Steel Sheet, Carbon, Metallic- and Nonmetallic-Coated for Cold-Formed Framing Members.
7. ASTM A1008 – Standard Specification for Steel Sheet and Strip, Hot-Rolled, Carbon, Structural High-Strength Low-Alloy, and High-Strength Low-Alloy with Improved Formability.
8. ASTM C954 – Standard Specification for Load-Bearing (Transverse and Axial) Steel Studs, Runners (Tracks) and Bracing or Bridging for Screw Application of Gypsum Panel Products and Plaster Bases.
9. ASTM C955 – Standard Specification for Load-Bearing (Transverse and Axial) Steel Studs, Runners (Tracks), and Bracing or Bridging for Screw Application of Gypsum Panel Products and Metal Plaster Bases.
10. ASTM C1007 – Standard Specification for Installation of Structural (Axial and Transverse) Steel Framing Members and Accessories.
11. ASTM E488 – Standard Test Methods of Strength Anchors in Concrete and Masonry.
12. ASTM E1190 – Standard Test Methods for Strength of Power-Actuated Fasteners Installed in Structural Members.
13. Manufacturer shall be a member of the Steel Stud Manufacturers Association (SSMA).

- B. Tolerances: Install walls and partitions on straight lines, plumb, free of twists or other defects, and contacting a 10-foot straight edge for its entire length at any location within a 1/8 inch tolerance. Install horizontal framing level within a tolerance of 1/8 inch in 12 feet in any direction.

1.04 DELIVERY, STORAGE AND HANDLING

- A. Materials shall be delivered in their original unopened packages and stored protected from damage. Do not store material directly on grade. Provide adequate support to prevent bowing of material prior to installation.
- B. Store welding electrodes in accordance with AWS D12.1.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

- A. Provide studs, tracks, joists, header, and accessories manufactured by one of following:
 - 1. ClarkWestern Building Systems.
 - 2. Dietrich Industries, Inc.
 - 3. Marino/WARE.
 - 4. Cemco.
 - 5. Equal.
- B. Special Connection Accessories: Products manufactured by The Steel Network, Inc., or equal.

2.02 MATERIALS

- A. Light Gage Metal Framing:
 - 1. Metal framing shall be formed from corrosion resistant-steel conforming to requirements of ASTM A653, 50 ksi minimum.
 - 2. Metal framing shall be zinc coated in conformance to requirements of ASTM A926, G60.
 - 3. Metal framing shall be manufactured in conformance to ASTM C955.
 - 4. Install metal framing per ASTM C1007, Standard Specification for Installation of Load-Bearing (Transverse and Axial) Steel Studs and Related Accessories.
- B. Gages and properties of studs shall be as indicated on Drawings.
- C. Mechanical anchors to concrete and masonry shall be metal cinch at least 3/8 inch in diameter threaded bolt head type. Anchor bolts to be installed in concrete shall be hook type 1/2 inch diameter or more. Unless otherwise indicated.
- D. Mechanical anchors to metal framing shall be No. 10 self-tapping and self-drilling wafer-head screws.
- E. Accessories: Special top tracks, angles, fasteners, and strips of gypsum wallboard, as required for fire rating assembly required at each condition.
- F. Mineral Wool Safing Insulation: 4.0 pcf density. Thermafiber, Fibrex, or equal.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Install plumb and true. Install necessary accessories for proper installation.
- B. Anchor top and bottom runner track to ceiling or roof structure overhead and to floor structure below.
- C. Install studs squarely in top and bottom runner track with firm abutment against track webs.
- D. Align and plumb studs, and fasten to flanges of both top and bottom runner tracks.
- E. Provide three studs minimum at corners of stud walls. Locate so as to provide surfaces for attachment of interior and exterior facing materials.
- F. Members not indicated to be welded together shall be attached with manufacturer recommended screws with minimum one screw at each flange of stud to top and bottom track. Wire tying of framing members is not permitted.
- G. Provide lateral bracing and bridging in accordance with manufacturer's written recommendations or as required by CBC.
- H. Intersecting walls and partitions, whether load-bearing or not, shall be connected.
- I. Splices in axially loaded studs are not permitted.
- J. Splice or butt weld butt joints in runner tracks. No splices are permitted in tracks over lintels, diaphragm sheathing, or diagonal bracing.
- K. Weld connections by fillet welds or plug welds in accordance with AWS recommended procedures and practices.
- L. Touch-up field abrasions and welds with galvanizing touch-up material.
- M. Studs that frame door openings shall be clipped to floor with 14 gage angle clips. Each clip to have two fasteners into studs and two fasteners into floor.
- N. Provide additional joists or blocking adjacent to exterior and interior walls, openings and elsewhere as required to provide support for indicated ceiling construction.
- O. Provide an additional joist under parallel partitions where partition length exceeds $\frac{1}{2}$ joist span and around floor and roof openings which interrupt one or more spanning members.

3.02 CONNECTIONS TO METAL DECKING

- A. Provide premolded neoprene filler strips matching flute profile for non-fire-rated walls and partitions covered on one or both sides up to metal decking.
- B. Top runner track of fire-rated partitions shall be a minimum of 36 mils (20 gage), unless noted otherwise, and attached to metal deck with required fasteners at spacing required for fire rating, but in no case over 16 inches on center. Areas above runner shall be friction fit with a minimum depth of $2\frac{1}{2}$ inches of 4 pounds per cubic foot

density mineral wool insulation. A minimum of ½ inch of firestopping compound shall be installed to each side of mineral wool insulation for a one-hour system, and one inch of firestopping for a two-hour system. Install required special tracks, angles, fasteners and strips of gypsum wallboard to provide required fire resistance rating.

- C. Fire-rated top tracks shall be installed in accordance with manufacturer's recommendations and fire rating approval requirements.

3.03 QUALITY CONTROL

A. Welding Inspection:

1. Inspection of field welding operations shall be performed by special inspector.
2. The special inspector shall inspect material, equipment, procedures, welds, and welder qualifications.

3.04 CLEAN UP

- A. Remove rubbish, debris, and waste materials and legally dispose of off Project site.

3.05 PROTECTION

- A. Protect Work of this section until Substantial Completion.

END OF SECTION

SECTION 05 50 00

MISCELLANEOUS METALWORK

PART 1 – GENERAL

1.01 REQUIREMENTS

- A. The Contractor shall provide miscellaneous metalwork and appurtenances, complete and in place, in accordance with the Standards & Specifications, and Contract Documents.

1.02 RELATED WORK SPECIFIED ELSEWHERE

- A. Section 09 90 00 – Protective Coatings

1.03 SPECIFICATIONS, CODES AND STANDARDS

- A. ASTM International (ASTM)
 1. ASTM A 123 Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products
 2. ASTM A 153 Zinc Coating (Hot-Dip) on Iron and Steel Hardware
 3. ASTM A 193 Alloy Steel and Stainless Steel Bolting for High Temperature or D. High Pressure Service and Other Special Purpose Applications
 4. ASTM A 194 Carbon Steel, Alloy Steel, and Stainless Steel Nuts for Bolts High Pressure or High Temperature Service, or Both
 5. ASTM A 307 Carbon Steel Bolts, Studs, and Threaded Rod 60,000 psi Tensile Strength
 6. ASTM A 325 Structural Bolts, Steel, Heat Treated, 120/105 ksi Minimum Tensile Strength

1.04 CONTRACTOR SUBMITTALS

- A. General: Furnish submittals in accordance with Section 013300 - Contractor Submittals.
- B. Product Information: An ICBO report listing the ultimate load capacity in tension and shear for each size and type of concrete anchor. Contractor shall submit manufacturer's recommended installation instructions, and procedures for adhesive anchors. Upon review, these instructions shall be followed specifically.

1.05 QUALITY ASSURANCE

- A. No substitution for the indicated adhesive anchors will be considered unless accompanied with ICBO (International Council of Building Officials) report verifying strength and material equivalency, including temperature at which load capacity is reduced to 90 percent of that determined at 75 degrees F.

PART 2 – PRODUCTS

2.01 BOLTS AND ANCHORS

- A. Bolt, Nut and Washer Requirements: Unless otherwise indicated, bolts, anchor bolts, washers, and nuts shall be steel as indicated herein. All bolts and cap screws shall have hexagon heads and nuts shall be Heavy Hexagon Series. The bolt and nut material shall be free-cutting steel. The nuts shall be capable of developing the full strength of the bolts. Threads shall be Coarse Thread Series conforming to the requirements of the Unified Thread Standard (UTS). Where galvanized bolts are specified, threads on galvanized bolts and nuts shall be formed with suitable taps and dies such that they retain their normal clearance after hot-dip galvanizing.
1. Except as otherwise indicated, steel for bolt material, anchor bolts and cap screws shall be in accordance with the following:
 - a. Structural Connections: ASTM A 307 - Carbon Steel Bolts, Studs, and Threaded Rod 60,000 psi Tensile Strength Grade A or B, hot-dip galvanized.
 - b. Anchor Bolts: ASTM A 307, Grade A or B, or ASTM A 36, hot-dip galvanized.
 - c. High Strength Bolts (where indicated): ASTM A 325 - Structural Bolts, Steel, Heat Treated, 120/105 ksi Minimum Tensile Strength.
 - d. Pipe and Equipment Flange Bolts: ASTM A 193 - Alloy Steel and Stainless Steel Bolting Materials for High Temperature or High Pressure Service and Other Special Purpose Applications, Grade B-7.
 2. Washers shall be installed wherever bolts are used to fasten plastic items, or wherever the corrosion protection coating of an item may be damaged when the bolt is tightened. Washers shall be fabricated of material matching the bolts, except that hardened washers for high strength bolts shall conform to the requirements of the AISC Specification. Lock washers and Nylock bolts shall be installed where indicated and shall be fabricated of material matching the bolts.

3. The length of each bolt shall be such that after the joint is made up, the bolt extends a minimum of 1/8-inch beyond the nut, but in no case more than 5/8-inch beyond the nut.
- B. Standard and Above Ground Service (Non-Corrosive Service): All bolts, nuts, and washers in standard/above ground service on factory assembled items shall be stainless steel or in accordance with the manufacturers recommendations for such exposure. All field installed bolts, nuts, and washers in standard/above ground service shall be Cadmium or Zinc coated unless specified otherwise. Where exposed to moisture or other corrosive conditions, bolts shall be epoxy coated after installation in accordance with Section 099000- Protective Coatings, or as otherwise specified.
- C. Buried Service (Corrosive Service): All bolts, nuts, and washers in buried service on factory assembled items shall be stainless steel unless specified otherwise. All field installed bolts, nuts, and washers in buried service shall be Cadmium or Zinc coated unless specified otherwise. Buried bolts shall be coated/wrapped with #1 Wax-Tape by Trenton Corporation, Ann Arbor, MI 48103.
- D. Vault and Submerged Service (Corrosive Service): Bolts shall be epoxy coated after installation in accordance with Section 09 90 00- Painting and Coatings. All bolts, nuts, and washers in the locations listed below shall be stainless steel unless specified otherwise.
1. Inside vaults, manholes, and buried structures.
 2. Submerged locations.
 3. Locations subject to seasonal or occasional flooding.
 4. Inside hydraulic structures below the top of the structure.
 5. Chemical handling areas.
 6. Locations indicated by the Contract Documents, the GWD Standards & Specifications, or designated by the City to be provided with stainless steel bolts.
- E. Stainless Steel Bolts: Unless otherwise indicated, stainless steel bolts, anchor bolts, nuts, and washers shall be Type 316 stainless steel, class 2. Bolts shall conform to ASTM A 193. Nuts shall conform to ASTM A 194 - Carbon Steel, Alloy Steel, and Stainless Steel Nuts for Bolts for High Pressure or High Temperature Service or Both. All bolt threads shall be protected with an antiseize lubricant suitable for submerged service conforming to government specification MIL-A-907E - Antiseize Thread Compound, High Temperature. Antiseize lubricant shall be NSF-61 approved for use with potable water. Antiseize lubricant shall be "PURE WHITE" by Anti-Seize Technology, Franklin Park, IL, 60131, AS-470 by Dixon Ticonderoga Company, Lakehurst, NJ, 08733 or equal.

- F. Adhesive Anchors: Unless otherwise indicated, drilled, concrete, and masonry anchors shall be epoxy adhesive anchors. Epoxy anchor grout shall comply with Section 03 61 11 – Non-Shrink Grout. No substitutions will be considered unless accompanied with ICBO report verifying strength and material equivalency.
1. Where exposed to weather, in submerged, wet, splash, overhead, and corrosive conditions, and for anchoring handrails, pumps, mechanical equipment, and reinforcing bars, threaded rod shall be stainless steel Type 316.
 2. Where indicated, in locations not included above, galvanized steel threaded rod and glass capsule, polyester resin adhesive anchors will be permitted and shall be Hilti HVA or Cobra Anchors.
- G. Expanding-Type Anchors: Expanding-type anchors, if indicated or permitted, shall be steel expansion type ITW Ramset/Redhead "Trubolt" anchors; Hilti "Kwik-Bolt;" or equal. Lead caulking anchors will not be permitted. Size shall be as indicated. Expansion type anchors which are to be embedded in grout may be steel. Non-embedded buried or submerged anchors shall be stainless steel.
- H. Impact Anchors: Impact anchors shall be an expansion type anchor in which a nail type pin is driven to produce the expansive force. The pin shall have a zinc sleeve with a mushroom style head and stainless steel nail pin. Anchors shall be Metal Hit Anchors by Hilti, Inc., Zamac Nailing by Powers Fasteners; or equal.

PART 3 – EXECUTION

3.01 FABRICATION AND INSTALLATION REQUIREMENTS

- A. Fabrication and Erection: Except as otherwise indicated, the fabrication and erection of structural steel shall conform to the requirements of the AISC "Steel Construction Manual."
- B. Aluminum Railings: Aluminum railing fabrication and installation shall be performed by craftsmen experienced in the fabrication of architectural metalwork. Exposed surfaces shall be free from defects or other surface blemishes. Dimensions and conditions shall be verified in the field. All joints, junctions, miters and butting sections shall be precision fitted with no gaps occurring between sections, and with all surfaces flush and aligned. Electrolysis protection of materials shall be provided.
- C. Access Hatches: Unless otherwise indicated, the Contractor shall provide a 1/2-inch drain line to the nearest floor drain for all floor hatches.

3.02 WELDING

- A. Method: Welding shall be by the metal-arc method or gas-shielded arc method as described in the American Welding Society's "Welding Handbook" as supplemented by other pertinent standards of the AWS. Qualification of welders shall be in accordance with the AWS Standards governing same.
- B. Quality: In assembly and during welding, the component parts shall be adequately clamped, supported, and restrained to minimize distortion and for control of dimensions. Weld reinforcement shall be as indicated by the AWS Code. Upon completion of welding, weld splatter, flux, slag, and burrs left by attachments shall be removed. Welds shall be repaired to produce a workmanlike appearance, with uniform weld contours and dimensions. All sharp corners of material which is to be painted or coated shall be ground to a minimum of 1/32 inch on the flat.

3.03 GALVANIZING

- A. Structural steel plates shapes, bars, and fabricated assemblies required to be galvanized shall, after the steel has been thoroughly cleaned of rust and scale, be galvanized in accordance with the requirements of ASTM A 123. Any galvanized part that becomes warped during the galvanizing operation shall be straightened. Bolts, anchor bolts, nuts, and similar threaded fasteners, after being properly cleaned, shall be galvanized in accordance with the requirements of ASTM A 153. Field repairs to galvanizing shall be made using "Galvinox," "GalvoWeld," or equal.

3.04 DRILLED ANCHORS

- A. Drilled anchors and reinforcing bars shall be installed in strict accordance with the manufacturer's instructions. Holes shall be roughened with a brush on a power drill, cleaned and dry. Drilled anchors shall not be installed until the concrete has reached the required 28-day compressive strength. Adhesive anchors shall not be loaded until the adhesive has reached its indicated strength in accordance with the manufacturer's instructions.

END OF SECTION

SECTION 05 50 13 METAL FABRICATIONS

PART 1 - GENERAL

1.01 SUMMARY

- A. Section Includes: Metal fabrications:
1. Steel ladders
 2. Steel framing and supports for mechanical and electrical equipment.
 3. Gratings, frames and covers.
 4. Embedded edge angles in concrete.
 5. Miscellaneous steel framing, supporting angles, plates, brackets, clips, anchors and bolts for equipment, and other work which is not specifically included in Section 05 12 00, Structural Steel Framing.
 6. Miscellaneous metal fabrications, as indicated on the Drawings.
- B. Related Requirements:
1. Division 01 - General Requirements.
 2. Section 05 50 13: Hot-Dip Galvanizing.
 3. Section 05 12 00: Structural Steel Framing.

1.02 REFERENCES

- A. ASTM International (ASTM):
1. ASTM A27 – Standard Specification for Steel Castings, Carbon, for General Application.
 2. ASTM A36 – Standard Specification for Carbon Structural Steel.
 3. ASTM A47 - Standard Specification for Ferritic Malleable Iron Castings.
 4. ASTM A53 - Standard Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless.
 5. ASTM A123 - Standard Specification for Zinc (Hot-Dipped Galvanized) Coatings on Iron and Steel Products.
 6. ASTM A153 - Standard Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware.
 7. ASTM A283 - Standard Specification for Low and Intermediate Tensile Strength Carbon Steel Plates.
 8. ASTM A307 - Standard Specification for Carbon Steel Bolts, Studs, and Threaded Rod 60 000 PSI Tensile Strength.
 9. ASTM A500 - Standard Specification for Cold-Formed Welded and Seamless Carbon Steel Structural Tubing in Rounds and Shapes.

10. ASTM A501 - Standard Specification for Hot-Formed Welded and Seamless Carbon Steel Structural Tubing.
 11. ASTM A563 - Standard Specification for Carbon and Alloy Steel Nuts.
 12. ASTM A653 - Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.
 13. ASTM C1107 - Standard Specification for Packaged Dry, Hydraulic-Cement Grout (Nonshrink).
 14. ASTM D1187 - Standard Specification for Asphalt-Base Emulsions for Use as Protective Coatings for Metal.
 15. ASTM F1554 - Standard Specification for Anchor Bolts, Steel, 36, 55, and 105-ksi Yield Strength.
 16. ASTM F2329 - Standard Specification for Zinc Coating, Hot-Dip, Requirements for Application to Carbon and Alloy Steel Bolts, Screws, Washers, Nuts, and Special Threaded Fasteners.
- B. American Welding Society (AWS):
1. AWS D1.1 Structural Welding Code - Steel.
 2. AWS D1.3 Structural Welding Code - Sheet Steel.
 3. AWS D-19.0 Welding Zinc Coated Steel.

1.03 COORDINATION

- A. Coordination between Steel Fabricator and Galvanizer:
1. Prior to fabrication, submit approved fabrication shop drawings to the galvanizer.
 2. Notify galvanizer of steel fabrications that exceed the ASTM A385 recommended percentages for carbon, phosphorus, manganese and silicon, so special galvanizing processing techniques are used.
- B. Coordinate installation of metal fabrications that are anchored to concrete or masonry, or that receive work specified by other Sections. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry.
- C. Field Measurements: Field verify dimensions prior to fabrication.
- D. Coordinate selection of shop primers with galvanizing, and with paintings to be applied over them. Comply with paint and coating manufacturers' written recommendations to ensure that shop primers and paintings are compatible with one another.

1.04 SUBMITTALS

- A. Shop Drawings: Submit Shop Drawings indicating provided materials, dimensions, anchoring detail, and details of termination or connection to adjacent construction. Indicate items that are purchased from a manufacturer and items that are shop fabricated. Indicate component parts requiring Project site fabrication or assembly.

- B. Product Data: Submit Product Data for manufactured items. Submit Product Data for primers and finishes.
- C. Material Samples: Submit Samples of primers and finishes on fabricated items.
- D. Fabricator qualifications per Article “Quality Assurance”.
- E. Welding:
 - 1. Welder’s Certificates: Field welders shall be Project certified in accordance with AWS D1.1.
 - 2. Welding Material Certification: Provide certificate that welding material complies with specifications.
- F. Research/Evaluation Reports: ICC-ES for post-installed anchors.
 - 1. LEED Submittals: Complete the LEED Material Buyout Form (MBoF) with all materials provided to the project. A complete submittal includes providing all material costs in the MBoF and all of the supporting documentation for the following credits:
 - a. MRc2 - Environmental Product Declarations (EPD): Provide Industry-Wide or Product-Specific EPD.
 - b. MRc3 - Sourcing of Raw Materials - Recycled Content: Provide product data for pre- and post- consumer recycled content.
 - c. MRc4 - Material Ingredients: Provide manufacturers Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, or Cradle to Cradle Health Product Certificate.
 - d. IEQc2 - Low-Emitting Materials – Interior Wet Applied Products: For paints, coatings, adhesives and sealants applied on site or used for laminating off-site, include product data indicating the VOC content (g/L) and testing certificates or third-party certification demonstrating compliance with California Department of Public Health (CDPH) v1.2-2017 emissions testing.

1.05 QUALITY ASSURANCE

- A. Fabricator Qualifications: Firm with a minimum five year experience in successfully producing metal fabrications similar to that shown on the drawings.
- B. Welding Qualifications: Qualify procedures and personnel according to the following:
 - 1. AWS D-1.1– Structural Welding Code – Steel.
 - 2. AWS D1.3 - Structural Welding Code - Sheet Steel.
- C. Inspection of Welding: Refer to Section 01 4523: Testing and Inspection.
- D. Field applied primers, paintings, sealers and adhesives shall be approved by the OWNER.
- E. Preassemble items in shop to greatest extent possible to minimize field welding. Mark units for reassembly and coordination of installation. Use marking method compatible with galvanizing.

1.06 DELIVERY, STORAGE AND HANDLING

- A. Store miscellaneous metal items above grade on platforms, skids, or other required supports.
- B. Protect from damage and from corrosion, dirt, grease and other foreign matter.

PART 2 - PRODUCTS

2.01 MATERIALS

- A. Structural Steel Shapes: ASTM A36.
- B. Rolled Steel Plates: ASTM A36. Plates to be bent or cold-formed shall conform to ASTM A283, Grade C.
- C. Round HSS: ASTM A500 Grade B or C.
- D. Square and Rectangular HSS: ASTM A500 Grade B or C.
- E. Steel Pipe: ASTM A53 Type E or S, Grade B, standard weight (Schedule 40), unless otherwise noted. Black finish.
- F. Steel Sheet: ASTM A1008 or ASTM A1011.
- G. Steel Bolts: ASTM A307, Grade A, or F3125 with hex steel nuts per ASTM A563 and washers. Galvanized in accordance with ASTM A153 for exterior locations.
- H. Steel Bars: Conforming to ASTM A108 or ASTM A575.
- I. Concrete Inserts: Threaded or wedge type; galvanized ferrous castings, either malleable iron, ASTM A47, or cast steel, ASTM A27. Provide bolts, washers, and shims, hot-dip galvanized per ASTM A153.
- J. Nonshrink, Nonmetallic Grout: Factory-packaged, non-staining, noncorrosive, nongaseous grout complying with ASTM C1107. Provide grout specifically recommended by manufacturer for interior and exterior applications.

2.02 FABRICATION

- A. General:
 - 1. Preassemble items in the shop to greatest extent possible. Use connections that maintain structural value of joined pieces. Mark units for reassembly and installation.
 - 2. Cut, drill, and punch metals cleanly and accurately. Ease exposed edges to a radius of approximately 1/32 inch, unless otherwise indicated or specified. Remove sharp and rough areas on exposed surfaces. Form exposed work with accurate angles and surfaces and straight edges. Form exposed connections with hairline joints, flush and smooth. Locate joints where least conspicuous.
- B. Welding:
 - 1. Weld connections unless otherwise indicated.

2. Weld corners and seams continuously and in accordance with requirements of AWS D1.1 Structural Welding Code. Welds shall be inspected as required in Section 05 12 00: Structural Steel Framing.
3. Grind exposed welds smooth and flush to match and blend with adjoining surfaces.

2.03 PREPARATION FOR GALVANIZING

- A. Fabricate to the largest size possible and whenever possible use slip joints to minimize field welding.
- B. Fabricate structural steel in accordance with Class I, II, III guidelines as described in AGA's Recommended Details for Galvanized Structures, to facilitate galvanizing process. Corners of gussets, stiffeners, and bracing shall be cropped to allow free flow of zinc during galvanizing process.
- C. Remove welding slag, splatter, anti-splatter compounds and burrs prior to delivery for galvanizing.
- D. Marking for Identification: Avoid unsuitable marking paints for identification, such as oil based paints and markers and crayon markers. Use water soluble paints or markers acceptable to galvanizer or steel tags wired to the work.
- E. Masking: Use masking materials recommended by the American Galvanizers Association (AGA) to produce ungalvanized areas for field welding and at slip critical bolts.
- F. Galvanize fabrications per Section 05 5013, Hot-Dip Galvanizing, in accordance with ASTM A123 and ASTM A153.

2.04 SHOP FINISH

- A. Metal fabrications shall be provided with a coat of primer, except those indicated to be hot-dip galvanized.
- B. Primers:
 1. Universal Shop Primer: Fast-curing, lead- and chromate-free, universal modified-alkyd primer complying with MPI#79 and compatible with topcoat. Use primer containing pigments that make it easily distinguishable from zinc-rich primer.
 2. Epoxy Zinc-Rich Primer: Complying with MPI#20 and compatible with topcoat.
 3. Minimum dry film thickness of primer shall be 2.0 mils.
- C. Preparation for Primer Painting: Miscellaneous ferrous metal, except items specified galvanized, shall be thoroughly cleaned and prepared for painting, including removal of shipping oils or protective coatings, mill scale, grease, dirt and rust. Prepare in accordance with SSPC recommendations. Deliver to Project site primed or galvanized as indicated, and ready to receive Project site applied finishes.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Examine the areas where metal fabrications are to be installed. Notify the OAR in writing of unsatisfactory conditions. Do not proceed with the work until unsatisfactory conditions have been corrected.

3.02 INSTALLATION

- A. Provide anchorage devices and fasteners as indicated in the drawings and where necessary for securing miscellaneous metal fabrications to in-place construction.
- B. Cut, drill, and fit as required for installation of miscellaneous metal fabrications. Set metal fabrication accurately in location, alignment, and elevation; with edges and surfaces level, plumb, true, and free of rack; and measured from established lines and levels.
- C. Fit exposed connections accurately together to form hairline joints. Weld connections that are not to be left as exposed joints but cannot be shop-welded because of shipping size limitations. Do not weld, cut, or abrade the surfaces of hot-dip galvanized fabrications intended for bolted or screwed field connections.
- D. Alignment: Verify alignment of items with adjacent construction. Coordinate related work.
- E. Grout: Follow manufacturer's recommendations for substrate preparation and application.
- F. Corrosion Protection: Coat concealed surfaces of metals that will come into contact with grout, concrete, masonry, or wood, with a heavy coat of bituminous paint or zinc chromate primer. Protect dissimilar metals from galvanic corrosion by pressure tapes, coating, or isolators.

3.03 FIELD WELDING

- A. Preparation of Weld Area of Galvanized Fabrications: Remove masking from fabrications. Remove remaining zinc coating between one inch and four inches from both sides of members to be welded, by grinding back the zinc coating, burning the zinc away or pushing back the molten zinc from the weld area.
- B. Welding: Comply with AWS Code for procedures of manual shielded metal-arch welding, appearance and quality of welds made, methods used in correcting welding work.
 - 1. Weld in accordance to AWS D-1.1.
 - 2. Weld galvanized fabrications in accordance to AWS D-19.0.
- C. Remove welding flux immediately. At exposed connections, finish exposed welds and surfaces smooth and blended so that no roughness shows after finishing and contour of welded surfaces matches those adjacent.
- D. Upon completion of welding plug vent, drainage and lifting holes of galvanized fabrications with appropriate diameter zinc plugs. Push in about half way by hand, and hammer to a tight fit. With a hand file or an abrasive tool, file away excess material. Repair scratches with a zinc rich coating.
 - 1. Plug railing holes.
 - 2. Plug visible holes of HSS members.

- 3.04 ADJUSTING AND CLEANING
- A. Touch Up Damaged Surfaces:
1. Shop Painted Finishes: Comply with SSPC-PA-1 for touch-up; apply with brush to produce a minimum 2.0 mil dry film thickness.
2. Galvanized Surfaces: Clean field welds, connections and damaged areas. Apply two coats of Carbomastic 15, by Carboline or equal product. Brush or roll to a 4 to 6 mil thickness.
- 3.05 CLEAN UP
- A. Remove rubbish, debris, and waste materials and legally dispose of off the Project site.
- 3.06 PROTECTION
- A. Protect the Work of this section until Substantial Completion.

END OF SECTION

SECTION 05 51 50

ALUMINUM FABRICATIONS

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Access ladders
2. Ships ladder
3. Crossovers

B. Related Requirements:

1. Division 01 - General Requirements.
2. Section 05 50 00: Metal Fabrications.
3. Section 05 12 00: Structural Steel Framing.

1.02 REFERENCES

A. AA – Aluminum Association.

B. ASTM International (ASTM):

1. ASTM B 209 - Standard Specification for Aluminum and Aluminum-Alloy Sheet and Plate.
2. ASTM B 221 - Standard Specification for Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles, and Tubes.

C. Occupational Safety and Health Administration (OSHA):

1. OSHA 1910.27 – Fixed Ladders.

1.03 COORDINATION

A. Coordinate installation of metal fabrications that are anchored to concrete or masonry, or that receive work specified by other Sections. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry.

B. Field Measurements: Field verify dimensions prior to fabrication.

- C. Coordinate selection of shop primers with paintings to be applied over them. Comply with paint and coating manufacturers' written recommendations to ensure that shop primers and paintings are compatible with one another.

1.04 SUBMITTALS

- A. Shop Drawings: Submit Shop Drawings indicating provided materials, dimensions, anchoring detail, and details of termination or connection to adjacent construction. Indicate items that are purchased from a manufacturer and items that are shop fabricated. Indicate component parts requiring Project site fabrication or assembly.
- B. Product Data: Submit Product Data for manufactured items. Submit Product Data for primers and finishes.
- C. Material Samples: Submit Samples of finishes on fabricated items.
- D. Fabricator qualifications per Article "Quality Assurance".
- E. Material Samples: Submit Samples of finishes on fabricated items. For each finish specified, two samples, minimum size 6 inches (150 mm) square, represent actual product color.
- F. Provide templates for anchors and bolts specified for installation under other Sections.
- G. Provide reaction loads for each hanger and bracket.

1.05 QUALITY ASSURANCE

- A. Manufacturer Qualifications: A firm experienced in producing aluminum metal fabrications similar to those indicated for this Project.
 - 1. Record of successful in-service performance.
 - 2. Sufficient production capacity to produce required units.
 - 3. Professional engineering competent in design and structural analysis to fabricate aluminum in compliance with industry standards and local codes.
- B. Installer Qualifications: Competent and experienced firm capable of selecting fasteners and installing to attain designed operational and structural performance.
- C. Product Qualification: Product design shall comply with OSHA 1910.27 minimum standards for ladders.

1.06 DELIVERY, STORAGE AND HANDLING

- A. Store products in manufacturer's unopened packaging until ready for installation.
- B. Protect from damage and from corrosion, dirt, grease and other foreign matter.

1.07 DELIVERY, STORAGE AND HANDLING

- A. Field Measurements: Verify dimensions by field measurement before fabrication.
 - 1. Established Dimensions: Where field measurements cannot be made without delaying the Work, indicate established dimensions on shop drawing submittal and proceed with fabrication.

1.08 DELIVERY, STORAGE AND HANDLING

- A. Manufacturer has responsibility for an extended Corrective Period for work of this Section for a period of 5 years commencing on the shipment date of the product against all the conditions indicated below, and when notified in writing from Owner, manufacturer shall promptly and without inconvenience and cost to Owner correct said deficiencies.
 - 1. Defects in materials and workmanship.
 - 2. Deterioration of material and surface performance below minimum OSHA standards as certified by independent third party testing laboratory. Ordinary wear and tear, unusual abuse or neglect exempted.
 - 3. Within the warranty period, the manufacturer shall, at its option, repair, replace, or refund the purchase price of defective ladder.
- B. Manufacturer shall be notified immediately of defective products, and be given a reasonable opportunity to inspect the goods prior to return.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

- A. Access Ladder, Ships' Ladder and Crossover:
 - 1. Basis of Design: O'Keeffe's Inc., 100 N Hill Drive, Suite 12, Brisbane, CA 94005. Toll Free Tel: (888) 653-3333. Tel: (415) 824-4900. Fax: (415) 824-5900. Email: info@okeeffes.com. Web: <http://www.okeeffes.com>.
 - 2. Erectastep
 - 3. Platforms and Ladders
 - 4. Equal

2.02 ACCESS LADDER

- A. Siderails: Continuous extruded-aluminum channels with spacing as indicated in drawings
- B. Rungs: Extruded-serrated aluminum as indicated in drawings. Fit rungs in centerline of siderails; fasten by welding or with stainless steel fasteners or brackets and aluminum rivets.
- C. Materials:
 - 1. Aluminum Extrusions: Alloy 6063-T6 to comply with ASTM B221.
 - 2. Alloy 5005-H34 to comply with ASTM B209.
- D. Aluminum Safety Post: As manufactured by Babcock-Davis, 9300 73rd Ave N, Brooklyn Park, MN 55428, PH: 888-412-3726. Web: www.Babcock-Davis.com. Or Equal
 - 1. Performance Requirements: Fabricate safety post to comply with OSHA 1910.27 for fixed ladders. Must support 200 pound load.
 - 2. Post: 1 1/2" x 1 1/2" square tubing- high strength. A pull up loop shall be provided at the upper end of the post to facilitate raising the post.
 - 3. Finish: Mill finish
 - 4. Spring assist: Stainless steel balancing spring mechanism shall be provided to provide smooth, easy, controlled operation when raising and lowering the safety post.
 - 5. Hardware: All mounting hardware shall be stainless steel.
 - 6. Acceptable Product Model: SPA as manufactured by Babcock Davis or Equal.

2.03 SHIPS' LADDER AND CROSSOVER

- A. Provide ships' ladders and pipe crossovers where indicated. Fabricate of open type construction with channel or plate stringers and pipe and tube railings unless otherwise indicated. Provide brackets and fittings for installation.
 - 1. Incline: As indicated in drawings.
 - 2. Tread: Dimensions as indicated in drawings.
 - 3. Riser height: As indicated in drawings.
 - 4. Fabricate ships' ladders and crossovers, including railings from aluminum.
 - 5. Fabricate treads and platforms from extruded-aluminum plank grating. Limit

openings in gratings to no more than 1/2 inch in least dimension.

6. Fabricate treads and platforms from rolled-aluminum-alloy.

B. Materials:

1. Aluminum Extrusions: Alloy 6063-T6 to comply with ASTM B221.
2. Alloy 5005-H34 to comply with ASTM B209.

2.04 FINISHES

A. As-Fabricated finish, AA-M12

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Examine the areas where metal fabrications are to be installed. Notify the OAR in writing of unsatisfactory conditions. Do not proceed with the work until unsatisfactory conditions have been corrected.
- B. Coordinate anchorages. Furnish setting drawings, templates, and anchorage structural loads for fastener resistance.
- C. Do not begin installation until supporting structure is complete and ladder installation will not interfere with supporting structure work.
- D. If supporting structure is the responsibility of another installer, notify Architect of unsatisfactory supporting work before proceeding.

3.02 INSTALLATION

- A. Provide anchorage devices and fasteners as indicated in the drawings and where necessary for securing fabrications to in-place construction.
- B. Cut, drill, and fit as required for installation of fabrications. Set fabrication accurately in location, alignment, and elevation; with edges and surfaces level, plumb, true, and free of rack; and measured from established lines and levels.
- C. Alignment: Verify alignment of items with adjacent construction. Coordinate related work.
- D. Install in accordance with manufacturer's instructions and in proper relationship with adjacent construction.

- E. Corrosion Protection: Coat concealed surfaces of metals that will come into contact with grout, concrete, masonry, or dissimilar material, with a heavy coat of bituminous paint or zinc chromate primer. Protect dissimilar metals from galvanic corrosion by pressure tapes, coating, or isolators.

3.03 INSTALLATION OF ACCESS LADDERS

- A. Secure ladders to adjacent construction with the clip angles attached to the stringer.
- B. Install brackets as required for securing of ladder welded or bolted to structural steel or built into other surfaces.

3.04 INSTALLATION OF SHIPS' LADDER AND CROSSOVER

- A. Secure top and bottom of ships' ladders to construction to comply with manufacturer's written instructions.
- B. Secure pipe crossovers to construction to comply with manufacturer's written instructions.

3.05 CLEAN UP

- A. Remove rubbish, debris, and waste materials and legally dispose of off the Project site.

3.06 PROTECTION

- A. Protect the Work of this section until Substantial Completion.
- B. Protect installed products until completion of project.
- C. Touch-up, repair or replace damaged products before Substantial Completion.

END OF SECTION

SECTION 05 75 19

DECORATIVE ALUMINUM SCREENING

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Prefabricated perforated aluminum screen and gate
2. Mounting components and accessories
3. Mechanical fasteners

B. Related Requirements:

1. Division 01
2. Section 01 33 00 - Submittal Procedures
3. Section 01 77 00 - Closeout Procedures
4. Section 07 64 25 – Fully Adhered TPO Roofing
5. Section 09 90 00 - Painting and Coating

1.02 REFERENCES

A. Reference Standards and Codes:

1. The Aluminum Association, Inc. (AA):
 - a. AA DAF-45, 2003(2009), Designation System for Aluminum Finishes
2. American Architectural Manufacturers Association (AAMA):

1.03 ADMINISTRATIVE REQUIREMENTS

- A. Coordination: Coordinate installation of anchorages for screen. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete. Deliver such items to Project site in time for installation.

1.04 ACTION SUBMITTALS

- A. Submit in accordance with Section 01 33 00:
 1. Product Data: Material description and installation instructions for manufactured products.
 2. Shop Drawings:
 - a. Include plans, elevations, sections, details, attachments, anchors, and size and type of fasteners, and accessories.
 - b. Indicate welded connections and details of welds.
 3. Furnish setting drawings, diagrams, templates, instructions, and directions for installation of anchorages, such as concrete inserts, anchor bolts and miscellaneous

items having integral anchors, which are to be embedded in concrete construction. Coordinate delivery of such items to Project site.

4. Samples for Initial Selection: For products involving selection of color, texture, or design.

1.05 QUALITY ASSURANCE

- A. Comply with Standards and Codes listed in Article 1.02 REFERENCES.
- B. Welding Qualifications: Qualify procedures and personnel according to the following:
 1. AWS D1.2/D1.2M, for aluminum.

1.06 DELIVERY, STORAGE, AND HANDLING

- A. Deliver, store and handle fence components in a manner that will prevent distortion or damage.
- B. Store clear of the ground and protect from moisture and the elements.
- C. Deliver items required to be built into concrete promptly to the site so they may be built in as the work progresses.
- D. Do not install damaged and otherwise unsuitable material.

1.07 FIELD CONDITIONS

- A. Field Measurements: Verify actual locations of walls and other construction contiguous with metal fabrications by field measurements before fabrication.
 1. Indicate field measurements on final shop drawings.
 2. Where field measurements cannot be made without delaying the Work, guarantee dimensions and proceed with fabrication of products without field measurements.
 3. Coordinate construction with work of other trades to ensure that actual dimensions correspond to guaranteed dimensions.

1.08 WARRANTY

- A. Special Finish Warranty (High-Performance Organic Coatings): Applicator's standard form in which applicator agrees to repair or replace components on which finishes do not comply with requirements or that fail in materials or workmanship within specified warranty period. Warranty does not include normal weathering.
 1. Warranty Period: 10 years from date of Substantial Completion.

PART 2 - PRODUCTS

2.01 ACCEPTABLE MANUFACTURER

- A. Basis of Design:
1. Astro Metal Craft
11059 Lamont Avenue NE
Hanover, MN 55341
(763)777-8087
www.astrometalcraft.com

- B. Or approved equal.

2.02 PERFORMANCE CRITERIA

- A. Thermal Movements: Allow for thermal movements from ambient and surface temperature changes acting on exterior metal fabrications by preventing buckling, opening of joints, overstressing of components, failure of connections, and other detrimental effects.
1. Temperature Change: 120 degrees F, ambient; 180 degrees F, material surfaces.
- B. Control of Corrosion: Prevent galvanic action and other forms of corrosion by insulating metals and other materials from direct contact with incompatible materials.

2.03 MATERIALS

- A. General:
1. Metal Surfaces: Provide materials with smooth surfaces, without seam marks, roller marks, rolled trade names, stains, discolorations, or blemishes.
 2. Aluminum: Provide alloy and temper recommended by aluminum producer and finisher for type of use and finish indicated, and with strength and durability properties for each aluminum form required not less than that of alloy and temper specified below.
 3. Component Sizes: Unless otherwise specified herein, sizes are indicated on Drawings.
- B. Perforated Screen and Gate Panels:
1. Aluminum Plate: ASTM B209, 5052 alloy; anodizing quality aluminum plate, 0.188-inch thick.
 2. Panel Dimensions:
 - a. Height: As indicated in drawings.
 - b. Length: As indicated in drawings.
 3. Perforations:

- a. Shape: Round holes, with 3/8-inch solid gaps between holes and 3/8-inch solid edges.
 - b. Size:
 - 1) Round Perforations: 1-inch diameter.
 - 2) Hole Centers: 1.375-inch c-c for 1-inch perforations.
 - a. Pattern: Straight pattern.
- C. Aluminum Tube Supports, vertical and horizontal: ASTM B221, 6061-T6 alloy, extruded tubing, 0.250-inch wall thickness.
- D. Aluminum Tube Support Caps: ASTM B209, 5052 alloy; aluminum plate, 0.190-inch thick.
- E. Exposed Fasteners: Flush countersunk screws or bolts, consistent with design of fence.
- F. Welding Electrodes: Comply with AWS requirements in D1.1 and D1.2.
1. For aluminum, provide type and alloy as recommended by producer of metal to be welded and as required for color match, strength, and compatibility in fabricated items.
- G. Fasteners, Anchors and Inserts:
1. Aluminum Component Fasteners: Type 304 stainless-steel fasteners.
 2. Fasteners for Anchoring Support Posts to Concrete: Select fasteners of type, grade, and class required to produce connections suitable for anchoring posts to concrete as indicated on Drawings and capable of withstanding design loads.
 3. Inserts: Furnish inserts to be set or otherwise secured to supporting Work.
 - a. For anchorage to concrete, provide inserts to be cast into concrete, for bolting anchors
- H. Gate Hardware
1. 2 qty Hinges: Heavy Duty Round Self-Closing Hinges model TruClose TCHDRND as manufactured by D&D.
 2. 1 each Keyed Latch/Lockset: Magnetic Gate Lock model LokkLatch LLMKABT as manufactured by D&D.
- 2.04 FABRICATION
- A. General:
1. Fabricate fence components to comply with requirements indicated for design, dimensions, member sizes and spacing, details, finish, and anchorage, but not less than that required to support structural loads.

- B. Joinery and Terminations:
 - 1. Fabricate components to produce joints tightly fitted and secured.
 - 2. Form curved sections, if any, by rolling to produce uniform curvature indicated without buckling, twisting, or otherwise deforming exposed surfaces of fence panels.
 - 3. Close exposed ends of tube supports by welding cover plate in place or by use of prefabricated fittings.

- C. Accurately form components to suit specific project conditions and for proper connection to other construction.
 - 1. Panels:
 - a. Perforations: Punch metals cleanly and accurately. Remove burrs.
 - b. Exposed Edges: Ease exposed edges to a radius of approximately 1/32 inch unless otherwise indicated.
 - c. Corners: Form bent-metal corners by scoring back of aluminum plate at bends as necessary to achieve the smallest radius possible without causing grain separation or otherwise impairing the work.
 - 1) Corner Notches: Refer to subparagraph 2 below.
 - d. Apply anodized finish specified, after bending.

- D. Dissimilar Metals: Provide nylon or other manufacturer suggested gaskets at mounting flanges, and other areas where fence panels or posts are scheduled to attach to dissimilar metals or concrete. Cut gaskets to match profile of mounting flange.

2.05 FINISHES

- A. Screen Posts and Panels:
 - 1. High-Performance Organic Finish: Two-coat fluoropolymer finish complying with AAMA 2605 and containing not less than 70 percent PVDF resin by weight in color coat. Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturers' written instructions.
 - a. Color and Gloss: As selected by Architect from manufacturer's full range.

- B. Protect shop-applied finishes on surfaces exposed to view in the finished Work from damage, by applying a temporary protective covering or by other methods recommended by the coating applicator before shipment.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Examine substrates, areas, and conditions, with installer present where indicated, for compliance with requirements for installation tolerances and other conditions affecting performance. Notify the Owner's representative of conditions detrimental to performance of the Work and recommended corrections. Where the installation and its completion may be delayed due to existing conditions, follow notification immediately with a written report. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION

- A. Coordinate post setting drawings, diagrams, templates, instructions, and directions for installation of anchorages, such as sleeves, concrete inserts, anchor bolts, and miscellaneous items having integral anchors, that are to be embedded in concrete construction. Coordinate delivery of such items to project site.
- B. Apply one coat of bituminous paint to concealed aluminum, steel and stainless-steel surfaces that will be in contact with cementitious or dissimilar materials.

3.03 INSTALLATION

- A. General:
 - 1. Install in accordance with manufacturer's instructions anchored securely to supporting construction.
 - 2. Fit panels together to form tight, hairline joints, free from distortion and other defects.
 - 3. Perform cutting, drilling, and fitting required for installing fence panels. Set panels accurately in location, alignment, and elevation; measured from established lines and levels and free of rack.
 - a. Do not weld, cut, or abrade surfaces of fence components that have been coated or finished after fabrication and that are intended for field connection by mechanical or other means without further cutting or fitting.
 - 4. Align panel tops so variations from level for horizontal members do not exceed 1/4 inch in 12 feet unless otherwise shown on the Drawings.
 - 5. Corrosion Protection: Coat concealed surfaces of aluminum that will be in contact with concrete or dissimilar metals, with a heavy coat of bituminous paint.
 - 6. Conceal anchor bolts and screws whenever possible; where not concealed, use flush countersunk fastenings.
- B. Screen Posts and Panels:
 - 1. Posts: Space posts at spacing indicated on final shop drawings. Plumb posts in each direction.

2. Panels: Set panels in proper location. Adjust panels prior to anchoring to ensure matching alignment of abutting joints and continuity of patterns, if any.

3.04 INSTALLATION TOLERANCES

- A. Maximum Variation from Plumb: 1/4 inch per floor level, noncumulative.
- B. Maximum Offset from True Alignment: 1/4 inch.
- C. Maximum Out-of-Position: 1/4 inch.
- D. Posts: 1/16 inch in 3 feet.

3.05 ADJUSTING

- A. Restore finishes damaged during installation and construction period so that no evidence remains of correction work. Return items which cannot be refinished in the field to the shop. Make required alterations and refinish affected area so that it is indistinguishable from adjacent undamaged areas. Provide new components where finishes cannot be restored to undamaged condition.

3.06 PROTECTION

- A. Protect finishes of fence components from damage during construction period with temporary protective coverings approved by fence manufacturer. Remove protective coverings at time of Substantial Completion.

END OF SECTION

SECTION 06 10 00

ROUGH CARPENTRY

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Rough carpentry Work.

B. Related Requirements:

1. Division 01 - General Requirements.
2. Section 03 10 00: Concrete Forming and Accessories.
3. Section 03 30 00: Cast-In-Place Concrete.
4. Section 06 20 00: Finish Carpentry.
5. Section 09 29 00: Gypsum Board.

1.02 SYSTEM DESCRIPTION

A. Regulatory Requirements:

1. Work of this Section shall comply with CBC Chapter 23.

1.03 SUBMITTALS

A. LEED Submittals: Complete the LEED Material Buyout Form (MBoF) with all materials provided to the project. A complete submittal includes providing all material costs in the MBoF and all of the supporting documentation for the following credits:

1. MRc2 - Environmental Product Declarations (EPD): Provide Industry-Wide or Product-Specific EPD.
2. MRc3 - Sourcing of Raw Materials - Recycled Content: Provide product data for pre- and post- consumer recycled content.
3. MRc3 - Sourcing of Raw Materials – Forestry Stewardship Council (FSC) Certified Wood: For all wood products designated in this specification as “FSC certified,” provide vendor invoices with the vendor’s Chain-of-Custody (COC) number and identify each FSC certified product on a line-item basis. If FSC

wood products are modified off-site by an architectural woodworker or millworker, the woodworker must have an FSC COC number.

4. MRc3 - Local/ Regional Material: Provide product data confirming product manufactured and extracted within 100 miles of the project site. Only applicable for products that also contain recycled content or FSC certified wood.
5. MRc4 - Material Ingredients: Provide manufacturers Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, or Cradle to Cradle Health Product Certificate.
6. IEQc2 - Low-Emitting Materials – Interior Wet Applied Products: For paints, coatings, adhesives and sealants applied on site or used for laminating off-site, include product data indicating the VOC content (g/L) and testing certificates or third-party certification demonstrating compliance with California Department of Public Health (CDPH) v1.2-2017 emissions testing.

1.04 QUALITY ASSURANCE

A. Comply with the following as a minimum requirement:

1. Redwood structural and framing lumber shall be graded in accordance with Standard Specifications for Grades of California Redwood Lumber of the Redwood Inspection Service.
 2. Douglas fir, larch or hemlock structural and framing lumber shall be graded in accordance with the Standard Grading Rules of the West Coast Lumber Inspection Bureau (WCLIB) or the Western Lumber Grading Rules of the Western Wood Products Association (WWPA).
 3. Plywood shall conform to requirements of Product Standard PS 1, and shall be grade marked by a recognized grading agency (APA and PTL).
- B. Lumber shall bear official grade mark of the association under whose rules it was graded or official grade mark of another recognized grading agency.
- C. Structural and framing members 2-inch thick (nominal) and larger shall be air-dried to moisture content not to exceed 19 percent before installation.
- D. Each piece of preservative treated lumber shall be identified by the Quality Mark of an approved inspection agency in accordance with CBC Chapter 23; refer to Section 01 45 23: Testing and Inspection.

1.05 STORAGE, HANDLING AND PROTECTION

- A. The materials supplied as part of the Work of this section shall be protected from exposure to inclement weather before being covered by other Work.

PART 2 - PRODUCTS

2.01 MATERIALS

- A. Lumber: Structural and framing lumber shall be of following species and grades:

<u>INSTALLATION</u>	<u>SPECIES</u>	<u>GRADE</u>
---------------------	----------------	--------------

- | | | |
|---|-------------------------------|---------|
| 1. Miscellaneous nailing strips and blocks embedded in concrete or masonry. | Douglas fir and Larch treated | Grade 1 |
|---|-------------------------------|---------|

- B. Plywood: Plywood furnished for structural purposes, when exposed outdoors, shall be exterior type plywood. Other plywood furnished for structural purposes shall be exterior type, or Exposure 1.

- C. OSB Board or Panels:

1. Oriented strand board or panels shall not be furnished as part of the Work of this section.

- D. Preservative Treated Wood:

1. Wood and plywood specified; as treated wood shall be pressure treated wood in accordance with CBC requirements.
2. Seasoning: Treated lumber shall be air seasoned after treatment, for a minimum of two weeks before installation. Moisture content shall be 15 percent maximum.
3. Creosote or arsenic is not permitted for treating wood.
4. When treated wood member have been notched, dapped, drilled, or cut, such newly cut surfaces shall be painted with a heavy coat of the same preservative material originally provided for treatment of wood member.

- E. Fire Retardant Protection: Wood and plywood specified as fire retardant protected wood shall be treated by approved methods and materials and shall be dried following treatment to maximum moisture content as follows:

1. Solid sawn lumber 2-inch thick or less: 19 percent.
2. Plywood: 15 percent.

2.02 LEED REQUIREMENTS

- A. IW/PS EPD: Products specified under this section must have either a Type III Product Specific EPD or the company must be listed in the industry group responsible for the Industry Wide Externally Verified EPD.
- B. PS EDP: Products specified under this section must have a Type III Product Specific EPD.
- C. HPDs: Products specified under this section must have one of the following unexpired material ingredient reports compliant with LEEDv4.1 requirements and declared to 1000 ppm or less: Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, Cradle to Cradle Health Product Certificate, or UL Product Lens Certification.
- D. FSC Certified Wood Products: Wood products shall be certified as "FSC 100%" or "FSC Mix Credit" or "FSC Recycled" according to FSC STD 40-004 v3-0 with proper chain of custody.
- E. Interior Wet Applied Products: All wet-applied on-site paints, coatings, adhesives, and sealants products provided under Part 2 of this specification section must be compliant with the VOC limits outlined under IEQc2: Low Emitting Materials in 01 81 13 Sustainable Design Requirements. In addition, all paints and coatings must be compliant with CDPH Standard Method v1.2-2017 emissions testing with proper unexpired CDPH testing certificates or acceptable third-party certification.

PART 3 - EXECUTION

3.01 FASTENINGS

- A. Nails and Spikes:
 - 1. Furnish only common wire nails or spikes whenever indicated, specified or required.
 - 2. Whenever necessary to prevent splitting, holes shall be pre-drilled for nails and spikes.
 - 3. Nails in plywood shall not be overdriven.
 - 4. Machine Applied Nailing: Machine nailing is not permitted for 5/16 inch plywood. Do not permit nail heads to penetrate outer ply. Maintain minimum allowable edge distances when installing nails.
- B. Lag Screws:

1. When installing lag screws in a wood member, pre-drill hole as required by the CBC.
 2. Lag screws, which bear on wood, shall be fitted with standard steel plate washers under head. Lag screws shall be screwed and not driven into place.
- C. Bolts:
1. Lumber and timber to be fastened together with bolts shall be clamped together with holes for bolts bored true to line.
 2. Bolts shall be fitted with steel plates or standard cut washers under heads and nuts. Bolts shall be tightened when installed and again before completion of the Work of this section.
- D. Wood Screws: When installing wood screws, pre-drill holes as required by the CBC.
- E. Metal Framing Devices: Framing anchors, joist hangers, ties, and other mechanical fastenings shall be galvanized or furnished with a rust inhibitive coating. Nails and fastenings shall be of the type recommended by manufacturer.
- F. Powder Driven Fasteners:
1. Loads shall not exceed 75 pounds unless indicated on the Drawings or when reviewed by the Architect.
 2. The operator, tool, and fastener shall perform the following as observed by the Inspector.
 - a. Observe installation of first 10 fasteners.
 - b. Test the first 10 fasteners by performing a pullout test. Load shall be at least twice the design load, or 150 pounds, whichever is greater.
 - c. Random testing:
 - 1) Load less than 75 pounds - approximately 1 in 10 pins.
 - 2) Load 75 pounds or greater - 1/2 of the pins.
 3. Failure of any test will result in testing of all installed pins.
 4. Nail heads shall not break the outer skin of sheathing.
 5. Non-compliant pins shall be replaced.

3.02 INSTALLATION

- A. Furring: Where metal furring is not indicated or specified, provide wood furring at points indicated and required for concealing conduit, piping, structural framing or other unfinished materials. Wood furring shall be 2-by studs of required width. Vertical members contacting concrete or masonry shall be attached as specified for anchoring interior wood stud partitions.
- B. Grounds:
1. Provide and set wood grounds at points where wood trim occurs and work is to be plastered. Grounds at 3/4 inch metal lath shall be 5/8 inch thick, net, 1 1/2-inch wide Douglas Fir, S1S. Grounds shall be doubled where trim member exceeds 5-inch width, or wherever indicated. Grounds shall be applied after lath has been installed set plumb, level and true to line.
 2. Apply grounds over wood framed surfaces and lath and securely nail to wood backing at each stud or bearing. Grounds applied over steel channel studs and lath shall be securely nailed at each stud or bearing to nail-blocks provided and installed in metal studs.
 3. Grounds applied to concrete surfaces shall be securely nailed to woodblocks provided and built into concrete.
- C. Nailing Strips and Plates:
1. Provide wood nailing strips, plates and blocking indicated or required. Nailing strips in connection with metal work shall be bolted to metal. Wood nailing blocks for securing grounds shall be built into concrete, or masonry.
 2. Nailing schedule shall comply with CBC requirements.
 3. Treated wood nailing strips for lightweight insulated concrete roof decks at eaves, ridges, rakes, base of curbs and wherever else indicated, shall be provided and installed. Strips shall be treated Douglas fir, 4 inches (nominal) width by thickness of insulated concrete.
- D. Wood Backing: Provide wood backing as indicated and as required to receive plumbing, electrical fixtures and equipment, cabinets, door stop plates and other fixed equipment.

3.03 CLEAN UP

- A. Remove rubbish, debris and waste materials and legally dispose of off the Project site.

3.04 PROTECTION

- A. Protect the Work of this section until Substantial Completion.

Department of Neighborhood Services and Public Safety
GOLETA TRAIN DEPOT PROJECT

END OF SECTION

SECTION 06 20 00

FINISH CARPENTRY

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Finish carpentry.

B. Related Requirements:

1. Division 01 - General Requirements.
2. Section 06 10 00: Rough Carpentry
3. Section 08 51 13: Aluminum Windows
4. Section 09 29 00: Gypsum Board.

1.02 SUBMITTALS

A. Shop Drawings: Submit Shop Drawings of each item of finish carpentry and millwork, indicating materials, dimensions, construction, and anchorage details.

B. LEED Submittals: Complete the LEED Material Buyout Form (MBoF) with all materials provided to the project. A complete submittal includes providing all material costs in the MBoF and all of the supporting documentation for the following credits:

1. MRc2 - Environmental Product Declarations (EPD): Provide Industry-Wide or Product-Specific EPD.
2. MRc3 - Sourcing of Raw Materials - Recycled Content: Provide product data for pre- and post- consumer recycled content.
3. MRc3 - Sourcing of Raw Materials – Forestry Stewardship Council (FSC) Certified Wood: For all wood products designated in this specification as “FSC certified,” provide vendor invoices with the vendor’s Chain-of-Custody (COC) number and identify each FSC certified product on a line-item basis. If FSC wood products are modified off-site by an architectural woodworker or millworker, the woodworker must have an FSC COC number.
4. MRc3 - Local/ Regional Material: Provide product data confirming product manufactured and extracted within 100 miles of the project site. Only applicable for products that also contain recycled content or FSC certified wood.

5. MRc4 - Material Ingredients: Provide manufacturers Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, or Cradle to Cradle Health Product Certificate.
6. IEQc2 - Low-Emitting Materials – Interior Wet Applied Products: For paints, coatings, adhesives and sealants applied on site or used for laminating off-site, include product data indicating the VOC content (g/L) and testing certificates or third-party certification demonstrating compliance with California Department of Public Health (CDPH) v1.2-2017 emissions testing.

1.03 QUALITY ASSURANCE

A. Comply with the following as a minimum requirement:

1. Douglas fir finish lumber shall be manufactured and graded in accordance with WCLIB - Standard Grading and Dressing Rule No. 17.
2. Solid wood finish lumber shall be manufactured and graded in accordance with NHLA - Rules for the Measurement and Inspection of Hardwood.
3. Softwood Plywood: Plywood shall comply with APA - Product Standard PS 1. Plywood shall be grade marked by APA.
4. Products and installation shall comply with the North American Architectural Woodwork Standards (NAAWS) for the Grade or Grades specified.

B. Finish lumber shall be kiln-dried according to recognized methods for the thickness and species. Lumber one inch thick or less shall be dried to an average moisture content of not more than 13 percent. Lumber 1-1/4 inches to 2 inches in thickness shall be dried to an average moisture content of not more than 15 percent.

1.04 DELIVERY, STORAGE AND HANDLING

- A. Materials shall be delivered to the Project site in undamaged condition, stored in fully covered, well ventilated areas, and protected from extreme changes in temperature and humidity.
- B. Interior millwork and finish carpentry shall not be installed unless interior building temperature and humidity levels are within the ranges recommended by the manufacturer and/or recognized standards.

PART 2 - PRODUCTS

2.01 MATERIALS

- A. Douglas Fir: Paintable interior trims, solid lumber shelves, partitions, door frames and other concealed members of interior finish; NAAWS Economy Grade.
- B. Solid Hardwood: Wood trims, window trims, with polyurethane finish. White Oak, unless noted otherwise.
 - 1. Birch: NAAWS Custom Grade.
- C. Softwood Plywood: Except where otherwise specified, AWI Custom Grade, Douglas fir unless otherwise indicated.
- D. Hardwood Plywood: NAAWS Premium Grade, species as indicated.
- E. White Oak: Exterior millwork, except framing lumber, shall be clear heartwood white oak. Where installed in direct contact with earth or provided for exterior, install Foundation Grade.
- F. Interior Solid Wood Shiplap Boards:
 - 1. White Oak
 - 2. Size: 1 inch thick, 6 inch wide

2.02 LEED REQUIREMENTS

- A. IW/PS EPD: Products specified under this section must have either a Type III Product Specific EPD or the company must be listed in the industry group responsible for the Industry Wide Externally Verified EPD.
- B. PS EDP: Products specified under this section must have a Type III Product Specific EPD.
- C. HPDs: Products specified under this section must have one of the following unexpired material ingredient reports compliant with LEEDv4.1 requirements and declared to 1000 ppm or less: Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, Cradle to Cradle Health Product Certificate, or UL Product Lens Certification.
- D. FSC Certified Wood Products: Wood products shall be certified as "FSC 100%" or "FSC Mix Credit" or "FSC Recycled" according to FSC STD 40-004 v3-0 with proper chain of custody.
- E. Interior Wet Applied Products: All wet-applied on-site paints, coatings, adhesives, and sealants products provided under Part 2 of this specification section must be compliant with the VOC limits outlined under IEQc2: Low Emitting Materials in 01 81 13 Sustainable Design Requirements. In addition, all paints and coatings must be

compliant with CDPH Standard Method v1.2-2017 emissions testing with proper unexpired CDPH testing certificates or acceptable third-party certification.

2.03 FABRICATION

- F. The means of fastening various parts together shall be concealed in finished Work. Work which is curved shall be fabricated from solid stock, or if veneered, shall be bent to a uniform radius.

PART 3 - EXECUTION

3.01 GENERAL

- A. Interior and exterior wood, millwork, blocking, and lumber shall be installed level, plumb, and true to line. Members shall be neatly and accurately scribed in place, maintaining full widths of end members, wherever possible. Trim shall be installed in full lengths, without piecing, except where use of single lengths is not required. Butt joints, if necessary, shall be beveled. Exterior angles shall be mitered, and interior angles of molding parts coped. Nails shall be set for putty. Grain and color of adjoining interior finish shall match adjacent finishes. Where Work specified in this section adjoins other Work, provide a neat tight joint.
- B. Interior and exterior finish carpentry and other fixed wooden equipment having hammer marks or other visible damage will be deemed defective Work.
- C. Staff or brick moulds of exterior wood doorframes shall be attached to frames after frames have been set and caulked. Moulds shall be mitered at corners and coped to sills, accurately secured in place with finish nails, and nails set.

3.02 INSTALLATION

- A. Install Work of this section as specified in the North American Architectural Woodwork Standards.
- B. Wood shoe base shall be fitted and temporarily tacked in place until floor covering is installed. Provide and install corner fillets, same contour and materials as shoe base, in corners where shoe base is installed.
- C. Platform Front: Plywood at platform front and adjoining steps in Multi-Purpose Building shall be provided with face veneers of unselect birch. Trim and frames shall match face veneer of panels. Joints shall be V-shaped where indicated.
- D. Door Frames: Frames shall be installed plumb and true, solidly blocked, reinforced for butts and hardware, and shall be fastened to structural frame with 16d set finish nails

at not more than 24 inches on centers. Nails securing exterior door and window frames shall be cement coated. Doorframes shall be dadoed together at the head.

- E. Sealing of Joints: Joints between exterior frames and adjoining surfaces shall be primed before sealing.

3.03 CLEAN UP

- A. Remove debris, rubbish and waste material and legally dispose of off the Project site.

3.04 PROTECTION

- A. Protect the Work of this section until Substantial Completion.

END OF SECTION

SECTION 06 61 00

FIBERGLASS FABRICATIONS

PART 1 - GENERAL

1.01 SUMMARY

- A. The CONTRACTOR shall furnish, fabricate, and install all fiberglass items including gratings, with all appurtenances, accessories and incidentals necessary to produce a complete, operable and serviceable installation as shown on the Contract Drawings and as specified herein, and in accordance with the requirements of the Contract Documents.

1.02 REFERENCES

- A. The publications listed below (latest revision applicable) form a part of this specification to the extent referenced herein. The publications are referred to within the text by the designation only.

AMERICAN SOCIETY FOR TESTING AND MATERIALS (ASTM) Test Methods:

1. ASTM D 635 Rate of Burning and/or Extent and Time of Burning of Self-Supporting Plastics in a Horizontal Position
2. ASTM E 84 Surface Burning Characteristics of Building Materials

1.03 CONTRACTOR SUBMITTALS

- A. The CONTRACTOR shall furnish shop drawings of all fabricated gratings and accessories in accordance with the provisions of this Section.
- B. The CONTRACTOR shall furnish manufacturer's shop drawings clearly showing material sizes, types, styles, part or catalog numbers, complete details for the fabrication and erection of components including, but not limited to, location, lengths, type and sizes of fasteners, clip angles, member sizes, and connection details.
- C. The CONTRACTOR shall submit the manufacturer's published literature including structural design data, structural properties data, grating load/deflection tables, corrosion resistance tables, certificates of compliance, test reports as applicable, concrete anchor systems and their allowable load tables, and design calculations for systems not sized or designed in the contract documents.
- D. The CONTRACTOR may be requested to submit sample pieces of each item specified

herein for acceptance by the ENGINEER as to quality and color. Sample pieces shall be manufactured by the method to be used in the WORK.

1.04 QUALITY ASSURANCE

- A. All items to be provided under this Section shall be furnished only by manufacturers having a minimum of ten (10) years experience in the design and manufacture of similar products and systems. Additionally, if requested, a record of at least five (5) previous, separate, similar successful installations in the last five (5) years shall be provided.
- B. Manufacturer shall offer a 3 year limited warranty on all FIBERGLASS products against defects in materials and workmanship.
- C. Manufacturer shall be certified to the ISO 9001-2008 standard.
- D. Manufacturer shall provide proof of certification from at least two other quality assurance programs for its facilities or products (UL, DNV, ABS, USCG, AARR).

1.05 PRODUCT DELIVERY AND STORAGE

- A. **Delivery of Materials:** Manufactured materials shall be delivered in original, unbroken pallets, packages, containers, or bundles bearing the label of the manufacturer. Adhesives, resins and their catalysts and hardeners shall be crated or boxed separately and noted as such to facilitate their movement to a dry indoor storage facility.
- B. **Storage of Products:** All materials shall be carefully handled to prevent them from abrasion, cracking, chipping, twisting, other deformations, and other types of damage. Adhesives, resins and their catalysts are to be stored in dry indoor storage facilities between 70 and 85 degrees Fahrenheit (21 to 29 degrees Celsius) until they are required.

PART 2 - PRODUCTS

2.01 MANUFACTURER

- A. **Basis of Design:** Floor Grating shall be 1-1/2 Inch Pultruded Wide T-Bar, MS-WT-1810 as manufactured by:

McNichols Grating Products

14108 Arbor Place

Cerritos, CA 90703-2402

(877) 520-0655 (562) 921-1015 (Fax)

Website: www.mcnichols.com

2.02 GENERAL

- A. All FIBERGLASS items furnished under this Section shall be composed of fiberglass reinforcement and resin in qualities, quantities, properties, arrangements and dimensions as necessary to meet the design requirements and dimensions as specified in the Contract Documents.
- B. Fiberglass reinforcement shall be continuous roving in sufficient quantities as needed by the application and/or physical properties required.
- C. Resin shall be Vinyl Ester, Polyester, with chemical formulations as necessary to provide the corrosion resistance, strength and other physical properties as required.
- D. All finished surfaces of FIBERGLASS items and fabrications shall be smooth, resin-rich, free of voids and without dry spots, cracks, crazes or unreinforced areas. All glass fibers shall be well covered with resin to protect against their exposure due to wear or weathering.
- E. All grating products shall have a tested flame spread rating of 25 or less per ASTM E-84 Tunnel Test. Gratings shall also have tested burn time of less than 30 seconds and an extent of burn rate of less than or equal to 10 millimeters per ASTM D635.
- F. All mechanical grating clips shall be manufactured of Type 316SS (stainless steel).

2.03 MOLDED FIBERGLASS GRATING

- A. **Manufacture:** Grating shall be of a one piece molded construction with tops and bottoms of bearing bars and cross bars in the same plane. Grating shall have a square mesh pattern providing bidirectional strength. Grating shall be reinforced with continuous rovings of equal number of layers in each direction. The top layer of reinforcement shall be no more than 1/8" below the top surface of the grating so as to provide maximum stiffness and prevent resin chipping of unreinforced surfaces. Percentage of glass (by weight) shall not exceed 35% so as to achieve maximum corrosion resistance, and as required to maintain the structural requirements of the CONTRACT.

After molding, no dry glass fibers shall be visible on any surface of bearing bars or cross bars. All bars shall be smooth and uniform with no evidence of fiber orientation irregularities, interlaminar voids, porosity, resin rich or resin starved areas.

- B. **Non-slip surfacing:** Grating shall be manufactured with a medium grit top surface.
- C. Bar intersections of full depth bars are to be filleted to a minimum radius of 1/16" to eliminate local stress concentrations and the possibility of resin cracking at these locations. Intersections of secondary, partial depth bars do not require a fillet.

- D. Fire rating: Grating shall be fire retardant with a tested flame spread rating of 25 or less when tested in accordance with ASTM E 84. Certifications shall be dated within the past two years and test data performed only on the resin shall not be acceptable.
- E. Color: As indicated in drawings or as selected by Architect.
- F. Depth: 1-1/2" with a tolerance of plus or minus 1/16

2.04 GRATING FABRICATION

- A. Measurements: Grating supplied shall meet the dimensional requirements and tolerances as shown or specified. The Contractor shall provide and/or verify measurements in field for work fabricated to fit field conditions as required by grating manufacturer to complete the work. When field dimensions are not required, contractor shall determine correct size and locations of required holes or cutouts from field dimensions before grating fabrication.
- B. Layout: Each grating section shall be readily removable, except where indicated on drawings. Manufacturer to provide openings and holes where located on the contract drawings. Grating openings which fit around protrusions (pipes, cables, machinery, etc.) shall be discontinuous at approximately the centerline of opening so each section of grating is readily removable.
- C. Sealing: All shop fabricated grating cuts shall be sealed to provide maximum corrosion resistance. All field fabricated grating cuts shall be coated similarly by the contractor in accordance with the manufacturer's instructions.
- D. Hardware: For panels installed on structural members, Type 316 stainless steel hold-down clips shall be provided, with a minimum of four per piece of grating, or as recommended by the manufacturer.

PART 3 - EXECUTION

3.01 INSPECTION

- A. Shop inspection is authorized as required by the Owner and shall be at Owner's expense. The fabricator shall give ample notice to Contractor prior to the beginning of any fabrication work so that inspection may be provided. The grating shall be as free, as commercially possible, from visual defects such as foreign inclusions, delamination, blisters, resin burns, air bubbles and pits. The surface shall have a smooth finish (except for grit top surfaces).

3.02 INSTALLATION

- A. Contractor shall install gratings in accordance with manufacturer's assembly drawings. Panels are to be supported with grating legs in each corner or other equivalent support mechanism. Lock grating panels securely in place with hold-down fasteners or as specified herein. Field cut and drill fiberglass reinforced plastic products with carbide or diamond tipped bits and blades. Seal cut or drilled surfaces in accordance with manufacturer's instructions. Follow manufacturer's instructions when cutting or drilling fiberglass products or using resin products; provide adequate ventilation.

END OF SECTION

SECTION 07 21 00 THERMAL INSULATION

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Thermal batt insulation for exterior walls and under roof decks.

B. Related Requirements:

1. Division 01 - General Requirements.
2. Section 05 30 00 - Metal Decking.
3. Section 05 41 00 - Structural Metal Stud Framing.
4. Section 09 22 16 - Non-Structural Metal Framing.
5. Section 09 24 23 – Portland Cement Plaster.

1.02 SUBMITTALS

A. Product Data:

1. Material List: Provide a list of materials for installation under this section.
2. Provide manufacturer's printed Product Data for each type insulation and accessory.

B. Manufacturer's Instructions: Submit manufacturer's printed installation instructions.

C. Certification: Provide certification that insulation materials conform to requirements of CBC Chapter 26.

D. Recycled Content: Provide certification that insulation materials contain a minimum 30 percent recycled materials.

E. LEED Submittals: Complete the LEED Material Buyout Form (MBoF) with all materials provided to the project. A complete submittal includes providing all material costs in the MBoF and all of the supporting documentation for the following credits:

1. MRc2 - Environmental Product Declarations (EPD): Provide Industry-Wide or Product-Specific EPD.
2. MRc3 - Sourcing of Raw Materials - Recycled Content: Provide product data for pre- and post- consumer recycled content.
3. MRc4 - Material Ingredients: Provide manufacturers Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, or Cradle to Cradle Health Product Certificate.
4. IEQc2 - Low-Emitting Materials – Interior Wet Applied Products: For paints, coatings, adhesives and sealants applied on site or used for laminating off-site,

- include product data indicating the VOC content (g/L) and testing certificates or third-party certification demonstrating compliance with California Department of Public Health (CDPH) v1.2-2017 emissions testing.
5. IEQc2 - Low-Emitting Materials –Thermal Insulation: Provide testing certificates or third-party certification demonstrating compliance with CDPH v1.2-2017 emissions testing.

1.03 QUALITY ASSURANCE

- A. Surface Burning Characteristics: Flame spread rating shall not exceed 25 and smoke density shall not exceed 50 when tested in accordance with ASTM E84.
- B. Combustion Characteristics: Rated as non-combustible when tested in accordance with ASTM E136.
- C. Comply with following as a minimum requirement:
1. ASTM C209 – Standard Test Methods for Cellulosic Fiber Insulating Board.
 2. ASTM C553: Specification for Mineral Fiber Blanket Thermal Insulation for Commercial and Industrial Applications.
 3. ASTM C578: Specification for Rigid, Cellular Polystyrene Thermal Insulation.
 4. ASTM C1363 - Standard Test Method for Thermal Performance of Building Materials and Envelope Assemblies by Means of a Hot Box Apparatus.
 5. ASTM D1621 – Standard Test Method for Compressive Properties of Rigid Cellular Plastics.
 6. ASTM D1622 – Standard Test Method for Apparent Density of Rigid Cellular Plastics.
 7. ASTM E84 - Standard Test Method for Surface Burning Characteristics of Building Materials.
 8. ASTM E 136 - Standard Test Method for Behavior of Materials in a Vertical Tube Furnace at 750 degrees C.
- D. CHP Low-Emitting Materials Table: Materials submitted for building insulation must be listed as low emitting on the CHPS website, www.CHPS.net, or must be tested by an independent laboratory to meet CHPS requirements. Components of an assembly must meet CHPS requirements individually or in an assembly.

1.04 DELIVERY, STORAGE AND HANDLING

- A. Deliver materials to Project site and store in a safe, dry place, with labels intact and legible at time of installation.
- B. Protect building insulation materials from damage.

1.05 PROJECT CONDITIONS

- A. Avoid exposure to humidity and moisture. Protect from exposure to sunlight.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

- A. Owens Corning.
- B. Johns Manville.
- C. CertainTeed Corporation.
- D. The DOW Chemical Company.
- E. Hunter Panels
- F. DiversiFoam Products.
- G. Equal.

2.02 MATERIALS

A. General:

- 1. Provide Unfaced, friction-fit batt insulation where both sides of installation are enclosed.
- 2. Provide batt insulation with integral vapor barrier when one side of installation will be unenclosed.
- 3. Provide batt insulation with integral vapor barrier where at least one side of installation will be exposed to high humidity, such as showers.
- 4. Recycled content shall be a minimum of 30 percent.

B. Mineral Fiber Batt Insulation:

- 1. Unfaced Mineral Fiber Batt Insulation: Provide friction-fit, unfaced mineral fiber batts. Insulation shall consist of mineral fibers, glass or slag, and thermosetting resins complying with ASTM C665, Type I.
- 2. Faced Mineral Fiber Batt Insulation: Provide mineral fiber batts with vapor barrier consisting of mineral fibers, glass or slag, and thermosetting resins complying with ASTM C665, Type III, Class A, with vapor-retardant membrane facing.
- 3. Fasteners for Attaching Insulation to Wood Framing:
 - a. For faced batt insulation provide one of following types of staples: Stainless steel, monel, or copper-coated steel, size as required by manufacturer or applicable code.
 - b. For unfaced batt insulation provide 18 gage, minimum, galvanized steel wire where required to maintain proper insulation placement.
- 4. Fasteners for Attaching Insulation to Underside of Metal Roof Decks:
 - a. Spindle Anchors: Stic-Klip Mfg. Co., Type A or B as required, with Type S adhesive; Miracle Adhesives Corp. "Miracle StukUps" with Type

HT994 adhesive; or Goodloe E. Moore Gemco or Tuff-Weld with G-P Improved or Tuff-Bond Quik-Set Type Adhesive as applicable; or equal. Provide adhesives of correct type for substrates and type of anchor.

- b. String Wires: Minimum 18 gage galvanized steel wire.

2.02 LEED REQUIREMENTS

- A. IW/PS EDP: Products specified under this section must have a Type III Product Specific EPD or the company must be listed in the industry group responsible for the Industry Wide Externally Verified EPD.
- B. PS EPD: Products specified under this section must have a Type III Product Specific EPD.
- C. HPDs: Products specified under this section must have one of the following unexpired material ingredient reports compliant with LEEDv4.1 requirements and declared to 1000 ppm or less: Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, Cradle to Cradle Health Product Certificate, or UL Product Lens Certification.
- D. Interior Wet Applied Products: All wet-applied on-site paints, coatings, adhesives, and sealants products provided under Part 2 of this specification section must be compliant with the VOC limits outlined under IEQc2: Low Emitting Materials in 01 81 13 Sustainable Design Requirements. In addition, all paints and coatings must be compliant with CDPH Standard Method v1.2-2017 emissions testing with proper unexpired CDPH testing certificates or acceptable third-party certification.
- E. Thermal Insulation: All thermal insulation products provided under this specification section must be compliant with CDPH Standard Method v1.2-2017 emissions testing with proper unexpired CDPH testing certificates or acceptable third-party certification.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Examine Work to verify suitability to receive insulation. Do not proceed until unsatisfactory conditions have been corrected.

3.02 INSTALLATION

- A. General:
 - 1. Fit batt insulation, of R-value indicated on Drawings, snugly between framing members.
 - 2. Maintain total insulation integrity over entire area to be insulated, including areas between closely spaced members.
 - 3. Extend full thickness insulation over entire area to be insulated. Furnish manufacturer's recommended clips to tightly fit batts at joints.

4. Cut and fit batt insulation tightly around pipes, conduits and penetrations.
5. Do not compress batt insulation in excess of 10 percent (R-19 may be installed in 2 by 6 stud walls).
6. Prevent batt insulation from sagging during and after installation by installing adequate wire.
7. Metal door and window frames in acoustically insulated walls shall be filled with insulation, unless otherwise indicated.
8. Where vapor barrier is provided, install with vapor barrier facing room.
 - a. Batts in Metal Framing: Provide friction-fit batts tightly fitted to stud webs and to metal furring.
 - b. Batts under Metal Roof Decks where underside of insulation will be exposed install foil-faced flanged-type insulation batts and staple flanges together at maximum 4-inch centers and seal joints at abutting vertical surfaces with a pressure-sensitive plastic tape. Where underside of insulation will be inaccessible, install secure with spindle anchors. Provide 18 gage galvanized string wires under batts wherever necessary to prevent sagging. Stretch wire taut.
 - c. Batts in Horizontal or Sloped Applications: Provide tightly stretched string wires along center of horizontal or sloping batts where support spacing exceed 16 inch on centers.
 - d. Batts in Ceiling Framing: Install batts between joists, so top of insulation is level with top of framing members. Do not install insulation over recessed lighting fixtures, speakers, or other heat producing elements in ceilings. At junction boxes, access panels, and other items requiring access from above or below ceiling, cut insulation on each side to fit item and install loosely on top. Fit insulation snugly around ducts, conduits, pipes, and other items projecting through ceiling construction.

B. Continuous Insulation:

1. Continuous insulation shall be installed in accordance to manufacturer instructions. Fasten the insulation board to the exterior face of the steel stud wall framing using preassembled screw/stress plate fasteners, of type and length as recommended by the manufacturer. Fastener spacing shall be 12" on center at the board perimeter and 16" on center in the field of the board.
2. Fasten insulation boards with corrosion resistant fasteners through sheathing into studs. Use 3/8 inch head roofing nails for wood studs, and self-drilling tapping screws for metal studs, or to "Z" channels, as applicable. Fastener penetration into studs shall be not less than 3/4 inch.
3. Stagger vertical joints at least one stud from adjacent courses.

3.03

PROTECTION

Department of Neighborhood Services and Public Safety
GOLETA TRAIN DEPOT PROJECT

- A. Protect Work of this section until Substantial Completion.

3.04 CLEANUP

- A. Remove rubbish, debris, and waste materials and legally dispose of off Project site.

END OF SECTION

SECTION 07 22 00
RIGID INSULATION

PART 1 - GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Roof and wall polyisocyanurate insulation.
- B. Related Requirements:
 - 1. Division 01 - General Requirements.
 - 2. Section 05 30 00 – Metal Decking.
 - 3. Section 05 31 13 – Roof Deck Ceiling.
 - 2. Section 06 10 00 - Rough Carpentry.
 - 3. Section 07 60 00 - Flashing and Sheet Metal.

1.02 REGULATORY REQUIREMENTS

- A. Comply with requirements of authorities having jurisdiction over the Work.

1.03 SUBMITTALS

- A. Shop Drawings: Submit roof plans and details. Include roof dimensions, drain and scupper locations, gutter locations, and the layout of insulation boards. Provide details indicating components, attachment and insulation thickness. Provide calculations indicating the average R-value for the system. Indicate drainage patterns and slopes required.
- B. Product Data: Submit manufacturer's data substantiating the insulation complies with specified requirements.
- C. Installation Instructions: Submit manufacturer's installation instructions.
- D. LEED Submittals: Complete the LEED Material Buyout Form (MBoF) with all materials provided to the project. A complete submittal includes providing all material costs in the MBoF and all of the supporting documentation for the following credits:
 - 1. MRc2 - Environmental Product Declarations (EPD): Provide Industry-Wide or Product-Specific EPD.
 - 2. MRc3 - Sourcing of Raw Materials - Recycled Content: Provide product data for pre- and post- consumer recycled content.

3. MRc4 - Material Ingredients: Provide manufacturers Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, or Cradle to Cradle Health Product Certificate.
4. IEQc2 - Low-Emitting Materials – Interior Wet Applied Products: For paints, coatings, adhesives and sealants applied on site or used for laminating off-site, include product data indicating the VOC content (g/L) and testing certificates or third-party certification demonstrating compliance with California Department of Public Health (CDPH) v1.2-2017 emissions testing.
5. IEQc2 - Low-Emitting Materials – Thermal Insulation: Provide testing certificates or third-party certification demonstrating compliance with CDPH v1.2-2017 emissions testing.

1.04 QUALITY ASSURANCE

- A. Comply with the following as a minimum requirement:
 1. ASTM C 1289 - Faced Rigid Cell Polyisocyanurate Thermal Insulation Board; Type II Class 1 Grade 2.
 2. Provide systems complying with requirements for FM Class 1.
 3. Provide systems complying with requirements for UL Class A.
 4. Achieve a minimum thermal resistance value of R-7 for re-roofing projects, unless noted otherwise.
 5. UL 2818 Green Guard Gold certification. Gold Standard for Chemical Emissions for Building Materials.
- B. Installer Qualifications: Minimum five years experience installing specified type of insulation under roofing systems, and certified by the insulation manufacturer to install the Work of this section.
- C. Pre-installation Meetings: In accordance with related Division 01 sections, conduct a pre-installation meeting on the Project site.

1.05 DELIVERY, STORAGE AND HANDLING

- A. Deliver materials in manufacturer's original sealed and labeled containers.
- B. Avoid exposure to sunlight and the elements.
- C. Handle materials in a manner to avoid damage or contamination with moisture or foreign matter.

1.06 PROJECT CONDITIONS

- A. Environmental requirements:
 1. Install products in strict accordance with manufacturer's recommendations.

2. Do not install any materials when water in any form is present on the deck or materials are wet. Do not install any materials if precipitation is forecast and partially completed Work will be left unprotected.
3. Do not install the Work of this section if the temperature of the roof deck is below 40 degrees F.

PART 2 - PRODUCTS

2.01 GENERAL

A. Insulation: Rigid polyisocyanurate insulation, with specially formulated organic/inorganic facers as manufactured by:

1. Hunter Panels
2. Dyplast Products.
3. Celotex Insulation.
4. GAFTEMP.
5. Sarnatherm (Atlas ACII).
6. Equal.

2.02 DESCRIPTION

- A. Tapered Roof insulation shall provide minimum per foot slope and provide minimum insulation values as indicated on drawings.
- B. Roof and Deck insulation shall consist of polyisocyanurate foam panels, chemically bonded during the foaming process to special organic/inorganic facers on the top and bottom surfaces, and shall conform to the following:

<u>PROPERTIES</u>	<u>TEST METHOD</u>	<u>VALUE</u>
Compressive Strength	ASTM D 1621	20PSI min.
Dimensional Stability (Thermal and Humid Aging)	ASTM D 2126 (-4 degrees F, amb RH) (158 degrees F, 97 percent RH) (200 degrees F, ambient RH)	Less than 2 percent linear change Less than 2 percent Linear change Less than 2 percent linear change
Flexural Strength (Modulus of Rupture) (Break load)	ASTM C 203	40 PSI min. 17 PSI min.
Tensile Strength (Perpendicular to surface)	ASTM C 203	500 PSF min.

Water Absorption	ASTM C 209	
Water Vapor Transmission	ASTM E 96	
Core Foam Flame Spread	ASTM E 84	

2.02 LEED REQUIREMENTS

- A. IW/PS EDP: Products specified under this section must have a Type III Product Specific EPD or the company must be listed in the industry group responsible for the Industry Wide Externally Verified EPD.
- B. PS EPD: Products specified under this section must have a Type III Product Specific EPD.
- C. HPDs: Products specified under this section must have one of the following unexpired material ingredient reports compliant with LEEDv4.1 requirements and declared to 1000 ppm or less: Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, Cradle to Cradle Health Product Certificate, or UL Product Lens Certification.
- D. Interior Wet Applied Products: All wet-applied on-site paints, coatings, adhesives, and sealants products provided under Part 2 of this specification section must be compliant with the VOC limits outlined under IEQc2: Low Emitting Materials in 01 81 13 Sustainable Design Requirements. In addition, all paints and coatings must be compliant with CDPH Standard Method v1.2-2017 emissions testing with proper unexpired CDPH testing certificates or acceptable third-party certification.
- E. Thermal Insulation: All thermal insulation products provided under this specification section must be compliant with CDPH Standard Method v1.2-2017 emissions testing with proper unexpired CDPH testing certificates or acceptable third-party certification.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Verify suitability of substrates to receive the Work. Do not proceed until unsatisfactory conditions have been corrected.
- B. Verify suitability of related Work such as the following:
 - 1. Roof drains and scuppers are properly installed.
 - 2. Roof curbs, nailers, equipment supports, vents, and other items penetrating the roof are of the proper height, properly prepared and fastened to the substrate.
 - 3. Concrete surface are sufficiently dry, free from extremes in pH, properly primed and free of fines, edges, or voids.

3.02 INSULATION APPLICATION

- A. General:

1. Install the Roof and Deck insulation in accordance with the manufacturer's recommendations and to provide the R values indicated. Butt the panels snugly together.
 2. Start boards from either the roof drain or the high point depending on the insulation system. Stencil direction of slope on each board. Stagger joints of underlayment boards from insulation boards.
 3. Cut valleys and hips. Field cut crickets from insulation boards. Install valleys, hips, and crickets as required for R values and drainage.
- B. Roofing Systems: Fasten insulation with a method recommended by the manufacturer. Method of attachment shall provide a minimum FM I-90 Wind Uplift Rating.

3.03 PROTECTION

- A. Protect the Work of this section until Substantial Completion.

3.04 CLEANUP

- A. Remove rubbish, debris, and waste materials and legally dispose of off the Project site.

END OF SECTION

SECTION 07 26 00

VAPOR BARRIERS

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Vapor barrier and accessories for installation under concrete slabs.

B. Related Requirements:

1. Division 01 - General Requirements.
2. Section 03 30 00: Cast-in-Place Concrete.
3. Division 09: Finishes; Flooring Sections.

1.02 REFERENCES

A. American Concrete Institute (ACI) Publication:

1. ACI 302.2R - Guide for Concrete Slabs that Receive Moisture-Sensitive Flooring Materials.

B. ASTM International (ASTM):

1. ASTM D882 - Standard Test Method for Tensile Properties of Thin Plastic Sheeting.
2. ASTM D1709 - Standard Test Methods of Impact Resistance of Plastic Film by the Free-Falling Dart Method.
3. ASTM E154 Standard Test Methods for Water Vapor Retarders Used in Contact with Earth under Concrete Slabs.
4. ASTM E1643 - Selection, Design, Installation, and Inspection of Water Vapor Retarders Used in Contact with Earth or Granular Fill under Concrete Slabs.
5. ASTM E1745 - Standard Specification for Plastic Water Vapor Retarders Used in Contact with Soil or Granular Fill under Concrete Slabs.

1.03 SUBMITTALS

A. Product Data: Submit manufacturer's product data and installation instructions for vapor barrier and accessories.

B. Samples:

1. 12 inch by 12 inch vapor barrier samples.

2. Pressure-Sensitive Tape: 12 inch long sample.
- C. Test Reports: Conducted by nationally recognized independent testing agency indicating conformance with specified performance requirements.

1.04 QUALITY ASSURANCE

- A. ASTM tests referenced in this Section shall be performed on a single production roll per ASTM E1745 Section 8.1. Submit third party documentation certifying this requirement.
- B. Pre-Installation Conference: CONTRACTOR shall coordinate and conduct pre-installation conference in accordance to Section 01 31 19, Project Meetings, to review the progress of construction activities and preparations for the installation of vapor barrier.

1.04 DELIVERY, STORAGE AND HANDLING

- A. Deliver, store, handle and protect in accordance with manufacturer's instructions and recommendations.
- B. Deliver materials in manufacturer's packaging with labels intact.
- C. Store materials in a clean and dry area.

PART 2 - PRODUCTS

2.01 MATERIALS

- A. Multi-layer plastic extrusion manufactured with high grade prime, virgin, polyolefin resins. Thickness shall be 15 mils minimum.
 1. Stego Wrap by Stego Industries LLC.
 2. Perminator by W.R. Meadows.
 3. Ecoshield-E by Epro.
 4. Husky Yellow Guard by Poly-America.
 5. Equal.
- B. Physical Properties:
 1. Maintain permeance of less than 0.01 Perms [grains/(ft² · hr · inHg)] as tested in accordance with mandatory conditioning tests per ASTM E1745 Section 7.1 (7.1.1-7.1.5).
 2. Class Rating per ASTM E1745: Class A.
 3. Puncture resistance per ASTM D1709: 2200 g or higher.
 4. Provide third party documentation that all testing was performed on a single production roll per ASTM E1745 Section 8.1

- C. Accessories: Provide manufacturer recommended accessories for seams, penetrations and perimeter edges, including tapes, mastics, termination for a complete vapor barrier installation per ASTM E1643.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Verification of Conditions: Examine subsoil and notify OAR of deficiencies detrimental to proper vapor barrier installation; do not proceed until corrected.

3.02 INSTALLATION

- A. Install vapor barrier in accordance ASTM E1643 and manufacturer's instructions.
 - 1. Unroll vapor barrier with the longest dimension parallel with the direction of the concrete placement and face laps away from the expected direction of the placement whenever possible.
 - 2. Extend vapor barrier to the perimeter of the slab. If practicable, terminate it at the top of the slab, otherwise, where obstructed by impediments, such as dowels, waterstops, or any other site condition requiring early termination of the vapor barrier. At the point of termination, seal vapor barrier to the foundation wall, grade beam or slab itself using manufacturer ASTM E1643 compliant accessory designed to adhere to concrete. Seam tape shall not be used for sealing the vapor barrier to the foundation wall, grade beam or slab.
 - 3. Overlap joints 6 inches and seal with manufacturer's seam tape.
 - 4. Seal vapor barrier penetrations per manufacturer's instructions.
 - 5. Avoid the use of non-permanent stakes driven through the vapor barrier.
- B. Prior to concrete placement inspect vapor barrier for damage. Clean damaged areas and with vapor barrier material cut a minimum 6 inches larger than damaged area on all sides. Seal to main vapor barrier with continuous seam tape.

3.03 CLEAN UP

- A. Remove rubbish, debris and waste materials and legally dispose of off the Project site.

3.04 PROTECTION

- A. Protect the Work of this section until Substantial Completion.

END OF SECTION

SECTION 07 31 13

ASPHALT SHINGLES

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Granule surfaced asphalt shingle roofing.
- B. Moisture shedding underlayment, eaves, valley and ridge protection
- C. Associated metal flashing

1.02 RELATED SECTIONS

- A. Section 06 10 00 – Rough Carpentry: Plywood Roof Sheathing
- B. Section 07 26 00 – Vapor Retarders
- C. Section 07 60 00 – Flashing and Sheet Metal.

1.03 REFERENCES

- A. ASTM A 653/A 653M – Standard Specification for Steel Sheets, Zinc-Coated (Galvanized) or Zinc-Iron-Alloy-Coated (Galvannealed) by the Hot-Dip Process
- B. ASTM B 209 – Standard Specification for Aluminum and Aluminum-Alloy Sheet and Plate
- C. ASTM B 370 – Standard Specification for Copper Sheet and Strip for Building Construction
- D. ASTM D 225 – Standard Specification for Asphalt Shingles (Organic Felt) Surfaced with Mineral Granules
- E. ASTM D 226 – Standard Specification for Asphalt-Saturated Organic Felt used in Roofing and Waterproofing
- F. ASTM D 1970 – Standard Specification for Self-Adhering Polymer Modified Bituminous Sheet Materials used as Steep Roofing Underlayment for Ice Dam Protection

- G. ASTM D 3018 – Standard Specification for Class A Shingles Surfaced with Mineral Granules
- H. ASTM D 3161 – Standard Test Method for Wind Resistance of Asphalt Shingles (Fan-Induced Method)
- I. ASTM D 3462 – Standard Specification for Asphalt Shingles Made from Glass Felt and Surfaced with Mineral Granules
- J. ASTM D 4586 – Standard Specification for Asphalt Roof Cement, Asbestos-Free
- K. ASTM D 4869 – Standard Specification for Asphalt-Saturated Organic Felt Shingle Underlayment used in Roofing
- L. ASTM D 6757 – Standard Specification for Inorganic Underlayment for use with Steep Slope Roofing Products
- M. ASTM E 108 – Standard Test Methods for Fire Test of Roof Coverings
- N. ASTM G 21 – Determining Resistance of Synthetic Polymers to Fungi

1.04 SUBMITTALS

- A. Submit under provisions of Section 01 30 00.
- B. Product Data: Provide manufacturer's printed product information indicating material characteristics, performance criteria and product limitations.
- C. Manufacturer's Installation Instructions: Provide published instructions that indicate preparation required and installation procedures.
- D. Certificate of Compliance: Provide Certificate of Compliance from an independent laboratory indicating that the asphalt fiberglass shingles made in normal production meet or exceed the requirements of the following:
 - 1. ASTM E 108/UL 790 Class A Fire Resistance
 - 2. ASTM D 3161/UL 997 Wind Resistance.
 - 3. ASTM D 3462
- E. Shop Drawings: Indicate specially configured metal flashing, jointing methods and locations, fastening methods and locations and installation details as required by project conditions indicated.
- F. LEED Submittals: Complete the LEED Material Buyout Form (MBoF) with all

materials provided to the project. A complete submittal includes providing all material costs in the MBoF and all of the supporting documentation for the following credits:

1. MRc2 - Environmental Product Declarations (EPD): Provide Industry Wide or Product-Specific EPD.
2. MRc3 - Sourcing of Raw Materials - Recycled Content: Provide product data for pre- and post- consumer recycled content.
3. MRc4 - Material Ingredients: Provide manufacturers Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, or Cradle to Cradle Health Product Certificate.
4. IEQc2 - Low-Emitting Materials – Interior Wet Applied Products: For paints, coatings, adhesives and sealants applied on site or used for laminating off-site, include product data indicating the VOC content (g/L) and testing certificates or third-party certification demonstrating compliance with California Department of Public Health (CDPH) v1.2-2017 emissions testing.

1.05 QUALITY ASSURANCE

- A. Installer Minimum Qualifications: Installer shall be licensed or otherwise authorized by all federal, state and local authorities to install all products specified in this section. Installer shall perform work in accordance with NRCA Roofing and Waterproofing Manual. Work shall be acceptable to the synthetic slate roof tile manufacturer.
- B. Mock-Up: Provide a mock-up for evaluation of surface preparation techniques and application workmanship.
 1. Finish areas designated by Architect
 2. Do not proceed with remaining work until workmanship, color and pattern are approved by Architect.
 3. Rework mock-up area as required to produce acceptable work.
- C. Pre-Installation Meeting – Conduct a pre-installation meeting at the site prior to commencing work of this section: Require attendance of entities directly concerned with roof installation.

Agenda will include:

1. Installation procedures and manufacturer's recommendations
2. Safety procedures
3. Coordination with installation of other work
4. Availability of roofing materials.

5. Preparation and approval of substrate and penetrations through roof.
6. Other items related to successful execution of work

- D. Maintain one copy of manufacturers application instructions on the project site.
- E. Verify that manufacturer's label contains references to specified ASTM standards

1.06 DELIVERY, STORAGE, AND HANDLING

- A. Store Products in manufacturer's unopened packaging until ready for installation.
- B. Store and dispose of solvent-based materials and materials used with solvent based materials, in accordance with requirements of local authorities having jurisdiction.
- C. Deliver shingles to site in manufacturer's unopened labeled bundles. Promptly verify quantities and conditions. Immediately remove damaged products from site.

1.07 PROJECT CONDITIONS

- A. Anticipate and observe environmental conditions (temperature, humidity and moisture) within limits recommended by manufacturer for optimum results. Do not install products under environment conditions outside manufacturer's absolute limits.
- B. Extra Material – Furnish under provision of section 01 70 00
- C. Provide 10 square feet of extra shingles of each color specified.

1.08 WARRANTY

- A. Manufacturer's Warranty: Furnish shingle manufacturer's warranty for the product listed below:
 1. CertainTeed Grand Manor: Lifetime limited warranty.

PART 2 PRODUCTS

2.01 MANUFACTURERS

- A. Basis of Design: Provide products manufactured by the CertainTeed Corporation. Contact Sales Support Group, P.O. Box 860, Valley Forge, PA 19482, Toll Free 800-233-8990
- B. Or approved Equal.

2.02 ASPHALT FIBERGLASS SHINGLES

- A. CertainTeed Grand Manor Shingles: Conforming to ASTM D 3018 Type I – Self-Sealing; UL Certification of ASTM D 3462, ASTM D 3161 Class “F” (110-mph) /UL997 Wind Resistance and UL Class A Fire Resistance; glass fiber mat base; ceramically colored/UV resistant mineral surface granules across the entire face of the shingle; algae-resistant; full two layer laminated four tab shingle, plus additional random tabs
 - 1. Weight: 425 pounds per square (100 square feet)
 - 2. Color: As selected by Architect from manufacturer's standards.

2.03 SHEET MATERIALS

- A. Underlayment: ASTM D 4869, Asphalt saturated felt.
- B. Underlayment: ASTM D 226, Asphalt saturated felt (non-perforated).

2.04 FLASHING MATERIALS

- A. Sheet Flashing: ASTM A 361/A361M; 26 Gauge (0.45 mm) steel with minimum G115/Z350 galvanized coating
- B. Paint: Color as selected by Architect to coordinate with shingle color.

2.05 ACCESSORIES

- A. Nails: Standard round wire type roofing nails, corrosion resistant; hot dipped zinc coated steel, aluminum or chromated steel; minimum 3.8 inch (9.5mm) head diameter; minimum 11 or 12 gage (2.5mm) shank diameter; shank to be sufficient length to penetrate through the roof sheathing or $\frac{3}{4}$ inch (19mm) into solid wood, plywood or non-veneer wood decking.
- B. Asphalt Roofing Cement: ASTM D 4586, Type I or II

2.06 FLASHING FABRICATION

- A. Form flashing to profiles indicated on Drawings and to protect roofing materials from physical damage and shed water.
- B. Form sections square and accurate to profile, in maximum possible lengths, free from distortion or defects detrimental to appearance or performance.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Verify existing site conditions under provisions of Section 01 70 00.
- B. Verify that roof penetrations and plumbing stacks are in place and flashed to deck surfaces.
- C. Verify deck surfaces are dry and free of ridges, warps or voids.

3.02 ROOF DECK PREPARATION

- A. Follow shingle manufacturer's recommendations for acceptable roof deck material.
- B. Broom clean deck surfaces under eave protection and underlayment prior to their application.

3.03 INSTALLATION – PROTECTIVE UNDERLAYMENT

- A. Roof Slopes 4:12 or Greater: Install one layer of asphalt felt shingle underlayment perpendicular to slope of roof and lap minimum 4 inches (100 mm) over eave protection.
- B. Weather-lap and seal watertight with asphalt roofing cement items projecting through or mounted on roof.

3.05 INSTALLATION – METAL FLASHING

- A. Weather-lap joints minimum 2 inches (50 mm).
- B. Seal work projecting through or mounted on roof with asphalt roofing cement and make weather tight.

3.06 INSTALLATION – ASPHALT SHINGLES

- A. Install shingles in accordance with manufacturer's instructions for product type and application specified.

3.07 FIELD QUALITY CONTROL

- A. Visual inspection of the work will be provided by Owner. If conditions are unacceptable, Owner will notify the Architect.

3.08 PROTECTION OF FINISHED WORK

Department of Neighborhood Services and Public Safety
GOLETA TRAIN DEPOT PROJECT

- A. Do not permit traffic over finished roof surface.

END OF SECTION

SECTION 07 42 43
COMPOSITE WALL PANELS

PART 1 - GENERAL

1.01 SECTION INCLUDES:

- A. Exterior, panelized fiber cement cladding system and accessories to complete a drained and back-ventilated rainscreen.
- B. Interior fiber cement panelized cladding system and accessories.

1.02 RELATED SECTIONS

1. Testing Application Standard (TAS) 202, 203 – HVHZ Test Procedures

D. National Fire Protection Association (NFPA):

1. NFPA 285 - Fire Test Method for Exterior Wall Assemblies Containing Combustible Material.

2. NFPA 268 – Ignition Resistance of Exterior Wall Assemblies.

E. Standards Council of Canada & Underwriters Laboratories Canada (ULC):

1. CAN/ULC S-102 – Standard Method of Test for Surface Burning Characteristics.

2. CAN/ULC S-134 – Standard Method of Fire Test of Exterior Wall Assembly.

1.04 SUBMITTALS

A. Submit under provisions of Section 01 33 00.

B. Product Data: Submit manufacturer’s product description, storage and handling requirements, and installation instructions.

C. Product Test Reports and Code Compliance: Documents demonstrating product compliance with local building code, such as test reports or Evaluation Reports from qualified, independent testing agencies.

D. Manufacturer’s Details: Submit drawings (.dwg, .rvt, and/or .pdf formats), including plans, sections, showing installation details that demonstrate product dimensions, edge/termination conditions/treatments, compression and control joints, corners, openings, and penetrations.

E. Samples: Submit samples of each product type proposed for use.

1.05 QUALITY ASSURANCE

A. Manufacturer Qualifications:

1. All fiber cement panels specified in this section must be supplied by a manufacturer with a minimum of 10 years of experience in fabricating and supplying fiber cement cladding systems.

a. Products covered under this section are to be manufactured in an ISO 9001 certified facility.

2. Provide technical and design support as needed regarding installation requirements and warranty compliance provisions.

- B. Installer Qualifications: All products listed in this section are to be installed by a single installer trained by manufacturer or representative.
- C. Mock-Up Wall: Provide a mock-up wall as evaluation tool for product and installation workmanship.
- D. Pre-Installation Meetings: Prior to beginning installation, conduct conference to verify and discuss substrate conditions, manufacturer's installation instructions and warranty requirements, and project requirements.

1.06 DELIVERY, STORAGE, AND HANDLING

- A. Panels must be stored flat and kept dry before installation. A waterproof cover over panels and accessories should be used at all times prior to installation. Do not stack pallets more than two high. Refer to the information included on each pallet.
- B. If panels are exposed to water or water vapor prior to installation, allow to completely dry before installing. Failure to do so may result in panel shrinkage at ship lap joints, and such action may void warranty.
- C. Panels MUST be carried on edge. Do not carry or lift panels flat. Improper handling may cause cracking or panel damage.
- D. Direct contact between the panels and the ground should be avoided at all times. It is necessary to keep panels clean during installation process.

1.07 WARRANTY

- A. Provide manufacturer's 15-year warranty against manufactured defects in fiber cement panels. Additional 5-year extension available when refinished in year 14-15.
- B. Provide manufacturer's 15-year warranty against manufactured defects in panel finish.
- C. Warranty provides for the original purchaser. See warranty for detailed information on terms, conditions and limitations.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

- A. Acceptable Manufacturers:
 - 1. Basis of Design: Nichiha USA, Inc., 3150 Avondale Mill Rd, Macon, GA 301216, USA
- B. Products:

1. Nichiha VintageWood.
 - a. Profile colors: Bark, Cedar, Redwood, Ash, and Spruce.
 - b. Profiles: Wood plank texture with three, 3/8” grooves running lengthwise, spaced 5-5/8” apart.
 - c. Accessory/Component Options:
 - i. Manufactured Corners with 3-1/2” returns for each profile size and color.
 - ii. Aluminum trim options: As shown in drawings or as selected by Architect.
 1. Finish: As selected by Architect.
 - iii. Essential Flashing System: Starter, Overhang.
 1. Finish: Matte black.
 - d. Dimensions:
 1. As indicated in drawings.
 - e. Panel Thickness: 5/8".
 - f. Factory sealed on six 6 sides.
2. Nichiha Illumination Series.
 - a. Profile colors: Designer-specified custom color (finished in U.S.).
 - b. Profiles:
 1. As selected by Architect.
 - i. Do not pair the different sizes directly together.
 - c. Accessory/Component Options:
 - i. Manufactured Corners with 3-1/2” returns for each profile size and color.
 - ii. Aluminum trim options: As shown in drawings or as selected by Architect.
 1. Finish: As selected by Architect.
 - iii. Essential Flashing System: Starter, Overhang.
 1. Finish: Matte black.
 - d. Dimensions:
 1. As shown in drawings or as selected by Architect

- e. Panel Thickness: 5/8".
- f. Factory sealed on six 6 sides.

2.02 MATERIALS

- A. Fiber cement panels manufactured from a pressed, stamped, and autoclaved mix of Portland cement, fly ash, silica, recycled rejects, and wood fiber bundles.
- B. Panel surface pre-finished and machine applied.
- C. Panels profiled along 3030mm edges so that the long joints between the installed panels are ship-lapped.
- D. Factory-applied sealant gasket added to top panel edge; all 3030mm edge joints contain a factory sealant.

2.03 PERFORMANCE REQUIREMENTS:

- A. Fiber Cement Cladding – Must comply with ASTM C-1186, Type A, Grade II requirements:
 - 1. Wet Flexural Strength: Result: 1418 psi, Lower Limit: 1015 psi.
 - 2. Water Tightness: No water droplets observed on any specimen.
 - 3. Freeze-thaw: No damage or defects observed.
 - 4. Warm Water: No evidence of cracking, delamination, swelling, or other defects observed.
 - 5. Heat-Rain: No crazing, cracking, or other deleterious effects, surface or joint changes observed in any specimen.
- B. Mean Coefficient of Linear Thermal Expansion (ASTM E-228): Max 1.0×10^{-5} in./in. F.
- C. Surface Burning (CAN-ULC S102/ASTM E-84): Flame Spread: 0, Smoke Developed: 0.
- D. Wind Load (ASTM E-330): Contact manufacturer for ultimate test pressure data corresponding to framing type, dimensions, fastener type, and attachment clips. Project engineer(s) must determine Zone 4 and 5 design pressures based on project specifics.
 - 1. Minimum lateral deflection: L/120.
- E. Water Penetration (ASTM E-331): No water leakage observed into wall cavity.
- F. Steady-State Heat Flux and Thermal Transmission Properties Test (ASTM C-518): 16mm thick panel thermal resistance R Value of 0.47.

- G. Fire Resistant (ASTM E-119): The wall assembly must successfully endure 60-minute fire exposure without developing excessive unexposed surface temperature or allowing flaming on the unexposed side of the assembly.
- H. Ignition Resistance (NFPA 268): No sustained flaming of panels, assembly when subjected to a minimum radiant heat flux of 12.5 kW/m² ± 5% in the presence of a pilot ignition source for a 20-minute period.
- I. Fire Propagation (NFPA 285): Wall assembly of Nichiha AWP, Ultimate Clips and Starter Track, Tyvek Commercial Wrap, ½” Densglass Gold Sheathing, 16” o.c. 18 gauge steel studs, mineral wool in-cavity insulation, and interior 5/8” Type X gypsum met the acceptance criteria of NFPA 285.
- J. Fire Propagation (CAN/ULC S-134): Wall assembly of Nichiha AWP, Ultimate Clips and Starter Track, Tyvek Housewrap, 5/8” FRT plywood, 16” o.c. 2x wood studs, fiberglass in-cavity insulation, and interior 5/8” Type X gypsum met the acceptance criteria of CAN/ULC S-134.
- K. Drained and Back Ventilated Rainscreen (AAMA 509-14): System classifications: W1, V1.

2.04 INSTALLATION COMPONENTS

A. Ultimate Clip System:

1. Starter Track:
 - a. Horizontal Panel Installations - FA 700 – 3,030mm (l) galvalume coated steel.
 - b. Vertical Panel Installations (AWP-3030 only) – FA 710T – 3,030mm (l) galvalume coated steel.
2. Panel Clips: JEL 778 “Ultimate Clip II” (10mm rainscreen for 16mm AWP) – Zinc-Aluminum-Magnesium alloy coated steel.
 - a. Joint Tab Attachments (included) – used at all AWP-1818 panel to panel vertical joints, NOT used with AWP-3030 installations.
3. Corner Clips: JE 777C (10mm rainscreen for 5/8” AWP Manufactured Corners) -- Zinc-Aluminum-Magnesium alloy coated steel.
4. Single Flange Sealant Backer – FHK 1015 R (10mm) – 6.5’ (l) fluorine coated galvalume.
5. Double Flange Sealant Backer – FH 1015 R (10mm) – 10’ (l) fluorine coated galvalume.
6. Corrugated Spacer – FS 1005 (5mm), FS 1010 (10mm) – 4’ (l).

- B. Aluminum Trim (optional): Paint primed trim as specified in finish schedule.
- C. Essential Flashing System (optional):
 - 1. Starter – main segments (3,030mm), inside corners, outside corners
 - 2. Overhang – main segments (3,030mm), inside corners, outside corners, joint clips
- D. Fasteners: Corrosion resistant fasteners, such as hot-dipped galvanized screws appropriate to local building codes and practices must be used. Use Stainless Steel fasteners in high humidity and high-moisture regions. Panel manufacturer is not liable for corrosion resistance of fasteners. Do not use aluminum fasteners, staples or fasteners that are not rated or designed for intended use. See manufacturer’s instructions for appropriate fasteners for construction method used.
- E. Flashing: Flash all areas specified in manufacturer’s instructions. Do not use raw aluminum flashing. Flashing must be galvanized, anodized, or PVC coated.
- F. Sealant: Sealant shall comply with ASTM C920, Class 35.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Verification of Conditions:
 - 1. Fiber cement panels can be installed over braced wood, steel studs and sheathing including plywood, OSB, plastic foam (1” or less) or fiberboard sheathing. Fiber cement panels can also be installed over Structural Insulated Panels (SIP’s), Concrete Masonry Units (CMU’s) and Concrete Block Structures (CBS’s) with furring strips, and Pre-Engineered Metal Construction. Insulated Concrete Forms (ICFs) require added measures. Consult with Nichiha Technical Services.
 - 2. Allowable stud spacing: 16” o.c. maximum.
 - 3. A weather resistive barrier is required when installing fiber cement panels. Use an approved weather resistive barrier (WRB) as defined by the 2015 IBC or IRC. Refer to local building codes.
 - 4. Appropriate metal flashing should be used to prevent moisture penetration around all doors, windows, wall bottoms, material transitions and penetrations. Refer to local building codes for best practices.

- B. Examine site to ensure substrate conditions are within alignment tolerances for proper installation.
- C. Do not begin installation until unacceptable conditions have been corrected.
- D. Do not install panels or components that appear to be damaged or defective. Do not install wet panels.

3.02 TOLERANCE

- A. Wall surface plane must be plumb and level within +/- ¼ inch in 20 feet in any direction.
 - 1. One layer of Nichiha 5mm (~3/16”) Spacer may be used as shim.

3.03 INSTALLATION

- A. General: Install products in accordance with the latest installation guidelines of the manufacturer and all applicable building codes and other laws, rules, regulations and ordinances. Review all manufacturer installation, maintenance instructions, and other applicable documents before installation.
 - 1. Consult with your local dealer or Nichiha Technical Department before installing any Nichiha fiber cement product on a building higher than 45 feet or three stories or for conditions not matching prescribed standard installation guide requirements and methods. A Technical Design Review (TDR) process is available to evaluate project feasibility.
 - 2. Vertical Control/Expansion Joints are required with AWP-1818, for walls wider than 30 feet, within 2-12 feet of outside corners finished with metal trim and approximately every 30 feet thereafter.
 - A. Vertical Control/Expansion Joints are required at each AWP-3030 vertical joint, or H-Mold trim may be used instead.
 - 3. Horizontal/Compression Joints are required for multi-story installations of AWP. Locate joints at floor lines. Joints are flashed minimum ½” breaks. Do not caulk. Refer to installation guide(s).
 - A. Wood framed buildings of three or more floors require a compression joint at each floor.
 - B. Steel framed buildings (including reinforced concrete core with LGMF exterior walls) of more than three floors (or 45 feet) require a compression joint every 25 feet at a floor line.

B. Panel Cutting

1. Always cut fiber cement panels outside or in a well ventilated area. Do not cut the products in an enclosed area.
2. Always wear safety glasses and NIOSH/OSHA approved respirator whenever cutting, drilling, sawing, sanding or abrading the products. Refer to manufacturer SDS for more information.
3. Use a dust-reducing circular saw with a diamond-tipped or carbide-tipped blade.
 - a. Recommended circular saw: Makita 7-1/4” Circular Saw with Dust Collector (#5057KB).
 - b. Recommended blade: Tenryu Board-Pro Plus PCD Blade (#BP-18505).
 - c. Shears (electric or pneumatic) or jig saw can be used for complicated cuttings, such as service openings, curves, radii and scrollwork.
4. Silica Dust Warning: Fiber cement products may contain some amounts of crystalline silica, a naturally occurring, potentially hazardous mineral when airborne in dust form. Consult product SDS or visit <https://www.osha.gov/dsg/topics/silicacrystalline/>.
5. Immediately clean dust from cut panels as it may bind to the finish.

3.04 CLEANING AND MAINTENANCE

- A. Review manufacturer guidelines for detailed care instructions.

END OF SECTION

SECTION 07 46 20

FIBER CEMENT SIDING

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Fiber cement lap siding and shingle siding, trim, fascia, moulding and accessories.
- B. Factory-finished fiber lap siding and shingle siding, trim, fascia, moulding and accessories.

1.02 RELATED SECTIONS

- A. Section 05 40 00 - Cold Formed Metal Framing
- B. Section 06 10 00 - Rough Carpentry: Sheathing.
- C. Section 07 21 00 - Insulation: Exterior wall insulation.
- D. Section 07 48 99 – Rainscreen Attachment System.

1.03 REFERENCES

- A. AS E136 - Standard Test Method for Behavior of Materials in a Vertical Tube Furnace at 750 degrees C.
- B. AS D3359 - Standard Test Method for Measuring Adhesion by Tape Test, Tool and Tape.

1.04 SUBMITTALS

- A. Submit under provisions of Section 01300.
- B. Product Data: Manufacturer's data sheets on each product to be used, including:
 - 1. Preparation instructions and recommendations.
 - 2. Storage and handling requirements and recommendations.
 - 3. Installation methods.
- C. Shop Drawings: Provide detailed drawings of atypical non-standard applications of cementitious siding materials which are outside the scope of the standard details and specifications provided by the manufacturer.
- D. Selection Samples: For each finish product specified, two complete sets of color chips representing manufacturer's full range of available colors and patterns.
- E. Verification Samples: For each finish product specified, two samples, minimum size 4 by 6 inches (100 by 150 mm), representing actual product, color, and patterns.

- F. LEED Submittals: Complete the LEED Material Buyout Form (MBoF) with all materials provided to the project. A complete submittal includes providing all material costs in the MBoF and all of the supporting documentation for the following credits:
1. MRc2 - Environmental Product Declarations (EPD): Provide Industry-Wide or Product-Specific EPD.
 2. MRc3 - Sourcing of Raw Materials - Recycled Content: Provide product data for pre- and post- consumer recycled content.
 3. MRc4 - Material Ingredients: Provide manufacturers Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, or Cradle to Cradle Health Product Certificate.
 4. IEQc2 - Low-Emitting Materials – Interior Wet Applied Products: For paints, coatings, adhesives and sealants applied on site or used for laminating off-site, include product data indicating the VOC content (g/L) and testing certificates or third-party certification demonstrating compliance with California Department of Public Health (CDPH) v1.2-2017 emissions testing.

1.05 QUALITY ASSURANCE

- A. Installer Qualifications: Minimum of 2 years experience with installation of similar products.
- B. Mock-Up: Provide a mock-up for evaluation of surface preparation techniques and application workmanship.
1. Finish areas designated by Architect.
 2. Do not proceed with remaining work until workmanship, color, and sheen are approved by Architect.
 3. Remodel mock-up area as required to produce acceptable work.

1.06 DELIVERY, STORAGE, AND HANDLING

- A. Store products in manufacturer's unopened packaging until ready for installation.
- B. Store siding on edge or lay flat on a smooth level surface. Protect edges and corners from chipping. Store sheets under cover and keep dry prior to installing.
- C. Store and dispose of solvent-based materials, and materials used with solvent-based materials, in accordance with requirements of local authorities having jurisdiction.

1.07 PROJECT CONDITIONS

- A. Maintain environmental conditions (temperature, humidity, and ventilation) within limits recommended by manufacturer for optimum results. Do not install products under environmental conditions outside manufacturer's absolute limits.

1.08 WARRANTY

- A. Product Warranty: Limited, non-pro-rated product warranty for 30 years.
- B. Finish Warranty: Limited product warranty against manufacturing finish defects.
 - 1. When used for its intended purpose, properly installed and maintained according to manufacturer's installation instruction, for a period of 15 years from the date of purchase: will not peel; will not crack; and will not chip. Finish warranty includes the coverage for labor and material.
- C. Workmanship Warranty: Application limited warranty for 2 years.

PART 2 PRODUCTS

2.01 MANUFACTURERS

- A. Acceptable Manufacturer: James Hardie Building Products, Inc., which is located at: 26300 La Alameda Suite 400 ; Mission Viejo, CA 92691; Toll Free Tel: 866-274-3464; Tel: 949-367-4980; Fax: 949-367-4981; Email: [request info \(info@jameshardie.com\)](mailto:info@jameshardie.com); Web: www.jameshardiepros.com.
- B. Allura Fiber Cement Siding located at Plycem USA 396 W. Greens Road Houston, Texas 77067 Toll free (1-844-425-5872): Web: www.allurausa.com
- C. Or approved equal.

2.02 SIDING AND TRIM

- A. Lap siding and Shingle siding requirement for materials:
 - 1. Fiber-cement siding - complies with ASTM C 1186 Type A Grade II.
 - 2. Fiber-cement siding - complies with ASTM E 136 as a noncombustible material.
 - 3. Fiber-cement siding - complies with ASTM E 84 Flame Spread Index = 0, Smoke Developed Index = 5.
 - 4. ICC-ES evaluation reports ESR-2290, ESR-1844, and ESR-2273 (IBC, IRC, CBC, CRC)
- B. Lap Siding:
 - 1. Type: Select Cedarmill 6-1/4 inches (159 mm) with 5 inches (127 mm) exposure.
- C. Shingle Siding:
 - 1. Type: Half Round Notched Panel 48 inches (1219 mm) wide by 19 inches (483mm) high with 7 inches (178 mm) exposure.
- D. Trim:
 - 1. Trim boards
 - a. Product: 5/4 NT3 Boards, width as indicated in drawings.
 - b. Texture: Wood grained.
 - c. Length: 12 feet (3658 mm).
 - d. Thickness: 1 inch (24 mm).
 - 2. Trim Fascia boards: as indicated in drawings.

3. Fiber-cement trim - complies with ASTM C 1186 Type A Grade II.
4. Fiber-cement trim - complies with ASTM E 136 as a noncombustible material.
5. Fiber-cement trim - complies with ASTM E 84 Flame Spread Index = 0, Smoke Developed Index = 5.
6. Intertek Product Listing.

2.03 FASTENERS

- A. Metal Framing:
 1. Fastening as recommended by manufacturer according substrate conditions.

2.04 FINISHES

- A. Factory Finish: Refer to Exterior Finish Schedule.
 1. Factory applied finish; defined as a finish applied in the same facility and company that manufactures the siding substrate.
 2. Process:
 - a. Factory applied finish by fiber cement manufacturer in a controlled environment within the fiber cement manufacturer's own facility utilizing a multi-coat, heat cured finish within one manufacturing process.
 - b. Each finish color must have documented color match to delta E of 0.5 or better between product lines, manufacturing lots or production runs as measured by photospectrometer and verified by third party.
 3. Protection: Factory applied finish protection such as plastic laminate that is removed once siding is installed
 4. Accessories: Complete finishing system includes pre-packaged touch-up kit provided by fiber cement manufacturer. Provide quantities as recommended by manufacturer.
- B. Factory Finish Color for Trim and Shingle Siding Colors:
 1. As selected by Architect from manufacturer's colors.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Do not begin installation until substrates have been properly prepared.
- B. If framing preparation is the responsibility of another installer, notify Architect of unsatisfactory preparation before proceeding.
- C. Minimum 20 gauge (33 mm) 3-5/8 inch (92 mm) C-Stud 16 inches maximum on center or 16 gauge (54 mm) 3-5/8 inches (92 mm) C-Stud 24 inches (610 mm) maximum on center metal framing complying with local building codes, including the use of water-resistive barriers and/or vapor barriers where required. Minimum 1-1/2 inches (38 mm) face and straight, true, of uniform dimensions and properly aligned.
 1. Install water-resistive barriers and claddings to dry surfaces.
 2. Repair any punctures or tears in the water-resistive barrier prior to the installation

- of the siding.
3. Protect siding from other trades.

3.02 PREPARATION

- A. Clean surfaces thoroughly prior to installation.
- B. Prepare surfaces using the methods recommended by the manufacturer for achieving the best result for the substrate under the project conditions.
- C. Install a water-resistive barrier is required in accordance with local building code requirements.
- D. The water-resistive barrier must be appropriately installed with penetration and junction flashing in accordance with local building code requirements.
- E. Install weather barrier in accordance with local building code requirements.
- F. Seam Tape and joint and laps.
- G. Install flashings per manufacturer's recommendations.

3.03 INSTALLATION - LAP SIDINGS

- A. Install materials in strict accordance with manufacturer's installation instructions.
- B. Starting: Install a minimum 1/4 inch (6 mm) thick lath starter strip at the bottom course of the wall. Apply planks horizontally with minimum 1-1/4 inches (32 mm) wide laps at the top. The bottom edge of the first plank overlaps the starter strip.
- C. Allow minimum vertical clearance between the edge of siding and any other material in strict accordance with the manufacturer's installation instructions.
- D. Butt joints must not fall within 4 inches (102 mm) of a stud. Do not nail within 2 inches (51 mm) of the end of planks.
- E. Maintain clearance between siding and adjacent finished grade.
- F. Locate splices at least one stud cavity away from window and door openings.
- G. For proper fastener selection and fastening schedules for various wind load requirements and framing options.
- H. Face nail to sheathing.
- I. Locate splices at least 12 inches (305 mm) away from window and door openings.

3.04 INSTALLATION - SHINGLE SIDINGS

- A. Install materials in strict accordance with manufacturer's installation instructions.

- B. Substrate: Install a minimum 7/16 inch (11 mm) thick OSB wall sheathing or equivalent braced walls complying with applicable building codes.
- C. Starting: Install a minimum 1/4 inch (6 mm) thick lath starter strip at the bottom course of the wall.
- D. Maintain clearance between siding and adjacent finished grade.
- E. Apply starter course of 10 inches (254 mm) shingles or 9-1/2 inches (241 mm) lap siding overlapping the starter strip.
- F. Apply subsequent courses horizontally with a minimum 10 inch overlap at the top and a minimum 2 inch (51 mm) side lap. The bottom edge of the first two courses overlaps the starter strip.
- G. Fasten between 1/2 inch (13 mm) and 1 inch (25 mm) in from the side edge and between 8-1/2 inches (216 mm) and 9 inches (229 mm) up from the shingle bottom edge.
- H. Allow minimum vertical clearance between the edge of siding and any other material in strict accordance with the manufacturer's installation instructions.
- I. Ensure vertical joints of overlapping shingle course do not align.
- J. Wind Resistance: Where a specified level of wind resistance is required, provide fasteners as recommended by manufacturer.

3.05 INSTALLATION - TRIMS

- A. Install materials in strict accordance with manufacturer's installation instructions. Install flashing around all wall openings.
- B. Fasten through trim into structural framing or code complying sheathing. Fasteners must penetrate minimum 3/4 inch (19 mm) or full thickness of sheathing. Additional fasteners may be required to ensure adequate security.
- C. Place fasteners no closer than 3/4 inch (19 mm) and no further than 2 inches (51 mm) from side edge of trim board and no closer than 1 inch (25 mm) from end. Fasten maximum 16 inches (406 mm) on center.
- D. Maintain clearance between trim and adjacent finished grade.
- E. Trim inside corner with a single board trim both side of corner.
- F. Outside Corner Board Attach Trim on both sides of corner with 16 gage corrosion resistant finish nail 1/2 inch (13 mm) from edge spaced 16 inches (406 mm) apart, weather cut each end spaced minimum 12 inches (305 mm) apart.
- G. Allow 1/8 inch gap between trim and siding.

- H. Seal gap with high quality, paint-able caulk.
- I. Shim frieze board as required to align with corner trim..
- J. Fasten through overlapping boards. Do not nail between lap joints.
- K. Overlay siding with single board of outside corner board then align second corner board to outside edge of first corner board. Shim frieze board as required to align with corner trim.
- L. Install Trim Fascia boards to rafter tails or to sub fascia.

3.06 FINISHING

- A. Finish unprimed siding with a minimum one coat high quality, alkali resistant primer and one coat of either, 100 percent acrylic or latex or oil based, exterior grade topcoats or two coats high quality alkali resistant 100 percent acrylic or latex, exterior grade topcoat within 90 days of installation. Follow paint manufacturer's written product recommendation and written application instructions.
- B. Finish factory primed siding with a minimum of one coat of high quality 100 percent acrylic or latex or oil based exterior grade paint within 180 days of installation. Follow paint manufacturer's written product recommendation and written application instructions.

3.07 PROTECTION

- A. Protect installed products until completion of project.
- B. Touch-up, repair or replace damaged products before Substantial Completion.

END OF SECTION

SECTION 07 48 00

RAINSCREEN ATTACHMENT SYSTEM

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Thermally broken, rainscreen attachment system for attachment of exterior cladding installed over exterior mineral fiber insulation.

1.02 RELATED SECTIONS

- A. Section 05 40 00 - Light Gage Metal Framing: Wall framing and bracing.
- B. Section 07 22 00 - Rigid Insulation: Exterior wall insulation.
- C. Section 07 46 20 – Fiber Cement Siding

1.03 SYSTEM DESCRIPTION

- A. System assembly shall include the following components from the substrate out:
 - 1. Substrate: Wall framing assembly and sheathing
 - 2. Weather Resistant/Air Barrier over substrate.
 - 3. Mineral fiber insulation.
 - 4. Thermally broken rainscreen attachment system.
 - 5. Exterior cladding.
- B. Design Requirements:
 - 1. Manufacturer is responsible for designing system, including anchorage to structural system and necessary modifications to meet specified requirements and maintain visual design concepts.
 - 2. Employ registered professional engineer, licensed to practice engineering in jurisdiction where Project is located, to engineer each component of rainscreen attachment system.
 - 3. Structural Design: Exterior-insulated rainscreen wall assembly capable of withstanding effects of load and stresses from dead loads, wind loads, ice loads (if applicable) as indicated on Structural General Notes on Structural Drawings, and normal thermal movement without evidence of permanent defects of assemblies or components.

- a. Thermal Movements: Provide assemblies that allow for thermal movements resulting from the following maximum ambient temperatures by preventing overstressing of components and other detrimental effects:
 - 1) Temperature Change (range): 120 degrees Fahrenheit (67 degrees C), ambient:
 4. Support Framing/Attachment System: a. Frequency and spacing of brackets as indicated by manufacture in project specific engineering package.
- C. Performance Requirements:
1. Rainscreen Attachment System Performance: Comply with ANSI/ASHRAE 90.1-2010 maximum U-Value for walls.
 2. Thermal Performance:
 - a. Wall Assembly effective R-Value required by Title 24 calculations.
 - b. Full constructed exterior assembly must have a minimum 90% EFFECTIVE R-value when compared to the exterior insulation's rated R-Value.
 - c. Continuous framing profiles (including C- or Z-shaped sections or furring) penetrating insulation not allowed.
 - d. Perform effective R-Value calculation or modeling in accordance with ASHRAE guidelines.
 3. Structural Performance:
 - a. Framing Members:
 - 1) Test framing components to AAMA TIR- A8-[04] – Section 7.2 to determine structural performance and effective moment of inertia for each perforated component. Minimum Effective Moment of Inertia for Primary Rail: 0.0134 in⁴ .
 - 2) Localized bending stress for eccentrically loaded framing members must be evaluated with the maximum effective length of resisting element not more than 12 inches.
 - b. Fasteners:
 - 1) Tension shall be taken as sum of direct tension plus tension due to prying for eccentrically loaded connections. Prying may be reduced or eliminated if proven via engineering analysis or testing.
 - 2) Minimum Safety Factor of 3 for both tension and shear values.

- 3) Combined tension and shear shall be evaluated according to an interaction formula. Sum of terms shall not exceed 1.0.

1.04 SUBMITTALS

- A. Submit under provisions of Section 01 33 00.
- B. Product Data: Submit manufacturer's product literature and descriptions of testing performed on system components to indicate meeting or exceeding specified performance.
- C. Shop Drawings:
 1. Submit connection details to the cladding manufacturer, showing interface of rainscreen attachment system to substrate and panels with adjacent construction, signed and sealed by Professional Engineer.
 2. Show system installation and attachment, including fastener size and spacing.
- D. Structural Calculations:
 1. Submit rainscreen attachment manufacturer's comprehensive Structural Design analysis signed and sealed by a Professional Engineer
- E. Samples: Submit following material samples for verification:
 1. Wall Brackets: Two (2) samples.
 2. Horizontal Rails: Two (2) 12-inch long samples. Store products in manufacturer's unopened packaging until ready for installation.
- F. Test Reports:
 1. Test to the following standards and provide written test reports by a third party:
 - a. AAMA TIR-A8-[04]: Structural Performance of Composite Thermal Barrier Framing Systems – Section 7.2.
 2. Comprehensive three-dimensional thermal modeling report indicating framing systems impact on exterior insulation rated R-value.

1.05 QUALITY ASSURANCE

- A. Manufacturer Qualifications:
 1. Minimum 5 years' experience specializing in the manufacturing of façade attachment/support framing similar to those specified.
 2. Ability to demonstrate conformance to testing requirements.

- B. Installer Qualifications:
 - 1. Minimum of 3 years' documented experience or minimum of 5 completed projects of equivalent scope and quality and recommended by manufacturer to perform work of this Section.
 - 2. Onsite superintendent or foreman overseeing installation on site during entire work of this Section with experience equivalent to installer and in good standing with the manufacturer.
- C. Engineer Qualifications: Registered professional engineer experienced in the design of curtain wall systems, anchors, fasteners and licensed to practice engineering in the jurisdiction where Project is located.
- D. Pre-Installation Meeting:
 - 1. Discuss sequence and scheduling of work and interface with other trades.
 - 2. Review metal wall framing assemblies for potential interference and conflicts and coordinate layout and support provisions for interfacing work.
 - 3. Review and document methods, procedures and manufacturer's installation guidelines and safety procedures for exterior wall assembly.
- E. Mock-Ups: Coordinate mock-up materials and requirements with mock-up specified in Division 01.

1.06 QUALITY CONTROL

- A. Single source responsibility:
 - 1. Furnish engineered rainscreen attachment system components under direct responsibility of single manufacturer.
- B. Field Measurements: Verify actual supporting and adjoining construction before fabrication.
- C. Record field measurements on project record shop drawings.
- D. Established Dimensions: Where field measurements cannot be made without delaying work, guarantee dimensions and proceed with fabrication of rainscreen attachment system corresponding to established dimensions.

1.07 WARRANTY

- A. Manufacturer Warranties:
 - 1. Attachment System: Ten (10) year Limited Warranty.
 - a. Covers components of the attachment system, including structural failure of

- components when all the materials and components are supplied and installed per manufacturer's requirements.
- b. Includes labor and material for removal and replacement of defective material.
 - c. Includes labor to remove and reinstall façade finish panels, finish closures and façade finish accessories necessary to access defective material.
- B. Contractor's Warranties: 2-year labor warranty, starting from date of Owner acceptance of completed work, to cover repair of materials found to be defective as a result of installation errors.
- C. Limitation of Warranties: Exclude repairs, replacement, and corrective work to the substrate, primary structure, finish panels, and/or property – unless otherwise noted above. Warranties exclude mechanical damage due to abuse, neglect, primary structure failure, or forces of nature greater than normal weather conditions.

PART 2 PRODUCTS

2.01 MANUFACTURERS

- A. Basis of Design: MFI "S" Series as manufactured by KNIGHT WALL SYSTEMS, inc 28308 N. Cedar Road - Deer Park, WA 99006 Toll Free: 1.855.KWS.WALL (597.9255) Telephone: 509.262.0104 Fax: 509.262.0106 Web: www.knightwallsystems.com E-mail: info@knightwallsystems.com General sales: sales@knightwallsystems.com
- B. Or approved equal.

2.02 RAINSCREEN ATTACHMENT/SUPPORT FRAMING SYSTEM

- A. Comply with ANSI/ASHRAE 90.1-2010.
- B. Coating Material: ASTM A1046, Zinc-Aluminum-Magnesium, minimum thickness ZM40.
 - 1. ASTM A653 Galvanized steel is not acceptable.
- C. Steel Classification: Structural Steel (SS), Grade 50, 50 ksi Yield.
- D. Spacing: Comply with manufacturer's Professional Engineer's project specific calculations.
- E. Wall Brackets:
 - 1. Minimum 0.074 inch thick (14 gauge) sheet steel.
 - 2. Dimensions:
 - a. Bracket Base: Minimum 3.125 inch high by 2.125 inch wide.

- b. Offset Brackets: As indicated in drawings.
 - 1) Align offsets to differing wall planes as shown on Drawings.
 3. Pre-Punched Holes: Two wall anchors per bracket.
 4. Recommended Product: ThermaBracket-S by Knight Wall Systems or approved equal.
- F. Primary Horizontal [Vertical] Rail, Static S-Series.
1. Minimum 0.046-inch thick (18 gauge) [0.054-inch thick (16 gauge)] cold-formed steel.
 2. Profile: C channel, two flanges of equal length and one web.
 3. Nominal Dimensions: Minimum 1.0 inch flange for attaching to wall bracket and 1.625 inch at web.
 4. Pre-Punched Attachment Holes: 1.0 inch on center along length of track and oversized allowing for thermal contraction and expansion of rail without placing stress on brackets.
 5. Recommended Product: S-Rail by Knight Wall Systems or approved equivalent.
- G. Secondary Rail: Nominal 0.046 inch thick cold-formed steel.
1. Profile: Hat channel with stiffening lips.
 2. Profile Depth: 0.75 inches.
 3. Girt Fastening Face: Manufacturer's recommendation
 4. Weep Drains: 0.75 inches diameter at 4 inches on center along flanges to allow for free air flow laterally.
 5. Attachment Holes: Locate at 2 inch on center along back to facilitate number 14 self drilling self-tapping screw attachment to primary rail.
 - a. Oversize holes to allow for thermal contraction and expansion of rail. 6. Basis of Design: PanelRail™ by Knight Wall Systems.
 7. Or approved equal.
- H. Reveal Rail: Nominal 0.046 inch thick (18 gauge) [0.054-inch thick (16 gauge)] cold-formed steel.
1. Profile: Square hat channel with stiffening lips

2. Depth: 0.75 inches.
3. Dimensions: 2.0 inches at web, 1.625 inches at each flange with 0.25 stiffening lips.
4. Basis of Design: RevealRail™ by Knight Wall Systems or approved equivalent.
- I. Thermal Isolation:
 1. Material: Injection molded Polyoxymethylene copolymer (POM), non-fiber reinforced.
 2. Tensile Yield Strength: 9.57 ksi per ISO 527.
 3. Melting Temperature: 329 degrees Fahrenheit per ISO 3146.
 4. Components:
 - a. Wall Anchor Isolation Washer: minimum 0.125 inch thick.
 - b. Support Wall Substrate Isolation: Minimum 0.375-inch thick at each wall bracket.
 - c. Rail to Bracket Isolation: Minimum 0.125 inch thick at each connection.
 - d. Bracket Shim: Match support wall substrate isolator profile; available in 0.125-inch thickness and does not decrease thermal or structural performance of system.
 5. Basis of Design: ThermaStop™ Isolators by Knight Wall Systems.
 6. Or approved equal.
- J. Fasteners:
 1. Sufficient length to provide solid attachment to structure as required by manufacturer.
 2. Thermally isolated.
 3. Framed substrate with sheathing: Self-drill hex-washer-head stainless steel with 1,000 hour salt-spray rated thermoset polyester coating.
 - a. Embedment depth: 0.625 inches or three full threads minimum, whichever is greater.
 - b. Minimum ultimate pull-out capacity from 18 gauge steel: 450 pounds.
 4. Concrete and concrete masonry units substrate:

- a. Embedment depth: 1.25 inches minimum.
 - b. Minimum ultimate pull-out capacity from substrate material: 450 pounds.
 - c. 1/4 inch Kwik-Con II+ by Hilti
 - d. 1/4 inch Tapcon by Buildex
 - e. 1/4 inch UltraCon by Elco Industries
 - f. Or approved equal.
5. For primary to secondary rail connection: Self-drill hex-washer-head stainless steel with 1,000 hour salt-spray rated thermoset polyester coating.
- a. Embedment depth: 0.625 inches or three full threads minimum, whichever is greater.
 - b. Minimum ultimate pull-out capacity from 18 gauge steel: 450 pounds.
- K. Accessories:
1. Bracing, Furring, Bridging, Plates, Gussets, and Clips: Formed sheet steel, thickness as necessary to meet structural requirements for special conditions encountered.
 2. Galvanic Protection: Utilize tapes and other methods as necessary to separate and prevent contact between dissimilar metals.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Examine substrates and conditions for compliance with manufacturer requirements for installation conditions affecting performance of the work.
 1. Do not proceed with installation until unsatisfactory conditions have been corrected.
 2. Ensure weather-resistant barrier (WRB) is installed prior to installing rainscreen attachment system.
 3. Ensure fenestration, transitions, discontinuities, sills, and ledgers are flashed and sealed to move moisture to the exterior of the building.
- B. Field verify architectural details and mechanical and electrical requirements prior to commencing installation.
- C. Commencement of installation constitutes acceptance of existing conditions and

3.02 PREPARATION

- A. Review areas of potential interference and conflicts and coordinate layout and support provisions for interfacing work.
- B. Installation: Install in strict accordance with manufacturer's installation instructions.
- C. Wall Brackets and Primary Rail:
 - 1. Mount wall brackets at 16 inch on center horizontally [vertically] on support wall (at each stud location).
 - a. Brackets must be laid out at 0.5 inch increments vertically or horizontally.
 - b. Tighten screws to substructure to a snug tight condition and not stripped. Do not over-torque beyond manufacturer's recommendation. If installed using hand tools, verify for each installer at beginning of project using snug-tight criteria. Do not use stripped holes.
 - 2. Thermally isolate wall bracket attachments by sandwiching thermal break material between metal bracket and support wall substrate.
 - 3. Thermally isolate screw fastener washers using material to thermally isolate fastener heads from metal bracket.
 - 4. Mineral Fiber Insulation: Install to expand into and friction fit between wall brackets as specified by Section 07 21 00 prior to installing horizontal rails.
 - 5. Attach horizontal rail to wall bracket stem by use of a self-tapping screw fastener through the pre-punched holes in the rail and into the pre-punched pilot holes on the bracket.
 - 6. Isolate horizontal rail from bracket by sandwiching a thermal break material between rail and bracket stem.
 - 7. Attach horizontal rail at proper pre-punched pilot holes on bracket stem to align plumb and true. Account for irregularities in support wall.
 - 8. Establish and re-establish and restart vertical bracket locations using laser or chalk-line at fenestrations and other obstructions to establish horizontal alignments.
- D. Secondary Rail:
 - 1. Space to make suitable bearing surfaces for each cladding system as instructed by manufacturer and as shown on drawings and accepted shop drawings.
 - 2. Begin at bottom and mount to horizontal rails using No. 14 self-drilling self-tapping stainless steel screws.

3. Tighten screws to snug tight. Verify equivalent snug tight condition for installers using hand tools.
 4. Install successive vertical rails as required for panel type and engineering.
 5. When encountering fenestrations and other openings, mount vertical rails so that fastening points are as close to the lower and upper edges as possible.
- E. Touch-up shop-applied protective coatings damaged during handling and installation.
 - F. Use shearing instruments (i.e. snips, nibbler, etc.) for cutting metal framing components. Saws are not recommended, as the sparks produced during cutting will damage the anti-corrosion coating. If sparks are generated during cutting, be sure the portion of the component to be installed on the building is protected from sparks and that any stockpile near the cutting station is also protected.
 - G. The systems components should not be cut while installed on the building, unless using a shearing instrument.
 - H. Replace thermal isolator pieces that break during installation.
 - I. Provide a 3/8" – 1/2" gap between girts for expansion when multiple lengths of rail are installed.
 - J. Minimum length of installed cut primary rail is 12" and must be attached to at least two separate wall brackets to prevent rotation of rail. Unsupported cantilever must not exceed 6" unless specified differently by manufacturer's engineer.
 - K. Minimum length of installed cut secondary rail is 12" and must be mechanically attached to at least two separate primary rails.

3.3 ERECTION TOLERANCES

- A. Maximum Framing Member Variation from True Position: 1/4 inch.
- B. Maximum Framing Member Variation from Plane:
 1. Individual Framing Members: Do not exceed 1/4 inch in 10 foot.
 2. Accumulative Over-all Variation for Wall and Floor System: Do not exceed 1/4 inch.

3.4 FIELD QUALITY CONTROL

- A. Manufacturer's Field Technical Service: Make intermittent and final inspection to verify installation in conformance to manufacturer instructions and suitable as framing assembly for subsequent metal panels, acrylic plastering, and other cladding installations.
 1. Confirm snug tight and fastener sizing.

2. Confirm framing members installed in correct orientation.

3.5 ADJUSTING

- A. Inspect and adjust after installation. Replace or repair defective work.
- B. Adjust, and reconfigure as necessary to accommodate cladding systems for installations over work of this Section. Do not reuse pre-drilled holes unless fastener size is increased.

END OF SECTION

SECTION 07 60 00

FLASHING AND SHEET METAL

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Sheet metal flashings in connection with roofing.
2. Miscellaneous metal flashing and counter flashing as required, except where provided under Divisions 22, Plumbing, 23, HVAC, or 26, Electrical.
3. Coping caps.
4. Gravel stops and metal edging.
5. Gutters and downspouts.
6. Splash pans where downspouts empty onto roofing.
7. Drip flashings.
8. Roof pipe flashings.
9. Other sheet metal items not necessarily specified herein or in other sections but required to prevent penetration of water into building.
10. Gutter guards.

B. Related Requirements:

1. Division 01 - General Requirements.
2. Section 05 30 00 – Metal Decking.
3. Section 07 22 00 - Roof and Deck Insulation.
4. Section 07 31 13 - Asphalt Shingles.
5. Section 07 64 25 – Fully Adhered TPO Roofing
6. Section 07 71 00 - Roof Specialties.
7. Section 07 92 00 - Joint Sealants.
8. Section 08 63 23 - Metal-Framed Skylights.
9. Division 22 – Plumbing.
10. Division 23 - HVAC.
11. Division 26 - Electrical.

1.02 SUBMITTALS

- A. Shop Drawings: Submit for fabricated sheet metal indicating shapes, details, methods of joining, anchoring and fastening, thicknesses and gages of metals, concealed reinforcement, expansion joint details, sections, and profiles.
- B. Samples: Submit Samples for materials or assemblies as requested.
- C. Product Data: Submit brochures of manufactured items.
- D. LEED Submittals: Complete the LEED Material Buyout Form (MBoF) with all materials provided to the project. A complete submittal includes providing all material costs in the MBoF and all of the supporting documentation for the following credits:
 - 1. MRc2 - Environmental Product Declarations (EPD): Provide Industry-Wide or Product-Specific EPD.
 - 2. MRc3 - Sourcing of Raw Materials - Recycled Content: Provide product data for pre- and post- consumer recycled content.
 - 3. MRc4 - Material Ingredients: Provide manufacturers Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, or Cradle to Cradle Health Product Certificate.
 - 4. IEQc2 - Low-Emitting Materials – Interior Wet Applied Products: For paints, coatings, adhesives and sealants applied on site or used for laminating off-site, include product data indicating the VOC content (g/L) and testing.

1.03 QUALITY ASSURANCE

- A. Drawings and requirements specified govern. Provide the Work of this section in conformance with the Architectural Sheet Metal Manual published by SMACNA for conditions not indicated or specified and for general fabrication of sheet metal items.
- B. Materials shall conform to following standards:
 - 1. ASTM A167 - Stainless and Heat-Resisting Chromium-Nickel Steel Plate, Sheet and Strip.
 - 2. ASTM A653 - Sheet Steel, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.
 - 3. ASTM B370 - Copper Sheet and Strip for Building Construction.
- C. Pre-installation Meetings: Refer to Division 07 roofing sections as appropriate. Attend the pre-installation and inspection meetings for roofing Work.

1.04 DELIVERY, STORAGE AND HANDLING

- A. Do not install bent or otherwise damaged materials.

PART 2 - PRODUCTS

2.01 MATERIALS

- A. Galvanized Sheet Steel: ASTM A653, coating designation G90, hot-dip galvanized.
- B. Copper Plate, Sheet and Strip: ASTM B370, cold-rolled, tempered. Copper sheet and strip shall be cold-rolled-temper.

- C. Stainless Steel: Plate, sheet and strip shall conform to ASTM A167, Type 304 or Type 316, No. 4 finish on exposed surfaces and No. 2 finish on concealed surfaces unless otherwise specified or indicated. Furnish Type 304 for general applications and Type 316 where exposed to acidic or alkaline conditions.
- D. Aluminum Sheet: ASTM B 209, alloy as standard with manufacturer for finish required, with temper as required to suit forming operations and performance required; with smooth, flat surface.
 - 1. Finish: Kynar 500 finish, color as selected by Architect.
- E. Fastenings:
 - 1. Galvanized Steel: Nails, rivets, and other fastenings furnished in connection with galvanized sheet steel Work shall be sealed with rust resistive coating. Rivets shall be tinned. Nails and other fastenings shall be zinc-coated.
 - 2. Copper: Nails, rivets, and other fastenings furnished in connection with copper sheet metal Work, shall be manufactured from hard-temper copper or hard brass.
 - 3. Stainless Steel: Nails, rivets and other fastenings furnished in connection with stainless steel Work, shall be 300 series alloy to match alloy of stainless steel being fastened.
- F. Soldering Flux: Raw muriatic acid for galvanized steel; rosin for tin, and tinned copper; non-corrosive soldering salts for uncoated copper and acid-type flux formulated for soldering stainless steel.
- G. Solder: ASTM B32, Grade 5A, composed of 95-5 tin-antimony. Name of product manufacturer and grade designation shall be labeled, stamped or cast onto each coil or bar.

2.02 FABRICATION

- A. General:
 - 1. Accurately form sheet metal Work to dimensions and shapes indicated and required. Cope finish molded and brake metal shapes with true, straight, sharp lines and angles and, where intersecting each other, to a precise fit. Unless otherwise specified, all galvanized sheet steel shall be 22 gage. Exposed edges of sheet metal shall have a ½ inch minimum hemmed edge.
 - 2. Soldering of sheet steel or copper shall be performed with well-heated copper soldering iron or soldering torch, joints full flowing, neat and consistent. Fill joint completely with solder. Clean materials at joints before soldering, and tin coppers before soldering. Exposed soldering on finished surfaces shall be scraped smooth. Lock seam work shall be fabricated flat and true to line and soldered along its entire length. Acid-fluxed Work shall be neutralized after fabrication.
 - 3. Form and install sheet metal Work to provide proper allowances for expansion and contraction, without causing undue stresses in any part of completed Work. Installation shall be water and weathertight.
- B. Gutters and Downspouts:

1. Gutters: Fabricate from 0.04 inch thick aluminum unless otherwise indicated. Maximum length of gutter shall be 40 feet between end or expansion joints unless the system is specially designed to accommodate the greater expansion, the larger flow and the need for special supports. Drain gutter towards nearest downspout and provide an expansion joint at mid-point between downspout outlets, but not to exceed 40 feet on center. Gutters shall not pond water. Rivet joints and ends with a minimum of 6 rivets per joint or maximum rivet spacing not to exceed 1 ½-inch on center and ½ inch from the edge of the metal, consisting of 3-inch overlap. Sweat solder from inside of gutter and in horizontal position where possible. Neatly fit downspouts to gutter using a slip joint. Provide expansion joints, consisting of 3-inch lap joints at not over feet.
 2. Form and install sheet metal Work to provide allowance for expansion and contraction without causing undue stresses in the completed Work.
 3. Downspouts: Fabricate downspouts from 3-inch by 4-inch rectangular shapes, unless noted otherwise, 0.04 inches thick aluminum unless indicated otherwise indicated in drawings. Downspouts shall be constructed connected to gutters or conductor heads. Downspout shall be fabricated with elbows at bottom discharge or connected to drains as indicated. Joints, except expansion joints shall be sealed with a continuous weld.
 4. Outlets where occurs: Fabricate outlets of 22 gage galvanized sheet steel with a 1/4 inch rolled flanged soldered continuously to gutter. Outside diameter shall be 1/8 inch less than the inside diameter of the downspout and extend into downspout 4 inches. Install a removable wire “bulb type” strainer to outlet opening. Strainer shall be fabricated of 22 gage galvanized steel and ½ inch hardware cloth.
- C. Splash Pans: Provide splash pans for all downspouts, which empty onto lower roofs. Pans shall be galvanized sheet steel 12-inch by 18-inch, unless otherwise indicated, and turned up 2 inches on at least three sides.
- D. Miscellaneous Flashing: Unless otherwise indicated, miscellaneous flashing shall be fabricated of galvanized steel. Exterior doors and windows, unless covered by overhangs shall be provided with 22 gage galvanized steel drip flashing as detailed. At wood construction, nail flashing to framing before paper backed lath is installed.
- E. Roof Pipe Flashings:
1. PVC roofs: provide PVC flashings or prefabricated welded or seamless flashings.
 2. Tile and built up roofs: provide 24 gage galvanized steel flashings with a storm worker.
- K. Gutter Guard:
1. Stainless steel micro-mesh gutter guard as manufactured by “Gutterglove”, email: gutterguard.com, (866) 892-8442. Or approved equal.

2.02 LEED REQUIREMENTS

- A. IW/PS EDP: Products specified under this section must have a Type III Product Specific EPD or the company must be listed in the industry group responsible for the Industry Wide Externally Verified EPD.
- B. PS EPD: Products specified under this section must have a Type III Product Specific EPD.
- C. HPDs: Products specified under this section must have one of the following unexpired material ingredient reports compliant with LEEDv4.1 requirements and declared to 1000 ppm or less: Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, Cradle to Cradle Health Product Certificate, or UL Product Lens Certification.
- D. Interior Wet Applied Products: All wet-applied on-site paints, coatings, adhesives, and sealants products provided under Part 2 of this specification section must be compliant with the VOC limits outlined under IEQc2: Low Emitting Materials in 01 81 13 Sustainable Design Requirements. In addition, all paints and coatings must be compliant with CDPH Standard Method v1.2-2017 emissions testing with proper unexpired CDPH testing certificates or acceptable third-party certification.

PART 3 - EXECUTION

3.01 PREPARATION

- A. Concrete and masonry materials in contact with sheet metal shall be painted with alkali resistant coating, such as heavy-bodied bituminous paint. Wood in contact with sheet metal shall be painted with two coats of aluminum paint or one coat of heavy-bodied bituminous paint.

3.02 INSTALLATION

- A. General: Coordinate with installation of underlayment indicated in the Drawings.
- B. Gutters and Downspouts:
 - 1. Anchor gutters to structure with 10 gage steel straps, galvanized after fabricating. Secure straps with galvanized fasteners at 3 feet on center. Drill pilot holes and use 12 by 2-inch pan head screws.
 - 2. Install 1/4 inch galvanized wire mesh continuous cover on gutter.
 - 3. Secure downspouts to walls with 1/8 inch by 2-inch galvanized steel straps. Straps shall be located at top, bottom, and at not over 10 feet on center. Block downspouts out 1/2 inch from the finish wall surfaces and 1 inch from the bottom of downspout grade. Secure straps to wall framing with 1/4 inch by 2-inch long galvanized anchors. Expansion type anchors shall be provided when anchoring to concrete and masonry. Provide toggle bolts for attachment to masonry or plaster. At steel columns, provide fasteners as indicated. Plastic anchors are not permitted.
 - 4. Anchor conductor heads to walls with 1/4 inch diameter by 2 1/2-inch long galvanized lag screws or 1/4 inch expansion type anchors.

- C. Reglets: Install reglets at constant height above cant or as indicated. Provide minimum 3-inch lap at end splices of reglets. Seal laps watertight.
- D. Counterflashing:
 - 1. Install at constant horizontal elevation across roof slope and slope at constant height above cant or as indicated.
 - 2. Provide minimum 3-inch lap at all end splices of counterflashing.
- E. Galvanized sheet steel parapet coping and flashing shall be continuous over top of parapet to form a watertight cap, with waterproof seams at approximately 10 feet on center, or as indicated. Anchor coping to outside of wall with a continuous cleat face nailed at 24 inch centers. Coping shall be fastened on inside wall with hex head screws and bonded sealing washers through oversized holes in the back of the coping. Corners and angles shall be lapped and soldered; do not install joint sealant.

3.03 TESTING

- A. Perform field water testing to demonstrate installation is watertight. Continue testing with a continuous hose stream applied at base of installation for at least 30 minutes. If leaking is observed, discontinue test and repair installation, then test until satisfactory results are obtained.

3.04 PROTECTION

- A. Protect the Work of this section until Substantial Completion.

3.05 CLEANING

- A. Remove rubbish, debris, and waste materials and legally dispose of off the Project site.

END OF SECTION

SECTION 07 64 25

FULLY ADHERED TPO ROOFING

GENERAL

1.01 SUMMARY

- A. Description: This section includes the Work for Fully Adhered TPO Roofing systems including the installation vapor retarder, roofing membrane, edge metal and walkways, and other miscellaneous items over concrete on steel deck at Mechanical spaces.
- B. Section Includes
 - 1. Inspection
 - 2. Preparation
 - 3. Installation of Roofing
 - 4. Installation – Membrane
 - 5. Installation Edge Metal and Coping
 - 6. Installation of Adjoining Work
 - 7. Installation – Walkways
 - 8. Protection and Cleaning
 - 9. Clean Up
- C. Related Specification Sections include but are not necessarily limited to:
 - 1. Completely coordinate with work of other trades.
 - 2. Section 07 62 00 - Flashing and Sheet Metal

1.02 REFERENCES

- A. SPRI: “Wind Load Design Guide for Low Sloped Flexible Membrane Roofing Systems.”
- B. Factory Mutual (FM) Research Corporation: “Loss Prevention Data Sheets 1-28, 29, and 49.”

- C. National Roofing Contractors Association (NRCA): Roofing and Waterproofing Manual.
- D. Material Standards – TPO Membrane:
 - 1. Standard Specification for TPO Membrane: ASTM D6878.
 - 2. Tolerance on Nominal Thickness (Max): ASTM D751
 - 3. Thickness over scrim (Min): ASTM D4637
 - 4. Breaking Strength (Min): ASTM D751
 - 5. Ultimate Elongation – Fabric Failure (Min): ASTM D751
 - 6. Tear Strength (Min): ASTM D751
 - 7. Linear Dimensional Change (Shrinkage) :ASTM D1204
 - 8. Field Seam - Peel Strength (min): ASTM D1876
 - 9. Permeance (max): ASTM E96
 - 10. Puncture Resistance (min): FTM 101C Method 2031
 - 11. Solar Reflectance (albedo X 100): ASTM E903
 - 12. Brittleness Point: ASTM D2137

1.03 QUALITY ASSURANCE

- A. Manufacturers Qualifications: Company specializing in successfully manufacturing the specified TPO membrane for a minimum of 10 years in their own facilities and not had any formulation changes within the last ten years. Membrane manufacturers shall submit the following certification for review when making substitution requests or submittals.
- B. Applicator Qualifications: Roofing installer shall have the following:
 - 1. Current approval, license, or authorization as applicator by the manufacturer.
 - 2. Manufacturer authorized roofing installer with five years-experience on projects of similar size, scale, complexity and location.
- C. The roof operations shall be coordinated with appurtenant work such as sheet metal work so that the roofing surfacing operations once started are continuous to completion.

- D. Total roofing system materials and applications shall be as per manufacturer's recommendations.

1.04 DESIGN CRITERIA

- A. Design roof system, including roof covering and metal edge securement to satisfy requirements of applicable building codes including local amendments:

- 1. Design Roof System and anchorage to meet Design Loads.

- a. Wind Loads: Use the greater of the following:

- 1) Wind Pressures as required per local building code based on wind speed, exposure factor and importance factor noted in the Structural Plans.
- 2) Wind Pressures defined by Building Code as locally adopted and amended.
- 3) 20 psf minimum.

- 2. Requirements applicable to designated warranty.

- 3. Roof Height(s) and Parapet Height(s): As indicated.

- B. Windborne-Debris-Impact Resistance: Provide exterior roofing that passes enhanced-protection testing requirements in ASTM E 1996 for Wind Zone indicated when tested according to ASTM E 1886. Test specimens shall be no smaller in width and length than glazing indicated for use on the Project and shall be installed in same manner as roofing indicated for use on the Project.

- 1. Small-Missile Test: For roofing located more than 30 feet above grade.

- 2. Large-Missile Test: For all roofing, regardless of height above grade.

- C. Fire resistance rating:

- 1. UL 790, Class A.

- 2. Assembly in conformance with fireproofing as specified.

1.05 SUBMITTALS

- A. Shop Drawings:

- 1. Roof layout showing insulation thicknesses and special details.

2. Profiles of flashing assemblies.
 3. Installation Drawings and pertinent details.
 4. Indicate location of expansion joints, crickets, saddles, curbs, safety tiebacks, vents, drains and other penetrations.
 5. Indicate slope amount and direction, locations of crickets, and key vertical elevation points.
- B. Samples:
1. 5 IN x 5 IN specimens of sheet goods.
 2. Color swatches of sheet metal colors for pre-selection.
 3. 3 IN x 5 IN samples of sheet metal color(s) for final approval.
- C. Products Data:
1. Submit Manufacturer's Material Product and Data and Material
 2. Safety Data Sheets for the following items:
 - a. Single-ply membrane sheet roofing
 - b. Vapor Barrier
 - c. Flashing and flashing accessories
 - d. Fasteners & Adhesive
- D. Certificates:
1. Contractor Certification: Prior to the start of any work, submit a signed certificate from the proposed roofing manufacturer stating that the roofer is a trained and authorized applicator of the assemblies and that the Manufacturer or the Technical Representative of the Manufacturer has trained the installation crew in the system's proper installation.
 2. Technical Representative Certification: Submit a signed certificate from the proposed roofing manufacturer naming their technical representative and their independent roofing auditor/inspector (where applicable) and attesting that this person is both qualified and authorized to act on and make commitments in their behalf.

3. Manufacturer's Certification: TPO membrane supplied for this project is made in its own facility and has had no formulations changes, within the past 10 years.
 4. Manufacturer's Certification: Roof membrane manufacturer to certify that metal flashing gauge specified, meets, ANSI/SPRI ES-1 Test Method RE-3.
 5. Warranty Certification: Submit a signed certificate from the Manufacturer or its Technical Representative stating that the plans and specifications for the project have been reviewed and fully comply with the Manufacturer's standards and meet the requirements for warranty of the Complete Roofing System for the specified project.
 6. Listing: Submit listing's from national recognized testing laboratory UL indicating the proposed roofing system has a fire classification rating of Class A or B. The listing's report shall also indicate the maximum roof slope permitted for the proposed roofing assembly. Where required, Factory Mutual approval for the roofing system must be clearly noted with the listing's.
 7. Warranty Certificate: Submit samples of the Manufacturer's Warranty from manufacturer-exhibiting conformance with the item entitled "Warranty" herein below.
- E. Project Information:
1. Meeting minutes from pre-installation conference.
 2. Report by manufacturer's representative that roof has been properly installed.
- F. Contract Closeout Information:
1. Warranty.
 2. Maintenance Data:
 - a. Include cleaning instructions.
- G. LEED Submittals: Complete the LEED Material Buyout Form (MBoF) with all materials provided to the project. A complete submittal includes providing all material costs in the MBoF and all of the supporting documentation for the following credits:
1. MRc2 - Environmental Product Declarations (EPD): Provide Industry-Wide or Product-Specific EPD.
 2. MRc3 - Sourcing of Raw Materials - Recycled Content: Provide product data for pre- and post- consumer recycled content.
 3. MRc4 - Material Ingredients: Provide manufacturers Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, or Cradle to Cradle Health Product Certificate.

4. IEQc2 - Low-Emitting Materials – Interior Wet Applied Products: For paints, coatings, adhesives and sealants applied on site or used for laminating off-site, include product data indicating the VOC content (g/L) and testing.

1.06 PRE-INSTALLATION CONFERENCE

- A. Pre-installation conference, directed by Contractor, prior to beginning of roofing work to discuss following:
 1. Contract Document requirements.
 2. Roof plan.
 3. Roofing and flashing details.
 4. Drain and scupper elevations.
 5. Roofing manufacturer's Specifications and details.
 6. UL requirements.
 7. Insulation manufacturer's recommendations.
 8. Available on site storage.
 9. Roof protection from damage by other trades.
- B. Attendance is recommended for:
 1. Contractor.
 2. Roofing installer's superintendent.
 3. Roofing manufacturer's representative.
 4. Sheet metal installer performing metal flashing work.
 5. Mechanical installer.
 6. Plumbing installer.
 7. Deck installer.
 8. Other trades whose work may affect roofing system.
- C. Minimum two (2) weeks prior to meeting forward pertinent information to Contractor for review.

1. Installation Drawings.
 2. Manufacturer product data.
 3. Samples of proposed materials.
 4. Sample warranty.
 5. Other information deemed pertinent for sound and secure application.
- D. Include review of Specifications, details, application requirements and preliminary work.
- E. Objectives of pre-installation meeting to include:
1. Review foreseeable methods and procedures related to roofing work.
 2. Tour representative areas of roofing substrates (decks), inspect and discuss condition of substrate, roof drains, curbs, penetrations and other preparatory work performed by others.
 3. Review structural loading limitations of deck and inspect deck for loss of flatness and for required attachment.
 4. Review roofing system requirements (Plans, Specifications and other Contract Documents).
 5. Review required submittals both completed and yet to be completed.
 6. Review and finalize construction schedule related to roofing work and verify availability of materials, installer's personnel, equipment and facilities needed to make progress and avoid delays.
 7. Review required inspection, testing, certifying and material usage accounting procedures.
 8. Review weather and forecasted weather conditions and procedures for coping with unfavorable conditions, including possibility of temporary roofing.
 - a. Review notification procedures for weather or non-working days.
 9. Record discussion of conference including decisions and agreements (or disagreements) reached.

- a. If substantial disagreements exist at conclusion of meeting, determine how disagreements will be resolved and set date for reconvening meeting.
- F. Furnish copy of record to each party who may be affected by roofing work, (weather or not they were in attendance) and to Owner and Architect.

1.07 WARRANTY

- A. The Contractor shall furnish a written warranty on the roofing membrane system and sheet membrane flashing for a three (3) year period covering labor and installation of specified system and components.
1. Repair of roofing, flashing, roof drains, overflow drains, sealants, etc. as necessary to seal leaks which are attributable to faulty materials and/or workmanship.
- B. The roofing system manufacturer shall submit a written 20-year roof membrane system and wind warranty up to 105 mph and flashing endorsement. The warranty shall cover both material and workmanship and shall provide that the roofing system manufacturer will make repairs as necessary to maintain the roof in a watertight condition at no cost to the Owner. The issuance of the warranty by the manufacturer is acceptance that the roof has been installed in accordance with the manufacturer's instructions.
1. Warranty to include the entire system: membrane, flashings, adhesives, sealants, counterflashings, fastener plates, fastener strips, hard rubber or metal edging, metal termination bars, sheet metal edge metal, and other material authorized by manufacturer.
- C. 20-year warranty on stainless steel coatings on edge metal and copings.

PRODUCTS

1.08 ACCEPTABLE MANUFACTURERS

- A. Roofing materials:
1. Base:
 - a. Carlisle SynTec.
 2. Acceptable Alternates:

- a. Firestone Building Products.
- b. Sika/sarnafil.
- c. Or approved equal.

1.09 GENERAL

- A. All components products shall be made by, or accepted as compatible by the selected membrane manufacturer.
- B. Unless otherwise approved by OWNER and accepted by the membrane manufacturer, products including insulation, concealed fasteners, fastening plates and edgings, must be manufactured and supplied by roofing system manufacturer and covered by warranty.

1.10 VAPOR RETARDER

- A. Vapor Retarder:
 - 1. Two plies of polyethylene, bonded over one layer of scrim reinforcing.
 - 2. Fire retardant type, with compatible fire retardant adhesive.
 - 3. Base Product: “TX-1200 FR” by Griffolyn, or approved equal as acceptable by the TPO membrane manufacturer.
 - 4. Minimum Properties:

26 LBS
0.036 Perm (US)
100 LBS / 4,504 PSI
26 LBS

- 5. Seaming Tape:
 - a. Self-adhering, asphaltic mastic.
 - b. Base Product: “Fab Tape” by Griffolyn.
- 6. Repair Tape, for punctures and other damaged areas:

- a. Base Product: “Griff Tape” by Griffolyn.

1.11 ROOFING MEMBRANE

A. TPO Roofing membrane:

1. Material: Thermoplastic Polyolefin (TPO) single-ply roofing membrane. Width and length of sheet shall be as recommended by the manufacturer.
 - a. Fire Retardant.
 - b. Polyester fabric reinforced.
2. Color:

Color 1: Tan.

Thickness: 80 mil thick.
3. Base Product: “SureWeld” by Carlisle SynTec, Firestone Building Products-Genflex or Approved Equal.
4. Minimum Physical Properties:

Minimum Physical Properties – 80mil, Reinforced, TPO Membrane		
Property	Test Method	Required Value
Tolerance on Nominal Thickness (Max)	ASTM D751	+/- 10%
Thickness over scrim (Min)	ASTM D4637	15 mil
	Optical	18 mil
Breaking Strength (Min)	ASTM D751	225 LBS
	Grab Method	340 LBS
Ultimate Elongation – Fabric Failure (Min)	ASTM D751	25%
Tear Strength (Min)	ASTM D751	55 LBS
	B Tongue Tear	130 LBS
Linear Dimensional Change (Shrinkage)	ASTM D1204	+/- 1.0%
Field Seam - Peel Strength (min)	ASTM D1876	40 LBS/IN

Permeance (max)	ASTM E96	<0.1 Perm (US)
Puncture Resistance (min)	FTM 101C Method 2031	250 LBS
Solar Reflectance (albedo X 100)	ASTM E903	80 (White Membrane)
Brittleness Point	ASTM D2137	-40 DegF

B. Membrane flashings, fasteners, adhesives, tapes, cements and sealants: Roofing manufacturer's standard.

1.12 EDGE METAL

A. General:

1. Roofing Manufacturer's pre-engineered, prefabricated system for termination of roofing membrane.
2. All fasteners must be concealed from view.
3. Concealed splice plates, with color matching snap-on covers.
4. Anchor cleats:
 - a. Material: G90 galvanized steel.
 - b. Thickness: 20 GA.
5. Snap-on cover:
 - a. Material: G90 galvanized steel.
 - b. Thickness:
 - 1) For dimensions less than 10 IN: 24 GA.
 - 2) For dimensions 10 to 24 IN: 22 GA.
 - c. Finish: Stainless Steel Type A316.
6. Wind Rating: Design for same FM design pressure indicated for balance of roof system.
7. Coverage of these items to be included in roof system warranty.
8. Comply with applicable FM and SPRI standards.

- B. Roof Edge/Fascia:
 - 1. Match profiles indicated.
 - 2. Include accessories such as pre-fabricated inside and outside corners, Spillover, Overflow and Downspout Scuppers, Edging Extensions, Fascia Sumps, and other items indicated.
 - 3. Base Product: “SecurEdge 200 Fascia” by Carlisle SynTec.

1.13 FASTENERS

- A. Type, spacing and quantity as recommended by manufacturer.
 - 1. All exposed fasteners to be Stainless Steel Type A316.
 - 2. Designed to resist uplift forces generated by specified wind speed (105 miles/hour).
- B. Minimum pullout values per fastener:
 - 1. For use with 22 GA steel decks: 350 LBS each.
 - 2. For use with normal weight concrete decks: 800 LBS each.
- C. Fasteners shall be capable of providing a static back-out resistance of at least 10 IN/LBS.

1.14 WALKWAYS

- A. Walkway: Where shown on Plans:
 - 1. Manufacturer’s standard walkway roll stock, designed to protect TPO roof membrane.
 - a. Slip-resistant surface.
 - 2. Nominal Thickness: 160 mil.
 - 3. Width: 30 IN.
 - 4. Color: To be selected by Architect from manufacturer’s standard line.
 - 5. Secure by heat welding tape as recommended by membrane manufacturer.

1.15 MISCELLANEOUS ITEMS

- A. Roofing accessories:

1. Use manufacturer's standard prefab accessories where available.
 2. Nailing strips: As detailed and required.
 3. Pipe flashings: Provide TPO pre-molded flashings for each pipe penetration; include clamps, adhesive and sealants.
- B. Bonding adhesives, cleaners, and primers: As recommended by roofing manufacturer.
- C. Fire-resistive Treated (FRT) Wood Blocking.
- D. Other Materials as required by manufacturer for complete system warranty.
- E. Sealers and Sealants: As recommended by the manufacturer.
- F. Metal Termination Bars: Manufacturer's standard stainless steel bars, approximately 1-inch wide, pre-formed and pre-punched.
- G. Fasteners and Plates: Manufactured supplied factory-coated steel fasteners and metal discs of appropriate type and lengths, designed for fastening system components to substrates meeting 2006 IBC uplift pressure and warranty requirements as specified.
- H. Miscellaneous Accessories: Provide preformed inside and outside corner sheet, flashings, and other accessories recommended by roofing system manufacturer for intended use. Provide products, which are recommended by membrane manufacturer to be fully compatible with indicated substrates, or provide separation materials as required to eliminate contact between incompatible materials.
- I. Pourable Sealer: Two-component, solvent free, polyurethane based sealant as furnished by membrane manufacturer to fill and seal pipe penetrations; to create a temporary seal of membrane to substrate when work is interrupted.
- J. Sealant Pockets: Prefabricated pockets for sealing irregular and hard to flash penetrations through the membrane.
- K. Pipe Flashing: TPO premolded pipe flashing.

1.16 ROOF SYSTEM

- A. Roof System – Fully Adhered TPO over concrete deck

EXECUTION

1.17 INSPECTION

- A. Inspect entire area to be roofed for acceptability.
 - 1. Correct, or have corrected, unsatisfactory conditions.
- B. A representative of manufacturer shall make an inspection during roofing construction and issue a report to OWNER that construction following manufacturers installation instructions.
- C. A representative of manufacturer shall make an inspection and issue written report to OWNER that roofing system has been installed properly.

1.18 PREPARATION

- A. Coordinate work with other trades to ensure that components, which are to be incorporated into the roofing system, are available to prevent delays or interruptions as the work progresses. Examine roofing substrates to which the roofing materials are to be applied to insure that their condition is satisfactory for its application. Do not permit voids greater than 1/4 -inch wide in the existing roofing substrate. Inspect substrates and correct defects before application of membrane sheets.
- B. Clean substrates of dust, debris, moisture, foreign material and other substances detrimental to roofing installation according to roofing system manufacturer's written instructions.
- C. Properly sloped roof should not have standing water before covering the area to be roofed prior to starting roofing work.
- D. Install required nailers.

1.19 INSTALLATION OF ROOFING - GENERAL

- A. Install materials in accordance with manufacturer's instructions and recommendations.
- B. Comply with code, design, and warranty requirements.
- C. Fasteners which will be exposed to view from finished spaces below:
 - 1. Project fastener through roof deck maximum 1 IN and cap.
- D. Comply with the manufacturer's instructions for the installation of the membrane roofing system including proper substrate preparation, jobsite considerations and weather restrictions.

- E. Install materials in accordance with procedures required for FM and UL assemblies.
- F. Arrange work to prevent use of newly constructed roofing for storage, walking surface, or equipment movement. If access is necessary, provide temporary walkways, platforms or runways to proceed to protect new roofing surfaces and flashing from mechanical damage.
- G. Do not dilute coatings or sealants unless specifically recommended by the material manufacturer's printed application instructions. Do not thin liquid materials with cleaners used for cleaning membrane sheet.
- H. Keep all liquids in airtight containers and keep containers closed except when removing materials.
- I. Use liquid components, including adhesives, within their shelf life period. Store adhesives at 90 to 80 degrees F for at least 24 hours prior to use. Avoid excessive adhesive application and adhesive spills, as they can be destructive to some membranes sheets and insulations; follow adhesive manufacturer's printed application instructions.
- J. Do not allow contact between various materials through mixing of remains, dual use of mixing, transporting or application equipment. Do not use equipment containing the remains of previous materials.
- K. Require workmen and others who walk on the membrane to wear clean, soft-soled shoes to avoid damage to roof materials.
- L. Do not use equipment with sharp edges which could puncture the membrane sheet.
- M. No roofing shall be installed during precipitation and shall not be started in the event there is a possibility of precipitation during applications.
- N. Absolutely no roofing shall be applied before the deck and the work in connection therewith have met the following conditions:
 - 1. Adjoining work, such as scuppers, metal counter-flashing, leader heads and collars for vent pipes shall either be in place, ready for the Installer to work in or shall be available for installation by others, as applicable.
 - 2. Phased construction (roofing purposely interrupted for a period to permit other work and trafficking over the membrane) shall not be permitted.
 - 3. At the end of the day's work, all incomplete roofing shall be protected using water cut-off and other materials to seal all incomplete edges against intrusion of water.

4. Water cut-off shall be removed before continuing installation of the roofing System.

1.20 INSTALLATION OF NAILERS

- A. Install nailers at perimeter of each roof level, curbs, skylights, expansion joints, and similar penetrations.

1.21 INSTALLATION - WOOD BLOCKING

- A. Install where indicated or required for proper securement of roofing system.
- B. Securement of wood blocking:
 1. Design to resist a minimum of 200 LBS/LF in any direction per SPRI Test Method RE-1.
- C. Install so that top of blocking is substantially flush ($\pm 1/4$ IN) with top of insulation.

1.22 INSTALLATION – MEMBRANE

- A. General:
 1. Unroll and position membrane without stretching.
 2. Secure the membrane with the required fasteners and plates.
 - a. Spacing as dictated by wind design and project conditions.
 3. Install adjoining membrane sheets in the same manner in accordance with the manufacturer's requirements.
 4. Position sheets to accommodate contours of roof deck.
 - a. Shingle splices to avoid bucking water.
 5. Perimeter Securement: Secure membrane along the perimeter of each roof level, roof section, curb, interior wall, penthouse, and other penetrations as recommended by membrane manufacturer.
 6. Hot or Cold Weather Procedures: Comply with manufacturer's instructions.
 7. Protect membrane from stains/discoloring caused by adhesives.
 8. Temporary Work: Install temporary cutoffs around incomplete edges of roofing assembly at the end of each day's work and when work must be postponed due to inclement weather. Temporary cutoffs provide protection

against moisture infiltration and absorption. Remove the temporary seals completely when work resumes. Provide temporary ballast on the roofing as necessary to prevent wind damage to the membrane sheet.

B. Adhering TPO Membrane:

1. Position TPO membrane over substrate.
2. Fold membrane sheet back lengthwise onto itself exposing half underside of membrane.
3. Apply bonding adhesive in accordance with the manufacturer's instructions, to exposed underside of the membrane and the corresponding substrate area.
 - a. Do not apply bonding adhesive along the splice edge of membrane to be hot air welded over the adjoining sheet.
 - b. Allow adhesive to dry until it is tacky.
 - c. Roll the coated membrane into coated substrate while avoiding wrinkles.
 - d. Brush down bonded section of the membrane sheet immediately after rolling membrane into the adhesive with a soft bristle push broom to achieve maximum contact.
 - e. Fold back unbonded half of sheet lengthwise and repeat the bonding procedures.
4. Membrane Splicing/Hot Air Welding Procedures:
 - a. Position adjoining sheets to allow a minimum overlap of 2 IN.
 - b. Hot air weld TPO membrane sheets using Automatic Hot Air Welding Machine or Hot Air Hand Welder in accordance with the manufacturer's hot air welding procedures.
 - 1) At splice intersections, roll seam with a roller prior to membrane seam cooling.
 - 2) Splice intersections shall be overlaid with non-reinforced TPO flashing material of type recommended by membrane manufacturer.

- c. Probe seams once the hot air welds have thoroughly cooled.
- d. Repair seam deficiencies same day they are discovered.
- e. Apply sealant of type recommended by membrane manufacturer on cut edges of reinforced membrane where scrim reinforcement is exposed after seam probing is complete.
- f. Pull membrane back along the welded splice so entire underside of membrane is exposed once Hot Air Weld has been completed.
 - 1) Apply bonding adhesive to exposed underside of membrane sheet and substrate.
 - 2) Allow adhesive to dry until tacky and roll membrane into substrate and brush down bonded section with a bristle broom following procedure noted above.
 - 3) Continue to install adjoining membrane sheets in same manner, overlapping edges a minimum of 2 IN and complete bonding procedures.

5. Flashing.

- a. Follow manufacturer's typical flashing procedures for wall, curb, and penetration flashing including metal edging/coping and roof drain applications.
- b. Flashing of parapets, curbs, expansion joints and other parts of roof must be performed using reinforced TPO membrane.
- c. Manufacturers standard, non-reinforced TPO membrane can be used for flashing pipe penetrations, sealant pockets, scuppers, as well as inside and outside corners when use of pre-fabricated accessories is not feasible.
- d. Terminate base-of-wall flashings in accordance with manufacturer's approved details.
 - 1) Install flashing as roofing sheets are installed in accordance with printed instructions of the sheet membrane manufacturer. Extend base flashing as indicated on the drawings above roofing surface. Completely adhere flashing sheets in place.

- e. Use prefabricated pipe seals at pipe penetrations. Pre-flashing at sheet metal parapet copings:
 - 1) Extend TPO membrane, flashing or both over top of parapet prior to capping with sheet metal.
- f. Expansion Joints:
 - 1) Extend TPO membrane across roofing expansion joints.
 - 2) Include adequate slack in membrane to accommodate anticipated movement.

1.23 INSTALLATION - EDGE METAL AND COPING

- A. Verify blocking has been installed and adequately secured.
- B. Sub-flash details with a layer of TPO membrane prior to installation of edge metal or coping system.
- C. Secure anchor cleat to blocking as recommended, using corrosion-resistant fasteners.
- D. Install splice plates and snap-on covers.
- E. Protect finished items from damage for balance of construction period.
 - 1. Repair/replace damaged items.

1.24 INSTALLATION OF ADJOINING WORK

- A. Unless otherwise shown on the plans, all adjoining work shall be done in accordance with the specifications and details of the manufacturer of the roofing assembly being used. The Contractor shall coordinate the Roofer's installation and any work that requires tying-in with the roofing so that the combined installation is leak-proof

1.25 INSTALLATION – WALKWAYS

- A. Install walkways at traffic concentration points, such as roof hatches, access doors, rooftop ladders, etc., and locations as indicated.
 - 1. Do not locate within 10 FT of roof edge.
- B. Clean surfaces to be bonded.
- C. Secure by heat welding as recommended by membrane manufacturer.

1.26 PROTECTION AND CLEANING

- A. Any work or materials damaged during the handling of roofing materials shall be restored to their original (undamaged) condition or replaced.
- B. The work of other trades shall not be marred or injured. Daubed or splashed surfaces shall be removed and the surface or finish restored to its original finish and appearance.
- C. Protective coverings shall be installed at all pavement and exposed building walls as necessary to prevent the marring of existing surfaces.
- D. Protection shall remain in place for the duration of the roofing work.
- E. Contractor shall have on hand at the roof appropriate weather protection materials to protect the substrate and building interior during inclement weather.
- F. Upon completion of roofing (including associated work), institute appropriate procedures for surveillance and protection of roofing during remainder of construction period. At end of construction period, or at a time when remaining construction will in no way affect or endanger roofing, make a final inspection of roofing and prepare a written report to the Engineer describing nature and extent of deterioration or damage found.
- G. Repair or replace (as required) deteriorated or defective work found at time of final inspection to a condition free of damage and deterioration at time of Substantial Completion and in accordance with requirements of specified warranty.

1.27 CLEAN UP

- A. Remove all construction debris and legally dispose off-site.
 - 1. The roof shall be left in good, clean condition.
- B. Roof drains, scuppers and overflow roof drains shall be cleaned out and all blockages shall be removed prior to acceptance of the project.

END OF SECTION

SECTION 07 84 13

PENETRATION FIRESTOPPING

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Penetrations for the passage of duct, cable, cable tray, conduit, piping, electrical busways and raceways through fire-rated vertical barriers (walls and partitions), horizontal barriers (floor/ceiling assemblies. Gaps between the top of walls and ceilings or roof assemblies.

B. Related Requirements:

1. Division 01 - General Requirements.
2. Section 03 30 00 - Cast-in-Place Concrete.
3. Section 07 21 00 - Thermal Insulation.
4. Section 07 92 00 - Joint Sealants.
5. Section 09 29 00 - Gypsum Board.
6. Division 22 - Plumbing.
7. Division 23 - HVAC.
8. Division 26 - Electrical.

1.03 SYSTEM DESCRIPTION

- A. Provide fire stops and smoke seals to prevent the passage of fire, smoke, toxic gasses or water from one floor or area to another. Seal openings in floors, fire rated walls and permanent partitions penetrated by pipes, ducts, conduits and other items as shown, specified, and as required for the type of construction.
- B. Mineral fiber insulation installed as fire safing at non-rated penetrations not containing pipes, ducts, conduits, and other items in floor slabs, wall partitions, construction-joint conditions between slabs and adjacent construction and where indicated or required.
- C. Provide damming material, clips, and closures as required for support and containment of dams, and other insulation materials required for tested and rated fire stop systems.

1.04 QUALITY ASSURANCE

A. Performance Criteria:

1. Provide materials and Work to conform to source quality control criteria specified herein and CBC requirements in fire resistant wall and floor assemblies to prevent the passage of fire, smoke, and toxic gases.
2. Installed fire stops shall be of sufficient thickness, width, and density to provide a fire resistance rating at least equal to the floor, wall, or partition construction into which it is installed.

B. Comply with CBC requirements for fire rated construction.

C. Qualifications of Manufacturer: Products furnished for fire stopping and smoke seals shall be manufactured by a firm which has been continuously and regularly employed in the manufacture of these materials for a period of at least 5 years; and which can provide evidence of these materials being satisfactorily installed on at least 5 projects of similar size and type within such period.

D. Qualifications of Installer: The Work of this section shall be installed by a firm which has been in the business of installing similar materials for at least 5 consecutive years; and can provide evidence of satisfactory completion of 5 projects of similar size and scope. Installer shall have applicators trained and certified by manufacturer for performing this Work. Comply with requirements of FICA Manual of Practice.

E. For those firestop applications that exist for which no UL tested system is available through a manufacturer, an engineering judgment derived from similar UL system designs or other tests will be submitted to local authorities having jurisdiction for their review and approval prior to installation. Engineering judgment drawings must follow requirements set forth by the International Firestop Council.

F. Firestopping tests shall be performed by a qualified testing and inspection agency. A qualified testing and inspection agency shall be UL, Intertek or another agency performing testing and follow-up inspection services for firestop systems acceptable to authorities having jurisdiction. Firestopping products shall bear the classification marking of a qualified testing and inspection agency.

1.05 SUBMITTALS

A. Product Data:

1. Submit manufacturer's Product Data for each type of fire stop and smoke seal material proposed for installation. Indicate product characteristics, typical installations, performance, and limitation criteria and test data.
2. Submit manufacturer's printed installation instructions for each type of product, system, and construction required for the Work. Indicate fire resistance rating of each installation.
3. Submit fire test reports from independent testing agency indicating the following:

- a. Fire test report of fire stop material installed to substrate and penetration materials similar to the Work of this section. Test to indicate both Fire Resistance (F) and Temperature (T) Ratings.
 - b. Test reports of products to be installed shall indicate conformance to ASTM E814 or UL 1479 for penetrations, ASTM E1966 or UL 2079 for joints, and ASTM E2307 for perimeter fire barrier (edge-of-slab) systems.
- B. Field Samples: No less than 10 days before commencing the Work of this section, provide field installed Samples of fire stop materials and systems.
1. Apply one Sample of fire stop material for each different penetration and related fire rating required for the Work.
 2. Sample areas shall comply with thickness, fire resistance ratings, and finished appearance.
- C. Manufacturer's Qualifications: Submit evidence of conformance with qualification requirements specified above.
- D. Installer's Qualifications: Submit evidence of conformance with qualification requirements specified above.
- E. LEED Submittals: Complete the LEED Material Buyout Form (MBoF) with all materials provided to the project. A complete submittal includes providing all material costs in the MBoF and all of the supporting documentation for the following credits:
1. MRc2 - Environmental Product Declarations (EPD): Provide Industry-Wide or Product-Specific EPD.
 2. MRc3 - Sourcing of Raw Materials - Recycled Content: Provide product data for pre- and post- consumer recycled content.
 3. MRc4 - Material Ingredients: Provide manufacturers Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, or Cradle to Cradle Health Product Certificate.
 4. IEQc2 - Low-Emitting Materials – Interior Wet Applied Products: For paints, coatings, adhesives and sealants applied on site or used for laminating off-site, include product data indicating the VOC content (g/L) and testing.

1.06 DELIVERY, STORAGE AND HANDLING

- A. Deliver products to the Project site in manufacturer's original, unopened containers bearing correct UL labeling.
- B. Fire stop material shall be stored above grade in an area protected from detrimental weather and moisture conditions and in compliance with manufacturer's requirements, including temperature restrictions.
- C. Fire stop and seal materials shall be installed before expiration of shelf life.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

- A. Unless otherwise noted, products of this section shall be as manufactured by:
1. 3M Fire Protection Products.
 2. Hilti, Inc.
 3. Nelson Firestop Products.
 4. Specified Technologies, Inc. (STI).
 5. Tremco, Inc.
 6. Equal.
- B. Provide materials and systems of specified manufacturers to suit penetration and substrate as determined by various conditions of installation.
- C. Provide firestopping composed of components that are compatible with the substrates forming openings and the items penetrating the firestop, under conditions of service and application, as demonstrated by the fire stopping manufacturer based on testing and field experience.

2.02 MATERIALS

- A. Cast-in Firestop Devices: Pre-installed firestop devices penetrating cast-in-place concrete decks and concrete over metal decks, for use with combustible and non-combustible pipe, (closed and open systems) insulated pipe, conduits and cable bundles. Provide metal deck adapters and top seal plugs.
1. 3M: Fire Barrier Cast-in-Place Devices.
 2. Hilti: CP 680 Cast-in-Place FS Device
 3. Tremco: CIPP Plastic, CIPP Metal.
 4. Specified Technologies, Inc. (STI): Cast-In Firestop Devices.
 5. Equal.
- B. Firestop Collar: Made of galvanized steel housing and Intumescent inserts for firestopping combustible pipes through walls and floors. For use with concrete, masonry, wood floor and gypsum wall assemblies. Provide two collars on walls, one on each side, and one collar on underside of floors.
1. 3M: Plastic Pipe Device PPD.

Department of Neighborhood Services and Public Safety
GOLETA TRAIN DEPOT PROJECT

2. Hilti: CP 643N and CP 644.
 3. Tremco: TREMstop D.
 4. Nelson Firestop Products: PCS Pipe Choke System.
 5. Specified Technologies, Inc. (STI): Intumescent Firestop Collars, type LCC, SSC or RTC.
 6. Equal.
- C. Fire Pillows and Blocks: Intumescent flexible pillows consisting of a mineral fiber core sealed with a water-resistant intumescent membrane, heat-sealed in a durable fire-retardant poly bag; or intumescent block based on a two component foam, for use in walls and floors and concrete, masonry and gypsum wall assemblies. For large openings containing multiple penetrations: wall openings up to 48 inches by 48 inches and floors up to 36 inches by 36 inches.
1. 3M: Fire Barrier Self-Locking Pillow.
 2. Hilti: FS 657.
 3. Tremco: TREMstop PS1, TREMstop PS2.
 4. Nelson Firestop Products: Fire Brick, Pillows.
 5. Specified Technologies, Inc. (STI): SSB Firestop Pillows.
 6. Equal.
- D. Firestop Mortar: Fire-resistant mortar suitable for firestopping large horizontal or vertical, concrete or masonry openings penetrated by single or multiple non-combustible pipes or cable trays.
1. 3M: Fire Barrier Mortar.
 2. Hilti: CP 637.
 3. Tremco: TREMstop Mortar.
 4. Nelson Firestop Products: CMP Firestop Mortar.
 5. Specified Technologies, Inc. (STI): SSM Firestop Mortar.
 5. Equal.
- E. Firestop Putty Stick: Intumescent, non-hardening, firestop putty for single or bundled cables and non-combustible pipe penetrations. For use in horizontal or vertical, concrete, masonry or gypsum wall assemblies.
1. 3M: MP + Stix.

Department of Neighborhood Services and Public Safety
GOLETA TRAIN DEPOT PROJECT

2. Hilti: CP 618 and CP 619T.
 3. Tremco: TREMstop MP Putty Stick.
 4. Nelson Firestop Products: FSP AA445, AA439.
 5. Specified Technologies, Inc. (STI): SSP Firestop Putty.
 6. Equal.
- F. Firestop Putty Pad: Moldable firestop putty for protection of electrical outlet boxes.
1. 3M: MPP+.
 2. Hilti: CP 617.
 3. Tremco: TREMstop MP Putty Pad.
 4. Nelson Firestop Products: FSP AA452, AA439.
 5. Specified Technologies, Inc. (STI): SSP Putty Pads or Electrical Box Insert.
 6. Equal.
- G. Firestop Sealant: Smoke, gas and water resistant. For use in horizontal or vertical, concrete, masonry or gypsum wall assemblies.
1. Single component intumescent sealant for protection of combustible and non-combustible pipe, conduit and cable penetrations.
 - a) 3M: CP-25WB+, IC-15WB+, 3000WT.
 - b) Hilti: FS ONE.
 - c) Tremco: TREMstop IA+ or FyreCaulk.
 - d) Nelson Firestop Products: ES1399.
 - e) Specified Technologies, Inc, (STI): LCI or SSS Intumescent Firestop Sealant.
 - f) Equal.
 2. Silicone based system that provides maximum movement in fire-rated joint applications and pipe penetrations.
 - a) 3M: 2000+, 2000 NS.
 - b) Hilti: CP 601S.
 - c) Tremco: TREMstop Fyre-sil.

Department of Neighborhood Services and Public Safety
GOLETA TRAIN DEPOT PROJECT

- d) Nelson Firestop Products: CLK AA529, AA542, AA492.
 - e) Specified Technologies, Inc. (STI): SIL Silicone Firestop Sealant SIL300 or SIL300SL (self-leveling).
 - f) Equal.
3. Acrylic based system that provides movement capability in fire rated joints and seals through penetration applications.
- a) 3M: FD 150+.
 - b) Hilti: CP 606.
 - c) Tremco: TREMstop Acrylic GG.
 - d) Nelson Firestop Products: FSC3.
 - e) Specified Technologies, Inc. (STI): ES Elastomeric Firestop Sealant.
 - f) Equal.
4. Self-leveling silicone-based firestop sealant for use with through penetrations and construction joints in horizontal floor/ceiling assemblies.
- a) 3M: 1000 SL.
 - b) Hilti: CP 604.
 - c) Tremco: TREMstop Fyre-sil S.L.
 - d) Nelson Firestop Products: CLK AA539, AA552.
 - e) Specified Technologies, Inc. (STI): SIL Silicone Firestop, type SIL300SL.
 - f) Equal.
- H. Firestop Wrap Strip: Wrap strip of intumescent, flexible firestop for use with plastic and insulated pipe penetrations. For use in horizontal or vertical, concrete, masonry or gypsum wall assemblies.
1. 3M: Ultra GS, FS-195.
 2. Hilti: CP 648-S, CP 648-E.
 3. Tremco: TREMstop SuperStrip or TREMstop WS.
 4. Nelson Firestop Products: MCT, MPS.
 5. Specified Technologies, Inc. (STI): SSW Intumescent Wrap Strips, type BLU, BLU2, RED or RED2.

6. Equal.
- I. Spray: Sprayable or brush applied fire-rated mastic for construction joints where maximum movement is required. For use in horizontal or vertical, concrete, masonry or gypsum wall assemblies, at top of wall joints, curtain wall/slab edge and expansion joints.
 1. 3M: FD 200.
 2. Hilti: CP 672.
 3. Tremco: TREMstop Acrylic SP spray.
 4. Nelson Firestop Products: FSC3.
 5. Specified Technologies, Inc. (STI): AS200 Elastomeric Spray with or without SpeedFlex® Joint Strip, or Fast Tack® Firestop Spray.
 6. Equal.
- J. Drywall Track Gaskets: Intumescent cover for drywall ceiling track providing fire, smoke and acoustical ratings for head-of-wall joints between gypsum walls and concrete floor slabs.
 1. Hilti: CFS-TTS Top Track Seal.
 2. Specified Technologies, Inc. (STI): TTG Track Top Gasket.
 3. Equal.
- K. Fire Rated Cable Pathways: Gangable device modules capable of being retrofitted around existing cables and comprised of steel raceway with built-in intumescent material allowing 0 to 100 percent cable fill and requiring no additional action in the form of plugs, twisting closure, putty, pillow, or sealant to achieve fire and leakage ratings.
 1. 3M: Fire Barrier Pass-Through Device.
 2. Hilti: CP 653 Firestop Speed Sleeve.
 3. Specified Technologies, Inc. (STI): EZ-Path Fire Rated Pathway.
 4. Equal.
- L. Fire Rated Grommet or Disc: For single or dual cable penetrations through the same small opening.
 1. Hilti: CFS-D Firestop Cable Disc.
 2. Specified Technologies, Inc. (STI): EZ-Path Firestop Grommets
 3. Equal.

- M. Metal Deck Strips and Plugs: Precut preformed mineral wool plugs and strips to fit flutes of metal deck profile and gap between top of wall and metal deck.
1. 3M: PM4.
 2. Hilti: CP 777 Speed Plugs; CP 767 Speed Strips.
 3. Tremco.
 4. Nelson Firestop Products.
 5. Equal.
- N. Fire Safing, Mineral Fiber or Ceramic Wool Non-Combustible Insulation:
1. Mineral Fiber: Density 4 pounds per cubic foot, USG Thermafiber, Johns Manville Industrial Insulation Group (IIG), Roxul AFB, or equal.
 2. Ceramic Wool: Density 6 pounds per cubic foot, Johns Manville "Ceramic Fiber Insulation", Unifrax "Fiberfrax" ceramic fiber, or equal. Provide material in tested thickness for required hour rating.
 - a. Flame Spread: Less than or equal to 25.
 - b. Smoke developed: Less than or equal to 50.
 3. For mineral fiber, provide 20 gage minimum size metal retainer clips and plates for fire safing support in vertical applications and in compliance with tested system design.
- O. Supplemental Material: Provide supplementary materials required for complete, fire rated, installation.

2.03 SOURCE QUALITY CONTROL

- A. Fire stop and smoke seal material shall be tested by an independent testing agency for conformance to Flame (F) and Temperature (T) requirements of ASTM E814/UL 1479, ASTM E1966/UL 2079, or ATSM E2307.
- B. Conform to UL Fire Hazard Classification Requirements. Material shall be classified as a fill, void, or cavity material and system for UL through Penetration Firestop System.
- C. Material shall be tested and shall display Flame Spread Index of 25 or less, and Smoke Developed Index of 450 or less when tested in accordance with ASTM E84.

2.02 LEED REQUIREMENTS

- A. IW/PS EDP: Products specified under this section must have a Type III Product Specific EPD or the company must be listed in the industry group responsible for the Industry Wide Externally Verified EPD.

- B. PS EPD: Products specified under this section must have a Type III Product Specific EPD.
- C. HPDs: Products specified under this section must have one of the following unexpired material ingredient reports compliant with LEEDv4.1 requirements and declared to 1000 ppm or less: Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, Cradle to Cradle Health Product Certificate, or UL Product Lens Certification.
- D. Interior Wet Applied Products: All wet-applied on-site paints, coatings, adhesives, and sealants products provided under Part 2 of this specification section must be compliant with the VOC limits outlined under IEQc2: Low Emitting Materials in 01 81 13 Sustainable Design Requirements. In addition, all paints and coatings must be compliant with CDPH Standard Method v1.2-2017 emissions testing with proper unexpired CDPH testing certificates or acceptable third-party certification.

PART 3 - EXECUTION

3.01 APPLICATION REQUIREMENTS

- A. Provide single component fire stop sealant or putty:
 - 1. Within penetrations subject to movement including conduit, cable bundles, buss duct, and noncombustible pipe.
 - 2. As a sealant or caulking for smoke barrier construction, fire, and smoke dampers, mechanical/electrical framed elements in masonry and gypsum board partition systems, and other conditions.
- B. Provide mineral fiber insulation for fire safing at joints and openings through floor slabs, walls, and partitions not indicated to be grouted, gaskets, sealed or otherwise made sound or air tight in this or other sections. Fire safing shall be packed and wedged solidly from both sides of walls and partitions, and from both top and bottom sides of slabs with noncombustible mineral fiber insulation.

3.02 PREPARATION

- A. Examine the areas and conditions where fire stops and smoke seals are to be installed for conditions detrimental to the proper completion of the Work. Do not proceed with the Work until unsatisfactory conditions have been corrected for rated fire protection.
- B. Surface to receive fire stops or smoke seals shall be free of dirt, dust, grease, form release agents, or other matter that would impair the bond of the fire stop material to the substrate or penetrating items. Substrate shall be frost free and when required, dry.
- C. Voids and cracks in substrate shall be filled and unnecessary projections removed before installation of fire stops.

- D. Assure that all pipes, conduit, cable, and other items, which penetrate fire rated construction, have been permanently installed before installation of fire stops. Schedule and sequence the Work to assure that partitions and other construction, which would conceal penetrations, are not installed before the installation of fire stops and smoke seals.
- E. Comply with manufacturer's recommendations for temperature and humidity conditions before, during, and after installation of fire stops and smoke seals.

3.03 INSTALLATION

- A. General: Provide installation in accordance with manufacturer's installation procedures, as required. Install fire stops in accordance with fire test reports, UL Fire Resistance Directory, Intertek Testing Services Directory or SpecDirect, and reviewed Sample installations.
- B. Dam Construction:
 - 1. Install dams when required to properly contain fire stopping materials within openings and as required to achieve fire resistance rating as tested and rated.
 - 2. Provide in conformance with installation requirements for type of floor, wall, and partition construction, and as recommended by fire stop manufacturer.
 - 3. Combustible damming material shall be removed after appropriate curing. Noncombustible damming material may be left as a permanent component of the fire stop system.
 - 4. Placement of dams shall not interfere with function, or adversely affect the appearance, of adjacent construction.
- C. Installation of Single Component Fire Stop Sealant:
 - 1. Provide noncombustible insulation as required to achieve fire resistance rating.
 - 2. Install with manual or powered sealant gun. For up to four hour rating, install to the thickness required by the Listed System Designs as directed for wall and floor applications.
 - 3. Surface of gun grade fire stop sealant shall be tooled in accordance with manufacturer's recommendations.
 - 4. Remove excess materials from adjacent surfaces within 10 minutes, with either water or other material compatible with sealant and recommended by sealant manufacturer, leaving the Work in a neat, clean condition.
- D. Installation of Cementitious Fire Stop Mortar:
 - 1. Mixing: Add dry powder to water and mix with mechanical mixer or hand mixing tools. Ratio and duration of mix shall be as instructed by fire stop mortar manufacturer. Average wet density of mortar shall be 70 pounds per cubic foot (plus or minus 5).

2. Wet surfaces before installation of fire stop mortar. Mortar may be hand installed or pumped into the opening.
3. When installing around layered and grouped cables, vibrate or move the cables slightly to prevent voids from forming between the cables.
4. Exposed surfaces shall be finished with conventional plastering tools before curing.
5. Allow at least 48 hours for initial cure before form removal. For full cure allow 28 days.

3.04 FIELD QUALITY CONTROL

- A. Examine sealed penetration areas to ensure proper installation before concealing or enclosing areas.
- B. Repair damaged areas and restore integrity of assembly.
- C. Keep areas of work accessible until inspection by authorities having jurisdiction.
- D. OWNER will engage a qualified independent inspection agency to inspect through-penetration firestop systems in accordance with ASTM E2174, or joint systems in accordance with ASTM E2393. Manufacturer representatives shall not perform inspections of installed firestopping systems.

3.05 PROTECTION

- A. Protect the Work of this section until Substantial Completion.

3.06 CLEANUP

- A. Clean surfaces adjacent to sealed openings and joints and remove excess of firestopping materials.
- B. Remove rubbish, debris, and waste materials and legally dispose of off the Project site.

END OF SECTION

SECTION 07 92 00

JOINT SEALANTS

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Joint sealants.
2. Preparation for application of sealants.

B. Related Requirements:

1. Division 01 - General Requirements.
2. Section 06 20 00 - Finish Carpentry.
3. Section 07 60 00 - Flashing and Sheet Metal.
4. Section 07 84 13 - Penetration Firestopping.
5. Division 08 - Openings.
6. Division 09 - Finishes.
7. Section 10 28 13 - Toilet Accessories.

1.02 SUBMITTALS

- A. **Shop Drawings:** Submit Shop Drawings indicating sealant joint locations, with full-size sealant joint details.
- B. **Product Data:** Submit manufacturer's literature for each sealant material.
- C. **Material Samples:** Submit Samples indicating color range available for each sealant material intended for installation in exposed locations.
- D. **Certifications:** Submit manufacturer's certification materials comply with requirements specified.
- E. **Site Samples:** At locations required, provide a Sample of sealant for each typical installation, approximately 24 inches long, including joint preparation, backing, sealant and tooling. Allow backing to extend 6 inches beyond end of sealant for inspection of substrate.

- F. Test Reports: Submit manufacturer's adhesion compatibility test reports according to ASTM C794 for each substrate.

1.03 QUALITY ASSURANCE

- A. Qualifications of Installer: The Work of this section shall be installed by a firm which has been in the business of installing similar materials for at least five consecutive years; and can show evidence of satisfactory completion of five projects of similar size and scope. Installer shall have applicators trained and approved by manufacturer for performing this Work.

1.04 DELIVERY, STORAGE AND HANDLING

- A. Store in accordance with manufacturer's recommendations. Provide a uniform ambient temperature between 60 and 80 degrees F.

1.05 WARRANTY

- A. Manufacturer: five year material warranty.
- B. Installer: two year installation/application warranty.

PART 2 - PRODUCTS

2.01 GENERAL

- A. Furnish sealants meeting following in-service requirements:
 - 1. Normal curing schedules are permitted.
 - 2. Non-staining, color fastness (resistance to color change), and durability when subjected to intense actinic (ultraviolet) radiation are required.
- B. Furnish the products of only one manufacturer unless otherwise required, sealant colors as selected to match the adjoining surfaces.

2.02 MANUFACTURERS

- A. Tremco Inc.
- B. Pecora Corporation
- C. Dow Corning Corp.
- D. General Electric Co.
- E. Equal.

2.03 MATERIALS

A. Sealants:

1. Sealant 1: Acrylic latex, one-part, non-sag, mildew resistant acrylic emulsion compound complying with ASTM C834, Type S, Grade NS, formulated to be paintable.
 - a. Tremco Inc., Acrylic Latex Caulk.
 - b. Pecora Corporation, AC-20.
 - c. Equal.
2. Sealant 2: Butyl sealant, one-part, non-sag, solvent-release-curing sealant complying with ASTM C1311, gun grade and formulated with a minimum of 75 percent solids.
 - a. Tremco Inc., Tremco Butyl Sealant.
 - b. Pecora Corp., BC-158.
 - c. Equal.
3. Sealant 3: Silicone sealant, one-part non-acid-curing silicone sealant complying with ASTM C920, Type S, Grade NS, Class 25.
 - a. Dow Corning Corp., Dow Corning 790, 791, 795.
 - b. General Electric Co., Silpruf.
 - c. Tremco, Inc., Spectrem 1.
 - d. Pecora Corp., 864.
 - e. Equal.
4. Sealant 4: One-part mildew-resistant silicone sealant, complying with ASTM C920, Type S, Grade NS, Class 25.
 - a. Dow Corning Corp., Dow Corning 786.
 - b. General Electric Co., Sanitary 1700.
 - c. Tremco, Inc., Proglaze White.
 - d. Equal.
5. Sealant 5: One-part non-sag urethane sealant, complying with ASTM C920, Type S, Grade NS, Class 25.
 - a. Sika Corporation, Sikaflex -221e.

- b. Equal.
- 6. Sealant 6: Multi-part pouring urethane sealant, complying with ASTM C920, Type M, Grade P, Class 25.
 - a. Sika Corporation, Sikaflex 2C NS/SL.
 - b. Equal.
- 7. Sealant 7: Acoustical sealant, non-drying, non-hardening permanently flexible conforming to ASTM D217.
 - a. Pecora Corp., BA-98 Acoustical Sealant.
 - b. Equal.
- B. See 07 8413 - Penetration Firestopping for rated sealants.
- C. .Joint Backing: ASTM D1056; round, closed cell Polyethylene Foam Rod; oversized 30 to 50 percent larger than joint width, reticulated polyolefin foam.
- D. Primer: Non-Staining Type. Provide primer as required and shall be product of manufacturer of installed sealant.
- E. Bond Breaker: Pressure sensitive tape recommended by sealant manufacturer.
- F. Sealants shall have normal curing schedules, shall be nonstaining, color fast and shall resist deterioration due to ultraviolet radiation.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Verify that joint openings are ready to receive Work and field tolerances are within the guidelines recommended by sealant manufacturer.

3.02 SURFACE PREPARATION

- A. Joints and spaces to be sealed shall be completely cleaned of all dirt, dust, mortar, oil, and other foreign materials which might adversely affect sealing Work. Where necessary, degrease with a solvent or commercial degreasing agent. Surfaces shall be thoroughly dry before application of sealants.
- B. If recommended by manufacturer, remove paint and other protective coatings from surfaces to be sealed before priming and installation of sealants.
- C. Preparation of surfaces to receive sealant shall conform to the sealant manufacturer's specifications. Provide air pressure or other methods to achieve required results. Provide masking tape to keep sealants off surfaces that will be exposed in finished Work.

- D. Etch concrete or masonry surfaces to remove excess alkalinity, unless sealant manufacturer's printed instructions indicate that alkalinity does not interfere with sealant bond and performance. Etch with 5 percent solution of muriatic acid; neutralize with dilute ammonia solution, rinse thoroughly with water and allow to dry before sealant installation.
- E. Perform preparation in accordance with ASTM C804 for solvent release sealants, and ASTM C962 for elastomeric sealants.
- F. Protect elements surrounding Work of this section from damage or disfiguration.

3.03 SEALANT APPLICATION SCHEDULE

	<u>Location</u>	<u>Type</u>	<u>Color</u>
A.	Exterior and Interior joints in horizontal surfaces of concrete; between metal and concrete masonry and mortar.	Sealant 6	To match adjacent material
B.	Exterior door, entrance and window frames. Exterior and interior vertical joints in concrete and masonry metal flashing.	Sealant 3 or 5	To match adjacent material
C.	Joints within glazed curtain wall system. Skylight framing system. Aluminum entrance system glass and glazing.	Sealant 3	Translucent or Black
D.	Interior joints in ceramic tile and at plumbing fixtures.	Sealant 4	Translucent or White
E.	Under thresholds.	Sealant 2	Black
F.	All interior joints not otherwise scheduled	Sealant 1	To Match Adjacent Surfaces
G.	Heads and sills, perimeters of frames and other openings in insulated partitions	Sealant 7	Match Adjacent Surfaces

3.04 APPLICATION

- A. Provide sealant around all openings in exterior walls, and any other locations indicated or required for structure weatherproofing and/or waterproofing.
- B. Sealants shall be installed by experienced mechanics using specified materials and proper tools. Preparatory Work (cleaning, etc.) and installation of sealant shall be as specified and in accordance with manufacturer's printed instructions and recommendations.
- C. Concrete, masonry, and other porous surfaces, and any other surfaces if recommended by manufacturer, shall be primed before installing sealants. Primer shall be installed with a brush that will reach all parts of joints to be filled with sealant.
- D. Sealants shall be stored and installed at temperatures as recommended by manufacturer. Sealants shall not be installed when they become too jelled to be discharged in a continuous flow from gun. Modification of sealants by addition of liquids, solvents, or powders is not permitted.
- E. Sealants shall be installed with guns furnished with proper size nozzles. Sufficient pressure shall be furnished to fill all voids and joints solid. In sealing around openings, include entire perimeter of each opening, unless indicated or specified otherwise. Where gun installation is impracticable, suitable hand tools shall be provided.
- F. Sealed joints shall be neatly pointed on flush surfaces with beading tool, and internal corners with a special tool. Excess material shall be cleanly removed. Sealant, where exposed, shall be free of wrinkles and uniformly smooth. Sealing shall be complete before final coats of paint are installed.
- G. Comply with sealant manufacturer's printed instructions except where more stringent requirements are indicated on Drawings or specified.
- H. Partially fill joints with joint backing material, furnishing only compatible materials, until joint depth does not exceed 1/2 inch joint width. Minimum joint width for metal to metal joints shall be 1/4 inch. Joint depth, shall be not less than 1/4 inch and not greater than 1/2 inch.
- I. Install sealant under sufficient pressure to completely fill voids. Finish exposed joints smooth, flush with surfaces or recessed as indicated. Install non-tracking sealant to concrete expansion joints subject to foot or vehicular traffic.
- J. Where joint depth prevents installation of standard bond breaker backing rod, furnish non-adhering tape covering to prevent bonding of sealant to back of joint. Under no circumstances shall sealant depth exceed 1/2 inch maximum, unless specifically indicated on Drawings.
- K. Prime porous surfaces after cleaning. Pack joints deeper than 3/4 inch with joint backing to within 3/4 inch of surface. Completely fill joints and spaces with gun applied compound, forming a neat, smooth bead.

3.05 MISCELLANEOUS WORK

- A. Sealing shall be provided wherever required to prevent light leakage as well as moisture leakage. Refer to Drawings for condition and related parts of Work.
 - B. Install sealants to depths as indicated or, if not indicated, as recommended by sealant manufacturer but within following general limitations:
 - 1. For joints in concrete walks, slab and paving subject to traffic, fill joints to a depth equal to 75 percent of joint width, but not more than 3/4 inch deep or less than 3/8 inch deep, depending on joint width.
 - 2. For building joints, fill joints to a depth equal to 50 percent of joint width, but not more than 1/2 inch deep or less than 1/4 inch deep.
- 3.06 CLEANING
- A. Remove rubbish, debris, and waste materials and legally dispose of off the Project site.
- 3.07 CURING
- A. Sealants shall cure in accordance with manufacturer's printed recommendations. Do not disturb seal until completely cured.
- 3.08 PROTECTION
- A. Protect the Work of this section until Substantial Completion.

END OF SECTION

SECTION 08 11 13

HOLLOW METAL DOORS AND FRAMES

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Hollow metal doors and frames.

B. Related Requirements:

1. Division 01 - General Requirements.
2. Section 07 92 00 - Joint Sealants.
3. Section 08 71 00 - Door Hardware.
4. Section 08 80 00 - Glazing.
5. Section 09 90 00 - Painting and Coating.

1.02 DESIGN REQUIREMENTS

- ###### A.
- Door-and-frame assemblies or frames shall include reinforcing and provisions for hardware as shown and specified. Drawings indicate profile and general details of steel frame fabrication and installation.

1.03 SUBMITTALS

- ###### A.
- Shop Drawings: Submit composite Shop Drawings indicating detailed relationships of installation including Work of adjacent construction, finish hardware, security, fire and life safety devices, glazing, sealing, and requirements for field installation. Include elevations of each hollow metal door type, details of each frame type, location schedule of doors and frames indicating same reference for details and openings as indicated on Drawings, conditions of openings of various wall sections and materials, typical and special details of construction, methods of assembling sections, location and installation requirements for hardware, material size, shape, and thickness, and joints and connections.
- ###### B.
- Product Data: Submit manufacturer's Product Data indicating composition and construction for each fabricated item including louvers, coatings, finishes, and other components demonstrating compliance with referenced standards.

- C. Certification: Submit certification of compliance with referenced standards and specified criteria, including but not limited to fire ratings in accordance with UL 10C, Physical Endurance in accordance with ANSI A250.4 and Prime Paint performance in accordance with ANSI A250.10.
- D. Samples:
 - 1. Hollow Metal Frame: Corner section of typical exterior and interior frame, of sufficient composite size to illustrate corner joint construction, hinge reinforcement, closer re-enforcement, floor anchor, dust cover, and jamb anchors, and showing galvanizing and prime coat finishes.
 - 2. Hollow Metal Door: Section of typical interior door of sufficient composite size to illustrate edge, top, bottom, and core construction, hinge reinforcement and face stiffening, closer reinforcement and kick plate reinforcement, and corner of vision opening construction with glazing beads.
- E. LEED Submittals: Complete the LEED Material Buyout Form (MBoF) with all materials provided to the project. A complete submittal includes providing all material costs in the MBoF and all of the supporting documentation for the following credits:
 - 1. MRc2 - Environmental Product Declarations (EPD): Provide Industry-Wide or Product-Specific EPD.
 - 2. MRc3 - Sourcing of Raw Materials - Recycled Content: Provide product data for pre- and post- consumer recycled content.
 - 3. MRc4 - Material Ingredients: Provide manufacturers Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, or Cradle to Cradle Health Product Certificate.
 - 4. IEQc2 - Low-Emitting Materials – Interior Wet Applied Products: For paints, coatings, adhesives and sealants applied on site or used for laminating off-site, include product data indicating the VOC content (g/L) and testing.

1.04 QUALITY ASSURANCE

- A. Manufacturer Qualifications: Minimum documented experience of more than five years in work of this section.
- B. Installer Qualifications: Minimum documented experience of more than five years in work of this section
- C. Coordinate with hardware supplier for fabrication of doors and frames to receive hardware items.
- D. Coordinate with intrusion alarm supplier for fabrication of doors and frames to receive intrusion detection devices.

- E. References: Work shall comply with physical and performance requirements of following standards, including standards referenced in them, except for more stringent provisions specified herein or required by regulatory agencies:
1. ANSI/SDI A250.8, SDI 100 Recommended Specifications for Standard Steel Doors and Frames.
 2. ANSI/NFPA 252, Fire Tests of Door Assemblies.
 3. ANSI/UL 10B, Fire Tests of Door Assemblies.
 4. ANSI/UL 10C, Positive-Pressure Fire Tests of Door Assemblies.
 5. ANSI/NFPA 80, Fire Doors and Fire Windows
 6. HMMA, Guide Specifications for Commercial Hollow Metal Doors & Frames (Standard of National Association of Architectural Metal Manufacturers).
 7. ANSI/SDI A250.4, Test Procedure and Acceptance Criteria for Physical Endurance for Steel Doors, Frames, Frame Anchors and Hardware Reinforcings.
 8. ANSI A250.10, Test Procedure and Acceptance Criteria for Prime Painted Steel Doors and Frames.
 9. ANSI A250.6, Recommended Practice for Hardware Reinforcing on Standard Steel Doors and Frames.
- F. Standards of Fabrication and Installation:
1. Finished Work shall be of uniform profile, accurately fabricated, rigid and strong, square and true, neat in appearance, smooth and free from dents, waves, warps, buckles, open joints, tool marks and/or other defects.
 2. Steel sheet shall be clean with smooth surfaces free of scale, pitting or other defects.
 3. Construction joints shall be flush, tight and welded their full length, ground flush and smooth on exposed surfaces.
 4. Frame and door reinforcing and hardware provisions shall be performed in fabrication shop. Provide cuts, welds, and other fabrications before galvanizing or shop priming.
 5. Lines and molded members shall be straight and true with angles as sharp as practical for thickness involved, surfaces flat, and fastenings concealed.

1.05 DELIVERY, STORAGE AND HANDLING

- A. Frames: Before shipment, install temporary spreaders at bottom of bucks and do not remove until frames are installed.
- B. Doors: Provide protection as required to protect doors during shipping and storage. Damaged doors will be rejected.
- C. Inspect hollow metal Work upon delivery for damage. Remove and replace damaged items with new Work as required.
- D. Store doors and frames in an upright position at Project Site under cover and protected from weather-related elements. Store units on minimum 4-inch high wood blocking with ½ inch air spaces between stacked doors to provide circulation. Do not store doors and frames under plastic or canvas shelters that can create a humidity chamber. If shipping packaging becomes wet, immediately remove packaging.

1.06 WARRANTY

- A. Manufacturer shall provide a five year material warranty.
- B. Installer shall provide a two year fabrication and installation warranty.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

- A. Doors and frames shall be products of a single manufacturer.
- B. The following are acceptable manufacturers, as are others that can demonstrate their products are equivalent in quality, performance and compliance with these specifications.
 - 1. Security Metal Products Corp.
 - 2. Curries Manufacturing, Inc.
 - 3. Steelcraft.
 - 4. Amweld Metal Doors and Frames.
 - 5. Stiles Custom Metal, Inc.
 - 6. Door Components Inc.
 - 7. CECO Door.

8. Equal.

C. Materials, fabrication and installation must comply with requirements of standards referenced in Section 1.04, Quality Assurance.

2.02 MATERIALS

A. Steel:

1. Exterior Doors and Frames: Galvanized Carbon Sheet Steel, Commercial Quality, A60 zinc coating (0.30 ounces per square foot per side), ASTM A653.
2. Interior Doors and Frames: Cold-Rolled Steel Sheets, Commercial Quality Carbon Steel, ASTM A1008.
3. Steel shall be free of scale, pitting, coil breaks or other surface blemishes, and free of buckles, waves or other defects.
4. Steel thicknesses expressed in steel gages (MSG) is for reference only. Actual steel thicknesses must meet minimum requirements of ASTM standards and as described in ANSI/SDI A250.8.

B. Supports and Anchors: Fabricate from a minimum 16 gauge galvanized sheet steel unless noted otherwise.

C. Fasteners: Provide as shown on Drawings and to suit conditions of secure installations. Furnish 304 Grade stainless steel types at exterior doors.

D. Door Louvers:

1. Louver free air flow shall be 50% free area.
2. Louvers shall be comply with SDI 111C and be furnished with factory primer.

E. Vision panels: Manufacturer's standard, U.L. approved, finished flush with door face, with no visible fasteners on either door face.

F. Shop Paint:

1. Conform to Steel Structures Painting Council (SSPC) for steel components.
2. Pretreatment/priming coatings shall be compatible with Project site finish painting system in accordance with Section 09 9000.
3. At frames to be grouted, surfaces that are inaccessible after installation shall be coated with bituminous or asphaltic base paint.

2.03 FABRICATION GENERAL

- A. General: Fabricate hollow metal units to be rigid, neat in appearance, and free from defects including warp or buckle.
 - 1. Accurately form metal to required sizes and profiles. Fit and assemble units in manufacturer's plant. Where practical, factory or shop fit and assemble units for shipment.
 - 2. Weld joints continuously; grind, dress, and make smooth, flush, and invisible. Filler to conceal manufacturing defects or damage is not permitted.
 - 3. Corner Joints: Finish corner joints by mitering, or coping and butting, or a combination of both. Trim and backbend shall be continuous around corner.
 - 4. Continuously weld joints for full depth and width of frame, trim, and backbends.
 - 5. Clearances for Fire-Rated Doors: As required by NFPA 80.

2.04 FRAMES

- A. General: Provide fully welded steel frames with integral stops and trim for doors, transoms, sidelights, borrowed lights, and other openings, and with details indicated for type and profile. Use concealed fastenings, unless otherwise indicated.
- B. Metal Thickness of Frames (minimum):
 - 1. Interior hollow metal frames up to 4-foot wide 16 gage
 - 2. Interior hollow metal frames wider than 4-foot 14 gage
 - 3. Exterior hollow metal frames 14 gage
 - 4. Borrowed lights up to 4-foot wide 16 gage
- C. Supports and Anchors: Fabricate from at least 16-gage, galvanized steel sheet. Frame anchors shall comply with fire rated label requirements of opening.
 - 1. Floor Anchors:
 - a. Minimum thickness: 12 gage galvanized steel sheet or bent steel plate, securely fastened inside each jamb, with two holes in anchor at each jamb for 3/8 inch floor anchorage fasteners. For preframed wood stud walls provide and additional wood stud anchor located as close to the bottom of the jamb as is practical.

- b. Where required at sloping and uneven floor conditions, or to coordinate adjustments for trim alignments, provide adjustable floor anchors, providing at least 2-inch height adjustments.
2. Jamb Anchors:
 - a. Locate anchors near top and bottom and at intermediate points not to exceed 24 inches on center. Provide two anchors per head for openings up to 48 inches wide; over 48 inches wide provide anchors at 24 inches on center maximum.
 - b. Anchors in masonry construction: Provide manufacturers standard jamb anchors. Steel wire complying with ASTM A510, 0.177 inch in diameter, may be furnished.
 - c. Anchors in Stud Partitions: Provide steel anchors, 16 gage minimum sheet steel, of design to suit partition construction, securely welded inside each jamb.
 - d. Through-Frame Anchors: At frames indicated to be anchored with bolts through frame, provide countersunk holes for bolts with 16 gauge minimum sheet steel stiffeners full thickness of frame, and securely welded inside each frame at each hole.
- D. Inserts, Bolts, and Fasteners: Provide manufacturer's standard units. Where zinc-coated items are to be built into exterior walls, comply with ASTM A153 Class C or D as required.
- E. Head Reinforcing: Refer to Detail #2 of this section. Reinforcing shall not act as lintel or load-carrying member and shall comply with fire rating requirements. Provide at frames regardless of whether a closer is called for.
- F. Hardware Reinforcement and Accessories:
 1. Butt Hinge: 7 gage minimum.
 2. Head assemblies: Reinforced internally with, full length, 10 gage angles on each side of frame and bar at bottom of stop for closer reinforcement in frames as shown in Detail #2 of this section.
 3. Reinforcing for other items of finish hardware shall be accomplished according to ANSI A250.6.
 4. Plaster Guards: Provide 26 gage galvanized steel plaster guards or dust cover boxes, welded to frame, at back of finish hardware cutouts where mortar or other materials might obstruct hardware operation and to close off interior of openings.

- G. Mullion and Transom bars: Furnished and fabricated as specified for frames.
- H. Glazed Openings: Applied stops with mitered or butted corners, of minimum 18 gage galvanized steel, one-piece lengths, secured within 3” of ends and at 12” centers with oval head countersunk tamper resistant screws. Corner joints shall be furnished with contact edges closed tight, with trim faces mitered and continuously welded. Frames for multiple openings shall be provided with mullion and/or rail members, fabricated of closed tubular shapes with no visible seams or joints. Joints between faces of abutting members shall be securely welded and finished smooth. Provide condensate weeps 4 inches on centers, maximum.
- I. Door Silencers: Except for exterior doors, drill and punch frames for three silencers at lock jamb of single swing doors or in double doors with astragal and one silencer per leaf in heads of doubled door frames.
- J. Where frames are installed in walls sitting on a concrete curb, provide a closure plate or extend backbends to provide closure where frame abuts concrete curb.

2.05 DOORS

- A. General: Custom-made, flush-panel “seamless type” with one-piece face panels; continuous weld, seamless edge construction with no visible seams or joints on faces or on vertical edges.
 - 1. Provide type and size of doors shown with louvers and openings for glazing where indicated.
 - 2. Door thickness: 1 ¾ inches.
 - 3. Face Sheet Minimum Gage: 16 gage.
 - 4. Stiffeners: Stiffen door face sheets with continuous vertical-formed steel (rib) sections or back to back hat sections, minimum 20 gage, full thickness of interior space between door faces, spaced 6” on center maximum, and spot welded to both faces 4” on center maximum.
 - 5. Acoustical Insulation: Provide sound deadening and insulating material through entire core of door (full height, width, and thickness of door). Provide STC ratings where indicated on Drawings, scheduled, or for partition ratings indicated on Drawings.
 - a. Doors shall have a minimum STC of 28 as tested under ASTM E90 and ASTM E413, unless noted otherwise..
 - 6. Thermal Insulation: Exterior doors shall be insulated to R values scheduled or indicated on drawings.

7. Labeled Doors: Where fire-rated openings and conditions are indicated.
 - a. Labeled doors shall be provided with fire-resistance rating indicated and shall be constructed as tested and approved by Underwriters' Laboratories (UL) for installation in labeled frame and door assemblies.
 - b. Gaskets: Gaskets are supplied under Section 08 7100 - Door Hardware. Gaskets and installation shall conform to requirements of NFPA 105, "Installation of Smoke and Draft Control Door Assemblies."
 - c. Fabricate labeled doors with same finished appearance as specified for non-labeled hollow metal doors; with welded door edges, filled and ground smooth; with label affixed to door.
 - d. Where fire labels are required and continuous hinge is specified, install label on top of door within 6" of hinge side of door.
8. Door Edges: Join door face sheets at vertical edges of door with continuous weld full height of door. Grind, fill, and dress welds smooth to provide invisible seam with smooth, flush surface.
 - a. Close ends of doors with continuous recessed channels, 16 gage steel minimum, spot welded to both face sheets. Close top and bottom edges of doors with a internal steel channel, screw attached into top and bottom of door. Channel shall be galvanized at exterior doors. No screws are allowed on visible faces of door. Provide openings in bottom closure of exterior doors to permit escape of entrapped moisture.
 - b. Profile of Door Edges:
 - 1) Single-acting swing doors: Bevel both vertical edges 1/8" in 2".
 - 2) Pairs of single-acting swing doors: Bevel hinge edge 1/8" in 2". Provide surface mounted astragals for labeled or unlabeled doors unless otherwise shown on Drawings or required.
 - 3) Double-acting swing doors: Round both vertical edges on 2" minimum radius.
9. Door Louvers: Install according to manufacturers recommendations.
10. Glass Stops:
 - a. Furnish fixed stops integral with and welded at security side of door.

- b. Finish: Factory primer.
- 11. Transom: Fabricate to requirements specified for flush doors.
- B. Hardware Reinforcement and Accessories:
 - 1. Provide sheet steel or plate reinforcement for finish hardware items wherever necessary. Mortise, drill and tap to template requirements for mortise type hardware.
 - 2. Butt reinforcing: 7 gage minimum, of length 4" longer than length of butt. Minimum 3 spot welds at top and bottom.
 - 3. Door closer reinforcement: 14 gage minimum steel channel, 6" high on each side of door. Reinforcement to extend full width of door in accordance with Detail #1 of this section.
 - 4. Kick plate reinforcement: 14 gage minimum steel plate, 10" high on each side of door. Reinforcement to extend full width of door in accordance with Detail #1 of this section.
 - 5. Other Hardware Requirements: Cut, reinforce, drill, and tap doors and frames for other hardware, including energy management switches or contacts and security devices, in accordance with furnished hardware templates for accessory items. Thickness and size of reinforcement shall be as required by ANSI A250.6.

2.06 SHOP PRIMING

- A. Exposed and concealed metal surfaces of hollow metal doors, frames and other hollow metal Work of this Section shall be bonderized and then shop primed.
- B. Exposed surfaces of doors, frames and accessories shall be filled, sanded smooth and cleaned before painting.
- C. Exposed surfaces shall be shop primed after assembly.

PART 3 - EXECUTION

3.01 FRAME INSTALLATION

- A. Install steel frames accurately in location, perfect alignment, plumb, straight and true. Brace frames to prevent displacement.

- B. Anchor frames in concrete and concrete unit masonry with galvanized anchor bolts; 3/8 inch diameter, counter-sunk at 24 inches on center at head and jamb unless noted otherwise.
- C. Anchor frames in steel and wood frame partitions with manufacturer recommended anchors.
- D. Install frame at fire rated openings in accordance with NFPA Standard No. 80.
- E. Furnish filler for anchor attachment screws, and sand smooth.

3.02 DOOR INSTALLATION

- A. Install steel doors in accordance with manufacturer's instructions and as indicated on Drawings and in Finish Hardware Specifications. Coordinate with Work of other trades.
- B. Ensure that door and jamb clearances comply with requirements of ANSI/NFPA 80. When wood doors are being installed in metal frames constructed pursuant to this section, allowable door and jamb clearances shall be as specified in Specification Section 08 1416.
- C. Adjust operable parts for correct function.
- D. Remove hardware, except primer-coated items, tag, box and install after finish painting has been completed.

3.03 PRIME COAT TOUCH-UP

- A. Immediately after installation, remove rust, repair damaged surfaces to new condition, sand smooth, and install touch-up primer.

3.04 CLEAN UP

- A. Remove rubbish, debris and waste materials and legally dispose of off Project site.

3.05 PROTECTION

- A. Protect Work of this section until Substantial Completion.

END OF SECTION

SECTION 08 14 05

ARCHITECTURAL WOOD DOORS

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Interior flush wood doors.

B. Related Requirements:

1. Section 08 71 00: Door hardware.

1.02 COORDINATION

- ###### A. STC-Rated Doors: Where installed in hollow metal frames, fill frames with compressed mineral wool insulation.

1.03 PREINSTALLATION MEETINGS

- ###### A. Conduct pre-installation meeting at Project site.

B. Discussion Topics:

1. Delivery, storage, and handling.
2. Coordination with hardware installers.
3. Protection of installed doors.

1.04 ACTION SUBMITTALS

A. Product Data: Each type of door and finish.

1. Core and edge construction.
2. Fire rated doors.
3. Finishes.

B. Shop Drawings and Schedule:

1. Use same unit designations used in Contract Documents.

2. Hardware preparation.

C. Samples for Selection:

1. Available standard stain colors and gloss options. Submit samples in the form of actual materials; printed brochures are not acceptable.
2. Available molding profiles for glazed openings.

D. Samples for Verification:

1. Each required veneer species and factory finish; corner unit showing construction and finish minimum 8 by 10 inches.

1.05 INFORMATIONAL SUBMITTALS

A. Sustainable Design Submittals:

1. Chain-of-Custody Certificates: For certified wood products. Include statement of costs.
2. Chain-of-Custody Qualification Data: For manufacturer and vendor.
3. Laboratory Test Reports: For adhesives, indicating compliance with requirements for low-emitting materials.
4. Laboratory Test Reports: For composite wood products, indicating compliance with requirements for low-emitting materials.

1.06 CLOSEOUT SUBMITTALS

- A. Maintenance data.
- B. Manufacturer warranties transferrable to Owner.

1.07 QUALITY ASSURANCE

- A. Manufacturer Qualifications: Certified for chain of custody by an FSC-accredited certification body.
- B. Vendor Qualifications: Certified for chain of custody by an FSC-accredited certification body.

1.08 DELIVERY, STORAGE, AND HANDLING

- A. Package factory-finished doors individually in manufacturer's standard plastic bags, stretch wrap, or cardboard cartons.
- B. Store doors inside building in clean, dry location.
- C. Mark each door on top bottom rail with opening number used on Shop Drawings.

1.09 FIELD CONDITIONS

- A. Environmental Limitations: Do not deliver or install doors until spaces are enclosed and weather tight, wet work in spaces is complete and dry, and HVAC system is operating and maintaining temperature between 60 and 90 deg F (16 and 32 deg C) and relative humidity at occupancy levels during remainder of construction period.

1.10 MANUFACTURER WARRANTIES

- A. Manufacturer agrees to repair or replace doors that fail in materials or workmanship within specified warranty period.
 - 1. Failures include, but are not limited to, the following:
 - a. Warping (bow, cup, or twist) more than 1/4 inch (6 mm) in 42-by-84-inch (1065-by-2130-mm) section.
 - b. Telegraphing of core construction in face veneers exceeding 0.01 inch in 3-inch (0.25 mm in 76-mm) span.
 - 2. Warranty shall also include installation and finishing that may be required due to repair or replacement of defective doors.
- B. Warranty Periods:
 - 1. Solid-Core Interior: Life of installation

PART 2 - PRODUCTS

2.01 MANUFACTURERS

- A. Basis of Design: Products of Aspiro™ Series | Marshfield-Algoma by Masonite Architectural are specified to indicate requirements for quality and appearance.
 - 1. Website: masonite.com/architectural/products/aspiro-series
 - 2. Phone: (877) 332-4484

3. Or approved equal

B. Source Control: Supply all wood doors from a single manufacturer.

2.02 MANUFACTURING STANDARDS

A. Interior Flush Wood Doors: Window & Door Manufacturers Association publication ANSI/WDMA I.S. 1A “Industry Standard for Interior Architectural Wood Flush Doors”.

B. Fire-Rated Wood Doors: Conforming to NFPA 80; listed and labeled for required ratings based on testing at positive pressure NFPA 252 or UL 10C by UL or other testing agency acceptable to authorities having jurisdiction

1. Pairs: Formed-steel edges and astragals with intumescent seals as required for ratings.

a. Steel edges and astragals factory primed for field painting.

b. Veneer wrapped steel edges in same species and finish as door faces.

c. Steel edges and astragals with baked enamel in color selected by Architect from manufacturer’s standard offering.

d. Stainless steel edges and astragals, #4 satin polish.

C. Acoustical Rating for Solid Core Doors: Unless indicated otherwise indicated on Drawings, provide STC 50 doors supplied with seals and gaskets tested by manufacturer.

2.03 SUSTAINABILITY REQUIREMENTS

A. Certified Wood: “FSC Pure” per FSC STD-01-001 and FSC STD-40-004.

B. Adhesives: Meeting testing and product requirements of California Department of Public Health’s “Standard Method for the Testing and Evaluation of Volatile Organic Chemical Emissions from Indoor Sources Using Environmental Chambers.”

C. Composite Wood Products: Manufactured with ultra-low-emitting formaldehyde resins as defined in California Air Resources Board’s “Airborne Toxic Control Measure to Reduce Formaldehyde Emissions from Composite Wood Products” or with no added formaldehyde.

2.04 INTERIOR SOLID CORE FLUSH WOOD DOORS FOR TRANSPARENT FINISH

A. Basis of Design: Aspiro™ Series | Marshfield-Algoma™ by Masonite Architectural.

B. Solid Core Select Wood Veneer Flush Doors:

1. WDMA Quality grade: Premium.

2. WDMA Performance Level: Heavy Duty.
3. Faces:
 - a. Veneer Grade: AA.
 - b. Veneer Species: White Oak.
 - c. Veneer Cut: Rift cut.
 - d. Veneer Leaf Match: Book match.
 - e. Veneer Face Match/Assembly: Center-balance.
4. Pair Match: Provide for doors hung in same opening.
5. Vertical Edges: Structural composite lumber Matching/Compatible Hardwood lumber that matches face veneer.
6. Horizontal Edges: Structural composite lumber. Veneer edge band-top rail only.
7. Core: Extra heavy duty wood-based particleboard (PC).
8. Construction: Five Plies; stiles and rails bonded to core, and entire unit is abrasive planed before veneering.
9. Thickness: 1-3/4 inch.
10. Wood Applied Moldings:
 - a. Pattern: As selected by Architect

2.05 FABRICATION

- A. Door Pairs
 1. Veneer Matching: Pair match.
- B. Factory Fitting: Fit to frame openings with clearances specified in WDMA I.S. 1A.
 1. Undercut: Maximum 3/8 inch (10 mm) above thresholds.
 2. Fire-Rated Doors: Comply with NFPA 80.
- C. Factory Machining: Machine doors for hardware that is not surface applied.
 1. Verify dimensions for hardware mortises in metal frames before machining.
- D. Door Frames:
 1. Refer to Section 08 13 11 – Hollow Metal Doors and Frames.
- E. Finish Grade: Match grade of door.
- F. Transparent: WDMA TR-8, UV-Cured Acrylated Polyester/Urethane.

1. Staining: Standard color selected by Architect.
2. Sheen: Satin.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Verify that door frames are plumb, square, and accurate size.
- B. Inspect each door before installation for damage and defects per WDMA Section F-6.

3.02 INSTALLATION

- A. Hardware installation is conforming to Section 08 7100 – Door Hardware.
- B. Reference Standards:
 1. Wood Doors: WDMA I.S. 1A and WDMA I.S. 6A.
- C. Align doors with uniform vertical and top edge clearance.

3.03 REPAIR

- A. Repair of damage or defects is subject to Architect's acceptance, including removal of soiling. Provide new replacement doors for doors that cannot be satisfactorily repaired.

3.04 PROTECTING AND CLEANING

- A. Protect installed doors from damage and soiling.
- B. Clean doors shortly before inspection for Substantial Completion.

END OF SECTION

SECTION 08 31 16

ACCESS PANELS AND FRAMES

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Steel access panels, except those specified under Divisions 22 - Plumbing, 23 - HVAC, or 26 - Electrical.

B. Related Sections:

1. Division 01 - General Requirements.
2. Section 01 81 13: Sustainable Design Requirements.
3. Section 09 29 00 - Gypsum Board.
4. Section 09 30 00 - Ceramic Tiling.
5. Section 09 90 00 - Painting and Coating.
6. Division 22 - Plumbing.
7. Division 23 - HVAC.
89. Division 26 - Electrical.

1.02 SUBMITTALS

A. Shop Drawings:

1. Indicate sizes, materials, thickness, fabrication methods, panel door and frame reinforcement, anchorage, and installation details.
2. Provide layout drawings, indicating dimensioned locations of proposed access panels, size of each panel, and installation details. Determine and indicate required access panels in finished surfaces, whether furnished under this section or as part of Work of Divisions 22-Plumbing, 23- HVAC, and 26-Electrical.

B. LEED Submittals: Complete the LEED Material Buyout Form (MBoF) with all materials provided to the project. A complete submittal includes providing all material costs in the MBoF and all of the supporting documentation for the following credits:

1. MRc2 - Environmental Product Declarations (EPD): Provide Industry-Wide or Product-Specific EPD.

2. MRc3 - Sourcing of Raw Materials - Recycled Content: Provide product data for pre- and post- consumer recycled content.
3. MRc4 - Material Ingredients: Provide manufacturers Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, or Cradle to Cradle Health Product Certificate.
4. IEQc2 - Low-Emitting Materials – Interior Wet Applied Products: For paints, coatings, adhesives and sealants applied on site or used for laminating off-site, include product data indicating the VOC content (g/L) and testing.

1.03 QUALITY ASSURANCE

- A. Panels shall be provided with UL listings and labels.
- B. Access panels and frames shall be products of one manufacturer.
- C. Coordinate access panels with plumbing, HVAC, and electrical work.

1.04 DELIVERY, STORAGE AND HANDLING

- A. Panels and Frames: Provide protection as required by manufacturer to protect panels from damage during storage.

PART 2 - PRODUCTS

2.01 MATERIALS

- A. Access Panels:

<u>Non-Rated</u>	<u>Milcor</u>	<u>Karp</u>	<u>Nystrom</u>
Ceramic Tile	MS	DSC214M	NT
Plaster	K	DSC214M	NP
Drywall, Plaster Veneer	DW	DSC214M	NW
<u>Fire Rated</u>			
Ceramic Tile	MS	KRP150FR	IT
Plaster	M	KRP150PR	IP
Drywall, Plaster Veneer	M	KRP150FR	IW

Equal.

- B. Unless otherwise indicated, provide brushed stainless steel finish for panels installed in ceramic tile. Provide prime coat finish suitable for field painting for panels installed in other finishes.
- C. Access Panels shall be 18 gage minimum with vandal-proof lock operated by Allen wrench or other special tool. Exposed fastenings shall be secured with vandal-proof screws.

2.02 LEED REQUIREMENTS

- A. IW/PS EDP: Products specified under this section must have a Type III Product Specific EPD or the company must be listed in the industry group responsible for the Industry Wide Externally Verified EPD.
- B. PS EPD: Products specified under this section must have a Type III Product Specific EPD.
- C. HPDs: Products specified under this section must have one of the following unexpired material ingredient reports compliant with LEEDv4.1 requirements and declared to 1000 ppm or less: Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, Cradle to Cradle Health Product Certificate, or UL Product Lens Certification.
- D. Interior Wet Applied Products: All wet-applied on-site paints, coatings, adhesives, and sealants products provided under Part 2 of this specification section must be compliant with the VOC limits outlined under IEQc2: Low Emitting Materials in 01 81 13 Sustainable Design Requirements. In addition, all paints and coatings must be compliant with CDPH Standard Method v1.2-2017 emissions testing with proper unexpired CDPH testing certificates or acceptable third-party certification.

PART 3 - EXECUTION

3.01 GENERAL

- A. Provide access panels in finish construction, where indicated on Drawings, wherever required for access to concealed mechanical and electrical equipment, and where required by codes. Panels indicated on architectural Drawings shall be furnished under this section. Required panels for access to equipment, but not indicated on architectural Drawings, shall be furnished as part of Work requiring access.

3.02 INSTALLATION

- A. Install panels accurately in location, perfect alignment, plumb, straight and true. Brace to prevent displacement by adjacent Work.
- B. Examine panels after installation for proper opening, closing and clearances. Replace damaged or defective panels.

3.03 CLEAN UP

- A. Remove rubbish, debris and waste materials and legally dispose of off Project site.

3.04 PROTECTION

- A. Protect Work of this section until Substantial Completion.

Department of Neighborhood Services and Public Safety
GOLETA TRAIN DEPOT PROJECT

END OF SECTION

SECTION 08 36 26

HYDRAULIC BI-FOLD DOOR

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Furnish SST-II Hydraulic Bi-Fold System complete from one manufacturer. Provide all labor, materials, tools, and equipment to furnish the SST-II Hydraulic Bi-Fold System complete as herein specified.
- B. Provide hydraulic fluid in quantity necessary for proper system operation.

1.02 RELATED SECTION

- A. Section 05 12 00 – Structural Steel Framing
- B. Section 05 41 00 – Cold Formed Metal Framing
- C. Section 07 46 20 –Fiber Cement Siding
- D. Section 07 92 00 – Joint Sealant
- E. Section 09 90 00 – Painting Coating

1.03 SUBMITTALS

- A. Product Data:
 - 1. Submit manufacturer's product data and roughing-in diagrams.
- B. Shop Drawings:
 - 1. Complete shop drawings are to be provided prior to fabrication indicating construction and installation details.
- C. Structural Calculations:
 - 1. Prior to fabrication, submit design calculations prepared by a Licensed Engineer in the State of California. The Engineer shall seal the calculations stating that the system components conform to the structural performance requirements.
- D. LEED Submittals: Complete the LEED Material Buyout Form (MBoF) with all materials provided to the project. A complete submittal includes providing all material costs in the MBoF and all of the supporting documentation for the following credits:

1. MRc2 - Environmental Product Declarations (EPD): Provide Industry-Wide or Product-Specific EPD.
2. MRc3 - Sourcing of Raw Materials - Recycled Content: Provide product data for pre- and post- consumer recycled content.
3. MRc4 - Material Ingredients: Provide manufacturers Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, or Cradle to Cradle Health Product Certificate.
4. IEQc2 - Low-Emitting Materials – Interior Wet Applied Products: For paints, coatings, adhesives and sealants applied on site or used for laminating off-site, include product data indicating the VOC content (g/L) and testing.

1.04 QUALITY ASSURANCE

- A. Provide each Hydraulic Bi-Fold System as a complete unit by one manufacturer, including frames, panels, brackets, guides, hardware, operators, and installation accessories to suit opening.
- B. Wind Loading: Design and reinforce Hydraulic Bi-Fold system to withstand wind loading pressure to comply with State and Federal Code or as indicated in structural loading criteria.
- C. Preparation of the opening shall conform to current criteria set forth by the California Building Code

1.05 DELIVERY, STORAGE, AND HANDLING

- A. Proper storage of the system before installation and continued protection during and after installation will be the responsibility of the general contractor.

1.06 WARRANTY

- A. All materials and components, supplied by Crown, shall be guaranteed against defects in material and workmanship, for a period of one year from date of delivery.
- B. Materials and components supplied by other than Crown is not included in this warranty.

PART 2 PRODUCTS

2.01 MANUFACTURERS

- A. Subject to compliance with requirements, manufacturers offering products which may be incorporated into the work, include, but are not limited to, the following:

Crown Doors, LLC 135 McLeod Avenue South Plato, MN. 55370 (320) 238-2616
www.crowndoors.com info@crowndoors.com

2.02 MATERIALS

- A. Product to be SST-II Hydraulic Bi-Fold System as furnished by Crown Doors, LLC
1. Construct operable panel and frame sections with structural steel (of ASTM-A500 grade minimum) framing to comply with applied wind code.
 2. Operable panels and frame shall be constructed of structural steel tubing and other structural steel shapes, and shall be designed to the same loading requirements for live, dead and wind loads as the surrounding construction.
 3. System shall be designed so that no center “cane bolt” is required in the floor
 4. Operable panels and frame shall be factory-welded at all joints and connections, with smooth welds not to exceed 1/4” thickness.
 5. Inside-Sash (infill) glass retainer system shall be factory pre-installed and seam-sealed, and necessary setting blocks, spacers, butyl and foam tape shall be supplied.
 6. System frame, operable panels, and factory pre-installed, inside-sash glass retainer shall be primed with gray-zinc, powder-based, epoxy primer, and finished with manufacturer’s standard powdercoat
 7. Factory-Supplied neoprene seals/weather stripping will be shipped loose for field-install to protect against damage during transport
 8. Bi-fold System shall be operated by hydraulic cylinders that are mechanically fastened to the panel frame.
 9. Cylinders are to be located on the top half of the door, only. Cylinders will be designed to carry the required loads during operation, open position, and closed position. Internal stops will be install so as not to allow over-extension of the cylinders, therefore restricting the system from opening or closing beyond its limit
 - a. Lift straps or cables, horizontal top and bottom drive shafts, pulleys, and strap or cable “kick outs” are unacceptable.
 - b. System shall be locked closed by means of the hydraulic cylinders providing a minimum of 1,000 lbs. of closing force
- C. Power Operator - Standard voltage is 208-230v, single phase.
1. Constant contact push-button or key-switch controls for separate mounting.
 2. Power unit to power (2) hydraulic cylinders which open and close the system. Power unit to be prewired and factory tested.
 3. “Open-Close” control units will be wired for constant-hold operation
 4. Coordinate with installation of incoming electrical source to hydraulic power unit.

5. Each door operator shall have thermal overload protection for the motor.

2.04 Finishes

- A. Entire system frame, operable panels, and factory pre-installed, inside-sash glass retainer shall be primed with gray-zinc, powder-based, epoxy primer, and finished with manufacturer's standard powder-coat
 1. Custom matched powder-coat color as selected by Architect.
 2. System shall be designed so that no center "cane bolt" is required in the floor

2.03 MATERIALS

- A. The Hydraulic Bi-Fold System shall be extended/retracted in the opening using a constant-contact pushbutton or key switch, operating hydraulic cylinders mounted to the system frame.

2.04 LEED REQUIREMENTS

- A. IW/PS EDP: Products specified under this section must have a Type III Product Specific EPD or the company must be listed in the industry group responsible for the Industry Wide Externally Verified EPD.
- B. PS EPD: Products specified under this section must have a Type III Product Specific EPD.
- C. HPDs: Products specified under this section must have one of the following unexpired material ingredient reports compliant with LEEDv4.1 requirements and declared to 1000 ppm or less: Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, Cradle to Cradle Health Product Certificate, or UL Product Lens Certification.
- D. Interior Wet Applied Products: All wet-applied on-site paints, coatings, adhesives, and sealants products provided under Part 2 of this specification section must be compliant with the VOC limits outlined under IEQc2: Low Emitting Materials in 01 81 13 Sustainable Design Requirements. In addition, all paints and coatings must be compliant with CDPH Standard Method v1.2-2017 emissions testing with proper unexpired CDPH testing certificates or acceptable third-party certification.

PART 3 EXECUTION

3.01 SAFETY

- A. Hydraulic power unit to have a manual emergency let-down valve for closing the system in case of a power outage.
- B. SST-II Hydraulic Bi-Fold System to incorporate pressure compensated orifice valves.

- C. Provide photoelectric and lead-edge pressure sensor.

3.02 INSTALLATION

- A. Installation of the Hydraulic Bi-Fold System shall be by a contractor familiar with this type of installation and be in strict accordance with the approved build drawings and manufacturers standard printed specifications, instructions, and recommendations. All moving parts will be left in good operating condition.
- B. Permanent or temporary electric wiring shall be brought to the power unit location before installation. After the Hydraulic Bi-Fold System is installed, the general contractor assumes the responsibility of any damage to the system or system components during construction until the building is turned over to the owner
- C. Fill reservoir with hydraulic fluid. Use ATF for cold weather applications or #32 hydraulic fluid for all other applications.

3.03 CLEANING

- A. Install in accordance with manufacturer's instructions. All surfaces shall be wiped clean and free of handprints, grease, and oil.

3.04 TRAINING

- A. Installer shall demonstrate proper operation and maintenance procedures to owner's representative.
- B. Operating keys and owner's manual shall be provided to owner's representative.

END OF SECTION

SECTION 08 41 13

ALUMINUM ENTRANCES AND STOREFRONTS

PART 1 - GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Aluminum framed, insulated glazing entrances and storefronts.
- B. Related Requirements:
 - 1. Division 01 - General Requirements.
 - 2. Section 05 41 00 – Cold Formed Metal Framing
 - 3. Section 07 26 00 – Vapor Barrier
 - 4. Section 07 46 20 –Fiber Cement Siding
 - 5. Section 07 92 00 - Joint Sealants.
 - 6. Section 08 51 13 - Aluminum Windows.
 - 7. Section 08 71 00 - Door Hardware.
 - 8. Section 08 80 00 - Glazing.
 - 9. Section 09 29 00 – Gypsum Board.

1.02 REFERENCES

- A. ASTM International (ASTM):
 - 1. ASTM B221 – Standard Specification for Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles and tubes.
 - 2. ASTM E283 - Standard Test Method for Determining Rate of Air Leakage through Exterior Windows, Curtain Walls and Doors by Uniform or Cyclic Static Air Pressure Difference.
 - 3. ASTM E330 - Standard Test Method for Structural Performance of Exterior Windows, Doors, Skylights and Curtain Walls by Uniform Static Air Pressure Difference.
 - 4. ASTM E331 - Standard Test Method for Water Penetration of Exterior Windows, Skylights, Doors, and Curtain Walls by Uniform Static Air Pressure Difference
 - 5. ASTM E783 - Standard Test Method for Field Measurement of Air Leakage through Installed Windows and Doors.
 - 6. ASTM E1105 Standard test Method for Field Determination of Water Penetration of Installed Exterior Windows, Curtain Walls and Doors by Uniform or Cyclic Static Air Pressure Difference.
- B. American Architectural Manufacturers Association (AAMA):

1. AAMA 611 – Voluntary Specification for Anodized Architectural aluminum.
 2. AAMA 2605 – Voluntary Specification, Performance Requirements and Test Procedures for Superior Performing Organic Coatings on Aluminum Extrusions and Panels.
 - C. National Fenestration Council Rating (NFRC):
 1. Component Modeling Approach (CMA), CMA Software Tool (CMAST).
 2. NFRC-100- Standard Procedure for Determining Fenestration Product U-factors.
 3. NFRC-200 - Procedure for Determining Fenestration Product Solar Heat Gain Coefficient and Visible Transmittance at Normal Incidence.
 - D. Code of Federal Regulations, Title 16, Part 1201 (16 CFR 1201):
 1. Consumer Product Safety Commission Safety Standard for Architectural Glazing Materials.
- 1.03 PERFORMANCE REQUIREMENTS
- A. Water-Resistance test: In accordance with ASTM E331. No water leakage when tested at 8 PSF (pounds per square foot) static pressure differential.
 - B. Air-Infiltration: In accordance with ASTM E283. Air infiltration shall not exceed 0.06 cfm/SF at a static air pressure difference of 6.24 psf.
 - C. Structural Performance: In accordance with ASTM E330. Deflection under design load shall not exceed L/175 of the clear span.
 - D. Energy-Related Performance Ratings:
 1. Thermal Performance U-Factor:
 2. Solar Heat Gain Coefficient (SHGC):
 3. Visible Transmittance (VT):
- 1.04 SUBMITTALS
- A. Shop Drawings: Submit Shop Drawings for the Work of this section, prepared and reviewed before fabrication. Include plans, elevations, opening, identification symbols, sizes, and complete details for materials, finishes, sizes, profiles, moldings, dimensioned locations of hardware items with reinforcement, methods of anchoring, assembly, installation, isolation, glazing procedure as well as reglazing procedures, materials, flashing and caulking.
 - B. Product Data: Submit manufacturer’s Product Data.
 - C. Test Reports: Submit test reports from AAMA accredited laboratories certifying the performance requirements of Article 1.03.
 - D. Material Samples: Submit the following:
 1. Storefront, door and frame sections with specified finish, fasteners and accessories.
 2. Cured sealant colors.

- E. Calculations: Provide structural calculations, signed and sealed by a structural engineer licensed in the State of California, indicating that materials furnished for installation conform to requirements specified.
- F. Energy Performance: Submit a report or calculation for each system and glass type listing the frame, glazing and spacer components and indicating the U-Factor, solar heat gain coefficient (SHGC) and visible transmittance (VT) of the storefront assembly demonstrating conformance to project energy calculations.
 - 1. Insulated Storefronts: Submit NFRC CMAST Fenestration Calculation Report / Bid Report:
 - 2. Non-Insulated Storefronts: Submit energy calculations.
- G. LEED Submittals: Complete the LEED Material Buyout Form (MBoF) with all materials provided to the project. A complete submittal includes providing all material costs in the MBoF and all of the supporting documentation for the following credits:
 - 1. MRc2 - Environmental Product Declarations (EPD): Provide Industry-Wide or Product-Specific EPD.
 - 2. MRc3 - Sourcing of Raw Materials - Recycled Content: Provide product data for pre- and post- consumer recycled content.
 - 3. MRc4 - Material Ingredients: Provide manufacturers Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, or Cradle to Cradle Health Product Certificate.
 - 4. IEQc2 - Low-Emitting Materials – Interior Wet Applied Products: For paints, coatings, adhesives and sealants applied on site or used for laminating off-site, include product data indicating the VOC content (g/L) and testing.

1.05 QUALITY ASSURANCE

- A. Regulatory Requirements:
 - 1. Except for more stringent requirements specified in this Section, manufactured aluminum windows shall comply with the requirements of the CBC Part 6, California Energy Code, Section 110.6, Mandatory Requirements for Fenestration Products and Exterior Doors.
 - 2. Windows shall be designed to withstand the minimum loads prescribed in CBC Section 1609.
- B. Field applied products that release VOC's, such as sealants, caulking, adhesives, primers and paints, shall be approved by the OWNER.
- C. Installer Qualifications:
 - 1. Minimum five-year experience installing windows of the type specified by this Section.
 - 2. Installer shall be approved by the window manufacturer as an approved installer.
- D. Manufacturer Qualifications: Minimum 5-year experience in producing aluminum windows of the type specified. Window manufacturer technical representative shall

provide field services to verify window installation is in accordance with manufacturer's written instructions.

- E. Mock-ups: Provide mock-up of one typical door and window unit for review by the ARCHITECT.
- F. Pre-Installation Conference: CONTRACTOR shall coordinate and conduct pre-installation conference, Project Meetings, to review the progress of construction activities and preparations for the installation of storefronts and other related work of this Section.

1.06 WARRANTY

- A. Manufacturer shall provide a 10-year material warranty for aluminum storefront.
- B. Manufacturer shall provide a 10-year material warranty for doors.
- C. Anodized finish of storefronts, doors and related components shall be warranted for 10 years against cracking, crazing, flaking, or blistering,
- D. Pigmented organic finished storefronts, doors and related components shall be warranted for 15 years against blistering, cracking, peeling or chipping or fading beyond AAMA 2605.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

- A. Offset Glazing:
 - 1. Kawneer (Basis of Design)
 - 2. Arcadia
 - 3. EFCO
 - 4. Or Approved Equal.

2.02 MATERIALS

- A. Extrusions shall be 6063-T6 alloy and temper, per ASTM B221.
- B. Fasteners: Aluminum, stainless steel, or zinc-plated steel at exposed conditions. Perimeter anchors shall be aluminum or steel. Steel anchors shall be isolated from aluminum members.
- C. Glazing Gaskets: EPDM elastomeric extrusions or vinyl reinforced with fiberglass cord.
- D. Glazing Sealants: As recommended by manufacturer for joint type.
- E. Spacers and Setting Blocks: Manufacturer's standard elastomeric type.
- F. Joint Sealants: For installation at perimeter of storefront system shall be as specified in Section 07 92 00, Joint Sealants.
- G. Glazing: Glazing shall be as specified in Section 08 80 00, Glazing.

2.03 FABRICATION

- A. Framing shall be per Kawneer Trifab Versa Glaze 451/451T Framing System.
 - 1. Dimensions: 4 ½" x 2"
 - 2. Major portions of door sections, except glazing beads, shall be nominal 0.125 inch.
 - 3. Wall thickness of frame members shall be nominal 0.093 inch.
- B. Framing system shall provide continuous head and sill channels spliced together with formed brake metal sleeves at center of vertical mullions. The framing system shall provide for flush glazing on sides with no projecting stops. Vertical and horizontal framing members shall have a nominal face dimension and overall depth as noted above. Diverters shall be provided to collect water infiltration and divert to the exterior.
- C. Door framing members shall match storefront framing appearance. Door stiles and rails shall be tubular sections, accurately joined at corners with heavy concealed reinforcement brackets secured with bolts and screws and shall be metal inert gas (MIG) welded. Doors shall be furnished with snap-in stops with bulb glazing gasket both sides of glass. Exposed screws are not permitted. Each door leaf shall be furnished with an adjusting mechanism, located in the top rail near the lock stile, which provides for minor clearance adjustments after installation. A hard-backed poly-pile weatherstrip shall be installed in both stiles of center hung single doors.

2.04 DOORS

- A. Basis of Design: Kawneer 350T Insulpour® Thermal Entrance. The door stile and rail face dimensions of the entrance door will be as follows:
 - 1) Vertical face dimension: 5"
 - 2) Top Rail: 5"
 - 3) Bottom Rail: 10"
- B. Door Hardware (Ea door leaf):

Refer to Door Hardware, Section 08 71 00.

Weatherstripping: Door manufacturer's Bottom door sweep.

2.05 FINISH

- A. Storefronts, doors and accessories shall be furnished with an organic finish applied over a five-stage aluminum pre-treatment. Finish shall be a two-coat PVDF fluorocarbon coating system with a minimum of 1.2 mil thickness and conforming to AAMA 2605. Color as selected by ARCHITECT.

2.06 LEED REQUIREMENTS

- A. IW/PS EDP: Products specified under this section must have a Type III Product Specific EPD or the company must be listed in the industry group responsible for the Industry Wide Externally Verified EPD.
- B. PS EPD: Products specified under this section must have a Type III Product Specific EPD.
- C. HPDs: Products specified under this section must have one of the following unexpired material ingredient reports compliant with LEEDv4.1 requirements and declared to 1000 ppm or less: Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, Cradle to Cradle Health Product Certificate, or UL Product Lens Certification.
- D. Interior Wet Applied Products: All wet-applied on-site paints, coatings, adhesives, and sealants products provided under Part 2 of this specification section must be compliant with the VOC limits outlined under IEQc2: Low Emitting Materials in Sustainable Design Requirements. In addition, all paints and coatings must be compliant with CDPH Standard Method v1.2-2017 emissions testing with proper unexpired CDPH testing certificates or acceptable third-party certification.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Examine openings, substrates, structural support, anchorage, and conditions, for compliance with requirements for installation tolerances and other conditions affecting performance of work. Verify rough opening dimensions, levelness of sill plate and operational clearances. Examine wall flashings, air barriers, and other built-in components to ensure a coordinated, weather tight aluminum framed storefront installation.

3.02 INSTALLATION

- A. Install storefronts in accordance with approved shop drawings and manufacturers installation instructions. Installation shall be level, square, plumb and in proper relation to wall flashing and adjacent construction.
- B. Apply sealants to provide a weather tight installation at joints, intersections and opening perimeters. Tool sealants to fill the joint and provide a smooth finished surface.
- C. Install security glazing with Dow 795 sealant, as required by Section 08 8053, Security Glazing.

3.03 FIELD QUALITY CONTROL

- A. CONTRACTOR shall retain and pay a testing agency to conduct on-site air and water infiltration tests. On-site tests shall be conducted with CONTRACTOR, storefront manufacturer's representative, OWNE'S representative present. The Owner's representative will select units to be tested.
- B. Ten percent of installed storefront panels will be selected for air and water testing. If one or more windows fail, an additional ten percent of windows (not including the

ones previously tested) will be selected for further testing. Selection of additional ten percent of units and retesting will be performed until no leaks occur.

- C. Water-Infiltration Test: Test will be conducted according to requirements of ASTM E1105. No water leakage is permitted. Windows will be tested at 6 pounds per square foot test pressure differential.
- D. Air-Infiltration Test: Test will be conducted according to requirements of ASTM E783. Allowable infiltration shall not exceed 0.9 cfm/SF when tested at 6.24 pounds per square foot field test pressure differential.
- E. Windows within storefronts will be tested per the requirements of Section 08 5113, Aluminum Windows.
- F. Field Test report will be submitted to the OWNER, CONTRACTOR and ARCHITECT. Field Test report will include the following:
 - 1. Name of the testing agency and testing agency's credentials.
 - 2. Date of test.
 - 3. Standards complied with during testing.
 - 4. Number and locations of specimens tested.
 - 5. Thorough analysis of test result indicating passing or failing of specimens at pressures specified.
 - 6. Photos illustrating conditions of failed compliance at pressures required.
- G. Credit to the OWNER the cost of failed tests.

3.04 PROTECTION

- A. Protect the Work of this section until Substantial Completion.

3.05 CLEAN UP

- A. Remove rubbish, debris and waste materials and legally dispose of off the Project site.

END OF SECTION

SECTION 08 51 13

ALUMINUM WINDOWS

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Aluminum framed, insulated glazing windows.

B. Related Requirements:

1. Division 01 - General Requirements.
2. Section 07 26 00 – Vapor Barrier.
3. Section 07 60 00 – Flashing and Sheet Metal.
4. Section 07 92 00 - Joint Sealants.
5. Section 08 41 13 - Aluminum Entrances and Storefront.
6. Section 08 80 00 - Glazing.
8. Section 09 29 00 - Gypsum Board

1.02 REFERENCE STANDARDS

A. ASTM International:

1. ASTM A36 - Standard Specification for Carbon Structural Steel.
2. ASTM A653 - Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.
3. ASTM C920 - Standard Specification for Elastomeric Joint Sealants.
4. ASTM E283 - Standard Test Method for Determining Rate of Air Leakage through Exterior Windows, Curtain Walls and Doors by Uniform or Cyclic Static Air Pressure Difference.
5. ASTM E330 - Standard Test Method for Structural Performance of Exterior Windows, Doors, Skylights and Curtain Walls by Uniform Static Air Pressure Difference.
6. ASTM E331 - Standard Test Method for Water Penetration of Exterior Windows, Skylights, Doors, and Curtain Walls by Uniform Static Air Pressure Difference.

7. ASTM E547 - Standard Test Method for Water Penetration of Exterior Windows, Skylights, Doors, and Curtain Walls by Cyclic Static Air Pressure Difference.
 8. ASTM E783 - Standard Test Method for Field Measurement of Air Leakage through Installed Windows and Doors.
 9. ASTM E972 - Standard Test Method for Solar Photometric Transmittance of Sheet Materials Using Sunlight.
 10. ASTM E1105 - Standard test Method for Field Determination of Water Penetration of Installed Exterior Windows, Curtain Walls and Doors by Uniform or Cyclic Static Air Pressure Difference.
 11. ASTM F588 - Standard Test Methods for Measuring the Forced Entry Resistance of Window Assemblies, Excluding Glazing Impact.
- B. American Architectural Manufacturers Association (AAMA):
1. AAMA/WDMA/CSA 101/I.S.2/A440 NAFS – North American Fenestration Standards / Specifications for Windows, Doors and Skylights.
 2. AAMA 502 - Voluntary Specification for Field Testing of Newly Installed Fenestration Products.
 3. AAMA 511 - Voluntary Guideline for Forensic Water Penetration Testing of Fenestration Products.
 4. AAMA 513 - Standard Laboratory Test Method for Determination of Forces and Motions Required to Activate Operable Parts of CW and AW Class Operable Windows, Sliding Glass Doors and Terrace Doors in Accessible Spaces.
 5. AAMA 609 - Cleaning and Maintenance Guide for Architecturally Finished Aluminum.
 6. AAMA 612 - Voluntary Specification, Performance Requirements, and Test Procedures Combined Coatings of Anodic Oxide and Transparent Organic Coatings on Architectural Aluminum.
 7. AAMA 701 / 702 – Voluntary Specification for Pile Weatherstripping and Replaceable Fenestration Weatherseals.
 8. AAMA 800 - Voluntary Specifications and Test Methods for Sealants.
 9. AAMA 803.3 - Narrow-Joint Seam Sealer.
 10. AAMA 902 - Voluntary Specification, Performance Requirements and Test Procedures for Sash Balances.
 11. AAMA 904.1 – Voluntary Specifications for Friction Hinges in Window Applications.

12. AAMA 910 - Voluntary Life Cycle Specifications and Test Methods for AW Class Architectural Windows and Doors.
 13. AAMA 1302.5 - Voluntary Specifications for Forced-Entry Resistant Aluminum Prime Windows.
 14. AAMA 2605 Voluntary Specification, Performance Requirements and Test Procedures for Superior Performing Organic Coatings on Architectural Extrusions and Panels.
- C. National Fenestration Rating Council (NFRC):
1. NFRC-100- Standard Procedure for Determining Fenestration Product U-factors.
 2. NFRC-200 - Procedure for Determining Fenestration Product Solar Heat Gain Coefficient and Visible Transmittance at Normal Incidence.
- D. Glass Association of North America (GANA):
1. GANA 01-0300 - Proper Procedures for Cleaning Architectural Glass Products.
- E. The Aluminum Association (AA):
1. AA DAF-45 – Designation System for Aluminum Finishes.
- 1.03 AAMA PRIMARY DESIGNATOR
- A. Primary Designator: Way in which compliant windows are identified by the American Architectural Manufacturers Association (AAMA). Consists of a four part code:
1. Performance Class: Is the likely target application for a door or window. Four classes are defined by the North American Fenestration Standards (NAFS) and corresponds to the first two letters of the designator. Only Performance Class AW is specified in this Section.
 - a. AW: Performance Class of windows commonly used in high-rise and mid-rise buildings to meet extreme loading requirements and limits on deflection.
 2. Performance Grade (PG): Corresponds to the digits of the designator and represents the Design Pressure, in pounds per square foot, a window specimen was tested to.
 3. Test Size: Is the maximum size tested to achieve this rating. Test Size is not used in the window designators specified in this Section.
 4. Product Type: Is the abbreviation for the window type specified, corresponds to the last two letters of the Primary Designator.
- 1.04 PERFORMANCE REQUIREMENTS

- A. Windows shall conform to AAMA/WDMA/CSA 101/I.S. 2/A440, Performance Class AW. Performance Grade shall be as indicated on Part 2 Products, for each specific manufacturer and each window type.
- B. Performance Requirements: Window manufacturer shall hold a current test report for a window specimen successfully tested to the gateway performance requirements of AAMA/WDMA/CSA 101/I.S. 2/A440, Performance Class AW.
 1. Life Cycle Testing: Tested in accordance with AAMA 910. There shall be no damage to fasteners, hardware parts, support arms, activating mechanisms, or any other damage that would cause the window to be inoperable.
 2. Structural Performance:
 - a. Uniform Load Deflection Test:
 - 1) With ventilators closed and locked, test unit in accordance with ASTM E330 at a static air pressure difference of 40 PSF, positive and negative pressure.
 - 2) No member shall deflect over $L/175$ of its span.
 - b. Uniform Load Structural Test:
 - 1) With ventilators closed and locked, test unit in accordance with ASTM E330 at a static air pressure difference of 60 PSF, both positive and negative.
 - 2) At conclusion of test there shall be no glass breakage, permanent damage to fasteners, hardware parts, support arms or actuating mechanisms, nor any other damage that would cause the window to be inoperable.
 3. Water Penetration Resistance: With ventilators closed and locked, test unit in accordance with ASTM E331 and/or ASTM E547 to twenty percent of the Design Pressure, without exceeding 12 PSF. There shall be no uncontrolled water leakage.
 4. Air Leakage Resistance: With ventilators closed and locked, test unit in accordance with ASTM E283 at a static air pressure difference of 6.24 PSF.
 - a. Single Hung, Double Hung Windows and Horizontal Sliding Windows: Air infiltration rate shall not exceed 0.30 cfm/SF.
 - b. Fixed, Awning, Hopper Casement and: Air infiltration rate shall not exceed 0.10 cfm/SF.
 5. Forced Entry Resistance: Test windows in accordance to ASTM F588 or AAMA 1302.5 and meet the requirements of performance level 40.

1.05 REGULATORY REQUIREMENTS

- A. Manufactured windows shall comply with the requirements of the California Energy Code, Section 110.6, Mandatory Requirements for Fenestration Products and Exterior Doors.
 - 1. Air Leakage: As indicated in Article 1.03, Performance Requirements.
 - 2. U-factor: Windows shall be rated in accordance with NFRC-100 or use the applicable default U-factor set forth in table 110.6-A.
 - 3. Solar Heat Gain Coefficient (SHGC): Window SHGC shall be rated in accordance with NFRC-200, or use the applicable SHGC set forth in table 110.6-A.
 - 4. Visible Transmittance (VT): The window VT shall be rated in accordance with NFRC-200 or ASTM E972.
 - 5. Labeling: Conform to Section 110.6 for temporary and permanent labels.

1.06 SUBMITTALS

- A. Shop Drawings: Submit Shop Drawings for the Work of this section including plans, elevations, window schedule, opening identification symbols, sizes, and complete details for materials, finishes, sizes, profiles, moldings, dimensioned locations of hardware items with reinforcement, methods of anchoring, size and spacing of anchors, assembly, erection, isolation, glazing procedure as well as re-glazing procedures, materials, caulking and sound transmission class.
- B. Product Data: Submit manufacturer's Product Data, recommendations and standard details for aluminum windows units, including independent laboratory certified tests as necessary to demonstrate compliance with specified requirements.
- C. Material Samples:
 - 1. Window Samples: Submit a window sample fabricated of the materials, finish, fasteners, glazing, panning and caulking system specified.
 - 2. Finish: When factory-finish color coating is specified, submit:
 - a. Five color charts of standard factory coatings.
 - b. Five coated six inch long sections of aluminum sheets finished with color selected by ARCHITECT.
- D. Certificates:
 - 1. AAMA Certified Test Reports: Window manufacturer shall affix AAMA Quality Certified label on every unit or shall submit a certified test report from an approved testing laboratory, certifying that the specified insulated glass window complies with ANSI/AAMA requirements.

2. Building Energy Efficiency Standards Certified Test Reports: Window manufacturer shall affix a clearly visible temporary label to the non-insulated glass windows or supply a project specific label certificate using NFRC CMA protocol, listing the U-Factors, solar heat gain coefficients (SHGC), visible transmittance (VT) and air leakage for the fenestration products to adhere to the prescriptive requirements of Title 24, CEC.
 3. Submit a certificate bearing official and legal signature of window supplier stating that the finish complies with AAMA 2605 for Organic Coatings and to AAMA 612 for Anodic Finish, as applicable.
 4. Submit a certificate bearing official and legal signature of window supplier stating that windows with security glazing had the glass installed in accordance with Section 08 8053, Security Glazing.
- B. Written statement signed by the sealant manufacturer or distributor stating that the sealant joints shown on the shop drawings have been reviewed and approved for adhesion and surfaces compatibility.
- C. LEED Submittals: Complete the LEED Material Buyout Form (MBoF) with all materials provided to the project. A complete submittal includes providing all material costs in the MBoF and all of the supporting documentation for the following credits:
1. MRc2 - Environmental Product Declarations (EPD): Provide Industry-Wide or Product-Specific EPD.
 2. MRc3 - Sourcing of Raw Materials - Recycled Content: Provide product data for pre- and post- consumer recycled content.
 3. MRc4 - Material Ingredients: Provide manufacturers Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, or Cradle to Cradle Health Product Certificate.
 4. IEQc2 - Low-Emitting Materials – Interior Wet Applied Products: For paints, coatings, adhesives and sealants applied on site or used for laminating off-site, include product data indicating the VOC content (g/L) and testing.

1.07 QUALITY ASSURANCE

- A. Regulatory Requirements:
1. Except for more stringent requirements specified in this Section, manufactured aluminum windows shall comply with the requirements of the CBC Part 6, California Energy Code, Section 110.6, Mandatory Requirements for Fenestration Products and Exterior Doors.
 2. Windows shall be designed to withstand the minimum loads prescribed in CBC Section 1609A.
- B. Field applied products that release VOC's, such as sealants, caulking, adhesives, primers and paints, shall be in compliance with Green Building Code requirements.

- C. Installer Qualifications:
 - 1. Minimum five year experience installing windows of the type specified by this Section.
 - 2. Installer shall be approved by the window manufacturer as an approved installer.
- D. Manufacturer Qualifications: Minimum 5 year experience in producing aluminum windows of the type specified. Window manufacturer technical representative shall provide field services to verify window installation is in accordance to manufacturer's written instructions.
- E. Pre-Installation Conference: CONTRACTOR shall coordinate and conduct pre-installation conference in accordance to Section 01 31 19, Project Meetings, to review the progress of construction activities and preparations for the installation of aluminum windows and other related work of this Section.

1.08 DELIVERY, STORAGE AND HANDLING

- A. Deliver materials in manufacturer's packaging to protect windows during transportation and storage.
- B. Store windows indoors in a clean ventilated area and stack vertically on edge with wood or plastic shims between components to provide water drainage and air circulation.
- C. Handle in a manner to evenly distribute material load and prevent twisting, ending and cracking of windows doors and associated parts.

1.09 WARRANTY

- A. Window installation shall be warranted by CONTRACTOR against defects under normal use and service, for a period of two years.
- B. Windows shall be warranted by window manufacturer against defects in material and fabrication under normal use and service, for a period of five years.
- C. Pigmented organic finished window and related components shall be warranted for ten years against blistering, cracking, peeling or chipping or fading beyond AAMA 2605.
- D. Anodized finished window and related components shall be warranted for five years against blistering, cracking, peeling or chipping or fading beyond AAMA 612.
- E. Factory glazed insulated glass units shall be warranted to be free from obstruction of vision as a result of dust or film formation on the internal glass surfaces caused by failure of the hermetic seal due to defects in material and workmanship for a period of ten years.

PART 2 – PRODUCTS

2.01 MANUFACTURERS, SERIES AND AAMA PRIMARY DESIGNATORS

- A. Fixed Windows:

1. Arcadia.
2. EFCO.
3. Kawneer.
4. Peerless.
5. Equal.

2.02 FABRICATION

- A. Aluminum windows shall conform to AAMA/WDMA/CSA 101/I.S.2/A440.
- B. Window frames, sash members and muntin bars, shall be extruded aluminum sections of 6063-T5 or 6063-T6 alloy. Framing sections and dimensions shall be as indicated in drawings.
- C. Windows shall be factory fabricated for inside glazing, of the types and sizes indicated and specified, and shall include hardware, fastenings, clips, fins, anchors, glazing beads, and other appurtenances necessary for a complete installation and proper operation. Windows shall be fabricated for inside glazing.

2.03 GLAZING

1. Glazing shall be glazed type as shown in indicated with an extruded aluminum snap-on glazing bead at the interior. Sashes shall be factory glazed by the manufacturer to provide proper seal.
2. Glazing beads shall be extruded aluminum of window manufacturer's standard design, 5/8 inch minimum height, cut to proper length.
3. For glass and glass setting materials refer to Section 08 80 00, Glazing.
- D. Fasteners: Provide concealed anchors conforming to AAMA/WDMA/CSA 101/I.S.2/A440 of the type recommended by the window manufacturer for the specific type of construction. Anchors and fasteners shall be compatible with the aluminum window and the adjoining construction materials.

2.04 FINISH

- A. Organic finish applied over a five stage aluminum pre-treatment. Finish shall be a Two coat pigmented organic coating system applied over a five stage aluminum pre-treatment to a minimum of 1.2 mil thickness and conforming with AAMA 2605. Color shall be selected by the ARCHITECT.

2.05 SEALANTS

- A. Sealants shall be as scheduled and shall be of the type recommended by the window manufacturer.

- B. Sealants shall conform with AAMA 800 and shall be compatible with aluminum finish and adjacent materials.
- C. Sealants used to seal mechanically fixed joints, it shall conform to AAMA 800 or ASTM C920, Type S, Grade S, Class 25.
- D. Refer to Section 07 92 00, Joint Sealants, for additional information.

2.06 GLASS

- A. Refer to Section 08 80 00, Glazing.

2.07 LEED REQUIREMENTS

- A. IW/PS EDP: Products specified under this section must have a Type III Product Specific EPD or the company must be listed in the industry group responsible for the Industry Wide Externally Verified EPD.
- B. PS EPD: Products specified under this section must have a Type III Product Specific EPD.
- C. HPDs: Products specified under this section must have one of the following unexpired material ingredient reports compliant with LEEDv4.1 requirements and declared to 1000 ppm or less: Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, Cradle to Cradle Health Product Certificate, or UL Product Lens Certification.
- D. Interior Wet Applied Products: All wet-applied on-site paints, coatings, adhesives, and sealants products provided under Part 2 of this specification section must be compliant with the VOC limits outlined under IEQc2: Low Emitting Materials in 01 81 13 Sustainable Design Requirements. In addition, all paints and coatings must be compliant with CDPH Standard Method v1.2-2017 emissions testing with proper unexpired CDPH testing certificates or acceptable third-party certification.

PART 3- EXECUTION

3.01 EXAMINATION

- A. Verify that conditions of substrate are acceptable for aluminum window installation in accordance with manufacturer's written recommendations.
- B. Verify openings are dimensionally correct and within allowable tolerances, and substrates are plumb, level and clean.
- C. Verify that anchoring surface is in accordance with approved shop drawings.
- D. Inform OAR of unacceptable conditions immediately upon discovery.
- E. Proceed with installation only after unacceptable conditions have been remedied.

3.02 INSTALLATION

- A. Windows and operators shall be installed in accordance with the window manufacturer's printed instructions and details. Set windows plumb, square, level, and true within their respective openings. Adjoining units of windows or assembly of windows shall be installed in the same plane and with rails, muntins, and like members accurately aligned.
- B. Aluminum in contact with plaster, concrete or steel shall be separated from dissimilar materials as recommended in the Appendix to AAMA/WDMA/CSA 101/I.S.2/A440. Screws, rivets, bolts and other fastening devices shall be of aluminum, non-magnetic stainless steel or other non-corrosive materials compatible with aluminum.
- C. Apply sealant in conformance to Section 07 92 00, Joint Sealants, in sufficient quantity at joints and intersections to provide a weathertight seal between the window and surrounding construction. Wipe off excess and leave exposed sealant surfaces clean and smooth.
- D. Upon completion of the Work of this section, inspect windows and operating devices for proper installation and operation. Operate vents and hardware and adjust to ensure proper fitting and functioning and leave in smoothly operating condition. Lubricate hardware and operating parts as necessary.
- E. Where indicated on the Drawings a two piece snap together receptor shall be furnished to fasten windows in place. The receptor aluminum finish shall match the window frame. When snapped together, system shall fasten window securely in place with no water penetration at specified test pressure.
- F. Where indicated on the Drawings provide panning, which shall be either a receiver or attached type. The panning extrusions shall be field secured at the corners with stainless steel screws in integral screw ports with the joints back sealed to prevent water intrusion. Exposed screws or fasteners on the exterior of the panning are not permitted. Panning and trim shall be furnished in the same color and finish as window system frames.
- G. Limit the opening of windows without security screens to 6 inches where window sills are at a height of ten feet or more above grade, balconies, stairs or lower roofs.

3.03 FIELD QUALITY CONTROL

- A. Conduct on-site tests in conformance with AAMA 502, with the OAR, ARCHITECT and CxSP present. The OAR will select units to be tested. Testing shall be performed by an AAMA accredited testing agency paid by the CONTRACTOR.
- B. Testing shall be performed as soon as possible after window installation and before drywall installation to allow visual access. AAMA 502 cannot be used for windows that have been installed for more than six months. In the case windows have been installed for more than six months the procedures of AAMA 511 shall be followed.
- C. Ten percent of installed windows shall be selected for testing. If one or more windows fail, additional ten percent of windows, not including the ones previously tested, will be

selected for further testing. Selection of additional ten percent of windows and retesting shall be performed until no leaks occur.

1. Air-Infiltration Test: Test set-up and equipment requirements for the test shall be in accordance to the requirements of ASTM E783. Windows shall be tested at 6.24 PSF field test pressure differential. Allowable rates for air leakage shall be 1.5 times the applicable AAMA/WDMA/CSA 101/I.S.2/A440 rate for AW performance class when testing according to AAMA 502, as follows:
 - a. Compression Seal and Fixed Windows: 0.15 cfm/ft².
 - b. Sliding Seal Windows: 0.45 cfm/ft².
 2. Water-Resistance Test: Test set-up and equipment requirements for the water penetration portion of the test shall be in accordance to the requirements of ASTM E1105, Method A, using a non-cyclic static pressure difference, and shall test the entire window assembly including perimeter joints. No water penetration is allowed.
 - a. The test pressure used shall be equal to two thirds of the tested and rated laboratory performance test pressure (twenty percent of the Performance Grade listed in Part 2 for each window type; however, shall not exceed twelve pounds per square feet.)
 - b. Windows with accessible hardware are permitted certain reductions in air infiltration and water resistance performance requirements in accordance with AAMA 513.
 - c. If water leakage occurs and source cannot be determined, a forensic evaluation using the procedures stated in AAMA 511 shall follow.
- D. Windows failing to meet specified air or water infiltration testing:
1. CONTRACTOR shall submit proposed remedial work to ARCHITECT for review.
 2. CONTRACTOR shall complete remedial work.
 3. When test results meet specified requirements, CONTRACTOR shall incorporate remedial work into other work on the Project.
- E. Field Test report shall be submitted to the OWNER, CONTRACTOR and ARCHITECT. Field Test report must include the following:
1. Name of the testing agency and testing agency's credentials.
 2. Date of test.
 3. Standards complied with during testing.
 4. Number and locations of specimens tested.

5. Thorough analysis of test result indicating passing or failing of specimens at pressures specified.
6. Photos illustrating conditions of failed compliance at pressures required.

3.03 CLEANING

- A. Clean interior and exterior surfaces of window frames of mortar, plaster, paint spattering spots, and other foreign matter in conformance with AAMA 609 and manufacturer's written recommendations.
- B. Clean glass using methods complying with GANA 01-0300.
- C. Touch-up, repair or replace damaged products before Substantial Completion.

3.04 CLEAN UP

- A. Remove rubbish, debris and waste materials and legally dispose of off the Project site.

3.05 PROTECTION

- A. Protect the Work of this section until Substantial Completion.

END OF SECTION

SECTION 08 63 23

METAL-FRAMED SKYLIGHTS AND SLOPED GLAZING

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Metal-Framed Skylights and Sloped Glazing. Engineering, including structural calculations of the entire skylight system.
2. Fabrication and erection of skylight frames.
3. Fabrication and erection of the aluminum gutter system including, when applicable, insulation and pitched liners.
4. Applied finish of aluminum extrusions and sheet.
5. Impact Resistant Skylight glass and glazing.
6. Skylight related flashings.

B. Related Requirements:

1. Division 01 - General Requirement.
2. Section 07 22 00 – Roof Deck Insulation
3. Section 07 26 00 – Vapor Barriers
4. Section 07 60 00 - Flashing and Sheet Metal.
5. Section 07 92 00 - Joint Sealants.
6. Section 08 88 00 - Glazing
6. Section 26 31 00 – Photovoltaic System

1.02 SECTION DEFINITIONS

- ###### A.
- Water leakage is defined as any uncontrolled water that appears on any exposed interior surface that is not drained back to the exterior.

1.03 DESIGN REQUIREMENTS

- A. Drawings indicate sizes, locations, profiles, and general details of skylight construction and installation.
- B. The total deflection of rafters less than 20 feet in length shall not exceed 1/75 of that length or one inch, whichever is smaller, at design loading. Rafters 20 feet or greater shall not exceed 1/240.
- C. The deflection of a framing member in a direction parallel to the plane of the glass, when carrying its full load, shall not reduce the glass or panel bite below 75 percent of the design dimension.
- D. Framing members and the edge of glazing products shall have a 1/8 inch minimum clearance at maximum deflection.
- E. Deflections shall not impair the function of or damage joint seals or glazing.
- F. Vault rafter segments shall be moment connections. The skylight shall impose no lateral loads on the supporting structure other than wind and seismic loads.
- G. Glass Performance Requirements:
 - 1. Probability of breakage shall not exceed 1/1000 for sloped glass upon imposition of design wind and live loads for one minute.
 - 2. Probability of breakage due to anticipated thermal stress not to exceed 1/1000.
 - 3. Comply with CBC requirements.

1.04 SUBMITTALS

- A. Shop Drawings: Submit plans, elevations, details and calculations.
- B. Material Samples:
 - 1. Submit finish Samples for aluminum materials and flashings.
 - 2. Submit glass Samples, minimum 12-inch by 12-inch.
- C. Certificates:
 - 1. Certification that adhesion of sealant to samples of metal and glass is adequate when tested in accordance with ASTM C794
 - 2. Certification that materials in contact with sealant are compatible with sealant after being exposed to 2,000-4,000 micro watt ultra-violet radiation for twenty-one (21) days.
 - 3. Statement that stress on each detailed sealant joint will not exceed design stress of sealant when exposed to specified wind loads.

- D. Calculations: Submit structural calculations prepared, signed, and sealed by a structural engineer licensed in the State of California.
- E. Test Reports:
 - 1. The skylight manufacturer shall submit for review at least three test reports by a nationally recognized testing facility indicating that similar skylight products by the manufacturer have been tested according to the referenced standards and that the skylight passed those tests.
 - 2. Test data on adhesion to production samples of metal and glass, tested in accordance with ASTM C794.
- F. LEED Submittals: Complete the LEED Material Buyout Form (MBoF) with all materials provided to the project. A complete submittal includes providing all material costs in the MBoF and all of the supporting documentation for the following credits:
 - 1. MRc2 - Environmental Product Declarations (EPD): Provide Industry-Wide or Product-Specific EPD.
 - 2. MRc3 - Sourcing of Raw Materials - Recycled Content: Provide product data for pre- and post- consumer recycled content.
 - 3. MRc4 - Material Ingredients: Provide manufacturers Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, or Cradle to Cradle Health Product Certificate.
 - 4. IEQc2 - Low-Emitting Materials – Interior Wet Applied Products: For paints, coatings, adhesives and sealants applied on site or used for laminating off-site, include product data indicating the VOC content (g/L) and testing.

1.05 QUALITY ASSURANCE

- A. Comply with the following as a minimum requirement:
 - 1. AAMA 501.1 - Standard Test Method for Metal Curtain Walls for Water Penetration Using Dynamic Pressure.
 - 2. AAMA 501.2 - Field Check of Metal Curtain Walls for Leakage.
 - 3. AAMA 501.3 - Field Check of Water Penetration Through Installed Exterior Windows, Curtain Walls, and Doors by Uniform Air Pressure Difference.
 - 4. AAMA 603.8 - Performance Requirements and Test Procedures for Pigmented Organic Coatings on Extruded Aluminum.
 - 5. AAMA 2605 - Specification for High Performance Organic Coatings on Architectural Extrusions and Panels.
 - 6. AAMA 606.1 - Voluntary Guide Specification and Inspection Methods for Clear Anodic Finishes for Architectural Aluminum.

7. ANSI Z97.1 - Safety Glazing Materials Used in Buildings - Safety Performance Specifications and Methods of Test.
8. ASTM A193 - Alloy Steel and Stainless Steel Bolting Materials for High Temperature Service.
9. ASTM A307 - Carbon Steel Bolts and Studs, 60,000 psi Tensile Strength.
10. ASTM B209 - Aluminum and Aluminum-Alloy Sheet and Plate.
11. ASTM B211 - Aluminum and Aluminum-Alloy Bar, Rod and Wire.
12. ASTM B221 - Aluminum-Alloy Extruded Bars, Rods, Wires, Profiles and Tubes.
13. ASTM B316 - Specification for Aluminum and Aluminum-Alloy Rivet and Cold-Heating Wire and Rods.
14. ASTM C719 - Adhesion and Cohesion of Elastomeric Joint Sealants under Cyclic Movement (Hockman Cycle).
15. ASTM C794 - Adhesion-in-Peel of Elastomeric Joint Sealants.
16. ASTM C1036 - Flat Glass.
17. ASTM C1048 - Heat-Treated Flat Glass - Kind HS, Kind FT Coated and Uncoated Glass.
18. ASTM D395 - Rubber Property - Compression Set.
19. ASTM D412 - Vulcanized Rubber and Thermoplastic Rubbers and Thermoplastic Elastomers - Tension.
20. ASTM D1171 - Rubber Deterioration - Surface Ozone Cracking Outdoors or Chamber (Triangular Specimens).
21. ASTM D2240 - Rubber Property - Durometer Hardness.
22. ASTM E283 - Determining the Rate of Air Leakage Through Exterior Windows, Curtain Walls, and Doors Under Specified Pressure Differences Across the Specimen.
23. ASTM E330 - Structural Performance of Exterior Windows, Curtain Walls, and Doors by Uniform Static Air Pressure Difference.
24. ASTM E331 - Water Penetration of Exterior Windows, Curtain Walls, and Doors by Uniform Static Air Pressure Difference.
25. ASTM E2190 - Standard Specification for Insulating Glass Unit Performance and Evaluation.

26. ASTM E783 - Field Measurement of Air Leakage Through Installed Exterior Windows and Doors.
 27. GANA - Glazing Manual.
 28. US CPSC Standard 16 CFR 1202 - Architectural Glazing Standards and Related Material.
- B. Qualifications of Installer: Minimum 10 years experience installing work of similar scope and complexity.
- 1.06 WARRANTY
- A. Submit manufacturer's warranty certifying that skylight work was furnished and installed in accordance with the Contract Documents.
 - B. Certify that skylight frame is free of defects in design, material, and construction for a period of ten (10) years from the Date of Skylight Completion.
 - C. Warrant glass against defective materials, delamination, seal failure, and defects in manufacture per the glass manufacturer's standard warranties from date of manufacture.
 - D. Warrant structural sealant for a period of ten (10) years per sealant manufacturer's standard warranty of merchantable quality. Warranty shall certify that cured sealant:
 1. Will not become brittle or crack due to weathering or normal expansion and contraction of adjacent surfaces.
 2. Will not harden beyond a Shore A durometer of 50, nor soften below a minimum of 10 points.
 3. Will not change color significantly when used with compatible back-up materials.
 4. Will not bleed significantly.
 - E. Warrant finish per the manufacturer's standard warranties from date of application.
 - F. Optional extended warranties may be purchasable on some products at an additional cost.
 - G. Warranty service becomes effective only following payment in full for the contract amount.

PART 2 - PRODUCTS

2.01 MANUFACTURER

A. Basis of Design: Provide products and systems manufactured by Super Sky Products Enterprises, LLC; 110301 N. Enterprise Drive; Mequon, WI 53092; Phone (800) 558-0457, (262) 242-2000; Fax (262) 242-7409; www.supersky.com.

B. Or approved equal.

2.02 MATERIALS

A. Framework:

1. Principal supporting members: 0.125-inch minimum thickness extruded aluminum alloy 6063-T5 or 6061-T6 complying with ASTM B221. Sizes, shapes and profiles as per Super Sky Products standard components unless indicated otherwise in drawings.
2. Snap-on Covers and Miscellaneous Non-supporting Trim: .062-in. minimum thickness extruded aluminum, alloy 6063-T5 per ASTM B221.
3. Principal formed metal members: 0.125-inch minimum thickness aluminum alloy 5052 or 6061-T6 complying with ASTM B209.

B. Glazing Strips:

1. Extruded EDPM rubber designed to comply with the following specifications
 - a. Hardness: ASTM D2240 Type A 50 +5 Durometer.
 - b. Tensile Strength: ASTM D412 800 psi minimum.
 - c. Elongation: 300 percent minimum.
 - d. Color: As selected by the Architect.
2. Compression Set: ASTM D395, 22 hours at 212 degrees F.: 25 percent maximum.
3. Heat Aging Characteristics:
 - a. Seventy hours at 212 degrees F.
 - b. ASTM D2240 hardness change: +3 Durometer.
 - c. ASTM D412 tensile change: -10 percent.
 - d. ASTM D412 elongation change: -20 percent.
4. ASTM D1171 weather-resistance, one part ozone per million, 500 hours at 20 percent elongation to show no cracks.

5. This material shall have no visual checks, cracks or breaks after completion of tests.
- C. Setting Blocks: Extruded setting blocks shall be Type II silicone rubber designed to permit adhesion and complying with the following:
1. Hardness: ASTM D2240 Type A 80 + 5 Durometer.
 2. Color: Black.
- D. Fasteners:
1. Exterior cap retainers: ASTM A193 B8 300 series stainless steel.
 2. Framework connections: ASTM B211 2024-T4 aluminum, ASTM A193 B8 300 stainless steel, and ASTM B316 aluminum rivets as required.
 3. Anchoring to support structure: ASTM A 307 zinc-plated steel fasteners.
 4. Exposed stainless steel truss head mechanical fasteners are utilized in accordance with standard connection details.
- E. Flashing:
1. Flashing shall be preformed 20 gage 5005-H4 aluminum, 0.40-inch minimum thickness, finished to match the skylight rafter caps.
 2. Sheet metal flashings/closures/claddings are to be furnished shop formed to profile in min. 10-ft. lengths. When lengths exceed 10-ft., field trimming of the flashing and field forming the ends is necessary to suit as-built conditions. Sheet metal ends are to overlap 6-in. to 8-in. minimum, set in a full bed of sealant and riveted if required.
- F. Exposed metal finishes – exterior and interior:
1. Coat aluminum components with a PVDF coating system, conforming to AAMA 2605. Color as selected by Architect, from manufacturer's standard colors.
- G. Glass:
1. Standard Certification Requirements:
 - a. Heat Treated Glass: ASTM C1048, with surface stress of 5,000 (+/-) 1500 psi.
 - b. Laminated Glass: Two lites interleaved with polyvinyl butyral (PVB). Units must meet criteria of ANSI Z97.1- 1984 and CPSC 16 CFR 1201 for safety glazing. Provide PVB layer of 0.030-in. for all glass units

unless a coating, and/or frit is applied to the inside face of the laminate thereby necessitating a 0.060-in. PVB layer.

- c. Insulating Glass: CBA rated by the Insulating Glass Certification Council (IGCC) when tested in accordance with ASTM E773 and ASTM E774. Dual edge seals with the secondary seal being silicone. Exterior lite of fully tempered glass and interior lite of laminated glass.
2. Performance Requirements:
 - a. Probability of breakage not to exceed 8/1000 for vertical glass and 1/1000 for sloped glass upon first application of design wind and live load pressures. For glass selection, design wind pressure for a one minute duration. For loads of longer duration use standard engineering practices for glass selection.
 - b. Probability of breakage due to anticipated thermal stress not to exceed 8/1000 for vertical glass and 1/1000 for sloped glass.
 3. Glazing Unit Composition:
 4. Impact Resistant Skylights, special tested glass products are required for laminated and insulated glass. Evidence of tested system, including glass to be provided.
 5. Custom Patterned Glazing: As specified in Section 08 80 00, applied on one side of the exterior glazing.

G. Sealants:

1. Structural joints and non-structural seals shall be high performance silicone sealants installed in accordance with the manufacturer's written recommendations.
2. Non-structural Flush Glazed Joints and Weather Seal Joints: Silicone sealants applied in accordance with manufacturer's recommendations.
3. Structural Sealant Performance Requirements:
 - a. Hardness: ASTM D2240 Type A, 30 Durometer.
 - b. Ultimate tensile strength: ASTM D412, 170 psi.
 - c. Tensile strength at 150 percent elongation: ASTM D412; minimum 80 psi.
 - d. Joint movement capability after 14 day cure: ASTM C719, +50 percent.

e. Peel strength (aluminum, glass concrete) after 21 day cure: ASTM C794, 32 pounds per inch.

4. Structural silicone shall not support dead weight of vertical glass or panel.

2.03 FABRICATION

- A. Construct skylights using extruded aluminum members.
- B. Construct skylights using a continuous curb.
- C. Insofar as practicable, fit and assemble work in the manufacturer's shop. Work which cannot be permanently assembled shall be shop-assembled, marked, and disassembled before shipment to the jobsite.
- D. Design rafter bars for slide-in type spline glazing strips.
- E. Design glass retainer fasteners to resist uplift loadings. Spacing to be determined by structural calculations, when applicable.
- F. Use snap-on beauty caps to conceal glass retainers and glass retainer fasteners.
- G. Shop locate drill and bolt, or weld aluminum clips to framing members.
- H. Set glass with interior and exterior EDPM glazing strips.
- I. Use silicone setting blocks to support glass and to provide edge clearances and glass bites as outlined below, in accordance with FGMA recommendations:
 - 1. Set blocks not less than 6-in. from edge of glass for support unit.
 - 2. Glass Bite: Not less than 1/2-in. nor more than 5/8-in. on any side of glass unit.
 - 3. Maintain 1/4-in. edge clearance between glass and adjacent metal framework.
 - 4. Use rubber spacers to maintain separation of glass and adjacent metal framework.
- J. Locate weepholes in curb to positively drain condensation to exterior of skylight at each rafter connection.

2.05 LEED REQUIREMENTS

- A. IW/PS EDP: Products specified under this section must have a Type III Product Specific EPD or the company must be listed in the industry group responsible for the Industry Wide Externally Verified EPD.

- B. PS EPD: Products specified under this section must have a Type III Product Specific EPD.
- C. HPDs: Products specified under this section must have one of the following unexpired material ingredient reports compliant with LEEDv4.1 requirements and declared to 1000 ppm or less: Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, Cradle to Cradle Health Product Certificate, or UL Product Lens Certification.
- D. Interior Wet Applied Products: All wet-applied on-site paints, coatings, adhesives, and sealants products provided under Part 2 of this specification section must be compliant with the VOC limits outlined under IEQc2: Low Emitting Materials in 01 81 13 Sustainable Design Requirements. In addition, all paints and coatings must be compliant with CDPH Standard Method v1.2-2017 emissions testing with proper unexpired CDPH testing certificates or acceptable third-party certification.

PART 3 - EXECUTION

3.01 FABRICATION

- A. The skylights shall be fabricated with extruded aluminum members of alloys as specified.
- B. Rafter bars shall be of one piece construction.
- C. Rafter bars shall be designed for snap-in type glazing strips.
- D. Clips for the attachment of rafter bars shall be aluminum and shall be shop riveted, bolted, or welded to rafter bars.
- E. Welding shall be performed by the heliarc process. Exposed welds shall be ground flush and smooth.
- F. Waterproofing shall be furnished by means of continuous exterior silicon sealant beads. Seal horizontal flush joints with a continuous silicone sealant bead.
- G. Silicone setting blocks shall be furnished for support of glass and shall be sized and installed in accordance with glass manufacturers written recommendations.
- H. Skylights shall be furnished with weep holes located at lower portion of extruded aluminum curb bar at each rafter connection for drainage of condensation to exterior.
- I. Field cutting or trimming of rafter bars, caps, or glass light is not permitted.
- J. Pressure bars shall be furnished for snap-in type glazing strips and shall have snap-on covers, so no exterior fastener is exposed.

- K. Pressure bars shall be fastened with stainless steel fasteners into a system of alternate serrations. Fasteners shall be furnished so glazing strips are compressed to a predetermined amount of uniform compression. Fasteners shall be installed at 12 inches on center maximum.
- L. Glass shall be installed with exterior silicone glazing strips.
- M. Waterproofing shall be provided by means of continuous exterior silicon sealant beads. Horizontal flush joints require a continuous silicone sealant bead.

3.02 EXAMINATION

- A. Examine the Work to determine that structure and substrate to receive system are properly prepared and ready to receive the Work of this section. Do not proceed until unsatisfactory conditions are corrected.

3.03 PREPARATION

- A. Surfaces to be sealed shall be completely cleaned and dry. Verify and follow sealant manufacturer's written recommendations for proper cleaning, priming, and installation procedures.
- B. Temperatures of the glass and aluminum surfaces shall be above 40 degrees F, during glazing and curing. Temperature range shall not vary more than 10 degrees F during sealant installation and curing.
- C. Install components and glazing under direct observation of the skylight manufacturer's technical representative.

3.04 ISOLATION OF INCOMPATIBLE MATERIALS

- A. Incompatible materials, such as aluminum and steel, shall be isolated from each other. Aluminum shall be furnished with one coat of zinc chromate, one coat bituminous paint, and further protected where required with isolation tape to prevent contact with incompatible materials and metal.

3.05 FIELD QUALITY CONTROL

- A. Water flood test completed skylights in accordance with AAMA 501.1, 501.2 and 501.3.

3.06 CLEAN UP

- A. Remove rubbish, debris and waste materials and legally dispose of off the Project site.

3.07 PROTECTION

- A. Protect the Work of this section until Substantial Completion.

Department of Neighborhood Services and Public Safety
GOLETA TRAIN DEPOT PROJECT

END OF SECTION

SECTION 08 71 00

DOOR HARDWARE

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Mechanical and electrified door hardware
2. Electronic access control system components

B. Section excludes:

1. Windows
2. Cabinets (casework), including locks in cabinets
3. Signage
4. Toilet accessories
5. Overhead doors

C. Related Sections:

1. Division 07 Section "Joint Sealants" for sealant requirements applicable to threshold installation specified in this section.
2. Division 08 Sections:
 - a. "Metal Doors and Frames"
 - b. "Flush Wood Doors"
 - c. "Interior Aluminum Doors and Frames"
 - d. "Aluminum-Framed Entrances and Storefronts"
 - e. "Special Function Doors"
 - f. "Entrances"
3. Division 26 "Electrical" sections for connections to electrical power system and for low-voltage wiring.
4. Division 28 "Electronic Safety and Security" sections for coordination with other components of electronic access control system and fire alarm system.

1.03 SUBMITTALS

A. General:

1. Submit in accordance with Conditions of Contract and Division 01 Submittal Procedures.
2. Prior to forwarding submittal:
 - a. Review drawings and Sections from related trades to verify compatibility with specified hardware.
 - b. Highlight, encircle, or otherwise specifically identify on submittals: deviations from Contract Documents, issues of incompatibility or other issues which may detrimentally affect the Work.

B. Action Submittals:

1. **Product Data:** Submit technical product data for each item of door hardware, installation instructions, maintenance of operating parts and finish, and other information necessary to show compliance with requirements.
2. **Riser and Wiring Diagrams:** After final approval of hardware schedule, submit details of electrified door hardware, indicating:
 - a. **Wiring Diagrams:** For power, signal, and control wiring and including:
 - 1) Details of interface of electrified door hardware and building safety and security systems.
 - 2) Schematic diagram of systems that interface with electrified door hardware.
 - 3) Point-to-point wiring.
 - 4) Risers.
3. **Samples for Verification:** If requested by Architect, submit production sample of requested door hardware unit in finish indicated and tagged with full description for coordination with schedule.
 - a. Samples will be returned to supplier. Units that are acceptable to Architect may, after final check of operations, be incorporated into Work, within limitations of key coordination requirements.
4. **Door Hardware Schedule:**
 - a. Submit concurrent with submissions of Product Data, Samples, and Shop Drawings. Coordinate submission of door hardware schedule with scheduling requirements of other work to facilitate fabrication of other work critical in Project construction schedule.
 - b. Submit under direct supervision of a Door Hardware Institute (DHI) certified Architectural Hardware Consultant (AHC) or Door Hardware Consultant (DHC) with hardware sets in vertical format as illustrated by Sequence of Format for the Hardware Schedule published by DHI.
 - c. Indicate complete designations of each item required for each opening, include:
 - 1) Door Index: door number, heading number, and Architect's hardware set number.
 - 2) Quantity, type, style, function, size, and finish of each hardware item.
 - 3) Name and manufacturer of each item.
 - 4) Fastenings and other pertinent information.
 - 5) Location of each hardware set cross-referenced to indications on Drawings.
 - 6) Explanation of all abbreviations, symbols, and codes contained in schedule.
 - 7) Mounting locations for hardware.
 - 8) Door and frame sizes and materials.
 - 9) Degree of door swing and handing.

10) Operational Description of openings with electrified hardware covering egress, ingress (access), and fire/smoke alarm connections.

5. Key Schedule:

- a. After Keying Conference, provide keying schedule that includes levels of keying, explanations of key system's function, key symbols used, and door numbers controlled.
- b. Use ANSI/BHMA A156.28 "Recommended Practices for Keying Systems" as guideline for nomenclature, definitions, and approach for selecting optimal keying system.
- c. Provide 3 copies of keying schedule for review prepared and detailed in accordance with referenced DHI publication. Include schematic keying diagram and index each key to unique door designations.
- d. Index keying schedule by door number, keyset, hardware heading number, cross keying instructions, and special key stamping instructions.
- e. Provide one complete bitting list of key cuts and one key system schematic illustrating system usage and expansion. Forward bitting list, key cuts and key system schematic directly to Owner, by means as directed by Owner.
- f. Prepare key schedule by or under supervision of supplier, detailing Owner's final keying instructions for locks.

C. Informational Submittals:

1. Provide Qualification Data for Supplier, Installer and Architectural Hardware Consultant.
2. Provide Product Data:
 - a. Certify that door hardware approved for use on types and sizes of labeled fire-rated doors complies with listed fire-rated door assemblies.
 - b. Include warranties for specified door hardware.

D. Closeout Submittals:

1. Operations and Maintenance Data: Provide in accordance with Division 01 and include:
 - a. Complete information on care, maintenance, and adjustment; data on repair and replacement parts, and information on preservation of finishes.
 - b. Catalog pages for each product.
 - c. Final approved hardware schedule edited to reflect conditions as installed.
 - d. Final keying schedule
 - e. Copy of warranties including appropriate reference numbers for manufacturers to identify project.
 - f. As-installed wiring diagrams for each opening connected to power, both low voltage and 110 volts.

E. Inspection and Testing:

1. Submit written reports to the Owner and Authority Having Jurisdiction (AHJ) of the results of functional testing and inspection for:
 - a. Fire door assemblies, in compliance with NFPA 80.
 - b. Required egress door assemblies, in compliance with NFPA 101.

F. LEED Submittals: Complete the LEED Material Buyout Form (MBoF) with all materials provided to the project. A complete submittal includes providing all material costs in the MBoF and all of the supporting documentation for the following credits:

1. MRc2 - Environmental Product Declarations (EPD): Provide Industry-Wide or Product-Specific EPD.
2. MRc3 - Sourcing of Raw Materials - Recycled Content: Provide product data for pre- and post- consumer recycled content.
3. MRc4 - Material Ingredients: Provide manufacturers Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, or Cradle to Cradle Health Product Certificate.
4. IEQc2 - Low-Emitting Materials – Interior Wet Applied Products: For paints, coatings, adhesives and sealants applied on site or used for laminating off-site, include product data indicating the VOC content (g/L) and testing.

1.04 QUALITY ASSURANCE

A. Qualifications and Responsibilities:

1. Supplier: Recognized architectural hardware supplier with a minimum of 5 years documented experience supplying both mechanical and electromechanical door hardware similar in quantity, type, and quality to that indicated for this Project. Supplier to be recognized as a factory direct distributor by the manufacturer of the primary materials with a warehousing facility in the Project's vicinity. Supplier to have on staff, a certified Architectural Hardware Consultant (AHC) or Door Hardware Consultant (DHC) available to Owner, Architect, and Contractor, at reasonable times during the Work for consultation.
2. Installer: Qualified tradesperson skilled in the application of commercial grade hardware with experience installing door hardware similar in quantity, type, and quality as indicated for this Project.
3. Architectural Hardware Consultant: Person who is experienced in providing consulting services for door hardware installations that are comparable in material, design, and extent to that indicated for this Project and meets these requirements:
 - a. For door hardware: DHI certified AHC or DHC.
 - b. Can provide installation and technical data to Architect and other related subcontractors.
 - c. Can inspect and verify components are in working order upon completion of installation.
 - d. Capable of producing wiring diagram and coordinating installation of electrified hardware with Architect and electrical engineers.
4. Single Source Responsibility: Obtain each type of door hardware from single manufacturer.

B. Certifications:

1. Fire-Rated Door Openings:
 - a. Provide door hardware for fire-rated openings that complies with NFPA 80 and requirements of authorities having jurisdiction.
 - b. Provide only items of door hardware that are listed products tested by UL LLC, Intertek Testing Services, or other testing and inspecting organizations acceptable to authorities having jurisdiction for use on types and sizes of doors indicated, based on testing at positive pressure and according to NFPA 252 or UL 10C and in compliance with requirements of fire-rated door and door frame labels.
2. Smoke and Draft Control Door Assemblies:
 - a. Provide door hardware that meets requirements of assemblies tested according to UL 1784 and installed in compliance with NFPA 105

- b. Comply with the maximum air leakage of 0.3 cfm/sq. ft. (3 cu. m per minute/sq. m) at tested pressure differential of 0.3-inch wg (75 Pa) of water.
 3. Electrified Door Hardware
 - a. Listed and labeled as defined in NFPA 70, Article 100, by testing agency acceptable to authorities having jurisdiction.
 4. Accessibility Requirements:
 - a. Comply with governing accessibility regulations cited in "REFERENCES" Section 08 71 00, herein for door hardware on doors in an accessible route. This project must comply with all Federal Americans with Disability Act regulations and all Local Accessibility Regulations.
- C. Pre-Installation Meetings
1. Keying Conference
 - a. Incorporate keying conference decisions into final keying schedule after reviewing door hardware keying system including:
 - 1) Function of building, flow of traffic, purpose of each area, degree of security required, and plans for future expansion.
 - 2) Preliminary key system schematic diagram.
 - 3) Requirements for key control system.
 - 4) Requirements for access control.
 - 5) Address for delivery of keys.
 2. Pre-installation Conference
 - a. Review and finalize construction schedule and verify availability of materials, Installer's personnel, equipment, and facilities needed to make progress and avoid delays.
 - b. Inspect and discuss preparatory work performed by other trades.
 - c. Inspect and discuss electrical roughing-in for electrified door hardware.
 - d. Review sequence of operation for each type of electrified door hardware.
 - e. Review required testing, inspecting, and certifying procedures.
 - f. Review questions or concerns related to proper installation and adjustment of door hardware.
 3. Electrified Hardware Coordination Conference:
 - a. Prior to ordering electrified hardware, schedule and hold meeting to coordinate door hardware with security, electrical, doors and frames, and other related suppliers.

1.05 DELIVERY, STORAGE, AND HANDLING

- A. Inventory door hardware on receipt and provide secure lock-up for hardware delivered to Project site. Promptly replace products damaged during shipping.
- B. Tag each item or package separately with identification coordinated with final door hardware schedule, and include installation instructions, templates, and necessary fasteners with each item or package. Deliver each article of hardware in manufacturer's original packaging.
- C. Maintain manufacturer-recommended environmental conditions throughout storage and installation periods.
- D. Provide secure lock-up for door hardware delivered to Project. Control handling and installation of hardware items so that completion of Work will not be delayed by hardware losses both before and after installation.
- E. Handle hardware in manner to avoid damage, marring, or scratching. Correct, replace or repair products damaged during Work. Protect products against malfunction due to paint, solvent, cleanser, or any chemical agent.
- F. Deliver keys to manufacturer of key control system for subsequent delivery to Owner.

1.06 COORDINATION

- A. Coordinate layout and installation of floor-recessed door hardware with floor construction. Cast anchoring inserts into concrete.
- B. Installation Templates: Distribute for doors, frames, and other work specified to be factory or shop prepared. Check Shop Drawings of other work to confirm that adequate provisions are made for locating and installing door hardware to comply with indicated requirements.
- C. Security: Coordinate installation of door hardware, keying, and access control with Owner's security consultant.
- D. Electrical System Roughing-In: Coordinate layout and installation of electrified door hardware with connections to power supplies and building safety and security systems.

1.07 WARRANTY

- A. Manufacturer's standard form in which manufacturer agrees to repair or replace components of door hardware that fail in materials or workmanship within published warranty period.

1. Warranty does not cover damage or faulty operation due to improper installation, improper use or abuse.
2. Warranty Period: Beginning from date of Substantial Completion, for durations indicated in manufacturer's published listings.
 - a. Mechanical Warranty
 - 1) Locks
 - a) Schlage L Series: 3 years
 - 2) Exit Devices
 - a) Von Duprin: 3 years
 - 3) Closers
 - a) LCN 4000 Series: 30 years
 - 4) Automatic Operators
 - a) LCN: 2 years

1.08 MAINTENANCE

- A. Furnish complete set of special tools required for maintenance and adjustment of hardware, including changing of cylinders.
- B. Turn over unused materials to Owner for maintenance purposes.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

- A. Approval of manufacturers and/or products other than those listed as "Scheduled Manufacturer" or "Acceptable Manufacturers" in the individual article for the product category shall be in accordance with QUALITY ASSURANCE article, herein.
- B. Approval of products from manufacturers indicated in "Acceptable Manufacturers" is contingent upon those products providing all functions and features and meeting all requirements of scheduled manufacturer's product.
- C. Where specified hardware is not adaptable to finished shape or size of members requiring hardware, furnish suitable types having same operation and quality as type specified, subject to Architect's approval.

2.02 MATERIALS

- A. Fabrication

1. Provide door hardware manufactured to comply with published templates generally prepared for machine, wood, and sheet metal screws. provide screws according to manufacturer's recognized installation standards for application intended.
 2. Finish exposed screws to match hardware finish, or, if exposed in surfaces of other work, to match finish of this other work including prepared for paint surfaces to receive painted finish.
 3. Provide concealed fasteners wherever possible for hardware units exposed when door is closed. Coordinate with "Metal Doors and Frames", "Flush Wood Doors", "Stile and Rail Wood Doors" to ensure proper reinforcements. Advise the Architect where visible fasteners, such as thru bolts, are required.
- B. Provide screws, bolts, expansion shields, drop plates and other devices necessary for hardware installation.
1. Where fasteners are exposed to view: Finish to match adjacent door hardware material.
- C. Cable and Connectors:
1. Where scheduled in the hardware sets, provide each item of electrified hardware and wire harnesses with number and gage of wires enough to accommodate electric function of specified hardware.
 2. Provide Molex connectors that plug directly into connectors from harnesses, electric locking and power transfer devices.
 3. Provide through-door wire harness for each electrified locking device installed in a door and wire harness for each electrified hinge, electrified continuous hinge, electrified pivot, and electric power transfer for connection to power supplies.

2.03 HINGES

A. Manufacturers and Products:

1. Scheduled Manufacturer and Product:
 - a. Ives 5BB series

B. Requirements:

1. Provide hinges conforming to ANSI/BHMA A156.1.
2. Provide five knuckle, ball bearing hinges.
3. 1-3/4 inch (44 mm) thick doors, up to and including 36 inches (914 mm) wide:
 - a. Exterior: Standard weight, bronze or stainless steel, 4-1/2 inches (114 mm) high
 - b. Interior: Standard weight, steel, 4-1/2 inches (114 mm) high
4. 1-3/4 inch (44 mm) thick doors over 36 inches (914 mm) wide:
 - a. Exterior: Heavy weight, bronze/stainless steel, 5 inches (127 mm) high

- b. Interior: Heavy weight, steel, 5 inches (127 mm) high
5. 2 inches or thicker doors:
 - a. Exterior: Heavy weight, bronze or stainless steel, 5 inches (127 mm) high
 - b. Interior: Heavy weight, steel, 5 inches (127 mm) high
6. Adjust hinge width for door, frame, and wall conditions to allow proper degree of opening.
7. Provide three hinges per door leaf for doors 90 inches (2286 mm) or less in height, and one additional hinge for each 30 inches (762 mm) of additional door height.
8. Hinge Pins: Except as otherwise indicated, provide hinge pins as follows:
 - a. Steel Hinges: Steel pins
 - b. Non-Ferrous Hinges: Stainless steel pins
 - c. Out-Swinging Exterior Doors: Non-removable pins
 - d. Out-Swinging Interior Lockable Doors: Non-removable pins
 - e. Interior Non-lockable Doors: Non-rising pins
9. Provide hinges with electrified options as scheduled in the hardware sets. Provide with number and gage of wires enough to accommodate electric function of specified hardware. Locate electric hinge at second hinge from bottom or nearest to electrified locking component. Provide mortar guard for each electrified hinge specified.

2.04 PIVOT SETS

A. Manufacturers:

1. Scheduled Manufacturer:
 - a. Ives

B. Requirements:

1. Provide pivot sets complete with oil-impregnated top pivot, unless indicated otherwise.
2. Where offset pivots are specified, Provide one intermediate pivot for doors less than 91 inches (2311 mm) high and one additional intermediate pivot per leaf for each additional 30 inches (762 mm) in height or fraction thereof. Intermediate pivots spaced equally not less than 25 inches (635 mm) or not more than 35 inches (889 mm) on center, for doors over 121 inches (3073 mm) high.
3. Provide appropriate model where pivot sets are scheduled at fire rated openings.

4. Provide pivots with electrified options as scheduled in the hardware sets. Provide with number and gage of wires enough to accommodate electric function of specified hardware. Locate electrified pivot nearest to electrified locking component. If manufacturer of electrified locking component requires another device for power transfer, then provide recommended power transfer device and appropriate quantity of pivots.
5. Provide mortar guard for each electric pivot specified, unless specified in hollow metal frame specification.

2.05 FLUSH BOLTS

A. Manufacturers:

1. Scheduled Manufacturer:
 - a. Ives

B. Requirements:

1. Provide automatic, constant latching, and manual flush bolts with forged bronze or stainless-steel face plates, extruded brass levers, and with wrought brass guides and strikes. Provide 12 inch (305 mm) steel or brass rods at doors up to 90 inches (2286 mm) in height. For doors over 90 inches (2286 mm) in height increase top rods by 6 inches (152 mm) for each additional 6 inches (152 mm) of door height. Provide dust-proof strikes at each bottom flush bolt.

2.06 COORDINATORS

A. Manufacturers:

1. Scheduled Manufacturer:
 - a. Ives

B. Requirements:

1. Where pairs of doors are equipped with automatic flush bolts, an astragal, or other hardware that requires synchronized closing of the doors, provide bar-type coordinating device, surface applied to underside of stop at frame head.
2. Provide filler bar of correct length for unit to span entire width of opening, and appropriate brackets for parallel arm door closers, surface vertical rod exit device strikes, or other stop mounted hardware. Factory-prepared coordinators for vertical rod devices as specified.

2.07 MORTISE LOCKS

A. Manufacturers and Products:

1. Scheduled Manufacturer and Product:
 - a. Schlage L9000 series

B. Requirements:

1. Provide mortise locks conforming to ANSI/BHMA A156.13 Series 1000, Grade 1, and UL Listed for 3-hour fire doors.
2. Indicators: Where specified, provide indicator window measuring a minimum 2-inch x 1/2 inch with 180-degree visibility. Provide messages color-coded with full text and/or symbols, as scheduled, for easy visibility.
3. Provide locks manufactured from heavy gauge steel, containing components of steel with a zinc dichromate plating for corrosion resistance.
4. Provide lock case that is multi-function and field reversible for handing without opening case. Cylinders: Refer to "KEYING" article, herein.
5. Provide locks with standard 2-3/4 inches (70 mm) backset with full 3/4 inch (19 mm) throw stainless steel mechanical anti-friction latchbolt. Provide deadbolt with full 1-inch (25 mm) throw, constructed of stainless steel.
6. Provide standard ASA strikes unless extended lip strikes are necessary to protect trim. Provide electrified options as scheduled in the hardware sets. Where scheduled, provide switches and sensors integrated into the locks and latches.
7. Provide motor based electrified locksets that comply with the following requirements:
 - a. Universal input voltage – single chassis accepts 12 or 24VDC to allow for changes in the field without changing lock chassis.
 - b. Fail Safe/Fail Secure – changing mode between electrically locked (fail safe) and electrically unlocked (fail secure) is field selectable without opening the lock case.
 - c. Low maximum current draw – maximum 0.4 amps to allow for multiple locks on a single power supply.
 - d. Low holding current – maximum 0.01 amps to produce minimal heat, eliminate “hot levers” in electrically locked applications, and to provide reliable operation in wood doors that provide minimal ventilation and air flow.
 - e. Connections – provide quick-connect Molex system standard.
8. Lever Trim: Solid brass, bronze, or stainless steel, cast or forged in design specified, with wrought roses and external lever spring cages. Provide thru-bolted levers with 2-piece spindles.
 - a. Provide levers that return to within 1/2 inch (13 mm) of door face.
 - b. Vandlgard: Provide levers with vandal resistant technology for use at heavy traffic or abusive applications.
 - c. Lever Design: Per Schedule.

2.08 DEADBOLTS

A. Manufacturers and Products:

1. Scheduled Manufacturer and Product:
 - a. Schlage B600/B700/B800 Series

B. Requirements:

1. Provide grade 1 deadbolt series conforming to ANSI/BHMA A156.
2. Cylinders: Refer to "KEYING" article, herein.
3. Provide deadbolts with standard 2-3/4 inches (70 mm) backset. Provide 2-3/8 inches (60 mm) where noted or if door or frame detail requires. Provide deadbolt with full 1-inch (25 mm) throw, constructed of steel alloy.
4. Provide manufacturer's standard strike.

2.09 EXIT DEVICES

A. Manufacturers and Products:

1. Scheduled Manufacturer and Product:
 - a. Von Duprin 98/35A series

B. Requirements:

1. Provide exit devices tested to ANSI/BHMA A156.3 Grade 1 and UL listed for Panic Exit or Fire Exit Hardware.
2. Cylinders: Refer to "KEYING" article, herein.
3. Provide smooth touchpad type exit devices, fabricated of brass, bronze, stainless steel, or aluminum, plated to standard architectural finishes to match balance of door hardware.
4. Touchpad must extend a minimum of one half of door width. No plastic inserts are allowed in touchpads.
5. Provide exit devices with deadlatching feature for security and for future addition of alarm kits and/or other electrified requirements.
6. Provide exit devices with weather resistant components that can withstand harsh conditions of various climates and corrosive cleaners used in outdoor pool environments.
7. Provide flush end caps for exit devices.
8. Provide exit devices with manufacturer's approved strikes.
9. Provide exit devices cut to door width and height. Install exit devices at height recommended by exit device manufacturer, allowable by governing building codes, and approved by Architect.
10. Mount mechanism case flush on face of doors or provide spacers to fill gaps behind devices. Where glass trim or molding projects off face of door, provide glass bead kits.
11. Provide cylinder or hex-key dogging as specified at non fire-rated openings.

12. Removable Mullions: 2 inches (51 mm) x 3 inches (76 mm) steel tube. Where scheduled as keyed removable mullion, provide type that can be removed by use of a keyed cylinder, which is self-locking when re-installed.
13. Provide factory drilled weep holes for exit devices used in full exterior application, highly corrosive areas, and where noted in hardware sets.
14. Provide electrified options as scheduled.
15. Top latch mounting: double- or single-tab mount for steel doors, face mount for aluminum doors eliminating requirement of tabs, and double tab mount for wood doors.
16. Provide exit devices with optional trim designs to match other lever and pull designs used on the project.
 - a. Provide levers that return to within 1/2 inch (13 mm) of door face.
17. Accessibility: Require not more than 5 lb. to retract the latchbolt, per CBC 2019 11B-404.2.7 and 11B-309.4.
 - a. Mechanical method: Von Duprin AX feature, where touchpad directly retracts the latchbolt with 5 lb. or less of force. Provide testing lab certification confirming that the mechanical device is independent third-party tested to meet this 5 lb. requirement.
 - b. Electrical method: Von Duprin's RX-QEL feature, where lightly pressing the touchpad with 5 lb. or less of force closes an electric switch, activating quiet electric latch retraction.

2.10 KEYSWITCHES

A. Manufacturers and Products:

1. Scheduled Manufacturer and Product:
 - a. Schlage 650 series

B. Requirements:

1. Provide key switches capable of being configured to momentary or maintained action.
2. Provide key switches that accept a mortise cylinder. Cylinders: Refer to "KEYING" article, herein.

2.11 CYLINDERS

A. Manufacturers and Products:

1. Scheduled Manufacturer and Product:
 - a. Schlage Everest 29 S

B. Requirements:

1. Provide cylinders/cores compliant with ANSI/BHMA A156.5; latest revision; cylinder face finished to match lockset; manufacturer's series as indicated. Refer to "KEYING" article, herein.
2. Provide cylinders in the below-listed configuration(s), distributed throughout the Project as indicated.
 - a. Conventional Patented Open: cylinder with permanent core with open keyway.
 - b. Conventional Patented Open: cylinder with interchangeable core with open keyway.
3. Patent Protection: Cylinders/cores requiring use of restricted, patented keys, patent protected.
4. Nickel silver bottom pins.

2.12 KEYING

A. Scheduled System:

1. New factory registered system:
 - a. Provide a factory registered keying system, complying with guidelines in ANSI/BHMA A156.28, incorporating decisions made at keying conference.

B. Requirements:

1. Construction Keying:
 - a. Replaceable Construction Cores.
 - 1) Provide temporary construction cores replaceable by permanent cores, furnished in accordance with the following requirements.
 - a) 3 construction control keys
 - b) 12 construction change (day) keys.
 - 2) Owner or Owner's Representative will replace temporary construction cores with permanent cores.
2. Permanent Keying:
 - a. Provide permanent cylinders/cores keyed by the manufacturer according to the following key system.
 - 1) Master Keying system as directed by the Owner.
 - b. Forward biting list and keys separately from cylinders, by means as directed by Owner. Failure to comply with forwarding requirements will be cause for replacement of cylinders/cores involved at no additional cost to Owner.
 - c. Provide keys with the following features:
 - 1) Material: Nickel silver; minimum thickness of .107-inch (2.3mm)
 - 2) Patent Protection: Keys and blanks protected by one or more utility patent(s).
 - d. Identification:

- 1) Mark permanent cylinders/cores and keys with applicable blind code for identification. Do not provide blind code marks with actual key cuts.
 - 2) Identification stamping provisions must be approved by the Architect and Owner.
 - 3) Stamp cylinders/cores and keys with Owner's unique key system facility code as established by the manufacturer; key symbol and embossed or stamped with "DO NOT DUPLICATE" along with the "PATENTED" or patent number to enforce the patent protection.
 - 4) Failure to comply with stamping requirements will be cause for replacement of keys involved at no additional cost to Owner.
 - 5) Forward permanent cylinders/cores to Owner, separately from keys, by means as directed by Owner.
- e. Quantity: Furnish in the following quantities.
- 1) Change (Day) Keys: 3 per cylinder/core.
 - 2) Permanent Control Keys: 3.
 - 3) Master Keys: 6.

2.13 KEY CONTROL SYSTEM

A. Manufacturers:

1. Scheduled Manufacturer:
 - a. Telkee

B. Requirements:

1. Provide key control system, including envelopes, labels, tags with self-locking key clips, receipt forms, 3-way visible card index, temporary markers, permanent markers, and standard metal cabinet, all as recommended by system manufacturer, with capacity for 150% of number of locks required for Project.
 - a. Provide complete cross index system set up by hardware supplier, and place keys on markers and hooks in cabinet as determined by final key schedule.
 - b. Provide hinged-panel type cabinet for wall mounting.

2.14 DOOR CLOSERS

A. Manufacturers and Products:

1. Scheduled Manufacturer and Product:
 - a. LCN 4040XP series

B. Requirements:

1. Provide door closers conforming to ANSI/BHMA A156.4 Grade 1 requirements by BHMA certified independent testing laboratory. ISO 9000 certify closers. Stamp units with date of manufacture code.
2. Provide door closers with fully hydraulic, full rack and pinion action with high strength cast iron cylinder, and full complement bearings at shaft.
3. Cylinder Body: 1-1/2-inch (38 mm) diameter piston with 5/8-inch (16 mm) diameter double heat-treated pinion journal. QR code with a direct link to maintenance instructions.
4. Hydraulic Fluid: Fireproof, passing requirements of UL10C, and requiring no seasonal closer adjustment for temperatures ranging from 120 degrees F to -30 degrees F.
5. Spring Power: Continuously adjustable over full range of closer sizes, and providing reduced opening force as required by accessibility codes and standards. Provide snap-on cover clip, with plastic covers, that secures cover to spring tube.
6. Hydraulic Regulation: By tamper-proof, non-critical valves, with separate adjustment for latch speed, general speed, and backcheck. Provide graphically labelled instructions on the closer body adjacent to each adjustment valve. Provide positive stop on reg valve that prevents reg screw from being backed out.
7. Provide closers with solid forged steel main arms and factory assembled heavy-duty forged forearms for parallel arm closers.
8. Pressure Relief Valve (PRV) Technology: Not permitted.
9. Finish for Closer Cylinders, Arms, Adapter Plates, and Metal Covers: Powder coating finish which has been certified to exceed 100 hours salt spray testing as described in ANSI Standard A156.4 and ASTM B117, or has special rust inhibitor (SRI).
10. Provide special templates, drop plates, mounting brackets, or adapters for arms as required for details, overhead stops, and other door hardware items interfering with closer mounting.

2.15 ELECTRO-MECHANICAL AUTOMATIC OPERATORS

A. Manufacturers and Products:

1. Scheduled Manufacturer and Product:
 - a. LCN Senior Swing

B. Requirements:

1. Provide low energy automatic operator units that are electro-mechanical design complying with ANSI/BHMA A156.19.
 - a. Opening: Powered by DC motor working through reduction gears.
 - b. Closing: Spring force.
 - c. Manual, hydraulic, or chain drive closers: Not permitted.
 - d. Operation: Motor is off when door is in closing mode. Door can be manually operated with power on or off without damage to operator. Provide variable adjustments, including opening and closing speed adjustment.

- e. Cover: Aluminum.
2. Provide units with manual off/auto/hold-open switch, push and go function to activate power operator, vestibule interface delay, electric lock delay, hold-open delay adjustable from 1 to 32 seconds, and logic terminal to interface with accessories, mats, and sensors.
3. Provide drop plates, brackets, and adapters for arms as required to suit details.
4. Provide motion sensors and/or actuator switches, and receivers for operation as specified. Provide weather-resistant actuators at exterior applications.
5. Provide key switches, with LED's, recommended and approved by manufacturer of automatic operator as required for function as described in operation description of hardware sets. Cylinders: Refer to "KEYING" article, herein.
6. Provide complete assemblies of controls, switches, power supplies, relays, and parts/material recommended and approved by manufacturer of automatic operator for each individual leaf. Actuators control both doors simultaneously at pairs. Sequence operation of exterior and vestibule doors with automatic operators to allow ingress or egress through both sets of openings as directed by Architect. Locate actuators, key switches, and other controls as directed by Architect.

2.16 DOOR TRIM

A. Manufacturers:

1. Scheduled Manufacturer:
 - a. Ives

B. Requirements:

1. Provide push plates, push bars, pull plates, pulls, and hands-free reversible door pulls with diameter and length as scheduled.

2.17 PROTECTION PLATES

A. Manufacturers:

1. Scheduled Manufacturer:
 - a. Ives

B. Requirements:

1. Provide protection plates with a minimum of 0.050 inch (1 mm) thick, beveled four edges as scheduled. Furnish with sheet metal or wood screws, finished to match plates.

2. Sizes plates 2 inches (51 mm) less width of door on single doors, pairs of doors with a mullion, and doors with edge guards. Size plates 1 inch (25 mm) less width of door on pairs without a mullion or edge guards.
3. At fire rated doors, provide protection plates over 16 inches high with UL label.

2.18 OVERHEAD STOPS AND OVERHEAD STOP/HOLDERS

A. Manufacturers:

1. Scheduled Manufacturers:
 - a. Glynn-Johnson

B. Requirements:

1. Provide overhead stop at any door where conditions do not allow for a wall stop or floor stop presents tripping hazard.
2. Provide friction type at doors without closer and positive type at doors with closer.

2.19 DOOR STOPS AND HOLDERS

A. Manufacturers:

1. Scheduled Manufacturer:
 - a. Ives

B. Provide door stops at each door leaf:

1. Provide wall stops wherever possible. Provide concave type where lockset has a push button or thumbturn.
2. Where a wall stop cannot be used, provide universal floor stops.
3. Where wall or floor stop cannot be used, provide overhead stop.
4. Provide roller bumper where doors open into each other and overhead stop cannot be used.

2.20 THRESHOLDS, SEALS, DOOR SWEEPS, AUTOMATIC DOOR BOTTOMS, AND GASKETING

A. Manufacturers:

1. Scheduled Manufacturer:
 - a. Zero International

B. Requirements:

1. Provide thresholds, weather-stripping, and gasketing systems as specified and per architectural details. Match finish of other items.
2. Smoke- and Draft-Control Door Assemblies: Where smoke- and draft-control door assemblies are required, provide door hardware that meets requirements of assemblies tested according to UL 1784 and installed in compliance with NFPA 105.
3. Provide door sweeps, seals, astragals, and auto door bottoms only of type where resilient or flexible seal strip is easily replaceable and readily available.
4. Size thresholds 1/2 inch (13 mm) high by 5 inches (127 mm) wide by door width unless otherwise specified in the hardware sets or detailed in the drawings.

2.21 SILENCERS

A. Manufacturers:

1. Scheduled Manufacturer:
 - a. Ives

B. Requirements:

1. Provide "push-in" type silencers for hollow metal or wood frames.
2. Provide one silencer per 30 inches (762 mm) of height on each single frame, and two for each pair frame.
3. Omit where gasketing is specified.

2.22 FINISHES

A. FINISH: BHMA 626/652 (US26D); EXCEPT:

1. Hinges at Exterior Doors: BHMA 630 (US32D)
2. Aluminum Geared Continuous Hinges: BHMA 628 (US28)
3. Push Plates, Pulls, and Push Bars: BHMA 630 (US32D)
4. Protection Plates: BHMA 630 (US32D)
5. Overhead Stops and Holders: BHMA 630 (US32D)
6. Door Closers: Powder Coat to Match
7. Wall Stops: BHMA 630 (US32D)
8. Latch Protectors: BHMA 630 (US32D)
9. Weatherstripping: Clear Anodized Aluminum
10. Thresholds: Mill Finish Aluminum

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Prior to installation of hardware, examine doors and frames, with Installer present, for compliance with requirements for installation tolerances, labeled fire-rated door assembly construction, wall and floor construction, and other conditions affecting performance. Verify doors, frames, and walls have been properly reinforced for hardware installation.
- B. Examine roughing-in for electrical power systems to verify actual locations of wiring connections before electrified door hardware installation.
- C. Submit a list of deficiencies in writing and proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION

- A. Mount door hardware units at heights to comply with the following, unless otherwise indicated or required to comply with governing regulations.
 - 1. Standard Steel Doors and Frames: ANSI/SDI A250.8.
 - 2. Custom Steel Doors and Frames: HMMA 831.
 - 3. Interior Architectural Wood Flush Doors: ANSI/WDMA I.S. 1A
 - 4. Installation Guide for Doors and Hardware: DHI TDH-007-20
- B. Install door hardware in accordance with NFPA 80, NFPA 101 and provide post-install inspection, testing as specified in section 1.03.E unless otherwise required to comply with governing regulations.
- C. Install each hardware item in compliance with manufacturer's instructions and recommendations, using only fasteners provided by manufacturer.
- D. Do not install surface mounted items until finishes have been completed on substrate. Protect all installed hardware during painting.
- E. Set units level, plumb and true to line and location. Adjust and reinforce attachment substrate as necessary for proper installation and operation.
- F. Drill and countersink units that are not factory prepared for anchorage fasteners. Space fasteners and anchors according to industry standards.
- G. Install operating parts so they move freely and smoothly without binding, sticking, or excessive clearance.
- H. Hinges: Install types and in quantities indicated in door hardware schedule but not fewer than quantity recommended by manufacturer for application indicated.
- I. Lock Cylinders:

1. Install construction cores to secure building and areas during construction period.
 2. Replace construction cores with permanent cores as indicated in keying section.
 3. Furnish permanent cores to Owner for installation.
- J. Wiring: Coordinate with Division 26, ELECTRICAL and Division 28 ELECTRONIC SAFETY AND SECURITY sections for:
1. Conduit, junction boxes and wire pulls.
 2. Connections to and from power supplies to electrified hardware.
 3. Connections to fire/smoke alarm system and smoke evacuation system.
 4. Connection of wire to door position switches and wire runs to central room or area, as directed by Architect.
 5. Connections to panel interface modules, controllers, and gateways.
 6. Testing and labeling wires with Architect's opening number.
- K. Key Control System: Tag keys and place them on markers and hooks in key control system cabinet, as determined by final keying schedule.
- L. Door Closers: Mount closers on room side of corridor doors, inside of exterior doors, and stair side of stairway doors from corridors. Mount closers so they are not visible in corridors, lobbies and other public spaces unless approved by Architect.
- M. Closer/holders: Mount closer/holders on room side of corridor doors, inside of exterior doors, and stair side of stairway doors.
- N. Power Supplies: Locate power supplies as indicated or, if not indicated, above accessible ceilings or in equipment room, or alternate location as directed by Architect.
- O. Thresholds: Set thresholds in full bed of sealant complying with requirements specified in Division 07 Section "Joint Sealants."
- P. Stops: Provide floor stops for doors unless wall or other type stops are indicated in door hardware schedule. Do not mount floor stops where they may impede traffic or present tripping hazard.
- Q. Perimeter Gasketing: Apply to head and jamb, forming seal between door and frame.
- R. Meeting Stile Gasketing: Fasten to meeting stiles, forming seal when doors are closed.
- S. Door Bottoms and Sweeps: Apply to bottom of door, forming seal with threshold when door is closed.

3.03 ADJUSTING

- A. Initial Adjustment: Adjust and check each operating item of door hardware and each door to ensure proper operation or function of every unit. Replace units that cannot be adjusted to operate as intended. Adjust door control devices to compensate for final operation of heating and ventilating equipment and to comply with referenced accessibility requirements.
 - 1. Spring Hinges: Adjust to achieve positive latching when door can close freely from an open position of 30 degrees.
 - 2. Electric Strikes: Adjust horizontal and vertical alignment of keeper to properly engage lock bolt.
 - 3. Door Closers: Adjust sweep period to comply with accessibility requirements and requirements of authorities having jurisdiction.

- B. Occupancy Adjustment: Approximately three to six months after date of Substantial Completion, examine and readjust each item of door hardware, including adjusting operating forces, as necessary to ensure function of doors and door hardware.

3.04 CLEANING AND PROTECTION

- A. Clean adjacent surfaces soiled by door hardware installation.
- B. Clean operating items per manufacturer's instructions to restore proper function and finish.
- C. Provide final protection and maintain conditions that ensure door hardware is without damage or deterioration at time of Substantial Completion.

3.05 DOOR HARDWARE SCHEDULE

- A. The intent of the hardware specification is to specify the hardware for interior and exterior doors, and to establish a type, continuity, and standard of quality. However, it is the door hardware supplier's responsibility to thoroughly review existing conditions, schedules, specifications, drawings, and other Contract Documents to verify the suitability of the hardware specified.
- B. Discrepancies, conflicting hardware, and missing items are to be brought to the attention of the architect with corrections made prior to the bidding process. Omitted items not included in a hardware set should be scheduled with the appropriate additional hardware required for proper application.
- C. Hardware items are referenced in the following hardware schedule. Refer to the above specifications for special features, options, cylinders/keying, and other requirements.
- D. Hardware Sets:

Hardware Group No. 01

END OF SECTION

SECTION 08 80 00

GLAZING

PART 1 - GENERAL

1.01. SUMMARY

A. Section Includes:

1. Glass and glazing as indicated.

B. Related Requirements:

1. Division 01 - General Requirements.
2. Section 08 41 12 - Aluminum Entrances and Storefronts.
3. Section 08 51 13 - Aluminum Windows.
4. Section 08 71 00 - Door Hardware.

1.02. SUBMITTALS

A. Product Data: Submit manufacturer's descriptive literature and installation recommendations for glass, glazing, and accessories.

B. Material Samples: Submit 6-inch square units of each type of glass specified.

C. LEED Submittals: Complete the LEED Material Buyout Form (MBoF) with all materials provided to the project. A complete submittal includes providing all material costs in the MBoF and all of the supporting documentation for the following credits:

1. MRc2 - Environmental Product Declarations (EPD): Provide Industry-Wide or Product-Specific EPD.
2. MRc3 - Sourcing of Raw Materials - Recycled Content: Provide product data for pre- and post- consumer recycled content.
3. MRc4 - Material Ingredients: Provide manufacturers Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, or Cradle to Cradle Health Product Certificate.
4. IEQc2 - Low-Emitting Materials – Interior Wet Applied Products: For paints, coatings, adhesives and sealants applied on site or used for laminating off-site, include product data indicating the VOC content (g/L) and testing.

1.03. QUALITY ASSURANCE

- A. Labeling: Label each piece of glass and glazing and mirrors with manufacturer's name, and the grade or quality of the material. Labels shall be intact before and after installation. Fire-protection-rated glazing shall bear a label or other identification in accordance to the CBC.
- B. Comply with the following as a minimum requirement:
 - 1. ASTM C864 - Standard Specification for Dense Elastomeric Compression Seal Gaskets, Setting Blocks, and Spacers.
 - 2. ASTM C1036 - Standard Specification for Flat Glass.
 - 3. ASTM C1048 - Standard Specification For Heat-Strengthened and Fully Tempered Flat Glass.
 - 4. ASTM C1172 - Standard Specification for Laminated Architectural Flat Glass.
 - 5. CPSC 16 CFR 1201 - Safety Standards for Architectural Glazing Materials issued by the Consumer Products Safety Commission.
 - 6. ANSI Z97.1 – Safety Glazing Materials Used in Buildings.
 - 7. GANA - Glazing Manual.
- C. Qualifications of Installer: Minimum five years experience installing glass in projects of similar scope and complexity.

1.04. DELIVERY, STORAGE AND HANDLING

- A. Deliver glass and glazing materials with manufacturer's labels intact.
- B. Do not remove labels until glass has been installed and inspected by the Project Inspector.
- C. Protect glass from staining, marking, and damage.
- D. Putty and glazing compound shall be delivered to the Project site in manufacturer's original unbroken containers labeled to identify contents.

1.05. PROJECT CONDITIONS

- A. Perform glazing when ambient temperature is above 40 degrees F.
- B. Perform glazing on clean, dry surfaces only.

1.06. WARRANTY

- A. Manufacturer shall provide a five year material warranty.

- B. Manufacturer shall provide a five year material warranty for coatings and thermally or acoustically rated insulation units against deterioration in acoustic or thermal rating.
- C. Installer shall provide a three year fabrications and installation warranty.

PART 2 - PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS AND FABRICATORS

- A. To maximum extent possible, provide domestically manufactured and fabricated glass, and provide glass from one manufacturer.
- B. Types of glass specified or indicated shall be manufactured or fabricated by one of the following:
 - 1. Pilkington LOF.
 - 2. Visteon Float Glass Operations.
 - 3. Viracon.
 - 4. Southwest Technologies.
 - 5. Or approved equal.

2.02 GLASS MATERIALS

- A. General: Conform to ASTM C1036, ASTM C1048, ASTM C1172 and to ANSI Z97.1. Label factory cut panes.
- B. Float Glass: Type I, (transparent glass flat), Class 1 (clear), Quality q3, (glazing select), minimum 1/4 inch thickness unless otherwise indicated or required.
- C. Tinted Float Glass: Type I (transparent glass), Class 2 (tinted heat absorbing and light reducing), quality q3 (glazing select), manufactured by PPG or LOF, color as selected by Architect, minimum 1/4 inch thickness unless otherwise indicated or required.
- D. Tempered Glass: Condition A (uncoated surfaces), Type I or II, Class 1, Quality q3 (glazing select), Kind FT (fully tempered glass), match color of clear or tinted glass as applicable; fully thermal tempered, heat strengthening or chemical tempering is not permitted. Perform tempering by horizontal oscillating roller hearth or high speed roller hearth process. Do not permit fabrication processes leaving gripper or tong marks. Handle and size glass according to manufacturer's written instructions.
- E. Clear Laminated Glass: Two layers of 1/8 inch clear float glass with 0.030 inch thick high strength polyvinyl butyral laminating sheet.

- F. Tinted Laminated Glass: One layer of 1/8 inch clear float glass and one layer of tinted glass to match other windows, with 0.030 inch thick high strength polyvinyl butyral laminating sheet. Edges of laminated glass shall be treated with Argotec, Argo Edge Seal Plus, or equal, edge protection to prevent contact of laminating sheet with sealants.
- G. Low Emissivity Glass (Low E Glass): Provide units with thin metallic high-transmittance coating applied to the number 3 surface of the unit, unless otherwise indicated. The U-value for the IGU shall be no greater than 0.34, unless otherwise indicated.
- H. Unframed Mirrors: Category II safety backed mirror-quality float glass, 1/4 inch thick, , edges finished and polished, double silvered with electro-deposited copper coating plus an organic protective coating, equal to Palmer Products Mirro-Bac Paint. Include polished stainless steel edge channels at top and bottom edges, plus mirror adhesive bonding to wall.
- I. Framed Mirrors: Fabricated of one-piece Type 304 stainless steel angle frame, 3/4 inch by 3/4 inch, with continuous integral stiffener on sides and beveled front to hold frame tightly against mirror. Corners shall be heliarc welded, ground and polished smooth. Exposed surfaces shall have stain finish with vertical grain. Mirror shall be fabricated of 1/4 inch Category II safety backed mirror quality float glass, free from tong marks. Edges shall be protected by plastic filler strips. Full-size, shock-absorbing, water-resisting, non-abrasive 1/8 inch thick polyethylene padding shall protect backs of mirrors. Mirrors shall be provided with 24 gage galvanized steel back with integral hanging brackets for mounting on concealed, rectangular wall hangers, and shall be secured with concealed Phillips head locking screws on bottom of frame.
- J. Custom Patterned Glazing: Lumi Frit Projectable Surface 1 Frit Glass, Medium Dot as manufactured by "Bendheim Corporate".

2.03 GLASS SETTING MATERIALS

- A. Glazing materials and accessories shall be fully compatible with the materials and finishes with which they are in contact.
- B. Setting Blocks: ASTM C864, channel shape; having 1/4 inch internal depth, Shore A hardness of 80 to 90 Durometer. Blocks shall be a minimum 2 inch long. Block width shall be approximately 1/16 inch less than the full width of the rabbet. Block thickness shall be at least 3/16 inch, sized for rabbet depth as required.
- C. Spacers: ASTM C864, channel shape, with 1/4 inch internal depth, 3/32 inch flanges, eb, 1/8 inch thick, one to 3 inches long. Spacers shall provide Shore A hardness of 40 to 50 Durometer.
- D. Vinyl Glazing Channels: Profile compatible with framing system and designed to accommodate glass of specified thickness, light gray in color. Provide for dry glazing aluminum frames where indicated or permitted.

- E. Glazing Tape: Poly-isobutylene based sealant tape, conforming to AAMA 804.1, with adhesive one side protected by temporary paper cover, Extru-Seal manufactured by Pecora Corp., No. 303 by Protective Treatments, Inc., or equal.
- F. Spring Steel Spacers: Galvanized steel wire or strip designed to position glazing in channel or rabbet sash with stops.
- G. Glazing Clips: Galvanized steel spring wire designed to hold glass in position in rabbet sash without stops.
- H. Glazing Points (Sprigs): Pure zinc stock, thin, flat, triangular or diamond-shaped pieces, 1/4 inch minimum size.
- I. Glazing Sealants for Metal Sash: GE Silicones Silglaze II 2800, GE Silicones Silpruf, GE Silicones 1200 Silicone, and Dow Corning 999A. Polybutylene, oleoresinous, asphalt, and oil base sealants are not permitted. Provide sealant of same color as structural silicone sealant unless otherwise required.
- J. Glazing Compound for Wood Sash: Provide acrylic latex glazing compound for bedding and sealing glass in wood frames
- K. Glazing Compounds and Sealants for Thermoplastic: Provide silicone, butyl, or polysulfide glazing compound.
- L. Mirror Setting Materials: Manufactured by Palmer Products Corporation, or equal, for installation of mirrors, and as follows:
 - 1. Mirror backing paint: Mirro-Bac Paint, or equal, formulated to protect mirror silvering.
 - 2. Mirror bond coat: Mirro-Mastic Bond, or equal, formulated to isolate deleterious backing materials from mastic and mirror.
 - 3. Mirror mastic: Palmers Super Set Mirro-Mastic PM290.

2.04 SPEAK HOLES

- A. Speak holes shall be stock No. 444, 4 to 6-inch diameter for 1/4-inch tempered float glass, stainless steel as manufactured by Nissen and Co., N666 by C.R. Laurence Co., or equal.

PART 3 - EXECUTION

3.01 TOLERANCES

- A. Thickness indicated or specified are nominal within standard tolerances. Maximum size of vertical panes shall not exceed the following:

Float Thickness:	1/8 inch	3/16 inch	1/4 inch
Maximum Areas in Square Feet:	9	16	20

When exceeding these square foot measurements glass is to be safety glazed.

3.02 INSTALLATION, GENERAL

- A. Glazed cabinet doors, windows, transoms, and fixtures, not otherwise noted or indicated, shall be glazed with clear float glass. Room or entrance doors shall be glazed with clear wire glass with impact film.
- B. Obscure glass in exterior openings shall be installed with smooth side of glass to weather. Patterned glass shall be installed with pattern running vertically, unless otherwise indicated.
- C. Glazing tapes or sealants shall be installed wherever glass contacts wood or metal surfaces. Width of strips shall be as required.
- D. Glazing compound shall be neatly and cleanly installed in straight lines, even with inside edge of sash members. Thumb puttying is not permitted.
- E. Display Cases and Sliding Glass Doors in Casework: Glass in display cases shall be 1/4 inch clear laminated glass as indicated. Edges of glass shall be rounded and polished.
- F. Serving windows in cafeterias with speak holes shall be laminated safety glass.
- G. Glazing Aluminum Sash: Glazing material in aluminum sash shall be installed in compound and secured in place with aluminum glazing beads. In addition, horizontal beads shall be installed with 6-inch by 1 inch, type A, self-tapping, stainless steel, Phillips-head screws, installed into pre-drilled, counter-sunk holes and spaced 2 inches from each end and 9 inches on centers.
- H. Speak holes shall be installed according to glass manufacturer's written recommendations.

3.03 INSTALLATION OF GLASS

- A. Conform to requirements of GANA Glazing Manual.
- B. Provide edge blocking to comply with requirements of referenced glazing standard, except where otherwise required by glass unit manufacturer.
- C. Provide compressible filler rods or equivalent back-up material to prevent sealant from extruding into glass channel weep systems, from adhering to back surface of joints and to control depth of sealant for optimum performance.
- D. Force sealants into glazing channels, in manner to eliminate voids and to ensure complete bond of sealant to glass and channel surfaces.

- E. Tool exposed surfaces of sealants to provide for drainage away from glass. Install pressurized tapes and gaskets to protrude slightly out of channel to eliminate dirt and moisture pockets.
- F. Where dry glazing of aluminum frame is indicated or permitted, provide vinyl glazing channels installed in accordance with frame manufacturers written recommendations. Do not stretch channels. Miter corners.
- G. For tape glazing, furnish tape of thickness to provide approximately 30 percent compression. Cut tape to proper length and install to permanent stops, the entire length of the head and sill first, then to jambs. Butt tape together with no overlap and remove paper backing. Install glass on setting blocks at quarter points and maintain uniform glass edge clearance around entire perimeter of glass. Maintain manufacturer's recommended edge clearance and bite on glass. Install glass firmly into tape with a slight lateral movement to assure proper adhesion. Install tape to removable stop with evenly distributed firmness, smoothing out wrinkles in tape. Secure removable stop in proper position so tape makes contact with glass as stop is installed, forcing contact with glass and completely sealing joint. Remove excess tape from both sides at slight angle oversight line. Do not undercut.
- H. Glass in Wood Frames: Install glass with glazing points and setting blocks as required. Seal glass with glazing compound and secure with wood stops. Install stops with fine finishing nails and set for putty stopping.
- I. Patterned Glass: Install glass with one patterned smooth surface on the weather side.
- J. Wire Glass: Install glass for fire doors in accordance with installation requirements of NFPA 80.
- K. Laminated Glass: Sashes, which are to receive laminated glass, shall be weeped to the outside to permit water in the channel to drain from the frame.
- L. Unframed Mirrors: Walls shall be clean, dry, plumb, rigid and smooth. Install mirror backing paint to back of mirror and to edges. Install mirror bond coat over painted backing, wood backing, concrete and masonry to receive mirrors. Bond coat is not required over vitreous surfaces. Install sufficient mirror mastic coverage when mirror is installed. Mirror mastic will be applied 4 inches from edge and at a maximum of every 12 inches at the size of a golf ball. Install mirror into place, providing 3/16 inch clearance between mirror and substrate. Support mirrors with temporary edge channels to allow mastic set-up and provide permanent top and bottom edge channels.
- M. Framed Mirrors: Walls shall be clean, dry, plumb, rigid and smooth. Install mirrors with concealed mounting devices, and secure with concealed screws on bottom of mirror. Conform to manufacturers written recommendations.

3.04 PROTECTION AND CLEANING

- A. Protect exterior glass from breakage by furnishing crossed streamers attached to framing and away from glass surface. Do not directly install markers to glass surfaces. Remove non-permanent labels and clean surfaces.
- B. Protect glass from contact with contaminating substances resulting from construction operations. If, despite such protection, contaminating substances do come into contact with glass, remove immediately by method recommended by glass manufacturer.
- C. Examine glass surfaces adjacent to or below exterior concrete and other masonry surfaces at frequent intervals during construction, but not less often than once a month, for build-up of dirt, scum, alkali deposits or staining. When examination reveals presence of these forms of residue, remove by method recommended by glass manufacturer. Glazing, which cannot be cleaned to a required condition, shall be deemed defective Work.
- D. Remove and replace glass, which is broken, chipped, cracked, abraded, or damaged during construction.
- E. Remove protective covering from thermoplastic not more than 4 days before Substantial Completion, and immediately before cleaning. Methods of final cleaning and finishing shall be as prescribed by thermoplastic glazing publications referenced above.
- F. Wash glass on both faces not more than four days before Substantial Completion. Wash glass by method recommended by glass manufacturer. Do not furnish harsh cleaning agents, caustics, abrasives, or acids for cleaning. Polish glass both sides and leave free of soil, streaks, and labels.

3.05 CLEAN UP

- A. Remove rubbish, debris and waste materials and legally dispose of off the Project site.

3.06 PROTECTION

- A. Protect the Work of this section until Substantial Completion.

END OF SECTION

SECTION 09 22 16

NON-STRUCTURAL METAL FRAMING

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Non-structural metal framing.
2. Slotted system for positive attachment of metal studs to fluted steel decks for head of wall expansion joint movement (cyclic).

B. Related Requirements:

1. Division 01 - General Requirements.
2. Section 05 41 00 - Structural Metal Stud Framing.
3. Section 09 24 23 - Cement Plaster and Metal Lath.
4. Section 09 29 00 - Gypsum Board.

1.02 PROJECT REQUIREMENTS

A. Regulatory Requirements: Comply with CBC requirements.

B. Design Requirements:

1. Metal Studs: Studs for interior partitions shall be roll-formed channel or C-shapes.
2. Track: Stud track for floor and ceiling anchorage shall be channel configuration, sized to fit studs. Galvanized steel as manufactured for installation with specified metal studs.
3. Design: Design is based on minimum 5 pounds per square foot load applied perpendicular to walls. Deflection shall not exceed 1/240 under design load.

B. Performance Requirements:

1. The top track fire-rated assembly, when incorporated into stud systems and tested in conjunction with products specified in Sections 07 8116 and/or 07 8413, shall exhibit the following performance characteristics:

- a. Cyclic System: When tested for cyclical movement, in accordance with UL 2079. Assembly shall achieve 500 cycles of wall movement at 35 to 40 cycles per minute.
- b. When subsequently tested for 1 and 2 hour fire-resistive rated construction, in accordance with ASTM E119 and ASTM E814, assembly shall conform to requirements for hose stream resistance.

1.03 SUBMITTALS

- A. Shop Drawings: Submit drawings showing framing, connection details, accessories and anchorage. Indicate location of assemblies and size and spacing of framing components.
- B. Product Data: Submit manufacturer's catalog data for each item proposed for installation.
- C. Certificates: Furnish manufacturer's certification that materials meet or exceed Specification requirements.
- G. LEED Submittals: Complete the LEED Material Buyout Form (MBoF) with all materials provided to the project. A complete submittal includes providing all material costs in the MBoF and all of the supporting documentation for the following credits:
 1. MRc2 - Environmental Product Declarations (EPD): Provide Industry-Wide or Product-Specific EPD.
 2. MRc3 - Sourcing of Raw Materials - Recycled Content: Provide product data for pre- and post- consumer recycled content.
 3. MRc4 - Material Ingredients: Provide manufacturers Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, or Cradle to Cradle Health Product Certificate.
 4. IEQc2 - Low-Emitting Materials – Interior Wet Applied Products: For paints, coatings, adhesives and sealants applied on site or used for laminating off-site, include product data indicating the VOC content (g/L) and testing.

1.04 DEFINITIONS

- A. Cyclic Anchoring Method: A system which provides for positive attachment (as described in ASTM C754) of studs to upper track, and of track to overhead fluted deck, while permitting up to 1-inch of vertical movement.
- B. System: The application of the above products in their entirety as tested. There can be no intermixing of components unless specifically outlined in the appropriate test reports.

1.05 QUALITY ASSURANCE

- A. Coordinate with related Work to provide blocking for items mounted on finished surfaces and to provide allowances for pipes and other items inside partitions and walls.

B. Comply with following as a minimum requirement:

1. American Welding Society (AWS): Structural Welding Code Steel (D1.1); and Structural Welding Code Sheet Steel (D1.3).
2. ASTM Standards:
 - a. ASTM A653 – Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc Iron Alloy-Coated (Galvannealed) by Hot-Dip Process.
 - b. ASTM A1003 – Standard Specification for Steel Sheet, Carbon, Metallic- and Nonmetallic-Coated for Cold-Formed Framing Members.
 - c. ASTM A641 – Standard Specification for Zinc Coated (Galvanized) Carbon Steel Wire.
 - d. ASTM C645 – Standard Specification for Non-Structural Steel Framing Members.
 - e. ASTM C955 – Standard Specification for Load Bearing (Transverse and Axial) Steel Studs, Runners (Tracks), and Bracing or Bridging, for Screw Application of Gypsum Panel Products and Metal Plaster Bases.
 - f. ASTM C954 – Standard Specification for Steel Drill Screws for Application of Gypsum Panel Products or Metal Bases to Steel Studs From 0.033 Inch to 0.112 Inch in Thickness.
 - g. ASTM E1190 – Standard Test Methods for Strength of Power-Actuated Fasteners Installed in Structural Members.

C. Tolerances: Install walls and partitions on straight lines, plumb, free of twists or other defects, and contacting a 10 foot straightedge for its entire length at any location within a 1/8 inch tolerance. Install horizontal framing level within a tolerance of 1/8 inch in 12 feet in any direction.

D. Manufacturers shall be members of Steel Stud Manufacturers Association (SSMA).

1.06 DELIVERY, STORAGE AND HANDLING

A. Materials shall be delivered in their original unopened packages and stored protected from damage. Do not store material directly on grade. Provide adequate support to prevent bowing of material prior to installation.

B. Store welding electrodes in accordance with AWS D12.1.

PART 2 – PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS

A. Non-structural metal framing:

1. ClarkWestern Building Systems, Inc.
2. Dietrich Industries, Inc.
3. Marino/Ware.
4. Cemco.
5. Equal.

B. Top Track Systems:

1. Sliptrack System by Dietrich Industries., Inc. or equal. Down-standing legs shall be nominally 2 1/2-inch and shall be provided with 1 1/2-inch slots at 1 inch on center.
2. VertiTrack or VertiClip System by The Steel Network, Inc. or equal. Pre-assembled track with clips installed to match stud spacing. Clips with attached bushing and screws to allow stud movement.
3. System must provide for minimum tested overall movement of 1 inch: 1/2 inch in each direction.
4. Track shall be provided in standard widths of 4 and 6 inches and in 16, 18, and 20 gage (54, 43, and 33 mil) sheet steel thickness, as required by Project conditions and detailed.

2.02 MATERIALS

A. Light Gage Metal Framing:

1. Metal framing shall be formed from corrosion resistant-steel conforming to requirements of ASTM A653, 33 ksi minimum.
2. Metal framing shall be zinc coated in conformance to requirements of ASTM A924, G60.
3. Metal framing shall be manufactured in conformance to ASTM C645.
4. Install metal framing according to ASTM C1007, Standard Specification for Installation of Load-Bearing (Transverse and Axial) Steel Studs and Related Accessories.

B. Studs: SSMA, ICC-ES ER-4943P, minimum yield 33 ksi, hot-dipped galvanized or electro galvanized sheet steel, G-60, C Stud type, punched web (except tracks and joists), C-shaped, sizes required to conform to details and scheduled wall thicknesses. Studs shall be rolled from new steel sheet and shall not be produced from re-rolled steel. Stud flanges shall not be less than 1 5/16-inch wide; track flanges, not less than 1 1/4-inch wide.

1. Wall Framing and Furring for Plaster and Mortar Beds: Studs and tracks shall be 18 gage (43 mil) minimum, unless otherwise indicated.

2. Wall Framing and Furring for Gypsum Wallboard: Studs and tracks shall be 20 gage (33 mils) minimum, unless otherwise indicated.
 3. Load-Bearing Studs: Studs and members thicker than 18 gage (43 mil) shall conform to requirements of Section 05 4100 - Structural Metal Stud Framing.
 4. Stud gages indicated on Drawings or specified are the minimum. Where required stud height and/or loads exceed code requirements or manufacturer's recommendations, provide heavier gage studs and/or decrease stud spacing as necessary to conform to code requirements.
- C. Suspended and Furred Ceiling Systems and Wall Furring: Suspended ceiling framing system shall support finished ceiling, light fixtures, air diffusers, and accessories, as required. Suspension system shall provide a maximum deflection of L/240. Carrying channels shall be fabricated from minimum 0.0548 inch thick cold-rolled steel, 1 ½-inch wide by 7/16 inch deep. Carrying channels for supports under ducts shall be 2 inches in size as specified. Carrying channels shall be fabricated from hot-dip galvanized coated sheet.
1. Plaster Ceilings: Cross furring members shall conform to ASTM C 645, and shall be fabricated from cold-rolled steel, 3/4 inch wide by 7/16 inch deep. Furring members shall be fabricated from hot-dip galvanized coated sheet.
 2. Gypsum Wallboard Ceilings: Furring members shall be fabricated from cold-rolled steel, 7/8 inch by 2 9/16-inch. Furring members shall be fabricated from hot-dip galvanized coated sheet.
- D. Framed Ceilings: Framed ceiling framing system shall support finished ceiling, light fixtures, air diffusers, and accessories, as required. Suspension system shall provide a maximum deflection of L/240.
1. Plaster and Gypsum Wallboard Ceilings: Ceiling joists shall conform to ASTM C645, hot-dip galvanized coated steel, C-shaped, unpunched, 20 gage (30 mil) minimum, unless noted otherwise.
- E. Shaft Wall Framing Members: CH studs and J runners, 20 gage (30 mil) minimum for 2, 4 or 6 inch studs, conforming to ASTM C645, fabricated of steel conforming to ASTM A653, hot-dip galvanized.
- F. Framing Accessories: Provide standard related accessories including floor and ceiling tracks, clips, web stiffeners, anchors, and similar items, of same manufacture as each type of stud specified, and as required for a complete installation.
- G. Splay Wires and Compression Struts: Approved manufacturers acceptable to manufacturer of ceiling grids, gages and types as required by building codes for ceiling types and weights specified.
- H. Wires: Soft-annealed galvanized steel wire, 8 gage for hanger wires and 16 gage for framing unless otherwise specified.

- I. Fasteners: Wafer-head screws, self-drilling type for 20 gage (30 mil) metal and heavier. ASTM C954 self-drilling, self-tapping screws, Type S-12 pan head, ½ inch long.
- J. Fire Rated Acoustical Foam Tape: Compressible, closed cell polyvinyl chloride foam with pressure sensitive adhesive, in rolls with protective release liner on non-adhesive face, 6 pounds per cubic foot density, 1 inch wide x not less than 1/4 inch thick, self-extinguishing, UL 94 recognized, Norseal V740FR, manufactured by Norton Performance Plastics Corporation, or equal.
- K. Acoustical Sealant: Permanently resilient type, non-hardening, as specified in Section 07 92 00.
- L. Zinc-Rich Paint: Conform to Fed Spec DOD-P-21035A, Z.R.C. "Cold Galvanizing Compound", manufactured by ZRC Products Company, or equal. Provide for touch-up of galvanized surfaces.
- M. Steel Backing Plates: Provide a minimum 4 inch wide by 16 gage (54 mil) steel, or sections of studs and stud track welded or fastened to web of studs, except as otherwise indicated. Apply shop coat of metal primer.
- N. Anchorage Devices Powder Actuated: Minimum 0.177 inch diameter by 1-7/16 inch long fasteners in regular concrete and 0.145 inch diameter by 1 1/8-inch long fasteners in lightweight concrete. Allowable shear and tension values as permitted in ICC ES reports shall be reduced to 80 percent.
- O. Anchorage Devices, Drilled Expansion Anchors: Minimum 3/8 inch diameter with 2-1/4 inch embedment. Allowable shear and tension values as permitted in ICC ES reports shall be reduced to 80 percent.
- P. Top Track System Materials:
 1. Forming steel shall be mill certified prime steel:
 - a. For 0.064 inch sections, conform to ASTM A1011, Grade 50 with a minimum yield point of 50,000 psi.
 - b. For 0.048 and 0.036 inch sections, conform to ASTM A1008, Grade C, with a minimum yield point of 33,000 psi.
 - c. Formed steel shall be provided with galvanizing in accordance with ASTM A653 for a Class G90 zinc coating.
 2. Fasteners:
 - a. For attachment of steel studs to slotted track or deflection clip, minimum No.8 corrosion resistant by ½ inch waferhead screws.
 - b. For attachment of track system to overhead structural element or metal decking, as provided for by the structural details affecting the Work.

3. Dry Method.
 - a. Dry mineral wool and sealant system shall use only such products as are represented to have been fully tested and approved under UL 2079 and as specified in Section 07 84 13 - Penetration Firestopping.
 - b. Mineral wool shall be compressed to the degree as used on approval fire and hose stream test.
 - c. The system supplier shall provide a measuring device capable of determining compression to determine compliance with required density.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Verify that overhead or concealed Work is completed, tested, inspected, and finished as required before starting Work of this section.

3.02 INSTALLATION

A. Walls and Partitions:

1. Fasten floor runners for exterior walls and interior partitions to concrete slab with required power driven fasteners. Spacing of fasteners not to exceed 24 inches on center. Fasten ceiling runners to structure as by top track system manufacturer.
2. Sound insulated walls and partitions: Embed floor runner tracks in two beads of acoustical sealant or two runs of compressible tape seal. Install top track nested into slotted track system, in same manner for full height of walls. Where wall ends abutting concrete, masonry, or steel set end studs in two beads of acoustical sealant or two tape seals and secure at 4-foot centers vertically.
3. Space studs not over 16 inch on center unless indicated otherwise. Studs shall be located approximately 2 inches from door frame jambs, abutting partitions and partition corners, except those providing support for door and window openings.
4. Furnish and install manufacturer's standard floor track. Fasten track to floor by means of 1/4 inch by 1 1/4-inch Star "Dryvin" hammer drive anchors or 3/16 inch by 1 inch round head, "Rawl-Drives" one-piece expansion bolts spaced not to exceed 3 feet, and installed in drilled holes in slab, or to wood joist with nails as indicated. Track may be fastened to concrete floor slabs with, power-driven fasteners.

5. Studs shall be seated squarely in track with stud web and flanges abutting track web, plumbed and securely fastened with sheet metal screws, to flanges or web of both floor and top tracks. Provide 4 screws per stud.
6. Where there is no suspended ceiling, tops of stud walls shall be provided with track and shoes and be fastened as specified for floors. Welding of studs to ceiling track will not be permitted except where bearing studs are installed.
7. Over metal doorframes, install a cut-to-length section of runner track, with flanges slit and web-bent to allow flanges to overlap adjacent vertical studs, and securely fasten to studs. At doorjamb, extend studs continuous to structure above.
8. Bridging, or horizontal bracing of 1 1/2-inch, cold-rolled channels shall be fastened in a manner to prevent stud rotation. Bridging shall be furnished as follows: walls up to 10 feet high, one row at mid-height; walls exceeding 10 feet high, bridging or bracing rows spaced not to exceed 5 feet on center.
9. Wind bracing shall be fastened where indicated on Drawings. Minimum size of strap shall be as indicated on Drawings. Track where strap terminates shall be anchored as indicated on Drawings.

B. Plaster Ceiling Suspension System:

1. Provide horizontal furring in accordance with CBC Section 2507.
2. Hanger Wires:
 - a. Hanger wires for ceilings suspended from wood frame construction shall be installed in accordance per CBC and shall be fastened with stem lag screws in bottom edge of joists or rafters. Wire shall be looped through hole in stem lag screw and then wrapped twice around it. Stem lag screws shall be "Stanlag Screws" by Stanline, Inc., or equal, of type and penetration as follows:

Type Size	Hanger Wire	Screw Penetration, Minimum
Stanlag #SLS-3	#12 & #10 (0.104 and 0.128 inch diameter)	1 1/4-inch
Stanlag #SLS-375	#9 & #8 (0.144 and 0.160 inch diameter)	1 1/2-inch

- b. Hanger wire shall be wrapped twice around runner channel, drawn up taut, and wrapped twice around itself.
3. Runner channels shall be installed 6 inches maximum from walls, parallel to runners. Splices in runner channels shall be provided at hangers only, by lapping channels not less than 12 inches and tying channels together at 2 points with a double wrap of tie wire twisted up taut.
4. Ends of runner channels abutting concrete or masonry surfaces shall be 1 1/4-inch clear and shall be tied to wall or partition with 3/4 inch channel brackets

providing a 4-inch right angle bend secured with two 1/4 inch by 1 inch power-driven fasteners. Brackets shall extend from face of surface not less than 8 inches and shall be tied to runner channels at two points with double wrap of tie wire twisted up taut.

5. Securely saddle-tie furring channels to runner channels at each crossing with 16 gage (0.064 inch diameter) tie wire twisted up taut, and with wings left uncut and bent back.

C. Gypsum Wallboard Ceiling Suspension and Framing: Suspended ceiling system framing shall be installed in accordance with ASTM C754, and as follows.

1. Hangers shall be spaced not more than 48 inches along runner channels and 36 inches in other direction or 42 inches in both directions unless otherwise indicated. Locations of hanger wires shall be coordinated with other Work. Hangers at ends of runner channels shall be located not more than 6 inches from walls. Hanger wire shall be fastened to structural elements with required fasteners. Sags or twists, which develop in suspended system, shall be adjusted. Damaged or faulty parts shall be replaced.
2. Main Runners: Hanger wires shall be double strand saddle-tied to runner channels and ends of hanger wire shall be twisted three times around itself. Main runners shall be located to within 6 inches of parallel wall to support ends of cross furring. Main runners shall not come in contact with abutting masonry or concrete walls. Where main runners are spliced, ends shall be overlapped 12 inches with flanges of channels interlocked, and shall be securely tied at each end of splice with wire looped twice around channels.
3. Furring channels shall be fastened to runner channels and to structural supports at each crossing with tie wire, hairpin clips, or required fastenings. Furring channels shall be located within 2 inches of parallel walls and beams, and shall be cut 1/2 inch short of abutting walls.
4. Ceiling Openings: Support members shall be provided as required at ceiling openings for access panels, recessed light fixtures, and air supply or exhaust. Support members shall be not less than 1 1/2-inch main runner channels and vertically installed suspension wires or straps shall be located to provide at least minimum support specified for furring and wallboard attachment. Intermediate structural members not a part of structural system, shall be provided for attachment or suspension of support members.
5. Light fixtures and air diffusers shall be supported directly from suspended ceiling runners. Wires shall be provided at required locations to support weight of recessed or surface mounted light fixtures and air diffusers.
6. Control Joints: Ceiling control joints for expansion and contraction shall be located where indicated on drawings. A control joint or intermediate blocking shall be installed where ceiling framing members change direction.
 - a. Interior Ceilings with Perimeter Relief: Control joints shall be installed so linear dimensions between control joints shall not exceed 50 feet in either direction or more than 2,500 square feet in area.

- b. Interior Ceilings without Perimeter Relief: Control joints shall be installed so linear dimensions between control joints shall not exceed 30 feet in either direction nor more than 900 square feet in area.

- D. Splay Wires and Compression Struts: Install as detailed and as required to prevent upward and sideward motion under seismic conditions, as required by code.
- E. Suspension Under Ducts: For hangers spaced at 4 to 5 ½-foot centers, provide 6 gage (0.192 inch diameter) hanger wires with minimum 2 inch runner channels spaced at maximum 48 inch centers. For greater spans, design system for live load of 10 pounds per square foot of area plus dead load and provide a detail in Shop Drawings.
- F. Furring: Provide framing for horizontal furring as shown or required. Conform to above requirements as applicable.

3.03 CONNECTIONS TO METAL DECKING

- A. Provide pre-molded neoprene filler strips matching flute profile for non-fire-rated walls and partitions covered on one or both sides up to metal decking.
- B. The top runner track of fire-rated partitions shall be a minimum of 20 gage (33 mils) and fastened to metal deck with required fasteners at spacing required for fire rating, but in no case over 16 inches on center. Neither wallboard nor metal studs shall be fastened to top runner to allow for slab deflection. Areas above runner shall be friction fit with a minimum depth of 2 1/2-inch of 4 pounds per cubic foot mineral wool insulation. A minimum of 1/2 inch of firestopping compound shall be installed to each side of mineral wool insulation for 1-hour system, and 1 inch of firestopping for a 2-hour system. Install required special tracks, angles, fasteners and strips of gypsum wallboard as required to achieve required fire resistance rating.
- C. Proprietary fire-rated top tracks are installed in accordance with manufacturer's recommendations and fire rating approval requirements.

3.04 CLEANING

- A. Remove debris, rubbish, and waste material and legally dispose of off Project site.

3.03 PROTECTION

- A. Protect Work of this section until Substantial Completion.

END OF SECTION

SECTION 09 24 00

PORTLAND CEMENT PLASTER ON MASONRY WALLS

PART 1- GENERAL

1.01 SUMMARY

- A. Section Includes: Work includes all labor, materials, and equipment necessary to install all aspects of a Portland cement plaster assembly.
- B. Related Sections
 - 1. Section 03 00 00 - Concrete
 - 2. Section 04 22 00 - Concrete Unit Masonry

1.02 REFERENCES

- A. ASTM C150 – Portland Cement
- B. ASTM C847 – Standard Specification for Metal Lath
- C. ASTM C1032 - Woven Wire Plaster Base
- D. ASTM C933 - Welded Wire Lath
- E. ASTM C144/C897 – Aggregate for Job-Mixed Portland Cement-Based Plaster
- F. ASTM C926 – Application of Portland Cement-Based Plaster
- G. ASTM C1063 – Installation of Lathing and Furring for Portland Cement Based Plaster
- H. PCA (Portland Cement Association) – Plaster (Stucco) Manual
- I. SMA Details and Technical Bulletins

1.03 ASSEMBLY DESCRIPTION

- A. General: Portland cement plaster over masonry with brown coat, and a finish coat. Nominal thickness is ½ to 5/8 inch.
- B. Application Methods: The plaster may be applied by hand tools or machine pumps but must be applied with sufficient pressure to adhere to the substrate.
- C. Masonry and concrete shall be sound, free of coatings, cured minimum 28 days.
- D. Thickness of plaster is considered maximum nominal measurements.

1.04 SUBMITTALS

- A. Product Data: All product data sheets, evaluation reports, details, and warranty information that pertain to the project in accordance with Submittal Procedures.
- B. Samples of the finish coat shall be of an adequate size as required to represent each color and texture to be utilized on the project and produced using the same techniques and tools required to complete the project. No sample shall be less than 12” by 12”.
- C. Retain approved samples at the construction site throughout the application process.

1.05 QUALITY ASSURANCE

- A. Qualifications:
 - 1. Plastering Contractor: Shall specialize in lath and plaster contracting with documented experience of at least 5 years in business.
 - 2. Provide proof of current contractor’s license and bond where required.
- B. On-Site Mock-Ups: Produced upon request.
- C. Mock-up shall represent construction using the same quality/techniques to be utilized on the project.
- D. Retain approved mock-up at job site throughout the application process.
 - 1. Where acceptable to the Architect, approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

1.06 DELIVERY, STORAGE, AND HANDLING

- A. Delivery: Deliver all materials to the construction site in their original, unopened packaging with labels intact.
 - 1. Inspection: Inspect the materials upon delivery to assure that specified product have been received. Report defects or discrepancies to the responsible party according to the construction documents; do not use reported material for application.
 - 2. Storage: Store all products per manufacturer’s recommendations. Generally, store materials in a cool, dry location; away from direct contact with the ground and/or concrete; out of direct sunlight; and protect from weather and other damage.

1.06 PROJECT CONDITIONS

- A. Environmental Requirements: Follow product manufacturer's recommendations for environmental conditions and surface preparation.
- B. Temperatures: Before, during and following the application of the Portland cement plaster, the ambient and surface temperatures must remain above 40 degrees F (4 C) for a minimum period of 24 hours. Protect stucco from uneven and excessive evaporation, especially during hot, dry and/or windy weather. Protect the portland cement plaster from freezing for a period of not less than 24-hours after set has occurred.
- C. Substrates: Prior to installation, inspect the wall for surface contamination, bond breakers, or other defects that may adversely affect the performance of the materials, and shall be free of foreign matter. Do not apply the Portland cement plaster to substrates with temperatures less than 40 degrees F (4 C) or that contain frost or ice.
- D. Inclement Weather: Protect applied material from deleterious effects until cured or dry.

1.07 SEQUENCING AND SCHEDULING

- A. Sequencing: Coordinate the installation of the lath and Portland cement plaster with all other construction trades. To reduce stucco cracking, insure the concrete/masonry substrate is cured a minimum of 28 days and not saturated prior to plastering.
- B. Plastering contractor shall request and attend a pre-installation meeting with general contractor and architect to advise architect of any control/expansion joint layout concerns. There shall be no cost to the owner for moving one-piece control joints prior and up to this meeting date, additional lineal footage of control joints from plans shall warrant a change order.
- C. Staffing: Provide sufficient manpower and proper supervision to ensure continuous operation, free of cold joints, scaffolding lines, curing, variations in texture, etc.

1.08 WARRANTY

- A. Warranty: Submit documentation on all products. At completion of work, contractor shall provide written warranty documentation for the assembly and products used.
- B. Warranty Length: Shall start at the time of substantial completion.

1.09 MAINTENANCE

- A. The following materials shall be presented to the owner following the application of the work:
 - 1. One container of finish for each color and texture utilized on the project.
 - 2. Supply a maintenance program for Owners O&M manual as required.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

A. Manufacturers:

1. BMI
2. Dryvit
3. Parex
4. La Habra
5. California Stucco
6. Shamrock Stucco
7. Quikrete/Specmix
8. Merlex
9. El Rey Stucco
10. Omega Products
11. CalPortland/Riverside Cement
12. Mission Stucco
13. Sacramento Stucco
14. Cemex
15. BMI/SIKA
16. Amermix/Old Castle

2.02 BROWN COAT (BASECOAT)

A. Cement: A portland cement complying with ASTM C150.

B. Sand:

1. Field mixes shall comply with ASTM C-926 and must have sand that is clean and free from deleterious amounts of loam, clay, silt, soluble salts and organic matter. Sampling and testing shall comply with ASTM C144 or C897.
2. An “engineered performance mix” by an SMA manufacturer is acceptable with appropriate approvals (ICC ES, IAPMO or Interek report) .

C. Water: Clean and potable without foreign matter.

2.03 ACCESSORIES

A. Sealants: Polyurethane, polyurethane modified, polysulfide, or silyl-terminated polyether elastomeric sealant complying with ASTM C920 or 100% silicone.

- B. Fasteners: Nails, staples, or screws used to rigidly secure lath and associated accessories shall be corrosion-resistant and meet the minimum requirements of ASTM C1063.
- C. Zinc and Zinc-Coated (Galvanized) Accessories: The following accessories shall be fabricated from zinc-coated (galvanized) steel.
 - 1. Corner Aid: Minimum 26-gauge thick; expanded flanges shaped to permit complete embedding in plaster; minimum 2 in. wide; Square-edge style; use unless otherwise indicated. for extra corrosion protection , trims can be double zinc dipped, extra charges will occur, specify PVC nose for acrylic finish coats.
 - 2. Casing Bead: Minimum 26-gauge thick; thickness governed by plaster thickness; maximum possible lengths; expanded metal flanges, with square edges.

2.04 FINISHES

- A. Portland cement-based blended stucco finish
- B. Color and Texture: Manufacturer, color and finish texture shall be as approved by the Architect.

2.05 MIXES

- A. Portland Cement Plaster Basecoats:
 - 1. Prescriptive Method: Ratios and Mix Design shall be per ASTM C926. Contractor shall select one of the following mixes (sand is per combined volume of cements), lime is cement:
 - a. Portland Cement 1 part
Masonry Cement 1 part
Sand 3 ½ to 4 ½ parts per Cement
Fibers Maximum 3 oz per batch
 - b. Portland Cement 1 part
Lime (type S) ¼ to ½ part
Sand 3 to 4 parts per cement & Lime
Fibers Maximum 3 oz per batch
 - c. Plastic Cement 1 part
Sand 3 ½ to 4 ½ parts per cement
Fibers Maximum 3 oz per bag plastic cement

- B. Finish Coats: Mixing and tinting instructions are contained in the appropriate product data sheets by the Manufacturer.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Prior to the application of the Portland cement plaster basecoat the plastering contractor shall ensure that:
 - 1. Surface and site conditions are ready to receive work.
 - 2. Grounds and Blocking: Verify that the items within the walls for other sections of work have been installed.
 - 3. Notify architect/owner of any defects that may impact the finished assembly. Proceed as directed.
- B. Substrates:
 - 1. Acceptable substrates must be sound, secure and suitable for lath (if applicable) and plaster.
 - 2. Substrates and adjacent materials must be dry and clean. Substrate surface must be flat, free of protrusions or planar irregularities greater than 1/4-inch in 10-feet (6mm in 3m).
- C. Flashings/Sealant joints: All flashing or sealant joints around windows, at deck attachments, utility penetrations, roof lines, etc. and all kick-out flashing must be properly installed prior to application of Portland cement plaster. Notify owner if flashings are missing, proceed as directed.
- D. Casing bead shall be applied around all penetrations with a minimum 1/4 inch to maximum 3/4 inch gap to receive a backer rod and sealant and where cement plaster terminates at horizontal and vertical. Gap width will depend on conditions.
- E. Unsatisfactory conditions or concerns shall be reported to the general contractor and/or builder and/or architect and/or owner. Do not proceed until directed in writing by architect or general contractor.

3.02 PREPARATION

- A. Substrate: inspect all work prior to starting lath and plastering. Notify architect of any issues impacting performance, proceed as directed.
- B. Surrounding Areas: Protect surfaces near the work of this section from damage, disfiguration, and overspray. Mask off all dissimilar materials.

3.03 INSTALLATION

- A. General Installation: Refer to, ASTM C926, ASTM C1063, and/or the appropriate manufacturer's product data sheet for additional installation requirements and recommendations of the manufacturer.
- B. All trims shall be securely fastened to prevent movement or shifting during plastering.
- C. Per ASTM C926, apply Portland cement plaster by hand-troweling or machine-spraying to a nominal thickness of 3/8-inch (9.5 mm) brown coat. Total basecoat shall be 1/2 inch for direct application to masonry substrates.
- D. Apply brown coat to fill and complete basecoat. When excess moisture leaves brown coat, hard float to provide densification per ATSM.
- E. Moist Curing: Provide sufficient moisture by fog or moist curing to permit proper hydration of the cementitious materials. The length of time and most effective procedure for curing will depend on climatic and job conditions.

3.04 INSTALLING FINISH COAT

- A. General: Mix and apply per manufacturer's product data sheet.
- B. Do not apply to soft, contaminated or frozen basecoat.
- C. Avoid applying to excessively hot walls.
- D. Fog coat (cement finish only) as needed to blend color variations
- E. Finish coat shall be free of eye catching imperfections.

3.05 CLEANING/PATCHING/TOLERANCE

- A. Cleaning: Remove any and all materials used, overspray from adjacent surfaces, and all protective masking.
- B. Patch and repair as needed, including but not limited to fog coating, imperfections and blisters.
- C. The basecoat of plaster shall be in tolerance:
 - 1. Not to exceed 1/4 inch in ten (10) feet
- D. Eye catching variations in color or texture pattern will not be accepted.

3.06 PROTECTION

- A. Protect applied material from inclement weather until dry and prevent it from freezing for a minimum of 24-hours after set and/or until dry. Refer to manufacturer's product data sheet for additional requirements.

Department of Neighborhood Services and Public Safety
GOLETA TRAIN DEPOT PROJECT

END OF SECTION

SECTION 09 24 00

PORTLAND CEMENT PLASTER

PART 1- GENERAL

1.01 SUMMARY

- A. Section Includes: Work includes all labor, materials, and equipment necessary to install all aspects of a Portland cement plaster assembly.

1.02 RELATED SECTIONS

- A. Section 05 41 00 – Cold Formed Framing
- B. Section 06 16 00 – Sheathing
- C. Section 07 90 00 – Joint Sealers

1.03 REFERENCES

- A. ASTM C150 – Portland Cement
- B. ASTM C847 – Standard Specification for Metal Lath
- C. ASTM C933 - Welded Wire Lath
- D. ASTM C144/C897 – Aggregate for Job-Mixed Portland Cement-Based Plaster
- E. ASTM C926 – Application of Portland Cement-Based Plaster
- F. ASTM C1063 – Installation of Lathing and Furring for Portland Cement Based Plaster
- G. PCA (Portland Cement Association) – Plaster (Stucco) Manual
- H. ICC-ES Acceptance Criteria for Weather-resistive Barriers (AC308)

1.04 ASSEMBLY DESCRIPTION

- A. General: Portland cement plaster is comprised of a water-resistive barrier, optional sheathing, lath, scratch, brown coats, and a finish coat. Minimum nominal $\frac{3}{4}$ inch cement thickness.
- B. Application Methods: The plaster may be applied by hand tools or machine pumps but must have sufficient force to adhere to the substrate.
- C. Framing shall have a deflection of L/360 or stiffer
- D. Fire Rated assemblies shall be per the test report or special instructions.

1.05 SUBMITTALS

- A. Product Data: All product data sheets, evaluation reports, details, and warranty information that pertain to the project in accordance with Section 01 30 00 Submittal Procedures.

- B. Samples: Submitted upon request.
- C. Samples of the finish coat shall be of an adequate size as required to represent each color and texture to be utilized on the project and produced using the same techniques and tools required to complete the project. No sample shall be less than 12” by 12”.
- D. Retain approved samples at the construction site throughout the application process.
- E. Submit a unit square foot price for a “ Stucco Crack Reduction System”

1.06 QUALITY ASSURANCE

- A. Plastering Contractor: Shall specialize in lath and plaster contracting, document experience of at least 5 years.
- B. Provide proof of current contractor’s license and bond where required.
- C. On-Site Mock-Ups: Produced upon request.
- D. Prior to commencement of work, provide an on- site mock-up.
- E. Mock-up shall represent construction using the same quality/techniques to be utilized on the project.
- F. Retain approved mock-up at job site throughout the application process.
- G. Where acceptable to the Architect, approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

1.07 DELIVERY, STORAGE, AND HANDLING

- A. Delivery: Deliver all materials to the construction site in their original, unopened packaging with labels intact.
- B. Inspection: Inspect the materials upon delivery to assure that specified products have been received. Report defects or discrepancies to the responsible party according to the construction documents; do not use reported material for application.
- C. Storage: Store all products per manufacturer’s recommendations. Generally, store materials in a cool, dry location; away from direct contact with the ground and/or concrete; out of direct sunlight; and protect from weather and other damage.

1.08 PROJECT CONDITIONS

- A. Environmental Requirements: Follow product manufacturer's recommendations for environmental conditions and surface preparation.
- B. Temperatures: Before, during and following the application of the Portland cement plaster, the ambient and surface temperatures must remain above 40 degrees F (4 C) for a minimum period of 24 hours. Protect stucco from uneven and excessive evaporation, especially during hot, dry and/or windy weather. Protect the Portland cement plaster from freezing for a period of not less than 24-hours after set has occurred.

- C. Substrates: Prior to installation, inspect the wall for surface contamination or other defects that may adversely affect the performance of the materials, and shall be free of residual moisture. Do not apply the Portland cement plaster to substrates whose temperature are less than 40 degrees F (4 C) or contain frost or ice.
- D. All wood based products covered shall be dry and have a moisture content below 19% .
DO NOT COVER WET FRAMING.
- E. Inclement Weather: Protect applied material from deleterious effects until cured or dry.
- F. Existing Conditions:
Contractor shall walk the project prior to starting work and notify the architect or owner's representative of any deficiencies that will negatively impact the plaster assembly. **DO NOT** proceed until remedied.
- G. Contractor shall advise architect of any horizontal surfaces with inadequate slope.

1.09 SEQUENCING AND SCHEDULING

- A. Sequencing: Coordinate the installation of the lath and Portland cement plaster with all other construction trades. To reduce stucco cracking, apply plaster only after the building is 90 percent dead loaded and the interior gypsum has been installed.
- B. Plastering contractor shall request and attend a pre-installation meeting with general contractor and architect prior to the framing being completed. Plastering contractor shall advise architect of control/expansion joint layout concerns. There shall be no cost to the owner for moving one-piece control joints prior and up to this meeting date, additional lineal footage of control joints from plans shall warrant a change order.
- C. Staffing: Provide sufficient manpower and proper supervision to ensure continuous operation, free of cold joints, scaffolding lines, curing, variations in texture, etc.

1.10 WARRANTY

- A. Warranty: Submit documentation on all products. At completion of work, contractor shall provide a written warranty documentation for the assembly and products used.
- B. Warranty Length: Shall start at the time of substantial completion.

1.11 MAINTENANCE

- A. The following materials shall be presented to the owner following the application of the work:
 - a. One container of finish for each color and texture utilized on the project.
 - b. Supply a maintenance program for Owners O&M manual as required.

PART 2 - PRODUCTS

2.01 SCRATCH AND BROWN COAT (BASECOAT)

- A. Cement: A Portland cement complying with ASTM C150.
- B. Sand:
 - 1. Field mixes shall comply with ASTM C-926 and must have sand that is clean and free from deleterious amounts of loam, clay, silt, soluble salts and organic matter. Sampling and testing shall comply with ASTM C144 or C897.
- C. Water: Clean and potable without foreign matter.

2.02 WATER-RESISTIVE BARRIER

- A. Over Wood-based Sheathing:

Two layers of D kraft building paper , minimum 30 minute, complying with UBC Standard 14-1.

2.03 LATH

- A. Expanded Lath: Nominal 3.4 lb/yd² weight, galvanized steel complying with ASTM C847.

2.04 SHEATHING

- A. Wood-based Structural Panels: 1/2 inch-thick plywood or as indicated in Structural drawings. Plywood shall be exterior grade.

2.05 ACCESSORIES

- A. Sealants: 100% silicone.
- B. Flashing (by others) : Flashing complying with IBC Section 1405.4 (2013) or IRC Section R703.8, as applicable, WRB must integrate in a “Shingle Fashion ” with flashings.
- C. Fasteners: Nails, staples, or screws used to rigidly secure lath and associated accessories shall be corrosion-resistant and meet the minimum requirements of ASTM C1063.
- D. Zinc and Zinc-Coated (Galvanized) Accessories: The following accessories shall be fabricated from galvanized) steel.
- E. Corner Aid: Minimum 26-gauge thick; expanded flanges shaped to permit complete embedding in plaster; minimum 2 in. wide; Square-edge style; use unless otherwise indicated.
- F. Strip Mesh: Metal Lath, 3.4 lb/yd² expanded metal; 6 in. wide x 18 in. long.
- G. Vent Screenshot: Minimum 26-gauge thick; thickness governed by plaster thickness; minimum 4-inch (102 mm) width, double “V” profile, with perforated expanse between “V’s” of longest possible lengths.
- H. Casing Bead: Minimum 26-gauge thick; thickness governed by plaster thickness; maximum possible lengths; expanded metal flanges, with square edges.

- I. Drip Screed: Minimum 26-gauge thick, depth governed by plaster thickness, minimum 3-1/2 in. high flange, maximum possible lengths.
- J. Control and Expansion Joints: Depth to conform to plaster thickness; use maximum practical lengths.
- K. Control Joints: One-piece-type, folded pair of unperforated screeds in M-shaped configuration; removable protective tape on plaster face of control joint.
- L. Expansion Joints: [Two-piece-type formed to produce a slip-joint.] [Pair of casing beads with sealant between.]
- M. Expansion Joints: Two-piece-type formed to produce a slip-joint.

2.06 FINISHES

- A. Portland cement-based blended stucco finish.
- B. Color and Texture: Color and finish texture shall be as selected by the Architect.

2.07 MIXES

A. Portland Cement Plaster Basecoats:

- 1. Prescriptive Method: Ratios and Mix Design shall be per ASTM C926. Contractor shall select one of the following mixes (sand is per combined volume of cements):

- a. Portland Cement 1 part
Masonry Cement 1 part
Sand 3 ½ to 4 ½ parts per Cement
Fibers Maximum 3 oz per batch
- b. Portland Cement 1 part
Lime (type S) ¼ to ½ part
Sand 3 to 4 parts per cement & Lime
Fibers Maximum 3 oz per batch
- c. Plastic Cement 1 part
Sand 3 ½ to 4 ½ parts per cement
Fibers Maximum 3 oz per bag plastic cement

- B. Finish Coats: Mixing and tinting instructions are contained in the appropriate product data sheets by the Manufacturer.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Prior to the application of the Portland cement plaster basecoat the plastering contractor shall ensure that:
- B. Surface and site conditions are ready to receive work.
- C. Grounds and Blocking: Verify that the items within the walls for other sections of work have been installed.
- D. Notify architect/owner of any defects that may impact the finished assembly. Proceed as directed.
- E. Substrates:
 - 1. Acceptable substrates must be sound, secure and suitable for lath and plaster.
 - 2. Substrates and adjacent materials must be dry and clean. Substrate surface must be flat, free of protrusions or planar irregularities greater than ¼-inch in 10-feet (6mm in 3m).
- F. Flashings: All flashing around windows, at deck attachments, utility penetrations, roof lines, etc. and all kick-out flashing must be properly installed prior to application of Portland cement plaster. Notify owner if flashings are missing, proceed as directed.
- G. Unsatisfactory conditions or concerns shall be reported to the general contractor and/or builder and/or architect and/or owner. Do not proceed until directed in writing by architect or general contractor.

3.02 PREPARATION

- A. Substrate/Framing: inspect all work prior to starting lath and plastering. Notify architect of any issues impacting performance, proceed as directed.
- B. Surrounding Areas: Protect surfaces near the work of this section from damage, disfiguration, and overspray. Mask off all dissimilar materials.

3.03 INSTALLATION, GENERAL

- A. General Installation: Refer to ASTM C926, ASTM C1063, and/or the appropriate manufacturer's product data sheet for additional installation requirements and recommendations.

3.04 INSTALLING WEATHER PROTECTION

- A. Water-Resistive Barrier: Apply water-resistive barrier complying California Building Code. Start at base of wall and overlap flashing flanges and in a "shingle-fashion" by a minimum of two (2) inches horizontal and six (6) inches vertical. Integrate with flashings to insure incidental moisture drains down and weeps out. Reverse laps shall not be allowed.
- B. Window Flashing: Contractor shall inspect and verify the flashing between the window/door and the cement plaster is appropriate for the condition. Notify architect of any concerns.
- C. Flashing: Install flashing and trim per current California Building Code.

3.05 INSTALLING LATH/TRIMS

- A. General: Installed per ASTM C1063 or per Architect's direction. Trims shall be full length and installed plumb/level to within 1/8 inch in eight (8) feet.
- B. Weep screed shall be installed at the base of all framed walls.
- C. Trims shall be attached per the trim manufacturer's instructions; however do not exceed 24 inches on center spacing.
- D. Apply lath per manufacturer's recommendations. Laps shall occur at horizontal and vertical joints. Attach lath six (6) to seven (7) inches on center along framing supports (studs). Fastener shall penetrate wood by a minimum 3/4 inch, penetration of wood based sheathing shall count as 50% of dimensional lumber. Metal framing by a minimum of three (3) full threads and engage the lath.
- E. Lath shall lap the flange of accessories by more than 50%.
- F. Control Joints: Installed per Architects direction. Single-piece control joint may be installed over continuous lath if approved by Building Official and/or Architect. If lath is discontinuous, framing shall support lath terminations. Notify architect of issues or changes.
- G. Expansion Joints: Install per Architect's direction. Two piece joints (expansion) must have lath terminate each side.
- H. Contractor shall honor control or expansion joints in substrates.
- I. Do not mix lath products on same wall.
- J. Avoid excessive laps with expanded metal lath
- K. Do not use rib lath on walls
- L. Use wire nose corner for cement finish, PVC nose for acrylic finish
- M. Lath shall cover more than 75% of solid flanges.

3.06 INSTALLING PORTLAND CEMENT PLASTER

- A. Per ASTM C926, apply Portland cement plaster by hand-troweling or machine-spraying to a nominal thickness of 3/8-inch (9.5mm) for scratch coat. Then apply a second coat to a nominal thickness of 3/8-inch (9.5 mm) brown coat. Total basecoat shall be a nominal 3/4 inch thickness.
- B. Scratch coat shall substantially cover the lath and be applied with sufficient pressure to encase the lath in cement. Slickers to apply cement plaster are prohibited. Score in a horizontal pattern.
- C. Allow to cure 48 hours, or until sufficiently rigid to accept a brown coat.
- D. Apply brown coat to fill and complete basecoat. Nominal 3/4 inch thickness. Rod to a flat plane. Do not apply to frozen or soft scratch coat. When excess moisture leaves brown coat,

hard float to provide densification per ATSM. Hard floating procedure may be omitted if the “Base coat and Mesh or Stucco crack reduction system” is selected.

- E. Moist Curing: Provide sufficient moisture by fog or moist curing to permit proper hydration of the cementitious materials. The length of time and most effective procedure for curing will depend on climatic and job conditions.

3.07 INSTALLING FINISH COAT

- A. General: Mix and apply per manufacturer’s product data sheet.
- B. Do not apply to soft, contaminated or frozen basecoat.
- C. Avoid applying to excessively hot walls.
- D. Verification: Verify the desired color, material and texture to match the approved sample and/or mock-up prior to installation.
- E. Avoid scaffold lines and cold joints
- F. Fog coat (cement finish only) as needed to blend color variations
- G. Finish coat shall be free of eye catching imperfections.

3.08 CLEANING/PATCHING/TOLERANCE

- A. Cleaning: Remove any and all materials used, overspray from adjacent surfaces, and all protective masking.
- B. Patch and repair as needed, including but not limited to fog coating, imperfections and blisters.
- C. The basecoat of plaster shall be in tolerance:
 - 1. Not to exceed ¼ inch in ten (10) feet
- D. Eye catching variations in color or texture pattern will not be accepted.

3.09 PROTECTION

- A. Protection: Protect applied material from inclement weather until dry and prevent it from freezing for a minimum of 24-hours after set and/or until dry. Refer to manufacturer’s product data sheet for additional requirements.

END OF SECTION

SECTION 09 29 00

GYPSUM BOARD

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Gypsum board wall and ceiling systems.
2. Fiberglass-mat faced, moisture and mold resistant gypsum sheathing.
3. Cement Tile Backer Board.

B. Related Requirements:

1. Division 01 - General Requirements.
2. Section 05 41 00 – Cold Formed Metal Framing.
3. Section 07 92 00 - Joint Sealants.
4. Section 09 22 16 - Non-Structural Metal Framing.
5. Section 09 90 00 - Painting and Coating.

1.02 PROJECT REQUIREMENTS

- A. Design Requirements: Provide systems capable of resisting deflection as required by CBC and authorities having jurisdiction.
- B. Regulatory Requirements: Comply with CBC requirements for design and installation.

1.03 SUBMITTALS

- A. Shop Drawings: Submit Shop Drawings indicating complete suspension system including connections, anchorage, and trim features.
- B. Material Samples: Submit 18 inch by 18 inch Samples of the texture coat of gypsum board panels with edges taped.
- C. Product Data: Submit manufacturer's catalog data for each product proposed for installation.

- D. LEED Submittals: Complete the LEED Material Buyout Form (MBoF) with all materials provided to the project. A complete submittal includes providing all material costs in the MBoF and all of the supporting documentation for the following credits:
1. MRc2 - Environmental Product Declarations (EPD): Provide Industry-Wide or Product-Specific EPD.
 2. MRc3 - Sourcing of Raw Materials - Recycled Content: Provide product data for pre- and post- consumer recycled content.
 3. MRc4 - Material Ingredients: Provide manufacturers Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, or Cradle to Cradle Health Product Certificate.
 4. IEQc2 - Low-Emitting Materials – Interior Wet Applied Products: For paints, coatings, adhesives and sealants applied on site or used for laminating off-site, include product data indicating the VOC content (g/L) and testing.

1.04 QUALITY ASSURANCE

- A. Comply with following as a minimum requirement:
1. ASTM C475 – Standard Specification for Joint Compound and Joint Tape for finishing Gypsum Board.
 2. ASTM C840 - Standard Specification for Application and Finishing of Gypsum Board.
 3. ASTM C919 - Standard Practice for Use of Sealants in Acoustical Applications.
 4. ASTM C1002 - Standard Specification for Steel Self-Piercing Tapping Screws for the Application of Gypsum Panel Products or Metal Plaster Bases to Wood Studs or Steel Studs.
 5. ASTM C1047 - Standard Specification for Accessories for Gypsum Wallboard and Gypsum Veneer Base.
 6. ASTM C1177 Standard Specification for Glass Mat Gypsum Substrate for Use as Sheathing.
 7. ASTM C1280 Standard Specification for Application of Gypsum Sheathing.
 8. ASTM C1325 - Standard Specification for Non-Asbestos Fiber-Mat Reinforced Cementitious Backer Units.
 9. ASTM C1396 - Standard Specification for Gypsum Board.
 10. ASTM C1629 - Standard Classification for Abuse-Resistant Nondecorated Interior Gypsum Panel Products and Fiber-Reinforced Cement Panels.

11. ASTM D3273 - Standard Test Method for Resistance to Growth of Mold on the Surface of Interior Coatings in an Environmental Chamber.
 12. ASTM D3274 – Standard Test Method for Evaluating Degree of Surface Disfigurement of Paint Films by Microbial (Fungal or Algal) Growth or Soil and Dirt Accumulation.
 13. Underwriters Laboratories (ULI) requirements and listings for fire-rated materials and products classification.
 14. GA 214 - Gypsum wallboard finish shall conform to requirements of GA 214, Application and Finishing of Gypsum Panel Products, published by the Gypsum Association, and as specified herein.
 15. GA 600 - Gypsum wallboard shall conform to requirements of GA 600 Fire Resistance Design Manual, published by the Gypsum Association.
 16. American National Standards for the Installation of Ceramic Tile.
 17. ANSI A118.9 - Specification for Cementitious Backer Units.
- B. Gypsum Association (GA): GA-253 Application of Gypsum Sheathing, ASTM C1280 and the manufacturer’s recommendations.
- C. Qualifications: Installer shall have a minimum 5 years experience in installing and finishing gypsum board.
- D. CHPS Low-Emitting Materials table: Materials submitted must meet the CHPS Low-Emitting criteria and be listed as Low-Emitting on the following web site: www.CHPS.net or be listed on UL website Greenguard.org as Greenguard Gold Certified
- 1.05 DELIVERY, STORAGE AND HANDLING
- A. Deliver materials in original, factory sealed packages, containers or bundles bearing brand name and name of manufacturer.
 - B. Materials shall be kept dry. Gypsum wallboard shall be neatly stacked flat; avoid sagging and damage to edges, ends, and surfaces.
 - C. Fire-rated materials shall have fire classifications numbers attached and legible.
 - D. Provide all means necessary to protect gypsum board systems before, during, and after installation.
 - E. Gypsum wallboard showing any evidence of water damage shall not be installed. Gypsum wallboard showing evidence of water damage after installation shall be removed and replaced.

PART 2 – PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS

- A. Georgia-Pacific.
- B. National Gypsum Co.
- C. U.S. Gypsum Co.
- D. Or equal.

2.02 MATERIALS

- A. Gypsum Board Type X (fire-resistant) or Type C or Type ULIX as required by fire rated design and acoustic requirements: 5/8 inch thick, 4-foot wide and up to 16-foot long conforming to ASTM C1396 with long edges tapered.
- B. Impact Resistant Gypsum Board, Type X (fire-resistant): 5/8 inch thick or Type C as required by fire rated design and acoustic requirements, 4-foot wide and up to 16-foot long complying with the following:
 - 1. Fire resistant rated gypsum core with additives to enhance impact resistance, faced with moisture and mold resistant paper and reinforcing fiber mesh. Comply with ASTM C1629 level 3 hard body impact resistance.
- C. Mold and Water Resistant Gypsum Board, Type X (fire-resistant): 5/8 inch thick 4-foot wide, up to 16-foot long conforming to ASTM C1396 with long edges tapered.
 - 1. Resistance to Mold Growth: Minimum score of “10” when tested in accordance to ASTM D3273 and evaluated in accordance with ASTM D3274.
- D. Fire-Rated Fiberglass-Mat Faced Gypsum Sheathing: Type X; 5/8” inch thick 4-foot wide, up to 16 foot long (if available), square edge, conforming to ASTM C1177. Used for building exterior sheathing.
 - 1. Basis of Design: GP Densglass.
 - 2. Resistance to Mold Growth: Minimum score of “10” when tested in accordance to ASTM D3273.
- E. Cement Tile Backer Board: In addition to manufacturers listed in Article 2.01, James Hardie Building Products Inc.
 - 1. Water resistant panels, 1/4 inch thick on horizontal and ½ inch thick on vertical surfaces, 4-foot wide and up to 8-foot long conforming to one of the following requirements:
 - a. Aggregated Portland cement board with polymer-coated, woven glass-fiber mesh embedded in front and back surfaces.
 - b. Cementitious board surfaced with fiberglass reinforcing mesh on front and back and complying with ANSI A118.9 and ASTM C1325.

2. Tile backer boards shall meet the following requirements:
 - a. Resistance to Mold Growth: Minimum score of “10” when tested in accordance to ASTM D3273 and evaluated in accordance with ASTM D3274.
- A. Metal Trim: Paper-faced metal drywall beads and trim meeting ASTM C1047, as manufactured by USG/Beadex, or equal. Trim units shall be of size and type to fit gypsum board construction and shall include corner beads, casings, edge trim and other shapes indicated and required. Provide 30 year warranty against edge cracking.
- B. Joint Compound for gypsum board products: meeting the following requirements:
 1. Shall conform to ASTM C475.
 2. In areas subject to moisture after installation such as bathrooms and locker areas use setting type joint compound.
 3. Interior areas not subject to moisture after installation use drying Type Joint compound.
- C. Joint Tapes for gypsum boards: Shall conform to ASTM C475.
- D. Joint Tapes for exterior gypsum sheathing: Approved for exterior application or as recommended by gypsum sheathing manufacturer.
- E. Joint mortar and Tape for Cement board.
 - a. Use type as recommended by cement board manufacturer
 - b. Fiberglass tape: Durock brand tile backer tape
 - c. Joint Mortar: Meet ANSI 118.4
- F. Finishing Materials: Texture coat finish material shall be manufactured by U.S. Gypsum, Hamilton, or Highland Stucco and Lime Products, Inc., or equal.
- G. Acoustical Sealant: Non-hardening, non-shrinking, for use in conjunction with gypsum board, as recommended by Board Manufacturer and conforming to ASTM C919. Sealant shall maintain fire and sound rating assembly.
- H. Fasteners:
 1. Self-drilling, self-tapping bugle-head drywall screws; in conformance to ASTM C1002. No. 6 Type S or S12, 1 5/8-inch long for metal framing,
 2. Wood framing: Screws: Type W 1 5/8-inch minimum length for single-layer panels. Screws shall be furnished with a corrosion-resistant treatment.
 3. Adhesive: as recommended by board manufacturer and in compliance to ASTM C557.

2.03 LEED REQUIREMENTS

- A. IW/PS EDP: Products specified under this section must have a Type III Product Specific EPD or the company must be listed in the industry group responsible for the Industry Wide Externally Verified EPD.
- B. PS EPD: Products specified under this section must have a Type III Product Specific EPD.
- C. HPDs: Products specified under this section must have one of the following unexpired material ingredient reports compliant with LEEDv4.1 requirements and declared to 1000 ppm or less: Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, Cradle to Cradle Health Product Certificate, or UL Product Lens Certification.
- D. Interior Wet Applied Products: All wet-applied on-site paints, coatings, adhesives, and sealants products provided under Part 2 of this specification section must be compliant with the VOC limits outlined under IEQc2: Low Emitting Materials in 01 81 13 Sustainable Design Requirements. In addition, all paints and coatings must be compliant with CDPH Standard Method v1.2-2017 emissions testing with proper unexpired CDPH testing certificates or acceptable third-party certification.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Metal Trim:
 - 1. Provide corner beads at outside corners and angles, metal casing where gypsum board terminates at uncased openings, metal edge trim where board edges abut horizontal and vertical surfaces of other construction.
 - 2. Install trim in accordance with manufacturer's directions with appropriate joint compound. Install trim in longest practical pieces.
- B. Gypsum Board:
 - 1. Install gypsum board in conformance with ASTM C840, fire rated design, and sound rating.
 - 2. Gypsum board shall be cut by scoring and breaking or by sawing, working from face side. Where board meets projecting surfaces it shall be scribed and neatly cut. Unless conditions require otherwise, gypsum board shall be installed first to ceilings, then to walls. End joints shall occur over a support. Install panels of maximum practical length so a minimum number of end joints occur.

3. End joints shall be staggered and joints on opposite sides of a partition shall be arranged to occur on different studs. Joint layout at openings shall be installed so no end joints will align with edges of openings.
 4. Except where specified otherwise, fasteners shall be spaced not less than 3/8 inch from edges and ends of gypsum board. Do not stagger fasteners at adjoining edges and ends.
 5. Install gypsum board vertically or horizontal as permitted by specific UL Design at walls. Fasten board with drywall screws spaced not to exceed 8 inches on centers around perimeter of boards and 8 inches on centers on intermediate studs. Space screws at 8 inches on centers along top and bottom runners. Screws shall be driven to provide screwhead penetration just below gypsum board surface without breaking surface paper. Where electrical outlet and switch boxes are indicated, provide adjustable attachment brackets between studs.
 6. Install gypsum board to ceiling framing with long dimension at right angles to furring channels, or wood framing members, and fasten with specified drywall screws or nails spaced 6 inches to 7 inches on centers across board. Screws or nails shall be not less than 1/2 inch from side joints and 3/8 inch from butt end joints. Abutting end joints shall occur over furring channels and end joints of boards shall be staggered. Support cutouts or openings in ceilings with furring channels.
 7. Install access doors, furnished under another section, in correct location, plumb, or level, flush with adjacent construction, and securely fastened to framing.
- C. Fire-Rated Fiberglass-Mat Faced Gypsum Sheathing:
1. General: Installation shall be in accordance with GA-253, ASTM C1280 and the manufacturer's recommendations.
 2. Edges of gypsum sheathing joints shall be covered with a water-resistive barrier or shall be sealed.
- D. Cement Board Backer System:
1. In shower areas, install water barrier in shingle-like manner to prevent water infiltration into stud cavity. Pre-cut all board to required sizes and make necessary cut-outs.
 2. Install cement board in accordance with UL Design and SA-932. Install Cement board plumb and flat. Shim behind board as required.
 3. Fasten cement board to steel studs spaced max. 16" o.c. and bottom runners with cement board fasteners spaced 8" o.c. maximum with perimeter fasteners at least 3/8" and less than 5/8" from ends and edges. Studs shall be not less than 20 gage.

4. Tape joints with cement board tape and joint mortar. Finished surface shall be level within 1/8" in 10".

3.02 TOLERANCES

- A. System shall appear flat and monolithic with no exposed joints.

3.03 JOINT TREATMENT AND FINISHING

*At completion of specified taping and finishing, install one coat of drywall primer as specified hereafter

- B. Levels: Install tape bedding compound, tape, and finishing cement on joints in wallboard as required for specified levels of finish.

- C. Levels 2 through 5:

1. Install joint cement and finishing cement over screw heads. Treat all inside corners with joint cement, tape, and finishing cement. Treat outside corners with corner beads and finishing cement.
2. Provide metal casing beads at all edges of gypsum wallboard, which abut ceiling, wall, or column finish, and elsewhere as required, such as openings, offsets, etc. Install all exposed joints, trims, and attachments non-apparent following installation of paint or other finishes. If joints and fasteners are visibly apparent, correct defects as required.
3. Seal raw edges of plumbing openings and boards that have been cut to fit with sealing compound brushed on.
4. When entire installation is completed, correct and repair broken, dented, scratched or damaged wallboard before installation of finish materials by other trades.

- D. Levels 3 and 4: Install one coat of drywall primer over entire surface prior to painting.

- E. Level 5: Install one coat of skim coat over entire surface, followed by one coat of drywall primer over entire surface prior to painting.

3.04 REQUIRED LEVELS OF FINISH

- A. Finishes shall conform to GA 214

- B. Unless otherwise indicated or specified, levels of finish required shall be as follows:

1. Level 1: Plenum areas above ceilings, insides of shafts, and other concealed areas. Taping to be as required for fire rated assemblies.
2. Level 2: Water-resistant wallboard backing for high moisture areas to be covered with a water resistant surface other than tile, vinyl or paint, i.e stainless steel cladding etc.

3. Level 3: Backing for vinyl wall covering and adhered acoustic tile. Also, provide where textured finish is indicated.
4. Level 4: Exposed painted wallboard in classrooms, utility rooms, and similar spaces not requiring Level 5 finish.
5. Level 5: Exposed, painted wallboard in offices and corridors.

3.05 CLEAN-UP

- A. Remove rubbish, debris, and waste materials and legally dispose of off Project site.

3.06 PROTECTION

- A. Protect Work of this section until Substantial Completion.

END OF SECTION

SECTION 09 30 13

TILING

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Ceramic tile, waterproof membrane for tile, stone thresholds, thin set mortar, and mortar setting beds for floor and wall tile.

B. Related Requirements:

1. Division 01 - General Requirements.
2. Section 03 30 00 - Cast-In-Place Concrete.
3. Section 07 92 00 - Joint Sealants.
4. Section 08 11 13 – Hollow Metal Doors Frames.
5. Section 08 31 16 – Access Panels and Frames.
6. Section 09 29 00 - Gypsum Board.

1.02 SUBMITTALS

A. Product Data: Manufacturer's product data, standard specifications, Safety Data Sheets, and other technical information for each product specified.

B. Material Samples: Manufacturer's standard palette, indicating full range of tile colors, textures, and grout colors.

C. Mock-Ups: For each type, color, and texture, minimum one foot square or three full tile courses, on Plexiglas to demonstrate proper bond mortar and coverage; grout color, hardness and depth.

D. Manufacturer's Instructions:

1. Manufacturer's preparation and installation instructions.
2. Maintenance instructions.

E. Product Certificates: Signed by manufacturer certifying that products furnished comply with requirements of this Specification.

- F. LEED Submittals: Complete the LEED Material Buyout Form (MBoF) with all materials provided to the project. A complete submittal includes providing all material costs in the MBoF and all of the supporting documentation for the following credits:
1. MRc2 - Environmental Product Declarations (EPD): Provide Industry-Wide or Product-Specific EPD.
 2. MRc3 - Sourcing of Raw Materials - Recycled Content: Provide product data for pre- and post- consumer recycled content.
 3. MRc4 - Material Ingredients: Provide manufacturers Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, or Cradle to Cradle Health Product Certificate.
 4. IEQc2 - Low-Emitting Materials – Interior Wet Applied Products: For paints, coatings, adhesives and sealants applied on site or used for laminating off-site, include product data indicating the VOC content (g/L) and testing.

- C. Tile Council of North America (TCNA) – Current edition of “Handbook for Ceramic, Glass and Stone Tile installation”.
- D. CHPS Low-Emitting Materials Table: Materials submitted for tile assemblies shall be listed as low emitting on the CHPS website www.CHPS.net.
- 1.04 QUALITY ASSURANCE
- A. Qualifications:
1. Tile Manufacturer: Company specializing in ceramic tile, mosaics, pavers, trim units, and thresholds with five years minimum experience.
 2. Installation System Manufacturer: Company specializing in installation systems/ mortars, grouts/ adhesives with ten years minimum experience.
 3. Installer: Company specializing in installation of ceramic tile, mosaics, pavers, trim units and thresholds with five years experience with installations of similar scope, materials, and design.
- E. Environmental Requirements: Adhesives, primers, caulk, sealants and liquid applied products shall be approved by the City, acceptable to the SB County Department of Public Health, and meet the technical requirements specified in this Section.
- F. Grade Certificate and Labeling: With each delivery of tile, furnish manufacturer’s “Master Grade Certificate” to the OAR.
- B. Source of Materials: Provide materials obtained from one source for each type and color of tile, grout, and setting materials.
- C. Consistent Quality: Products shall be consistent in appearance and physical properties.
- D. Comply with requirements of California Building Code and ADAAG.
- 1.05 PRE-CONSTRUCTION MEETINGS:
- A. Prior to start of Work of this section and after approval of submittals, schedule an on-site meeting between CONTRACTOR, OAR, Project Inspector, and representatives of the material manufacturer and tile installer to review construction conditions and Drawings for conformance with the requirements of this Section for each substrate.
- 1.06 DELIVERY, STORAGE AND HANDLING

- A. Deliver tile and other materials in sealed containers, with manufacturer's labels intact.
- B. Store materials in clean, dry and secure areas.

1.07 MAINTENANCE

- A. Extra Materials: Provide the following in labeled manufacturers' cartons:
 - 1. Five percent of each type and color of tile installed.
 - 2. Ten linear feet of coved base and bullnose tile for each color installed.
 - 3. Six units of each type and color of corner pieces.

1.08 WARRANTY

- A. Manufacturer shall provide a five year material warranty. Installer shall provide a five year installation warranty.
- B. For waterproofing, manufacturer shall provide a 10 year material warranty for waterproofing installation, tile setting, and grouting materials.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

- A. Tile: Standard Grade Products from the following manufacturers conforming to ANSI A137.1:
 - 1. Dal-Tile Corporation.
 - 2. American Olean Company.
 - 3. Florida Tile, Inc.
 - 4. Equal.
- B. Installation Materials: Products and methods of the following manufacturers conforming to ANSI A137.1:
 - 1. Laticrete International, Inc.
 - 2. Custom Building Products.
 - 3. MAPEI.
 - 4. Siena Tile and Stone Installation Products.

5. Equal.

2.02 MATERIALS

- A. Colors, Textures, and Patterns: Tile shall be from manufacturer's standard product line as selected by Architect. Tile trim and accessories shall match adjoining tile. Grout color shall match tile unless otherwise indicated.
- B. Tile sizes: Tile sizes specified are modular dimensions unless otherwise indicated.
- C. Portland cement mortar bed for floor, walls and shower areas:
 - 1. Laticrete International, Inc., 3701 Fortified Mortar.
 - 2. Custom Building Products, Quickrete Floor Mud.
 - 3. MAPEI, Modified Mortar Bed.
- D. Latex Portland cement bond mortar thin-set for tiles under 15" in one dimension on floor installations:
 - 1. Laticrete International, Inc., 254 Platinum.
 - 2. Custom Building Products, Porcelain Tile Professional Thin Set Mortar.
- E. Latex Portland cement bond mortar thin-set for tiles over 15" in one dimension on floors. For all tile on wall installations:
 - 1. Laticrete International, Inc., Tri-Lite.
 - 2. Custom Building Products, ProLite Premium LFT Mortar.
 - 3. MAPEI, UltraLite Mortar.
- F. Waterproof Membrane: Cold-applied, single component liquid with embedded reinforcing fabric where recommended by manufacturer: Laticrete International, Inc. Hydro Ban Waterproof Membrane, Custom Building Products Red Guard Waterproof Membrane, or MAPEI Mapelastix Aqua Defense.
- G. Reinforcing Wire Fabric: 2-inch by 2-inch, 16 by 16 gage, galvanized electrically welded wire reinforcing, per ASTM A1064.
- H. Latex Portland Cement Grout: Laticrete International, Inc. Sanded Grout (1500 Series), Custom Polyblend Sanded Grout, Laticrete International, Inc. Unsanded Grout 1600 Series (for joints smaller than 1/8"), Custom Polyblend Unsanded Grout, or MAPEI Ultracolor Plus FA.

- I. Cleavage Membrane and Wall Backing Paper: Cleavage membrane shall be 15-pound asphalt-saturated felt manufactured according to ASTM D226 Standard Specification for Asphalt-Saturated Organic Felt Used in Roofing and Waterproofing.
- J. Separation Material (for all sealed joints including perimeters): Quality Foam, QF 200 white, 3/8 inch wide by 5-inch high.
- K. Backer Rod for sealants (for ceramic mosaic fields): Polyethylene foam, closed-cell, flexible and compressible, 3/16 inch diameter.
- L. Cleaner and Sealer:
 1. Cleaner and sealer shall be from one manufacturer, acceptable to tile and grout manufacturers. To establish quality, the Specification is based on Aqua Mix Inc. Equivalent products from Miracle Sealants Co., Watco Tile and Brick, MAPEI, or equal may be provided.
 2. Cleaner: Aqua Mix Concentrated Tile Cleaner, neutral phosphate-free cleaner, Custom Building Products Tile Lab Concentrated Tile and Stone Cleaner, or Mapei Ultracare cleaner.
 3. Sealer: Aqua Mix Penetrating Sealer, fungus- and bacteria-resistant, stain-resistant, and slip-resistant as specified for tile, Custom Building Products Tile Lab Surface Gard, Mapei Ultracare, or equal.
- M. Sealants:
 1. Sealant and primer shall be from one manufacturer, acceptable to tile and grout manufacturers. See Section 07 9200 - Joint Sealants.
 2. Ceramic Mosaic Tile: One-Part, Mildew-Resistant Silicone Sealant: ASTM C920; Type S; Grade NS; Class 25; Uses NT, G, A, and, as applicable to nonporous joint substrates indicated, O; formulated with fungicide, intended for sealing interior ceramic tile joints and other nonporous substrates that are subject to in-service exposures of high humidity and extreme temperatures.

2.03 TILE

- A. Unglazed Porcelain Floor Tile:
 1. Size: As indicated in drawings.
 2. Colors and patterns as selected by Architect from price groups specified.
 3. Slip Resistance: Resistant to slipping appropriate to the installed conditions of use, as required by the California Building Code, ADAAG, ANSI 137.1 and TCNA.

- B. Wall Tile:
 - 1. Size: As indicated in drawings
 - 2. Colors and patterns as selected by Architect from price groups specified.
- C. Trim:
 - 1. Integral bullnose at external corners.
 - 2. Provide bullnose where tile projects from jamb.
 - 3. Tile base with wall tile above
 - 4. Bullnose at wainscot.
- D. Stone Thresholds:
 - 1. Exterior installation: Marble thresholds with minimum abrasive hardness value of 10 tested in accordance with ASTM C241.
 - 2. White honed marble complying with Marble Institute of America Group "A," unless other color indicated and ASTM C503.
 - 3. Size and profile shaped to provide transition between tile surfaces and adjoining finished floor surfaces, or as indicated. Width not less than 4 inches. Edges beveled on a slope of no greater than 1:2. Cut to fit door frame profile.

2.04 LEED REQUIREMENTS

- A. IW/PS EDP: Products specified under this section must have a Type III Product Specific EPD or the company must be listed in the industry group responsible for the Industry Wide Externally Verified EPD.
- B. PS EPD: Products specified under this section must have a Type III Product Specific EPD.
- C. HPDs: Products specified under this section must have one of the following unexpired material ingredient reports compliant with LEEDv4.1 requirements and declared to 1000 ppm or less: Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, Cradle to Cradle Health Product Certificate, or UL Product Lens Certification.
- D. Interior Wet Applied Products: All wet-applied on-site paints, coatings, adhesives, and sealants products provided under Part 2 of this specification section must be compliant with the VOC limits outlined under IEQc2: Low Emitting Materials in 01 81 13 Sustainable Design Requirements. In addition, all paints and coatings must be

compliant with CDPH Standard Method v1.2-2017 emissions testing with proper unexpired CDPH testing certificates or acceptable third-party certification

PART 3 - EXECUTION

3.01 EXAMINATION AND PREPARATION

- A. Examine substrates and conditions for compliance with installation requirements. Verify that all penetrations through substrate have been installed. Proceed with Work only after all conditions are in compliance.
- B. Substrates shall be firm; dry; clean and within flatness tolerances required by relevant ANSI A108 tile installation standards. Prepare surfaces as follows:
 - 1. Concrete Floors: Allow concrete floors to cure for 28 days minimum before beginning tile and grout installation. Remove laitance, sand, dust, and loose particles.
- C. Substrates to receive wall tile and base shall be:
 - 1. Scratch coat of cement plaster, as specified in Section 09 24 23 - Cement Plaster and Metal Lath (required in restrooms, showers and locker rooms).
 - 2. Cementitious backing panels, as specified in Section 09 29 00 - Gypsum Board.
- D. Verify that installation of grounds, anchors, recessed frames, electrical and mechanical items of Work, and similar items located in or behind tile has been completed before installing tile.
- E. Verify that joints and cracks in tile substrates are coordinated with caulked-joint locations; if not coordinated, adjust as required by the ARCHITECT.
- F. Do not install tile until construction in spaces is completed and ambient temperature and humidity conditions are maintained in compliance with referenced standards and manufacturer's written instructions.
- G. Protect adjacent surfaces during progress of Work of this section.

3.02 TILE INSTALLATION, GENERAL

- A. Install tile in grid pattern, unless otherwise indicated. Align joints when adjoining tiles on floor, base, walls, and trim are same size. Center the tile fields in both directions for each space or on each wall area. Adjust to minimize tile cutting. Provide uniform joint widths, unless otherwise indicated.

- B. For tile mounted in sheets: Joints between tile sheets shall be the same width as joints within tile sheets.
- C. Extend Work into recesses and under or behind equipment and fixtures to form a complete covering without interruptions, unless otherwise indicated. Terminate Work neatly at obstructions, edges, and corners without disrupting pattern or joint alignments.
- D. Accurately form intersections and returns. Perform cutting and drilling of tile without damaging tile. Carefully grind the cut edges of tile abutting trim, finish, or built-in items. Fit tile closely to electrical outlets, piping, fixtures, and other penetrations so plates, collars, or covers overlap tile.
- E. Locate joints, directly above joints in concrete substrates, at horizontal and vertical changes in plane, or where indicated during installation of mortar beds. Provide 3/8-inch wide foam at joints. Do not saw-cut joints after installing tiles.
- F. Prepare and clean joints to be sealed. Apply sealants to comply ASTM C920 with requirements of Section 07 9200 - Joint Sealants.
- G. Conform to manufacturers printed instructions, and applicable requirements of ANSI and TCNA Standards.

3.03 TILE INSTALLATION, FLOOR

- A. Install reinforcing and latex Portland-cement mortar setting bed over cured concrete slab or cleavage membrane on plywood floor. Lap reinforcing at least one full mesh, and support or lift so that it is approximately in the middle of mortar bed. Do not abut against vertical surfaces. Install foam separation material at perimeters and expansion joint locations for caulked joints.
- B. Mix setting mortar in accordance with ANSI recommendations and ASTM C185.
- C. Once begun, mortar installation shall continue until room is completed. Discard any batch not floated and finished within ½ hour of mixing. Firmly compact before screeding. Screed to true plane and pitch as indicated. Slope mortar bed sufficiently that water flows to drain and no puddling will occur. Slope mortar down to floor drains for proper installation of waterproof membrane. After screeding, firmly rub down with steel or wood float.
- D. Cure mortar bed with a light fog spray of water and cover with 6-mil Visqueen for 72 hours.
- E. Install tile on floors with the following joint widths:
 - 1. Ceramic Mosaic Tile: 1/16 to 1/8 inch.
 - 2. Paver Tile: 3/16 to 3/8 inch.

3.04

TILE INSTALLATION, WALLS

- A. Install wall mortar beds before floor mortar beds.
- B. On plaster walls, clean scratch coat surface of loose or foreign materials, fog spray with water, and install brown coat mortar bed over scratch coat to a thickness not less than 3/8 inch and not greater than 3/4 inch. Once started, wall mortar installation shall continue until wall is completely floated. Discard any batch not floated and finished within a half an hour of mixing. As soon as wall mortar is dried to sufficient hardness, but still plastic, firmly rub with wood float.
- C. Cover cure with 40-weight Kraft paper for 72 hours minimum.
- D. Install tile over properly cured setting bed, waterproof membrane, or cementitious backing panels utilizing "thin-set" method with latex portland cement bond mortar, in accordance with manufacturer's printed instructions and ANSI A108.5. Confirm substrate is completely clean and free of dust. Ensure that bond coats do not intrude into joints to be caulked.
- E. Minimum coverage of bond mortar shall be 80 percent except 95 percent in shower areas or exterior installations. Set and test as specified for floors.
- F. Lay out Work so tiles will be centered on each wall or section of wall in order to minimize tile cuts. Lay out tile wainscots to next full tile beyond dimensions indicated. Spot setting bed with mortared tile, set plumb and true, accurately indicate plane of finished tile surfaces.
- G. Install tile on walls with following joint widths:
 - 1. Glazed Wall Tile: 1/16 inch.
 - 2. Ceramic Mosaic Tile: 1/16 to 1/8 inch.
 - 3. Special Large Tile: 3/16 to 3/8 inch.
- H. Horizontal joints shall be level, vertical joints plumb with surfaces true and plumb, edges of tiles flushed.
- I. Rub exposed cuts smooth with a fine stone; no cut edge shall be set against a fixture or adjoining surface without a 1/16 inch joint to be caulked.
- J. Install access doors where required, furnished under another section, in correct location, plumb or level, flush with adjacent construction, and securely fastened to framing.

3.05

THIN SET METHOD

- A. Confirm substrate is completely clean and free of dust. Cut foam at floor perimeters flush with top of mortar bed. Ensure that bond coats do not intrude into joints to be

sealed. Install tile over properly cured setting bed or waterproof membrane utilizing "thin-set" method with latex portland cement bond mortar, in accordance with manufacturer's printed instructions and ANSI A108.5.

- B. Minimum coverage of bond mortar shall be 80 percent except 95 percent in shower areas and exterior installations. Place tile into fresh mortar press tile to ensure full contact. Before setting proceeds, set and remove three tiles or sheets of tiles to confirm specified coverage of bond mortar. If coverage is insufficient, utilize a larger toothed trowel or back butter tiles until proper coverage is provided.

3.06 GROUTING

- A. Prior to starting, ensure that all tile surfaces are clean and excessive bond mortar is scraped and vacuumed from joints (approximately 2/3 depth of tile should be open for grouting). Follow manufacturer's instructions for mixing grout. Once grout Work commences, proceed until complete wall or floor area is finished utilizing one batch of grout.
- B. Latex portland cement grouting: Dampen tile surface and joints with water using sponge but leaving no puddles in joints. Force grout into joints using sufficient pressure on rubber float so as to fill joints completely and scrape excess grout off tile surface with rubber float. Smooth or tool grout to uniform joint finish. Do not over water.
- C. Curing latex Portland cement grout: Remove final grout haze with clean soft cloth, and cover with 40-weight Kraft paper to cure. Leave paper in place for protection. Cover wall surfaces with 40-weight Kraft paper for 72 hours.

3.07 CLEANING AND SEALING

- A. If grout scum is not visible on tile surface after curing, clean tile surface with clear water. Remove and replace cracked, broken or defective Work with proper material.
- B. If, when curing membrane is removed, grout scum is visible on tile surface, use the following cleaning method:
 - 1. Immediately recover floor with paper or felt and allow to continue curing for a minimum of 14 days; uncover floor and maintain entire tile surface saturated with clean cool water for not less than two hours.
 - 2. Utilize a neutral cleaner acceptable to manufacturers of tile and grout and follow manufacturer's instruction. Do not provide generic acid cleaners.
 - 3. Wet tile floors and apply cleaning solution to floor surface, then scrub with a brush. Rinse area several times with clean water to flush solution off floor surface.

- C. Apply penetrating sealer in accordance with manufacturer's instructions utilizing a dense sponge applicator, paint pad, sprayer or brush. Avoid overlapping, puddling, and rundown. Completely wipe surface dry within 3 to 5 minutes using cotton or paper towels; do not allow sealer to dry on tile. After two hours, test surface by applying water droplets to surface. If water is absorbed, apply a second coat. Avoid surface traffic for 24 hours.

3.08 SEALANTS

- A. Ensure joints to be sealed are free of setting and grouting materials and construction debris. Do not permit any foot traffic on installed sealants for a minimum of 48 hours or protect with hardboard strips.
- B. Install in accordance with Section 07 92 00 - Joint Sealants.

3.09 PROTECTION

- A. Admit no traffic where tile is installed until mortar and grout has set for a minimum of 72 hours.
- B. Protect Work of this section until Substantial Completion.

3.10 CLEAN UP

- A. Remove rubbish, debris, and waste material and legally dispose of off the Project site.

END OF SECTION

SECTION 09 51 13

ACOUSTICAL PANEL CEILINGS

PART 1 – GENERAL

1.01 SUMMARY

A. Section Includes:

1. Lay-in acoustical ceiling systems and metal suspension system.

B. Related Requirements:

1. Division 01 - General Requirements.
2. Section 09 22 16 - Non-Structural Metal Framing.
3. Section 09 29 00 - Gypsum Board.
4. Division 23 - HVAC.
5. Division 26 - Electrical.

1.02 QUALITY ASSURANCE

- A. Ceiling systems shall consist of lay-in acoustical ceiling panels by a single manufacturer and suspension systems by a single manufacturer for the entire project.

- B. Qualifications of Installer: Minimum five years experience in installing acoustical ceiling systems of the types specified.

C. Design Criteria:

1. Deflection of finished surface to 1/360 of span or less.
2. 1/8 inch maximum permissible variation from true plane measured from 10 foot straightedge placed on surface of finished acoustical fiber units.

D. Requirements of Regulatory Agencies:

1. Conform to CBC requirements and UL - Tunnel Test for Fire Hazard Classification of Building Materials.
2. CISCA: Acoustical Ceilings Use and Practice.
3. Division of the State Architect: Comply with requirements of IR 25-2.10.

E. American Society for Testing and Materials (ASTM):

1. ASTM A641 - Standard Specification for Zinc-Coated (Galvanized) Carbon Steel Wire.

2. ASTM A653 - Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.
 3. ASTM C423 - Standard Test Method for Sound Absorption and Sound Absorption Coefficients by the Reverberation Room Method.
 4. ASTM C635 - Standard Specification for the Manufacture, Performance, and Testing of Metal Suspension Systems for Acoustical Tile and Lay-in Panel Ceilings.
 5. ASTM C636 - Standard Practice for Installation of Metal Ceiling Suspension Systems for Acoustical Tile and Lay-In Panels.
 6. ASTM E84 - Standard Test Method for Surface Burning Characteristics of Building Materials.
 7. ASTM E580 – Standard Practice for Installation of Ceiling Suspension Systems for Acoustical Tile and Lay-in Panels in Areas Subject to Earthquake Ground Motions.
 8. ASTM E1264 - Standard Classification for Acoustical Ceiling Products.
 9. ASTM E1414 - Standard Test Method for Airborne Sound Attenuation Between Rooms Sharing a Common Ceiling Plenum.
 10. ASTM E1477 - Standard Test Method for Luminous Reflectance Factor of Acoustical Materials by Use of Integrating-Sphere Reflectometers.
- F. American Society of Civil Engineers (ASCE):
1. ASCE 7 - Minimum Design Loads for Buildings and Other Structures, as amended by CBC 1615A.1.16.
- G. CHPS Low-Emitting Materials Table: Materials submitted must be listed as low emitting on the CHPS website, www.CHPS.net,

1.03 SUBMITTALS

- A. Samples:
1. Lay-in panels of each specified type, 6-inch by 6-inch minimum size.
 2. Suspension System: 12-inch long samples of suspension system members, connections, moldings and wall angles, for each color specified.
- B. Shop Drawings:
1. Indicate complete plan layouts and installation details.
 2. Indicate related Work of other sections which is installed in, attached to, or penetrates ceiling areas, such as air distribution and electrical devices.
- C. Product Data:

1. Suspension System for Lay-in Ceiling: Printed data for suspension system components, including load tests, indicating conformance to specified tests and standards.
 2. Acoustical units: Printed data indicating conformance to specified tests and standards.
- D. Maintenance Materials: Provide extra panels equal to 1 percent of the area of each typical module size of acoustical panel, but not less than 8 of each specified size, style and color.
- E. LEED Submittals: Complete the LEED Material Buyout Form (MBoF) with all materials provided to the project. A complete submittal includes providing all material costs in the MBoF and all of the supporting documentation for the following credits:
1. MRc2 - Environmental Product Declarations (EPD): Provide Industry-Wide or Product-Specific EPD.
 2. MRc3 - Sourcing of Raw Materials - Recycled Content: Provide product data for pre- and post- consumer recycled content.
 3. MRc4 - Material Ingredients: Provide manufacturers Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, or Cradle to Cradle Health Product Certificate.
 4. IEQc2 - Low-Emitting Materials – Interior Wet Applied Products: For paints, coatings, adhesives and sealants applied on site or used for laminating off-site, include product data indicating the VOC content (g/L) and testing certificates or third party certification demonstrating compliance with California Department of Public Health (CDPH) v1.2-2017 emissions testing.
 5. IEQc2 - Low-Emitting Materials – Ceilings: Provide testing certificates or third-party certification demonstrating compliance with CDPH v1.2-2017 emissions testing.

1.04 DELIVERY, STORAGE AND HANDLING

- A. Deliver materials to the Project site in original sealed packages.
- B. Storage: Store materials in building area where they will be installed, in original package. Keep clean and free from damage due to water or deteriorating elements.
- C. Handle in a manner to prevent damage during storage and installation.

1.05 PROJECT CONDITIONS

- A. Installation of acoustical ceiling system shall not begin until the building is enclosed, permanent heating and cooling is in operation, and residual moisture from plaster and concrete work has dissipated. Building areas to receive ceilings shall be free of construction dust and debris.
- B. Environmental Requirements: Maintain temperature in space at 55 degrees F or above for 24 hours before, during, and after installation of materials.

C. Scheduling:

1. Before concealing Work of other sections, verify required tests and inspections have been completed.
2. Coordinate with related Work of other sections. Coordinate location and symmetrical placement of air distribution devices, electrical devices, and penetrations with related Work section.

1.06 WARRANTY

- A. Manufacturer shall provide a 10 year material warranty.
- B. Installer shall provide a two year fabrication and installation warranty.

PART 2 - PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS

- A. USG Corporation.
- B. Armstrong World Industries.
- C. CertainTeed Ceilings Corp.
- D. Equal.

2.02 SUSPENSION SYSTEM

- A. Metal suspension system for acoustical lay-in tile shall be hot-dipped galvanized steel conforming to ASTM A653. Main beams and cross tees shall be double-web steel construction with exposed flange design, with factory punched cross tee slots, hanger holes and integral couplings.
- B. Metal suspension system for acoustical lay-in tile shall conform with ASTM C635, C636 and E580 and section 13.5.6 of ASCE 7, as amended by CBC Section 1615A.1.16, for installation in high seismic areas.
- C. Structural classification of suspension systems shall be heavy-duty in conformance to ASTM C635.
- D. Vertical Strut: USG Donn Compression Post, or equal, or as indicated; types and designs complying with requirements of authorities having jurisdiction and seismic Zones D, E and F requirements. Provide base attachment clip for connection of vertical strut to main beams.
- E. Wall Molding: Fabricated from galvanized steel with 2-inch horizontal leg and hemmed edges, same finish as main and cross tees.

- F. Spacer/Stabilizer Bars: Provide for tying together the ends of main runners and cross tees that are not attached to wall molding.
- G. Hanger Wire: 0.106 inch diameter (0.144 inch diameter for pendant fixtures), galvanized soft annealed mild steel wire as defined in ASTM A641, Class 1 coating.
- H. Provide attachment devices and any other required accessories for a complete suspended ceiling system installation.

2.03 ACOUSTICAL CEILING PANELS

- A. Acoustical ceiling panels shall be class A in accordance to ASTM E1264.
- B. Acoustical panels shall meet the following surface-burning characteristics when tested in accordance to ASTM E84 for Class A materials:
 - 1. Maximum Flame Spread: 25.
 - 2. Maximum Smoke Developed: 50.
- C. Mold and Mildew Resistance: Panels and faces shall be treated with a biocide paint additive or an antimicrobial solution to inhibit mold and mildew.

2.04 CEILING TYPES

- A. ACT 1:
 - 1. Acoustical Ceiling Panels:
 - a. Panel Name: Armstrong Ultima 1912 USG Mars ClimaPlus 86985, CertainTeed Symphony M #1222BF-OVT-1, or equal.
 - b. Panel Size: 2-foot by 2-foot.
 - c. Panel Thickness: 3/4 inch.
 - d. Edge Detail: Beveled tegular.
 - e. Light Reflectance: 0.89 minimum, in accordance with ASTM E1477.
 - f. CAC: Minimum 35, UL Classified, complying with ASTM E1414.
 - g. NRC: Minimum 0.70, UL Classified, complying with ASTM C423.
 - h. Color: White.
 - i. Recycled Content: 74 percent minimum.
 - 2. Suspension System:
 - a. Suspension System Name: Silhouette XL by Armstrong, Fineline by USG, 4500 Ultraline Series by Chicago Metallic Corporation, or equal.
 - b. Color: White.

2.03 LEED REQUIREMENTS

- A. IW/PS EDP: Products specified under this section must have a Type III Product Specific EPD or the company must be listed in the industry group responsible for the Industry Wide Externally Verified EPD.
- B. PS EPD: Products specified under this section must have a Type III Product Specific EPD.
- C. HPDs: Products specified under this section must have one of the following unexpired material ingredient reports compliant with LEEDv4.1 requirements and declared to 1000 ppm or less: Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, Cradle to Cradle Health Product Certificate, or UL Product Lens Certification.
- D. Interior Wet Applied Products: All wet-applied on-site paints, coatings, adhesives, and sealants products provided under Part 2 of this specification section must be compliant with the VOC limits outlined under IEQc2: Low Emitting Materials in 01 81 13 Sustainable Design Requirements. In addition, all paints and coatings must be compliant with CDPH Standard Method v1.2-2017 emissions testing with proper unexpired CDPH testing certificates or acceptable third-party certification.
- E. Ceiling: All ceiling products provided under this specification section must be compliant with CDPH Standard Method v1.2-2017 emissions testing with proper unexpired CDPH testing certificates or acceptable third-party certification.

PART 3 - EXECUTION

3.01 PREPARATION

- A. Furnish layouts for inserts, clips or other supports and struts required to be installed by the Work of other trades that depend on the suspended ceiling system for support.
- B. Coordinate related Work to ensure completion prior to installation of clips or fasteners.
- C. Compare layouts with construction conditions. Tile shall be spaced symmetrically about the centerlines of the room or space, and shall start with a tile or joint line as required to avoid narrow tiles at the finish edges unless indicated otherwise. Joints shall be tight with joint lines straight and aligned with the walls. Ceiling moldings shall be provided where tile abuts wall with matching caulking to eliminate any space.

3.02 INSTALLATION OF SUSPENSION SYSTEMS

- A. General:
 - 1. Install suspension system in accordance with ASTM C636 and ASTM E580.
 - 2. System shall be complete; with joints neatly and tightly joined and securely fastened; suspension members shall be installed in a true, flat, level plane.
 - 3. Hanger Wires: 0.106 inch diameter minimum; larger sizes as indicated or required.

- a. Fasten wires to panel points and structure above per most stringent requirements of fabricator and CBC and as indicated on Drawings.
 - b. Wires exceeding 1:6 out-of-plumb shall be braced with counter-sloping wires.
 - c. Maintain wires at least 6 inches from non-braced ducts, pipes, conduits, and other items.
 - d. Install wire along main runners at 4 feet on center. Terminal ends of each main runner and cross tee must be supported within 8 inches of each wall with a perimeter wire or within one-fourth (1/4) of the length of the end tee, whichever is least, for the perimeter of the ceiling area.
 - e. Where obstructions prevent direct suspension, provide trapezes or equivalent devices; 1 1/2-inch minimum cold rolled channels back to back may be installed for spans to 6 feet maximum.
 - f. Wire shall be straight, without extraneous kinks or bend. Hanger wire connections must be capable of carrying a 200 - pound pull without stretching or shifting the suspension clip.
4. Bracing Wires to Resist Seismic Forces: 0.106 inch diameter minimum, larger sizes as indicated or required.
- a. System for Bracing Ceilings: Lay-In Ceiling Systems: Install one four-wire set of sway-bracing wires and a vertical strut for each 144 square feet maximum of ceiling area. Locate wire-sets and struts at 12 feet maximum on center. At ceiling perimeters, wire-sets shall be installed within 6 feet of walls.
 - b. Install four-wire sets and struts within 2 inches of cross-runner intersection with main runner; space wires 90 degrees from each other.
 - c. Do not install sway bracing wires at an angle greater than 45 degrees with the ceiling plane.
 - d. Wires shall be tight, without causing ceiling to lift.
 - e. Fasten struts in accordance with CBC requirements.
 - f. Maintain wires at least 6 inches from non-braced ducts, pipes, conduit, and other items.
5. Provide additional wires, 0.106 inch diameter minimum, necessary to properly support suspension at electrical devices, air distribution devices, vertical soffits, and other concentrated loads.
6. Suspension:
- a. Suspension members shall be fastened to two adjacent walls per ASTM 580; but shall be at least 3/4 inches minimum clear of other walls.

- b. Any suspension members not fastened to walls shall be interconnected to prevent spreading, near their free end, with a horizontal metal strut or stabilizer bar or 0.064 inch diameter taut tie wire.
 - c. Provide additional tees or sub-tees to frame openings for lights, air distribution devices, electrical devices, and other items penetrating through ceiling, which do not have an integral flange to support and conceal cut edges of acoustic panels. Provide cross bracing necessary to securely support any surface mounted fixtures or other items.
7. Attachment of Wires:
- a. To Metal Deck or Steel Framing Members: Install as required by current code.
 - b. To Suspension Members: Insert through holes in members or supporting clips.
 - c. Wires shall be fastened with three tight turns minimum for hanger wires and four tight turns minimum bracing wires. Turns shall be made in a 1 ½-inch maximum distance.
- B. Suspension System for 2-foot by 4-foot Lay-in Acoustical Ceilings:
1. Main Runners: Install main runners 48 inches apart; 0.106 inch diameter hanger wires space 48 inches on center maximum along runners, and within 8 inches of ends.
 2. Install wall moldings with fasteners to studs. Install corner caps at molding intersections.
 3. Cross-Tees: Install between main runners in a repetitive pattern of 2-foot spacings.
 4. Sub-Tees: Install at edges of penetrations.

3.03 INSTALLATION OF ACOUSTICAL PANELS

- A. Install panels into suspension system. Partial panels shall be neatly cut and fitted to suspension and around penetrations and/or obstructions. Duplicate tegular edges at partial panels; cuts to be straight. Repaint cut tiles to match color or as directed by manufacturer for mylar facing at visually exposed conditions or as required by the Architect.
- B. Penetrations through the ceilings for sprinkler heads and other similar devices that are not integrally tied to the ceiling system in the lateral direction shall have a 2 inch oversized ring, sleeve or adapter through the ceiling tile to allow free movement of one inch in horizontal directions. Alternatively per ASTM E580, a flexible sprinkler hose fitting that can accommodate one inch of ceiling movement shall be permitted to be used in lieu of the oversized ring, sleeve or adapter.

- 3.04 AIR DISTRIBUTION DEVICES
- A. Refer to and coordinate with Division 23 - HVAC.
 - B. Install air distribution grilles and other devices into suspension system. Install 4 taut wires, each 0.106 inch diameter minimum, to each device within 3 inches of device corners, to support their weight independent of the suspension system.
- 3.05 LIGHT FIXTURES
- A. Refer to and coordinate with Division 26 - Electrical.
 - B. Fixtures weighing less than 56 pounds: Install fixtures into suspension systems and fasten earthquake clips to suspension members. Install minimum 2 slack safety wires, each 0.106 inch diameter minimum, to each fixture at diagonally opposite corners, to support their weight independent of the system.
 - C. Fixtures weighing 56 Pounds or more: Install fixtures into suspension system and fasten earthquake clips to suspension system members as required by the Drawings and/or code. Install not less than 4 taut 0.106 inch diameter wires capable of supporting four times the fixture load.
 - D. Support pendant-mounted light fixtures directly from the structure above with hanger wires or cables passing through each pendant hanger and capable of supporting two times the weight of the fixture. Brace the pendant-mounted light fixtures by either a bracing assembly at the ceiling penetration or below the ceiling to the walls, as indicated in the drawings.
- 3.06 CLEANING
- A. General: After installation of acoustical material has been completed, clean surfaces of the material, removing any dirt or discolorations. Replace panels as required.
 - B. Acoustical Panels: Minor abraded spots and cut edges shall be touched up with the same paint as was used for factory applied finish of the lay-in panels.
 - C. Remove and replace work that can not be successfully cleaned and repaired to eliminate evidence of damage.
- 3.07 CLEAN UP
- A. Remove rubbish, debris, and waste materials and legally dispose off of the Project site.
- 3.08 PROTECTION
- A. Protect the Work of this section until Substantial Completion.

1.03 SUBMITTALS

- A. Shop Drawings: Layout and details of ceilings. Show locations of items that are to be coordinated with or supported by the ceilings.
- B. Installation Instructions: Submit manufacturer's installation instructions as referenced in Part three, Installation.
- C. Product Data: Submit manufacturer's technical data for each type of ceiling unit and suspension system required.
- D. Samples: Real Wood Veneer on fire rated particle board – Semi-gloss tinted topcoat – Clear Finish
- E. Certifications: Manufacturer's certifications that products comply with specified requirements, including laboratory reports showing compliance with specified tests and standards.
- F. Non-Conformance: All products not conforming to the requirements of this specification and or the manufacturer's published values are to be disposed. The Contractor performing the work will replace with approved product at their expense.

1.04 QUALITY ASSURANCE

- A. Single-Source Responsibility: Provide ceiling panel units and grid components by a single manufacturer.
- B. Fire Performance Characteristics: Identify ceiling components with appropriate markings of applicable testing and inspecting organization.
 - 1. Surface Burning Characteristics: As follows, tested per ASTM E-84 and complying with ASTM E 1264 for Class A products.
 - 2. HPVA (Hardwood Plywood and Veneer Association) certification and audit program per ASTM E-84 tunnel test.
- C. Woodworking Standards: Manufacturer must comply with specified provisions of Architectural Woodworking Institute quality standards.
- D. Coordination of Work: Coordinate ceiling work with installers of related work including, but not limited to building insulation, gypsum board, light fixtures, mechanical systems, electrical systems, and sprinklers.

1.05 DELIVERY, STORAGE, AND HANDLING

- A. Store ceiling components in a dry interior location in their cartons prior to installation to avoid damage. Store cartons in a flat, horizontal position. The protectors between the panels should not be removed until installation.
- B. Do not store in unconditioned spaces with humidity greater than 55 percent or lower than 25 percent relative humidity and temperatures lower than 50 degrees F or greater than 86 degrees F. Panels must not be exposed to extreme temperatures, for example, close to a heating source or near a window with direct sunlight.
- C. Handle ceiling units carefully to avoid chipped edges or damage to units in any way.

1.06 PROJECT CONDITIONS

- A. Wood ceiling materials should be permitted to reach room temperature and have a stabilized moisture content for a minimum of 72 hours before installation. (Remove plastic wrap to allow panels to climatize).
- B. The wood panels should not be installed in spaces where the temperature or humidity conditions vary from the temperatures and conditions that will be normal in the occupied space.
- C. As interior finish products, the veneered panels are designed for installation in temperature conditions between 50 degrees F and 86 degrees F, in spaces where the

building is enclosed, and HVAC systems are functioning and will be in continuous operation. Relative humidity should not fall below 25 percent or exceed 55 percent.

1.07 WARRANTY

- A. Veneered Wood Panel: Submit a written warranty executed by the manufacturer, agreeing to repair or replace panels that fail within the warranty period. Failures include, but are not limited to:
 - 1. Veneered Wood Panels: Defects in materials or factory workmanship.
 - 2. Grid System: Rusting and manufacturing defects.
- B. Warranty Period:
 - 1. Veneered Wood panels: One (1) year from date of installation.
 - 2. Grid: Ten years from date of installation.
- C. The Warranty shall not deprive the Owner of other rights the Owner may have under other provisions of the Contract Documents and will be in addition to and run concurrent with other warranties made by the Contractor under the requirements of the Contract Documents.

1.08 MAINTENANCE

- A. Extra Materials: Deliver extra materials to Owner. Furnish extra materials described below that match products installed. Packaged with protective covering for storage and identified with appropriate labels.
 - 1. Ceiling Units: Furnish quality of full-size units equal to 2.0 percent of amount installed.
 - 2. Exposed Suspension System Components: Furnish quantity of each exposed suspension component equal to 1.0 percent of amount installed.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

- A. Basis of Design: WoodWorks Linear Veneered Panels:
 - 1. Armstrong World Industries, Inc.
- B. Suspension Systems:
 - 1. Armstrong World Industries, Inc.

2.02 WOOD CEILING UNITS

A. Ceiling Panels Type AP-1:

1. Surface Texture: Smooth
2. Composition: Real wood veneer on fire rated particle board
3. Finish(s): Real Wood Veneer
 - a) Plain Slice Maple (NMP) – Natural Variations™
4. Plank Width:
 - a) 4” Plank Modules (Nominal) Width: 4.05-inch (Actual)
Panel Width:
 - a) 4” Plank Module Panel Width: 24-inch (Nominal): 23-1/4-inch (Actual)
 - a) 4” Plank Module Panel Length: 96-inch (Nominal): 95-1/4-inch (Actual) - With 3/4” reveal panel to panel @ length & Width
5. Acoustical Performance Infill Options:
 - 1) Fiberglass Infill Panel – Item 8200T10
6. Flame Spread:
 - a. Class A: ASTM E84 surface burning characteristics. Flame Spread Index 25 or less. Smoke Developed Index 50 or less.
 - b. CAN/ULC S102 surface burning characteristics. Flame Spread Rating 25 or less. Smoke Developed Classification 50 or less.
7. Acceptable Product: WoodWorks Linear Veneered Panels – items 6690F01W1 (NMP) as manufactured by Armstrong World Industries.

B. Accessories:

1. Backer Clip - Item 5687
2. Tee Bar Hook – Item 5986
3. Wood Screws – Item 7123PKG300
4. Safety Cable – Item 6091
5. Support Hanger – Item SH12
6. Beam End Retaining Clip – Item BERC2

2.03 SUSPENSION SYSTEMS

- A. Components: All main beams and cross tees shall be commercial quality hot dipped galvanized steel as per ASTM A653. Main beams and cross tees are double-web steel construction with 15/16-inch type exposed flange design. Exposed surfaces chemically cleansed, capping prefinished galvanized steel in baked polyester paint. Main beams and cross tees shall have rotary stitching.
 - 1. Structural Classification: ASTM C635 (Heavy Duty)
 - 2. Color: Tech Black.
 - 3. Acceptable Product: Prelude XL 15/16" 12' HD Main beam item 7301BL, Prelude XL 2' Cross Tee XL8320BL as manufactured by Armstrong World Industries, Inc.
 - 4. 12-Gauge Hanger Wire – Item 7891
- B. Attachment Devices: Size for five times design load indicated in ASTM C 635, Table 1, Direct Hung unless otherwise indicated.
- C. Wire for Hangers and Ties: ASTM A641, Class 1 zinc coating, soft temper, pre-stretched, with a yield stress load of at least times-three design load, but not less than 12 gauge.
- D. Accessories/Edge Moldings and Perimeter Trim:
 - a. Axiom Vector Straight Trim - AX6VESTRBL

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Do not proceed with installation until all wet work such as concrete, terrazzo, plastering and painting has been completed and thoroughly dried out.
- B. Proper designs for both supply air and return air, maintenance of the HVAC filters and building interior space are essential to minimize soiling. Before starting the HVAC system, make sure supply air is properly filtered and the building interior is free of construction dust.

3.02 PREPARATION

- A. Measure each ceiling area and establish layout of acoustical units to balance border widths at opposite edges of each ceiling. Avoid use of less than half width units at borders and comply with reflected ceiling plans. Coordinate panel layout with mechanical and electrical fixtures.

- B. WoodWorks ceiling materials should be permitted to reach room temperature and have a stabilized moisture content for a minimum of 72 hours before installation. (Remove plastic wrap to allow panels to climatize).

3.03 INSTALLATION

- A. Interior WoodWorks products, the veneered wood panels are designed for installation in temperature conditions between 50 degrees F and 86 degrees F, in spaces where the building is enclosed, and HVAC systems are functioning and will be in continuous operation. Relative humidity should not fall below 25 percent or exceed 55 percent.
- B. Install suspension system and panels in compliance with ASTM C636, ASTM E580, with the approval of the authorities having jurisdiction, and in accordance with the manufacturer's WoodWorks Linear Veneered Panels Installation Instructions.

3.04 ADJUSTING AND CLEANING

- A. Replace damaged and broken panels.
- B. Clean exposed surfaces of ceilings panels, including trim, edge moldings, and suspension members. Comply with manufacturer's instructions for cleaning and touch up of minor finish damage.

END OF SECTION

SECTION 09 65 13

RUBBER BASE

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Topset coved rubber base for installation with surface flooring.

B. Related Requirements:

1. Division 01 - General Requirements.
2. Section 09 29 00 – Gypsum Board
3. Section 09 30 13 – Ceramic Tiling.

1.02 SUBMITTALS

- A. Product Data: Submit manufacturer's published technical data describing materials, construction and recommended installation instructions. Submit technical data and installation instructions for each adhesive material.
- B. Maintenance Instructions: Submit manufacturer's recommendations for maintenance, care and cleaning of base.
- C. Samples: Submit Samples of topset base in each available color. Following color selections, submit Samples, not less than 12 inches long of each selected color and type. Submit pint cans of each type adhesive.
- D. Maintenance Materials: Before Substantial Completion, deliver at least 50 lineal feet and five outside corner units of each color of rubber base installed. Deliver the materials in unopened factory containers or in sealed cartons with labels identifying the contents, matching installed materials. Include unopened cans of adhesives adequate to install the maintenance materials.
- E. LEED Submittals: Complete the LEED Material Buyout Form (MBoF) with all materials provided to the project. A complete submittal includes providing all material costs in the MBoF and all of the supporting documentation for the following credits:
 1. MRc2 - Environmental Product Declarations (EPD): Provide Industry-Wide or Product-Specific EPD.
 2. MRc3 - Sourcing of Raw Materials - Recycled Content: Provide product data for pre- and post- consumer recycled content.

3. MRc4 - Material Ingredients: Provide manufacturers Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, or Cradle to Cradle Health Product Certificate.
4. IEQc2 - Low-Emitting Materials – Interior Wet Applied Products: For paints, coatings, adhesives and sealants applied on site or used for laminating off-site, include product data indicating the VOC content (g/L) and testing certificates or third party certification demonstrating compliance with California Department of Public Health (CDPH) v1.2-2017 emissions testing.

1.03 QUALITY ASSURANCE

- A. Qualifications of Installer: Minimum five years experience in successfully installing the same or similar flooring materials.
- B. Comply with the following as a minimum requirement:
 1. ASTM E84: Standard Test Method for Surface Burning Characteristics of Building Materials.
 2. ASTM F1861: Standard Specification for Resilient Wall Base.
 3. Comply with current CHPS requirements, www.chps.net.
 4. Chemically based products such as sealers, primers, fillers, adhesives, etc. must be approved by Owner's Office of Environmental Health and Safety (OEHS).
 5. Each selected color and configuration shall be from same dye lot and color.

1.04 DELIVERY, STORAGE AND HANDLING

- A. Materials shall be delivered to the Project site in original unopened manufacturer's packaging clearly labeled with manufacturer's name. Store materials at room temperature, but not less than 70 degrees F, for a minimum of 48 hours before installation, unless otherwise indicated in manufacturer's printed instructions.

1.05 PROJECT CONDITIONS

- A. Ventilation and Temperature: Verify areas that are to receive rubber base are ventilated to remove fumes from installation materials, and areas are within temperature range recommended by the various material manufactures for site installation conditions.

1.06 WARRANTY

- A. Manufacturer shall provide a five year material warranty.

- B. Installer shall provide a two year fabrication and installation warranty.

PART 2 - PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS

- A. Mannington/Burke Wall Base.
- B. Roppe, Pinnacle Rubber Base.
- C. Flexco Company, Wallflower Premium Rubber Wall Base.
- D. Equal.

2.02 MATERIALS

- A. Rubber base: Conform to ASTM F1861; Group 1, solid (homogeneous); Type 1, TS, (thermoset) vulcanized rubber, Style B (coved), 4-inch high unless otherwise indicated, integral colors as selected, non-shrinking, 1/8 inch thick, with matching molded outside corners.
- B. Base Adhesive: Water based, low odor type, as recommended by manufacturer of rubber base.

2.03 LEED REQUIREMENTS

- A. IW/PS EPD: Products specified under this section must have a Type III Product Specific EPD or the company must be listed in the industry group responsible for the Industry Wide Externally Verified EPD.
- B. PS EPD: Products specified under this section must have a Type III Product Specific EPD.
- C. HPDs: Products specified under this section must have one of the following unexpired material ingredient reports compliant with LEEDv4.1 requirements and declared to 1000 ppm or less: Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, Cradle to Cradle Health Product Certificate, or UL Product Lens Certification.
- D. Interior Wet Applied Products: All wet-applied on-site paints, coatings, adhesives, and sealants products provided under Part 2 of this specification section must be compliant with the VOC limits outlined under IEQc2: Low Emitting Materials in 01 81 13 Sustainable Design Requirements. In addition, all paints and coatings must be compliant with CDPH Standard Method v1.2-2017 emissions testing with proper unexpired CDPH testing certificates or acceptable third-party certification.

PART 3 - EXECUTION

3.01 COORDINATION

- A. Coordinate the Work of this section with other sections to provide a level, smooth and clean finish surfaces to receive rubber base.

3.02 EXAMINATION

- A. Field verify dimensions and other conditions affecting the Work of this section before commencing the Work of this section.
- B. Before Work is started, examine surfaces that are to receive rubber base. Deficiencies shall be corrected before starting the Work of this section.

3.03 PREPARATION

- A. Do not start preparation until adjacent concrete floor slabs are at least 90 days old and finish flooring is installed.
- B. Install rubber base when ambient temperature is 70 degrees F. or higher.

3.04 INSTALLATION

- A. Install topset base at:
 - 1. Hard floors, including resilient flooring, concrete and wood, carpet tile and other soft floors.
 - 2. Along cabinetry base and where flooring extends into open cabinets.
- B. Install all wall base with pre-molded outside corners. Clean and prep existing wall and apply adhesive to the wall or back of base. Ensure that not less than 18-inch-long filler or end pieces are not installed. Roll base to ensure that the top of the base installed is tight against the wall and toe is tight against the floor, all end joints to be tight with no gaps. Install matching factory pre-molded outside corners at all offsets. Should pre-molded outside corners become unavailable and confirmed, corners are to be wrapped tight by slightly gouging the back of the Base and apply adhesive at gauge. Wrap base around the corner, Push base down at the corner to form a consistent toe, ensuring that it is snug to the floor on both sides of the corner, All Inside corners shall be scribed fit tight with no gaps at the top or bottom of the base. Wrapped inside corners are not acceptable.
- C. Use of adhesive gun is prohibited. Apply adhesive directly to substrate using the appropriate notched trowel or spreader according to manufacturer's instructions. Maintain 1/8 inch gap from top of base to prevent adhesive oozing onto adjacent surfaces.
- D. Base and outside corners shall be rolled with a seam roller before adhesive sets.

3.05 CLEANING

- A. Maintain surfaces of base clean as installation progresses. Clean rubber base when sufficiently seated and remove foreign substances.
- B. Clean adjacent surfaces of adhesive or other defacement. Replace damaged and/or defective Work to the specified condition.

3.06 CLEAN UP

- A. Remove rubbish, debris and waste materials and legally dispose of off the Project site.

3.07 PROTECTION

- A. Protect the Work of this section until Substantial Completion.

END OF SECTION

SECTION 09 77 00

SPECIAL WALL SURFACES

PART 1 GENERAL

1.01 SECTION INCLUDES

1. Pre-manufactured High Pressure Decorative Laminate (HPL) and Phenolic Panel systems including mounting hardware and specified accessories.

1.02 RELATED SECTIONS

1. Section 06 10 00 - Rough Carpentry; furring, blocking, and other carpentry work that is not exposed to view.
2. Section 09 26 00 - Gypsum Board Assemblies; for metal support systems not included in this section.

1.03 REFERENCES

1. American Society for Testing and Materials (ASTM) E84 - Standard Test Method for Surface Burning Characteristics of Building Materials.
 - a) Class 1/A - Flame Spread 0-25, Smoke Developed 450 or less.
2. Architectural Woodwork Institute (AWI) Quality Standards.
3. National Electrical Manufacturer's Association (NEMA)

1.04 SUBMITTALS

1. Submit under provisions of Section 01 33 00.
2. Product Data: Manufacturer's Safety Data Sheets (MSDS) on each product to be used, including:
 - a) Preparation instructions and recommendations.
 - b) Storage and handling requirements and recommendations.
 - c) Installation methods.
3. Shop Drawings: Shop drawings in sufficient detail to show fabrication, installation, anchorage, and interface of the work of this Section with adjacent work.
4. Selection Samples: For each finish product specified, one complete set of color samples representing manufacturer's standard range of available colors and patterns.
5. LEED Submittals: Complete the LEED Material Buyout Form (MBoF) with all materials provided to the project. A complete submittal includes providing all material costs in the MBoF and all of the supporting documentation for the following credits:

- a) MRc2 - Environmental Product Declarations (EPD): Provide Industry-Wide or Product-Specific EPD.
- b) MRc3 - Sourcing of Raw Materials - Recycled Content: Provide product data for pre- and post- consumer recycled content.
- c) MRc4 - Material Ingredients: Provide manufacturers Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, or Cradle to Cradle Health Product Certificate.
- d) IEQc2 - Low-Emitting Materials – Interior Wet Applied Products: For paints, coatings, adhesives and sealants applied on site or used for laminating off-site, include product data indicating the VOC content (g/L) and testing certificates or third party certification demonstrating compliance with California Department of Public Health (CDPH) v1.2-2017 emissions testing.

1.05 QUALITY ASSURANCE

1. Manufacturer Qualifications:
 - a) Firm experienced in successful production of wall systems similar to that indicated for the Project, with sufficient production capacity to produce required units without causing delay in the work.
 - b) Provide certificate signed by panel manufacturer certifying that products comply with specified requirements.
2. Installer Qualifications: Demonstrate successful experience in installing architectural woodwork similar in type and quality to those required for this project.

1.06 DELIVERY, STORAGE, AND HANDLING

1. Do not deliver wall system until painting, wet work, grinding, and similar operations that could damage, soil, or deteriorate wall system have been completed in installation areas as specified by AWI 1700-G-3.
2. If panels are stored prior to installation, store them flat in completely enclosed areas, out of the weather. If panels must be stored in other than installation areas, store only in areas where environmental conditions comply with manufacturers recommendations. Do not expose panels to continuous direct sunlight, nor to extremes in temperature and humidity. Store products in manufacturer's packaging until ready for installation.
3. Store and dispose of solvent-based materials, and materials used with solvent-based materials, in accordance with requirements of local authorities having jurisdiction.

1.07 PROJECT CONDITIONS

1. Do not deliver or install wall system until building is enclosed, wet work is complete and HVAC system is operating and will maintain temperature and relative humidity at occupancy levels during the remainder of the construction period as specified by AWI 1700-G-3.
2. Do not install wall system until normal lighting conditions exist. Normal lighting

conditions are described as those in place when the project is finished. This includes, but not limited to, design lighting (wall washers, spot lights and flood lights, and similar fixtures) and natural lighting.

3. Wall, ceilings, floors, and openings must be level, plumb, straight, in-line and square as specified by AWI 1700-G-3.
4. Maintain environmental conditions (temperature, humidity, and ventilation) within limits recommended by manufacturer for optimum results. Do not install products under environmental conditions outside manufacturer's absolute limits. Panels shall be conditioned in the environment in which they will be installed for a minimum of 72 hours prior to installation. The recommended environment is 75 degrees F (24 degrees C) and 45 percent relative humidity.
5. Environmental Conditions: Comply with Woodwork Manufacturer's recommendations for optimum temperature and humidity conditions for woodwork during its storage and installation. Do not install woodwork until these conditions have been attained and stabilized so that woodwork is within plus or minus 1.0 percent of optimum moisture content from date of installation through remainder of construction period.

1.08 WARRANTY

1. Manufacturer warrants any product it has manufactured and sold against defects in materials or workmanship for a period of five years from the date of original purchase and acceptance for use. This warranty extends to products assembled / installed and used in the manner intended and does not cover damage or failure caused by: misuse, abuse or accidents, exposure to extreme temperature, improper installation, improper maintenance and exposure to water or excessive humidity or excessive moisture.

PART 2 PRODUCTS

2.01 MANUFACTURERS

1. Basis of Design: Panel Specialists, Inc.; 3115 Range Rd., Temple, TX 76504. ASD. Toll Free Tel: (800) 947-9422. Tel: (254) 774-9800. Fax: (254) 774-7222. Email: psiwalls@panelspec.com. Web: <http://www.panelspec.com>.
2. Or approved equal.

2.02 PANEL SYSTEMS

1. Provide prefinished decorative panels where shown on the drawings, as specified herein, and as needed for a complete and proper installation.
2. Comply with applicable requirements of "Architectural Woodwork Quality Standards" in the production and installation of the wall panel system as published by the Architectural Woodwork Institute (AWI) unless otherwise indicated.

3. Panel System: #310 as manufactured by Panel Specialists, Inc. A progressive panel system with an exposed divider molding creating a 1/16 inch (1.5mm) horizontal and vertical reveal between edge banded panels. Recommended for vertical and horizontal interior installations. Maximum panel length for horizontal installations is 96 inches (2438 mm).
 - a) Panel Thickness: 7/16 inches (11.1 mm).
 - b) Horizontal Reveal: System to provide a reveal of 1/16 inch (1.5mm) between panels.
 - c) Vertical Reveal: System to provide a recessed reveal of 1/16 inch (1.5mm) between panels.
 - d) Panel Edge Finish: Panel edges to be finish with .018 inch (.5mm) PVC edge banding or as indicated in drawings.
 - e) Panel Finish: High Pressure Decorative Laminate.
 - f) Main Laminated Panel Fire Rating:
 - 1) Fire Rating: ASTM E84, Class A.
 - g) Panel Dimensions: Refer to drawings.
 - h) Molding: All moldings to be .062" thick (at structural areas) 6063 alloy aluminum with T5 temper.
 - 1) Divider Moldings
 1. #302A Divider Molding
 - i) Finishes:
 - 1) Panel Face:
 1. Finish: Wilsonart Island (D498)
 - 2) Panel Face Pattern Direction:
 1. Horizontal
 - 3) Panel Edge Banding:

As indicated in drawings
 - 4) Aluminum Molding Finish:
 1. Clear Anodized

4. Panel System: #312 as manufactured by Panel Specialists, Inc. A progressive panel system with an exposed divider molding creating a 1/2inch (12mm) recessed channel reveal horizontally and vertically between edge banded panels. The reveal can be accented with a concave insert or p-lam or veneer strips. Recommended for vertical and horizontal interior installations. Maximum panel length for horizontal installations is 96 inches (2438 mm).
 - a) Panel Thickness: 7/16 inches (11.1 mm).
 - b) Horizontal Reveal: System to provide a reveal of 1/2 inch (12mm) between panels.
 - c) Vertical Reveal: System to provide a recessed reveal of 1/2 inch (12mm) between panels.
 - d) Panel Edge Finish: Panel edges to be finish with .018-inch (.5mm) PVC edge banding or as indicated in drawings.
 - e) Panel Finish: Phenolic .
 - f) Main Laminated Panel Fire Rating:
 - 1) Fire Rating: ASTM E84, Class A.

- g) Panel Dimensions: Refer to drawings.
- h) Molding: All moldings to be .062" thick (at structural areas) 6063 alloy aluminum with T5 temper.
 - 1) Divider Moldings
 - 1. #312 ½ in. Recess Channel Divider Molding
- i) Finishes:
 - 1) Panel Face:
 - 1. Finish: Wilsonart Biltmore Cherry (7924)
 - 2) Panel Face Pattern Direction:
 - 1. Horizontal
 - 3) Panel Edge Banding:
 - 1. As indicated in drawings
 - 4) Aluminum Molding Finish:
 - 1. Clear Anodized

2.03 MATERIALS

- 1. High Pressure Decorative Laminates (VGS, VGF.) and non-decorative backers (BKV) used to surface wall panels systems shall be manufactured to meet or exceed the National Electrical Manufacturing Association (NEMA LD3-2005) for thickness, performance properties and appearance.
- 2. Phenolic Panels
 - a) Panels to be durable 3/8" Compact Laminate panels formed from melamine resin saturated overlay and decorative papers bonded to a core of phenolic resin impregnated kraft papers to provide superior impact and moisture resistance.

2.04 LEED REQUIREMENTS

- A. IW/PS EPD: Products specified under this section must have a Type III Product Specific EPD or the company must be listed in the industry group responsible for the Industry Wide Externally Verified EPD.
- B. PS EPD: Products specified under this section must have a Type III Product Specific EPD.
- C. HPDs: Products specified under this section must have one of the following unexpired material ingredient reports compliant with LEEDv4.1 requirements and declared to 1000 ppm or less: Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, Cradle to Cradle Health Product Certificate, or UL Product Lens Certification.
- D. Interior Wet Applied Products: All wet-applied on-site paints, coatings, adhesives, and sealants products provided under Part 2 of this specification section must be compliant with the VOC limits outlined under IEQc2: Low Emitting Materials in 01 81 13 Sustainable Design Requirements. In addition, all paints and coatings must be compliant with CDPH

Standard Method v1.2-2017 emissions testing with proper unexpired CDPH testing certificates or acceptable third-party certification

PART 3 EXECUTION

3.1 EXAMINATION

1. Do not begin installation until substrates have been properly prepared according to AWI 1700-G-3.
2. If substrate preparation is the responsibility of another installer, notify Architect of unsatisfactory preparation before proceeding.

3.2 FIELD DIMENSIONS

1. Where wall system is indicated to be fitted to other construction, check actual dimensions of other constructions by accurate field measurements before manufacturing wall system; show recorded measurements on final shop drawings. Coordinate manufacturing schedule with construction progress to avoid delay of work.
2. Where field measurements cannot be made without delaying the work, guarantee dimensions and proceed with manufacture of wall system without field measurements coordinate other construction to ensure that actual dimensions correspond to guaranteed dimensions.

3.3 PREPARATION

1. Panels must be acclimated to ambient temperature and humidity conditions in accordance with manufacturer's specifications prior to installation. Refer to PSI installation guide for proper, handling, storage and acclimation procedures.
2. Clean surfaces thoroughly prior to installation.
3. Prepare surfaces using the methods recommended by the manufacturer for achieving the best result for the substrate under the project conditions.

3.4 INSTALLATION

1. Install in accordance with manufacturer's instructions.
2. When interior paneling is on an exterior wall or in a wet area, provide a barrier sheet of plastic film between the outside wall and the panels in order to prevent condensation affecting the stability of the panels.
3. Field cutting of all wall systems should be accomplished using carbide tools. All face penetrations and cutouts should have a minimal 1/8 inch (3 mm) radius in corners according to NEMA Standards Publication LD 3-2005.

4. All wall systems should receive an "S" bead of panel mastic on the back of the panel during installation.
5. For vertical applications, wall systems shall be mechanically fastened to horizontal metal furring strapping spaced 24 inches (610 mm) O.C. Furring straps shall be no less than 18-ga 3-1/2 inches (89 mm) wide, continuously. Metal strapping to be installed to the drywall studs prior to the application of the gypsum board by the framing contractor. For panels installed with a horizontal orientation strapping is recommended but not necessary

3.5 PROTECTION

1. Protect installed products until completion of project.
2. Touch-up, repair or replace damaged products before Substantial Completion.

END OF SECTION

SECTION 09 77 13

REINFORCED FIBERGLASS PLASTIC (FRP)

PART 1: GENERAL

1.01 SUMMARY

A. Section Includes: Durable, decorative wall panels with smooth or textured finishes. Mounting hardware, adhesives, accessories and trims.

B. RELATED SECTIONS

1. Division 06: Section: Rough and Finish Carpentry.
2. Division 09: Section: Gypsum Board Assemblies.

1.02 REFERENCES

A. General: Standards listed by reference, including revisions by issuing authority, form a part of this specification section to the extent indicated. Standards listed are identified by issuing authority, authority abbreviation, designation number, title or other designation established by issuing authority. Standards subsequently referenced herein are referred to by issuing authority abbreviation and standard designation.

B. ASTM International:

1. ASTM E84 Standard Test Method for Surface Burning Characteristics Building Materials.
2. ASTM D256 Standard Test Methods for Determining the Izod Pendulum Impact Resistance of Plastics.
3. ASTM D638 Standard Test Method for Tensile Properties of Plastics.
4. ASTM D790 Standard Test Methods for Flexural Properties of Unreinforced and Reinforced Plastics and Electrical Insulating Materials
5. ASTM D2583 Standard Test Method for Indentation Hardness of Rigid Plastics by Means of a Barcol Impressor.

1.03 SYSTEM DESCRIPTION

- A. Performance Requirements: Provide durable, decorative wall panels which have been manufactured and installed to maintain performance criteria stated by manufacturer without defects, damage or failure.

1.04 SUBMITTALS

- A. General: Submit listed submittals in accordance with Conditions of the Contract and Division 01 33 00 Submittal Procedures Section.
- B. Product Data: Submit manufacturer's product data, storage, handling and preparation requirements and installation instructions.
- C. Shop Drawings: Submit shop drawings showing layout, profiles and product components, including anchorage, accessories, finish colors, patterns and textures. Indicate location and dimension of joints and fastener attachment.
- D. Samples: Submit selection and verification samples for finishes, colors and textures. Submit 2 samples of each type of panel, trim and fastener
- E. General: Firm experienced in successful production of wall system similar to that indicated for the Project. Quality Assurance/Control Submittals: Submit the following:
 - 1. Test Reports: Certified test reports showing compliance with specified performance characteristics and physical properties.
 - 2. Certificates:
 - a. Submit manufacturer's certificate that products meet or exceed specified requirements.
 - b. Submit certificate of installer's qualifications.
 - 3. Manufacturer's Instructions: Manufacturer's installation instructions.
- F. Closeout Submittals: Submit the following:
 - 1. Operations and Maintenance Data: Operation and maintenance data for installed products in accordance with Division 01 Closeout Submittals (Maintenance Data and Operation Data) Section. Include methods for maintaining installed products and precautions against cleaning materials and methods detrimental to finishes and performance.
 - 2. Warranty documents specified herein.

1.05 QUALITY ASSURANCE

- A. Installer Qualifications: Installer shall have a minimum of 5 years experience with composite wall panel work similar in scope and size to this project.
- B. Mock-Ups: Provide 24" x 24" mock-up..
 - 1. Subject to acceptance by owner, mock-up may be retained as part of finish work.
 - 2. If mock-up is not retained, remove and properly dispose of mock-up.

1.06 DELIVERY, STORAGE AND HANDLING

- A. General: Comply with Division 01 Product Requirements Section.
- B. Lead Time: Comply with manufacturer's ordering instructions and lead time requirements to avoid construction delays.
- C. Delivery: Deliver materials in manufacturer's original, unopened, undamaged containers with identification labels intact.
- D. Storage and Protection: Store materials protected from exposure to harmful environmental conditions and at temperature and humidity conditions recommended by the manufacturer.
 - 1. Store panels indoors.
 - 2. Lay panels flat. Do not stand panels on edge.
 - 3. Protect panels from moisture.
 - 4. Do not store panels in contact with the floor or against an outside wall.
 - 5. Do not remove protective film from panel surface until after installation (if applicable).
 - 6. Maintain optimum storage conditions of 60-75 degrees F (16-24 degrees C) at 35 - 55% relative humidity. Avoid extremes in temperature and humidity.
- E. Handling: Remove foreign matter from face of panel by using a soft bristle brush, avoiding abrasive action.

1.07 PROJECT/SITE CONDITIONS

- A. Environmental Requirements:
 - 1. Installation shall not begin until building is enclosed, permanent heating and

cooling equipment is in operation and residual moisture from plaster, concrete or terrazzo work has dissipated.

2. Install panels between 60 degrees F - 75 degrees F (15 - 24 degrees C) and relative humidity below 55%, ideally at the same conditions as the room's normal operating temperatures after building is occupied.
3. Provide ventilation to disperse fumes during application of adhesive as recommended by adhesive manufacturer.
4. Do not install wall system until normal lighting conditions exist. Normal lighting conditions are described as those in place when the project is finished.

B. Field Measurements: Verify actual measurements/openings by field measurements before fabrication; show recorded measurements on shop drawings. Coordinate field measurements and fabrication schedule with construction progress to avoid construction delays.

1. Wall, ceilings, floors and openings must be level, plumb, straight, in-line and square

1.08 WARRANTY

- A. Project Warranty: Refer to Conditions of the Contract for project warranty provisions.
- B. Manufacturer's Warranty: Submit, for Owner's acceptance, manufacturer's standard warranty document executed by authorized company official. Manufacturer's warranty is in addition to, and not a limitation of, other rights Owner may have under Contract Documents.
- C. Warranty Period: 10 years commencing on Date of Substantial Completion.
 1. Warranty extends to products assembled / installed and used in the manner intended and does not cover damage or failure caused by: misuse, abuse or accidents, exposure to extreme temperature, improper installation, improper maintenance and exposure to water or excessive humidity or excessive moisture.

1.09 MAINTENANCE

- A. Extra Materials: Provide 10 percent of additional material for use by owner in building maintenance and repair.

PART 2: PRODUCTS

2.01 COMPOSITE WALL PANELS

- A. Manufacturer:
 - 1. Basis of Design: Nudo, Contact: 1500 Taylor Avenue, Springfield, IL 62703; Telephone: (800) 826-4132, (217) 528-5636; Fax: (217) 528-8722; E-mail: info@nudo.com ; website: www.nudo.com
- B. Proprietary Products/Systems: Composite wall & ceiling panels, including the following: Fiberlite: Fiberglass Reinforced Plastic (FRP) panel.
 - 1. Texture: Smooth, High Pressure Laminate (HPL)
 - 2. Thickness: 0.090"
 - 3. Fire Rating Class: A
 - 4. Color: As selected by Architect from standards manufacturer's colors.
 - 5. Size: As indicated in drawings.
- C. Properties:
 - 1. Flexural Strength (ASTM D790)
 - 2. Flexural Modulus (ASTM D790)
 - 3. Tensile Strength (ASTM D638)
 - 4. Barcol Hardness (ASTM D2583)
 - 5. Izod Impact (ASTM D256)

2.02 ACCESSORIES

- A. Moldings: Aluminum coordinating moldings, color as selected by Architect from manufacturer's color chart.

2.03 LEED REQUIREMENTS

- A. IW/PS EPD: Products specified under this section must have a Type III Product Specific EPD or the company must be listed in the industry group responsible for the Industry Wide Externally Verified EPD.
- B. PS EPD: Products specified under this section must have a Type III Product Specific EPD.
- C. HPDs: Products specified under this section must have one of the following unexpired material ingredient reports compliant with LEEDv4.1 requirements and declared to

1000 ppm or less: Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, Cradle to Cradle Health Product Certificate, or UL Product Lens Certification.

- D. Interior Wet Applied Products: All wet-applied on-site paints, coatings, adhesives, and sealants products provided under Part 2 of this specification section must be compliant with the VOC limits outlined under IEQc2: Low Emitting Materials in 01 81 13 Sustainable Design Requirements. In addition, all paints and coatings must be compliant with CDPH Standard Method v1.2-2017 emissions testing with proper unexpired CDPH testing certificates or acceptable third-party certification.

PART 3: EXECUTION

3.01 MANUFACTURER'S INSTRUCTIONS

- A. Adhesive: Provide panel adhesive as recommended by panel manufacturer.
- B. Trim and Seam Treatment:
 - 1. Manufacturer: Acceptable to panel manufacturer.
 - 2. Material and Color: Aluminum moldings, color as selected by Architect.
- C. Fasteners: Provide appropriate fasteners and accessories as required to properly complete installation.

3.03 PREPARATION

- A. Comply with the instructions and recommendations of the durable, decorative wall panel manufacturer.
- B. Site Verification of Conditions: Verify substrate conditions, which have been previously installed under other sections, are acceptable for product installation in accordance with manufacturer's instructions. Verify that site conditions are acceptable for installation of durable, decorative wall panels. Examine back-up surfaces to determine that corners are plumb and straight, surfaces are smooth, uniform, clean and free from foreign matter, nails are countersunk and joints and cracks are filled flush and smooth with the adjoining surface. Do not proceed with installation of durable, decorative wall panels until unacceptable conditions are corrected

3.04 INSTALLATION

- A. General: Prior to installing panels, remove packaging and allow panels to acclimate to room temperature and humidity for at least 48 hours.
 - 1. Wall substrate must be dry and free from dirt, dust, grease and other

contaminants. Walls must be flat and even. Remove high spots and fill low spots with material acceptable to panel manufacturer.

2. Inspect panels for any defects immediately. Do not install panels of unacceptable quality. Field cutting of all wall systems should be accomplished using a circular saw with fine tooth carbide blade.
3. Position panel so that the saw blade enters the finished HPL side first to avoid chipping or damage. Protect decorative laminate face of panel by covering work area, do not remove protective will until after installation.
4. Follow adhesive manufacturer's recommendations for appropriate height of adhesive bead left by trowel and do not allow adhesive to skin over. When interior paneling is on an exterior wall or wet area, provide a barrier sheet and/or follow the adhesive manufacturer's installation recommendations for a secure bond.

B. Installation Using Aluminum Moldings:

1. Start in the corner. Mark plumb line 48 1/8 inches from corner.
2. Apply adhesive directly to entire back of composite wall panel using correct trowel with 100% adhesive coverage using crosshatch pattern. Apply adhesive to within 1/2 inch of all edges of panel.
3. Slide panel into molding and withdraw 1/16 inch for aluminum moldings to provide appropriate gap. Align with plumb line.
4. Begin in top corner nearest molding with laminate roller, rolling down and out toward the edge without molding.
5. Continue rolling down and out working across panel away from previously installed panel or initial molding. Remove all trapped air.
6. Install one-piece division bar and caps or next molding by sliding onto panel.
7. Repeat process, working in one direction around room.
8. Immediately remove all adhesive residue. To remove, clean with nonabrasive cotton cloth and warm water. If necessary, use a mild nonabrasive detergent. For cleanup with solvent based adhesives, use mineral spirits or acetone to remove residue.

C. Installation Using Caulk:

Plan panel layout so seams are not directly over seams of substrate.

1. Apply adhesive directly to back of composite wall panel with 100% adhesive coverage using crosshatch pattern. Extend adhesive to all edges of panel.
2. Install panel. Place six-penny finishing nails at 1/8 inch (3.2mm) spacing against the panel about 2 feet (610mm) apart to hold panels in place while adhesive sets and provide proper spacing for color caulk. Continue installing panels using this method, leaving nails in place during installation.
3. Remove nails after adhesive sets.
4. Place a narrow piece of masking tape along panel edge from top to bottom, exactly at joint edge. Firmly apply tape to both panels.
5. Fill 1/8 inch (3.2mm) gap between the panels with caulk, making sure gap is completely filled.
6. Tilt caulking tube back from vertical so that tip of tube advances first in direction of travel.
7. Wet finger and smooth bead if necessary.
8. Remove masking tape before bead cures. Clean off excess caulk with damp cloth.
9. Install corner moldings as described in molding instructions.

3.05 CLEANING

- A. Clean panel surfaces in compliance with manufacturer's recommendations.
 1. Use a clean, damp, nonabrasive cotton cloth and a mild liquid detergent or household cleaner.
 2. Rinse with clean water using a clean, nonabrasive cotton cloth.
 3. Dry panels with a soft, clean nonabrasive cotton cloth.
 4. Do not use cleaners containing acid, alkali or sodium hypochlorite.

3.06 PROTECTION

- A. Protect installed work from damage due to subsequent construction activity on the site.

END OF SECTION

SECTION 09 90 00

PAINTING AND COATING

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Interior and exterior painting.

B. Following items shall not be painted:

1. Brass valves, chromium or nickel-plated piping and fittings.
2. Boiler control panels and control systems.
3. Fabric connections to fans.
4. Flexible conduit connections to equipment, miscellaneous name plates, stamping, and instruction labels and manufacturer's data.
5. Mechanical and electrical utility lines, piping and heating and ventilation ductwork in tunnels, under-floor excavated areas or crawl spaces, attic spaces and enclosed utility spaces.
6. Flag, floodlight, parking light poles and loudspeaker poles, metal stairs, handrails and chain-link fence with a galvanized finish, unless otherwise noted.
7. Structural and miscellaneous steel, open web steel joists and metal floor decking, which will not be exposed in final construction, shall have no finish other than one coat of shop primer.
8. Hardboard covering on tops and backs of counters and benches.
9. Brass, bronze, aluminum, lead, stainless steel and chrome or nickel-plated surfaces.
10. Non-metallic walking surfaces unless specifically shown or specified to be painted.

1.02 REGULATORY REQUIREMENTS

- ###### A. Paint materials shall comply with the Food and Drug Administration's (F.D.A.) Lead Law and the current rules and regulations of local, state and federal agencies governing the use of paint materials.

1.03 SUBMITTALS

- A. List of Materials: Before submittal of samples, submit a complete list of proposed paint materials, identifying each material by distributor's name, manufacturer's name, product name and number, including primers, thinners, and coloring agents, together with manufacturers' catalog data fully describing each material as to contents, recommended installation, and preparation methods. Identify surfaces to receive various paint materials.
- B. Material Samples: Submit manufacturer's standard colors samples for each type of paint specified. Once colors have been selected, submit Samples of each color selected for each type of paint accordingly:
 - 1. Samples of Paint and Enamel must be submitted on standard 8 ½" x 11" Leneta Opacity-Display Charts. Each display chart shall have the color in full coverage. The sample shall be prepared from the material to be installed on the Work. Identify the school on which the paint is to be installed, the batch number, the color number, the type of material, and the name of the manufacturer.
 - 2. Elastomeric shall be submitted in duplicate samples of the texture coating. Samples will be not less than 2 ½ by 3 ½ in size and installed upon backing. Finished Work will match the reviewed Sample in texture.
 - 3. Materials and color samples shall be reviewed before starting any painting.
- C. For transparent and stained finishes, prepare samples on same species and quality of wood to be installed in the Work, with written description of system used.
- D. LEED Submittals: Complete the LEED Material Buyout Form (MBoF) with all materials provided to the project. A complete submittal includes providing all material costs in the MBoF and all of the supporting documentation for the following credits:
 - 1. MRc2 - Environmental Product Declarations (EPD): Provide Industry-Wide or Product-Specific EPD.
 - 2. MRc3 - Sourcing of Raw Materials - Recycled Content: Provide product data for pre- and post- consumer recycled content.
 - 3. MRc4 - Material Ingredients: Provide manufacturers Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, or Cradle to Cradle Health Product Certificate.
 - 4. IEQc2 - Low-Emitting Materials – Interior Wet Applied Products: For paints, coatings, adhesives and sealants applied on site or used for laminating off-site, include product data indicating the VOC content (g/L) and testing certificates or third party certification demonstrating compliance with California Department of Public Health (CDPH) v1.2-2017 emissions testing.

1.04 QUALITY ASSURANCE

- A. Certification of Materials: With every delivery of paint materials, the manufacturer shall provide written certification the materials comply with the requirements of this section.

- B. Coats: The number of coats specified is the minimum number. If full coverage is not obtained with the specified number of coats, install additional coats as required to provide the required finish.
- C. Install coats and undercoats for finishes in strict accordance with the recommendations of the paint manufacturer as reviewed by the Architect.
- D. Paint materials shall comply with the following as a minimum requirement:
 - 1. Materials shall be delivered to Project site in original unbroken containers bearing manufacturer's name, brand number and batch number.
 - 2. Open and mix ingredients on premises in presence of the Project Inspector.

1.05 DELIVERY, STORAGE AND HANDLING

- A. Storage and Mixing of Materials: Store materials and mix only in spaces suitable for such purposes. Maintain spaces clean and provide necessary precautions to prevent fire. Store paint containers so the manufacturer's labels are clearly displayed.

1.06 SITE CONDITIONS

- A. Temperature: Do not install exterior paint in damp, rainy weather or until surface has thoroughly dried from effects of such weather. Do not install paint, interior, or exterior, when temperature is below 50 degrees F, or above 90 degrees F, or dust conditions are unfavorable for installation.

1.07 WARRANTY

- A. Manufacturer shall provide a three year material warranty.
- B. Installer shall provide a three year application warranty.

1.08 MAINTENANCE

- A. Provide at least one gallon of each type, color and sheen of paint coating installed. Label containers with color designation indicated on Drawings.

PART 2 - PRODUCTS

2.01 PAINT MATERIALS

- A. Furnish the products of only one paint manufacturer unless otherwise specified or required. Primers, intermediate and finish coats of each painting system must all be the products of the same manufacturer, including thinners and coloring agents, except for materials furnished with shop prime coat by other trades.
- B. Factory mix paint materials to correct color, gloss, and consistency for installation to the maximum extent feasible.
- C. Paint materials to be minimum "Architectural Grade".

D. Gloss degree standards shall be as follows:

HIGH GLOSS	70 and above	EGGSHELL	30 to 47
SEMI-GLOSS	48 to 69	SATIN	15 to 29

2.02 MANUFACTURERS

A. Acceptable manufacturers, unless otherwise noted:

1. Dunn-Edwards Corporation Paints
2. Frazee Paints and Wall coverings
3. Vista Paints
4. Sherwin Williams
5. ICI Paints
6. Equal.

2.03 LEED REQUIREMENTS

- A. IW/PS EDP: Products specified under this section must have a Type III Product Specific EPD or the company must be listed in the industry group responsible for the Industry Wide Externally Verified EPD.
- B. PS EPD: Products specified under this section must have a Type III Product Specific EPD.
- C. HPDs: Products specified under this section must have one of the following unexpired material ingredient reports compliant with LEEDv4.1 requirements and declared to 1000 ppm or less: Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, Cradle to Cradle Health Product Certificate, or UL Product Lens Certification.
- D. Interior Wet Applied Products: All wet-applied on-site paints, coatings, adhesives, and sealants products provided under Part 2 of this specification section must be compliant with the VOC limits outlined under IEQc2: Low Emitting Materials in 01 81 13 Sustainable Design Requirements. In addition, all paints and coatings must be compliant with CDPH Standard Method v1.2-2017 emissions testing with proper unexpired CDPH testing certificates or acceptable third-party certification.

PART 3 - EXECUTION

3.01 PREPARATION

- A. Examine surfaces to receive paint finish. Surfaces which are not properly prepared and cleaned or which are not in condition to receive the finish specified shall be corrected before prime coat is installed.

- B. New woodwork shall be thoroughly cleaned, hand sandpapered, and dusted off. Nail holes, cracks or defects in Work shall be filled. On stained woodwork, fill shall be colored to match stain. Filling shall be performed after the first coat of paint, shellac or varnish has been installed.
- C. Plaster surfaces except veneer plaster shall be allowed to dry at least 3 weeks before painting. Veneer plaster shall be allowed to dry sufficiently to receive paint as determined by moisture meter tests.
- D. Metal surfaces to be painted shall be thoroughly cleaned of rust, corrosion, oil, foreign materials, blisters, and loose paint.
- E. Do not install painting materials to wet, damp, dusty, dirty, finger marked, rough, unfinished or defective surfaces.
- F. Concrete surfaces shall be dry, cleaned of dirt and foreign materials and in proper condition to receive paint. Neutralize spots demonstrating effects of alkali.
- G. Mask off areas where necessary.

3.02 APPLICATION

- A. Backpainting: Immediately upon delivery to the Project site, finish lumber and millwork shall be backpainted on surfaces that will be concealed after installation. Items to be painted shall be backpainted with priming coat specified under "Priming".
- B. Priming: New wood and metal surfaces specified to receive paint finish shall be primed. Surfaces of miscellaneous metal and steel not embedded in concrete, and surfaces of unprimed plain sheet metal Work shall be primed immediately upon delivery to the Project site. Galvanized metal Work and interior and exterior woodwork shall be primed immediately after installation. Priming of surfaces and priming coat shall be as follows:
 - 1. Knots, Pitch and Sap Pockets: Shellac before priming.
 - 2. Exterior Woodwork and Wood Doors: Prime with one coat of exterior waterborne emulsion wood primer.
 - 3. Interior Woodwork: Where indicated to be painted, prime with one coat of waterborne wood primer.
 - 4. Stain: Woodwork indicated to receive a stain and varnish finish shall be stained to an even color with water borne stain. On open-grained hardwood, mix stain with paste filler and completely fill pores in wood.
 - 5. Galvanized Metal Work: Clean oil, grease and other foreign materials from surfaces. Install vinyl wash pretreatment coating. Follow manufacturer's instructions for drying time, and then prime with one coat of metal primer.
 - 6. Unprimed Iron, Steel, and Other Uncoated Metals: Where specified to be painted, prime with one coat of metal primer.

7. Shop Primed Metal Items: Touch up bare and abraded areas with metal primer before installation of second and third coats.
 8. Coats shall be installed evenly and with full coverage. Finished surfaces shall be free of sags, runs and other imperfections.
- C. Allow at least 24 hours between coats of paint.
 - D. Rollers shall not be used on wood surfaces.
 - E. Each coat of painted woodwork and metal, except last coat, shall be sandpapered smooth when dry. Texture-coated gypsum board shall be sanded lightly to remove surface imperfections after first coat of paint has been installed.
 - F. Each coat of paint or enamel shall be a slightly different tint as required. Each coat of paint, enamel, stain, shellac, and varnish will be inspected by the IOR before next coat is applied. Notify the Project Inspector that such Work is ready for inspection.
 1. Tinting Guideline: The first coat, primer/undercoat(s) to be untinted or tinted up to 50 percent lighter or darker (at the discretion of the installer) than the finish coat. The second coat (or third coat if a seal coat and undercoat have been specified) is to be factory tinted in the range of 10 percent to 15 percent lighter or darker (at the discretion of the installer) than the finish coat. The final coat is to be factory tinted to the required color selected. These tinting guidelines shall be provided on all surfaces receiving paint.
 - G. Do not "paint-out" UL labels, fusible links and identification stamps.
 - H. Paint Roller, brush and spray.
 1. Only Paint rollers shall be used on interior plaster, drywall, masonry/plaster and plywood surfaces, nap shall not exceed one half inch in length.
 2. First coat on wood overhang and ceilings shall have material applied by roller and then brushed out in a professional manner to leave surface free of imperfections. Finish coat may be sprayed.
 3. Other surfaces shall have all coatings applied with brushes of proper size.
 4. Spray work is permitted only on radiators, acoustic plaster, masonry and plaster.
 - I. Where ceilings are specified to be painted, beams, cornices, coves, ornamental features, plaster grilles, etc. shall be included.
 - J. Ceilings shall be white, including classrooms, storage rooms, offices, arcades, etc. Boiler room and fan room ceiling color shall match adjacent walls.

3.03 CLEANING

- A. Remove rubbish, waste, and surplus material and clean woodwork, hardware, floors, and other adjacent Work.

- B. Remove paint, varnish and brush marks from glazing material and, upon completion of painting Work, wash and polish glazing material both sides. Glazing material, which is damaged, shall be removed and replaced with new material.
- C. Clean hardware and other unpainted metal surfaces with recommended cleaner. Do not furnish abrasives or edged tools.

3.04 SCHEDULE

- A. Interior:
 - 1. Woodwork, Painted: 3 coats.
 - a. First Coat: As specified in this section under Priming.
 - b. Second and Third Coats: Interior enamel, semi-gloss or gloss as indicated.
 - 2. Woodwork, Stained and Varnished: 4 coats.
 - a. First Coat: As specified in this section under Priming.
 - b. Second, Third and Fourth Coats: Varnish, semi-gloss.
 - 3. Wood Corridor doors: 4 coats.
 - a. First Coat: As specified in this section under Priming.
 - b. Second, Third, and Fourth Coats: Varnish, gloss.
 - 4. Other Wood Doors: 4 coats.
 - a. Varnished or painted as indicated.
 - b. If varnished, same finish system as painted woodwork, with semi-gloss or gloss finish to match adjacent wall.
 - 5. Miscellaneous Woodwork: 4 coats. Wood items including, but not limited to: stair treads and risers, handrails, rolling ladders, wood base and shoe, chair rails, counter tops and locker room benches.
 - a. First Coat: As specified in this section under Priming.
 - b. Second, Third and Fourth: Exterior varnish, gloss.
 - 6. Casework: Interior surfaces of casework (except plastic laminate-faced casework) including top, edges and underside of shelving, poles, surfaces of drawers (except fronts), interior surfaces of mailbox pigeonholes, and particle board.
 - a. First Coat: Waterborne stain.

- b. Second and Third Coats: Satin varnish.
 7. Plaster: 4 coats.
 - a. First Coats: Pigmented wall sealer.
 - b. Second coat: Enamel under coater.
 - c. Third and Fourth Coats – Interior enamel, semi-gloss or gloss as indicated.
 8. Gypsum Board: 4 coats.
 - a. First Coat: Drywall sealer.
 - b. Second Coat: Enamel under coater.
 - c. Third and Fourth Coats: Interior enamel, semi-gloss or gloss as indicated.
 9. Concrete: 3 coats.
 - a. First: Concrete sealer.
 - b. Second and Third: Interior enamel, semi-gloss or gloss as indicated.
 10. Concrete Block: 3 coats.
 - a. First: Concrete block filler.
 - b. Second and Third: Interior enamel, semi-gloss or gloss as indicated.
 11. Metal: Shall be cleaned, pre-treated and painted with 3 coats. Items to be painted include, but are not limited to: exposed structural and miscellaneous steel, metal doors and frames, ladders, table and bench legs.
 - a. First Coat: Metal primer.
 - b. Second and Third Coats: Interior gloss enamel, except metal doors and frames which shall be semi-gloss or gloss to match adjacent wall.
- B. Exterior:
1. Woodwork: 3 coats.
 - a. First Coat: As specified in this section under Priming.
 - b. Second and Third Coats: Exterior house and trim enamel.
 2. Wood Doors: 3 coats.
 - a. First Coat: As specified in this section under Priming.

- b. Second and Third Coats: Exterior gloss enamel.
 3. Plaster and Stucco: 3 coats. Flat 100 percent acrylic.
 - a. Prime Coat: Alkali resistant primer/sealer.
 - b. Exterior 100 percent acrylic.
 4. Concrete: 3 coats. Flat 100 percent acrylic.
 - a. First Coat: Concrete sealer.
 - b. Second and Third Coats: Exterior 100 percent acrylic.
 5. Concrete Block: 3 coats. Flat 100 percent acrylic.
 - a. First Coat: Concrete block filler.
 - b. Second and Third Coats: Exterior 100 percent acrylic.
 6. Metal: 3 coats. Shall be cleaned and pre-treated. Items to be painted include, but are not limited to: steel columns and miscellaneous steel items, gravel stops, metal doors and frames, hoods and flashings.
 - a. First Coat: As specified in this section under Priming.
 - b. Second and Third Coats: Exterior gloss enamel.
- C. Mechanical and Electrical Work:
 1. Except where interior mechanical and electrical Work to be painted is specified to receive another paint finish, Work occurring in finished rooms and spaces shall be cleaned, pre-treated, and painted with 3 coats. Items to be painted include, but are not limited to: steel and copper piping, pipes, vents, fittings, ducts, plenums, miscellaneous supports and hangers, electrical conduit, fittings, pull boxes, outlet boxes, unfinished surfaces of plumbing fixtures, miscellaneous metal cabinets, panels, and access doors and panels.
 - a. First Coat: As specified in this section under Priming.
 - b. Second and Third Coats: Interior enamel, semi-gloss or gloss to match adjacent wall or ceiling finish.
 2. Insulation and Taping on Pipes and Ducts: 3 coats.
 - a. Finished Rooms:
 - 1) First Coat: Interior waterborne primer.
 - 2) Second and Third Coats: Interior semi-gloss or gloss enamel to match adjoining wall or ceiling finish.

- b. Building Exterior:
 - 1) First Coat: Exterior waterborne primer.
 - 2) Second and Third Coats: Exterior gloss enamel.
 - 3. Inside surfaces of ducts, vents, dampers and louvers as far back as visible from room in which they open shall be painted with 2 coats of flat black paint.
- D. Miscellaneous:
- 1. Outside Storage Units (wood or metal): 3 coats.
 - a. First Coat: As specified in this section under Priming.
 - b. Second and Third Coats: Exterior gloss enamel.
 - 2. Exterior and interior surfaces of storage bins, and potting tables shall have 3 coats of acrylic stain.
 - 3. Wood compost bins shall be finished with 3 coats of acrylic stain.

3.05 PROTECTION

- A. Protect the Work of this section until Substantial Completion.

3.06 CLEANUP

- A. Remove rubbish, debris, and waste materials and legally dispose of off the Project site.

END OF SECTION

SECTION 09 96 23

GRAFFITI-RESISTANT COATINGS

PART 1 - GENERAL

1.01 SUMMARY

- A. Work includes anti-graffiti coating.
- B. Related Requirements:
 - 1. Division 01 - General Requirements.
 - 2. Section 09 90 00: Painting and Coating.

1.02 SUBMITTALS

- A. Provide submittals in accordance with Division 01.
- B. Samples: Submit Samples of coating system.
- C. Product Data: Submit anti-graffiti coating manufacturer's technical data and installation instructions, recommended coverage rates for types of surfaces to be treated, and evidence that coatings conform to requirements specified. Submit evidence of code approvals.
- D. Furnish Samples on the same materials to which coating will be applied on. Indicate satin or flat finish. Coat one-half of each Sample, with the other half non-coated.
- E. Installer: Submit written evidence the installer for the Work of this section has completed at least five projects of similar complexity within the past five years.
- F. Certificate and Summary Statement: Before Substantial Completion, submit a certificate stating that coatings applied conform to reviewed submittals and specified requirements. Provide a summary statement setting forth the following:
 - 1. Number of square feet of each surface treated with coating, classified as to the kind of material treated, open pore or closed pore type, and whether vertical or horizontal.
 - 2. The number of gallons of each type, class, or grade of coating required to treat involved surfaces, based on the number of square feet of each type and orientation of the material the coating was installed on.
 - 3. Total gallons of each coating type, class, or grade installed.
- G. Maintenance Instructions: Furnish manufacturer's recommended graffiti removal instructions, and recommendations for recoating. Furnish names and addresses of cleaning firms and of suppliers of maintenance materials.
- H. Maintenance Material: Furnish five gallons of each product specified.

- I. LEED Submittals: Complete the LEED Material Buyout Form (MBoF) with all materials provided to the project. A complete submittal includes providing all material costs in the MBoF and all of the supporting documentation for the following credits:
1. MRc2 - Environmental Product Declarations (EPD): Provide Industry-Wide or Product-Specific EPD.
 2. MRc3 - Sourcing of Raw Materials - Recycled Content: Provide product data for pre- and post- consumer recycled content.
 3. MRc4 - Material Ingredients: Provide manufacturers Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, or Cradle to Cradle Health Product Certificate.
 4. IEQc2 - Low-Emitting Materials – Interior Wet Applied Products: For paints, coatings, adhesives and sealants applied on site or used for laminating off-site, include product data indicating the VOC content (g/L) and testing certificates or third party certification demonstrating compliance with California Department of Public Health (CDPH) v1.2-2017 emissions testing.

1.03 QUALITY ASSURANCE

- A. Manufacturer's Observation: Start coating application under the observation of the coating manufacturer's technical representative. Notify Project Inspector and coating manufacturer at least 72 hours before starting installation.
- B. Preliminary Tests: Perform tests on each kind of surface to be treated to establish the actual application rates required to provide the surfaces resistant to defacing and meet warranty requirements. Tests shall demonstrate the coating does not yellow, darken, mottle, or discolor any treated surface and those surfaces to be treated are dry. Established application rates shall not be less than those recommended in the coating manufacturer's technical data for the kind and surface orientation of the material.
- C. Compliance with Regulations: Materials shall comply with the current rules and regulations of the local air quality management district, with the rules regarding volatile organic compounds, and with FDA rules and regulations for dangerous materials in coatings.
- D. Materials shall meet requirements of SCAQMD regarding emission of solvents and other pollutants.
- E. Qualifications:
1. Manufacturer: Anti-graffiti coating shall be product of a manufacturer who has been regularly engaged in manufacturing anti-graffiti coatings for at least 5 years. Manufacturer shall supply references of at least five satisfactory installations in which anti-graffiti coating has been in service for at least five years.

1.04 DELIVERY, STORAGE AND HANDLING

- A. Deliver coating materials to the Project site in containers bearing name and batch number of manufacturer, with seals intact.

1.05 PROJECT CONDITIONS

- A. Protection: Install temporary coverings and protection, and do not allow coating to contact plastic, planting soil, plants, asphaltic paving, roofing membranes, or other materials that are likely to be damaged by coating.
- B. Weather Conditions: Do not install coating during windy, wet, or excessively hot or dry weather conditions.

1.06 WARRANTY

- 1. Manufacturer shall provide a five year material warranty.
- 2. Installer shall provide a one year application warranty.

PART 2 - PRODUCTS

2.01 ACCEPTABLE PRODUCTS

- A. Permashield, by Monopole Inc.:
 - 1. Permashield Premium 5600 over Aquaseal ME12, Permanent Graffiti Control, Monopole Inc., ND Graffiti Shield System, Rainguard VandlGuard System, or equal. Matte finish.
- B. Coval Anti-Graffiti coating by Coval Molecular Coatings.

2.02 PROPERTIES

- A. Coatings shall not darken or discolor the treated surfaces and shall be non-toxic, compatible with standard polymer type sealing materials, conforming to AQMD 1113, and certified by manufacturer as suitable over paint finish.
- B. Colors of opaque materials shall match adjoining colors, or shall be selected from manufacturer's custom colors.

2.03 LEED REQUIREMENTS

- A. IW/PS EDP: Products specified under this section must have a Type III Product Specific EPD or the company must be listed in the industry group responsible for the Industry Wide Externally Verified EPD.
- B. PS EPD: Products specified under this section must have a Type III Product Specific EPD.
- C. HPDs: Products specified under this section must have one of the following unexpired material ingredient reports compliant with LEEDv4.1 requirements and declared to 1000 ppm or less: Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, Cradle to Cradle Health Product Certificate, or UL Product Lens Certification.
- D. Interior Wet Applied Products: All wet-applied on-site paints, coatings, adhesives, and

sealants products provided under Part 2 of this specification section must be compliant with the VOC limits outlined under IEQc2: Low Emitting Materials in 01 81 13 Sustainable Design Requirements. In addition, all paints and coatings must be compliant with CDPH Standard Method v1.2-2017 emissions testing with proper unexpired CDPH testing certificates or acceptable third-party certification.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Do not start installation of coating if conditions are present that prevent or interfere with the correct preparation of surfaces or installation of coating system.

3.02 PREPARATION

- A. Remove dust, dirt, oil, grease, other deleterious substances and stain, and efflorescence and laitance from surfaces. Repair cracks and holes over 1/16 inch size. Spot prime cracks and holes 1/16 inch size and smaller and prime horizontal surfaces other than soffits with a heavy duty coating supplied by same coating manufacturer. Mask and protect adjoining surfaces and glass, unless coating is harmless and easily removed.

3.03 APPLICATION

- A. Install the anti-graffiti coating to surfaces indicated on drawings.
- B. Test graffiti resistant coating in an inconspicuous location to ensure adhesion and performance.
- C. Apply the anti-graffiti coating to surfaces indicated on drawings per manufacturer's recommended application methods and thicknesses.

3.04 CLEANING

- A. Remove rubbish, debris, and waste materials and legally dispose of off the Project site.

3.05 PROTECTION

- A. Protect the Work of this section until Substantial Completion.

END OF SECTION

SECTION 10 14 00 SIGNAGE

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Interior and exterior accessibility, identification, directional and informational signs.
2. Parking signs.
3. Building sign.

B. Related Requirements:

1. Section 08 11 13: Hollow Metal Doors and Frames.
2. Division 09: Finishes.
3. Section 32 13 13 – Portland Cement Concrete Paving

1.02 REFERENCES

A. ASTM International:

1. ASTM A500 - Standard Specification for Cold-Formed Welded and Seamless Carbon Steel Structural Tubing in Rounds and Shapes.
2. ASTM B209 - Standard Specification for Aluminum and Aluminum-Alloy Sheet and Plate.
3. ASTM D4802 - Standard Specification for Poly (Methyl Methacrylate) Acrylic Plastic Sheet.

1.03 SUBMITTALS

- A. Product Data: Submit material descriptions, finishes and color charts for each type of sign.
- B. Shop Drawings: Submit Shop Drawings indicating sign style, lettering, overall dimensions and quantities. Submit floor plans showing locations for each sign.
- C. Material Samples: Submit three samples illustrating full size sample sign, of type, style and color specified.
- D. Manufacturer's installation instructions.
- E. LEED Submittals: Complete the LEED Material Buyout Form (MBoF) with all materials provided to the project. A complete submittal includes providing all material costs in the MBoF and all of the supporting documentation for the following credits:
 1. MRc2 - Environmental Product Declarations (EPD): Provide Industry-Wide or Product-Specific EPD.
 2. MRc3 - Sourcing of Raw Materials - Recycled Content: Provide product data for pre- and post- consumer recycled content.

3. MRc4 - Material Ingredients: Provide manufacturers Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, or Cradle to Cradle Health Product Certificate.
4. IEQc2 - Low-Emitting Materials – Interior Wet Applied Products: For paints, coatings, adhesives and sealants applied on site or used for laminating off-site, include product data indicating the VOC content (g/L) and testing certificates or third party certification demonstrating compliance with California Department of Public Health (CDPH) v1.2-2017 emissions testing.

1.04 QUALITY ASSURANCE

- A. Pre-Installation Conference: Notify OAR when signs are ready for installation. Arrange for conference at site. Do not proceed with installation until ARCHITECT'S approval of specific locations and methods of attachment has been obtained.
- B. Provide signs from one manufacturer.

1.05 DELIVERY, STORAGE AND HANDLING

- A. Deliver products to site and protect from damage. Store until immediately prior to installation.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

- A. Products of following manufacturers are acceptable and are the basis for intended design and quality.
 1. ASI Signage Innovations
 2. H. Toji and Company.
 3. Karman Ltd., Architectural Signs.
 4. Vomar Products Inc.
 5. ASI-Modulex, Inc.
 6. Mohawk Sign Systems, Inc.
 7. Accent Signage Systems.
 8. The Gruenke Company.
 9. Ada Sign Products.
 10. AccuBraille.
 11. Equal.

2.02 MATERIALS AND FABRICATION

- A. Interior Sign Materials:
 1. Substrate Panel: 1/8 inch minimum thick, integrally colored or clear acrylic plastic, or laminated acrylic. Conforming to ASTM D4802; non-glare (matte), UV stable, suitable for interior and exterior use.

- a. Corners shall be square.
 - b. Edges shall be square and eased.
 - c. Colors as selected by ARCHITECT from manufacturer's custom color range.
2. Fasteners:
- a. Stainless steel tamper-proof screws and plastic anchors.
 - b. Signs mounted on fire-rated doors shall be secured with adhesive.
 - c. Adhesives and sealants shall comply with the limits for VOC content.
- B. Exterior Sign Materials:
1. Sign: ASTM B209 aluminum sheet, 0.080 inch thick with rounded corners of at least 1/8 inch radius and eased edges. White figure on a blue background; non-glare, high contrast signs. The blue shall be equal to color number 15090 in Federal Standard 595B.
 2. Post: 2 by 2 inch galvanized steel tubing, weighing minimum of 4.31 pounds per foot and conforming to ASTM A500, Grade B, 3/16 inch thick wall thickness.
 3. Concrete Post Footings: Refer to Section 32 13 13, Site Concrete Work.
 4. Fasteners: Stainless steel carriage bolts with tamper resistant nuts.
- C. Exterior Building Sign.
1. Illuminated Channel Letters
 - a. Material: Aluminum body with translucent acrylic face.
 - b. Letter Size: 14" high, 2" minimum depth.
 - c. Letter Style: As indicated in drawings.
 - d. Face Finish: As indicated in drawings.
 - e. Body Finish: Baked enamel, color as selected by from manufacturer's color chart.
 - f. Illumination: Combination of face and halo lit.
 - g. Mounting: wall mount.
- D. Characters and Symbols: Shall be fabricated by one of the processes described below:
1. Computer cut raised characters and graphics shall be cut from 1/16 inch integrally colored acrylic. Raised characters and graphics shall be inlaid 1/32 inch minimum into first surface of sign background, secured with adhesive so it cannot be removed without the use of tools. Raised characters and graphics shall have beveled, eased or rounded edges. Non-tactile text and graphics shall be applied to the second surface, and background color shall be applied to the second surface and protected with film or an additional backplate. Pictograms and other symbols including the International Symbol of Accessibility, which are included on signs with raised characters and Braille, are not required to be raised.

2. Raised characters and graphics including braille shall be integral to sign face and shall be formed into sign face by high pressure thermoforming using a negative mold. No applied, glued, welded tactile elements are acceptable. Raised characters and graphics shall have beveled, eased or rounded edges. No sharp, square edges are acceptable. Non-tactile text and graphics shall be applied to the second surface, and background color shall be applied to the second surface and protected with vinyl film. Pictograms and other symbols including the International Symbol of Accessibility, which are included on signs with raised characters and Braille, or other signs are not required to be raised.

2.03 COMMUNICATION ELEMENTS AND FEATURES

- A. Raised Characters Raised characters shall comply with CBC 11B-703.2.
 1. Character Type: Characters on signs shall be raised 1/32 inch minimum above their background and shall be sans serif uppercase characters duplicated in Braille. Characters and Braille shall be in a horizontal format.
 2. Character Height: Character height measured vertically from the baseline of the character shall be 5/8 inch minimum and 2 inch maximum based on the height of the uppercase letter “I”.
 3. Character Proportions: Characters shall be selected from fonts where the width of the uppercase letter “O” is 60 percent minimum and 110 percent maximum of the height of the letter “I”.
 4. Stroke Thickness: Stroke thickness of the uppercase letter “I” shall be 15 percent maximum of the height of the character.
 5. Character and Line Spacing shall be in conformance to CBC 11B-703.2.7 and 11B-703.2.8.
 6. Character Placement: Shall be placed in accordance to Paragraph 2.03, C below.
- B. Visual Characters: Visual characters shall comply with CBC Section 11B-703.5. Characters shall be conventional in form, and shall be uppercase or lowercase or a combination of both, as indicated on the drawings. Characters shall not be italic, oblique, highly decorative, or of other unusual forms.
 1. Finish and Contrast: Characters and their backgrounds shall have a non-glare finish. Characters shall contrast with their background with either light characters on a dark background or a dark characters on a light background.
 2. Character Proportions: Characters shall be selected from fonts where the width of the uppercase letter “O” is 60 percent minimum and 110 percent maximum of the height of the uppercase of the letter “I”.
 3. Character Height: Minimum character height shall comply with CBC Table 11B-703.5.5.
 4. Height from Finish Floor or Ground: Visual characters shall be a 40 inches minimum above the finish floor or ground
 5. Stroke Thickness: Uppercase letter “I” shall be 10 percent minimum and 20 percent maximum of the height of the character.

6. Character and Line Spacing: Shall be in accordance to CBC 11B-703.5.8 and 11B-703.5.9.
- C. Braille: Contracted Grade 2 Braille, conforming to CBC 11B-703.3. Braille characters shall be inlaid optically correct acrylic Raster beads into computer drilled holes in the panel surface.
1. Dimensions and Capitalization: Braille dots shall have a domed or rounded shape and shall comply with CBC Table 11B-703.3.1. The indication of an uppercase letter or letters shall only be used before the first word of sentences, proper nouns and names, individual letters of the alphabet, initials, and acronyms.
 2. Position: Braille shall be positioned below the corresponding text in a horizontal format, flush left or centered. If text is multi-lined, Braille shall be placed below the entire line of text. Braille shall be separated 3/8 inch minimum and 1/2 maximum from any other tactile characters and 3/8 inch minimum from raised borders and decorative elements.
- D. Pictograms: In conformance to CBC 11B-703.6. Pictograms shall have a field height of 6 inches minimum. Characters and Braille shall not be located in the pictogram field.
1. Finish and Contrast: Pictograms and their field shall have a non-glare finish. Pictograms shall contrast with their field with either a light pictogram on a dark field or a dark pictogram on a light field.
 2. Text Descriptors: Pictograms shall have text descriptors located directly below the pictogram field, and shall comply with CBC 11B-703.2, 11B-703.3 and 11B-703.4.
- E. International Symbol of Accessibility (ISA): Shall comply with CBC 11B-703.7 and CBC Figure 11B-703.7.2.1. The ISA shall consist of a white figure on a blue background. The blue color shall be approximate to FS. 15090 in Federal Standard 595C.
- F. Mounting Locations and Height: Signs with tactile characters shall be as indicated on the drawings and in conformance to CBC 11B-703.4.
1. Mounting Locations:
 - a. Identification signs for rooms and spaces shall be located on the wall adjacent to the latch side of the door, as one enters the room or space.
 - b. Signs that identify exits shall be located at the exit door when approached in the direction of egress travel.
 - c. Signs containing tactile characters shall be located so that a clear floor space 18 inches minimum by 18 inches minimum, centered on the tactile characters, is provided beyond the arc of any door swing between the closed position and 45 degree open position.
 - d. Where a tactile sign is provided at a door, the sign shall be located alongside the door at the latch side.
 - e. Where a tactile sign is provided at double doors with one active leaf, the sign shall be located at the inactive leaf.

- f. Where a tactile sign is provided at double doors with two active leaves, the sign shall be located to the right of the right hand door.
 - g. Where there is no wall space at the latch side of a single door or at the right side of double doors, signs shall be located on the nearest adjacent wall.
2. Mounting height above finish floor or ground: Tactile characters on signs shall be located 48 inches minimum above the finish floor or ground surface, measured from the baseline of the lowest Braille cells and 60 inches maximum above the finish floor or ground surface, measured from the baseline of the highest line of raised characters.

2.04 ROOM IDENTIFICATION SIGNS

A. Room Identification Sign Types:

1. Room Identification Sign with Changeable Insert: 7 inches high by 9 inches wide, minimum, with 4 inches high by 9 inches wide window for name and title removable insert. Locate room name immediately below window, and centered above room number. Room name shall be raised characters 3/4 inches high minimum, and room number 1 inch minimum; and shall be accompanied with Braille indicators.
2. Room Identification Sign with Room Name and Room Number: 7 inches high by 9 inches wide, minimum. Room name shall be raised characters 3/4 inches high minimum, and room number 1 inch minimum; and shall be accompanied with Braille indicators.
3. Room Number Sign: 7 inches wide by 4 inches high; room number, 1 inch high minimum, raised character, accompanied by Braille indicator immediately below.

B. Room Identification Sign Requirements:

1. Finish and Contrast: Refer to paragraph 2.03.B.
2. Raised Characters and Proportions: Refer to paragraph 2.03.A.
3. Braille: Refer to paragraph 2.03.C.
4. Mounting Location and Height: Refer to paragraph 2.03.F.

2.05 RESTROOM SIGNAGE

A. Multiple-Occupancy restrooms shall be provided with geometric symbols and wall mounted pictograms with text descriptors.

B. Geometric Symbols:

1. Doorways leading to toilet rooms shall be identified by a geometric symbol complying with CBC Section 11B-703.7.2.6.
2. Male Restroom Door Symbol: 1/4 inch thick equilateral triangle with edges 12 inches long, with vertex pointing upward, the triangle symbol shall contrast with the door, either light on a dark background or dark on a light background. A male silhouette shall appear within the equilateral triangle in contrasting color to it.

3. Female Restroom Door Sign: 1/4 inch thick circle 12-inch diameter, the circle symbol shall contrast with the door, either light on a dark background or dark on a light background. A female silhouette shall appear within the circle in contrasting color to it.
 4. “All Gender” Restroom Door Sign (Single occupancy restrooms): 1/4 inch thick circle, 12-inch diameter with a 1/4 inch thick equilateral triangle with the vertex pointing upward superimposed on the circle and within the 12-inch diameter. Triangle and circle shall be of contrasting colors; the circle symbol shall contrast with the door. A female and male silhouettes shall appear within the equilateral triangle in contrasting color to it, and the word “restroom” shall appear on the bottom part of the circle in contrasting color to it.
 5. Edges and Vertices on Geometric Symbols: Shall be eased or rounded at 1/16 inch minimum, or chamfered at 1/8 inch maximum. Vertices shall be radiused between 1/8 minimum and ¼ inch maximum.
 6. Location and Mounting Height: Symbols shall be mounted at 58 inches minimum and 60 inches maximum above the finish floor or ground surface measured from the centerline of the symbol. Where a door is provided the symbol shall be mounted within one inch of the vertical centerline of the door.
- C. Room Identification for Multiple-Occupancy Restrooms: Provide a 16 inch long by 6 inch tall room identification sign, including a pictogram of the International Symbol of Accessibility on a side. Restroom names shall be “Women” and “Men”. Characters, Braille, pictograms and mounting locations and height shall be in conformance to Article 2.03.
- D. Room Identification for Single-Occupancy Restrooms: Provide a 16 inch long by 6 inch tall room identification sign, including a pictogram of the International Symbol of Accessibility on a side. Text descriptor shall be “All Gender Restroom”. Characters, Braille, pictograms and mounting locations and height shall be in conformance to Article 2.03.

2.06 RAISED CHARACTER AND BRAILLE EXIT SIGNS

- A. Tactile Exit Sign Types:
1. “EXIT”.
 2. “EXIT ROUTE”.
 3. “TO EXIT”.
 4. “EXIT ONLY” on exit doors which lock from outside and does not allow a return.
- B. Sign Requirements:
1. Finish and Contrast: Refer to paragraph 2.03.B.
 2. Raised Characters and Proportions: Refer to paragraph 2.03.A.
 3. Braille: Refer to paragraph 2.03.C.
 4. Mounting Location and Height: Refer to paragraph 2.03.F.

2.07 ACCESSIBILITY ENTRANCE SIGNS AND PATH OF TRAVEL DIRECTIONAL SIGNS

- A. Entrance Sign: Provide at each building entrance an International Symbol of Accessibility sign. Signs shall be visible to persons along approaching pedestrian ways.
- B. Directional Signs: Provide where indicated on the drawings with arrow indicators and International Symbol of Accessibility.
- C. Signs shall be mounted on wall with lower edge between 48 inches and 60 inches above ground surface or finish floor. Pole mounted, overhead and projecting signs shall have the lower edge at least 80 inches from the ground surface or finish floor.
- D. Sign shall comply with the following requirements.
 - 1. Directional Signs: Refer to paragraph 2.03.B.
 - 2. Symbol of Accessibility: Refer to paragraph 2.03.E.
- E. No Smoking Sign: Provide at each building entrance. Reverse cut white vinyl sign with 4 1/2-inch high no smoking symbol, mounted on glass entry doors. Under No Smoking symbol, place words "No Smoking", 1/2 inch high minimum, San Serif upper and lower case characters.

2.08 PARKING SIGNS

- A. Tow-Away Sign: 18 inches by 24 inches with rounded corners. Black graphics on white background, with lettering not less than 1 inch high. Sign to read: "UNAUTHORIZED VEHICLES PARKED IN DESIGNATED ACCESSIBLE SPACES NOT DISPLAYING DISTINGUISHING PLACARDS OR SPECIAL LICENSE PLATES ISSUED FOR PERSONS WITH DISABILITIES WILL BE TOWED AWAY AT THE OWNER'S EXPENSE. TOWED VEHICLES MAY BE RECLAIMED AT [Insert location] OR BY TELEPHONING (213) 625-6631".
- B. Parking Space Identification Sign: 12-inch by 18-inch with rounded corners. White reflectorized graphic on dark blue background, and shall display an 8-inch high International Symbol of Accessibility per paragraph 2.03.E.
 - 1. Additional language or an additional sign below the International Symbol of Accessibility shall state I "Minimum Fine \$250".
 - 2. Signs identifying van accessible parking spaces shall contain additional language or an additional sign with the designation "Van Accessible".
- C. Signs shall be mounted on posts at head of each accessible parking with lower edge 80 inches minimum above ground surface, or mounted on walls at a minimum height of 60 inches from ground surface.

2.09 OCCUPANT LOAD SIGNS

- A. Provide maximum occupancy load signs. Post in a conspicuous place near the main exit or exit access doorway from the room or space of rooms and areas indicated in the drawings.
- B. Minimum size: 4 inches high by 8 inches wide, 7/8 inch high letters, 1 inch high numerals.

- C. Sign to read: “MAXIMUM OCCUPANCY LOAD XXX”. Indicate occupant load shown on drawings.

2.10 FIRE SPRINKLER RISER ROOM SIGN

- A. Locate one sign at each fire sprinkler riser room door as indicated in drawings.
- B. Text: Sign to read “Fire Sprinkler Riser Inside”, white characters, 1 inch high on red background.
- C. Sign Requirements:
 - 1. Raised Characters and Proportions: Refer to paragraph 2.03.B.
 - 2. Braille: Refer to paragraph 2.03.C.
 - 3. Mounting Location and Height: Mounted on the door, refer to paragraph 2.03.F.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Verify that surfaces are ready to receive work.
- B. Beginning of installation means installer accepts condition of existing surfaces.

3.02 METHODS OF INSTALLATION

- A. Interior Identification Signs and Interior Directional Signs:
 - 1. Fasten to wall with four tamper-proof round-head screws, one at each corner of sign. Furnish plastic anchors.
 - 2. When concealed installation is specified, install backplate to wall as above. Fasten sign to backplate with very high-bond double-faced tape.
 - 3. For installation on glass, fasten sign to glass with very high bond double faced tape. On opposite side of glass, anchor matching backplate to glass with very high-bond double-faced tape.
- B. Geometric Signs: Geometric toilet room signs shall be fastened to doors with three tamper-proof oval-head counter-sunk screws.
- C. Exterior Post Mounted Directional Signs: Size of required footing shall be as indicated on the drawings. Fasten sign with tamperproof stainless steel bolts.
- D. Exterior Wall Mounted Identification Signs and Directional Signs:
 - 1. Aluminum signs: Fasten to wall with 4 tamper-proof round-head screws, one at each corner of sign. Furnish plastic anchors.
 - a. Cement Plaster, Brick, or Masonry: Provide plastic anchors. For signs greater than 640 square inches use Leadwood Screw Anchors, concrete fasteners 1WSA 10112, or equal.
 - b. Chain Link Fence: Fasten with 9 gage hog rings, King Hughes Fasteners 5150DG50, or equal, with 11/16 inch opening at each corner of sign.

- c. Wrought Iron Fence: Install at each corner with 3/16 inch stainless steel rivets.
 2. Acrylic signs: Install backplate to wall as indicated above. Fasten sign to backplate with high-bond double-faced tape and silicone.
- E. Exterior Building Sign:
 1. Each letter shall be furnished with a minimum of three cast mounting lugs on backside, drilled and tapped to receive installation bolts.
 2. Letters shall be installed according to manufacturer's method PMC-1. Letters shall be installed $\frac{3}{4}$ inch away from wall surface, by an aluminum sleeve spacer.

3.03 CLEANUP

- A. Remove rubbish, debris, and waste materials and legally dispose of off Project site.

3.04 PROTECTION

- A. Protect Work of this section until Substantial Completion.

END OF SECTION

SECTION 10 21 13

PHENOLIC TOILET COMPARTMENTS

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Solid phenolic toilet compartments, urinal screens, and vision screens.

B. Related Requirements:

- 1 Division 01 - General Requirements.
- 2 Section 05 41 00 - Structural Metal Stud Framing.
- 3 Section 06 10 00 - Rough Carpentry.
- 4 Section 10 28 13 - Toilet Accessories.

1.02 DESIGN REQUIREMENTS

- A. Design and fabrication shall conform to requirements of ADAAG and CBC Chapter 11B.
- B. Toilet Compartments: Floor supported overhead braced type units consisting of solid phenolic pilasters, panels and doors; plated steel leveling devices with stainless steel covers; and stainless steel fittings, hardware and fastenings.
- C. Urinal Screens: Floor supported and wall hung type consisting of solid phenolic screen panels and plated steel leveling devices with stainless steel covers, stainless steel fittings and fastening.
- D. Vision Panels: Floor- and wall-mounted solid phenolic type.

1.03 SUBMITTALS

- A. Shop Drawings: Submit Shop Drawings indicating complete layout, elevations of partitions, thickness of solid phenolic panels, fastenings, proposed method of anchoring, size and spacing of anchors, details of construction, hardware, fittings, mountings, method of assembly, other related items, and installation details.
- B. Product Data: Submit manufacturer's technical data for materials, fabrication, finishing, fastenings, hardware, and installation details.
- C. Material Samples:

1. Submit full range of Samples of phenolic chips for initial color selection. Chips shall be at least 2-inch by 3-inch.
 2. Submit Samples of hardware and fasteners.
- D. Certificates: Furnish manufacturer's certification that materials meet or exceed Specification requirements.

1.04 QUALITY ASSURANCE

- A. Comply with the following as a minimum requirement:
1. ASTM A167: Standard Specification for Stainless and Heat-Resisting Chromium-Nickel Steel Plate, Sheet and Strip.
 2. ASTM E84: Standard Test Method for Surface Burning Characteristics of Building Materials.
 3. Underwriters Laboratories Inc. (UL):
 - a. UL Fire Resistance Directory; applicable UL Design Numbers for application of fireproofing and conditions as indicated.
 4. Chemical Resistance: Panels to meet or exceed Scientific Equipment Furniture Association's (S.E.F.A.) list of 49 standard chemicals.
 5. Consistency:
 - a. Panels to have uniform thickness (+0.03 inch).
 - b. Panels to have uniform flatness (maximum difference of 0.03 inch) for a 10-foot span.

1.05 DELIVERY, STORAGE AND HANDLING

- A. Deliver materials to Project site with manufacturer's labels intact and legible, in sealed containers. Materials shall be kept dry.
- B. Protect compartments and screens.

1.06 COORDINATION

- A. Field Measurements: Secure field measurements prior to fabrication, for proper and adequate fabrication and installation of the Work of this section.
- B. Furnish inserts and anchorage built into other construction for installation of toilet compartments, urinal screens and vision panels.

1.07 WARRANTY

- A. Toilet Compartment Manufacturer shall provide a 25 year material warranty for solid phenolic panels and hardware.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

- A. Manufacturer:
 - 1. Qualifications of Toilet Compartment Manufacturer: Partition Manufacturer shall have been regularly engaged in the construction of Phenolic Toilet Compartments of the type specified for a minimum of five years.
- B. Solid Phenolic Panels:
 - 1. Basis of Design: Formica Solid Phenolic panels with -692 Folkstone Celesta, 689 Stellar, Formica Corporation.
 - 2. Wilsonart.
 - 3. Nevamar Surface Systems.
 - 4. Equal.
- C. Hardware:
 - 1. Basis of Design: Galaxy Hardware, Series 8033.
 - 2. Jacknob Corporation.
 - 3. Equal.

2.02 MATERIALS

- A. Toilet compartments panels, doors and pilasters; urinal screens and visual screens.
 - 1. Core: Phenolic impregnated Kraft papers. Panel shall be at least 93 pounds per cubic foot to ensure full saturation of Kraft core.
 - 2. Face Sheet: Over decorative papers impregnated with melamine resin and integrally compression molded with the core.
 - 3. Fire Resistance: The panels shall have the following surface burning characteristics and smoke generation values in accordance with UL 723 classification and labeling in accordance with ASTM E84 Class A tests and shall be self-extinguishing.
 - a. Flame spread: Maximum 30 for $\frac{3}{4}$ inch thick panels; 30 for $\frac{1}{2}$ inch thick panels.

- b. Smoke developed: Maximum 70 for 3/4 inch thick panels; 85 for 1/2 inch thick panels.
- 4. Panels shall be UL registered and labeled.
- 5. Panel shall be resistant to cleaning solvents and uric acid.
- 6. Product/Material Specification:
 - a. Modulus of Elasticity: 1.5 million psi minimum.
 - b. Shear Strength: 2,000 psi minimum.
 - c. Compressive strength: 24,000 psi minimum.
 - d. Water Absorption: 3 percent maximum.
 - e. Use Temperature: 350 degrees F maximum.
 - f. Surface and Edges: Non-porous.
 - g. Material Resistance: Will not support fungus or bacteria.
 - h. Uniform Load Deflection: 1/4 inch maximum per Table A:

<u>Table A: Uniform Load (lbs) which causes 1/4 inch deflection at Center</u>				
(Shelves not fixed at either end, static load on E modulus of 2.0 by 106)*				
Uniform Load in pounds:				
<u>Thickness</u>	<u>12 by 24-inch</u>	<u>12 by 36-inch</u>	<u>12 by 48-inch</u>	<u>24 by 36-inch</u>
1/2 inch	370	110	45	220
1/4 inch	1,400	400	170	800
*Loads can be affected by temperature, humidity, time, and other environmental factors. Users should test shelves in appropriate environment. It is assumed that deflection greater than 1/4 inch is undesirable aesthetically, even though rupture has not occurred.				

- B. Stainless Steel: ASTM A167, Type 304.
- C. Concealed Fasteners and Leveling Devices:
 - 1. Concealed Fasteners: Stainless steel.
 - 2. Leveling Devices: Zinc or cadmium coated steel, Stainless steel.

2.03 FABRICATION

- A. Doors shall be $\frac{3}{4}$ inch thick, panels $\frac{1}{2}$ inch thick, pilasters $\frac{3}{4}$ inch thick and screens $\frac{1}{2}$ inch thick. Edges shall be machined to a radius of $\frac{3}{16}$ inch; exposed surfaces shall be free of fabrication marks.
- B. Pilasters: Flush, formed of $\frac{3}{4}$ inch thick solid phenolic panels. Edges shall be machined to a radius of $\frac{3}{16}$ inch.
 - 1. Door Dimensions: Unless otherwise indicated, furnish 24-inch wide in-swinging doors for standard toilet compartments, 36-inch wide clear opening out-swinging doors when located at the end, and 36-inch wide clear opening out-swinging doors when located at the side for stalls equipped for use by the physically disabled
 - 2. Anchorage: Provide stainless steel anchorage, complete and threaded rods, washers, and leveling adjustment nuts at pilasters, to permit connection to floor slab. Furnish devices, which are designed to support pilasters from structure without transmitting load to floor fill.
 - 3. Overhead Bracing: Provide anti-grip, decorative, heavy duty, extruded aluminum head rail with clear anodized finish.
- C. Panels and Urinal Screens: Flush, formed of $\frac{1}{2}$ inch thick solid phenolic panels with a one inch corner radius. Height and width as indicated in drawings.

2.04 HARDWARE

- A. Door hardware shall be cast Type 304 stainless steel, as follows:
 - 1. Hinges: 11 gage Cast Stainless Steel Hinge. Hinge shall be cast of type 304 stainless steel and shall have a Satin finish. Hinge shall be gravity type for self-closing action and shall be fully adjustable up to 360 degrees. Pivot pin shall be made of type 304 stainless steel. Only stainless steel components shall be used in the construction of the Hinge. Plastic inserts are unacceptable. Hinges shall provide emergency access by lifting the door. Hinges shall be pre-drilled for mounting to door and pilaster with Stainless Steel through-bolts. Stamped stainless steel is not acceptable.
 - a. Galaxy Hardware: CS-560 (LeftHand IN/RightHand OUT) or CS-561 (RightHand IN/LeftHand OUT).
 - b. Jacknob Corporation: 7273 (RightHand IN/LeftHand OUT) or 7283 (LeftHand IN/RightHand OUT).
 - c. Equal.
 - 2. Continuous Hinge: Continuous 14 gauge stainless steel hinge (48.5") shall be made of Type 302/304 Stainless Steel and shall have a Satin Finish. Hinge shall be 3" wide and shall have four (4) Stainless Steel wire springs for self-closing action. Pivot pin shall be .250" in diameter, and shall be made of Type 304 Stainless Steel. Hinges shall provide emergency access by lifting the door. Hinges shall be pre-drilled for mounting to door and pilaster with Theft Proof

Stainless Steel Torx Head with Pin Through-Bolts. Brass inserts are unacceptable. Each Hinge Set is to be packaged in a separate carton, and is to be labeled by stock number, manufacturer, and left or right hand. Furnish one per door.

- a. Galaxy Hardware: SS-953 (LeftHand IN/RightHand OUT) or SS-954 (RightHand IN/LeftHand OUT).
 - b. Jacknob Corporation: 7339 (RightHand IN/LeftHand OUT) or 7349 (LeftHand IN/RightHand OUT).
 - c. Equal.
2. Strike and Keeper with Emergency Access: Refer to Detail #1 of this section. Strike and keeper shall be heavy duty ASTM A167, Type 304 cast stainless steel with a polished satin finish. All outside corners and edges shall be rounded to ensure there are no sharp edges. The strike and keeper shall provide emergency egress by lifting of the door. The strike and keeper shall be 2.50" high, with the mounting holes at 1.50" O.C. The wall thickness shall be a minimum of .125". The keeper shall have a minimum 7/8 inch tab to prevent impaling injuries. The strike and keeper shall be mounted to the pilaster with theft proof stainless steel Torx Head with pin through-bolts. Strike and keeper shall have an integral rubber bumper door stop rated and able to withstand a sudden impact of 350 lbs. Stamped stainless steel strike and keepers are unacceptable. Extra door stops that encumber the door opening and create a hazard are unacceptable. The stock number shall be molded into the back of strike and keeper for ease in identification. Furnish one per door.
- a. Galaxy Hardware: CS-458 (inswing strike & keeper), or CS-456 (outswing strike & keeper).
 - b. Jacknob Corporation 6283 (inswing strike & keeper), or 4913 (outswing strike & keeper).
 - c. Equal.
3. Slide Latch: Heavy duty cast stainless steel with satin finish. Slide latch shall be surface mounted. The slide bar shall be .150 inch thick, 1.020 inch wide and 3.720 inch long. Latch shall have an internal stainless steel buffering spring to prevent damage when door is inadvertently slammed against the latch. Mounting holes are to be spaced at 3.50 inch on center. Latch knob shall be riveted to the slide bar and welded to insure that the knob will not come off. Stock number shall be molded into the back of the slide latch for ease identification. Furnish one per door. Stamped stainless steel is not acceptable.
- a. Galaxy Hardware: CS-233.
 - b. Jacknob Corporation: 5053

- c. Equal.
4. Coat Hook: Heavy duty cast stainless steel with satin finish. Coat hook and bumper shall be 2.340 inch high, 1.230 inch wide and shall protrude out from the door 3.05 inch. The hook portion shall have a finished diameter of .250 inch thick. The stock number shall be molded into the back of the Coat Hook and Bumper for ease in identification. Furnish one per door. Stamped stainless steel is not acceptable. Mount at 48 inches maximum above finished floor in accessible toilet compartments.
 - a. Galaxy Hardware: CS-274.
 - b. Jacknob Corporation.
 - c. Bobrick: B-212.
 - d. Equal.
5. Door Stop: Heavy duty cast stainless steel with satin finish. Plated Zarnac Door stops are unacceptable. Door Stop shall have a 2.125 inch base diameter and shall protrude 1.80 inch from the Wall. The bumper at the end of the Door Stop shall be .250 inch thick. The diameter of the shaft shall be .6875 inch. The stock number shall be molded into the back of the Door Stop for ease in identification. Stamped stainless steel is not acceptable.
 - a. Galaxy Hardware: CS-276.
 - b. Jacknob Corporation: 4123.
 - c. Equal.
6. Pull Handle:
 - a. Heavy duty cast stainless steel with satin finish. Plated Zamac Door pulls are unacceptable. Pull Handle shall protrude from the face of the door .940 inch and shall be 4.735 inch long. The Pull Handle shall have mounting holes drilled and tapped for 10/24 threads at 3.50 inch on center. The Pull Handle shall be .655 inch wide and shall be mounted back to back with the slide latch. The stock number shall be molded into the back of the pull handle for ease in identification. Stamped stainless steel is not acceptable. Provide u-pull shape handle on each side of accessible toilet compartment doors.
 - 1) Galaxy Hardware: CS-277.
 - 2) Jacknob Corporation: 6253.
 - 3) Equal.
 - b. Accessible Door Pull: 5-1/8 inch by 3 inch high stainless steel pull:

- 1) Galaxy Hardware: PH-200.
 - 2) Jacknob Corporation: 6253.
 - 3) All Partitions A0625.
 - 4) Equal.
- B. Pilaster Shoes: ASTM A167, Type 302/304 Stainless Steel, minimum 3-inch high, 18 gauge, finish with #3 Directional polish, attached with stainless steel through bolts.
- C. Brackets: One piece double ear bracket or single ear bracket (at end partition) extending within 3 inches of top and bottom panel edges. Extruded 6063-T5 Aluminum with a satin anodized finish or 304 stainless steel. The minimum weight shall be 1.685 pounds per lineal foot. Inside opening of Bracket shall be .50 inch for panels, .75 inch for pilasters. Holes for mounting to wall and panel/pilaster shall be pre-drilled. Holes are to be spaced at 9 inches on center along the full length of the bracket for a total of twelve holes (double ear) for mounting to the wall and six holes (single ear) for mounting to the panel/pilaster. Each bracket is to have a minimum wall thickness of .125 inch.
- D. Overhead Bracing (Headrail): Continuous heavy duty extruded 6063-T5 Aluminum Headrail with anti-grip profile. Head rail shall have integral reinforcing channel and curtain track. Head rail shall have Satin Anodized finish. Provide headrail corner brackets, wall brackets, and headrail end caps as required. The headrail and headrail brackets shall have a minimum wall height of 2 inch. The minimum wall thickness of the headrail and head rail brackets shall be .125 inch.
1. Galaxy: AL-115 (16' antigrip headrail), EC-120 (3/4" END CAP), HP-132 (Headrail to wall bracket pack), HP-970 (Corner headrail bracket pack).
 2. Jacknob Corporation: 80188 – Extruded Aluminum Headrail, 2109 Headrail Wall Brackets, 6672 Headrail End Caps.
 3. Equal.
- E. Chrome-plated, non-ferrous cast alloy material shall not be furnished for hinges, brackets, locks, latches and other fittings and accessories.

PART 3 - EXECUTION

3.01 EXAMINATION AND PREPARATION

- A. Before covering wall framing with finish materials, examine framing to ensure that backing plates and structural framing have been installed in such position as to receive all attachment screws.
- B. Verify spacing of plumbing fixtures to ensure compatibility with installation of compartments.

- C. Do not start the Work of this section until all deficiencies have been corrected.

3.02 INSTALLATION

- A. Install partitions and screens as shown in the Shop Drawings and in accordance with manufacturer's instructions and as specified. Install straight, level and plumb.
- B. No evidence of drilling, cutting or patching shall be visible in finished Work.
- C. Fasten panel brackets securely to walls and ceilings with recommended anchoring devices.
- D. Fasten panels and pilasters to brackets with through bolts and nuts.
- E. Fasten urinal screen panels to walls with a continuous bracket.
- F. Provide ½ inch spaces between wall surface and panels or pilasters.
- G. Provide for adjustment of floor variations with non-breakable plastic shoes on pilasters. Conceal floor fastenings in pilaster shoes.
- H. Furnish each toilet compartment door with top and bottom hinges, and door latch.
- I. Install door strike keeper on each pilaster in alignment with door latch.
- J. Furnish each toilet compartment door with one coat hook and bumper.

3.03 TOLERANCES OF INSTALLED WORK

- A. Maximum Variation from Plumb or Level: 1/8 inch.
- B. Maximum Misplacement from Intended Position: 1/8 inch.

3.03 ADJUSTING AND CLEANING

- A. Hardware Adjustment: After installation, adjust hardware for proper operation. Install hinges on in-swinging doors to hold open approximately 30 degrees from the closed position when unlatched. Install hinges on out-swinging doors to return to the fully closed position. Door shall be plumb with pilasters when door is closed.
- B. Adjust and align door hardware to uniform clearance at vertical edges of doors. Clearance space shall not exceed ¼ inch.
- C. Cleaning: Clean compartments, hardware, and doors before Substantial Completion and leave free from imperfections. Remove protective coverings.

3.04 CLEANUP

- A. Remove rubbish, debris, and waste materials and legally dispose of off the Project site.

Department of Neighborhood Services and Public Safety
GOLETA TRAIN DEPOT PROJECT

3.05

PROTECTION

- A. Protect the Work of this section until Substantial Completion.

END OF SECTION

SECTION 10 28 13

TOILET AND JANITOR ACCESSORIES

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Toilet accessories.

B. Related Requirements:

1. Division 01 - General Requirements.
2. Section 05 41 00 - Structural Metal Stud Framing.
3. Division 9 - Finishes
4. Section 10 21 13 - Plastic Toilet Compartments.

1.02 REGULATORY REQUIREMENTS

- A. Comply with CBC Chapter 11B requirements and ADAAG recommendations for accessibility.

1.03 SUBMITTALS

- A. Shop Drawings: Submit a schedule of accessories and Shop Drawings indicating installation methods and fasteners.

- B. Changing Tables: Submit conformance to specified standards.

- C. LEED Submittals: Complete the LEED Material Buyout Form (MBoF) with all materials provided to the project. A complete submittal includes providing all material costs in the MBoF and all of the supporting documentation for the following credits:

1. MRc2 - Environmental Product Declarations (EPD): Provide Industry-Wide or Product-Specific EPD.
2. MRc3 - Sourcing of Raw Materials - Recycled Content: Provide product data for pre- and post- consumer recycled content.
3. MRc4 - Material Ingredients: Provide manufacturers Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, or Cradle to Cradle Health Product Certificate.

4. IEQc2 - Low-Emitting Materials – Interior Wet Applied Products: For paints, coatings, adhesives and sealants applied on site or used for laminating off-site, include product data indicating the VOC content (g/L) and testing certificates or third party certification demonstrating compliance with California Department of Public Health (CDPH) v1.2-2017 emissions testing.

1.04 QUALITY ASSURANCE

- A. Coordinate related Work as required to ensure proper and adequate provision in framing of backing and wall finish for installation of accessories.
- B. Coordinate requirements of Section 10 21 13 - Plastic Toilet Compartments to ensure that correct openings are provided in partitions for toilet accessories where required.

1.05 DELIVERY, STORAGE AND HANDLING

- A. Protect accessories from damage.

PART 2 - PRODUCTS

2.01 GENERAL

- A. Manufacturer Basis of Design: Bobrick Washroom Equipment, Inc. 6901 Tujunga Ave. North Hollywood, CA. 91605-6213, Tel: (818) 764-1000, or approved equal.
- B. Accessories shall be provided with necessary anchoring devices and fasteners appropriate for surfaces on which items are to be fastened.

2.02 TOILET AND JANITOR ACCESSORIES

- A. Refer to architectural drawings for Toilet and Janitor accessories schedule.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Check openings in substrates to receive accessories. Verify openings are correctly located and sized to receive accessories, and that locations will comply with disability access requirements. Confirm that blocking, backing or support is properly located and adequate for the accessory installation.
- B. Verify spacing of plumbing fixtures and toilet partitions. Confirm spacing and locations are compatible with proposed accessory locations and will allow compliance with disability access requirements.

3.02 INSTALLATION

- A. Install toilet accessories in accordance with manufacturer's written recommendations and accessibility requirements. Fasten components firmly in place.
- B. Drill holes to correct size and application that is concealed by item with ¼ inch tolerance.
- C. Install recessed accessories into wall openings with sheet metal screws into metal frames.
- D. Install surface-mounted accessories to backing plates with machine screws, plumb, and aligned.
- E. Grab Bars:
 - 1. Fasten to toilet partition with 3-inch diameter stainless steel back plates with studs, couplings, and stainless steel machine screws.
 - 2. At wood stud walls, fasten wood blocking with threaded stainless steel wood screws of sufficient length to penetrate blocking 1 ¼-inch minimum.
 - 3. At metal stud walls, provide 1/8 inch cold-rolled steel plate, drilled and tapped for machine screws, or 16 gage cold-rolled steel plate complete with threaded sleeves for stainless steel machine screws. Weld plates to studs.
 - 4. At concrete or masonry walls, install bars with sheet metal screws and expansion anchors.
 - 5. At plaster or gypsum board walls, provide spacers of same thickness as wall material to prevent crushing of wall material.
- F. Mirrors: Install mirror on manufacturer supplied concealed wall hanger and fasten with two theft-resistant locking screws.
- G. Stainless Steel Medicine Cabinet: Fasten cabinet to wall.
- H. Before Substantial Completion, deliver keys and maintenance instructions and product data to OAR.

3.03 ADJUSTING AND CLEANUP

- A. Adjust accessories for proper operation.
- B. Remove rubbish, debris, and waste material and legally dispose of off the Project site.

3.04 PROTECTION

Department of Neighborhood Services and Public Safety
GOLETA TRAIN DEPOT PROJECT

- A. Protect the Work of this section until Substantial Completion.

END OF SECTION

SECTION 10 44 13

FIRE EXTINGUISHERS AND CABINETS

PART 1 - GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Fire Extinguishers and Cabinets.
- B. Related Requirements:
 - 1. Division 01 - General Requirements.
 - 2. Section 09 29 00 - Gypsum Board.

1.02 SUBMITTALS

- A. Shop Drawings: Indicate materials, sizes, anchorage, and installation details.
- B. Product Data: Submit manufacturer's product literature, indicating product characteristics.
- C. Material Samples: Submit manufacturer's standard cabinet color Samples for selection by Architect.
- D. LEED Submittals: Complete the LEED Material Buyout Form (MBoF) with all materials provided to the project. A complete submittal includes providing all material costs in the MBoF and all of the supporting documentation for the following credits:
 - 1. MRc2 - Environmental Product Declarations (EPD): Provide Industry-Wide or Product-Specific EPD.
 - 2. MRc3 - Sourcing of Raw Materials - Recycled Content: Provide product data for pre- and post- consumer recycled content.
 - 3. MRc4 - Material Ingredients: Provide manufacturers Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, or Cradle to Cradle Health Product Certificate.
 - 4. IEQc2 - Low-Emitting Materials – Interior Wet Applied Products: For paints, coatings, adhesives and sealants applied on site or used for laminating off-site, include product data indicating the VOC content (g/L) and testing certificates or third party certification demonstrating compliance with California Department of Public Health (CDPH) v1.2-2017 emissions testing.

1.03 QUALITY ASSURANCE

- A. Installer shall be manufacturer trained and certified to install the Work of this section.

1.04 DELIVERY, STORAGE AND HANDLING

- A. Deliver products in manufacturer's wrapping to protect items.
- B. Store items in a dry, enclosed area.

PART 2 - PRODUCTS

2.01 FIRE EXTINGUISHERS AND CABINETS

- A. Location: Fire extinguisher cabinets and fire extinguishers shall be installed where indicated on Drawings or as required by authorities having jurisdiction.
- B. Manufacturer: Fire extinguishers and cabinets shall be manufactured by one of the following:
 - 1. Potter-Roemer.
 - 2. J. L. Industries.
 - 3. Larsen's Manufacturing.
 - 4. Modern Metal Products.
 - 5. Waltrous.
 - 6. Amerex (fire extinguishers).
 - 7. Equal.
- C. Fire Extinguisher Type: Provide a legally appropriate rechargeable fire extinguisher for every fire extinguisher cabinet and as otherwise indicated.
 - 1. Type ABC multi-purpose dry chemical with UL rating 2A:10B:C, 5 pound size, also with red glossy polyester coated steel cylinder, pressure gage, hose and horn. Maximum Height: 15 ¼-inch. Maximum Cylinder Diameter: 4 ½-inch.
- D. Fire Extinguisher Requirements:
 - 1. Design Specification:
 - a. Finish: Corrosion and impact resistant red epoxy.

- b. Valve Stem Assembly: Metal, reusable, connects to cylinder by threaded pipefitting, aluminum or steel siphon tube, and shatter resistant plastic face gage.
 - c. Gage (if applicable) to Indicate: “Recharge,” “fully charged (195 PSI),” and “over charge.”
 - d. Pull Pin: Metal, reusable and securely fastened to unit with metal, aluminum chain or very heavy plastic line approximately 4 ½-inch long.
 - e. Mechanical Operation: Pistol grip, heavy duty metal handle (plastic not permitted), and shall be operated by a grip and squeeze lever.
 2. Manufacturer Identification/Information: Manufacturer’s name, date manufactured, model number, U.L. approval seal and number, contents operating instructions, Fire Marshall approval, etcetera shall be identified on the Fire Extinguisher.
 3. Warranty:
 - a. Manufacturer shall provide a five year material warranty.
 - b. Installer shall provide a five year installation warranty.
 4. Material Safety Data Sheet: Provide an MSDS sheet with every shipment.
- E. Fire Extinguisher Cabinet: Potter-Roemer cabinets are listed as the standard of quality, products by other listed manufacturers are acceptable.
 1. Fully recessed cabinet: Provide fully recessed, square trim edge cabinet with ½ inch projection:
 - a. Potter-Roemer Fire Extinguisher Cabinet 7020:
 - 1) Door Style: either DVL (Duo Vertical Panel with lock) or E (Center Break Glass with lock), glass to be clear tempered safety glass.
 - 2) Cabinet Door and Frame: Cold rolled steel electrostatically applied, thermally fused polyester coating with recoatable white finish.
 - 3) Identification Lettering: Cabinet door to be furnished with die cut lettering indicating “FIRE EXTINGUISHERS” in contrasting color to cabinet finish, and either vertical or horizontal lettering depending upon door style.

2. Semi-recessed cabinet: Provide semi-recessed, square trim edge cabinet with 1 1/4 inch to 2-inch projection:
 - a. Potter-Roemer Fire Extinguisher Cabinet 7022:
 - 1) Door Style: either DVL (Duo Vertical Panel with lock) or E (Center Break Glass with lock), glass to be clear tempered safety glass.
 - 2) Cabinet Door and Frame: Cold rolled steel with electrostatically applied, thermally fused polyester coating with recoatable white finish.
 - 3) Identification Lettering: Cabinet door to be furnished with die cut lettering indicating "FIRE EXTINGUISHERS" in contrasting color to cabinet finish, and either vertical or horizontal lettering depending upon door style.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Installation shall be in accordance with manufacturer's recommendations.
- B. Cabinets shall be installed plumb and level, where indicated on Drawings, at heights required by authorities having jurisdiction.

3.02 PROTECTION

- A. Protect the Work of this section until Substantial Completion.

3.03 CLEANUP

- A. Remove rubbish, debris, and waste materials and legally dispose of off Project site.

END OF SECTION

SECTION 10 51 13 METAL LOCKERS

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Metal lockers and accessories.

B. Related Requirements:

1. Division 01 - General Requirements.
2. Section 03 30 00 - Cast-In-Place Concrete.

1.02 REFERENCES

- A. ASTM International (ASTM): ASTM A792, Standard Specification for Steel Sheet.

1.03 SUBMITTALS

- A. Shop Drawings: Submit Shop Drawings indicating locker sizes, locations, construction details and locker numbering layout. Indicate size and location of accessories, mounting heights of hardware and details of anchorage.
- B. Material Samples: Submit color chips of manufacturer's standard colors for selection by ARCHITECT.
- C. The manufacturer shall supply a Certificate of Conformance stating that finished surfaces are lead free and that they satisfy finish requirements of these specifications.
- D. LEED Submittals: Complete the LEED Material Buyout Form (MBoF) with all materials provided to the project. A complete submittal includes providing all material costs in the MBoF and all of the supporting documentation for the following credits:
1. MRc2 - Environmental Product Declarations (EPD): Provide Industry-Wide or Product-Specific EPD.
 2. MRc3 - Sourcing of Raw Materials - Recycled Content: Provide product data for pre- and post- consumer recycled content.
 3. MRc4 - Material Ingredients: Provide manufacturers Declare label, Health Product Declaration (HPD), Cradle to Cradle Certification, or Cradle to Cradle Health Product Certificate.

4. IEQc2 - Low-Emitting Materials – Interior Wet Applied Products: For paints, coatings, adhesives and sealants applied on site or used for laminating off-site, include product data indicating the VOC content (g/L) and testing certificates or third party certification demonstrating compliance with California Department of Public Health (CDPH) v1.2-2017 emissions testing.

1.04 QUALITY ASSURANCE

A. Qualifications:

1. Manufacturer: Regularly engaged in manufacturing metal lockers for at least 5 years.
2. Installer: Trained and certified by the equipment manufacturer.

1.05 DELIVERY, STORAGE AND HANDLING

- A. Deliver materials to the Project site with manufacturer's labels intact and legible.
- B. Protect metal lockers before, during and after installation. In case of damage, immediately provide necessary repairs and replacements.

PART 2 -- PRODUCTS

2.01 MANUFACTURERS

- A. Lyon Metal Products Inc.
- B. Nelson Adams Naco.
- C. Penco Products.
- D. List Industries Inc., Superior, Heavy-Duty Corridor.
- E. Equal.

2.02 FABRICATION

- A. Frames: Constructed from 16 gage steel formed to a channel to include a continuous door stop on each side of frame, with at least 16 gage steel formed channel cross lapped members located at top and bottom and welded at corners. Bodies shall be at least 16 gage cold-rolled steel for tops, intermediate bottoms and sides. Backs shall be minimum of 18 gage cold rolled steel with bottoms and intermediate bottoms totally enclosed and bolted or riveted. The bottoms and intermediate bottoms shall fit tight along the sides and backs. A gap minimally greater than 1/16" is allowable at the tabs locating the part

inside the door frame and at the back corners where legs can be fitted. The bottom of lowest opening in the locker shall be constructed from 16 gage cold rolled steel, reinforced each one with a 16 gage cold rolled steel hat section to prevent distortion when anchored. Lockers bodies assembled of all welded construction are not acceptable.

B. Doors:

1. Lockers shall be furnished with right-hand hinged doors, unless otherwise indicated. Doors shall be at least 14 gage cold-rolled steel. Custodial lockers shall have mini louver perforations – 16 minimum at top of door and 16 minimum at bottom of door. No louver perforations for lockers at corridors, halls, exterior, etc.
2. Door stiffeners – Minimum 18 gage steel, 2 inches wide, formed in a hat channel shape and located top to bottom along the hinge side of each door. Weld a minimum of 6 inches on center and tack welded to the top and bottom door flange. Door stiffeners shall not have openings.
3. Doors shall be provided with non-corrosive number plates, 22 gage aluminum minimum, having figures approximately 3/8 inch high etched into metal, finished in black enamel and fastened with binder-head bolts, or rivets. Split rivets are not permitted. Holes in number plates and doors shall be the same size and shall not exceed 0.125 inch.
 - a. Provide numbering for lockers.
 - b. Locker numbering shall start with number 1, and increase consecutively throughout the room, running first from top to bottom on multi-tiered lockers and then from left to right consecutively.
 - c. Accessible lockers shall also be numbered following this sequence.

C. Door Handles: Recessed handles shall be constructed 22 gage, drawn plated steel, stainless steel, or die cast zinc alloy, nickel plated, with a minimum tensile strength of 40,000 PSI, and shall be furnished with a 3/8 inch eye for a 3/16 inch standard padlock and padlock strike. Doors 72 inches or more in height shall be furnished with three locking points. The two locking points shall be no more than 8 inches from top and bottom. The third locking point shall be at the center. Doors shall be automatic latching when pushed shut. All other locker doors shall be single point latching.

D. Hinges: 16 gage continuous piano hinge for the full height of the door. Weld the hinge to the door and rivet to the door frame using 3/16 inch diameter rivets.

E. Shelves, Hooks and Coat Rods: Lockers shall be furnished with at least two single-prong hooks with ballpoints, located on opposite sides. Hooks shall be smooth and

rustproof and shall be fastened with two dome head 10-14 bolt with Kep nuts (nut with built on external tooth lock washer) each or 2 each 3/16" diameter pop rivets. Lockers that are 72 inches, and are 18 inches or deeper, shall be furnished with coat rod and 2 coat hooks. Single-tier 72-inch high lockers shall be furnished with one shelf, 9 inches from top of locker.

F. Accessible lockers

1. Comply with Americans with Disabilities Act (ADA) requirements.
2. Handle: One handed operation and shall not require tight grasping, pinching, or twisting of the wrist. The force required to activate operable parts shall be 5 pounds maximum. Operable handle shall be located no lower than 15" and no higher than 48" above finish floor.
3. Locker bottom: The locker bottom shall be no lower than 15" above finish floor. If the bottom of the opening designated as ADA accessible is located below this minimum, an additional shelf shall be installed no less than 15" above finish floor.
4. Single Tier Lockers: 72-inch Lockers: Provide shelf and coat hooks 48 inches above finish floor. If locker is 18 inches or deeper, a coat rod shall be provided with 2 coat hooks.
5. Assigned Lockers: minimum one locker and not less than 5 percent of total lockers shall be accessible.
6. Provide manufacturer's 4 by 4-inch ISA symbol decal.
7. Accessible lockers shall include an accessible lock with a metal dial, 1695MK ADA Master Lock Company, Zephyr 1992A or equal. 72 inch locker doors shall include 1636MKADA Master Lock, Zephyr 1930A or equal. Mounting height for locks shall be 48 inches maximum above floor.

G. Kep nuts and/or 3/16" diameter pop rivets shall be used for assemblies, including those to attach wardrobe hooks. Bolts shall not protrude more than 1/8 inch past dome head 10-14 bolt with Kep nut.

H. Exposed ends, backs and tops ends, backs tops and hoods, shall be 16 gage cold-rolled steel.

I. Parts shall be finished before assembly; fasteners shall be cadmium-plated.

J. Locks:

1. All keyed/combo combination locks shall have black metal dials with white lettering.

2. Lockers shall be furnished with built-in Master 1690MD, Zepher 1992, or equal, master keyed combination locks. Each shall be furnished with separate control keys; 12 each for 24 keys. Control key numbers shall be obtained from the OAR.
 3. Custodial lockers shall be furnished with built-in Master 1790KA key lock or equal locks. Locks shall be keyed differently and master-keyed. Furnish two keys for each lock. Master key number shall be obtained from the OAR. Provide two master keys.
 4. 72 inch locker doors shall include 1630MD Master Lock, Zephyr 1930, or equal. Cafeteria lockers shall be furnished with 3/8-inch hole in handle for personal locks (no-built-in locks). Blank off combo hole.
- K. Accessories: Lockers shall be furnished with 16 gage sloping tops unless recessed. Lockers shall be furnished with metal legs and skirts unless they are installed on a raised concrete curb and/or platform. Provide 16 gage cold-rolled steel trim, cap strips, filler strips, corner fillers, and other items required for a complete assembly.

2.03 FINISH

- A. Lockers shall be GREENGUARD Gold Certified by UL Environment through the GREENGUARD Certification Program.
- B. Steel shall be galvalume coated per ASTM A792. Surfaces shall be finished with either powder coating, or a heavy coat of baked-on enamel. Dry film thickness shall be a minimum of 2 mil for all surfaces. The manufacturer shall supply a Certificate of Conformance stating that the lockers satisfy finish requirements of these specifications.
- C. Finished surfaces shall be lead free. The manufacturer shall supply a Certificate of Conformance stating that finished surfaces are lead free and that they satisfy finish requirements of these specifications.
- D. Manufacturer shall provide a minimum of five standard colors. Standard color to be selected by ARCHITECT. The selected color applied at exterior exposed areas including side panels, tops, frame, hinges and doors with a light shade common color applied on all internal areas.

2.04 LOCKER BENCHES

- A. Bench Tops: Provide manufacturer's standard solid phenolic resin, one-piece units, 3/4 inch thick, with rounded corners and edges.
 1. Standard bench: 9 ½-inch wide.
 2. Accessible bench: 24-inch wide and 48-inch in length.

3. Height: 17 to 19 inches above finish floor.
 4. Bench lengths shall be as indicated on the drawings.
- B. Pedestals: Provide manufacturer's standard pedestal supports, with predrilled fastener holes, complete with fasteners and anchors, and as follows:
1. Type: Tubular steel, minimum 1 ¼ inch diameter by 0.12 inch thick wall, with steel flanges welded at top and base. Steel flanges shall be minimum 7-3/8 inches diameter by 0.125 inch thickness for shaped flanges; flat flanges shall have a minimum thickness of 0.375 inch. Finish shall be baked enamel.
 2. Color: As selected by ARCHITECT from manufacturer's full range.
 3. Bench Fastener: Thru Bolt with ¼ inch by 20 Stainless Steel Carriage Bolts, Nuts, and Lock Washers.
 4. Floor Fastener: No. 14 by 2 inch stainless steel expansion bolts sunk into concrete floor.
- C. Bench Assembly: Furnish a minimum of two pedestals for each bench, with pedestal spacing not more than 36 inches on centers.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Locker banks shall be fabricated with independent backs.
- B. Installation of lockers shall be in accordance with manufacturer's written recommendations and reviewed Shop Drawings. Installation shall meet requirements of Department of Health Services codes. Installed lockers shall comply with ADAAG and CBC Chapter 11B requirements.
- C. Provide and install trim, sloped, hoods, tops, cap strips, ends and back panels, filler strips, corner fillers and any other items required to complete installation in accordance with manufacturer's written recommendations and this specification. Exposed ends, tops, and backs shall be 16 gage cold-rolled steel and powder coated to match new lockers.
- D. Lockers shall be completely assembled and ready for installation prior to delivery to the Project site. The lockers shall be set plumb and securely fastened in place. Bottom of lockers shall be reinforced to prevent distortion from anchoring devices.
- E. Anchor lockers to back wall, not to exceed 4 feet. Anchor back to back lockers to floor, not to exceed 4 feet.

- F. The back shall be secured with a minimum thickness of 5/16 inch zinc plated steel or stainless steel anchor as indicated on drawings.

3.02 CLEANUP

- A. Remove rubbish, debris, and waste materials and legally dispose of off the Project site.

3.03 PROTECTION

- A. Protect the Work of this section until Substantial Completion.

END OF SECTION

SECTION 10 81 13

BIRD CONTROL DEVICES

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Spike bird deterrent system including adhesives and anchorage.

1.02 SUBMITTALS

- A. Product Data: Submit manufacturer's Product Data for materials and accessories and installation instructions.
- B. Shop Drawings: Submit Shop Drawings indicating locations of spikes.
- C. Samples: Provide material and color samples for each type of spike.
- D. Qualifications: Submit installer's qualifications per Article below.

1.03 QUALITY ASSURANCE

A. Installer Qualifications:

1. Installer shall have at least five years experience in installing materials of types specified and shall have successfully completed at least three projects of similar scope and complexity.
2. Installer shall submit a letter of certification from the material manufacturer, indicating installer is certified to install the products of this section.

- B. Single Source Responsibility: Furnish products from one manufacturer for entire project.

1.04 DELIVERY, STORAGE AND HANDLING

- A. Store materials and accessories in their original packages, dry, clean and undamaged. Do not stack or place other packaging on these boxes.
- B. Keep products in original packaging until installation.

1.05 WARRANTY

- A. Five year warranty against U.V. breakdown.
- B. Two year installation warranty.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

- A. Bird B Gone, Inc.
- B. Bird-X, Inc.
- C. ABC Advanced Bird Control.
- D. Nixalite of America, Inc.
- E. Equal.

2.02 PRODUCT DESCRIPTION

- A. Bird Spikes: U.V. stabilized, injection molded, polycarbonate. Heat and weather resistant. Non-conductive and not interfering with electronic security systems or transmissions.
 - 1. Widths: 3", 5" and 7" spike width.
 - 2. Length: Between 3 and 5 inches, and set at 90, 60 and not less than 30 degrees.
 - 3. Base Strip: 2 feet long with not less than 10 screw attachment points.
 - 4. Points per Inch: No less than 20 points per foot.
 - 5. Color: As selected by Architect from manufacturer's standard color options.

2.03 MOUNTING DEVICES

- A. Bird Spikes:
 - 1. Screws: #8 wood screws for fastening into wood.
 - 2. Adhesive: Outdoor construction adhesive, non-silicone based, as recommended by manufacturer for application on steel, brick, stone or concrete. Screws and bolts shall be used in conjunction for location where additional support is required.
 - 3. Ty-Wraps: U.V. protected for use on pipes or poles in conjunction with adhesives.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Visually inspect the surfaces to receive bird control devices and report any damaged or incomplete work to OAR.

1.02 SURFACE PREPARATION

- A. Clean surfaces thoroughly. Remove bird droppings, nesting materials and any other debris. Use cleaning products that will neutralize bird droppings and follow manufacturer's cleaning recommendations.
- B. Allow all surfaces to air dry completely, and then reapply to sanitize and deodorize the surface before proceeding with installation.

3.03 INSTALLATION

- A. Install bird deterrent devices following manufacturer's installation instructions.
- B. Bird Spikes:
 - 1. Install covering the entire depth of the surface, not just the perimeter.
 - 2. Follow contours and angles closely; cut or break away to fit properly. Space materials in accordance with manufacturer's recommendations.

3.04 PROTECTION

- A. Protect the Work of this section until Substantial Completion.

3.05 CLEAN UP

- A. Remove rubbish, debris and waste materials and legally dispose of off the Project site.

END OF SECTION

SECTION 11 11 00

ELECTRIC VEHICLES CHARGING STATIONS

PART 1 - GENERAL

1.01 SUMMARY

- A. This specification covers single-phase and three-phase Electric Vehicles Charging Stations (EVCS), including equipment, accessories, and wiring necessary to provide a complete and functional system.
- B. Work, material or equipment shall comply with the codes, industry standards, and ordinances and regulations of the local government having jurisdiction, including the regulations of serving utilities and any participating agencies having jurisdiction.
- C. Related Requirements – General provisions of the contract, including General Conditions, Supplementary Conditions, and the following related sections apply:
 - 1. Division 01 - General Requirements.
 - 2. Section 26 05 00: Common Work Results for Electrical.
 - 3. Section 26 05 13: Basic Electrical Materials and Methods.
 - 4. Section 26 05 26: Grounding and Bonding.
 - 5. Section 26 05 19: Low-Voltage Wires (600 Volts AC)
 - 6. Section 26 05 33: Raceways and Boxes, Fittings and Supports.
 - 7. Section 26 08 00: Electrical Systems Commissioning.
 - 8. Section 26 26 00: Power Distribution Units.
 - 9. Division 27: Communications.
- D. Codes and Applicable standards: Products and installation shall meet or exceed the latest edition of the following standards.
 - 1. ADA – Americans with Disabilities Act (ADA).
 - 2. ANSI/NEMA 250 Enclosure for Electrical Equipment (1000 Volts Maximum).
 - 3. ANSI/UL 62 – Safety Flexible Cord Cables.

4. ANSI/UL 2202 – Safety Electric Vehicle Charging System Equipment (AC to DC).
5. ANSI/UL 25942 – Electric Vehicle Supply Equipment (AC to AC).
6. ANSI/UL 2231-1 – Personnel Protection Systems for Electric Vehicle Supply Circuits – General ANSI/Requirements (referred to in UL 2202/UL 2594).
7. ANSI/UL 2231-2 –Protective Devices for Use in Charging Systems (referred to in UL 2202/UL 2594).
8. ANSI/UK 2251 – Safety Plugs, Receptacles and Couplers for Electric Vehicles.
9. ANSI/UL 2271 – Batteries for Use in Light Electric Vehicle (LEV) Applications.
10. California Air Resources Board (CARB) – Regulation for Electric Vehicle Supply Equipment.
11. California Building Code (CBC).
12. California Electrical Code (CEC).
13. California Green Building Code. (CalGreen).
14. Department of Energy, Energy Act.
15. IEEE C2 – National Electrical Safety Code.
16. IEEE-1100 – Recommended Practice for Powering and Grounding Sensitive Electronic Equipment.
17. IEEE 1547 – Interconnection and Interoperability of Distributed Energy Resources with Associated Electric Power Systems Interfaces
18. International Electrical Code adopted by the State of California.
19. ISO 15118 – Energy, Transportation Technology, Health and Safety
20. SAE J-1772 – EV Conductive Charge Coupler.
21. UL 2580 – Batteries for Use in Electric Vehicles.
22. UL 2750 – Outline Of Investigation For Wireless Power Transfer Equipment For Electric Vehicles.
23. UL 9741 – Standard for Bidirectional Electric Vehicle (EV) Charging System Equipment

E. No requirement of these drawings and specifications shall be construed to void any of the provisions of the above standards. The CONTRACTOR Shall bring to the attention of the OWNER any conflicts or changes required to the contract documents in order to obtain compliance with applicable codes and standards.

F. ACRONYMS

ANSI	American National Standards Institute
AOR	Architect of Record
CEC	California Electrical Code
EOR	Engineer of Record
IEEE	Institute of Electrical and Electronics Engineers
NEC	National Electrical Code
NEMA	National Electrical manufacturers Association
SAE	Society of Automotive Engineers
UL	Underwriters Laboratory

1.02 SUBMITTALS

- A. Provide submittals in accordance with Division 01.
- B. Shop Drawings: Include make, catalog number, dimensions, weight, KVA, KW, KWh Charging Rate, Amperage, finish, type, insulation class, design and operating temperature ranges, sound levels, efficiency, installation instructions and testing procedures, maintenance manual, communication interface and communication protocols.
- C. Provide manufacturers data for all major components, including batteries, inverters, charge controllers, monitoring systems, fire suppression, and fire alarm, and inspection reports that confirms EVCS compliance with standards listed in article 1.01.D
- D. Provide a full connection schematic and wiring diagrams.
- E. Provide copies or required test reports and manufacturer's certification of compliance with applicable standards and codes and certification of installers.
- F. Submit one copy for each set of shop drawings.

- G. Provide a list of replacement parts.

1.03 SUBSTITUTIONS

- A. EVCS that deviate from these requirements shall not be accepted without written approval from OWNER'S Design Standards and Maintenance and Operations Technical Units. When deviating or proposing substitutions the following information shall be submitted:
 - 1. Substitution request form with substantiating reasons for the deviation and benefits to the OWNER.
 - 2. Proposed substitutions requests shall provide proof of compliance with EVCS characteristics indicated in this specifications section.
- B. Submittals must comply with contract general provisions.

1.04 QUALITY ASSURANCE

- A. Provide charging stations from a manufacturer with a minimum of seven-years of experience in designing and manufacturing EV charging stations.
- B. The EVCS shall be certified to comply with the applicable codes, industry standards, and federal and stated applicable regulations.
- C. Installation shall be performed by California Electric Vehicle Infrastructure Training Program (EVITP) certified installers. Provide certificate as part of the submittal process.
- D. EVCS shall be listed and approved for the intended application by Underwriter's Laboratories (UL), or other Nationally Recognized Testing Laboratory (NRTL), and in compliance with applicable industry standards and codes, including those mentioned under REFERENCES.
- E. Provide manufacturer's testing of EVCS supply equipment.
- F. Proposed products shall have been in the market for a minimum of five years,
- G. Provide labor, engineering, design, testing, supervision, material and equipment required.
- H. Charging stations and related equipment shall be delivered to the site in the manufacturer's original packaging, labeled with the manufacturer's name, model number, and electrical specifications.

- I. Visual and Mechanical Inspection: CONTRACTOR shall verify the equipment nameplate data with specifications and approved shop drawings.
 - 1. Inspect physical and mechanical condition. Damaged equipment shall not be acceptable.
 - 2. Perform specific inspections and mechanical tests as recommended by manufacturer.
- J. Provide electrical tests results that indicate the following:
 - 1. Perform resistance measurements through all bolted connections with low-resistance ohmmeter.
 - 2. Verified voltage levels.
 - 3. Check ground ding level and continuity.
 - 4. Check and verify pilot signal detection and verification.
 - 5. Check and verify current limit.
 - 6. Check system response for compliance with expected performance.
 - 7. Check and verify operation of alarms.
 - 8. Check and verify Electronic Data Interface, demand response, .
- K. CONTRACTOR shall have an established communication mechanism for providing support (regarding technical questions, billing, operations, etc.) to OWNER.
- L. EVCS are required to comply with the California Air Resources Board (CARB) Regulation for Electric Vehicle Supply Equipment.

1.05 COMMISSIONING

- A. CONTRACTOR shall provide as part a copy of fully completed and verified EVCS manufacturer's start-up and functionality test reports, and commissioning and functionality acceptance criteria.
- B. CONTRACTOR shall provide all tools and personnel, and perform start-up, prefunctional and functional performance testing in the presence of the OWNER.

1.06 TRAINING

- A. Provide a 4 hours hands-on training session to OWNER's Maintenance and Operations personnel. Training shall include:
 - 1. EVCS description, features, and operation.

2. Demonstration on routine testing and maintenance operations, and instruction on all items included in the maintenance and operations manual.
3. Safety criteria and protection.
4. Programming features and firm ware reprogramming.
5. Recommendations and lessons learned from previous projects.

1.07 WARRANTY

- A. Provide a one-year labor warranty.
- B. EVCS shall be warranted to be free from defects in materials and fabrication for a period of five-years from the date of substantial completion.
- C. Warranty period begins at project acceptance for beneficial occupancy.
- D. Warranty exclusions for third party components is not acceptable.

PART 2 – PRODUCTS

2.01 ALTERNATING CURRENT EVCS

- A. EVCS shall be listed for Level 2 (208/240 volts AC, 40 amps minimum) charging.
- B. EVCS shall be pedestal or wall mounted, single or double units with charging cords type SAE J1772 or other approved universal type connector.
- C. Each item of equipment shall have a nameplate bearing the following:
 1. Manufacturer's name and address.
 2. EVCS model number and serial number securely affixed in a conspicuous place. Nameplate of the distributing agent will not be acceptable. Include additional information as applicable to fully identify the equipment.
 3. Nameplates shall be made of noncorrosive metal.
- D. EVCS shall use cellular network connection for communication with owners, operators, and users.
- E. EVSE shall include automatic web-based tracking / metering and control connection via a cell phone service provider compatible with Electric Vehicle Management system.

Department of Neighborhood Services and Public Safety
GOLETA TRAIN DEPOT PROJECT

1. The web-based application shall generate per vehicle kW and Kwh usage and charging times based on user input intervals.
2. EVCS Electronic Data Interface shall capture and be capable of push and pull file transfer of the parameters listed below:
 - a) Web-based control capability shall enable remote charger station administration and access control by the OWNER.
 - b) Open Charge Point protocol (OCPP) 1.6 minimum.
 - c) Data must be User ID and Password protected.
 - d) KW data report shall be Microsoft Excel compatible.
 - e) It shall have the option to limit usage to designated users with bar code/key card type system (locked or open access).
 - f) Manufacturer control of EVCS is not allowed without prior OWNER's approval.
- F. The system shall support (Network Time Protocol) NTP/UTC time synchronization.
- G. Provide an OpenADR 2.0b VEN interface that includes the following features:
 1. Support for the events profile services.
 2. Support for required set of common signals.
 3. Support for all transport requirements as specified including HTTP (pull), URI usage, header and behavior requirements, and error codes.
 4. Conformance to security requirements, including RSA or ECC, and TLS 1.2 support.
- H. OpenADR 2.0b VEN interface shall be certified. The VEN shall be a software VEN that allows owners/operators and/or users to interact with the signals prior to enacting any controls.
- I. The system shall not act on expired signals or messages or create duplicate events.
- J. Communication solutions shall offer a "power down" throttling capability to limit charge current to a percent of normal current during a Demand Response (DR) event (e.g., 25%, 50% or 75%). This shall be achievable via J1772 PWM Duty Cycle commands.

1. EVCSs shall be able to respond to requests to initiate charging (e.g., close contact) or increase charging in response to a DR event.
 2. The system shall be able to inform the OWNER, operators and/or users of utility company issued DR events.
 3. The system shall allow the OWNER, operators and/or users to interact with utility company events e.g., opt out or choose to curtail or throttle EV charging (as opposed to complete curtailment) in real time.
- K. EVCSs and communications solutions shall have metering capacity through an internal or onboard metrology device and shall be able to measure or calculate the following:
1. Accumulated consumption (aggregated kWh), consumption per session (kWh), demand (peak and average, per session).
 2. Consumption (kWh) at 15-minute intervals.
- L. Message priority shall be set, programed, and not modifiable by unauthorized users.
- M. The system shall provide the following explicit error and communication failures messages:
1. Unrecognized message.
 2. Out of range/low signal strength.
 3. Low battery level.
 4. Feature not supported.
 5. Meter faults.
 6. EVCS faults and receipt of control signals.
- N. Provide communication solutions that are independent of existing site communications (e.g., cellular communications rather than using customer internet).
- O. Provide field-programmable or remote software upgrade function (i.e., firmware upgrade).
- P. EVCS shall be programmed for Cold Load Pickup (Randomized auto restart following power outages).

- Q. After loss of power, the EVCSs shall return to its previous configuration state. The station shall retain communication and registration configurations. This does not include continuing user sessions when authorization is required to start a session.
- R. EVCSs shall provide a reset option, which returns the device to its pre-charge state.
- S. EVCSs shall have health checking functionality, reporting, logging and bi-directional alerting capability.
- T. EVCS shall be UL listed for outdoor use and be California ADA compliant.
- U. EVCS shall be standalone type with necessary circuitry to enable communications and safe charging.
- V. EVSEs SHALL use cellular network connection for communication with owners, operators, and users.
- W. Approved Products: AeroVironment – EVSE-RS 19356-32A-025; EVBOX –Iqon; ChargePoint – CT4023 and CT4021; EVSE – 3703; OPConnect Mark II, Or OWNER approved equal.

2.02 CONNECTOR HOLSTER DOCK

- A. Provide connector holster dock to store charger plugs when not in use.
- B. Holster construction consist of high strength injection molded plastic with temperature ratings of minus 10 deg C to 60 deg C.
- C. Provide holster to match EV plug.
 - 1. Provide ADA compliant cord management mechanism and retractor with all necessary hardware.

2.03 ACCESSORIES

- A. Back-lit touch button interface keypad with audio feedback. LCD must display: READY TO CHARGE, CHARGING, CHARGE COMPLETE, PAUSE-WAITING TO CHARGE AND FAULT.
- B. Daylight readable 640x480 active matrix LCD with auto brightness control.
- C. Units shall be capable of activation of EVCS upon identification utilizing magnetic swipe, RFID, QR code, or plug-and-charge via ISO 15118.
- D. Units shall be equipped with real-time energy measurement controls, 15 minutes energy measurement interval recording, and time of day pricing capability.

- E. Provide minimum four keycards/barcodes/RFID keys for each charger to activate the charger and its data network.

2.04 SECURITY

- A. data stored or transmitted by EVCSs, gateways, and BMSs shall be designated an appropriate level of controls to protect its confidentiality, integrity or availability. CONTRACTOR shall ensure the same level of controls wherever the data is subsequently stored and whenever it is transmitted.
- B. Personal identifiable information shall be encrypted using secure industry standard techniques to protect confidentiality.
- C. The EVCS shall provide the same level of protection and controls as is commensurate with its security profile, as governed by emerging standards from the following organizations:
 - 1. National Institute of Standards and Technology (NIST).
 - 2. Society of Automotive Engineers (SAE).
 - 3. California Department of Food and Services, Division of Measurements Standards (DMS)

2.05 PAVEMENT MARKINGS, SIGNAGE, AND PROTECTION

- A. Provide pavement markings and signage to indicate the restrictions for electrical vehicle charging parking per CBC requirements.
- B. Provide wheel stops and bollards for protection of electric vehicle supply equipment.
- C. A label indicating fuel dispensed in accordance with Part 309, Title 16 Code of Federal Regulations must be installed. The label must indicate fuel dispensed, rate and amperage, and dispense manner (conductive or inductive).

2.06 PAYMENT AND PROCESSING

- A. The system shall comply with the California Department of Food and Agriculture, Division of Measurement Standards (DMS) requirements for the use of electricity as vehicles' fuel.
- B. Fees associated with EVCS use shall be displayed at the point of sale.
- C. The system shall be customizable for customer fees and charging response to comply with DR events.

- D. The system shall accept, process, and manage payments and billing settlements using customer credit/debit cards. or other system acceptable to the OWNER.
 - 1. As a minimum provide the following options: Credit card reading (EMV chip and contactless), over the phone processing, or other system acceptable to the OWNER.
 - 2. Customers shall have the option for 3rd party payment mechanisms.
 - 3. The system shall provide for billing the user by time charging, time connected, session, kWh used per session, time of use pricing, parking space rental, or a combination of several while remaining in compliance with the DMS regulations.
 - 4. The system shall provide for customization of invoicing on transactional, monthly, or a combination basis.
- E. The systems shall have user identification capabilities via card reader, keypad, or smart phone application for access and payment purposes.
- F. The system shall be preprogrammed with a free charge option to allow users to operate EVCS with and without authorization. The option shall be activated with an OWNER security provided code or electronic key, via OCPP, or plug-and-charge ISO 15118.

2.07 REPORTING

- A. Comply with the reporting requirements of the California Electric Vehicle Supply Equipment (EVSE or EV Charging Station) Standards Regulation.

PART 3 - EXECUTION

3.01 DELIVERY AND STORAGE

- A. Deliver, storage, protect and handle products in accordance with the manufacturer's recommendations.
- B. EVCS shall be stored in a dry, clean, and protected area to keep units from damage and theft until installation.
- C. Where field applied painting of enclosures is required to correct damage to the manufacturer's factory applied coatings, provide manufacturer's recommended coatings and apply in accordance with manufacturer's instructions.

3.02 INSTALLATION

- A. EVCS shall be mounted on concrete pads, unless noted otherwise in the construction documents.
- B. EVCS units frame shall be installed level on concrete pads. Mounting bolts for floor mounted EVCS shall be extended into pads only and shall not be in direct contact with building structural members.
- C. Comply with CBC seismic requirements.
- D. EVCS shall be effectively grounded.

3.03 TESTING

- A. Provide instruments and accessories required to perform checks. Voltmeters, Amp meters, etc., shall be accurate within .075 percent or one percent and shall have scales permitting voltage readings to be performed on upper half of scale.
- B. Test meters and ammeter calibration: Calibration shall be in compliance of
- C. Visual and Mechanical Inspection:
 - 1. CONTRACTOR shall verify the equipment nameplate data with specifications and approved shop drawings.
 - 2. Inspect physical and mechanical condition. Check for damage. Damaged equipment shall not be acceptable.
 - 3. Inspect anchorage, alignment, and grounding.
 - 4. Perform specific inspections and mechanical tests as recommended by manufacturer.
- D. Provide Electrical Tests results that indicate the following:
 - 1. Perform resistance measurements through all bolted connections with low-resistance ohmmeter.
 - 2. Verified voltage levels.
 - 3. Check verify ground fault circuit interrupt.
 - 4. Check and verify pilot signal detection and verification.
 - 5. Check and verify current limit.
 - 6. Check and verify operation of alarms.

7. Check and verify Electronic Data Interface.
8. Validate charging times.

3.04 PROTECTION

- A. Protect the Work of this section until Substantial Completion.

3.05 CLEANUP

- A. Remove rubbish, debris and waste materials and legally dispose of off Project site.
- B. Repair scratched or marred surfaces affected during the execution of work. Repair surfaces shall match original finish.

END OF SECTION

SECTION 12 36 61 QUARTZ COUNTERTOPS

GENERAL

1.01 SECTION INCLUDES

- A. Quartz agglomerate surfacing countertops.
- B. Quartz agglomerate backsplashes.
- C. Quartz agglomerate endsplashes.
- D. Adhesives and sealants.

1.02 RELATED REQUIREMENTS

- A. Section 01 30 00 - Submittals.
- B. Section 05 50 00 - Metal Fabrications.
- C. Section 06 10 00 - Rough Carpentry.
- D. Section 07 90 00 - Joint Sealants.

1.03 REFERENCES

- A. Reference Standards:
 - 1. ASTM C 97: Standard Test Methods for Absorption and Bulk Specific Gravity of Dimension Stone.
 - 2. ASTM C 170: Standard Test Method for Compressive Strength of Dimension Stone.
 - 3. ASTM C 501: Standard Test Method for Relative Resistance to Wear of Unglazed Ceramic tile by the Taber Abraser.
 - 4. ASTM C 834: Standard Specification for Latex Sealants.
 - 5. ASTM C 920: Standard Specification for Elastomeric Joint Sealants.
 - 6. ASTM D 790: Standard Test Methods for Flexural Properties of Unreinforced and Reinforced Plastics and Electrical Insulating Materials.
 - 7. ASTM E 84: Standard Test Method for Surface Burning Characteristics of Building Materials
 - 8. LEED: Leadership in Energy and Environmental Design.

9. NEMA LD-3: High Pressure Decorative Laminates.
10. NSF/ANSI Standard 51: Food Equipment Materials.
11. ISO: International Organization for Standardization.
12. ISO 9001: Quality Management Systems.
13. SCAQMD Rule 1168: Adhesive and Sealant Applications.
14. UL 2818: GREENGUARD Certification Program for Chemical Emissions for Building Materials, Finishes and Furnishings.

1.04 SUBMITTALS

- A. Submit under provisions of Section 01 3000 - Submittals.
- B. Product Data:
 1. Submit product data for each specified product. Include manufacturer's technical data sheets and published instruction instructions.
 2. Submit Safety Data Sheets (SDS) for adhesives and sealants.
- C. Shop Drawings:
 1. Submit fully dimensioned shop drawings showing countertop layouts, backsplashes, end splashes, vanities, joinery, edge conditions, terminations, substrate construction, cutouts and holes. Show plumbing installation provisions. Include elevations, section details, and large scale details.
- D. Samples:
 1. Submit selection and verification samples for each color and pattern required.
- E. Quality Assurance Submittals:
 1. Test Reports: Submit certified test reports showing compliance with specified performance characteristics and physical properties, if required.
 2. LEED Submittals: Submit applicable LEED documentation for potential credits specified in this Section.
 3. Warranty: Specimen copy of specified warranty.
- F. Closeout Submittals:
 1. Maintenance Data: Submit manufacturer's published Care & Maintenance manual with closeout submittals.

1.05 REGULATORY REQUIREMENTS

- A. Accessibility Requirements: Comply with the U.S. Architectural & Transportation Barriers Compliance Board ADA-ABA Accessibility Guidelines for Buildings and Facilities.
- B. Adhesives, Sealants, and Sealant Primers:
 - 1. SCAQMD (South Coast Air Quality Management District) Rule 1168.

1.06 QUALITY ASSURANCE

- A. Qualifications:
 - 1. Manufacturing Facility Qualifications: Quartz surfacing materials produced in an ISO 9001 certified facility.
 - 2. Fabricator Qualifications: Minimum of five years documented experience in fabricating quartz surfacing countertops similar in scope and complexity to this Project, using water-cooled cutting tools. Currently certified by the manufacturer as an acceptable fabricator.
 - 3. Installer Qualifications: Minimum of five years documented installation experience for projects similar in scope and complexity to this Project, and currently certified by the manufacturer as an acceptable installer.
- B. LEED 2009 rating system potential credits for adhesives:
 - 1. LEED-CI IEQ Credit 4.1 Low-Emitting Materials - Adhesives and Sealants.
- C. Mock-Ups:
 - 1. Install at Project using acceptable products and manufacturer approved installation methods. Obtain Architect's acceptance of color, pattern, finish, fabrication, and installation standards.
 - 2. Mock-Up Size: 24" by 36".
 - 3. Mock-Up Location: As directed by Architect.
 - 4. Maintain mock-up during construction for fabrication and installation comparison. If required, remove and legally dispose of mock-up when no longer required.
 - 5. Incorporation: If permitted by Architect, mock-up may be incorporated into as part of the completed Work.

1.07 DELIVERY, STORAGE, AND HANDLING

- A. Delivery and Handling: Comply with manufacturer's recommendations for shipping and handling quartz surfacing materials to preclude breakage or

damage. Brace quartz surfacing units as necessary during shipment, transporting in near-vertical position with finished face towards finished face. Do not allow finished surfaces to rub during shipping and handling.

- B. Storage and Protection: Store materials protected from exposure to harmful weather conditions, at temperature and humidity conditions recommended by manufacturer. Store quartz surfacing sheet materials on racks in near-vertical position to preclude damage. Store with finished face turned towards finished face. Prevent warpage and breakage.

1.08 PROJECT CONDITIONS

- A. Field Measurements: Verify actual measurements and openings by field measurements before fabrication; show recorded measurements on shop drawings. Coordinate field measurements and fabrication schedule with construction progress to avoid construction delays.
- B. Adhesive: Acclimate adhesives to occupancy room temperatures with maximum temperature not to exceed 75 deg F.

1.09 WARRANTY

- A. Manufacturer's Limited Warranty: Provide manufacturer's standard 10 Year Commercial and Residential Limited Warranty against defects in quartz surfacing sheet materials.

PRODUCTS

2.01 MANUFACTURER

- A. Basis of Design: Wilsonart. 2501 Wilsonart Drive, Temple, TX 76503- 6110. Tel. 254.207.7000, Toll-Free 800.433.3222, Fax 254.207.2384. Websites are: www.wilsonart.com (primary website), <http://sustain.wilsonart.com> (sustainable design website)
- B. Or Approved equal.

2.02 QUARTZ SURFACING SHEET MATERIAL

- A. Acceptable Product: "Wilsonart Quartz."
- B. Composition: Up to 93 percent quartz aggregate combined with polyester resin binders and proprietary pigments that are fabricated into slabs using vacuum vibrocompaction technology.
- C. Material Thickness: Product Type 063 - 1.18 inch (3 cm)], nominal.

- D. Material Weight: 15 lbs./ft² for 3 cm thick surfacing.
- E. Countertop Dimensions: As indicated on Drawings.
- F. Conformance Standards:
 - 1. NSF/ANSI Standard 51. 2. UL 2818:
 - a. GREENGUARD - Emission levels in UL 2818, Section 7.1 are applicable for furniture products.
 - b. GREENGUARD Gold - Emission levels in UL 2818, Section 7.2 are applicable for building materials, finishes, and furnishings.
- G. Physical Characteristics:
 - 1. Flexural Strength: Greater than 4,500 psi; ASTM D 790.
 - 2. Flexural Strain: Less than 0.375 percent; ASTM D 790.
 - 3. Flexural Modulus: Greater than 3.75 MPsi; ASTM D 790.
 - 4. Stain Resistance (24 Hour): No effect to moderate effect; NEMA LD-3.
 - 5. Abrasion Resistance: Greater than 100 in.-lbs.; ASTM C 501.
 - 6. Density: Greater than 2.1 g/cm³; ASTM C 97.
 - 7. Compressive Strength (One Axis - Dry): Greater than 20,000 psi; ASTM C 170.
 - 8. Moisture Absorption: Maximum 0.022 percent; ASTM C 97.
- H. Quartz Finish: Polished finish with Glossometer reading greater than 45.
- I. Color and Pattern: Selected from manufacturer's standard offerings.
- J. Edge Detail: Selected from manufacturer's standard offerings.

2.03 ACCESSORY MATERIALS

- A. Joint Adhesive: Methacrylate-based adhesive for chemically bonding quartz surfacing seams. Color complementary to quartz surfacing sheet material. UL 2818 GREENGUARD Gold certified and complies with SCAQMD Rule 1168.
 - 1. Basis of Design: "Wilsonart Hard Surface Adhesive."
 - 2. Other Acceptable Products: Pigmented knife grade adhesives suitable

for use with quartz surfacing are also acceptable.

- B. Elastomeric Sealant: Mildew-resistant silicone sealant for filling gaps between countertops and terminating substrates in wet environment applications. Complies with ASTM C 920, Type S (single component), Grade NS (nonsag).
 - 1. Product: Acceptable to countertop manufacturer.
 - 2. Color: Selected from sealant manufacturer's standard offerings.
- C. Siliconized Acrylic Sealant: Siliconized acrylic latex sealant. For general applications to fill gaps between countertops and at terminating substrates. Complies with ASTM C 834, Type OP, Grade NF, and SCAQMD Rule 1168.
 - 1. Product: Color Matched Caulk".
 - 2. Color: Selected from sealant manufacturer's standard offerings.
- D. Construction Adhesive: Countertop manufacturer's recommended silicone-based construction adhesive for backsplashes, endsplashes, and other applications according to manufacturer's published fabrication instructions.

2.04 FABRICATION

- A. Fabricate components in shop, to greatest extent practicable, in sizes and shapes indicated according to approved shop drawings and Quartz Fabrication Manual.
- B. Form joint seams between quartz surfacing components with specified seam adhesive. Completed joints inconspicuous in appearance and without voids. Provide joint reinforced if required by manufacturer for particular installation conditions.
- C. Provide holes and cutouts for plumbing fixtures and accessories indicated on approved shop drawings. Rout cutouts and finish edges smooth.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Examine substrates and conditions that could adversely affect the work of this Section.
- B. Substrates must be sound, flat, smooth, and free from dust or other surface contaminants.

- C. Commencement of work will constitute acceptance of substrates and conditions to receive the work.

3.02 COUNTERTOP INSTALLATION

- A. Install quartz surfacing components plumb, level, and true according to approved shop drawings and manufacturer's published installation instructions. Use woodworking and specialized fabrication tools acceptable to manufacturer.
 - 1. Fasten quartz surfacing components to base cabinets or other supporting substrates with suitable adhesives acceptable to manufacturer.
- B. Form joint seams with specified seam adhesive. Seams to be inconspicuous in completed work. Seams in locations shown on approved shop drawings and acceptable to manufacturer. Promptly remove excess adhesive.
 - 1. Clamp or brace quartz surfaces in position until adhesive sets.
- C. Fill gaps between countertop and terminating substrates with specified silicone sealant.
- D. Install backsplashes and endsplashes where indicated on Drawings. Adhere to countertops with specified construction adhesive.

3.03 REPAIRS

- A. If permissible to Architect, minor surface marring for quartz surfacing components may be repaired according to manufacturer's published installation instructions.
- B. Remove and replace quartz surfacing components that are damaged and cannot be satisfactorily repaired.

3.04 CLEANING AND PROTECTION

- A. Clean quartz surfacing components according to manufacturer's published maintenance instructions. Completely remove excess adhesives and sealants from finished surfaces.
- B. Protect completed work from damage during remainder of construction period.

END OF SECTION

SECTION 12 67 23

FURNISHINGS

PART 1 - GENERAL

1.01 DESCRIPTION OF WORK

- A. Furnish all materials, labor, transportation, services, and equipment necessary to furnish and install site furnishings as shown on the Drawings and as specified herein.
- B. Work included in this Section:
 - 1. Trash Receptacles and Recycling Trash Receptacles
 - 2. Folding Chairs and Tables
 - 3. Stackable Chairs
 - 4. Carts
 - 5. Seating Units
 - 6. Charging Gadget Desk
- C. Work related in other Sections:
 - 1. Portland Cement Concrete Paving - Section 32 1313.

1.02 QUALITY CONTROL

- A. Manufacturer's Directions:
 - 1. Manufacturer's directions and drawings shall be followed in all cases where the manufacturers of articles used in the Section furnish directions covering points not shown in the Drawings and Specifications.
- B. Project Assurance:
 - 1. Do not fabricate components that require fitting to structural elements or into finished spaces until dimensions have been verified in the field.

1.03 COORDINATION

- A. The Contractor shall notify all other trades, such as plumbers, electricians and concrete installers in ample time to install his work, including sleeves, bolts and drains.

1.04 SUBMITTALS

The specific submittal requirements of this section shall be guided by Division 1.

- A. Product Data:
 - 1. Submit manufacturer's catalog cuts, or a typed listing of all products specified in this Section.
- B. Shop Drawings:
 - 1. Submit for review and approval all manufacturers catalogue information or shop drawings indicating size, materials, finishes, specifications, installation methods and quantities of items being supplied.

1.05 PRODUCT HANDLING

- A. Delivery:
 - 1. Deliver all specified products on-site in their original unopened packages for review by the Owner's Authorized Representative. If damaged has occurred to the products, the Contractor shall be responsible to replace the damaged product with new at his own expense.
- B. Storage:
 - 1. Store materials in a dry and protected location. Protect from damage, deformation, staining, and moisture damage.
- C. Protection:
 - 1. Protect products from damage due to Contractor negligence, vandalism and inclement weather.

PART 2 - PRODUCTS

2.01 MANUFACTURER

- A. Trash Receptacles: Manufacturer indicated in plans.
- E. Stackable Chairs and Tables: Manufacturer indicated in plans.
- F. Folding Chairs and Tables: Manufacturer indicated in plans.
- G. Chair and Table Carts: Manufacturer indicated in plans.
- H. All other Interior Furnishings: Manufacturer indicated in plans.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Location shall be approved by OAR prior to installation.
- B. Installation shall be per manufacture's recommendations unless otherwise stated in drawings.
- C. Work shall be set plumb, level, and true to line and shall present a neat and finished appearance. Include setting each item in its correct place, fastening it, connecting it, or incorporating it into other portions of the work, as each item may require.
- D. The work of this Section shall include the furnishing of anchors and adhesives required for installing and attaching the equipment specified herein. All furnishings shall be installed per manufacturer's recommendations unless noted otherwise in the Drawings.
- E. Adequately protect all work from damage by subsequent construction operations. Damaged work shall be replaced.

3.2 CLEAN UP

- A. Upon completion of the work under this Section, remove all rubbish, waste and debris resulting from his operations offsite. Remove all equipment and leave the entire work area in a neat, clean, and Architect-accepted condition.

END OF SECTION

SECTION 12 93 13

BICYCLE RACKS

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. High capacity bicycle racks

1.02 RELATED SECTIONS

- A. Section 03 30 00 - Poured in Place Concrete
- B. Section 09 90 00 – Painting

1.03 REFERENCES

- A. American Society for Testing and Materials ASTM A513 - Standard Specification for Electric-Resistance-Welded Carbon and Alloy Steel Mechanical Tubing.
- B. American Society for Testing and Materials ASTM A500B - Standard Specification for Cold-Formed Welded and Seamless Carbon Steel Structural Tubing in Rounds and Shapes.

1.04 SUBMITTALS

- A. Submit under provisions of Section 01 33 00.
- B. Product Data : Manufacturer's data sheets on each product to be used, including:
 - 1. Preparation instructions and recommendations.
 - 2. Storage and handling requirements and recommendations.
- C. Shop Drawings: Manufacturing details for each bicycle rack.
- D. Selection Samples: For each finish product specified, two complete sets of color chips representing manufacturer's full range of available colors and patterns.
- E. Verification Samples: For each finish product specified, two samples, minimum size 6 inches (150 mm) square representing actual product, color, and patterns.

1.05 QUALITY ASSURANCE

- A. Manufacturer Qualifications:
 - 1. A firm experienced in manufacturing bicycle racks similar to those required for

this project and with a record of successful in-service performance.

- B. Installer Qualifications:
 - 1. An experienced installer who has completed installation of bicycle racks similar in material, design, and extent to that indicated for this project and whose work has resulted in construction with a record of successful in-service performance.
- C. Source Limitations: Obtain each color, finish, shape and type of bicycle rack from a single source with resources to provide components of consistent quality in appearance and physical properties.
- D. Mock-Up: Provide a mock-up for evaluation of surface preparation techniques and application workmanship.
 - 1. Install in areas designated by Architect.
 - 2. Do not proceed with remaining work until workmanship and installation are approved by Architect.
 - 3. Refinish mock-up area as required to produce acceptable work.

1.06 DELIVERY, STORAGE, AND HANDLING

- A. Store products in manufacturer's unopened packaging until ready for installation.
- B. Store and dispose of solvent-based materials, and materials used with solvent-based materials, in accordance with requirements of local authorities having jurisdiction.

1.07 PROJECT CONDITIONS

- A. Maintain environmental conditions (temperature, humidity, and ventilation) within limits recommended by manufacturer for optimum results. Do not install products under environmental conditions outside manufacturer's absolute limits.

PART 2 PRODUCTS

2.01 MANUFACTURERS

- A. Basis of Design: Saris Cycling Group; 5253 Verona Rd., Madison, WI 53711. ASD. Toll Free TEL: (800) 783-7257. Te1: (608) 274-6550. Fax: (608) 274-1702. Email: info@sarisinfrastructure.com Web: <http://www.sarisinfrastructure.com>
- B. Or approved equal.

2.02 HIGH CAPACITY BICYCLE RACKS

- A. Stretch Series: #8118

1. Construction: 11 gauge (0.06 inch) (1.52 mm) steel for corner pieces and cross braces.
2. Capacity: 8 bike capacity, 13.5 inch (343 mm) spacing.
3. Locking Bar: 3/8 inch (9.5 mm) solid steel locking bar.
4. Finish: Polyester powder coat.
5. Color: Black.
6. Quantity: As shown in drawings.

2.03 EXTERIOR BIKE RACKS

- A. Manufacturer indicated in plans (Landscape Forms) or equal approved by the OAR.

2.04 EXTERIOR BIKE LOCKERS

- A. Salvage existing, restore, paint, and install per plan. Provide SS Anchorage.

2.05 FINISH

- A. Manufacturer's standard factory-applied polyester paint finishes using a powder coating heat-cured system.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Do not begin installation until substrates have been properly prepared.
- B. If substrate preparation is the responsibility of another installer, notify Architect of unsatisfactory preparation before proceeding.

3.02 INSTALLATION

- A. Install in accordance with manufacturer's instructions.
- B. Anchor racks as directed by Architect using manufacturer's recommended anchors.

3.03 PROTECTION

- A. Protect installed products until completion of project.
- B. Touch-up, repair or replace damaged products before Substantial Completion.

END OF SECTION

SECTION 13 47 13

CORROSION MONITORING / CATHODIC PROTECTION

PART 1 – GENERAL

1.01 WORK OF THIS SECTION

- A. The work of this Section includes installation of bonding across insulating devices, test stations, deep anode wells and rectifiers, as indicated in the plans and details, including electrical connections, installation of test stations, bond cables, exothermic welds, anodes, test leads, rectifiers, conduit, AC service to rectifiers, and all accessories required for a complete operable system, including testing the system after installation.
- B. The work also includes coordination of assembly, installation and testing.

1.02 CODES AND STANDARDS

- A. The work of this Section shall comply with the current editions of the following codes as adopted by Goleta Water District:
 - 1. National Electric Code
- B. The Contractor shall install each system component in a workmanlike manner and in strict conformance with the latest edition of the following standards:
 - 1. NEMA National Electrical Manufacturers Association
 - 2. ASTM American Society for Testing and Materials
 - 3. IEEE Institute of Electrical and Electronic Engineers
 - 4. ANSI American National Standard Institute
 - 5. ICEA Insulated Cable Engineers Association
 - 6. OSHA Occupational Safety and Health Administration
 - 7. NACE National Association of Corrosion Engineers
 - 8. UL Underwriters Laboratories
- C. Where the drawings or these Specifications require a higher degree of workmanship or better quality of material than implied by the above codes and standards, these drawings and Specifications shall prevail

1.03 SHOP DRAWINGS AND SAMPLES

- A. The following shall be submitted to the District, prior to installation:

1. Catalog cuts, bulletins, brochures or data sheets for all equipment including test stations, wire/cable/test leads, exothermic welding equipment, anode assemblies, rectifiers, test station hardware and test boards, wire identifiers and any other equipment to be installed.
2. Certification that the equipment and materials proposed meets the Specifications and the intent of the Specifications.

1.04 OWNER'S MANUAL

- A. The following shall be included in the Owner's Manual:
 1. Operations and maintenance instructions.
 2. List of spare parts recommended for 2 years' successful operation.

1.05 INTERFERENCE AND EXACT LOCATIONS

- A. The locations of corrosion monitoring/cathodic protection equipment, devices, outlets and appurtenances as indicated are approximate only. The Contractor, subject to approval of the Engineer, shall determine exact locations.
- B. The Contractor shall verify in the field, all data and final locations of work done under other Sections of the Specifications required for placing of the corrosion monitoring/cathodic protection, including installation of A.C. service or other electrical work.
- C. In case of interference with other work or erroneous locations with respect to equipment or structures, the Contractor shall furnish all labor and materials necessary to complete the work in an acceptable manner.

PART 2 – PRODUCTS

2.01 GENERAL

- A. All materials to be installed must be new and of a quality generally accepted by the industry and must comply with the codes and standards as specified in Section 1.2. Nothing in the drawings or Specifications is to be construed as permitting work not conforming to these codes and standards. Where larger size or better grade materials than required by the above-mentioned regulations and codes are specified, these drawings and Specifications shall have precedence. All equipment and materials supplied shall be similar to that which has been in satisfactory service for at least 5 years.

2.02 CONDUIT AND FITTINGS

- A. The minimum conduit size shall be 3/4-inch unless otherwise indicated. Rigid steel conduit shall be galvanized conforming to UL 6. Rigid nonmetal conduit shall be PVC schedule 40 conduit approved for underground use.
- B. Fittings for use with rigid steel conduit shall be galvanized cast ferrous metal, with gasketed covers, Crouse Hinds Condulets, Appleton Unilets, or equal. Rigid metallic conduit fittings shall be galvanized conforming to UL 514B.
- C. Fittings for use with either rigid nonmetallic conduit or duct shall be PVC and shall have solvent weld type conduit connections. If such are not available, then the Specification for rigid steel fittings shall apply except in corrosive locations where PVC coating shall be provided.
- D. Union couplings for conduits shall be the Ericson or Appleton type EC or 0-Z Gedney 3-piece Type 4, or equal.

2.03 TEST STATION HOUSINGS - POST MOUNTED TEST STATIONS

- A. The test station housings shall be made from 3-inch diameter, schedule 80 PVC pipe, 6 feet in length. The test head shall be a “Fink” test head, mounted at the top of the PVC post, as shown in the details.

2.04 TRAFFIC VALVE BOXES - FLUSH MOUNTED TEST STATIONS

- A. The traffic valve box for test stations shall be G05 Traffic Box as manufactured by Christy Concrete Products, Inc., No. 1-RT Traffic Valve Box as manufactured by Brooks Products or approved equal. Traffic box covers for anode beds and test stations shall be cast iron with welded bead legend "CP TEST" or “ANODE.”

2.05 TERMINAL BOARDS - FLUSH MOUNTED TEST STATIONS

- A. Terminal boards for flush mounted test stations shall be “Fink” test heads, as shown in the details. Test boards shall be labeled as required to identify the piping to which the leads are connected. All hardware installed on the test boards shall be brass or bronze.

2.06 WIRE

- A. Conductors shall consist of solid or stranded copper of the gauge indicated. Wire sizes shall be based on American Wire Gage (AWG). Copper wire shall be in conformance with ASTM Designations B3 and B8.

- B. All wires terminating in a junction box or test station shall have a wire identifier attached within 4 inches of end of wire at terminal board, prior to backfill, as specified under "Wire Identification".

2.07 ANODE WIRES

- A. The wire attached to the anodes shall be (AWG) stranded, single conductor, copper and insulated for 600 volts. Wire size shall be minimum No. 6 AWG Kynar for deep anode wells and shall conform to the requirements of ASTM D1248 Type 1, Class C, Grade 5. Connection of wire to the anode shall have a pulling strength, which shall exceed the tensile strength of the wire. Any damage to the wire insulation or anode shall require complete replacement of the wire and anode.
- B. The anode supplier shall mark the reel holding the anode wire for shipment to the job site with the same anode numbering system used on the test records and the total length of attached anode wire.
- C. Anode wires shall be of one continuous length from the anode connection to rectifier or anode splice box. Anode wires with the attached anode shall be shipped to the job site with the wire wound on a reel. The minimum core diameter of the reel shall be 5-1/2 inches. The anode wire insulation shall be free of surface damage such as nicks, abrasions, scratches, etc., in all respects throughout the entire length of the wire. Precaution shall be taken during fabrication, transportation and installation of the anodes to see that the wire is not kinked or sharply bent. Bends sharper than 2-1/2 inches in radius are not permissible.
- D. All wires used for corrosion monitoring/cathodic protection systems shall be visually inspected for any damage to the insulation prior to and after installation by the Contractor. Any damage to the insulation will require replacement of the cable. Splicing of cables will not be permitted.

2.08 WIRE IDENTIFICATION

- A. All test lead and drain cables shall be coded with circular brass stamped or engraved identifier or wrap around marker. The letters and numbers shall be printed, minimum 3/16-inch in size, and shall identify the piping to which the lead is connected.
- B. Wire identifiers for anodes shall be the wrap around type with a high resistance to oils, solvents and mild acids. Marker shall fully encircle wire with imprinted alpha-numeric characters for pipe identification.
- C. The following colors and minimum wire gauges have been used:
 - 1. Test Leads:

- Impressed Current System #10 THHN White
- 2. Drain Cable:
Impressed Current System #6 HMWPE Black
- 3. Anode Leads:
Impressed Current System #6 Kynar Black
- 4. Bond Cables:
At AC Insulators #4 HMWPE Black

2.09 EXOTHERMIC WELDS

- A. Exothermic welds shall be provided for connecting cables to structures in strict accordance with the manufacturers' recommendations. Connections shall be made at locations indicated. Exothermic welds shall be Cadweld, as manufactured by Erico Products, Inc. or Thermoweld, or approved equal. Duxseal packing as manufactured by JM Clipper or approved equal shall be used where necessary to prevent leakage of molten weld metal.
- B. The shape and charge of the exothermic weld shall be chosen based on the following parameters:
 - 1. Pipe material
 - 2. Pipe size
 - 3. Wire material
 - 4. Number of strands to be welded
 - 5. Orientation of weld (vertical or horizontal)
- C. All exothermic weld locations shall be coated with a coating, which is compatible with the pipeline coating. The area of the weld shall be coated with a suitable epoxy, as shown in the details, to provide protection to the area of the cadweld and any metal surface exposed during the welding.

2.10 MIXED METAL OXIDE CONTINUOUS ANODE FOR DEEP ANODE WELL

- A. Active anode area shall be mixed metal oxide coated titanium, installed in a preassembled unit, including anode lead cables, attached to either end of the active area of the anode, using a waterproof connection. The active area of the anode shall be equipped with a perforated vent pipe. The assembly shall be equipped with a lowering rope and supplied with sufficient coke breeze to fill the annular space between the

anode assembly and the drilled hole for the active area of the anode. The active area shall be 100-feet.

2.11 CALCINED COKE BREEZE

- A. Backfill material for impressed current system anodes shall be calcined coke breeze with a resistivity of 25 ohm-cm or less when tested with an applied pressure of 2 pounds per square inch. The material shall conform to the following gradation requirements:

<u>Sieve Size</u>	<u>Percent Passing</u>
3/8	100 minimum
1/8	5 maximum

- B. The impressed current system anode backfill shall have the following chemical properties:

Fixed carbon	98.0% minimum
Ash	0.5% maximum
Sulfur	5.0% maximum
Volatile Matter	1.0% maximum
Moisture	1.0% maximum

2.12 PEDESTAL MOUNTED AIR COOLED RECTIFIERS

- A. Rectifiers shall have a minimum 120 Volt Single-phase AC input and have a minimum rated DC output of 20 volts-20 amperes. Rectifiers shall be pedestal mounted. Rectifiers shall be manufactured by Matcor, Inc., or an approved equal.
- B. Rectifier shall be supplied with a set of slide out racks for the transformer and stacks.
- C. Rectifiers shall meet with the following specifications: NEMA Pub. No. MR-20-1958, reaffirmed by NEMA 1971 and 1975. Rectifiers shall be capable of operating continuously at the rated output current at any voltage from zero to 100 percent without damaging any rectifier components. Full rated DC output voltage shall be adjustable by not less than 20 equal steps from approximately 5 percent of rated voltage to full rated output. This adjustment may be accomplished with studs and link-bars or tap switches. If tap switches are used, they shall not carry over 50 percent of the nominal current rating assigned by the manufacturer. Rectifiers shall be designed to operate continuously at rated maximum voltage and current in ambient temperature of 45 degrees C without damage to the rectifier components. Cooling shall be accomplished by natural convection. Fan cooling is not acceptable for unattended equipment.

- D. All rectifiers shall have overload protection. Protection from overload on the input shall be accomplished by molded case, fully magnetic circuit breakers on the incoming power lines. These circuit breakers shall hold at 100 percent of load and may trip between 101 percent and 125 percent of rated load. They shall trip at 125 percent of rated load. The trip point shall be unaffected by changes in ambient temperature. Trip handles of individual pole breakers shall be mechanically linked to open all lines when an overload occurs. Units shall be equipped with silicon stacks, overload protection shall be provided by a quick opening fuse in the transformer secondary.
- E. Voltage surge protection for units equipped with silicon stacks shall be supplied by AC and DC lightning arresters and metal oxides varistors across all secondary lines to the stack and across the DC output of the rectifier. The metal oxide varistors must fire before the voltage surge reaches the peak inverse voltage rating of the diodes used in the stack. Transformers shall be isolation type with a grounded electrostatic shield between the primary and secondary windings. Dielectric strength of all insulating materials shall not be less than 2,000 volts RMS as tested for one minute and applied between windings and the transformer core. Magnetic wire insulation and layer insulation shall be rated no less than 155 degrees C. Magnetic wire insulation shall not show signs of softening or crazing after 24 hours immersion in any of the following chemicals: Naptha, Toluene, Ethyl Alcohol, Trichloro-Ethylene, Styrene Polyester, Butyl Acetate, Mild Acids, or Acetone. Impregnating varnish used shall meet the standards for 155 degrees C when tested according to AIEE test procedures. The transformer shall be preheated before dipping and baked after dipping. The transformer temperature rise, as measured by thermocouples within the transformer, shall not exceed 85 degrees C. The transformer efficiency shall not be less than 85 percent. The transformer voltage regulation shall not exceed 3 percent from full rated load to 1/4 of rated load when measured in accordance with the procedure described in MR-20-1958. Chokes and reactors shall meet the requirements listed for transformers.
- F. Silicon stacks shall be equipped with silicon diodes rated a minimum of 800 peak inverse volts. Heat sinks shall be sized to keep diode junction and case temperatures from exceeding 100 degrees C under 45 degrees C ambient temperature conditions.
- G. Separate voltmeter and ammeter shall be provided for monitoring rectifier output. Minimum meter width shall be 3-1/2 inches round or rectangular with minimum scale length of 2-7/8 inches. Meter movement shall be jewel and pivot D'Arsonval type. Taut band meters are not acceptable because of a tendency to break when jolted during shipment. Meter accuracy shall be a minimum of plus or minus 2 percent of full scale at 80 degrees F and shall be temperature compensated to vary no more than 1 percent per 10 degrees F temperature variation. Scale faces shall be metal or plastic. Ammeter shunt shall be block type mounted on the front panel for easy access. Current and millivolt ratings shall be clearly stamped on the shunt. Shunt accuracy shall be at least plus or minus 1 percent.
- H. Electrical tests shall be performed by the manufacturer and recorded as listed below:

- AC Volts Input
 - DC Amperes Input
 - Apparent Watts Input
 - True Watts Input
 - Power Factor
 - DC Volts Output
 - DC Amperes Output
 - DC Watts Output
 - Conversion Efficiency
 - Dielectric Strength
 - Transformer Primary to Ground
 - Transformer Secondary to Ground
 - Transformer Primary to Secondary
 - Stack AC to Ground
 - Stack DC to Ground
 - Ripple Voltage at Full Output
- I. Rectifier shall be heavy steel or anodized aluminum swing open case, with white baked-enamel finish, and 10-inch standard leg support, or shall be suitable for post mounting.

PART 3 – EXECUTION

3.01 GENERAL

- A. Upon completion of installation of all components as shown on the drawings and in accordance with these specifications, testing shall be performed to demonstrate that the installation has been completed and is in working order in conformance with the Contract Documents. In no case shall the testing be less than that outlined herein unless requested in writing by the Contractor and approved by the Engineer. The interim testing described herein shall be in addition to and not substitution for any required testing of individual items at the manufacturers' plant. District shall provide testing of the system. The test data shall be submitted to the Engineer for acceptance to demonstrate that the system is in proper working order.

3.02 EXCAVATION AND BACKFILL

- A. Buried wires shall have a minimum cover of 24 inches. The bottom of the trenches shall be covered with 1 inch of mortar sand prior to placing wires, insulation, anodes, coatings or other underground appurtenances.
- B. Wire identification tags shall be placed on the wires prior to placing wire in conduit or backfilling.

3.03 TEST STATIONS

- A. Test stations shall be placed at the locations indicated. The Contractor shall field verify final location of the test stations. Wire identifiers shall be placed on all wire prior to backfill and installation of test stations.

3.04 WIRES

- A. Wires buried in the ground shall be laid straight, without kinks. Each wire run shall be continuous in length and free of joints or splices, unless otherwise approved. Care shall be taken during installation to avoid punctures, cuts or other damage to the wire insulation. Damage to insulation shall require replacement of the entire length of wire at the Contractor's expense.
- B. At least 18 inches of slack (coiled) shall be left for each conductor, at each test station housing. Slack in the wire shall be sufficient to allow removal of wire extension for testing. Wire shall not be bent into a radius of less than 8 times the diameter of the wire. Copper split bolts or other appropriate connection hardware shall be used for all test station connections.
- C. Where buried cable is to be placed in existing conduit, the conduit must be of sufficient diameter to accommodate the additional cable. This shall be determined by the number and size of both the existing and new cable in accordance with all applicable codes and standards. This shall also apply where new cable is to be installed in new PVC conduit. PVC conduit shall be installed to a minimum depth of 24 inches below grade.
- D. Red caution tape, 3 inches in width, or colorized slurry shall be installed above buried wire and conduits at a maximum depth of 18 inches below grade over the wire and conduit location

3.05 WIRE IDENTIFICATION

- A. Brass wire identifiers or wrap around cable markers shall be placed on the wires prior to backfill.

3.06 EXOTHERMIC WELD CONNECTIONS

- A. Exothermic weld connections shall be installed in the manner and at the locations indicated. Coating materials shall be removed from the surface over an area of sufficient size to make the connection. The steel surface shall be cleaned to white metal by grinding or filing prior to welding the conductor. The use of resin impregnated grinding wheels will not be allowed. The conductor shall be welded to the pipe by the exothermic welding process with a copper sleeve fitted over the

conductor. Only enough insulation shall be removed such that the copper conductor can be placed in the welding mold.

- B. After the weld has cooled, all slag shall be removed and the metallurgical bond shall be tested for adherence to the pipe or casing. All defective welds shall be removed and replaced. All exposed surfaces of the copper and steel shall be covered with insulating materials as indicated. No connections to the piping shall be buried prior to inspection and approval of the Engineer.

3.07 COATING OF WELDS

- A. The Contractor shall furnish all materials, clean surfaces and repair any damage to protective coatings and linings damaged as a result of the welding.
- B. A coating shall be applied to all exothermic weld locations. The coating shall be an epoxy, as shown in the details. All surfaces must be clean and dry and free of oil, dirt, loose particles and all other foreign materials prior to application of the coating.

3.08 JOINT BONDS

- A. Bond cables shall be provided across flexible couplings, A/C insulators and nonwelded joints on steel pipe, on cement mortar coated steel cylinder pipe joints and ductile iron pipe joints as necessary to ensure electrical continuity. Joint bonds shall be installed as indicated. A minimum of two bonds shall be installed per joint. Joint bonds shall not be installed immediately across dielectric flange kits but shall be required around appurtenances, which are isolated, in order to provide electrical continuity along the main pipeline.

3.09 DEEP ANODE WELL INSTALLATION

- A. The Contractor shall obtain and pay for all fees and permits required for well drilling. Contractor shall log the well in accordance with local and State agency requirements.
- B. Anodes shall be installed in the deep anode well at the approximate location indicated. All drilling shall be done in strict conformance to California State Bulletin Number 74 regulating the classification, construction and sealing of wells. In addition, a well permit shall be obtained by the Contractor from the local, state or federal agency, as required prior to well construction. The Contractor shall provide a grout seal for a minimum of 50 feet.
- C. The impressed current system anode holes shall be drilled by means of a rotary drill rig using circulating water based drilling mud or air, as required. Holes shall be drilled to obtain a nominal 8 inch diameter anode well at a minimum. The well shall be drilled to the minimum depth indicated and shall be essentially straight and plumb. Drilling mud may be circulated through a portable sump or through a sump dug in the

ground at the drill site. If a "dug sump" is used, it shall be emptied and backfilled upon completion. Backfilling shall be such that the sump is safe for vehicle traffic without settling. Drilling mud and cuttings shall be disposed by the Contractor at a suitable disposal site at no additional cost to the Owner, unless it is determined that the cuttings contain hazardous materials. If hazardous materials are suspected, the cuttings will be tested and disposal and chain of custody would be the responsibility of the District.

- D. When the hole has been drilled to specified depth, and in the presence of the Engineer, fresh water shall be circulated from the bottom of the hole to clear the hole of drilling mud and cuttings. The hole shall be flushed until fluid is thinned as much as possible without danger of cave-in. The Engineer shall determine the degree to which the hole is flushed. The hole shall be maintained full to the top with fresh water throughout the entire loading operations. Preparation of the impressed current system anode hole and loading of anodes and other equipment in the hole shall be done in the presence of the Engineer. Loading of the anode hole shall be begun early enough in the day to ensure completion of all loading, including backfilling, to accommodate inspection by County Health inspectors.
- E. Anode assemblies shall be lowered into the hole supported by the attached lead wires. The Engineer shall visually inspect the insulation on the anode lead wire for abrasion or other damage to the insulation and wire as the anode is lowered into place. Splices and/or any form of wire repair shall not be allowed on the anode lead wire from the point of connection at the anode to the top of the deep well anode bed hole. In the event that an anode must be retrieved after it has been lowered into the hole, the entire length of the anode lead wire shall be inspected by the Engineer for abrasion or other forms of damage to the insulation and wire. Anodes with damaged wires shall be rejected by the Engineer and shall not be reinstalled.
- F. When an anode has been placed at specified depth, it shall be securely fixed in that position by tying the anode lead wire to a rack, sawhorse, etc., placed over or adjacent to the anode hole.
- G. All anodes shall be loaded prior to coke breeze backfill. No anodes shall be buried until the Engineer has inspected the placement of the anodes and given permission to backfill.
- H. Coke breeze shall be placed in the hole by pouring directly from the bag into the anode hole or by pumping. Pouring shall be at a steady rate and shall be slow enough to insure that the coke breeze does not bridge or block in the hole. The hole shall be kept completely full of water during placement of backfill. The top of the hole shall be kept free of floating coke breeze particles.

- I. Settling of the backfill and coverage of the anode shall be determined by observing the measurement of anode current output or circuit resistance through a 12V DC power source circuit.
- J. Backfill of the hole above the coke breeze column shall be sealed with 5 feet of sand. Following placement of the sand, the hole shall be sealed within 3 feet of the top with premixed grout or bentonite as specified in California State Bulletin Number 74. Backfill of the uppermost 3-foot portion of the anode hole shall consist of round drain rock as indicated. Round drain rock used for backfill shall be 3/4-inch to 1/2-inch diameter thoroughly washed to insure removal of sand and fines.
- K. A concrete traffic box shall be set near the top of the anode hole for termination of the vent pipe. From the top of the anode hole, the anode leads shall be run to the rectifier location. Anode leads shall be permanently marked with cable identifiers.

3.10 WIRE CONNECTIONS

- A. After installation, all wire connections shall be tested at the test station, junction box locations, or at rectifiers to ensure that they meet the requirements of the Contract Documents.

3.11 EXOTHERMIC WELDS

- A. Exothermic welds shall be tested by the Contractor for adherence to the pipe or casing and for electrical continuity between the pipe or casing and wires. A 22-ounce hammer shall be used for adherence testing by striking a blow to the weld. Care shall be taken to avoid hitting the wires.

3.12 JOINT BOND TESTING

- A. Upon completion of the installation, the Contractor shall provide testing of the system by a qualified corrosion engineer to ensure compliance with the Contract Documents. The testing shall include, but not be limited to the following, at the discretion of the Engineer, measurement of all anode currents and potentials, potentials of metallic pipelines prior to and after connection of anodes. Measurements shall be made at all test station locations. Any deficiencies of systems tested shall be reported to the Engineer and retesting of systems and repairs to the systems shall be at no additional cost to the District.

END OF SECTION

SECTION 21 13 13 FIRE-SUPPRESSION SPRINKLER SYSTEM

PART 1 - GENERAL

1.01 SUMMARY

A. Work Scope:

1. Complete wet automatic sprinkler system provision.
2. The system is intended to be designed as a NFPA 13 Light Hazard occupancy, as the structural frame and building interior/exterior are of low hazard, non-combustible construction. The contractor shall review and confirm the building construction, before proceeding with their final hydraulic design and final selection of the hazard occupancy. The final design shall be code compliant, per the subcontractor's independent design and review of the A/E complete set of drawings.
3. All sprinkler heads are to be centered between light fixtures or in the center of tiles, and NOT independent of the reflected ceiling plan elements. Note sprinkler heads may be relocated by contractor preference, but shall follow the placement rule in the preceding sentence. This requires effort by the sprinkler to center the heads between the ceiling elements including lighting fixtures and ceiling grids in an aesthetic manner.
4. Painting of all exposed sprinkler piping (in finished spaces and viewable from public or back of house no ceiling areas) is to be included. Color to be matching paint color of exposed arch. finishes. The General Contractor is to have this primary cost provision responsibility of the sprinkler painting, unless they assign it to a subcontractor. This will not be a negotiable point. Bottom line, the exposed pipes visible to view from the public spaces are to be painted.
5. For sprinkler coverage under the three roof skylight areas, it will be acceptable to utilize sidewall heads, to minimize the routing and hanging of sprinkler pipes from the skylight structural members. Note the contract documents may show an intention preference of sidewall heads, to minimize any pipes under the skylights. The arch. submittal review comments on aesthetics on the submitted automatic sprinkler shop drawings shall be incorporated into the final contractor's design, in particular the skylight protection. This is a primary intent for the overall aesthetics.
6. The sprinkler contractor shall be responsible for the water pressure hydrant test performance, if a recent test is not provided. FYI – the Goleta Water District conducted a hydrant test for Hydrant #394 on 10-28-20 showing 1600 gpm at 44 psi residual pressure, and a 2nd one for Hydrant #1194. If the contractor needs this report, contact the Water District or the Architect.

7. Submission of sprinkler-contractor generated engineered shop drawings shall be submitted showing sprinkler head placement and branch pipe sizing for Arch. review and comment. The shop drawings shall be also submitted to the City Fire Dept. for their review.B. Related Requirements: The requirements of this Section, NFPA 13 and NFPA 14 shall take precedence over requirements found in the following:
 1. Division 01 - General Requirements.
 2. Section 07 84 13 Penetration Fireproofing.
 3. Section 10 44 13 Fire Extinguishers and Cabinets
 5. Section 22 05 00 Common Work Results for Plumbing.
 6. Section 22 05 13 Basic Plumbing Materials and Methods.
 7. Section 28 31 00 Fire Detection and Alarm.
 8. Section 31 23 23 Excavation and Fill for Utilities.
 9. Section 33 11 00 Site Water Distribution Utilities.

1.02 SUBMITTALS

A. Manufacturer's Data:

1. Submit complete and detailed equipment and material list of items to be furnished and installed under this section.
2. Submit manufacturer's specifications and other data required to demonstrate compliance the plans and specified requirements.

B. Drawings:

1. Submit shop drawings of wet pipe fire protection sprinkler system in compliance to NFPA 13, Standard for the Installation of Sprinkler Systems, Sprinkler systems shall comply with the provisions of NFPA 13 and 14.
2. Shop drawings shall fully comply with the most stringent provisions of this specification and plans, and with the applicable codes and standards.
3. Shop drawings shall be same size as the Contract Drawings and shall be produced using Revit or AutoCAD. Paper print submission of shop drawings will be acceptable, with a paper and electronic PDF format for record drawings.

C. Regulatory Requirements:

1. Installation of fire sprinkler system shall not vary from the submitted plans unless alterations have been approved by the State Fire Marshal.
2. Complete standard testing forms and get sign-off by the Project Inspector.

D. Closeout Submittals: Submit in accordance to Section 01 7700, Contract Closeout, and as specified herein:

1. Record Drawings:

- a. Record drawings of installed Work shall be maintained current on the Project site, available for Fire Marshal and the Project Inspector to review.
- b. At completion of installation submit Record Drawings signed by installing Contractor in pdf format produced in AutoCad or Revit format, including:
 1. Record Specifications.
 2. Record Product Data: Include specific model, type and size for equipment and material installed.
 3. Record Test Results.
 4. Maintenance Manuals.

1.03 QUALITY ASSURANCE

- A. Comply with applicable national or local codes and standards.
- B. Except where exceeded by the requirements of these specifications, the following are made part of this section: prints and details, and provisions of the NFPA 13 Standard for Installation of Sprinkler Systems and NFPA 14 Standard for the Installation of Standpipes and Hose Systems.
- C. Qualifications of Manufacturer: Products used in work of this section shall be produced by manufacturers regularly engaged in manufacture of similar items and with a 5 year history of successful production that is acceptable to the Architect.
- D. Qualifications of Installer: Installer shall have a current C-16 license in the State of California in the installation of fire sprinkler systems.

1.04 FIRE SERVICE WATER CONNECTION

- A. The Owner shall pay fees and provide for the fire main POC (point of connection), consisting of the installation of a detector check valve (if one is required) and meter shut off valve inside a meter vault.
- B. Fire Service Mains shall be provided with approved Meter Service Backflow protection. An approved Reduced Pressure Principle Backflow Prevention Assembly (RP) to meet minimum backflow protection requirements for meter service protection (MSP) shall be provided on the fire main, according to the California Plumbing Code (CPC), NFPA 13 and 14, and according to the current City rules for backflow assemblies).

1.05 PRODUCT HANDLING

- A. Comply with the provisions specified in Sections 22 0500 and 22 0513.

1.06 COORDINATION

- A. Coordinate activities in accordance with provisions of Section 22 0500.

1.07 JOB CONDITIONS

- A. Unscheduled utility flow interruptions are not permitted. Schedule service interruptions in advance.

1.08 EXTRA MATERIALS FOR MAINTENANCE

- A. Provide spare sprinkler heads in quantity equal to 2 percent of total number of each type of sprinkler head installed. There shall be no less than two heads of each type and temperature rating provided, and in no case less than six spare sprinkler heads per building. There shall be no fewer than 4 spare sprinkler heads for up to 300 sprinkler heads installed. Spare sprinkler heads shall be kept inside of spare sprinkler head box(s). A spare sprinkler wrench for each type of sprinkler head shall also be provided inside of each spare sprinkler head box, at each building. Locations of spare sprinkler boxes shall be located at:
 - 1. Mech. Plumbing room, when enclosed and secure.

PART 2 - PRODUCTS

2.01 WET AUTOMATIC SPRINKLER SYSTEM SCOPE

- A. General: Provide system complete including, but not limited to:
 - 1. Provide underground and above ground sprinkler piping including trenching and backfilling. Materials and equipment shall be UL/FM listed and approved as required by NFPA for their application. Required signage shall be provided and installed as required by NFPA 13 and NFPA 14.
 - 2. Provide overhead sprinkler system with sprinklers installed as required according to type, location and temperature rating.
- B. Sprinkler Heads:
 - 1. Provide concealed chrome pendant spray type sprinkler heads with matching escutcheons in areas with finished ceilings. Exterior escutcheons shall be poly-coated or concealed type to prevent rusting and oxidation.
 - 2. Provide upright sprinklers in areas with exposed piping.
 - 3. Provide poly-coated glass bulb corrosion resistance type sprinklers heads in areas exposed to a corrosive environment of coastal air (all outside areas under canopy).
 - 4. Sprinklers shall be glass bulb type, with hex-shaped wrench boss integrally cast into the sprinkler body to reduce the risk of damage during installation,
 - 5. Sprinklers in concealed spaces, exterior locations, and other areas that will experience over 100 degrees F ambient temperature shall be furnished with 200 to 225 degree rated sprinklers. Sprinkler heads in other locations, unless otherwise noted, shall be 155 to 165 degrees F rated.
 - 6. Automatic fire sprinkler head type shall be as follows:
 - a. In areas with ceiling heights of nine-feet or lower, sprinkler heads installed shall be or fully recessed or concealed.
 - 7. Sprinkler heads in light hazard occupancies are required to be Quick Response sprinklers as required in NFPA 13. Sprinkler heads shall be of the same manufacturer throughout the building/site as indicated. Sprinklers shall

- typically be ½ inches NPT, standard orifice, minimum 5.6 nominal K factor, UL listed for 175 psi, and listed for light and ordinary hazard occupancies.
8. Sprinkler head location shall be designed and installed in an aesthetically pleasing manner and shall be located in center of ceiling tiles and in center of 24-inch by 48-inch ceiling tiles in the 24-inch direction and no closer than 12-inch from the edge in the 48-inch direction.
 10. UL/FM listed Sprinkler head guards shall be provided on Sprinkler heads installed at seven feet six inches above floor or lower in exposed locations, or that are deemed subject to damage. Sprinkler head guards shall securely fasten with bolt-on feature to the base of the sprinkler or be a factory installed guard. Guards shall also be provided on upright and sidewall heads where sprinklers are installed at seven feet six-inch heights or lower.

C. Fire Sprinkler Systems:

1. Underground piping: Comply with the requirements of Section 33 1100, Site Water Distribution Utilities.
2. Provide an underground UL/FM listed PVC or Ductile iron supply line connected to detector check meter or water main as indicated. Install site water mains no closer than 10'- 0" parallel to the building foundations. Underground fire water lines shall be installed 36 inches below grade. Tracer wire shall be installed in accordance with Section 33 1100: Site Water Distribution Utilities.
3. Fire Department Connection (FDC) with check valve (wafer type) shall be provided after the backflow preventer, and before the building fire sprinkler riser(s), located where the FDC will be accessible to the fire department from the street or sidewalk without obstructions. No shut off valve shall be allowed on the FDC line as per NFPA 13. FDCs shall have a height between two and four-foot above the ground.
4. Provide a UL listed, FM approved FDC, approved RP type backflow assembly, check valves, shut-off valves, drain valves, ITV, and flow indicator at the locations required. (Test-and-drain combination valves are prohibited.)
5. Flow indicator shall activate the fire alarm system between 45 and 90 seconds, and activate a local alarm on the outside of the building continuously with water flow. Connection of this switch is a part of the Work of Division 26 fire alarm work. Shut-off including valves on the fire main backflow preventer shall be electrically supervised according to CBC 903.4., NFPA 13 and Section 28 3100 – “Fire Detection and Alarm”.
6. Pipe through ceilings at head locations shall be furnished with a two piece, or fully concealed escutcheon. Unless otherwise designated, escutcheons shall be identical and match the other escutcheons of the same type throughout the building or site. Piping through walls and ceilings shall have a split ring chrome escutcheon.
 - a. Flexible stainless steel sprinkler head drop system may be used. Flexible drops shall be UL listed, FM approved, and shall be compatible with ceiling systems. Flexible drop length shall be included

in the Hydraulic Calculations. The drop system shall include the required support bracing.

7. Furnish and install required signs, spare heads, special wrenches, and spare sprinkler head boxes as required to satisfy NFPA 13, NFPA 14 and this specification.
8. Sprinkler system piping shall be provided with complete drainage as required by NFPA. Test valve discharge shall be piped away from planters to asphalt areas. Furnish protection of piping against accidental or malicious damage.
9. Upon completion of the Work of this section, and before Substantial Completion, subject system, including underground supply connection, to tests required. A minimum hydrostatic test shall be two hundred pounds (200 psi) or fifty pounds (50 psi) in excess of the maximum system working pressure, whichever is greater, for two hours with no leaks or loss of pressure per NFPA 13. The Project Inspector shall be furnished with a NFPA 13 test certification.
10. Local fire sprinkler alarm requirements shall be accomplished with a vane or paddle type water flow detector switch and an electrically powered fire sprinkler horn located on the street side of the building and connected to the fire alarm control panel with secondary power provided from the fire alarm batteries. The drilled out disk shall be attached to the mounting U-bolt. Time delay shall be set at 45 to 60 seconds. Mechanically activated water bells with alarm valve and pressure switch are prohibited.
11. Hanging, bracing and support shall utilize only UL/FM listed approved products, and comply with NFPA 13, Chapter 9 requirements for rod and bolt sizes except for the following: 4 and 6 inch pipe shall be supported by a minimum 1/2 inch hanger rod, 8 inch pipe shall be supported by a minimum 5/8 inch hanger rod, 10 and 12 inch pipe shall be supported by a minimum 3/4 inch hanger rod. Hanger rods in exterior locations and in parking structures shall have Electrodeposited Zinc Coating per ASTM B633 to prevent rusting.
12. Building Fire Sprinkler assemblies shall be provided as follows. Building shall be provided with an accessible and electrically supervised shut off valve at a height not to exceed five-feet above the floor. Assembly shall be equipped with a check valve followed by a main drain valve and then the flow indicating switch and pressure gauge immediately after the shut-off valve.

2.02 MATERIALS

A. Globe or Angle Valves: UL/FM listed.

AV-1 Bronze angle valve: 2 inches and smaller, screwed-in bonnet, threaded ends, rising stem:

Nibco	Kennedy	Fairbanks	United	Or equal
T-301	98 SD	0210	126T	

B. Automatic Fire Sprinkler Head, UL/FM listed:

Brass pendant type for areas with suspended ceilings:

Victaulic V27	Tyco TY 3231	Viking VK302	Reliable F1FR56	Or equal
------------------	-----------------	-----------------	--------------------	----------

Brass upright type for areas with no ceilings:

Victaulic V27	Tyco TY3131	Viking VK300	Reliable F1FR300	Or equal
------------------	----------------	-----------------	---------------------	----------

Chrome or poly coated semi recessed type with semi-recessed escutcheon:

Victaulic V27	Tyco TY3231	Viking VK302	Reliable F1FR56	Or equal
------------------	----------------	-----------------	--------------------	----------

Fully concealed type sprinklers; chrome cover:

Victaulic V38	Tyco TY3531	Viking VK462 VK404	Reliable F4FR G4A	Or equal
------------------	----------------	--------------------------	-------------------------	----------

D. Backflow Prevention Assemblies:

BPV-1 Reduced Pressure Principle Backflow Prevention Assembly (RP) type for meter service protection (MSP) requirements:

Ames 4000SS C400 M400	Febco 860 OS&Y 880 OS&Y	Watts 909 RP 957 RP 994 RP	Wilkins 975 RP 375 RP	Or equal
--------------------------------	-------------------------------	-------------------------------------	-----------------------------	----------

E. Butterfly Valves:

GOBFV-1 Grooved end Gear Operated Butterfly Valve, 300 psi, for fire protection sprinkler risers. UL listed, FM approved, with weatherproof gearbox and double pole/double throw monitor switch, double seal design for bubble tight shut off at 175 psi. Corrosion-resistant, fusion-bonded nylon II body coating, easy to read position indicator:

Kennedy Figure 82M	Nibco GD-4765-8N, 300 psi	Victaulic 705W 300 psi	Tyco 580 300 psi	Or equal
-----------------------	---------------------------------	------------------------------	------------------------	----------

GOBFV-2 Wafer Type Gear Operated. Butterfly Valve, same requirements as GOBFV-1:

Kennedy Figure 82W	Nibco WD-3510 300 psi	Or Equal
-----------------------	-----------------------------	----------

F. Check Valves:

- CV-1 Bronze check valves: 2 inches and smaller, 200 psi WOG, bronze disc, swing type, conforming to MSS-SP-80-97, threaded ends:
- | | | | | |
|-------|---------|----------|--------|----------|
| Crane | Nibco | Stockham | United | Or Equal |
| 37 | T-433-Y | B-319 | 62T | |
- CV-2 Iron check valves: 2-1/2 inches and larger, class 175, composition disc, swing type, bolted cap, UL listed, FM approved flanged ends:
- | | | | | |
|----------|---------|---------|-------|----------|
| Stockham | Kennedy | Tyco | Clow | Or Equal |
| G-940 | 126 | Model G | F5380 | |
- CV-3 Wafer Type Check Valve:
- | | | |
|------------------------|----------------|----------------|
| United Wafer Check #90 | Nibco KW-900-W | Mueller A-2102 |
|------------------------|----------------|----------------|
- Or equal.
- CV-4 Grooved Check valve 2 1/2 inch and larger:

|--------|----------|----------|------------|------|
| United | Gruvlock | Reliable | Victaulic | Tyco |
| 67 | 7800 | Mode "G" | Series 717 | 590F |
- Or equal.

G. Escutcheons

- ES-1 Chrome plated, or white poly-coated, 2-piece canopy (escutcheon), 2.25 to 3.5 inches in extended position:
- | | | | |
|-----------|-----------|--------------|----------|
| FPPI | Tyco | Reliable | Or equal |
| 01 - 401 | No. 401 | HBC (chrome) | |
| Chrome or | Chrome or | HBW (white) | |
| White | White | | |
- ES-2 Chrome plated or white poly coated, 2-piece recessed:
- | | | | |
|----------|------|--------------------------|----------|
| FPPI | Tyco | Reliable (semi recessed) | Or equal |
| 01 - 400 | 410 | GF2-C (chrome) | |
| 01 - 402 | 420 | GF2-W (white) | |

H. Fire Department Connections:

- FDC-1 UL listed, FM approved, type, 4 inch by 2-1/2 inches by 2-1/2 inches bronze body fire department hose connection (FDC):
- | | | | | |
|---------|---------------|------|-----------|----------|
| Crocker | Potter-Roemer | Tyco | Powhatten | Or equal |
| 6405 or | 5710 or | 86 | 21-201 or | |
| 6420 | 5730 | | 31-133 | |

I. Flow Indicators:

FIA-1 Listed by State Fire Marshal, with double pole, double-throw switch, one normally open and one normally closed, UL listed and FM approved:

Potter-Roemer	Notifier	Or equal
VSRF Series	WFR Series	

J. Outside Stem and Yoke Gate Valves:

OS&Y-1 Bronze Gate Valves: 2 inches and smaller, class 175, solid bronze wedge disc, OS&Y, copper silicon alloy stem, UL/FM listed, threaded ends:

Stockham	Crane	Nibco	United	Or equal
B-133	459	T-14	18	

OS&Y-2 Iron gate valves: 2 ½-inch and larger, class 175, IBBM, OS&Y, solid wedge disc, Teflon-impregnated packing, UL/FM listed, flanged ends:

Stockham	Crane	Kennedy	Mueller	Victaulic
G-634	467	68	A-2073	771

Or equal.

OS&Y-3 2 ½-inch and larger, epoxy coated, resilient wedge, 175 pounds gate valve for riser valves, P.I.V., and shut off:

Clow	Nibco	Kennedy	Mueller	Or equal
F-6136	617-0	KV-4068	A-2360	

K. Gate Valves:

GV-1 Bronze gate valves: 2-inch and smaller, class 175, solid bronze wedge disc, rising stem copper silicon alloy stem, UL/FM listed, threaded ends:

Stockham	Crane	Grinnell	United	Or equal
B-133	459	Fig. 66	14	

GV-2 Iron gate valves: 2 ½-inch and larger, class 175, IBBM, solid wedge disc, Teflon impregnated packing, UL/FM listed, flanged ends:

Stockham	Crane	Kennedy	Mueller	Victaulic
G-634	467	68	A-2052	772

Or equal.

L Sprinkler Guards:

SPG-1 Sprinklers installed at seven feet six inches above floor or lower in exposed locations, or that are deemed subject to damage shall be equipped with a UL/FM listed, head guard. Guards shall be listed, supplied and approved for use with the sprinkler by the sprinkler manufacturer. Sprinkler head guards shall securely fasten with bolt-on

feature to the base of the sprinkler or be a factory installed guard. Guards shall also be provided on upright and sidewall heads where sprinklers are installed at seven feet six-inch heights or lower.

Reliable Viking Tyco FPPI Victaulic
Or equal.

M. Sprinkler Horn:

SPH-1 UL/FM approved, surface-mounted, weatherproof and red finished:

Horn:	Bell:	Wheelock equal
HRK System Sensor	SSM-24-10 System Sensor	
24 V-DC	24 V-DC	
Weatherproof with	Weatherproof with	
BBS-2 back-box for	WBB box for	
Surface mount	Surface mount installation	
Or equal		

N. Hangers, Supports, Bracing:

HSB-1 Tolco products or UL listed and FM or equal.

O. Threaded fittings:

TF-1 Ductile iron, 300 psi rated, UL listed, FM or NFPA approved.

TF-2 Cast iron fittings, 175 psi rated, UL listed, FM or NFPA approved:

Anvil Ward Taylor Or equal

TF-3 Malleable Iron, 300 psi rated, UL, Listed, FM or NFPA approved

TF-4 Galvanized, 175 psi rated, UL Listed, FM or NFPA approved

P. Fire Sprinkler Pipes and Standpipes:

FSP-1 Aboveground fire sprinkler pipe: 1 inch through 8-inch, Schedule 10 or 40, black or galvanized steel meeting ASTM Standards A53, A135, or A795. Pipe Corrosion Resistance Ratio (CRR) shall be 1.00 or greater. Pipe may be threaded or grooved.

a. Piping 2 inches and smaller shall have threaded joints and fittings in concealed, non-accessible locations. Groove coupler connections (Victaulic, Viking VGS, or equal) on pipe sizes 1 inch through 2 inches are acceptable in accessible areas with required seismic bracing provided. Plain end connections such as “Plainlock” and “FIT” are prohibited.

b. For pipe sizes 2 ½-inch and larger, grooved type (Victaulic, Viking VGS, or equal), welded, threaded and flanged

connections may be used. Any connection that does not utilize a threaded, welded or grooved connection is prohibited, except for mechanical tee bolt-on branch outlet fittings sizes 2-inch and smaller (Victaulic 920 and the 920N).

- c. Submit Verification from manufacturer stating that piping material furnished meets above criteria; (i.e.: threadable pipe has a UL assigned CRR of 1.00 minimum, that it meets ASTM A53, A135 or A795, and it is UL listed, FM or NFPA approved.)

FSP-2 Ductile iron pipe, AWWA C151 (for pipes below grade). Gasketed self retaining joints per ASME/ANSI B16.4.

FSP-3 Flexible Fire Sprinkler Head Connectors: 1 inch pipe size flexible stainless steel fire sprinkler head connectors “Flex Head Industries” Models 2024, 2036, 2048, 2060 and 2072, or equal.

2.03 ACCESSORIES AND APPURTENANCES

- A. Escutcheons: Polished chrome plated split-ring type for exposed piping at every penetration inside finished rooms.
- B. Guards: Provide sprinklers with guards at ceiling at or under seven feet six-inch high and where subject to damage or vandalism.
- C. Miscellaneous: Provide accessories and appurtenances for a complete system.

2.04 FIRE HOSE VALVES

- A. Schedule Numbers:

SPV-1 Valve, Fire Hose, cast brass angle valve, UL listed and Factory Mutual approved; 1 ½-inch at 175 psi, female NPT outlet with 1 ½-inch male NPT by 1 ½-inch male NST adapter nipple.

POTTER-ROEMER	POWHATAN	UNITED
4070	500	88
Or equal		

SPV-2 Valve, Standpipe for 2 ½-inch for 150 or higher psig working pressure, male NST outlet for fire department hose connection. Cast brass, replaceable composition disc, and rough chromium-plated body (unless provided inside UL listed valve cabinet) with hand wheel.

POWHATAN	UNITED	POTTER-ROEMER
DXWDGV-250F DXAV5-250F	88H	4065
Or equal		

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Examine areas and conditions under which Work of this section shall be performed. Correct conditions detrimental to proper and timely completion of Work. Do not proceed until unsatisfactory conditions have been corrected.

3.02 PREPARATION

- A. Ream pipe and tube ends. Remove burrs. Bevel or groove plain end ferrous pipe ends.
- B. Remove scale and foreign matter, from inside and outside of pipes, before assembly.
- C. Provide piping connections to equipment with flanged or grooved connections.

3.03 INSTALLATION

- A. Install underground supply line connected to detector check or water main indicated. Braced or clamped bends shall be in accordance with requirements of NFPA 24. Provide vertical clamp rods at flange and spigot piece of risers, long enough to pass through riser's base flange where required. Furnish concrete thrust blocks where required. Tracer wire shall be installed as per Section 22 0553: Plumbing Identification on PVC underground piping.
- B. Install FDCs, check valves, shut-off valves, gauges, Inspector's test and drain assemblies and flow indicator. FDC must be installed so that it is unobstructed and accessible for the Fire Department's first response unit.
- C. Pipe through floors, wall, and ceilings, at head locations, shall be furnished with required sleeves, and escutcheons and fire caulking where indicated and/or required by code. Escutcheons shall be polished chrome plated unless other finish is selected by the Architect.
- D. Sprinkler system shall be provided with complete drainage facilities in accordance with CBC standards. Drain discharge may discharge into a sewer, storm drain, sump pit or street gutter. Fire sprinkler drains shall not discharge onto a playground or across a sidewalk. Discharge to plumbing fixtures is prohibited due to the inability of a plumbing fixture to receive a full flow of water from a fire sprinkler drain valve under working pressure.

- E. Upon completion of the Work of this section, and before Substantial Completion, subject the entire system, including underground supply connections, to tests as required by NFPA 13, and CBC standards and furnish the City of Goleta and Owner with a certificate of compliance as required.
- F. Close nipples are prohibited. Threaded unions are prohibited. Where a threaded union or coupling is needed, a groove type fitting (Victaulic or equal) shall be used instead. If a groove style coupling is used in a concealed area, an access panel allowing full access to that connection shall be provided.
- G. Fire sprinkler systems piping hangers, seismic bracing, anchors and supports shall conform to NFPA 13, CBC and other applicable codes and the requirements of this specification.
- H. Grooved joints shall be installed in accordance with the manufacturer's latest published installation instructions. Grooved ends shall be clean and free from indentations, projections, and roll marks in the area from pipe end to groove. Gaskets shall be of an elastomer grade suitable for the intended service, and shall be molded and produced by the coupling manufacturer.
- I. Tee branch outlets on fire sprinkler mains shall be by the use of a threaded ductile iron tee fitting, a groove type tee fitting, (Victaulic or equal), or by the use of a thread-a-let welded on by a certified welder as required by NFPA. Mechanical tee bolted branch outlet fittings are prohibited except for branch outlet sizes 2-inch and smaller.
- J. Sprinkler lines within the building shall be concealed within the structure. Risers shall be installed in utility, supply rooms or similar service areas whenever possible, and shall not obstruct access, or maintenance of other equipment within the space. Mains and risers shall be located within the area protected by the sprinkler system unless otherwise approved by fire authorities having jurisdiction.
- K. Sprinklers that have been dropped, damaged, have cracked bulbs, or show a visible loss of fluid shall not be installed.
- L. Sprinkler bulb protectors shall be removed by hand after sprinkler installation. Tools or other devices to remove the protector that could damage the bulb in any way shall not be used.
- M. Routing of piping in non-concealed exposed areas shall be subject to the Architect's review in the final shop drawings. This review will include the glazing skylight areas at the roof level.
- N. Underground piping shall have a minimum of 36 inches of cover to grade. Underground pipe shall be installed on a flat not less than 6-inch thick undisturbed sand bed. After required pressure-leak test, pipe shall be covered with sand not less than 6 inches thick, before backfilling. Comply with NFPA Standards. Piping is not allowed to be underground below the building floor slab.
- O. Provide approved backflow prevention assemblies. Installations of backflow prevention assemblies shall be tested and certified by a certified backflow prevention

device tester prior to Substantial Completion. Tests shall be performed in the presence of the Project Inspector. Test reports shall be turned over to the Project Inspector for mailing to proper agency.

- P. Test valve (ITV) shall be located at the opposite end of the sprinkler system from the supply. Test-and-drain type combination valves are prohibited. ITV discharge and main drain lines shall be piped to a sump pit or to the outside of the building to within a foot from the ground where it will drain away from the building to an exterior storm drain.
- R. Fire sprinkler riser shall be furnished with an accessible shut off riser valve installed no higher than five feet from the finish floor. System shall have a separate shut off valve with flow switch, and shall be securely enclosed or secured with a chain and break-a-way lock.

3.04 PROTECTION

- A. Protect the Work of this section until Substantial Completion.

3.05 CLEANUP

- A. Remove rubbish, debris, and waste materials and legally dispose at off-project site.

END OF SECTION

SECTION 22 05 13

BASIC PLUMBING MATERIALS AND METHODS

PART 1 – GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. This Section prescribes basic materials and methods generally common to the Work of Division 22.
- B. Related Requirements:
 - 1. Division 01: General Requirements.
 - 2. Division 22: Plumbing.

1.02 SUBMITTALS

- A. Provide in accordance with Division 01, Section 22 05 00 and specific requirements of each section of Division 22.
- B. Submit all fixtures and equipment shown on Plumbing drawing P-002 Equipment Schedules, providing submittals for all listed items shown.

1.03 QUALITY ASSURANCE

- A. Standards: Comply with applicable national, state, and local codes and standards: ASTM, ASME, and ANSI. Federal Specifications, AWWA, SISPI, NFPA, FM, UL, CPC (California Plumbing Code), CMC (California Plumbing Code), CSA.
- B. Conform to provisions of Section 22 05 00: Common Work Results for Plumbing.
- C. Manufacturer of plumbing products must be third-party certified to ANSI/NSF Standard 61, Section 9 certification, and ANSI/NSF 372 to demonstrate compliance with the federal requirements for lead contribution to drinking water, the Safe Drinking Water Act SDWA, and the California Health and Safety Code Section 116875.
- D. Qualifications of Manufacturer: Products used in the Work of this Section shall be produced by manufacturers regularly engaged in manufacture of similar items and with a history of successful production as reviewed by the ARCHITECT.

1.04 COORDINATION

- A. Coordinate related Work in accordance with provisions of Section 01 31 13: Project Coordination.

PART 2 – PRODUCTS

2.01 GENERAL

- A. Provide the following products if they are indicated in the Contract Documents or if they are required for the proper installation, function or operation of equipment, systems or components indicated in the Contract Document.
- B. Provide the following products as a complete assembly with required accessories for a complete and functioning entity in compliance with governing codes and applicable standards as specified in Section 22 05 00, manufacturer's instructions or as required.
 - 1. Omission of minor details in the Contract Documents does not waive and/or otherwise relinquish compliance with the above requirements.

2.02 MANUFACTURERS AND MATERIALS

- A. Plumbing Fixtures: Submit for approval all schedule info shown on Equipment Schedule Drawing P-002: Bottom-line, submit all fixtures and equipment shown are to be from major recognized manufacturers.
- B. Ball Valves: 2-inch and smaller:
 - Class 150, 600 psi, Bronze, CWP two piece construction with reinforced TFE seats, full port, adjustable packing gland, (no threaded stem designs allowed), threaded or solder ends. Manufacturer: Apollo Valves 77CLF-100A/77CLF-200A, NIBCO T-685-66-LF/S-685-66-LF, Hammond UP8303A/UP8513, Milwaukee UPBA400S/UPBA450S, or equal.
 - Class 150, 600 psi, Stainless Steel, CWP two piece construction with reinforced TFE seats, full port, adjustable packing gland, (no threaded stem designs allowed), threaded or solder ends. Manufacturer: Apollo Valves 76F-100, NIBCO T-585-S6-R-66-LL, Milwaukee BA260, or equal.
 - Ball Valves in Insulated Piping: Use extended operating handle of non-thermal conducive material, and protective sleeve that allows operation of valve without breaking the vapor seal or disturbing insulation and memory stops that are fully adjustable after insulation is applied. Apollo Valves Therma-Seal, NIBCO Nib-Seal Handle.
- C. Butterfly Valves:
 - Centerline Series A, 200 psi CWP tight shut-off.
 - 1. Body: Lug type ductile iron. Suitable for bi-directional dead-end service at rated pressure without use of downstream flange.
 - 2. Disc: Bronze, or aluminum bronze.
 - 3. Stem: One or two-piece, 400 series stainless steel.
 - 4. Seat and O-Rings: EPDM.
 - 5. Upper and Lower Stem Bearings: Copper alloy or non-metallic material.

6. Operators: Valves 6 inches and smaller, with lever handle. Valves 8 inches and larger, with manual gear operator and disc position indicator.
 7. Manufacturers:
 - a) Valves 2.5 to 6-inch: Apollo Valves LD141, Milwaukee ML 233E, Hammond 6411-03, or equal.
- D. Check Valves:
1. Bronze, 2-inch and smaller:

200 psi, CWP horizontal swing, Y pattern, renewable seat and disc, threaded ends. Manufacturer: Apollo Valves 163T-LF, NIBCO T-413-Y-LF, Milwaukee UP-509, Hammond UP-904, or equal.

200 psi, CWP, bronze body, horizontal swing, Y pattern, renewable seat and disc, solder ends. Manufacturer: Apollo Valves 163S-LF, NIBCO S-413-Y-LF, Hammond Up-943, or equal.

Class 125, 200 psi, swing check, bronze body, Teflon disc, soldered ends. Manufacturer: Apollo Valves 163S, Stockham B-310TY, Crane 1340, NIBCO S-413-Y, Milwaukee 1509-T, Hammond IB-912, or equal.
- E. Earthquake Gas Valve:
- Mechanically triggered by seismic movement, complying with state of California seismic response specifications, UL listed and certified by D.S.A. Size and pressure as required or indicated on Drawings. (Minimum 1/4 psi, maximum 10 psi. Earthquake valve shall shut off gas automatically during an earthquake to prevent an explosion or fire. Acceptable Manufacturers: California Valve (former Koso), or equal.
1. Sensitive to wide amplitude G's only. Preset at factory for the correct G-rating.
 2. Positive sealing from minus 10 degrees F. to 150 degrees F.
 3. Visual open-close indicator.
 4. Manual reset.
 5. Tripping mechanism has non-creeping rolling latch.
 6. Install valve per manufacturer's recommendations only.
- F. Domestic Heating Hot Water Diaphragm Expansion Tank:
- Pressurized, vertical, steel expansion tank for potable water systems with FDA approved, replaceable, heavy duty, butyl rubber blend diaphragm, polypropylene lined dome, 1/2 inch, 3/4 inch, 1 inch or 1 1/2-inch NPT system connection, 1/2 inch or 3/4 inch drain, 0.302 inch-32 standard automobile tire valve type charging connection, lifting rings and a floor mounting skirt for vertical installation. The tank must be constructed in accordance with Section VII of the ASME Boiler and Pressure Vessel Code and stamped for 125 psi working pressure. The tank must be also rated for a continuous working temperature of 240 degrees F. Provide weather and rust resistant

coating. Manufacturer: Apollo Valves 16XT, Bell and Gossett, Wheatley, Taco, Amtrol, or equal.

G. Flow Control Valve – Manual:

Flow control valves: Bell and Gossett Series CB circuit setter balancing valve, line size, with integral pointer (to register degree of valve opening), differential pressure meter connections with built-in check valves and lockable memory stops. Manufacturer: Apollo Valves 58A, Armstrong ARMFLO circuit-balancing valves, series CBV, or equal.

H. Gate Valves:

1. Bronze, 2-inch and smaller:

Class 125, 200 psi, CWP, bronze body and bonnet, non-rising stem, inside screw, screw-in bonnet, solid disc, threaded ends: Manufacturer: Apollo Valves 101T-LF, NIBCO T-113-LF, Milwaukee UP105-P2, Hammond UP645, or equal.

Manufacturer: Apollo Valves 101S-LF, NIBCO S-113-LF, Milwaukee UP115, Hammond UP647, or equal.

2. Iron, 2-1/2-inch and larger:

GV-3: Class 125 250 psi CWP iron body, flanged ends, bolted bonnet with wheel handle, resilient wedge, non-rising stem. Manufacturer: Apollo Valves 610F-LFA, NIBCO F-619-RW, or equal.

GV-4: Class 125, 250 psi CWP iron body, flanged ends, bolted bonnet with 2-inch operating nut, resilient wedge, non-rising stem, fusion bonded epoxy coated. Manufacturer: NIBCO F-619-RW-SON, or equal.

I. Globe Valves:

1. Bronze, 2-inch and smaller: Class 125, 200 psi, CWP, screw-in bonnet, press ends: Manufacturer: Apollo Valves 120T-LF, Milwaukee UP502-P2, Hammond UP440-P2, or equal.

Class 125, 200 psi, CWP, screw in bonnet, soldered ends. Manufacturer: Apollo Valves 120S-LF, Hammond UP418, Milwaukee UP1502, or equal.

J. Gas Heater Vent Pipe:

Shall be UL approved for service specified. Concealed heater vent pipe, including pipe in or through attic spaces, shall be City approved Type B double wall metal vent pipe. Clearances must comply with code and conditions of UL listing. Manufacturer: American Metal Products Co., Inc., Simpson Dura-Vent, AmeriVent, Hart & Cooley Mfg. Co., Metalbestos, or equal.

K. Piping and fittings:

1. Piping shall be continuously and permanently marked with manufacturer's name, type of material, size, pressure rating, and the applicable ASTM, ANSI, UL, or NSF listing. On plastic pipe, date of extrusion must also be marked.
2. Underground non-ferrous pressure pipes shall be installed with proper color tracer wires. Refer to color code provisions in Section 22 05 53: Plumbing Identification.

P-1: Cast iron: Hubless, service weight, ASTM A888, CISPI 301, conforming to CISPI 310 and installed in accordance to IAPMO IS 6.

Manufacturer: American Foundry, Tyler, AB & I, or equal.

PF-1a: Cast iron, soil or waste no-hub coupling with neoprene gaskets, stainless steel corrugated shields and stainless steel clamps. 2 bands for size 1 ½-inch thru 4-inch, IAPMO, ASTM C 564 and CISPI 310.

Manufacturer: American Foundry, Tyler, AB & I, or equal.

Cast iron, soil or waste, Heavy-duty no-hub coupling with neoprene gaskets, stainless steel corrugated shields and stainless steel clamps. 4 bands for size 5-inch thru 10-inch. IAPMO, ASTM C564 and CISPI 310.

Manufacturer: American Foundry, Tyler, AB & I, or equal.

Same as PF-1a with Heavy Duty Husky SD 4000 Coupling and stainless steel clamps. IAPMO, ASTM C564 and CISPI 310.

P-2: Copper drainage tube, inside structure and above grade. Type DWV hard temper, ASTM B 306.

Manufacturer: Mueller, Anaconda, Cerro Brass, Cambridge-Lee, Halstead, or equal.

PF-3: Cast brass drainage fittings ASA B 16.23, ASTM B 42.

Manufacturer: Mueller Brass, Nibco, Stanley Flagg, Lee Brass, or equal.

P-4: Copper water tube, Type L hard, ASTM B88. (For above ground use only.)

Manufacturer: Mueller, Cambridge-Lee, Halstead, or equal.

PF-4a: Copper Press-Connect pressure fittings, comply with ASME B16.51 "Copper Alloy Press-Connect Pressure Fittings", with Ethylene Propylene Diene Monomer, EPDM O-Ring Seal in each end. Fittings with the sizes of 2-1/2" and larger shall have cross-section Grab Rings and separation rings.

Manufacturer: Viega, Mueller Industries, Apollo, or equal.

Wrought copper - solder type ANSI B 16.22.

Manufacturer: Mueller Brass, Nibco, Lee Brass, or equal.

Grooved end type– ASTM B75 or B152 and ANSI B16.22 wrought copper, bronze sand casting per ASTM B584-87 copper alloy CDA 836 per ANSIB16.18. Couplings shall be CTS style 606 supplied with angle pattern bolt pads for rigidity, coated with copper coated alkyd enamel. Gaskets shall be pre-lubricated Flush seal type.

Manufacturer: Apollo Shurjoint, Victaulic, or equal.

P-5: Copper water tube, Type K hard, ASTM B88.

Manufacturer: Mueller, Cerro Brass, Cambridge-Lee, Halstead, or equal.

P-7: Black steel pipe, Schedule 40, ASTM A53, Type E, ERW threaded or welded.

Manufacturer: US Steel, or equal.

Malleable iron, Class 125, ANSI B 16.3, threaded or welded Schedule 40 black steel for 2-inches and below and welded for 2 ½-inch and above.

Manufacturer: Stockham, or equal.

Press fittings, ASME B31, Carbon Steel, – For aboveground piping 2-inches and below. Provide fittings with Hydrogenated Nitrile Butadiene Rubber, HNBR Sealing Element.

Manufacturer: Apollo Valves: Power Press, Viega: MegaPressG, or equal.

P-8: Underground site water service pipe sizes 4-inch and larger shall be C900 water service pipe material. Refer to guide specification section 33 11 00 “site water distribution utilities”.

PF-9: Ductile Iron. Refer to guide specification section 33 11 00 “site water distribution utilities”.

Manufacturer: Spears, Charlotte, or equal.

L. Pipe and Fitting Requirements Schedule: Unless otherwise specified or indicated on Drawings, pipe and fittings shall be installed in accordance with the following table:

TABLE I
PIPE AND FITTING SCHEDULE

Use	Limits	Pipe	Fittings
Domestic Cold Water, underground	Within 5’ from building, All sizes	P-5	PF-4a, or PF-4b
Domestic Cold Water, underground	Site distribution only, sizes up to 3”	P-5 Refer to 33 1100	PF-4a, PF-4b, Refer to 33 1100
Domestic Cold Water, underground	Site distribution only, 4” and over	Refer to 33 1100	Refer to 33 1100

Use	Limits	Pipe	Fittings
Domestic Hot and Cold water, aboveground	Interior only	P-4	PF-4a, or PF-4b
Downspouts, Interior Storm Drainage	Within 5' from building, All sizes	P-1	PF-1a, or PF-1b
Exposed Downspouts, Interior Storm Drainage	Aboveground only	P-2	PF-2
Natural Gas, Interior, aboveground	All sizes	P-7	PF-7a, PF-7b, or PF-7c
Waste and Vent - Indirect	All sizes	P-1	PF-1a or 1b
Waste and Vent – Sanitary	All sizes	P-1	PF-1a, or 1b
Waste and Vent – Sanitary, underground	Underground, site only	P-1 Refer to 33 3000	PF-1a, or 1b Refer to 33 3000

M. Pipe Isolators:

PLA-1 Absorption pad shall be not less than ½ inch thick, unloaded. Pad shall completely encompass pipe.

Manufacturer: Holdrite, LSP, Stoneman, Potter-Roemer, Trisolator, PR-Isolator, or equal.

Manufacturer: Hydra-Zorb Cushion Clamps, Acousto-Clamp, or equal.

N. Pressure Gage: Aluminum or steel case, minimum 4 ¼-inch dial; pressure type or combination vacuum-pressure type, with provisions for field calibration. Dial indicator to indicate pressure in psi with accuracy to within plus or minus 0.5 percent of maximum dial reading. Furnish gages with restriction screw, size 60, to eliminate vibration impulses. Black case and ring, bourdon tube of seamless copper alloy with brass tip and socket. Three way gage cock, constructed of brass with stuffing box, 1/2 inch couplings, with fixed or movable cap nut to shut off pressure gage.

PG-1 Pressure type, black drawn steel case, 4-1/2-inch glass dial, range approximately twice line pressure.

Manufacturer: Marsh Keckley, Trerice, Weksler, Weiss, or equal.

O. Plug Valves:

2 inches and smaller: Rockwell No.114, lubricated plug type, 200-pound., water operating gauge pressure iron body and plug, regular pattern, threaded, with indicating arc. Manufacturer: Walworth, Homestead, WKM, or equal.

P. Safety Relief Valves:

Combination temperature and pressure relief type. CSA approved. Set to open at 125 psi pressure. Manufacturer: Apollo Valves: 18C, Watts: 40L, Cash-Acme: NCLX-1, or equal.

Q. Strainers:

STR-1 Description: Wye type with monel or stainless steel strainer cylinder (manufacturer's standard mesh), and gasketed machine strainer cap. Where indicated on Drawings, provide with valved (globe valve) blowout piping, same size as blowout plug.

1. 2-inch and smaller:

C.M. Bailey No.100-A, 250 lb., cast iron body, threaded, Keckley: Style B, Spirax Sarco Y-type, or equal.

2. 2 ½-inch and larger:

C.M. Bailey No.100-A, 125 lb., cast iron body, flanged, or Victaulic style 732, 300 psi, ductile iron body, grooved, fusion bonded epoxy coated.

Manufacturer: C.M.Bailey, Armstrong, Muessco, Keckley 'A', or equal.

STR-2 Y pattern cast iron bodies, 125 psi, monel screen. Open area at least twice the cross-sectional area of IPS pipe in which strainer is installed and may be woven wire or perforated type. Screwed ends for sizes up to 2 inches, flanged ends fusion bonded epoxy coated for 2 ½-inch and larger perforations, in accordance with the following:

1. Steam service - 40 square mesh.

2. Other services - 16 square mesh.

Bailey No.100, Armstrong, RP&C, Keckley or equal.

R. Vent Caps:

VC-1 Vandal-proof hood type, for plumbing vent lines.

Manufacturer: Stoneman Engineering and Mfg., Semco 1550, or equal.

P. Protective Coating for Underground Steel Piping Applied to Underground Gas:

a. Black steel or galvanized steel piping indicated for below grade installation, shall be protected as specified prior to delivery to the Project site:

i. Sandblast black steel pipe to a gray finish. Sandblast galvanized steel pipe lightly only.

Department of Neighborhood Services and Public Safety
GOLETA TRAIN DEPOT PROJECT

- ii. Install one coat of cut back asphalt to galvanized pipe immediately after sandblasting. Pre-heat black pipe to 180 degrees F. immediately before coating.
 - iii. Install one coat of high-temperature (melting point of 240 degrees F. minimum) Grade B asphalt enamel.
 - iv. Install one wrapping of 20 mils thick glass, fiber mat, Owens-Corning Coromat or L.O.F. Blueflag with 1/4 inch overwrap. Glass fiber shall be dry at time of installation.
 - v. Install a second coat of asphalt enamel as specified above. Glass fiber mat shall be centered in the asphalt enamel.
 - vi. Install an overwrap of Kraft ripple paper.
- b. Total thickness of pipe wrapping shall be not less than 1/8 inch. Entire coating operation shall be accomplished by mechanical means in a continuous operation. Hand installation of protective coating is not permitted.
 - c. Each piece of wrapped pipe shall be legibly identified at no greater than 5 feet intervals by fabrication company. Each material installed shall include the name of the fabrication company.
 - d. Acceptable manufacturers of wrapping are: Hunt, Mobile, Conway or equal.
 - e. Fittings (including couplings), unprotected pipe adjacent to fittings, and damaged pipe protection shall be wrapped at Project site as follows:
 - i. Fittings and pipe to be wrapped shall be thoroughly cleaned of material foreign to pipe manufacturer.
 - ii. Install one coat of Plicoflex No. 105 or Protecto Wrap No. 1170 adhesive primer to metal.
 - iii. Wrap pipe and fittings with a minimum thickness of 3/32 inch of Plicoflex No. 310 pipe line butyl molding tape, or Protecto Wrap No. 200 molding tape. Install 3 layers, each layer overlapping next approximately 2/3 width of tape, without stretching. Tape and primer shall be of the same manufacturer.
 - iv. Wrap vinyl tape, 10 mil thickness, over molding tape with 1 inch minimum overlap.
 - v. Manufacturer: J.M. Trantex, 3M Scotchwrap or equal.
5. Pipe and fittings specified to be wrapped shall be tested with a holiday detector, after pipe has been installed in trench and before backfilling, in presence of the Project Inspector. Furnish a Tinkler and Raser model E-P holiday detector, or similar equipment for this test. Work, which is deemed defective, shall be repaired or replaced. The Project Inspector may test for damaged pipe wrapping after backfilling.

6. Instead of wrapping underground steel pipe as specified above, pipe may be machine-wrapped before delivery to the Project site as follows:
 - a. Pipe shall be cleaned of moisture, oil, grease, scale, and other foreign material by cleaning with non-oily solvent and wire brushing. Remove metal burrs and projections.
 - b. Install one coat of Plicoflex No.105 adhesive primer to cleaned pipe. If thinning is required, furnish only non-oily thinners as recommended by tape manufacturer.
 - c. Wrap coated pipe with Plicoflex No.340-25 tape (15 mil butyl and 10 mil vinyl laminate) Tape shall be installed by machine wrapping at approved plant only. Maintain tension (minimum of 5 pounds per inch of width) on tape over entire diameter of pipe. Tape shall be permanently identified and visible on vinyl side.
 - d. Fittings, unprotected pipe, and damaged pipe protection shall be wrapped as indicated above.
- Q. Flanges: Flanges shall be furnished and installed at each flanged connection of each type of equipment, tanks, and valves. Faces of flanges being connected shall be furnished alike. Connection of a raised face flange to a flat-faced flange is not permitted. Flanges shall conform to following schedules:
 1. Gasket material for flanged connections shall be full faced or ring type to suit facing on flanges and shall be furnished in accordance with following schedule:

Grooved end flange adapters supplied with pressure responsive elastomeric Gaskets supplied with grooved flange adapters shall be pre-lubricated by the manufacturer. Grade of gasket to suit intended service.
- R. Unions:
 - a. Unions shall be furnished and installed in accordance with the following requirements (unless flanges are furnished):
 - i. At each threaded or soldered connection to equipment and tanks, except in Freon or fuel gas, piping systems, whether indicated or not.
 - ii. Immediately downstream of any threaded connection to each manually operated threaded valve or cock, and each threaded check valve, yard box or access box except those in Freon piping systems, whether indicated or not.
 - iii. At each threaded connection to threaded automatic valves (except those in Freon piping systems) such as reducing valves and temperature control valves, whether indicated or not.
 - iv. If grooved piping is used, couplings shall serve as unions. Additional unions are not required

- b. Unions shall be located so that piping can be easily disconnected for removal of equipment, tank, or valve.

PART 3 – EXECUTION

3.01 EXAMINATION

- A. Examine areas and conditions under which Work of this Section shall be performed. Correct conditions detrimental to proper and timely completion of Work. Do not proceed until unsatisfactory conditions have been corrected.

3.02 INSTALLATION

- A. Provide all materials and equipment for the Work. Furnish and install necessary apparatus, parts, materials, and accessories.
- B. Pipe Installation:
 1. Install piping parallel to wall and provide an orderly grouping of proper materials and execution.
 2. Piping shall clear obstructions, preserve headroom, provide openings and passageways clear, whether indicated or not. Verify the Work of other Divisions to avoid interference.
 3. If obstructions or the Work of other Divisions prevent installation of piping or equipment as indicated by the Drawings, perform minor deviations as required by the ARCHITECT.
 4. Install piping after excavation or cutting has been performed. Piping shall not be permanently enclosed, furred in, or covered before required inspection and testing is performed.
 5. Exposed polished or enameled connections from fixtures or equipment shall be installed with no resulting tool marks or threads at fittings. Residue or exposed pipe compound shall be removed from exterior of pipe.
 6. Piping shall be concealed in chases, partitions, walls, and between floors, unless otherwise directed or specifically noted on Drawings. When penetrating wood studs, joists, and other wood members, provide such members with reinforcement steel straps of Continental Steel & Tube Co., ULINE, Independent Metal Strap, or equal.
 7. Reduce fitting where any change in pipe size occurs. Bushings shall not be furnished unless specifically reviewed by the ARCHITECT, or indicated on Drawings.
 8. Piping subject to expansion or contraction shall be anchored in a manner, which permits strains to be evenly distributed. Swing joints or expansion loops shall be installed. Seismic restraints shall be installed so as not to interfere with

expansion and contraction of piping. Seismic loops required at all building separations.

9. Immediately after lines have been installed, openings shall be capped or plugged to prevent entrance of foreign materials. Caps shall be left in place until removal is necessary for completion of installation.
10. Couplings shall not be installed except where required pipe runs between other fittings are longer than standard length of type of pipe being installed and except where their installation is specifically reviewed by the ARCHITECT.
11. Water piping shall be installed generally level, free of traps, unnecessary offset, arranged to conform to building requirements, clear of ducts, flues, conduits, and other Work. Piping shall be arranged with valves installed to provide for complete drainage and control of system. Piping shall not be installed which causes an objectionable noise from flow of water therein under normal conditions. Refer to Section 23 0500: Common Work Results for Plumbing.
12. Water lines may be installed in same trench with sewer lines, provided bottom of water line is 12 inches minimum above top and to the side of sewer line.
13. Changes in pipe sizes shall be furnished with eccentric reducers, flat on top. Offsets to clear obstruction shall not be installed so as to produce air pockets.

C. Pipe Sleeves and Plates:

1. Provide pipe sleeves of Schedule 40 black steel pipe or Schedule 40 PVC plastic pipe in concrete or masonry walls, footings, and concrete floors below grade. Provide adjustable submerged deck type sleeves at locations where pipes pass through concrete floors, except concrete slab floors on grade, and at locations where soil pipe for floor type water closets passes through concrete floors.
2. Sleeves shall provide ½ inch clearance around pipes, except plastic pipe shall have 1 inch clearance. Caps of deck type sleeves shall be removed just prior to installation of pipe. Area around sleeves shall be smooth and without high or low spots. Sleeves in walls shall not extend beyond exposed surface of wall. Sleeves in concrete floors and walls shall be securely fastened to forms to prevent movement while concrete is being placed.
3. Piping installed on a roof shall clear the roof surface by 10 inches minimum, with or without insulation. Bottom of individual fittings may infringe on 10 inches clear space but not groups of fittings or fittings located within 27 inches of each other.
4. Stiles shall be provided to facilitate crossing of piping when parallel piping runs are laterally greater than 12 inches out-to-out, or any pipe is higher than 18 inches, and more than 40 feet long or runs between two or more major pieces of equipment or housings greater than 20 feet apart. Stiles shall be not less than 20 inches wide with a minimum tread depth of 10 inches. Where

stiles are required, they shall be located so greatest obstructed distance is 30 feet.

5. Where pipes pass through waterproofed walls, floors, or floors on grade, sealant with Link-Seal Modular Seals, or equal, between pipe and sleeve to provide a waterproof joint. Where earth is in contact with pipe on both sides of a wall or foundation, the waterproof joint is not required. Commercial rubber compression units may be furnished instead of sealed sleeves if reviewed by the ARCHITECT.
6. A swing joint, or other required device, shall be furnished and installed in hot water lines with 10 feet of sealant or compression joint to allow for expansion.
7. Provide polished, chrome-plated flanges when plumbing pipes pass through walls at plumbing fixtures, etcetera as specified in Section 22 1000 Plumbing. Provide polished steel, chromium-plated split floor and ceiling plates at locations where pipes pass through walls, floors, ceilings, and partitions in finished portion that neatly conceals pipe insert.
8. Pipe sleeves shall be provided where pipes intersect footings or foundation walls and sleeve clearances shall provide for footing settlement, but not less than one inch all around pipe.

D. Welding of Pipe and Qualifications of Welder:

1. Joints above grade or accessible conduit or tunnels in steel piping may be either welded or screwed unless specifically indicated otherwise on Drawings or specified. Joints in below grade steel piping, whether in insulation or not, shall not be welded, unless otherwise indicated.
2. Welded joints in pipe shall be continuous around pipe and shall comply with ASME B31: Code for Pressure Piping, unless otherwise specified.
3. Each pipe weld shall be stamped with welder's identification mark. Welding shall be performed by welders possessing a valid certificate of qualification for welding carbon steel welding pipe in horizontal position (2G) and horizontal fixed position (5G) in accordance with the requirements of Section IX of the ASME Boiler and Pressure Vessel Code, by an approved testing laboratory.
4. Before any welder performs welding on the Work, furnish the INSPECTOR with a copy of welder's valid qualification papers and obtain verification. Welder qualification is not valid unless it has been issued while welder was performing work for current employer, and has performed type of work described by qualification in the preceding 3 months.
5. Welding performed under these Specifications is subject to special tests and inspections including rigid Ultra Sonic Testing (UT) and radiographic inspection at random, in accordance with Technique for Radiographic Examination of Welded Joints by an approved testing laboratory.

E. Unacceptable Welds and Repairs to Welding:

1. Welds containing any of the following types of imperfections shall be deemed defective Work:
 - i. Cracks of any type.
 - ii. Zones of incomplete (in excess of 1/32 inch) fusion or penetration.
 - iii. Elongated slab inclusions longer than 1/4 inch.
 - iv. Groups of slag inclusions in welds having an aggregate length greater than thickness of parent metal in a length 12 times the thickness of the parent metal.
 - v. Undercuts greater than 1/32 inch.
 - vi. Overlaps, abrupt ridges or valleys.
 2. When a defective weld is detected by examination as outlined above, two additional welds shall be radiographed at locations selected by the Project Inspector. If the two selected welds demonstrate compliant welding, then the two tested welds shall be deemed to be in compliance. Welding revealed by radiographs to be defective Work shall be removed, repaired, and tested by radiograph.
 3. If either of the two selected welds demonstrates welding deemed to be defective Work, all welding in that portion of the Work shall be deemed defective Work and either: all welds shall be cutout, prepare new ends for welding and weld to comply with this Specification, or radiograph all welds, removing and repairing only such welding deemed to be defective Work.
 4. Repair welding shall be performed in a manner in full compliance with ASME B31. The welded joints or repairs shall be spot examined with UT or radiographic tests in accordance with foregoing requirements.
 5. Installer shall be responsible for the costs of UT and radiographic re-examinations of welds deemed defective Work and not in compliance with this Specification, and shall repair or replace said welds in accordance with specified requirements.
- F. Qualification Tests for Low-pressure Welding:
1. Tests shall be performed on 3-inch standard weight pipe ASTM A53, Grade A, and shall be welded by acetylene and electric arc. Each sample shall consist of 2 pieces, each 10 inches long, with 30-degree bevel at point weld.
 2. Two 20-inch samples shall be performed in the 2G and two 20-inch samples in the 5G positions, with positions defined in Section IX, ASME Boiler and Pressure Vessel Code. Welds shall have the reinforcement ground or machined flush to the surface of the pipe before testing. Samples shall be tested as full section tensile.
 3. Weld shall develop a load of 90 percent of 50,000 psi, i.e., 45,000 psi or shall develop a fracture in parent metal.

4. Each qualified welder shall carry an identification card listing welder's name, date of test, and type of welding tests passed; signed by the welder and the laboratory.
 5. A valid certificate of qualification issued in compliance with requirements of the ASME Boiler Pressure Vessel Code Section IX shall qualify a welder for issuance of a certificate for low-pressure pipe welding.
- G. Pipe Joints and Connections:
1. Pipe and tubing shall be cut per IAPMO Installation Standards. Pipe shall have rough edges or burrs removed so that a smooth and unobstructed flow shall be provided.
 2. Hot tapping of gas lines is strictly prohibited.
 3. Threaded Pipe: Joints in piping shall be installed according to the following service schedule:
 - i. Soap Piping: Litharge and glycerine, or Expando, Gasoila, or equal.
 - ii. Plastic Piping: Teflon pipe joint compound tape.
 - iii. Oxygen Piping: Wash treads with S.P., rinse, blow-dry and apply litharge and glycerine.
 - iv. Cleanout Plugs: No compound shall be used. After inspection and test, plugs shall be removed, cleaned, greased, and replaced.
 - v. Other services furnish sealant, suitable and as reviewed by the ARCHITECT.
 4. Threads on pipe shall be cut with sharp, clean, unblemished dies and shall conform to ANSI/ASME B2.1 for tapered pipe threads.
 5. Joint compounds shall be smoothly placed on male thread and not in fittings. Threaded joints shall be installed tight with tongs or wrenches and sealant of any kind is not permitted. Failed joints shall be replaced with new materials. Installation of thread cement or sealant to repair a leaking joint is not permitted.
 6. Sharp-toothed Stillson, or similar wrenches, is not permitted for the installation of brass pipe or other piping with similar finished surfaces.
- H. Copper Tubing and Brass Pipe with Threadless Fittings:
1. Silver brazed joints shall be used for attaching fittings to non-ferrous metallic refrigerant piping.
 2. Non-pressure gravity fed condensate lines may be soldered with 95/5 solder.
 3. Silver brazing alloy, Class BCUP-5. Surfaces to be joined shall be free of oil, grease, and oxides. Socket of fitting and end of pipe shall be thoroughly cleaned with emery cloth and wiped to remove oxides. After cleaning and before assembly or heating, flux shall be installed to each joint surface and

spread evenly. Heat shall be applied in accordance with instructions in the Copper Tube Handbook issued by Copper Development Associates. Joints constructed of rough bronze fittings shall be provided as recommended by manufacturer.

4. Do not overheat piping and fittings when installing silver brazing.
5. Joints in non-ferrous piping for services not covered above shall be installed with solder composed of 95/5 tin/antimony, ASTM B32, Grade 5A. Surfaces to be jointed shall be free of oil, grease, and oxides. Sockets of fitting and end of pipe shall be cleaned with emery cloth to remove oxides. Solder flux shall be sparingly installed and solder added until joint is completely filled. Do not overheat. Excess solder, while plastic, shall be removed with a small brush in order to provide an uninterrupted fillet completely around joint. Random inspection of joints shall be conducted by Project Inspector to ensure joints are lead-free.
6. Grooved end joints for copper piping shall be assembled in accordance with the latest manufacturer recommendations. Pipe ends shall be clean and free from indentations, projections, and roll marks in the area from pipe end to groove for proper gasket sealing. Grooving tools shall be as manufactured by Victaulic, RIDGID, MAG Tool, or equal.
7. Pressed fittings for copper or copper alloy pipe or tubing shall have an elastomeric O-ring that forms the joint. The pipe or tubing shall be fully inserted into the fitting, and the pipe or tubing marked at the shoulder of the fitting. Pipe or tubing shall be cut square, mechanically cleaned and reamed prior to joining to remove all burrs (interior and exterior) and restore full inside diameter and a smooth, chamfered exterior surface. The fitting alignment shall be checked against the mark on the pipe or tubing to ensure the pipe or tubing is inserted into the fitting. The joint shall be pressed using the tool recommended by the manufacturer.
 - a. Press Installation Training Requirement: Installation training shall be provided on site by manufacturer personnel and documented with Engineer. Installation procedures, depth guides, and tool inspection shall be provided by manufacturer for all product types (steel or copper) for reference and safety assurance.
- I. Ring-Type Pipe: Joints shall be installed in accordance with manufacturer's instructions with grooved couplings, fittings and rubber rings. Couplings and pipe shall be compatible and of the same manufacturer. Rings shall be accurately located and installed by grooves in coupling. Pipe shall be installed with zero deflection unless otherwise specified. Pressure pipe shall be furnished with thrust blocks at each offset point.
- J. Welded Pipe Joints:

1. Joints in welded steel pipelines shall be installed by oxyacetylene or electric arc process. Welding shall be continuous around pipe and provided as specified.
 2. Butt welds shall be of the single V-type, with ends of pipe and fittings beveled approximately 37 ½ degrees. Piping shall be aligned before welding is started with the alignment maintained during welding.
 3. Welds for flanges and socket fittings shall be of the fillet type with a throat dimension not less than pipe wall thickness.
- K. Grooved End Pipe Joints: Grooved end joints for carbon steel piping shall be assembled in accordance with the latest manufacturer recommendations. Pipe ends shall be clean and free from indentations, projections, and roll marks in the area from pipe end to grove for proper gasket sealing. Grooving tools shall be as manufactured by Victaulic, RIDGID, MAG Tool, or equal.
- L. Underground Gas Service Polyethylene (Plastic) Pipe:
1. Joints shall be installed by the heat fusion method, in accordance with manufacturer's recommendations and IAPMO installation standard IS 12, for natural gas.
 2. Pipe Riser at Meter, Regulator and Building Wall: Prefabricated, anodeless type, utilizing a grade level transition between underground polyethylene pipe and gas supply steel pipe of riser outlet, GF Piping Systems, or equal. Below grade to above grade transition shall be installed in a welded, epoxy coated, steel casing.
 3. Connections to Existing Pipe Line or Branch:
 - a. Steel-to-plastic (PE): Provide manufacturer's prefabricated standard transition fitting, transition from epoxy-coated steel pipe to plastic, R. W. Lyall Co., or equal.
 - b. Plastic-to-plastic, PVC to PE: Provide manufacturer's prefabricated standard transition fitting, transition from PVC to epoxy-coated steel pipe to PE; R.W. Lyall Co., or equal.
 - c. Plastic-to-plastic, PE to PE: Provide manufacturer's standard fused tapping tee assembly with shut-off feature.
 4. Provide PE reinforcing sleeves where PE pipe is fused to multi-saddles, service punch tee, reducing tees, transition fittings and anodeless risers.
- M. Valves: Valves shall conform to the following:
1. Piping systems shall be furnished with valves at points indicated on Drawings and specified, arranged to provide complete regulating control of piping system throughout building and the Project site.
 2. Valves shall be installed in a neat grouping, so that parts are easily accessible and maintained.

3. Valves shall be full size of line in which they are installed, unless otherwise indicated on Drawings or otherwise specified, and shall be one of types specified.
 4. Provide chain operators on valves 2-inch and larger located 7 feet or more above the servicing floor level.
 5. Valves for similar service shall be of one manufacturer.
 6. Except where otherwise specified, valves shall be Apollo, Belimo, Victaulic, Stockham, Crane, Jenkins, Milwaukee, Hammond, American, NIBCO, Hoffman, or equal.
 7. Ball valves below grade in yard boxes shall have stainless steel handles.
 8. Safety valves and pressure relief valves shall have stamp of approval as required by ASME and shall be provided with annual test lever. Where a hot water storage tank is heated by means of a coil, pressure relief valve shall have a steam BTU discharge rating of the coil. Discharge pipe from safety or pressure relief valves shall be not less than one pipe size larger than inlet pipe size of valve. Discharge pipe shall terminate as indicated and shall be free of traps. In addition to locations specified, pressure relief valves shall be installed in the following locations:
 - a. On discharge side of each pressure-reducing valve.
 - b. On each water heater connected to a hot water storage tank and other pressure vessels.
 - c. On cold water line to each water heater or hot water storage tank when there is a check valve, backflow prevention valve or similar device between water heater or hot water storage tank and meter or relief valve at the pressure reducing valve assembly.
 - d. On discharge side of each air compressor.
 - e. On each air receiver connected to an air compressor.
 9. Temperature relief valves and combination temperature and pressure relief valves shall be as specified and furnished as set forth in this Section. Discharge pipe from relief valves shall be not less than discharge area of valve or valves it connects, based on discharge area of valves, and shall terminate as indicated and free of any traps. Valves shall be installed at following locations:
 10. A combination temperature and pressure relief valve or combination of valves on each heating hot water storage tank. Temperature sending element shall extend into water inside tank.
- N. Strainers: Strainers shall be installed on each water main (except for fire line) downstream of the meter, above grade, when a pressure regulator assembly is not installed. Main strainer shall be of Y-flange or groove type. On closed loop chilled and heating hot water systems pump systems, a strainer shall be installed at each pump

inlet and upstream of each flow control valve assembly. The control valve assembly may include a modulating temperature control valve and a flow-limiting valve, manufactured by Griswold, AutoFlow, Flow Control Industries, Inc., or equal.

O. Hangers and Supports:

1. Piping shall be securely fastened to building structure by approved iron hangers, supports, guides, anchors, and sway braces to maintain pipe alignment to prevent sagging and to prevent noise or excessive strain on piping due to uncontrolled or seismic movement under operating conditions. Hangers and supports shall conform to Manufacturer's Standardization Society Specification SP-69. Hangers shall be relocated as required to correct unsatisfactory conditions that may become evident when system is placed into operation. Appliances, heat exchangers, storage tanks, and similar equipment shall be securely fastened to structure in accordance with seismic requirements. Outdoor metal hangers and supports shall be hot-dipped galvanized steel, unless otherwise specified.
2. Hose faucets, compressed air outlets, and similar items at ends of pipe branches shall be rigidly fastened to building construction near point of connection.
3. Piping shall not be supported by wire, rope, wood, plumbers' tape, or other non-recognized devices.
4. Hangers and supports shall be designed to support weight of pipe, fittings, weight of fluid and weight of pipe insulation, and shall have a minimum factor of safety of five, based on ultimate tensile strength of material installed.
5. Burning or welding of any structural member under load is not permitted. Field welding not specified on Drawings or reviewed Shop Drawings is not permitted without review by ARCHITECT.
6. Burning holes in beam flanges or other structural members is not permitted without review by the ARCHITECT.
7. Pipe hangers on piping covered with low temperature insulation shall be installed on outside of insulation and not in contact with pipe unless otherwise detailed on Drawings. Insulation shall be protected by 18 gage galvanized steel shield, with a minimum length of 10 inches, installed completely around pipe covering between covering and hanger. Installing hangers directly on pipe and butting adjoining sections of insulation against hanger is permitted provided void and hanger rod are properly insulated and sealed so that no sweating occurs at hangers.
8. Hanger rods shall be fastened to structural steel members with suitable beam clamps. Clamps shall be Tolco, Carpenter & Patterson, Fee and Mason, or equal, as follows:
 - a. Tolco I beam, Fig.62 for maximum 1000 pounds.

- b. Tolco I or WF beam, Fig. 329, for maximum of 1290 pounds.
9. Hanger rods shall be fastened to concrete inserts in concrete slabs or beams. Inserts shall be Tolco, Carpenter & Patterson, Fee and Mason, or equal, as follows:
 - a. Tolco Fig.310 for maximum of 600 pounds.
 - b. Tolco Fig. 309 for maximum of 1140 pounds.
10. For fastening to wood ceilings, beams, or joists, furnish Grinnell Fig. 128R, Grinnell Fig. 153, Tolco 78, or equal pipe hanger flange fastened with drive screws. Under wood floors, 3/8 inch hanger rods shall be hung from 2-inch by 2-inch by 1/4 inch angle clips 3 inches long, with 2, staggered 10d nails, clinched over joist.
11. Pipe hanger rod sizes: 3/8-inch for pipe sizes 1/2-inch through 4-inch, 1/2-inch for pipe sizes 5-inch through 8-inch, and 5/8-inch for pipe size 10-inch through 12-inch.
12. Where rod hangers are used with a diameter greater than 3/8-inch, they shall be equipped with swivels or eye nuts to prevent bending in the rod.
13. Turnbuckles, if furnished, shall provide a load carrying capacity equal to that of the pipe hanger with which they are being installed.
14. Pipe hangers shall be of same size, or nearest larger manufactured size available, as pipe or tubing on which they are being installed.
15. Hangers, clamps, and guides furnished for support of non-metallic pipe shall be padded with 1/8 inch thick rubber, neoprene, or soft resilient cloth.
16. Where special pipe-supporting requirements in the Specifications conflict with any standard requirements specified herein, the Specification requirements shall govern.
17. Vertical Piping:
 - a. Vertical pipe risers shall be securely supported with riser clamps of recognized type. Risers in reinforced concrete buildings shall be furnished with extension clamps fastened to pipe above each concrete floor slab with extended arms of clamp to rest on slab. Clamps shall be provided with lead or Teflon liners when installed on copper tubing. Clamps shall be plastic-coated when installed on non-ferrous pipe or tubing.
 - b. Copper tubing in sizes 1 1/2-inches and larger and steel pipelines passing up through building shall be supported at each floor of building or every 15 feet whichever is less.
 - c. Copper tubing sizes 1 1/4-inches and smaller shall be supported at not intervals not more than 6 feet on center. Special provisions shall be

installed for vertical lines subject to expansion and contraction caused by operating temperature differences.

- d. Vertical cast iron pipelines shall be supported from each floor and at its base. Malleable iron or steel pipe clamps with minimum thickness of 1/4 inch shall be furnished and fastened around pipe for support.

18. Horizontal Piping:

- a. Roof Mounted Piping: Pressure and non-pressure piping shall be supported from channels, stands, clamps, trapezes, rollers, or structures mounted on 100% rubber, UV resistant rooftop supports with reflective strips, Dura-Block, or equal. Roller type supports shall be provided below and above pipe to prevent its dislodgement. Bottom of pipes shall clear the roof surface by 10 inches.
- b. Insulated steam and space heating hot water insulated condensate lines, insulated domestic hot water supply and return piping shall be supported with Tolco Figure 4, B-Line Figure B3140, Grinnell Figure 212, or equal, steel hangers with welded eye rods to permit hinge movement at point of attachment of hangers. Hinge movement at point of support shall be provided by welded eye linked rods Tolco Figure 101L, B-Line Figure B3211X, Grinnell Figure 278, or equal.
- c. Domestic cold water piping, water supply and return piping, condenser water piping, insulated refrigerant piping gas piping, compressed air piping, cast iron soil piping, galvanized steel vents, waste and downspout piping and glass to be supported with Tolco Figure 1, B-Line Figure B3100, Grinnell Figure 260, or equal, hangers with rods, turnbuckles and inserts suitable for above hangers.
- d. Maximum hanger and support spacing shall conform to CPC schedule for horizontal piping installed above grade.

19. A hanger or support shall be installed close to the point of change in direction of a pipe run, in either a horizontal or vertical plane.

20. When practicable, supports and hangers for cast iron soil pipe shall be installed as close as possible to joints and when hangers or supports are not located within one foot of a branch line fitting, an additional hanger or support shall be installed at fitting.

21. In systems where grooved piping is used, couplings shall be provided with angle pattern bolt pads to comply with support and hanging requirements of ANSI/ASME B31.1, ANSI/ASME B31.9, and NFPA Pamphlet 13.

P. Flashings:

1. Each pipe, duct, or gas-fired equipment vent passing through roof shall be installed with waterproof flashing.

2. Flashing or flanges on pipes, vents, and ducts passing through a tile or slate roof shall be constructed of sheet lead. Flashing for pipes and heater vents passing through a roof shall be 4 pound soft sheet lead. Flashing and flanges for ducts and heater vents passing through exterior walls shall be 22 gage sheet metal. Install caps on top of heater pipes. Flanges and flashing shall be installed waterproof at point of connection with pipe or duct by welding. No soldered joints on roof flashings will be allowed. No Stoneman lead roof flashings will be allowed.
 3. Lead flashing and flanges shall be constructed of 4 pound sheet lead with burned joints. Flange of lead flashing or lead flange on a duct shall extend out onto roof a minimum of 12 inches from pipe or duct. Lead flashing shall extend up the pipe or duct not less than 8 inches.
 4. Sheet metal flashing shall be constructed of 24 gage galvanized sheet steel. Flanges on these flashings shall extend out onto roof a minimum of 10 inches from pipe or duct. Flanges on ducts through exterior walls shall extend out from duct a minimum of 2 ½ inches. Flanges on gas-fired equipment single-wall vents shall be of ventilated type. Type B gas vents through a roof shall be furnished with non-ventilated flashing as per NFPA Pamphlet 211.
 5. Cast iron, steel, brass, and copper pipe, which terminates less than 18 inches above roof, shall be furnished with a combination counter-flashing and vandal-proof hood for protection against water, birds and foreign matter. Cast iron, steel, brass and copper pipe, which does not terminate within 18 inches of roof, shall be furnished with a counter-flashing sleeve. Pipe, which terminates more than 18 inches above roof, shall be furnished with protection against entrance of water, birds, and foreign matter.
 6. Counter-flashing and combination counter-flashing sleeves and vandal-proof hoods shall be cast iron, vandal-proof, threaded, sealed or approved gas-heated sleeve type. Counter-flashing sleeves on each of these items shall extend down over flashing a minimum of ¾ inch.
 7. Storm collars shall be securely screwed and installed waterproof around appliance vent pipe immediately above flashing.
 8. Vent piping above roof shall be furnished with a combination counter-flashing sleeve and vandal-proof hood.
- Q. Equipment Installation: Install water heater on level platforms, 4-inch housekeeping pads or curbs and provide sound, vibration and seismic control measures per Section 23 0548 even if not indicated on Drawings.

END OF SECTION

SECTION 22 05 53 PLUMBING IDENTIFICATION

PART 1 – GENERAL

1.01 SUMMARY

- A. Section Includes: Marking and identification on mechanical plumbing piping systems, controls, valves, and apparatus.
- B. Related Requirements:
 - 1. Division 01: General Requirements
 - 2. Section 22 05 13: Basic Plumbing Materials and Methods.
 - 4. Section 22 10 00: Plumbing.

1.02 SUBMITTALS

- A. Submit in accordance with Division 01 and Section 22 05 00: Common Work Results for Plumbing.
- B. Submit product data and installation instructions for each item specified.

1.03 QUALITY ASSURANCE

- A. Comply with provisions of:
 - 1. Section 22 05 00: Common Work Results for Plumbing.
 - 2. ANSI/ASME A13.1: Scheme for the Identification of Piping Systems.
 - 3. APWA: Uniform Color Code.
 - 4. IAPMO: Uniform Plumbing Code (UPC)

PART 2 – PRODUCTS

2.01 MATERIALS

- A. General: Piping systems, controls, valves, apparatus, etc., except those that are installed in inaccessible locations in partitions, walls, and floors, shall be permanently identified.

2.02 VALVES

- A. Furnish prepared chart or diagram for each piping system, indicating by identifying letter or model number of each valve in the system, its location, and function.
- B. Install charts in aluminum frame with clear glass front and secure on wall.
- C. Bind copies of each chart in operating instructions manual.
- D. Provide each valve with a brass, aluminum, or plastic disc, not less than 1-1/4 inches diameter bearing engraved numbers corresponding to those indicated on chart. Fasten discs to valve with No. 14 brass wire.

- E. Provide an additional tag for safety valves and other valves that could be hazardous to safety and health of occupants. Distinguish these tags from regular valve tags by color (such as yellow with black letters and marked "Danger").

2.03 INSTRUMENTS AND CONTROLS

- A. Identify panel-mounted instruments and controls with engraved bakelite nameplates permanently affixed to panel boards.
- B. Identify alarm indicating devices and alarm reset devices by nameplates.
- C. Identify automatic valves, flow switches, and pressure switches, with embossed aluminum or plastic tape affixed to controller, indicating service and setting.

2.04 EQUIPMENT

- A. Identify each major piece of equipment with engraved bakelite nameplates permanently affixed to the equipment, indicating the room numbers it services, Equipment identification designation shall be the same to its designation indicated on the "As-Built Drawings". Room numbers in the nameplates shall correspond to the final room numbers.

2.05 ABOVE GRADE PIPE IDENTIFICATION

- A. Identify pipes by means of colored labels with directional flow arrows and identification of the pipe content, in conformance to ANSI/ASME A13.1 or the UPC.
- B. Materials: Precoiled acrylic plastic with clear polyester coating, all-temperature, self-adhering, as manufactured by Brady, Brimar Industries, Seton, Stranco, Inc., or equal.
- C. Size:

Outside Diameter of Pipe or Insulation (in inches)	Length of Color Field (in inches)	Size of Letter (in inches)
¾ to 1 ¼	8	½
1 ½ to 2	8	¾
2 ½ to 6	12	1 ¼
8 to 10	24	2 ½
over 10	32	3 ½

- D. Locations:
 - 1. On accessible piping, whether insulated or not (including mechanical rooms, attic and ceiling spaces); except that labels shall be omitted from piping where

- contained material is obvious due to its connection to fixtures (such as faucets, water closets, etcetera.).
2. Near each valve and branch connection in such accessible piping.
 3. At each pipe passage through wall or floor.
 4. At not more than 20 feet spacing on straight pipe run between bands required in 2 and 3 above.
 5. At each change in direction.
- E. Application: Install on clean surfaces free of dust, grease, oil, or any material that will prevent proper adhesion. Replace non-adhering or curling labels with new labels.
- F. Color Schedule:

Content of Pipe	Legend	Background Color	Lettering Color
Domestic cold water	Domestic. C.W.	Green	White
Domestic hot-water 140°F	Domestic H.W. 140°F	Blue	Black
Sanitary waste	San waste	Green	White
Sanitary vent	San vent	Green	White

PART 3 – EXECUTION

3.01 INSTALLATION

- A. Correct detrimental conditions prior to commencing the Work of this Section. Install markers and identification tags as specified with materials and installation procedures recommended by manufacturer.
- B. Install underground detectable pipe marking tape continuously buried 8 to 10 inches above the buried utility pipe. Wrap tape on pipe risers up to a height of 12 inches above grade.

3.02 CLEANUP

- A. Remove rubbish, debris, and waste materials and legally dispose of off the Project site.

END OF SECTION

SECTION 22 07 00 PLUMBING INSULATION

PART 1 – GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Insulation for plumbing piping.
- B. Related Requirements:
 - 1. Division 01: General Requirements.
 - 2. Section 22 05 00: Common Work Results for Plumbing.
 - 3. Section 22 05 13: Basic Plumbing Materials and Methods.
 - 4. Section 22 05 53: Plumbing Identification.
 - 5. Section 22 10 00: Plumbing.

1.02 REFERENCES

- A. American Society for Testing and Materials International (ASTM):
 - 1. ASTM C302 - Standard Test Method for Density and Dimensions of Preformed Pipe-Covering-Type Thermal Insulation.

- C. National Fire Protection Association:
 - 1. NFPA 255 - Standard Method of Test of Surface Burning Characteristics of Building Materials.
- D. California Code of Regulation Title 24.
 - 1. California Green Building Standards Code.

1.03 SUBMITTALS

- A. Submit in accordance with Division 01 and Section 22 05 00: Common Work Results for Plumbing.
 - 1. Complete material list of items to be furnished and installed under this Section.
 - 2. Manufacturer's specifications and other data required demonstrating compliance with the specified requirements.
 - 3. Shop Drawings, catalog cuts and manufacturer's data indicating insulation, jacketing, adhesives, and coating. Insulating materials shall be certified by manufacturer to comply with the California quality standards for insulating materials.
 - 4. Manufacturer's recommended method of installation procedures, which will become part of this Section.

1.04 QUALITY ASSURANCE

- A. Qualifications of Manufacturer and Installer, Materials, Fabrication, Execution, and Standard of Quality: Comply with provisions stated under Section 22 05 00: Common Work Results for Plumbing and Section 22 05 13: Basic Plumbing Materials and Methods.
- B. Insulation Work shall be in accordance with the California Building Energy Efficiency Standards, CBC, and the California Green Building Standards Code.
- C. Test Ratings:
 - 1. Comply with provisions stated under Section 22 05 00 and 22 05 13 with emphasis on ASTM E84, NFPA 255, or UL 723. ASTM C167, ASTM C302, UL label or listing of satisfactory test results from the National Institute of Standards and Technology, or a satisfactory certified test report from an acceptable testing laboratory. Approval by the State Fire Marshal is required.
 - 2. Furnish labels, legibly printed with the name of the manufacturer or listings indicate that fire hazard ratings do not exceed those specified for materials proposed for installation. Flame spread index of not more than 25 and smoke developed rating not exceeding 50.
 - 3. Tests shall be performed on each item individually when insulation, vapor barrier covering, wrapping materials, or adhesives are installed separately at the Project site.
 - 4. Test insulation, vapor barrier covering, wrapping materials and adhesives as an assembly when they are factory composite systems.
- D. Regulatory Requirements: Insulation furnished and installed under this Section shall meet minimum legal requirements of the Building Energy Efficiency Standards adopted and incorporated in the California Energy Commission, Title 24, Part 2, Chapters 2 through 53 and the California Green Building Standards Code unless otherwise noted, for the piping,
- E. Chemically based products such as sealers, primers, fillers, adhesives, etcetera must meet the California air quality regulations.

1.05 PRODUCT HANDLING

- A. Protection, Replacement, Delivery and Storage: Comply with provisions stated under Sections 22 0500: Common Work Results for Plumbing and 22 05 13: Basic Plumbing Materials and Methods.

PART 2 – PRODUCTS

2.01 MATERIALS

- A. General:
 - 1. Insulating material shall be fire resistant, non-corrosive, shall not break, settle, sag, pack or disintegrate under vibration, nor absorb more than 1 percent moisture by weight.
 - 2. Insulating material shall be furnished with thickness indicated in Table 1, and shall furnish thermal resistance in the range of R-4.0 to 4.6 in accordance with inch at 75 degrees F. For any other value of R, insulation thickness shall be calculated accordingly and submitted for review.
 - 3. Provide insulation materials, adhesives, coatings, sealants, fitting covers, and other accessories with a fire hazard rating not to exceed 25 for flame spread, 25 for fuel contributed and 50 for smoke developed, except for materials listed as follows:
 - a. Nylon anchors for installing insulation to equipment.
 - b. Treated wood blocks.
 - 4. Flame-proofing treatments subject to moisture damage are not permitted.

TABLE 1 - MINIMUM PIPING INSULATION THICKNESS ⁽¹⁾

Insulation Thickness Required (in inches)

Piping System Type	Temp. Range (degrees F)	Runouts up to 2 ⁽²⁾	1 and less	1.25 to 2	2.5 to 4	5 to 6
Domestic Hot Water, and Recirculated Line	Up to 180	0.5	1.0	1.0	1.5	1.5

- B. Lagging Adhesives: Shall be nonflammable and fire-resistant and shall have a maximum flame spread index of 25 and a maximum smoke developed index of 50 when tested in accordance with ASTM E84. Insulation finished with canvas shall be provided with laps adhered in accordance to manufacturer’s recommendation. A finish coat of same material shall be applied to entire outer surface of lagging cloth at coverage specified by manufacturer.
- C. Canvas Jackets: Provide 6 ounce, in accordance with square foot minimum, 48 by 48 thread count canvas jacketing.

D. Insulation Jackets:

1. Exterior insulation exposed to weather shall be weatherproofed with Childers aluminum jacketing as basis of design, or Pabco, RPR, or equal. Jacketing shall be manufactured from 1100, 3105 or 5010 aluminum alloy with 3/16 inch corrugations. Smooth or embossed jackets may be permitted in special situations to match an existing installation. Jacketing shall be furnished with an integrally bonded moisture barrier over entire surface in contact with insulation. A minimum thickness of 0.016 aluminum jacketing is to be provided on ducts and piping. A minimum thickness of 0.020 shall be provided on tanks, equipment, and heat exchangers.
2. Insulated elbows, of 90 degrees and 45 degrees, with a nominal iron pipe size of ½ inch to 8-inch shall be provided with Childers aluminum Ell-Jacs insulation covers as basis of design, or Pabco, RPR, or equal, manufactured from 1100 aluminum alloy of 0.024 inch thickness. Insulated elbows with a nominal pipe size of 10-inch to 18-inch shall be provided with Childers 4-piece aluminum Ell-Jacs as basis of design, or Pabco, RPR, or equal.
3. Tees, Flanges, and Valve Insulation in Conjunction with Aluminum Jacketing: Furnish Childers Aluminum Special Fabrications Insulation Covers as manufactured by Childers Products Company, Pabco, RPR, or equal.

E. Adhesives: Adhesives shall be water based, UL Classified, meet the requirements of NFPA 90A and NFPA 90B, have been tested according to relevant ASTM requirements, and be acceptable to the State Fire Marshal. Name, type and method of installation shall be submitted for review.

F. Valve and Fitting Cover: When installed in conjunction with PVC jacketing, furnish Zeston 25/50 rated polyvinyl chloride fitting covers as manufactured by Johns Manville, Knauf Insulation, Speedline, or equal.

2.02 DOMESTIC HOT WATER PIPING SYSTEM INSULATION

A. General: Insulate domestic hot water supply and return piping, including valves, strainers and fittings with insulation thickness as indicated on Table below.

B. Materials:

1. Classes of Insulation:
 - a. Class A: Glass fiber molded pipe insulation suitable for service temperatures up to 850 degrees F. Pipe insulation shall be one piece, preformed, and provide a minimum R factor of 4.0 at 75 degrees F mean temperature. Insulation shall be faced with all-purpose fire retardant vapor barrier jacket. Pipe insulation shall be Johns Manville Micro-Lok, Knauf Redi-Klad 1000, Owens Corning FIBERGLAS Pipe Insulation SSL II-ASJ, or equal.
2. Locations and Class of Insulation Required:

TABLE – LOCATIONS AND CLASS OF INSULATION REQUIRED

<u>LOCATION</u>	<u>CLASS OF INSULATION</u>
All locations	A

3. Fittings on indoor piping shall be covered with flush, hand-wrapped Class A insulation, to match the adjoining pipe insulation and covered with polyvinyl chloride fitting covers: Zeston 2000 25/50 by Johns Manville, Knauf Insulation Proto PVC Fitting Cover, Speedline Polyco Smoke Safe, or equal.
4. Adhesive: Fibrous Adhesive to bond calcium silicate to itself and non-porous surfaces.

PART 3 – EXECUTION

3.01 INSTALLATION

- A. Except as specified herein, install material in accordance with recommendations of manufacturer. Do not install insulation materials until tests specified in other sections are completed. Remove foreign material such as rust, scale, or dirt. Surfaces shall be clean and dry. Maintain insulation clean and dry at all times.
- B. On cold surfaces where a vapor barrier must be provided and maintained, insulation shall be installed with a continuous, unbroken moisture and vapor seal. Hangers, supports, anchors, or other projections that are fastened to cold surfaces shall be insulated and vapor sealed to prevent condensation.
- C. Surface finishes shall be extended in such a manner as to protect raw edges, ends, and surfaces of insulation.
- D. Pipe insulation shall be continuous through walls, ceiling or floor openings, or sleeves; except where firestop or firesafing materials are required.
- E. Metal shields shall be installed between hangers or supports and the piping insulation. Rigid insulation inserts shall be installed between the pipe and the insulation shields. Inserts shall be of equal thickness to adjacent insulation and shall be vapor sealed accordingly.
- F. Insulation shall not be installed in the following locations unless otherwise noted:
 1. On unions, flanged connections or valve handles.
 2. Over edges of any manhole, clean-out hole, clean-out plug, and to restrict opening or identification of access.
 3. Over any label or stamp indicating make, approval, rating, inspection, or similar data, unless provision is made for identification and access to label or stamp.

3.02 INSTALLATION OF DOMESTIC HOT WATER PIPING SYSTEM INSULATION

- A. General: Domestic hot water, tempered water supply and return piping and condensate return piping, after having been tested, shall be cleaned and insulated.
- B. Application: Insulate domestic hot water supply and return, including tempered supply and return piping in accordance with manufacturer's instructions and as specified herein.

1. Install insulation on valve bodies up to valve bonnet. Fill void in saddles, in accordance with Section 22 0513: Basic Plumbing Materials and Methods, with insulation and seal joints.
 2. Install insulating material to fittings, valves, and strainers and smooth to thickness of adjacent covering. Leave strainer clean-out plugs accessible. Covers fabricated from polyvinyl chloride shall be furnished.
- C. Insulation Jackets in Exposed Indoor Locations:
1. Cover completed insulation with canvas jacket tightly pasted to covering with lagging adhesive. Lap jacket seams 1 1/2-inch minimum. Finish entire jacket with coating of undiluted adhesive.
 2. Equivalent factory applied pre-sized, glass fiber reinforced, or glass fiber jackets may be furnished. Seal jacket seams with adhesive in accordance with manufacturer's instructions.
 3. Johns Manville Zeston 2000, Knauf Insulation Proto PVC Fitting Cover, Speedline Polyco Smoke Safe, or equal, fitting covers may be furnished, with molded or segmented insulation equal to specified insulation applied to fittings. Secure covers in accordance with manufacturer's instructions.
 4. In addition to above requirements, cover exposed insulated piping within a distance of 8 feet above floors with 26 gage galvanized steel jacket. Omit jacket in areas accessible only to maintenance personnel, such as mechanical equipment rooms, utility corridors, accessible pipe tunnels and manholes.
- D. Concealed Indoor Locations: Cover insulation over fittings, valves, and strainers with canvas. Provide pipe insulation with factory or field applied standard jacket of 4 ounce minimum canvas, fiberglass cloth, or glass fiber reinforced jacket. Seal jacket laps with adhesive in accordance with manufacturer's instructions.
- E. Exposed Outdoors: In addition to canvas or fiberglass cloth cover, pipe insulation exposed to weather shall be provided with an additional 0.016 inches thick aluminum jacket with 2-inch lap connected with one inch hem overlap joint located on side of pipe and turned down to shed water. Jacket shall be strapped 12 inches on center with 1/2-inch wide stainless steel strapping and wing seals. Aluminum jacket shall be mitered to fit fittings.
- 3.03 CLEANUP
- A. Remove rubbish, debris, and waste materials and legally dispose of off the Project site.
- 3.04 PROTECTION
- A. Protect the Work of this Section until Substantial Completion.

END OF SECTION

SECTION 22 10 00 PLUMBING PIPING AND FIXTURES

PART 1 - GENERAL

1.01 SUMMARY

- A. Section Includes: Labor, materials, tools, and equipment to install complete plumbing systems.
- B. Related Sections:
 - 1. Division 01 - General Requirements.
 - 2. Section 22 05 00: Common Work Results for Plumbing.
 - 3. Section 22 05 13: Basic Plumbing Materials and Methods.
 - 4. Section 22 05 53: Identification for Plumbing Piping and Equipment.
 - 5. Section 22 07 00: Plumbing Insulation.

1.02 SUBMITTALS

- A. Provide in accordance with Division 01 and Section 22 05 00: Common Work Results for Plumbing. SUBMITTALS
- B. Provide in accordance with Division 01, Section 22 05 00 and specific requirements of each section of Division 22.
- C. Submit all fixtures and equipment shown on Plumbing drawing P-002 Equipment Schedules, providing submittals for all listed items shown. Bottom-line, submit all fixtures and equipment shown are to be from major recognized manufacturers.

1.03 QUALITY ASSURANCE

- A. The California Plumbing Code is hereby made part of this section.
- B. Conform to provisions of Section 22 05 00: Common Work Results for Plumbing.
- C. Manufacturer of plumbing products must be third-party certified to ANSI/NSF Standard 61, Section 9 certification, and ANSI/NSF 372 to demonstrate compliance with the federal requirements for lead contribution to drinking water, the Safe Drinking Water Act SDWA, and the California Health and Safety Code Section 116875.

1.04 PRODUCT HANDLING

- A. Conform to provisions of Section 22 05 13: Basic Plumbing Materials and Methods.

PART 2 - PRODUCTS

2.01 PIPING SYSTEMS

- A. Materials: Refer to Section 22 05 13: Basic Plumbing Materials and Methods.
- B. Insulation for Piping: Refer to Section 23 07 00: Plumbing Insulation.

2.02 FIXTURES AND DRAINS

- A. General: Fixtures specified shall be furnished complete with trim and fittings. Cast iron plumbing fixtures shall be acid resistant enamel, and identified by casting letters "AR" or words "acid-resistant" into metal. Fixtures shall be white unless otherwise specified. Cast iron fixtures shall be white enamel inside and on back, rim and apron, with exposed unfinished surfaces painted white. Fixtures of same general classifications shall be of same make.
- B. Finished Brass:
 - 1. Finished and exposed brass plumbing, except floor, shower and urinal drains shall be chromium-plated and polished. Floor, shower and urinal drains, unless otherwise specified, shall be nickel-bronze metal.
- C. Traps, Trap Arms and Tailpieces:
 - 1. Fixture Traps shall be all cast brass chromium-plated and polished. Exceptions as follows:
 - a. Traps that are an integral part of a fixture.
 - b. Traps concealed in floors, walls and furring.
 - 2. Trap Arms shall be all IPS Threaded Brass Nipples into Female IPS Threaded Drainage Tee.
 - 3. Tailpieces, Extension Tailpieces, 2-part wastes and any other tubular products shall be minimum 17 gage polished chromium-plated brass, except as otherwise specified.
 - 4. Furnish polished chromium-plated brass wall flanges with setscrews and polished chromium-plated brass cover casing on discharge side of each trap.
- D. Faucet Valve Handles: Faucet valve handles shall be solid brass, chromium-plated and polished, and fastened to their stems by Allen type hollow head stainless steel set screws through the side of the handle extending into the stem. Handles with sharp edges or projections shall not be furnished. At accessible fixtures: handles shall be operable with one hand and shall not require tight grasping, pinching, or twisting of the wrist. The force required to activate handles shall be 5 pounds maximum.
- E. Fixture Supplies:
 - 1. Supplies for water heaters shall be unplated rigid copper water tube with threaded adaptors for connections to valves and other threaded connections. All other supplies shall be chromium-plated brass with hospital threads or shall be furnished with fittings and valves, which completely cover threads.
 - 2. Supplies to water closet tanks, lavatories, and drinking fountains shall be furnished with a NSF 372/61 threaded brass nipple. Exposed unfinished piping shall be sleeved with chrome plated brass or copper cover casing and have an appropriate escutcheon for a clean finished appearance. Angle/straight valve stops shall be female 1/2 IPS (inlet) by 3/8 compression (outlet). Fixture

supplies shall be polished chrome-plated, solid supply bulbed end risers with size compatible supply nut connection to fixture and 3/8 O.D. compression nut and ferrule connection to angle stop outlet. Stainless steel flexible braided connectors with re-enforced PVC inner hose are not allowed.

3. Hot and cold water fitting supply outlet piping serving water closets, urinals, lavatories, drinking fountains, sinks, faucets, hose bibs, and sillcocks shall be iron pipe size (IPS) brass nipple, and piped in such a manner that through wall water supply outlet piping be removable, size appropriate, and lead free. The use of copper, copper MIP sweat adapters or similar fittings, in lieu of brass nipples is not allowed. The IPS brass nipple shall be directly connected to the fixture as follows:
 - a. Control stops for water closet and urinal flush valves.
 - b. Angle stop for lavatories, sinks and drinking fountains.
 - c. Shank/arm adapters for wall mounted sink faucets.
 - d. Iron pipe size (IPS) brass nipple connection for hose bibs, sillcocks, and other plumbing related fixture and/or plumbing fitting water supply outlets.
4. Water supply pipe that penetrates a finished surface, wall, countertop or part of a cabinet shall be appropriately sized polished chromium-plated cover casing and wall flange/escutcheon fitting tight to the brass through wall nipple and securely affixed to the finished wall surface.
5. Water supplies of plumbing fixtures shall be protected against back-siphonage in event of a vacuum in piping system. Toilet and urinal flush valves shall be furnished with recognized atmospheric vacuum breakers, installed a minimum of 6 inches above fixture.
6. Discharge outlets of supply faucets for lavatories and sinks shall clear top of overflow rim by at least one inch.

2.03 ACCESS PLATES (To cleanouts, valves, water hammer arrestors and hose faucets)

- A. Round type, stainless steel, vandal-proof, 5/16 inch No. 18 or 1/4 inch No. 20 flat-head machine screw into cleanout plug. Plate shall be prime coated minimum 18 gage steel or polished chrome-plated brass, 18-8 No. 302 stainless steel, or polished nickel bronze.

2.04 BACKFLOW PREVENTION ASSEMBLIES

- A. Pressure vacuum breakers 1/2 inch to 2 inches, City approved.

2.05 CLEANOUT ASSEMBLIES

- A. Cleanout plug shall be line size. Iron body cleanout tee full line size up to 4 inches and round access plate, plugs shall be brass, countersunk with tapped boss for 5/16 inch No. 18 or 1/4 inch No. 20 screws.

2.06 CIRCULATING PUMPS, HOT WATER HEATING SYSTEM

- A. In-line mounted. Close coupled, centrifugal type with an all bronze water chamber, bronze sleeve bearings, bronze impellers, water tight shaft seal suitable for water temperature range from 20-300 degrees F. Forged steel shaft. It must be provided with bracket support to damper vibrations. GPM and TDH capacities as indicated on schedule. Acceptable Manufacturers: Bell & Gossett, Grundfos, Taco or approved equal.

2.07 DIELECTRIC UNIONS

- A. Dielectric style Unions using ferrous and no-ferrous metals are prohibited. Dielectric flanges are admitted for use – see DU-2.

2.08 ELECTRIC WATER COOLERS

- A. Water Coolers shall be provided with brass free waterways and lead mitigating water filtering systems (DFWF). Wall-mounted electric chiller type UL listed for access compliant with minimum capacity of 8.0 GPH certified to comply with Air Conditioning and Refrigeration Institute (ARI) Standard 1010/73. Fountain with brass free waterways shall be furnished with stainless steel apron and cabinet push bar operated bubbler, automatic stream regulator, brass P-trap, and hermetically sealed, air-cooled condensing unit with 115 volt, single phase 1/5 HP motor with thermal overload protection (Hubbell No. 5264 or equal). Provide with approved 3-wire grounding cord and connector. Complete water cooler must have been tested and certified to ANSI/NSF 61 and NSF/ANSI 372 lead free.

2.09 FAUCETS

- A. Access compliant faucets: Force to activate controls shall be no greater than 5 pounds. Self-closing metering, where specified, to remain open 10 seconds minimum when activated. Handles shall be operable with one hand and shall not require tight grasping, pinching, or twisting of the wrist.

2.10 FLOOR DRAINS

- A. See Drawing schedule P-002 for details.

2.11 FLEXIBLE HOSES

- A. Braided stainless steel metal hose (for gas use). Braided bronze metal hose (for non-pressure condensate connection use). US Flex, Metraflex, Nelson Dunn or equal.

2.12 FLUSH VALVE ASSEMBLY

- A. Valves shall be furnished so that flush remains constant and will not require any adjustment.
 - 1. Each flush valve shall be provided with a loose key, square shank, lock shield angle service stop connected to flush valve with a union connection.
 - 2. Provide 17 gage pressed brass escutcheons for wall and fixture. Escutcheons shall be fastened to not turn or rattle.

3. Each flush valve shall be furnished with a vacuum breaker providing one inch opening to atmosphere, which will not leak under any degree of back pressure and will not restrict rate of flow more than 10% at 10 PSI, and will operate noiselessly.
4. Tailpiece shall not be lighter than 17 gage and shall be part of flush valve assembly.
5. Exposed metal parts of flush valve assembly shall be nickel or chromium-plated on a brass or copper base.
6. Controls for water closet flush valves shall be mounted on the wide side of toilet areas.

2.13 LAVATORIES

- A. Access compliant faucets for Lavatories: Force to activate controls shall be no greater than 5 pounds. Self-closing metering, when specified, to remain open 10 seconds minimum when activated.
- B. Cast Iron Lavatories shall be acid resistant enamel and shall conform to Commercial Standards CS 77.63. Unites furnished in conjunction with strainer installation or faucet installation shall be brass. Exposed brass nuts shall be chrome plated.
- C. Exposed trim shall be free from sharp edges or points. Fixture shall be furnished with other listed manufacturer specified trim. Instead of solid supply pipe, polished chrome-plated risers, 3/8 inch outside diameter with ferrule stop end and metal nosepiece may be furnished.
- D. Insulate cold water, hot water and drain lines under all access compliant lavatories with approved type insulation.

2.14 PIPE HANGERS

- A. Refer to Section 22 0513: Basic Plumbing Materials and Methods. Complete with clamps, inserts, etc.

2.15 P-TRAPS

- A. Cast brass complete, chrome-plated.

2.16 PRESSURE REGULATING VALVE ASSEMBLIES

- A. Furnish for sizes ½-inch to 2-inch water service, all bronze body, stainless steel seat, bronze strainer, calibrated springs, and corrosion resistant, adjustable control.

2.17 ROOF DRAINS

- A. See plumbing Drawing schedule P-002 for details. Acceptable Manufacturers: Smith, Zurn, Watts, MiFab, Josam or approved equal.

2.18 SERVICE SINKS AND TRIM

- A. See Drawing schedule P-002 for details.

2.19 SERVICE STOP GAS VALVES

- A. Bronze/Brass gas cock valve with double stake packing nut, ½ inch to 2-inch, with IPS, inclusive, with flat or square head. CSA approved.

2.20 THERMOSTATIC MIXING VALVE ASSEMBLIES (TMVA)

- A. General: Valve bodies shall be cast brass or bronze valve assembly provided with holding bracket and shall be installed on wall bracket. Valve shall be rough brass or bronze satin sprayed finish unless otherwise noted. Assembly shall include a 3 5/8-inch diameter dial thermometer, color-coded with white face and black letters. The temperature range between 100 degrees F. and 150 degrees F. shall be background in red or red line enclosed. Valve complete with fail safe feature, square shank loose key stops, checks and strainers on both hot and cold-water inlets and shutoff valve on outlet. Valves shall be sized on a 45 psig (maximum) pressure drop:

2.21 TRAP PRIMERS

- A. Automatic, multi-trap primer, cast bronze with access panel. Pressure drop of three p.s.i. shall activate trap seal primers. Manufactured by MIFAB, or equal. (Installed in accessible location.)

2.22 URINALS

- A. Wall-hung vitreous china with replaceable trap cartridge or integral liquid seal trap, provided with a biodegradable liquid seal in compliance with the California Building Code and maintains a sanitary and odor-free environment. Furnish complete with hanger brackets, fasteners, gaskets and drain line connections.
 1. Fixtures shall comply with the following requirements:
 - a. Current versions of ASME A112.19.19, standard for Vitreous China Non-Water Urinals and/or IAPMO IGC 161.
 - b. Shall meet performance, testing, and labeling requirements for American National Standards Institute (ANSI).
 - c. Non-water urinals shall hold a current certificate of listing with IAPMO, and shall bear the C/IAPMO triangular certification and shall be manufactured in compliance with current IAPMO IGC 161.
 2. Trap shall permit the uninhibited flow of waste through the Urinal to the sanitary drainage system.
 3. Manufacturers:
 - a. Falcon Waterfree Sealant.
 - b. Waterless Co. Blue Seal Liquid.
 - c. Zurn Aqua Green Sealant.

- d. Kohler Waterless Urinal Sealing Liquid.
- e. Zero Flush Odor Barrier Liquid.
4. Urinals shall at time of school opening be serviced by replacing with an entirely new cartridge and liquid sealant, for units with removable cartridges. All urinals with built in traps shall be rinsed out and liquid sealant replaced.
5. Provide the following replacement quantity based on manufacturer's annual maintenance requirements:
6. Training shall consist of two hours of manufacturer certified training for all site-based operations personnel prior to school occupancy. Certificates shall be issued for all personnel who attend the original training session. The plant manager shall be certified as a trainer by the manufacturer. Provide two video tape copies of the original training session.
7. Provide a manufactured supplied "non-water urinal" descriptive placard at each urinal. Mounting heights shall be 48-inch for standard urinals and 42-inch for access compliant urinals.
8. Provide chrome brass flange and chrome brass I.P.S. cap to each urinal water supply line.
9. Provide accessible clean-out above each urinal.

2.23 WATER CLOSETS

- A. General: Water closets shall be vitreous china with Polyvinyl chloride bolt caps. Fixtures with auto-flush valves shall be provided with manual override button.

2.24 WATER TEMPERATURE CONTROLLERS

- A. Remote bulb type, plain steel case, baked enamel finish, glass fronted cover, mercury to mercury switch. 80 degrees F. to 240 degrees F. range of not more than 10 degrees F. differential.

2.25 GAS-FIRED WATER HEATERS

- A. Gas fired water heaters shall meet the Flammable Vapors Ignition Resistance requirements (FVIR).
- B. Gas water heaters must meet NAECA energy efficiency requirements. In capacity and gas models over 75,000 BTUH.
- C. Water heaters from 75,000 BTU/hr to Boilers 2,000,000 BTU/hr shall comply with rule 1146.2 "Emission of Nitrogen from large water heaters and small boilers". Natural gas fired water heaters with heat input rates less than 75,000 Btu/hr shall comply with rule 1121.
- D. Storage type water heaters shall be provided with a five year unconditional guarantee on tank heater and working parts. Complete guarantee for each heater shall be delivered to the Owner's Authorized Representative (OAR).

- a. Heater shall be furnished complete with baked enamel jacket, double density insulation, heating device, energy saver thermostat, drain valve is to be a ball valve with a plug in one end, and appurtenances necessary for satisfactory operation. Proper label of approval and manufacturer name, model number, size in gallons, and rated capacity shall be permanently secured to jacket.
- b. Heater shall be furnished with a combination pressure temperature relief valve, installed in water heater tank.
- c. Heaters shall be certified by the California Energy Commission.
- d. Floor-mounted heaters shall be on legs that are part of heater. Each heater shall be securely strapped to structure (with 2 straps per code).
- e. Water heaters shall be UL tested, approved and listed. Heaters shall be furnished complete with baked enamel jacket, glass fiber insulation, heating element, double break snap acting thermostat, drain valve and appurtenances required for operation. Electric heaters shall be factory wired ready for connection to electrical source. Install a gate valve on inlet side and union on both inlet and outlet sides of heaters and combination pressure-temperature relief valve on discharge side. Flexible water piping connectors shall not be used.
- f. Water heaters shall be of sizes indicated on Drawings and shall be furnished with equipment necessary to provide a complete and satisfactory piece of equipment.
- g. Pilot lines, gas valves, relays and their wiring shall be located outside boiler jacket to protect them from ambient temperature within. Flame safeguard relay shall be mounted on a control panel attached to wall at location indicated or as directed. All other controls and manual operators shall be so located as to be readily accessible when the boiler is in the installed position.
- h. Wiring of water pump control circuit and line voltage supply to control panel is part of the Work of Division 23. All other wiring in connection with boilers is a part of the Work of this section. Wiring between boiler and wall-mounted control panel shall be installed 7 feet or more above floor level.
- i. Gas-fired, storage type, size indicated on Drawings, with draft diverter and energy cut-off devices. Gas supply connections supplying less than 100,000 BTUs shall be with UL listed corrugated flexible appliance connector, and comply with ANSI Z21.24/CSA 6.10, Connectors for Gas Appliances. Connections supplying 100,000 BTUs and over shall be solid pipe. Heater shall be seismically secured with an approved restraint. HOLDRITE QS-50, QS-120.

2.26 WATER HAMMER ARRESTORS

- A. Lead Free Water Hammer Arrestor provided for Headers for Lavatories, Wash Sinks, Wash Fountains, Kitchen Sinks, Service Sinks, Urinals and Water Closets. For sizing purposes size according to manufacturer’s recommendations.

2.27 FIXTURE CONNECTIONS

- A. Branches to individual fixtures shall be of the following sizes (Inches) unless larger sizes are indicated on Drawings:

Fixture	Copper, Cold (Inches)	Copper, Hot (Inches)	Trap and Connections (Inches)	Soil/ Waste (Inches)	Vent (Inches)
WC Flush Valve	1	N/A	4	4	2
Lavatories	1/2	1/2	1-1/2 by 1-1/4	2	1-1/2
Service Sink	1/2	1/2	2	2	1-1/2
Wash Sink	3/4	1/2	1-1/2 by 1-1/2	2	1-1/2
Single Drinking Fountains	3/8	N/A	1-1/2	2	1-1/2
Standard Urinals, Wall-Hung Flush Valve:		N/A	N/A	2	1-1/2
Access Compliant Urinals, Wall-Hung Flush Valve:		N/A	N/A	2	1-1/2
Sillcocks	3/4 minimum	N/A	N/A	N/A	N/A

- B. Water headers serving water closets shall be copper water tube, with following size throughout length:
1. 1-1/2 inches for 2 flush valves.
 2. 2 inches for 3 to 9 flush valves.
- C. Water headers serving urinals shall be of following size throughout length:
1. 1” for 1 or 2 flush valves.

2. 1-1/4" for 3 flush valves.
 3. 1-1/2" for 4 to 8 flush valves.
- D. Water headers serving lavatories shall be of following size throughout length:
1. 1/2 inch for 2 lavatories.
 2. 3/4 inch for 3 and 4 lavatories.
 3. One inch for 5 and 6 lavatories.

2.28 HEIGHT OF FIXTURES

A. Heights for standard fixtures.

Fixture	
Toilets, height to top of seat	15 to 17
Lavatories, sink top height	32
Wash Sinks	30
Urinals, lip height	24

B. Heights for access compliant fixtures.

Fixture	
Toilets, center line from wall/partition	17-1/2
Toilets Seat Height	18
Lavatories, sink top height	34 maximum
Lavatories, sink knee clearance	27 minimum
Urinals, lip height	16
Urinals, flush handle height	43
Drinking fountains, bubbler height.	36 maximum
Drinking fountains, knee clearance	27 minimum
Wash Sink	Per Drawings

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Examine areas and conditions under which Work of this section will be performed. Correct conditions detrimental to proper and timely completion of Work. Do not proceed until unsatisfactory conditions have been corrected.

3.02 INSTALLATION

- A. General:
1. Unless otherwise specified, plumbing fixtures, equipment and appliances that require connections to plumbing line shall be connected. This shall include fixtures specified or indicated as furnished by others, furnished by Owner, or specified in other related sections. Install supplies, stops, valves, traps, wall flanges, or pipe casing for connection of this equipment.
 2. Install equipment as indicated on reviewed and accepted Shop Drawings.
 3. Avoid interference with Work of other trades. Do not deviate from Drawings without review of the Architect.
- B. Examination: Check each piece of equipment in system for defects verifying that parts are properly furnished and installed.
- C. For piping Work, refer to Section 22 0513: Basic Plumbing Materials and Methods.
- D. Plumbing Fixture and Equipment Installation:
1. Unless otherwise indicated, fixtures shall be installed with 5/16 inch brass bolts or screws of sufficient length to securely fasten fixture to backing, wall, or closet ring.
 2. Fixtures installed against concrete or masonry walls shall have their hangers fastened with 5/16 inch brass bolts, Philip Shield type anchors, or 2 unit cinch anchors. Wood or plastic plugs are not permitted.
 3. Fixtures installed against wood or metal stud walls shall have their hangers fastened to metal backing plates with 5/16 inch brass bolts screwed into plate. Fixture hangers for urinals shall be fastened centered vertically on metal backing plate with three 5/16 brass bolts each for small individual hangers and six, for larger one piece hangers. Lavatories shall be hung with not less than four 5/16 inch brass bolts or not less than five 1/4 inch brass bolts. Each sink hanger shall be hung with not less than four 5/16 inch brass bolt or not less than five 1/4 inch brass bolts.
 4. Pan type drinking fountains shall be hung with 5/16 inch cadmium plated bolts with a bolt in each bolt opening in hanger. Hangers for pan type drinking fountains shall provide 2 inches (plus or minus 1/4 inch) between pan and wall. Spaces due to irregularities between fixtures and tile walls shall be neatly filled with white cement or silicone filler.

5. Backing for hanging of plumbing fixtures and equipment shall be installed in supporting wall at time rough piping is installed. Backing for stud walls shall be steel plate 1/4 inch thick, not less than 4 inches wide. Backing for urinals shall be 1/4-inch thick by 6-inch wide steel plate. Steel plate shall be attached to stud at each end of plate and to each stud it crosses. Plate shall be attached to metal studs by bolting with two 1/4 inch U-bolts per stud with bolts through plate and around stud flange or by welding with a 1/8 inch fillet weld full width of stud flange, top and bottom of plate. At wood studs, plate shall be carefully recessed flush with face of stud and attached to each stud with 2 No. 14 flat-head wood screws, 2 inches in length into pre-drilled 1/8 inch holes. Backing for stud walls supporting wall-hung closets shall be as detailed.
 6. Rough-in for fixtures, equipment and appliances shall be as indicated on Drawings and as specified, including those items indicated as furnished by others, furnished by Owner, or future capacity. When connections to equipment from capped or plugged lines are required, caps or plugs shall be removed at time equipment is set and stops or valves installed and connections provided as specified.
 7. Piping shall be stubbed out to exact location of fixtures and stubs shall be installed symmetrical with fixtures. Hot and cold water supplies for center set faucets on lavatories shall be installed on 8-inch centers, unless otherwise specified or required.
- E. Cleanouts in Drain, Waste, Vent and Sewer Lines:
1. Cleanouts shall be installed at locations stated in the California Plumbing Code and accessible at following locations:
 - a. At locations above first floor as stated on construction documents and 5 feet outside of the building.
 - b. Install an accessible main line upper terminal cleanout in all restrooms above water closet overflow. (Install above upper terminal water closet where there are more than one water closets in a restroom).
 - c. Above faucets of each sink with brass plug.
 - d. Above service sink with brass plug.
 - e. At each Drinking Fountain with brass plug.
 - f. At each urinal and locate above urinal with brass plug.
 - g. Above overflow level of pot sinks with brass plug.
 - h. In vertical line at base of each downspout connected to an underground storm drain system extend cleanout to exterior of building.
 - i. At upper end of a horizontal vent line when any part of horizontal line is below overflow level of fixture it serves.

- j. Not to exceed 100-foot intervals in sewer and waste lines exterior of building.
 - k. At property line connection.
 - l. Where indicated on Drawings.
 2. Cleanouts shall be extended to grade as follows:
 - a. Not to exceed 100-foot intervals in straight runs of pipe outside buildings.
 - b. At horizontal changes of direction in aggregate greater than 135 degrees (underground).
 - c. At property lines.
 - d. Where cleanouts occur under concrete.
 - e. Where marked for future connections.
 3. Cleanouts in building shall be extended to floor level or above floor level or above floor level in walls or furring when cleanouts are not accessible or where clearance is less than 18 inches.
 4. Cleanouts in finished areas in building shall be concealed except that cleanouts above service sinks in janitor's rooms or closet, and cleanouts above service sinks or in exposed piping in boiler or heater equipment rooms, may be exposed. Cleanouts for urinals shall be installed above urinal and shall terminate behind an access plate.
 5. Cleanouts in floors of covered areas and those extended to grade in concrete areas shall be floor level type with extensions body brass plugs and detachable nickel-bronze or aluminum alloy scoriated.
 6. Concealed cleanouts in vertical lines shall be service weight soil cleanout tees with brass plugs and round cover plates unless otherwise specified or indicated. A snug fitting sleeve of galvanized sheet metal shall be placed around hub of tee and shall extend to flush with finished soil, or cleanout shall be extended to finished wall.
 7. Cleanouts extended from below floor to a wall or furring or on horizontal lines above floor that terminate at a wall or furring shall be iron body type with brass plugs and round cover plates.
 8. Cover plates over cleanouts in painted walls shall be steel, bonderized and prime coated. Cover plates cover cleanouts in tile walls shall be chromium-plated brass or nickel bronze. Plates shall be attached to cleanout plugs with 5/16 inch No. 18 or 1/4 inch No. 20 stainless steel vandal-proof type screws. Plates shall be one inch larger in diameter than fitting opening.
 9. Cleanouts at bases of downspouts shall be tapped soil tees with brass plugs as hereinafter specified, full size of line.

10. Cleanouts extended to grade in exterior sewer lines other than floors or concrete areas shall be a cleanout assembly with secured top, extra heavy-duty, adjustable sleeve, cut-off ferrule, countersunk threaded brass plug and scoriated tractor type cover.
11. Other cleanouts shall be iron body type.
12. Cleanout extensions shall be no-hub cast iron soil pipe. Exterior cleanouts, those in concrete excepted, shall terminate in a 14-inch by 6-inch thick concrete block with cleanout assembly and top of block flush with finish grade.
13. Fittings in lines utilized as cleanouts shall be approved soil fittings including no-hub pipe. Tees and crosses in vent headers excepted.
14. Pipe joint compound shall not be installed on cleanout plug. After lines are tested and approved, each cleanout plug shall be removed, greased, and replaced.

3.03 EXCAVATION, TRENCHING AND BACKFILLING

- A. Perform trenching, excavation, and backfilling required for Work of this section as specified herein and in Section 31 2323: Excavating, Backfilling, and Compacting for Utilities.

3.04 SERVICE CONNECTIONS

- A. Determine exact location of required water, drain, and sewer connections and provide proper connections.
- B. Potable water lines shall be purged completely before connecting to sources of water for the Project. Determine quality of water supply before connection.

3.05 WATER HAMMER ARRESTORS

- A. Install water hammer arrestors indicated on Drawings and in following locations (only non-ferrous arrestors may be installed in copper water system):
 1. Water lines to lavatory headers, water closet and urinal headers, service sinks, kitchen sinks, wash fountains, drinking fountains, laboratories with medical type faucets and on wash sinks having three or more stations and all other quick closing fixture such as clothes washers, as close to fixture as possible.
 2. Between last two fixtures when three or more fixtures, other than those listed in Number 1 above, are served by a common header.
- B. When possible, arrestor shall be installed in wall or furring. When arrestor is installed in wall or furring, furnish an access plate large enough to permit removal of arrestor. Access plate shall be a minimum of 2 inches larger in each direction than the arrestor.
- C. Fixture water lines shall be provided with mechanical water arrestor hammer dampening devices. Air chambers are not approved.

3.06 GAS SERVICE

- A. Above Grade Service: Black steel schedule 40 pipe shall be steel, hammered, free of dirt and scale, and blown out with oil-free air or nitrogen to a clean, dry condition. Piping shall not be installed in or through a ventilation duct or plenum.
- B. Underground Service, Gas approved (yellow) Polyethylene Plastic Pipe: Refer to Section 22 0513: “Basic Plumbing Materials and Methods”.
 - 1. Pipes shall be joined with polyethylene fitting and joined together by thermal fusion in accordance with procedures recommended by Polyethylene plastic pipe and fitting manufacturer.
 - 2. Underground Warning Tape shall be installed 12 inches above buried gas piping. Warning tape shall be yellow with caution statement as follows: “CAUTION – BURIED GAS LINE BELOW”.
 - 3. Pipe shall be installed on a 6 inches deep sand bed. After required pressure-leak test, pipe shall be covered with sand not less than 6 inches thick.
 - 4. Piping shall not support weight of valves, metal fittings or other items. Pipe shall be installed strain free.
 - 5. Installer of piping is required to have training and to have attained a certification. Non-trained/Non-certified installer must contact the manufacturer or manufacturer’s representative to provide on-site fusion training and certification, prior to work commencement
 - 6. Where a steel pipe riser passes into a structure or building, a double swing or double-offset joint shall be furnished. Pipe shall pass into structure 6-inches above grade and through a sleeve with a minimum one inch clearance. An isolation valve is required before pipe entering the building.

3.07 CLEANING - PLUMBING PIPING SYSTEMS AND FIXTURES

- A. Plumbing lines and fixtures shall be flushed to remove dirt and foreign material until water runs clear and no foreign substance or odor is present. Strainers and screens on faucets shall be removed during this cleaning operation.
- B. After satisfactory cleaning of strainer and screen replacements has been witnessed by the Project Inspector, post and maintain signs stating: "CAUTION - Water at this construction project has not yet been certified for human consumption." Signs shall be furnished with letters at least 1/2 inch in height and shall be conspicuously posted at entrances to the Project site. Signs shall be paneled, black and yellow, in conformance with OSHA Section 1910.1455.

3.08 DISINFECTING DOMESTIC WATER PIPING SYSTEMS

- A. Newly installed or replaced piping and/or fixtures dispensing potable water, and any additional piping and/or equipment impacting the integrity of this system shall be

disinfected and undergo an approved bacteriological analysis before water system is allowed for public use.

- B. Disinfection shall commence upon complete installation of all related domestic water systems including fixtures, valves, faucets, water heating systems, etc.
- C. Work shall be performed by Technicians Certified by the American Water Works Association (AWWA) and/or the State of California Department Health Services, Grade II Water Treatment Operator Certification or higher issued by the Department of Health Services (DHS) for the State of California. Comply with Title 22, Code of Regulations Division 4, Chapter 13, and Article 2 Operator Certification Grades.
- D. Method:
 - 1. A Physical Separation of minimum 6” or Reduced Pressure Backflow assembly shall be installed to protect from cross contamination of the local water purveyor’s meter service supply when at any time there is any type of water connection with the piping to be disinfected (Chlorinated) and the water meter service supply.
 - 2. Install a Chlorination Port including a T fitting and a shut off valve to the proximity of the point of connection at the new piping system.
 - 3. System is to be flushed to remove any materials that may have entered the system.
 - 4. Using a chemical feed metering pump and a chlorine tank, the chlorine solution is injected into the water system.
- E. Disinfection and De-chlorination procedure (24 or 3 Hour Contact Time):
 - 1. 24-hour Test Method:
 - a. Prior to disinfection, post signs on all water outlets of the system to be disinfected. Sign or tags shall read, “Water System Being Chlorinated-“Danger Do Not Drink Water” or similar warning.
 - b. Piping system shall then be adequately flushed with water to remove any particles and eliminate air pockets.
 - c. Using the continuous feed method, sodium hypochlorite conforming to ANSI/ AWWA B300 will be injected into the water system at a minimum of 50 PPM. A water flow meter provided by the water treatment technician will be used to determine the rate of injection and a chlorine test kit, Hach or equivalent, will be used to monitor the residual.
 - d. Chlorine residual test will be taken at all appropriate points and outlets to verify 50 PPM residual levels.
 - e. The chlorinated system shall be shut down for any use and the chlorinated water shall remain in the water system for retention of 24 hours.

- f. After 24 hours, chlorine residual levels will again be tested at various points throughout the system to insure a minimum of 25 PPM residual. If the system has not met the minimum of a 25 PPM residual, the above disinfection process shall be repeated.
 - g. After satisfactory completion of the residual testing, flush out system until Hach or equivalent test reveal the water outlets have a free chlorine residual concentration less than 0.5 PPM. The procedure shall be in accordance with the AWWA standard C651-05.
 - h. The OAR may allow temporary use of the water system for construction purposes pending results of the bacteriological test analysis. Sign or Tags shall be left on all outlets stating water system is not safe for consumption until laboratory results are complete and meet these specifications.
2. 3 Hour Test Method:
- a. If the water systems must be turned on for use as soon as possible, a 3 hours chlorine contact time to allow for disinfection is permitted with the OAR's approval.
 - b. Prior to disinfection, post signs on all water outlets of the system to be disinfected. Sign or tags shall read, "Water System Being Chlorinated- "Danger Do Not Drink Water" or similar warning.
 - c. Piping system shall be then adequately flushed with water to remove any particles and eliminate air pockets. Using the continuous feed method, sodium hypochlorite conforming to ANSI/ AWWA B300 will be injected into the water system at a minimum of 200 PPM. A water flow meter provided by the water treatment technician will be used to determine the rate of injection and a chlorine test kit, Hach or equivalent, will be used to monitor the residual.
 - d. Chlorine residual test will be taken at all appropriate points and outlets to verify 200 PPM levels. The chlorinated system shall be shut down for any use and the chlorinated water shall remain in the water system for retention of 3 hours.
 - e. After satisfactory completion of a 3 hour disinfection period, flush out system until Hach or equivalent test reveal the water outlets have a free chlorine residual concentration less than 0.5 PPM. The procedure shall be in accordance with the AWWA standard C651-05.
 - f. The OAR may allow temporary use of the water system for construction purposes pending results of the bacteriological test analysis. Sign or Tags shall be left on all outlets stating water system is not safe for consumption until laboratory results are complete and meet these specifications.

F. Bacteriological Test:

1. After final flushing and satisfactory results from the residual free chlorine concentration test, Bacteriological test samples shall be collected. The intent of the following is to provide insurance for an accurate representation to a complete Bacteriological test of the water system. At least two samples shall be taken from each floor of each building.
2. Bacteriological test samples shall be delivered to a State of California Department of Health Services Certified Laboratory to perform qualitative and quantitative bacterial analyses on the water samples for the presence of any Total Coliform bacteria and Plate Count. This count must be less than 500 cfu/mL.
3. The procedure shall be repeated if it shown by bacteriological examination made by an approved agency that the level of Disinfection does not meet these specifications.
4. After satisfactory results for the bacteriological test are provided to the OAR, the physical barrier or temporary reduce pressure back flow device shall be removed, and the new piping shall be connected to the point of connection. All the connecting piping and fittings shall be disinfected prior to installation. Chlorination Port shall be capped water tight. Warning sign or tags shall be removed.

- G. Drinking Fountain and Bottle Filler Lead Test: After installation of Drinking Fountain or Bottle Filler, and successful Bacteriological Test, shut off domestic water supply line feeding the fixture, and inform OAR. OAR will coordinate with the Drinking Water Quality Program (DWQP) Supervisor in local Project Unit and M&O's Plumbing Technical Unit Supervisor to conduct lead detection test and mitigate as necessary. Do not remove related construction warning sign and tags.

3.09 VALVES ON PLUMBING SYSTEM

- A. Furnish and install gates, ball, globes, angles, and check valves on plumbing Work at following locations whether indicated on drawings or not.
- B. Hot and cold valves shall be:
 1. Lead free complying with AB1953.
 2. Above the ground copper water system, 2-inch and larger, may utilize Victaulic butterfly valves and fittings for their connections. A 2-inch or larger Victaulic valve may be in a wall if an adequately sized access panel is provided for maintenance or removal.
- C. Valves shall be accessible and installed within an access panel approximately 3 feet above floor and no more than 7 feet above floor, or in a marked yard box to prevent tampering.

1. Immediately after each water meter, in addition to any valve furnished by utility company, there shall be an accessible valve on the inlet side for a strainer assembly, dual backflow device assembly and/or possibly a dual pressure reducing valve assembly.
2. A gate or ball valve on each water supply before it enters building. Valves shall be accessible from outside building and shall be installed in a marked yard box, unless otherwise indicated on drawings. Ball valves 2 ½-inch size or larger shall omit gate valve handle and furnish 2-inch square operating nut.
3. For restrooms, a gate or ball valve shall be installed in each restroom to isolate the hot and cold water supply into a restroom regardless of the number of fixtures. These valves shall control and be accessible only from within the restroom in which fixtures are installed. Valves shall be installed on the same wall as the group of fixtures it serves. Valves shall control only fixtures in restroom in which they are installed. Back to back restrooms shall be isolated separately and individually.
4. Install a gate or ball valve on each building branch line, which serves two or more fixtures, when these fixtures are not provided with a group isolation valve as specified above. These valves shall be located approximately 3 feet but not more than 7 feet above finish floor.
5. Install a gate, ball valve or partition stop for a drinking fountain or a group of drinking fountains.
6. Install a gate, ball valve or partition stop for hot and cold water supply to plumbing fixtures with no accessible supply stops, such as wall mounted faucets.
7. Install a gate, ball valve or partition stop for stops adjacent to, and controlling water flow to each sill cock and hose bib except as follows:
 - a. A sill cock immediately below an exterior drinking fountain may be controlled by the same gate, ball valve or partition stop as drinking fountain.
 - b. Valves or stops will not be required for individual hose bibs when these hose bibs are on a branch line serving only hose bibs and branch line is furnished with a shut-off valve.
8. Install a lose key angle stop, on each exposed fixture supply, and for each flush valve unless otherwise specified,
9. Install gate or ball valve at each location where a water line is connected to a piece of equipment other than items mentioned above.
10. Install a check valve on each hot water return line where it connects to a hot water storage tank or a water heater.
11. Handles, hand wheels (including dishwasher fill valve handles) and operating nuts shall be furnished of steel, brass, or cast iron and shall be removable.

Unless specified to be loose key type, handles shall be securely fastened to their stems. On exposed outdoor valves, omit operating handles and provide operating nuts.

12. Provide a handle or a key for each five, or fraction thereof, loose key valves, bibs, or stops and deliver them to the project OAR.

3.10 VALVES - GAS SERVICE

- A. A gas readily accessible shut-off stop shall be installed on each gas line entering a building immediately prior to the point it enters the building. Unless otherwise specified or indicated, shut-off valves for lines entering a permanent structure, buildings or portable buildings, shall be installed in a vertical riser above grade.
 1. Gas shut off valve for portable buildings – In addition to the gas readily accessible shut-off stop specified above, a dedicated Gas shut off valve shall be provided in a marked Yard Box, for each portable building to facilitate relocation/removal of building without the need to shut off gas to entire school.
- B. Gas Shut off valve within a building – A gas shut off valve with handles shall be accessible and serviceable within an access panel. Install valve minimum 3 feet above floor but less than 7 feet above floor.
- C. In addition to locations specified, gas shut off valve shall be installed at following locations:
 1. Install a lubricated plug gas shut off valve on any line connected to gas main or header at master assembly.
 2. Install a lubricated plug gas shut off valve before entering any building or structure.
 3. Install a gas valve on each outlet, in addition to any gas stop furnished with equipment.
 4. Service to laboratory gas cocks shall be furnished with a special precision check valve, located downstream from gas stop servicing room outlet at each laboratory cock. Unless otherwise specified, 1/8-inches bore shall be provided for each outlet cock.
 5. Install a gas shut-off valve on each gas line serving 2 or more gas outlets in same room. Service stop shall be installed not more than 7 feet above floor, and shall be in the room it serves.
 6. Install a gas shut-off valve on inlet side of each gas pressure regulating valve.
 7. Gas shut-off valves to be furnished with equipment.
 8. Install gas shut-off valve at not more than 1,000 foot intervals on each gas main.
 9. Gas shut-off valves in classrooms and locations subject to tampering shall be protected while remaining accessible.

- D. When a gas-shut off valve adjacent to gas-fired equipment is indicated in Contract Documents it shall be furnished and installed as part of Work of this section.
- E. When electrical wall switches with emergency push button are specified for controlling gas outlets at Laboratory Classrooms, provide main shut-off gas valve with normally closed electric solenoid valve within an accessible access panel.

3.11 ELECTROLYSIS PREVENTION

- A. Brass nipples, 6 inches, with recognized brass unions; flanges shall be furnished and installed at locations described herein. Flanges shall be installed with complete insulating component consisting of gasket bolt sleeves and bolt washers. Dielectric insulators shall be installed at following locations:
 - 1. Where special applications indicated on Drawings require an insulation flange or brass union, with 6-inch brass nipple to be installed in a condensate line, or steam line, flange insulation shall be of a high temperature type, suitable for continuous operation at temperatures up to 220 degrees F. for condensate and 400 degrees F. for steam.
 - 2. Where steel or cast iron in ground connects to copper or brass piping above ground, transition from steel or cast iron pipe to copper or brass pipe shall be provided in an accessible location.
 - 3. Underground dielectric connections shall be furnished in accessible yard boxes.
 - 4. Above ground dielectric connections shall be exposed; or if in finished rooms shall be located in accessible access boxes.

3.12 UNDERGROUND PIPE MARKERS

- A. Pipe markers shall be furnished according to Section 22 0553: "Plumbing Identification"
- B. Underground Caution Tape shall be placed 12 to 18 inches above the utility line. The Caution Tape shall be a designated color and marked with the appropriate name for the specific type of utility pipe as follows:
 - 1. Yellow – with the words: CAUTION GAS LINE BELOW
 - 2. Blue – with the words: CAUTION WATER LINE BELOW

3.13 HOT WATER CIRCULATING PUMPS

- A. Piping shall be supported from building structure so as to prevent any strain on pump casing.
- B. In-line pumps, unless otherwise specified, shall be centrifugal type with non-overloading characteristics and shall not overload motor above its horsepower rating under operating conditions with ratings based on continuous operation.

- C. Centrifugal water pumps shall be rated according to Hydraulic Institute Test Code for Centrifugal Pumps. Pumps shall be furnished with bronze water chamber, bronze impeller and mechanical seal. Rotating parts shall be statically and dynamically balanced.
- D. Hot water circulating pump shall be arranged so that pump can be automatically turned off when hot water system is not in operation.

3.14 WATER TEMPERATURE CONTROLLERS

- A. Furnish and install a water temperature controller in hot water line adjacent to, and for control of, circulating pumps on hot water return lines when said pump is indicated on Drawings or herein specified. Bulb of temperature controller shall be installed so as to be directly in path of flowing water and so as not to obstruct flow of water.
- B. Furnish and install a water temperature controller in hot water storage tanks for control of circulating pump on hot water circulating line when said pump is indicated on Drawings or specified herein.

3.15 DEPTH OF SEWER LINES

- A. Minimum depth of below grade sewer lines shall be 24 inches to centerline of pipe. Sewer lines shall slope $\frac{1}{4}$ inch per foot minimum, unless otherwise indicated. Minimum depth at Owner property line shall be 6 feet, unless otherwise required.

3.16 BACKFLOW PREVENTION DEVICES

- A. Backflow Devices: Installation of backflow devices shall be tested and certified by County backflow device tester before Substantial Completion. Tests shall be performed in presence of Project Inspector. Test reports shall be turned over to Project Inspector for mailing to proper agency.

3.17 CLEANUP

- A. Remove rubbish, debris, and waste materials and legally dispose off Project site.

3.18 PROTECTION

- A. Protect Work of this section until Substantial Completion.

END OF SECTION

SECTION 23 05 00 COMMON WORK RESULTS FOR HVAC

PART 1 – GENERAL

1.01 SUMMARY

A. Section Includes:

1. This Section provides the basic mechanical requirements that apply to the Work of Division 23.

B. Related Requirements:

1. Division 01: General Requirements.
2. Division 26: Electrical.

1.02 REGULATORY REQUIREMENTS

- A. Materials, fabrication, equipment, and installation shall comply with industry standards and code requirements. Where manufacturer's recommendations exceed industry standards, the manufacturer's recommendation shall establish the minimum standard. As a minimum, standards from the following organizations shall apply:

1. AMCA - Air Movement and Control Association.
2. ANSI - American National Standards Institute.
3. ASME - American Society of Mechanical Engineers.
 - a. ASME B31 - Code for Pressure Piping.
4. AHRI - Air-Conditioning, Heating, and Refrigeration Institute.
5. ASHRAE - American Society of Heating, Refrigerating and Air-Conditioning Engineers.
6. ASTM - American Society for Testing and Materials.
 - a. ASTM A53 - Specification for Welded and Seamless Pipe.
7. CSA - Canadian Standards Association.
8. FM Global - Factory Mutual Global
9. IAPMO - International Association of Plumbing and Mechanical Officials.
10. NFPA - National Fire Protection Association.
11. OSHA - Occupational Safety and Health Administration.
12. SMACNA - Sheet Metal and Air Conditioning Contractors' National Association.
13. UL - Underwriters Laboratories Inc.

14. Intertek (ETL Certification).
- B. Materials, fabrication, equipment, and installation shall comply with federal, state, and local codes including, but not limited to, the following:
 1. CBC, California Building Code, and CMC, California Mechanical Code.
 - a. Latest edition as adopted by the City, the County, and the State of California including amendments effective on the Effective Date of the Contract.
 2. California Code of Regulations, Title 8, Industrial Relations, Division 1, Chapter 4, Division of Industrial Safety.
 3. OSHA - Occupational Safety and Health Administration.
 4. CDPH – California Department of Public Health.
 5. SCAQMD - South Coast Air Quality Management District.
- C. Specifications or Drawings shall not be construed to permit deviation from the requirements of governing codes unless approval has been obtained from legally constituted authorities having jurisdiction, and the Architect. The Contract Documents may contain more stringent requirements than those legally required.
- D. Permits and Fees: Refer to the General and Supplementary Conditions.

1.03 SUBMITTALS

- A. Provide submittals in accordance with Section 01 33 00: Submittal Procedures and with specific requirements of Division 23 sections, as applicable.
- B. After Architect's approval, the above information shall become the basis for inspecting and testing materials and actual installation procedures performed in the Work.
- C. Shop Drawings: Submit sheet metal duct layout and diffuser layouts for review and approval. Drawings prepared in accordance with requirements of Section 01 31 13: Project Coordination and Section 01 33 00 may be provided by the Architect to serve as a background for the Shop Drawings. Shop Drawings shall comply with the requirements of Section 01 31 13 and Section 01 33 00 and shall indicate at a minimum:
 1. Complete system layout of equipment, components, ductwork, and piping, indicating service clearances, duct and pipe sizes, fitting types and sizes, top or bottom of duct and pipe elevations, distances of ducts, pipes and equipment from building reference points and hanger / support locations. All the above items shall be coordinated on the shop drawings according to the requirements of Section 01 31 13.
 2. Schedule and description of equipment, ductwork, piping, fittings, valves, dampers, and controllers.

1.04 PROJECT RECORD DOCUMENTS

- A. Comply with provisions of Section 01 77 00: Contract Closeout.
- B. Project Record Drawings:
 - 1. Provide a complete set of mechanical and control system drawings in AutoCAD and, if available, BIM, complete with external reference drawings, fonts, blocks and plotter pen color/line thickness settings on CD-ROM. Also submit one set of full size reproducible plots on vellum and three sets of prints.
 - 2. Before Contract Completion, deliver corrected and completed prints to the OAR. Delivery of project record documents to the OAR does not relinquish responsibility of furnishing required information omitted from project record documents.
- C. Operation and Maintenance Manuals:
 - 1. Submit operation and maintenance manuals in required form and content. If no revisions are required, furnish one additional copy. If revisions are required, one copy shall be returned with instructions for changes; perform such changes and return manuals. Manuals shall be bound in accordance to Section 01 7700. Deliver manuals to the OAR. Submit an electronic copy of the entire manual in PDF file format.
 - 2. Contents of Manual:
 - a. Title sheet with Project name, including names, addresses and telephone number of CONTRACTOR, installer, and related equipment suppliers.
 - b. Manufacturer's operating instructions including, but not limited to, the following:
 - 1) Identification of components and controls.
 - 2) Pre-start checklist and start-up procedures.
 - 3) Normal operation settings and checklists.
 - 4) Pre-shut down checklist and shut down procedures.
 - 5) Trouble shooting checklist and guidelines.
 - 6) Recommendations for optimum performance.
 - 7) Warnings and safety precautions on improper or hazardous operational procedures or conditions
 - c. Manufacturer's product data and parts and maintenance booklet for each item of equipment furnished under Division 23 that includes the following as a minimum:
 - 1) Manufacturer's model, identification and serial numbers.

- 2) Exploded view of assembly drawings identifying each component or part with the relevant part number.
 - 3) Directory of manufacturer's representatives, service CONTRACTORS and part distributors.
 - 4) Maintenance and trouble-shooting instructions, including schedule for preventive maintenance, periodic inspection and cleaning criteria.
- d. Project Record Drawings: Complete set of mechanical and control system drawings in 50 percent reduced print format shall be furnished with the manual. Submit the above record drawings on CD-ROM in AutoCAD and, if available, BIM, complete with external reference drawings, fonts, blocks, and plotter pen color/line thickness settings.
 - e. Testing, Adjusting, and Balancing reports: Submit as specified in Section 01 4525.
 - f. South Coast Air Quality Management District (SCAQMD) permits to install and operate fuel burning equipment and third-party source test reports as required by SCAQMD to allow start-up and operation of equipment.
 - g. Valve directory complete with location, function, size, and model of each valve with reference to the project record drawings.
 - h. Equipment and component identification chart complete with location, function, size, and model of each equipment or component with reference to the project record drawings.

1.05 COORDINATION

- A. Contract Documents indicate extent and general arrangement of Work under Division 23. CONTRACTOR shall coordinate work in accordance with Section 01 31 13 requirements and make adjustments as required to provide maximum headroom, a neat arrangement to keep passageways and openings clear to provide accessibility and provisions for maintenance, and to meet code requirements.

1.06 DELIVERY, STORAGE, AND HANDLING

- A. Delivery and Storage: Deliver materials to Project site in their original unopened containers with labels intact and legible at time of delivery. Store in strict accordance with manufacturer's recommendations.
- B. Do not store plastic pipe or materials in direct sunlight.

1.07 PRELIMINARY OPERATION

- A. OAR may require any portion of mechanical Work to be operated before Substantial Completion. Such operation shall be in addition to regular tests, demonstrations and instructions required under the Contract Documents, and shall be performed as required.
- B. Notify the Project Inspector at least 24 hours in advance of lighting or re-lighting pilots.

1.08 TRAINING OF OWNER PERSONNEL

- A. Training of Owner's personnel shall include:
 - 1. A minimum of 2 hour of on-site overview of the overall Mechanical System.
 - 2. Refer to Division 23 sections for specific training on each of the components of the Mechanical System.
 - 3. A minimum of 2 hours of (in classroom) software training. Training shall be conducted at the site with computer setup for each person attending.
- B. Contract shall include the cost of training Owner operation and maintenance personnel in operating, adjusting, maintenance, trouble-shooting, and Project site repair of each component, equipment, or system provided under this Contract.
- C. Operational and maintenance training shall be conducted on the Project site, unless indicated otherwise.
- D. Upon completion of Owner training, a completion certificate indicating the nature of the training and a description of the systems, complete with equipment and component lists shall be issued to each trainee. The certificate should be issued in duplicate with one copy retained by OAR.
- E. An attendance sheet with the names and signatures of all participants attending the training shall be submitted to the OAR and kept as part of the project documents.

1.09 GUARANTEES AND DAMAGE RESPONSIBILITY

- A. Sound of water flowing in piping shall not be transmitted to building structure. Operation of mechanical system shall not produce operational sounds that can be heard outside of rooms enclosing apparatus or equipment.

PART 2 – PRODUCTS

2.01 MATERIALS AND EQUIPMENT

- A. Unless otherwise specified, materials and equipment shall be new, in good and clean condition. Equipment, materials, and components shall be of the make; type and model number noted on Drawings or specified. Pieces of equipment of the same type shall be by the same manufacturer.
- B. Whenever an item is listed by a single proprietary name, with or without model number and type, it shall be for purpose of design only, to indicate characteristics and quality desired. Proprietary designation listed on Drawings, or listed first in Specifications, is

used as a basis for design to establish a standard for quality and performance and space requirements.

- C. HVAC equipment products from different manufacturers are never identical. Equipment approved as being equal is interpreted as being equivalent in capacity, performance and quality. The dimensions, weight, configuration and utility requirements could be quite different from the equipment used as the basis of design. Due to these differences, additional coordination and adjustments by the CONTRACTOR are required. For the equipment to be deemed truly equal, the additional coordination and adjustments by the CONTRACTOR should not incur any additional cost to the Owner and any additional labor to the design team.
- D. Equipment and materials indicated or required to be installed outdoors shall be of the type that is designed, manufactured, listed or approved by authorities having jurisdiction for outdoor installation by being resistant to the adverse effects of weather. All the additional protective measures against outdoor weather required by the manufacturers' installation instructions and prevalent practice shall be provided.
- E. For substitution of materials or products, refer to the General Conditions.

PART 3 – EXECUTION

3.01 GENERAL INSTALLATION REQUIREMENTS

- A. CONTRACTOR shall arrange for a preconstruction meeting with IOR prior to the installation to discuss installation and testing requirement.

3.02 LOCATION OF PIPING AND EQUIPMENT

- A. Location of piping, apparatus and equipment as indicated on Drawings is approximate and shall be altered to avoid obstructions, preserve headroom, and provide free and clear openings and passageways.
- B. Trenches parallel to footings shall not be closer than 18 inches to the face of footings and shall not be below a plane having a downward slope of 2 horizontal to one vertical, from a line 9 inches above bottom of footing.

3.03 PIPING INSTALLATION

- A. Drawing plans, schematics, and diagrams indicate general location and arrangement of piping systems; indicated locations and arrangements were used to size pipe and calculate friction loss, expansion, pump sizing, and other design considerations. Install piping as indicated unless deviations to layout are approved on Shop Drawings.
- B. Install piping in concealed locations unless otherwise indicated and except in equipment rooms and service areas.
- C. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.

- D. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal.
- E. Install piping adjacent to machines to allow service and maintenance.
- F. Install piping free of sags and bends.
- G. Install fittings for changes in direction and branch connections.
- H. Select system components with pressure rating equal to or greater than system operating pressure.
- I. Install piping as short and direct as possible, with a minimum number of joints, elbows, and fittings.
- J. Arrange piping to allow inspection and service of refrigeration equipment. Install valves and specialties in accessible locations to allow for service and inspection. Install access doors or panels as specified in Division 08 Section "Access Panels Frames" if valves or equipment requiring maintenance is concealed behind finished surfaces.
- K. Install pipe sleeves at penetrations in exterior walls and floor assemblies.
- L. Seal penetrations through fire and smoke barriers according to Division 07 Section "Penetration Firestopping."
- M. Install piping with adequate clearance between pipe and adjacent walls and hangers or between pipes for insulation installation.
- N. Install sleeves through floors, walls, or ceilings, sized to permit installation of full-thickness insulation.
- O. Seal pipe penetrations through exterior walls according to Division 07 Section "Joint Sealants" for materials and methods.

3.04 TESTS AND TESTING

- A. Tests shall be as required under the applicable sections of Division 23, including this Section.
- B. Tests required by other sections of the Contract Documents include the following:
 - 1. Test and balance of mechanical equipment and systems: Refer to Section 01 4525: Testing, Adjusting, and Balancing for HVAC.2.
- C. Additional tests may be required in the case of products, materials, and equipment if:
 - 1. Submitted items are altered, changed, or cannot be determined as exactly conforming to the Contract Documents.
 - 2. Performance testing and results may also be required on certain items which are as specified, including fan, and pump performance.
- D. Equipment Performance Assurance Tests:
 - 1. Before operating any equipment or systems, a thorough check shall be performed to determine that systems have been flushed and cleaned as required

and that equipment has been properly installed, aligned, lubricated, and serviced. Factory instructions shall be checked to verify installations have been completed and recommended lubricants have been installed in bearings, gearboxes, crankcases, and similar equipment. Particular care shall be furnished in lubricating bearings to avoid damage by over-lubrication and blowing out seals. Equipment shall also be checked for damage that may have occurred during shipment, after delivery, or during installation. Damaged equipment, products, and materials shall be replaced or repaired as required.

2. Upon completion of the above, adjust the system settings to within normal operating conditions to prevent the system from being damaged upon start-up.
3. Run-test the equipment after start-up for five consecutive days. Tests shall include operation of heating, ventilating, and air conditioning equipment and systems for a period of not less than two 8 hour periods at 90 percent of the full specified heating and cooling capacities. If equipment passes, install new filters. If equipment fails, it shall be adjusted and retested until system meets all applicable codes.
4. Equipment Start-up Reports: For each equipment or system on which start-up is performed, submit 8 copies of start-up report for review by the Architect.
 - a. The start-up report shall include the manufacturer's standard start-up form completed and signed by the start-up technician.
5. Provide, maintain, and pay costs for equipment, instruments, and operating personnel as required for specified tests.
6. Provide electric energy and fuel required for tests.
7. Final adjustment to equipment or systems shall meet specified performance requirements.
8. Equipment, systems, or Work deemed defective during testing shall be replaced or corrected as required. Test until satisfactory results are provided.

E. Specific Coordinated Plan for Test and Balance:

1. Provide a narrative of the operational intent that clearly describes the function and sequence of operation of each component, equipment, or system installed. Instruct designated Owner personnel in the operation of the installed systems.
2. Prior to final test and balance, mechanical equipment and systems shall be operated and tested as indicated in Paragraph 3.04.F above to demonstrate satisfactory overall operation of the installed systems.
3. Immediately before starting tests, air filter media shall be cleaned or renewed. Disposable type filters shall be replaced with new filters. Replaceable media shall be replaced with new media.

4. An accurate means of measuring air flow and temperatures shall be furnished to balance air supply, return, and exhaust systems so uniform temperatures occur in every room and design airflow is obtained through registers, diffusers, and grilles.
5. Systems shall be adjusted to provide airflows indicated including maximum fresh air and maximum return air. Dampers shall be checked for proper settings and operation. Air and water inlet and leaving temperatures at coils shall be checked. Complete operational data including airflows, room temperatures, fan speeds, motor currents, plenum, and duct static pressures shall be tabulated.
6. Welding performed as part of this Division may be subject to radiographic inspections at random in accordance with requirements specified in Section 23 0500: Basic HVAC Materials and Methods.

3.05 NOISE AND VIBRATION REDUCTION

- A. Correct noise or vibration caused by mechanical systems. Provide all necessary adjustments to specified and installed equipment and accessories to reduce noise to the lowest possible level
- B. Correct noise or vibration problems caused by failure to install work in accordance with Contract Documents. Include all labor and materials required as a result of such failure. Pay for re-testing of corrected noise or vibration problems by the project acoustical consultant including travel, lodging, test equipment expenses, etc.

3.6 PROTECTION, CARE AND CLEANING

- A. In addition to storage criteria of the General Conditions, and provisions under Section 01 5000: Construction Facilities and Temporary Controls, the following shall be provided:
 1. Provide for the safety and good condition of materials and equipment until Substantial Completion. Protect materials and equipment from damage.
 2. Protect installed Work.
 3. Replacements: In case of damage, immediately provide repairs and/or replacements as required.
 4. Interior of ductwork shall be maintained free of dirt, grit, dust, loose insulation, and other foreign materials.
 5. Air handling equipment shall not be operated until building is cleaned and air filters are installed.
 6. Before initial start-up and again before Substantial Completion, piping shall be drained and flushed to completely remove grease and foreign matter. Pressure regulating assemblies, traps, strainers, boilers, flush valves, and similar items shall be thoroughly cleaned. Tag system with an information tag listing responsible party and date of element, before initial start-up and again before Substantial Completion.

SECTION 23 07 00

HVAC INSULATION

PART 1 – GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Supply and return air ducts for heating and cooling systems.
- B. Related Requirements:
 - 1. Division 01: General Requirements.
 - 2. Section 23 05 00: Common Work Results for HVAC.
 - 3. Section 23 05 13: Basic HVAC Materials and Methods.
 - 4. Section 23 30 00: Air Distribution.
 - 5. Section 23 80 00: Heating, Ventilating and Air Conditioning Equipment.

1.02 REFERENCES

- A. American Society for Testing and Materials International (ASTM):
 - 1. ASTM C167 - Standard Test Methods for Thickness and Density of Blanket or Batt Thermal Insulations.
 - 2. ASTM C209 - Standard Test Methods for Cellulosic Fiber Insulating Board.
 - 3. ASTM C302 - Standard Test Method for Density and Dimensions of Preformed Pipe-Covering-Type Thermal Insulation.
 - 4. ASTM C411 - Standard Test Method for Hot-Surface Performance of High-Temperature Thermal Insulation.
 - 5. ASTM C518 - Standard Test Method for Steady-State Thermal Transmission Properties by Means of the Heat Flow Meter Apparatus.
 - 6. ASTM C534 - Standard Specification for Preformed Flexible Elastomeric Cellular Thermal Insulation in Sheet and Tubular Form.
 - 7. ASTM C547 - Standard Specification for Mineral Fiber Pipe Insulation.
 - 8. ASTM E84 - Standard Test Method for Surface Burning Characteristics of Building Materials.
 - 9. ASTM E96 - Standard Test Methods for Water Vapor Transmission of Materials.
- B. Underwriters Laboratories Inc.:
 - 1. UL 181 - Standard for Factory-Made Air Ducts and Air Connectors.

2. UL 723 - Standard for Test for Surface Burning Characteristics of Building Materials.

National Fire Protection Association:

1. NFPA 90A - Standard for the Installation of Air-Conditioning and Ventilating Systems .
2. NFPA 90B - Standard for the Installation of Warm Air Heating and Air-Conditioning Systems.
3. NFPA 255 - Standard Method of Test of Surface Burning Characteristics of Building Materials.

1.03 SUBMITTALS

- A. Submit in accordance with Division 01 and Section 23 05 00: Common Work Results for HVAC.
 1. Complete material list of items to be furnished and installed under this Section.
 2. Manufacturer's specifications and other data required demonstrating compliance with the specified requirements.
 3. Shop Drawings, catalog cuts and manufacturer's data indicating insulation, jacketing, adhesives, and coating. Insulating materials shall be certified by manufacturer to comply with the California quality standards for insulating materials.
 4. Manufacturer's recommended method of installation procedures, which will become part of this Section.

1.04 QUALITY ASSURANCE

- A. Qualifications of Manufacturer and Installer, Materials, Fabrication, Execution, and Standard of Quality: Comply with provisions stated under Section 23 05 00: Common Work Results for HVAC and Section 23 05 13: Basic HVAC Materials and Methods.
- B. Test Ratings:
 1. Comply with provisions stated under Section 23 0500 and 23 05 13 with emphasis on ASTM E84, NFPA 255, or UL 723. ASTM C167, ASTM C302, UL label or listing of satisfactory test results from the National Institute of Standards and Technology, or a satisfactory certified test report from an acceptable testing laboratory. Approval by the State Fire Marshal is required.
 2. Furnish labels, legibly printed with the name of the manufacturer or listings indicate that fire hazard ratings do not exceed those specified for materials proposed for installation. Flame spread index of not more than 25 and smoke developed rating not exceeding 50.
 3. Tests shall be performed on each item individually when insulation, vapor barrier covering, wrapping materials, or adhesives are installed separately at the Project site.
 4. Test insulation, vapor barrier covering, wrapping materials and adhesives as an assembly when they are factory composite systems.

- C. Regulatory Requirements: Insulation furnished and installed under this Section shall conform to the requirements of the California Building Code Parts 4, Mechanical Code, Part 5, Plumbing Code and Part 6, Energy Code.
- D. All chemically based products such as sealers, primers, fillers, adhesives, etc. shall meet the California air quality regulations.

1.05 PRODUCT HANDLING

- A. Protection, Replacement, Delivery and Storage: Comply with provisions stated under Sections 23 05 00: Common Work Results for HVAC and 23 05 13: Basic HVAC Materials and Methods.

PART 2 – PRODUCTS

2.01 MATERIALS

- A. General:
 - 1. Piping insulating material shall be fire resistant, non-corrosive, shall not break, settle, sag, pack or disintegrate under vibration, nor absorb more than 1 percent moisture by weight.
 - 2. Piping insulating material shall be furnished with thickness indicated in Table 1, unless otherwise noted on the drawings, and shall furnish thermal resistance in the range of R-4.0 to 4.6 in accordance with inch at 75 degrees F.
 - 3. Provide insulation materials, adhesives, coatings, sealants, fitting covers, and other accessories with a fire hazard rating not to exceed 25 for flame spread, 25 for fuel contributed and 50 for smoke developed, except for materials listed as follows:
 - a. Nylon anchors for installing insulation to ducts or equipment.
 - b. Treated wood blocks.
 - 4. Flame-proofing treatments subject to moisture damage are not permitted.
- B. Lagging Adhesives: Shall be nonflammable and fire-resistant and shall have a maximum flame spread index of 25 and a maximum smoke developed index of 50 when tested in accordance with ASTM E84. Insulation finished with canvas shall be provided with laps adhered in accordance to manufacturer's recommendation. A finish coat of same material shall be applied to entire outer surface of lagging cloth at coverage specified by manufacturer.
- C. Insulation Jackets:
 - 1. Exterior insulation exposed to weather shall be weatherproofed with Childers aluminum jacketing as basis of design, or Pabco, RPR, or equal. Jacketing shall be manufactured from 1100, 3105 or 5010 aluminum alloy with 3/16-inch corrugations. Smooth or embossed jackets may be permitted in special situations to match an existing installation. Jacketing shall be furnished with an integrally bonded moisture barrier over entire surface in contact with

insulation. A minimum thickness of 0.016 aluminum jacketing is to be provided on ducts and piping.

2. Insulated elbows, of 90 degrees and 45 degrees, with a nominal iron pipe size of ½-inch to 8-inch shall be provided with Childers aluminum Ell-Jacs insulation covers as basis of design, or Pabco, RPR, or equal, manufactured from 1100 aluminum alloy of 0.024-inch thickness. Insulated elbows with a nominal pipe size of 10 inches to 18 inches shall be provided with Childers 4-piece aluminum Ell-Jacs as basis of design, or Pabco, RPR, or equal.
- D. Adhesives: Adhesives shall be water based, UL Classified, meet the requirements of NFPA 90A and NFPA 90B, have been tested according to relevant ASTM requirements, and be acceptable to the State Fire Marshal. Name, type and method of installation shall be submitted for review.
- E. Valve and Fitting Cover: When installed in conjunction with PVC jacketing, furnish Zeston 25/50 rated polyvinyl chloride fitting covers as manufactured by Johns Manville, Knauf Insulation, Speedline, or equal.

2.02 DUCTWORK AND PLENUM INSULATION/ACOUSTICAL LINING

- A. General: Insulate ductwork and plenums with not less than the amount of insulation tabulated in Table 2, unless noted otherwise on the drawings.

TABLE 2 - INSULATION OF DUCTS AND PLENUM

<u>Duct Location</u>	<u>Insulation Type</u>
Interior concealed supply air ductwork and plenums (Exposed to inside conditioned environment no insulation required)	F-1
Interior acoustically-lined supply and return ductwork (where shown on plans close to ac units)	L-1 (no F-1 exterior insulation required)
Exterior outside supply and return air ducts and plenums	L-1 (no F-1 exterior insulation required)

Notes:

1. Minimum insulation provided shall be as required by the current California Mechanical Code Title 24 for the most restrictive condition.
2. Refer to the materials indicated in this section for external insulation & internal acoustical lining.
3. For sound attenuation provide internal acoustical duct lining (1-½-inch unless noted otherwise) where indicated on the drawings. Where acoustical lining is shown or required, external duct insulation will not be required.

- 4. All exterior insulated ductwork shall be water proofed at joints, seams and duct penetrations.
- B. External insulation may be omitted under the following conditions:
 - 1. Exposed supply ductwork within inside conditioned environment.
 - 2. Return air ductwork in conditioned space.
 - 3. Interior acoustically lined rectangular supply and return plenums and ductwork
- C. Insulation Types:
 - 1. F-1: 1½-inch blanket fiberglass, factory-laminated with foil skim service jacket (FSK) vapor barrier.
 - 2. L-1: 1½-inch internal acoustical duct lining.
- D. Materials:
 - 1. Fire-Resistive Insulation Materials and Coatings: Submit State Fire Marshal pre-approved materials only.
 - 2. Adhesives: See Paragraph 2.01.D for applicable products.
 - 3. F-1 - External Insulation: Provide glass fiber blankets that are factory-laminated with Foil Reinforced Kraft (FRK) vapor barrier facing; Johns Manville Microlite, Owens-Corning SOFTR Duct Wrap, Knauf Insulation Friendly Feel Duct Wrap, or equal. Provide a minimum installed R value as required by the CEC Building Energy Efficiency Standards; but not less than scheduled on Table 3:

TABLE 3
INSULATION OF DUCTS AND PLENUMS
THERMAL RESISTANCE “R” VALUES

Type	Thickness (in inches)	Installed R Value (hr.ft ² .°F/Btu)
F-1	1 ½	4.2
L1	1 ½	6.0

- 4. L-1 - Internal Acoustical Lining: Internal Lining shall be of the type that inhibits the growth of mold, mildew and fungi and shall not contain harmful VOC’s or contain glass fiber. Approved Material:
 - a. Polyester Acoustical Duct Liner:
 - 1) Polyester duct liner shall be an engineered nonwoven, thermally bonded Polyester with a smooth and durable FSK facing.
 - 2) Polyester duct liner must be able to withstand a constant internal temperature up to 250°F must be compliant with Greenguard Environmental Institute and contain zero VOCs per ASTM D5116. Liner must comply with all applicable standards including ASTM E84, ASTM C411, ASTM C518, ASTM G21, NFPA 90A and 90B, and UL 181.

- 3) Approved Manufacturer: Ductmate Industries “PolyArmor” duct liner or approved equal.
- b. Elastomeric Acoustical Duct Liner:
 - 1) Closed-cell, sponge- or expanded-rubber materials. Elastomeric liner must be able to withstand a constant internal temperature up to 300°F and must comply with all applicable standards including ASTM E84, ASTM E96, ASTM C209, ASTM C534 - Type II sheet materials, ASTM C411, ASTM C518, ASTM G21, ASTM G22, NFPA 90A and 90B, and UL 181.
 - 2) Approved Manufacturer: Armacell LLC “AP Armaflex FS” duct liner or approved equal.
- c. Duct liner must be attached per manufacturer’s requirements using a non-flammable, low VOC water-based adhesive. When applicable, apply a non-flammable, low VOC water-based lagging adhesive to the exposed leading edge of the insulation. Install fasteners per SMACNA HVAC Duct Liner installation instructions.
- d. Duct liner must be installed per SMACNA Manual, “HVAC Duct Construction Standards, Metal and Flexible,” Third Edition unless otherwise specified.

PART 3 – EXECUTION

3.01 INSTALLATION

- A. Except as specified herein, install material in accordance with recommendations of manufacturer. Do not install insulation materials until tests specified in other sections are completed. Remove foreign material such as rust, scale, or dirt. Surfaces shall be clean and dry. Maintain insulation clean and dry at all times.
- B. On cold surfaces where a vapor barrier must be provided and maintained, insulation shall be installed with a continuous, unbroken moisture and vapor seal. Hangers, supports, anchors, or other projections that are fastened to cold surfaces shall be insulated and vapor sealed to prevent condensation.
- C. Surface finishes shall be extended in such a manner as to protect raw edges, ends, and surfaces of insulation.
- D. Pipe or duct insulation shall be continuous through walls, ceiling or floor openings, or sleeves; except where fire-stop or fire-safing materials are required.
- E. Metal shields shall be installed between hangers or supports and the piping insulation. Rigid insulation inserts shall be installed between the pipe and the insulation shields. Inserts shall be of equal thickness to adjacent insulation and shall be vapor sealed accordingly.
- F. Insulation shall not be installed in the following locations unless otherwise noted:
 1. On unions, flanged connections or valve handles.

2. Over edges of any manhole, clean-out hole, clean-out plug, access door or opening to a fire damper, so as to restrict opening or identification of access.
3. Over any label or stamp indicating make, approval, rating, inspection, or similar data, unless provision is made for identification and access to label or stamp.

3.02 INSTALLATION OF DUCTWORK AND PLENUM INSULATION

A. External Covering:

1. Before installing duct insulation, sheet metal ducts shall be clean, dry, and tightly sealed at joints and seams, inspected, and accepted by the site Inspector.
2. Duct exterior insulation shall be firmly wrapped around ductwork with joints lapped a minimum of 2-inch. Insulation shall be securely fastened with 18 gage copper-lined steel wire, or 16 gage soft-annealed galvanized wire spaced approximately 12-inch on centers and at loose ends, presenting a neat and workmanlike appearance. Where duct width is such that wiring will not fasten insulation firmly against duct an adhesive shall be furnished to fasten insulation to duct with wiring being installed at ends of insulation segment.
3. Insulation on ductwork transporting conditioned air, both supply and return, and outside air intake ducts when pre-conditioned, shall be furnished with a factory-applied, fire-resistant vapor barrier.
4. Exposed Ducts or Plenum:
 - a. Install insulation to ducts or plenum furnished with butt joints, without voids and with adhesive over entire surface of duct. Cover insulation with canvas jacket, fastened tightly to insulation with lagging adhesive. Install 2 finish coats of undiluted adhesive.
 - b. When installing jacket, finished covering shall be even and level, without humps, with constant diameters on round ducts maintained.

B. Interior Insulation –Acoustical Lining:

1. Where ducts are internally acoustically lined, external duct insulation will not be required.
2. Dimensions of ducts indicated are net inside dimensions and must include thickness of duct liners to obtain the required duct size.
3. Install insulation in square turns, where required, to cover interior surfaces before duct turns are installed.
4. Install lining material during fabrication of duct with sealed face only exposed to air stream.
5. Interior insulation in ducts or plenums shall not have exposed edges. Edges open to entering or leaving air streams shall be covered, secured in place and sealed with approved duct liner edge sealers.
6. Insulation shall be fastened to sheet metal with an approved fire-retardant adhesive, with minimum 90 percent coverage and edges firmly adhered.
7. Mechanical fasteners shall supplement the adhesive on top sections of ducts more than 12-inch wide and on sides of ducts more than 24-inch high and shall

be spaced on 16-inch centers maximum. Fastener posts shall be cut off approximately ¼-inch from metal disc.

3.03 CLEANUP

- A. Remove rubbish, debris, and waste materials and legally dispose of off the Project site.

3.04 PROTECTION

- A. Protect the Work of this Section until Substantial Completion.

END OF SECTION

SECTION 23 08 00

HVAC SYSTEMS COMMISSIONING

PART 1 – GENERAL

1.01 SUMMARY

A. Section Includes:

1. General requirements for Commissioning of HVAC systems and equipment including installation, start-up, testing, documentation, and training according to the Construction Documents.

B. Related Requirements:

1. Division 01: General Requirements.
2. Section 01 45 23: Testing and Inspection.
3. Section 01 45 25: Testing, Adjusting, and Balancing for HVAC.
4. Section 01 91 13: General Commissioning Requirements.
5. Section 23 05 00: Common Work Results for HVAC.
6. Section 23 30 00: Air Distribution.
7. Section 23 80 00: Heating, Ventilating and Air Conditioning Equipment.

1.02 REFERENCES

A. Applicable codes, standards, and references: inspections and tests shall be in accordance with the following applicable codes and standards:

1. InterNational Electrical Testing Association – NETA.
2. National Electrical Manufacturers Association – NEMA.
3. American Society for Testing and Materials – ASTM.
4. Institute of Electrical and Electronics Engineers – IEEE.
5. American National Standards Institute – ANSI.
6. National Electrical Safety Code – NESC.
7. California Building Code – CBC.
8. California Electrical Code – CEC.
9. California Mechanical Code – CMC.
10. Occupational Safety and Health Administration – OSHA.
11. National Institute of Standards and Technology – NIST.

12. National Fire Protection Association – NFPA.
13. American Society of Heating and Air-Conditioning Engineers – ASHRAE
(The HVAC Commissioning Process, ASHRAE Guideline).
14. Associated Air Balance Council – AABC (National Standards for Total System Balance).

1.03 SUBMITTALS

- A. Submittals package shall include the following:
 1. Commissioning required submittals in accordance with Division 01 Specification Sections.
 2. Copy of the Architect’s reviewed and accepted submittals to the OAR.
 3. List of team members who will represent the Contractor in the Pre-functional Equipment Checks (PEC) and Functional Performance Tests (FPT), at least six weeks prior to the start of Pre-functional Equipment Checks.
 4. Detailed manufacturer installation and start-up, operating, troubleshooting and maintenance procedures, a copy of full details of Owner-contracted tests, full factory testing reports, if any, and Warranty information, including responsibilities of Owner to keep Warranty in force clearly defined.
 5. Installation and checklist documentation shipped with equipment and field checklist forms to be used by factory or field technicians.
 6. Detailed manufacturer’s recommended procedures and schedules for PECs, supplemented by Contractor’s specific procedures, and FPTs, at least four weeks prior to the start of PEC.

1.04 MEETINGS, SEQUENCING AND SCHEDULING

- A. Meetings: Attend the Commissioning meetings as required.
- B. Sequencing and Scheduling: The work described in this Section shall begin only after work required in related Divisions 23 and 26 Sections has been successfully completed and tests, inspection reports, and Operation and Maintenance manuals required have been submitted and accepted. The start-up and PEC shall be completed and submitted to the Owner at least two weeks prior to beginning FPT.
 1. Coordinate HVAC work with the work of other trades prior to scheduling of any Commissioning procedures.
 2. Coordinate the completion of HVAC testing, inspection, and calibration prior to start of Commissioning activities.

1.05 QUALITY CONTROL

- A. Comply with Division 01 quality control specifications.

- B. Incorporate manufacturer's recommended Commissioning procedures for the systems and equipment to be commissioned under this Section.
- C. Comply with Section 01 45 25: Testing, Adjusting, and Balancing for HVAC.

1.06 EQUIPMENT AND SYSTEMS TO BE COMMISSIONED

- A. Packaged gas heating electric dx air conditioning unit(s) systems.
- B. Exhaust fan(s) systems.

PART 2 – PRODUCTS

2.01 TEST EQUIPMENT

- A. Equipment to be utilized in the commissioning process shall meet the following requirements:
 - 1. Provide test equipment as necessary for the testing of the equipment and systems to be commissioned.
 - 2. Provide testing equipment and accessories that are free of defects and certified for use.
 - 3. Provide testing equipment with current calibration labels as per NIST Standards.
 - 4. Equipment shall be calibrated on the manufacturer's recommended intervals with calibration tags affixed to the instrument.
 - 5. Testing equipment shall be maintained in good operating condition for the duration of the project.

PART 3 – EXECUTION

3.01 COMMISSIONING PROCESS REQUIREMENTS

- A. Work to be performed prior to commissioning:
 - 1. Complete phases of the work so the system(s) can be started, tested, adjusted, balanced, and otherwise commissioned.
 - 2. If modifications or corrections to the installed system(s) are required to bring the system(s) to acceptance levels due to Contractor's incorrect installation or defective materials, such modifications shall be made at no additional cost to the Owner.
 - 3. Normal start-up services required to bring each system into full operational state:
 - a. Testing, motor rotation check, control sequences of operation, full and part load performance.
 - b. Commissioning shall not start until each system is complete and start-up has been performed.
- B. Pre-Commissioning responsibilities:

1. Inspection, calibration and testing of the equipment required to commission the following systems:

- a. HVAC System(s).

3.02 PREPARATION

- A. Provide certified HVAC technicians as required, with tools and equipment necessary to perform Commissioning activities specified.
- B. Provide certified testing agency personnel and equipment factory representatives as require in the Commissioning plan and other related Sections.
- C. Verify that work required in this Section is complete prior to starting of FPT.
- D. Verify that complete operational manuals have been reviewed and accepted by the Commissioning service provider as specified before starting FPT.

3.03 TESTING

- A. Testing procedures shall include the following minimum information:
 1. Test number.
 2. Equipment used for the test, with manufacturer and model number and date of last calibration.
 3. Date and time of the test.
 4. Indication of whether the record is for a first test or retest following correction of a problem or issue.
 5. Identification of the system, subsystem, assembly, or equipment.
 6. Conditions under which the test was conducted, including (as applicable); ambient conditions, set points, override conditions, status, and operating conditions that impact the results of the test.
 7. Systems and assemblies test results and performance and compliance with contract requirements.
 8. Issue number, if any, generated as the result of the test.
 9. Name(s) and signature(s) of witnesses and the person(s) performing the test.
- B. Contractor shall participate and perform Commissioning related testing requirements as specified.
- C. General Requirements for Mechanical, Controls, and Testing and Balance:
 1. Construction and Acceptance Phases:
 - a. Provide assistance to Commissioning service provider in preparing FPT procedures specified. Sample test forms are included in the project Commissioning Plan.
 - b. Develop full startup and initial checkout plan using manufacturer's start-up procedures and Commissioning checklists for commissioned

- equipment. Submit to Commissioning service provider for review and approval prior to startup.
- c. During startup and initial checkout process, execute mechanical-related portions of PEC for the equipment and systems to be commissioned.
 - d. Perform and clearly document completed startup and system operational checkout procedure. Providing four copies of the results to the Owner.
 - e. Resolve any open punch list items before FPT. Air testing and balance shall be completed with discrepancies and problems remedied before FPT of respective air -related systems.
 - f. Provide skilled technicians to execute starting of equipment and to execute PFT. Ensure that technicians are available and present during agreed upon schedules and for sufficient duration to complete necessary tests, adjustments, and solutions to identified problems.
 - g. Maintain a log of events and issues of tests and related Commissioning activities. Submit handwritten reports of discrepancies, deficient or uncompleted work by others, contract interpretation requests, and lists of completed tests as specified.
 - h. Correct open issues and re-test as needed to prove compliance with system operational standards.
 - i. Prepare Operation and Maintenance Manuals and provide training for the Owner maintenance personnel and end-users per Section 01 7900.
 - j. Coordinate with equipment manufacturers to determine specific requirements to maintain validity of Warranty and notify the Owner.
 - k. Execute simulated seasonal FPT, witnessed by the Owner and the Commissioning service provider, as specified. Document results and perform corrections as needed for system acceptance and make necessary adjustments to Maintenance and Operations Manuals and Record Drawings.

3.04 SENSOR CALIBRATION

- A. Field-installed temperature, relative humidity, CO₂, pressure sensors, pressure gages, and actuators (dampers and valves) shall be calibrated using the methods described below. Calibration procedures shall be documented during execution of the Start-up and the PEC. Alternate methods may be used, if approved by the Commissioning service provider.
- B. Test instruments shall have had a NIST certified calibration within the last 12 months. Sensors installed in the unit at the factory with provided calibration certification need not be field calibrated.
- C. Sensors:
 1. Verify that sensor locations are appropriate and away from causes of erratic operation.
 2. Verify that sensors with shielded cable are grounded only at one end.

3. For sensor pairs that determine a temperature difference, make sure they are reading within 0.2 degrees F of each other.
4. For sensor pairs that determine a pressure difference, make sure they are reading within 2 percent of each other.
5. Calibration: Put the equipment in operation. Make a reading with a calibrated test instrument within six inches of the site sensor. Verify that the sensor reading (via the permanent thermostat or gage) is within the tolerance listed in the table below of the instrument-measured value. If not, calibrate or replace sensor.

6. Tolerances:

<u>Sensor</u>	<u>Required Tolerance (+/-)</u>
AHU wet bulb or dew point	2.0 degrees F
Outside air, space air, duct air temps	0.4 degrees F
Flow rates, air	10 percent of sensor range (inc. design value)
Relative humidity	4 percent
CO ₂ monitor	100 ppm
Sound level	5 db - Type 1 meter (Per Calibrator Mfg.)
Flow Rates	5 percent of sensor range (inc. design value)

3.05 ADJUSTING

- A. Perform work required to rectify installations not meeting contract requirements at no additional cost to the Owner.
- B. Corrective work shall be completed in a timely manner to permit completion of the Commissioning process.
- C. If systems' Commissioning deadline, as defined in the Project Schedule, goes beyond the scheduled completion without resolution of the problem(s), the Owner reserves the right to obtain supplementary services or equipment to resolve the problem.

3.06 TRAINING

- A. Provide training plan for systems to be commissioned as required in applicable Division 23 specification sections and Section 01 7900.

END OF SECTION

SECTION 23 09 00 HVAC CONTROLS

PART 1 – GENERAL

1.01 SUMMARY

- A. Section Includes: HVAC system environmental controls, including equipment, materials, installation, start-up, testing, documentation and training according to construction documents. The project drawings establish the scope of HVAC system(s) controls work with local and remote status/alarm monitoring by the Owner and their HVAC system equipment service contractors.
- B. The DDC system shall have the capable of remote Web browser interface for HVAC system adjustments of system operational times, temperatures, and remote alarm/ failure indication for remote service notification thru an Ethernet IP address. No laptop or on-site desktop workstation/printer access is required, as no on-site building engineer is foreseen. Capability shall be provided for a remote service person upon alarm or maintenance notification receiving alarm/notice, remotely via the Etherne, to plug their service tablet or laptop (provided by the Contractor) into the main DDC HVAC system control panel to be located in the Electrical room and then access the project HVAC system network. The DDC system shall have the capability to generate email and/or text messages to be sent to the service co., notifying there is an alarm malfunction or an unexpected change of events. It is anticipated servicing of the system will be performed by local mechanical contractors, who will require the provisions for remote web IP access.
- C. Related Requirements:
 - 1. Division 01: General Requirements.
 - 2. Section 01 45 23: Testing and Inspection.
 - 3. Section 23 05 00: Common Work Results for HVAC.
 - 4. Section 23 05 13: Basic HVAC Materials and Methods.
 - 5. Section 23 08 00: HVAC Systems Commissioning.
 - 6. Section 23 30 00: Air Distribution.
 - 7. Section 23 80 00: Heating, Ventilating and Air Conditioning Equipment.
 - 8. Section 26 05 00: Common Work Results for Electrical.
 - 9. Section 26 05 13: Basic Electrical Materials and Methods.

1.02 REFERENCES

- A. The latest version of applicable codes, standards, and references. Inspections and tests shall be in accordance with the following applicable codes and standards, except as provided otherwise herein.

1. International Electrical Testing Association – NETA.
2. National Electrical Manufacturers Association – NEMA.
3. American Society for Testing and Materials – ASTM.
4. Institute of Electrical and Electronics Engineers – IEEE.
5. American National Standards Institute – ANSI.
6. National Electrical Safety Code – NESC.
7. California Building Code – CBC.
8. California Electrical Code – CEC.
9. California Mechanical Code – CMC.
10. Insulated Cables Engineers Association – ICEA.
11. Occupational Safety and Health Administration – OSHA.
12. National Institute of Standards and Technology – NIST.
13. National Fire Protection Association – NFPA.
14. American Society of Heating, Refrigerating, and Air-Conditioning Engineers – ASHRAE
(The HVAC Commissioning Process, ASHRAE Guideline).
15. International Electrical Testing Association (NETA) Acceptance Testing.

1.03 SUBMITTALS

- A. Provide in accordance with Division 01 and Section 23 05 00: Common Work Results for HVAC.
- B. Shop Drawings shall include but not limited to:
 1. Cover page with legend, common notes, symbol schedule, and drawing index.
 2. Complete point to point environmental controls and energy management network communication diagram(s) for Direct Digital Controls (DDC) of each system:
 - a. Identify all components.
 - b. Indicate conduit and wire characteristics, sizes and quantities.
 - c. Provide bill of materials.
 3. Floor plans showing control panels and intercommunication wiring.
 - a. Show system(s) interface connections.
 4. Operations and Maintenance Manuals.
 5. As-built submittal drawings.
 6. Installation Instructions of each control device.
 7. Supplemental local or factory training schedule for post warranty support.
 8. A complete list of recommended spare parts with pricing for the OWNER's use in keeping the environmental control system downtime to a minimum.

9. Composite DVD with AutoCAD or electronic pdf drawings in a “.dwg” format.

1.04 QUALITY CONTROL

- A. CONTRACTOR shall have adequate experience installing systems of similar size and complexity with the control product line proposed for this project.
 1. Qualifications of Installer: Minimum five years experience installing products and systems of similar scope and complexity.
 2. Installer shall submit certification from the equipment manufacturer indicating that installer is an authorized representative of the equipment manufacturer and is trained on network applications.
 3. Installer shall maintain a fully equipped service organization capable of furnishing repair service to the equipment and shall maintain a spare set of major parts for the system at all times.
 4. Installer shall furnish a letter from manufacturer of equipment certifying equipment has been installed according to factory standards and that system is operating properly.
 5. CONTRACTOR shall have participated in the commissioning of a minimum of 10 projects of similar magnitude to those needed for this project.
 6. System startup and testing shall be performed under the direct observation of the Project Inspector and OAR.
- B. Materials and equipment installed shall be new.
- C. System installation shall not begin until Shop Drawings are submitted and reviewed by the Architect or Engineer of Record.
- D. Components for Direct Digital Control (DDC) shall comply with ASHRAE standards.
- E. The installer shall provide the system components required by code and for the life safety of the service personnel.
- F. System shall be able to interface with open protocol BACnet systems.
- G. Provide all ancillary components for the system to perform the required sequence of operations. Install, test and adjust the system accordingly.
- H. System components shall operate per industry standards. The standards shall be as defined by ASHRAE, SMACNA, AABC, NEBB, TABB, and the literature of the manufacturers listed in this Section.
- I. Provide field engineering tools including software and hardware needed for programing and/or modifying system controller and devices.

1.05 WARRANTY

- A. Components, system hardware and software, and parts and labor shall be guaranteed against defects in materials, fabrication, and execution for three years from date of system acceptance. Provide labor and materials to repair, reprogram, or replace defective components at no charge to the OWNER during the warranty period.

- B. Provide a list of applicable warranties for equipment and components, this list shall include warranty information, names, addresses, telephone numbers, and procedures for filing a claim and obtaining warranty services.
- C. CONTRACTOR shall respond to OWNER's request for warranty service within four hours of initial call to schedule a mutually agreeable time for service. Submit records of the nature of the call, the work performed, and the parts replaced or service rendered.

1.06 TRAINING

- A. Provide a competent instructor who is factory trained and has comprehensive knowledge of system components and operations to provide full instructions to designated personnel in the system operation, maintenance, and programming. Training shall be specifically oriented to installed equipment and systems.
 - 1. Provide 2 hours of onsite OWNER familiarization and training for the installed system. Training shall include system overview, time schedules, override commands, emergency operation, and programming and report generation. OWNER employees attending this training session shall be provided with the following documentation:
 - a. As-built drawings of System layouts and point to point connection diagrams.
 - b. System components cut sheets.
 - c. Operations and maintenance data.
 - 2. Programmer and maintenance training shall include database entry; trend logs application programs, diagnostic routines, reporting, failure recovery and calibration.
 - a. Provide 4 hours of training as follows:
 - 1) Training session shall accommodate a minimum of 2 persons and be facilitated at CONTRACTOR's training facility, which should be no more than 50 miles from the Project Site.
 - a) Training shall be delivered in 1 session increments.
 - b) Obtain OWNER's approval for training locations exceeding 50 miles. In such cases, the CONTRACTOR shall be responsible for transportation expenses.
 - c) CONTRACTOR shall provide training computers for all attendees. Computers shall be ready for live training sessions.
 - 2) Training shall cover instruction, theory, and expose the trainees to system's features, components, architecture, operations, programming, report generation, communications, and any other pertinent information required for the operations and maintenance of the system.
 - 3) Each training session shall have an itemized agenda covering all aspects of the training to be covered in the sessions.

CONTRACTOR shall obtain agendas approval from OWNER and Commissioning Agent.

- 3) Instructor(s) shall give the trainees the opportunity to practice on simulated and actual (installed) systems.
- 4) The training session shall cover, but not be limited to the following instruction modules or sessions:
 - a) System Architecture:
 - (1) System layout and components interrelations and hierarchical structure.
 - b) User Operations:
 - (1) Familiarization and navigation with the EMS operating System.
 - (2) Window panes, menus, navigation buttons, alarm response windows, system passwords and accessibility features and options, monitoring and managing data points (inputs, outputs, numeric values, time and date, strings).
 - (3) Views: Provide sufficient information as to train staff on how and where to access programs, functions, adjust or alter diagnostic points and related data, override messages, reports and actions taken.
 - c) Trending: Setting trend(s) intervals, accessing data trends and history logs for diagnosis points or groups, and reporting. Working with trended data graphical displays, including but not limited to hiding points, setting display types and colors, viewing and setting scales.
 - d) Graphics: Standard symbols and color codes, graphics customization, how and where to access and manage the system with the graphic displays, including changing points and values, using HOA switches and viewing results, mapping to or with other graphic sources and functions, including groups, navigation, sequence of operations, and displays and reports.
 - e) Alarms: Reading and interpreting alarms, acknowledging and silencing alarms, routing and setting priorities, viewing and responding e-mailed and paged alarms.

PART 2 – PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS

- A. Alerton, Automated Logic, Schneider Electric, Trane, Carrier, or approved equal.

2.02 SYSTEM ARCHITECTURE

- A. The system shall be capable of providing a peer-to-peer network of distributed stand-alone DDC controllers that meet ANSI/ASHRAE Standard 135 for open protocol communications.
- B. A maximum of 32 controllers shall be connected to any one MS/TP bus. Minimum Speed of 38kb and can support 127 devices per COM port. Provide a minimum of 2 ports.
1. Provide a Building Automation System (BAS) that consists of Network Server/Controllers (NSCs), a family of Standalone Digital Control Units (SDCUs), Administration. The BAS shall provide control, **remote** alarm detection, scheduling, reporting and information management for the entire facility, WEB enable capabilities, and Wide Area Network (WAN).
 2. The system shall be a top-level 100/1000bT Ethernet network that utilizes BACnet/IP, LonWorks IP, and/or Modbus TCP protocol.
 - a. A sub-network of SDCUs using the BACnet MS/TP protocol shall connect the local, and stand-alone controllers with Ethernet-level Network Server Controllers/IP Routers.
- C. Only systems that use HTML 5 structured language are allowed.
- D. The supplied computer software shall employ object-oriented technology (OOT) for representation of data and control devices within the system. For each global, system or unitary controller, provide a PICS document showing the installed device's compliance level. Minimum compliance is Level 3 with the ability to support data read and write functionality.
- E. Maximum acceptable response time from any alarm occurrence (at the point of origin) to the point of annunciation shall not exceed three seconds for network connected controllers or user interfaces.
1. For each system point, alarms can be created based on high/low limits or in comparison to other point values.
 2. There is no limit to the number of alarms that can be created or stored in system hardware for any point, up to the system capacity.
 3. System shall generate configured alarms from single or multiple system conditions.
 4. Alarms will be generated from an evaluation of the alarm condition, and presented to the user in a fully configurable order, by priority, time, and category,
 - a. Alarm views shall be presented to the user upon logging into the system WorkStation and/or Webstation.

5. Program the alarm management system to create and report alarm events history; the alarm events history data base shall provide the option to select alarm cause and action notes associated with an alarm event. The alarm management system shall also generate checklists for operators' use when utilizing a suggested mode of troubleshooting.
 6. Provide alarm event history for a feature use to permit assigning of events for resolution to OWNER staff. The system shall notify the user and assigned resolution personnel.
 7. Alarms shall be capable of being routed to any BACnet workstation that conforms to the B-OWS device profile and uses the BACnet/IP protocol.
- F. The system shall be able to interface with subsystems that utilize ANSI/CEA-709.1: Control Network Protocol Specification.
- G. EMS SERVER Provide a Web Server to automatically convert system displays on the workstation to an Internet page. Internet page shall be readable from standard PC browsers. Acceptable browsers shall be latest version of Chrome or Firefox. No additional plug-ins, programs, software, hardware, etc. shall be needed to access the Internet page. The server shall be a separate device to provide security protection for the building system from outside hackers.
- a. Coordinate individual system components IP addresses, switch port assignments, security settings such as but not limited to SNMP alarm delivery, HTTPS/SSL settings, VLAN assignment and authorized IP address ranges with the OWNER's Information Technology Division. Coordination activities with ITD shall be executed through the OAR.
 - b. Provide IP address label on the interior of each cabinet door or equipment.
 - c. The system shall support the ability to notify the Train Depot or OWNER designated personnel by SMS or Email messages, utilizing the OWNER's mail server when problems or situations that require immediate attention arise.
2. Operator Workstation shall display data associated with the project as called out on drawings or object type list supplied. Graphic files shall be created using digital, full color photographs of system installation, AutoCAD or Visio drawing files of field installation drawings and wiring diagrams from as-built drawings. Operator's workstation shall display data using three-dimensional graphic representations of mechanical equipment. System shall be capable of displaying graphic files, text, trend data and dynamic object data together on each display screen with animation of equipment operation.
 3. Controllers shall be programmed using graphical software tools that allow connection of function blocks for visual sequencing of control logic. Function blocks shall display real time data and be animated to show status of data inputs and outputs when in real time operation. Animation shall also show change of status on logic devices and countdown of timer devices in a graphical format.

4. Operator Tracking Log shall record operator changes to the system for future review. This shall include, but not be limited to setpoint changes, time schedule overrides, alarm limits, etc.
5. The system shall be equipped with a battery back-up source capable of providing 30 minutes of operation (computer and monitor) in the absence of normal power, to allow for an orderly shutdown and data back-up.

2.03 GLOBAL CONTROLLER

- A. Building controllers shall incorporate the functions of a 3-way BACnet router. Controller shall route BACnet messages between the high-speed LAN (Ethernet 100MHz), master slave token passing (MS/TP) LANs, a point-to-point (PTP/RS-232) connection and telephone modem.
- B. Provide global control strategies for the system based on information from any point objects in the system. Programming shall be object-oriented using graphical control function blocks. Global strategies shall include, but not limited to unit scheduling, electrical demand limiting, optimized start-stop of equipment, central plan reset control, etc.
- C. Battery shall retain static RAM memory and real-time clock functions for a minimum of 1.5 years (cumulative). Battery shall provide up to five minutes of powerless operation for orderly shutdown and data backup.
- D. Alarms may be generated within the system for any object change of value or state either real or calculated. This includes events such as analog object value changes, binary object state changes and various controller communication failures. Each alarm may be automatically dialed out to a telephone pager or emailed to any Internet PC computer.
- E. Provide a UPS with battery back-up capability to provide a minimum of 30 minutes of operation (computer and monitor) for orderly shutdown and data backup. Make connections and test the system for proper operation in the presence of the Project Inspector.
- F. The global controller shall be equipped with ADR demand limiting capacity interface.
 1. The system shall include 5 DI for interfacing to local utility ADR program. The 5 DI shall be located in a 24 X 24 X 6 NEMA 12 cabinet mounted in the MDF or IDF room. Upon closer of each DI the control system shall raise or lower (depend on system mode) global room temperature set point 1 degree (user adjustable).
 2. The system shall also include a demand-limiting program that utilizes data from site utility meter. Features indicated below shall be available via a switchable graphical user interface in all operating stations:
 - a. Shed/Restore equipment in digital format shall include 5 data input points for interface to future ADR web appliance located in an MDF/IDF room. System server shall accept ADR command from utility service via web interface, and shall include at least 5 priority

levels of equipment shedding. Load shedding on a given priority level shall include two methods. In one the loads shall be shed and restored in a “first-off/first-on” mode and in the other; the loads shall be shed/restored in a linear fashion.

- b. Adjust operator selected control setpoints in analog format based on energy usage when compared to shed and restore settings.
- c. Shedding may be implemented independently on each and every zone or piece of equipment connected to the system.
- d. Status of every load shed shall be capable of being displayed on every operator terminal connected to the system. Statuses shall be displayed along with the English description of each load.

2.04 APPLICATION (system and unitary) DDC CONTROLLERS.

- A. Application controllers shall include universal inputs with 10-bit resolution that accept 3K and 10K thermistors, 0 to 10VDC, 0 to 5 VDC, 4 to 20 mA and dry contact signals. Any input on a controller may be either analog or digital with a minimum of three inputs that accept pulses. Controller shall include support and modifiable programming for interface to intelligent room sensor with digital display, and set point adjustment and override button. Controller shall include binary and analog outputs on board. Analog outputs shall be switch selectable as either 0–10VDC or 0–20mA. Software shall include scaling features for analog outputs. Application controller shall include a supply voltage to power external sensors.
- B. Program sequences shall be stored in EEPROM or flash memory. No batteries shall be needed to retain logic program. Controller shall execute program sequences 10 times per second and be capable of multiple PID loops for control of multiple devices. Calculations shall be completed using floating-point math. Programming of application controller shall be completely modifiable in the field over the installed BACnet LANs or remotely via modem interface.
- C. CONTRACTOR shall provide a laminated wiring diagram for each control panel. Locate diagrams on interior side of control panel’s doors.

2.05 TEMPERATURE SENSORS

- A. Temperature sensors shall be 10K ohm thermistor factory-calibrated to within 0.5 degrees F, totally interchangeable with housings appropriate for the application.
- B. Wall sensors shall be installed 48 inches above finished floor. Duct sensors to be installed such that the sensing element is in the main air stream. Immersion sensors to be installed in wells filled with thermal compound. Outside air sensors shall be installed away from exhaust or relief vents, not in an outside air intake and in a location that is in the shade most of the day.
- C. Intelligent room sensors shall be equipped with digital display, set point adjustment and override button. Smart room temperature sensor/thermostat shall incorporate PIR motion sensor, temperature display, set point adjustment and override button.

Acceptable Manufacturers: Schneider Electric SE8600 series, Viconics VT8600 series, Sigler 8600 series or equal.

- D. Room thermostat shall be BACnet capable, Acceptable manufacturers: Schneider Electric SE8600 series, Viconics VT8600 series, Sigler VT8600 series or equal.

2.06 PRESSURE SENSORS

- A. Differential and pressure sensors shall have a tensioned stainless steel diaphragm to form a variable capacitor that produces a linear output with an accuracy of 1.0 percent of full scale. The unit shall be able to withstand 10 PSIG over pressurization.
- B. Differential pressure switches shall utilize a diaphragm operated snap-acting switch with a setpoint range of 0.05 to 2.0 inches WC.

2.07 DEMAND CONTROL VENTILATION (DCV) CARBON DIOXIDE (CO₂) SENSORS

- A. Sensors shall be wall mounted at a height of approximately 4 feet. Locate sensors adjacent to room thermostat.
- B. Sensors shall be furnished with a display window that provides continuous monitoring and sensor status readings, and with tamperproof cover.
- C. Sensors shall be gold plated for long-calibration stability, be factory calibrated and certified for a minimum of five years.
- D. Carbon dioxide concentration levels shall be sensed by non-dispersive infrared technology. A corrosion-free sensing chamber shall be used for accurate, stable CO₂ sensing. An LCD shall display sensed CO₂ concentration.
- E. Sensor shall be gold plated and have a range of 0-2000 PPM at +/- 5 percent accuracy for long-term calibration stability. Both analog and binary relay output circuits shall be available on the sensor. An automatic background calibration algorithm shall reduce required maintenance.
- F. Acceptable Manufacturers: Telaire, Honeywell, Johnson Controls, or equal.

2.08 DAMPER ACTUATORS

- A. Electric damper actuators shall be direct shaft mounted and use a V-bolt and toothed V-clamp. The actuator mounting arrangement and spring return feature shall permit normally open or normally closed positions of the damper as required.
- B. Actuators shall be sized for 200 percent of the design torque requirements.
- C. Damper actuators shall incorporate a release mechanism to manually position the damper for maintenance or emergency override.
- D. Damper actuators located outdoors shall have a clear plastic weather shield specifically designed for the application.
- E. Damper motor control shall be with 2-10 VDC
- F. Acceptable Manufacturers: Belimo, Honeywell, Johnson Controls, Schneider Electric, or equal.

2.09 CURRENT SWITCH

- A. Current sensing switch shall be self-powered with solid-state circuitry and a dry contact output. A multi-turn setpoint adjustment shall set the trip point status. An LED shall indicate the on or off status.

2.10 CONTROL RELAY

- A. The relay shall be contained in a plenum rated NEMA 12 enclosure with a ¾” NPT conduit fitting. Coil voltage shall be 24 or 120 VAC with a contact rating of 10A. An LED on the enclosure cover shall indicate the relay is energized.

2.11 POWER SUPPLIES

- A. Power supplies and panel assemblies shall be UL or NRTL listed.
- B. Control subcontractor shall be responsible for providing an operational powered system. This means from the control system power supply providing the control power wiring and conduit and connecting to the electrical panelboard.

2.12 ENCLOSURES

- C. Controllers, power supplies and relays shall be mounted in Hoffman A-LP NEMA 12 enclosures or equal when located in an indoor environment.
- D. Enclosures for outdoor applications shall be metal NEMA 4, Hoffman A-ALP, A-BLP or equal, and be mounted on the north exposure of the controlled unit.
- E. Enclosures shall have hinged, locking doors with common keying (CAT-60) for control panel on the Project Site.
- F. Enclosures shall have permanently affixed to the door an engraved nametag identifying the equipment served. The nametag shall be a minimum 1 inch by 3-inch with ½ inch lettering.

PART 3 – EXECUTION

3.01 CONTROLS INSTALLATION

- A. Wiring methods for control system shall be as defined in the Division 26 specifications. Wire types shall conform to manufacturers’ recommendations.
- B. Mount control panels adjacent to associated equipment on vibration-free walls or freestanding angle iron supports. One cabinet may accommodate more than one system in same equipment room. Control panel assemblies must be UL listed.
- C. Provide software and hardware required to provide controls and monitoring of diagnostic points indicated in specification Section 23 8000.
- D. Coordinate with Division 26 electrical installer so that "Hand/Off/Auto" selector switches are installed to override automatic interlock controls when switch is in the "Hand" position. Safety shutdown interlock wiring shall disable the equipment regardless of the position of the H-O-A switch.

3.02 ROOM SENSORS INSTALLATION

- A. Room sensors shall be wall mounted at a 48-inch height above finished floor. Room sensors are not permitted on outside walls, between shelving, in recesses or above heat producing equipment. Coordinate with Division 26 for sensor or thermostat mounting adjacent to light switches.

3.03 COORDINATION

- A. Coordinate the work with other aspects of mechanical, electrical, fire-life safety and security systems, controls, and photo voltaic systems to obtain a complete and operating system in accordance with the contract documents.
- B. Meet with the OAR and school principal and other school staff to determine when each zone or building will be occupied, and to determine programming and scheduling of the heating, ventilating and air conditioning equipment.
- C. CONTRACTOR shall contact Goleta Train Depot facility personnel to coordinate for timely availability of VPN access point(s) from OWNER's Information Technology Division.

3.04 CONTROL SYSTEM ADJUSTMENTS

- A. Make adjustments under operating conditions to provide sequence of operation for each control system per design intent. If required operating conditions cannot be obtained prior to completion date of the contract due to outdoor seasonal temperatures, return to the job site when requested by the OWNER and re-adjust control system when outdoor temperatures will permit proper operating conditions. Start re-adjustment within seven calendar days after notification.

3.05 PERFORMANCE AND ACCEPTANCE:

- A. Test and calibrate each device including but not limited to the following for proper operation, connection, signal value or response.
 - 1. Building Controllers.
 - 2. Custom Application Controllers.
 - 3. Application Specific Controllers.
 - 4. Input / Output Devices. (Sensors, actuators and monitoring devices)
 - 5. Operator Interfaces.
- B. Verify that systems are standalone and operable upon network failure.
- C. Verify that systems return to normal operation automatically upon resumption of network operation or return of power.
- D. Test each system for functions of the required control sequence of operation either by normal control operation or forced operation as required. Log and submit results.
- E. Test the network for connectivity, data transmission rates, input/output responses, and other appropriate parameters Failure modes, including network failure, individual control system failure, and power outages, shall be simulated and responses logged, with any effects on network operation noted and corrected.

- F. Test each preprogrammed time and holiday schedule.
- G. Commissioning requirements of Divisions 01, 23, and 26 apply to this Section.

3.06 WIRING AND INFRASTRUCTURE

- A. Provide necessary wiring, terminations, connections and conduit infrastructure for the complete system as indicated in the construction documents.
- B. Exterior cables whether above or below ground level shall be rated for exterior applications. When entering a building provide a code sized pull box with necessary hardware to transition exterior rated cables to interior applications.
- C. Provide both labeling and record documentation for all EMS system cabling. A cable management schedule and diagram shall be provided at each system panel or cabinet, in addition to a complete cabling diagram to be provided at the head end equipment location.
 - 1. The cable management spread file shall include the following:
 - a. Cable Schedule.
 - b. Cable Test Forms.
 - c. Cable Label sequence and nomenclature.
 - d. Network chart.
 - 2. Cable numbering shall be based on a defined format which readily identifies cable type, and allows maintenance technicians to determine originating and terminating locations.
 - 3. Present the data in an Excel spreadsheet that will operate on the latest Windows platform. Information shall be presented in paper and electronic formats.
 - 4. A copy of the cable schedule in a transparent plastic sleeve shall be affixed in the interior side of the front door of each network cabinet or cables convergence hub points.

3.07 DATA LOGGING REQUIREMENTS

- A. The system must be capable of storing the system's collected and diagnosis data for a minimum of seven days.
- B. Program the system for a standard seven day schedule including holidays.

3.08 CLEANUP

- A. Remove rubbish, debris and waste materials and legally dispose of off Project Site.

3.09 PROTECTION

- A. Protect Work of this Section until Substantial Completion.

END OF SECTION

SECTION 23 05 93

TESTING, ADJUSTING, AND BALANCING FOR HVAC

PART 1 – GENERAL

1.01 SUMMARY

A. SECTION INCLUDES

1. This Section specifies the requirements for test and balance of HVAC systems.

B. RELATED REQUIREMENTS

1. Section 01 11 00: Summary of Work.
2. Section 01 31 13: Project Coordination.
3. Section 01 32 13: Construction Schedule.
4. Section 01 33 00: Submittal Procedures.
5. Section 01 77 00: Contract Closeout.
6. Section 23 05 00: Common Work Results for HVAC.
7. Section 23 05 13: Basic HVAC Materials and Methods.
8. Section 23 05 48: HVAC Sound, Vibration and Seismic Control.
9. Section 23 09 00: HVAC Instrumentation and Controls.
10. Section 23 3 000: Air Distribution.
11. Section 23 80 00: Heating, Ventilating and Air Conditioning Equipment.

PART 2 – PRODUCTS (Not used)

PART 3 – EXECUTION

3.01 DEFINITIONS AND APPLICABLE PUBLICATIONS

- ###### A. For the purposes of this Section definitions are as indicated in applicable publications of AABC, NEBB, TABB, ASHRAE, ANSI and SMACNA.

1. TAB: Testing, Adjusting and Balancing.
2. TABB: Testing, Adjusting and Balancing Bureau.
3. AABC: Associated Air Balance Council.
4. NEBB: National Environmental Balancing Bureau.
5. ASHRAE: American Society of Heating, Refrigerating and Air-Conditioning Engineers.
6. ANSI: American National Standards Institute.

7. SMACNA: Sheet Metal and Air Conditioning Contractors' National Association.
8. OAR: OWNER'S Authorized Representative

3.02 QUALITY ASSURANCE

- A. The General Contractor shall contract directly with the test and balance agency. Tests performed by testing agencies contracted with the system's subcontractor will not be accepted. The qualifications of the agency shall comply with Article 3.02, Quality Assurance. The agency shall be responsible for furnishing labor, instruments, and tools required to test, adjust, and balance the heating, ventilating, and air conditioning (HVAC) systems and related plumbing systems, as described and/or as indicated in the Contract Documents.
- B. CONTRACTOR shall obtain services of an independent, qualified testing agency acceptable to Architect to perform testing and balancing Work as specified and as follows:
 1. Agency shall be currently certified by either the Associated Air Balance Council (AABC), the National Environmental Balancing Bureau (NEBB), or the Testing, Adjusting and Balancing Bureau (TABB). NEBB or TABB certification shall be for Air and Hydronic Testing, Adjusting and Balancing and Sound and Vibration Measurement.
 2. Work shall be in accordance with the latest edition of the AABC, NEBB, or TABB National Standards. Where the requirements of the two standards are different, the more stringent requirements shall prevail. Also, if the Contract Documents impose a more stringent standard, then the Contract Documents shall prevail.
- C. Performance Criteria: Work of this Section shall be performed in accordance with approved Testing, Adjusting, and Balancing agenda.
- D. Test Equipment Criteria: Basic instrumentation requirements and accuracy/calibration required by Section Two of the AABC, Section II of the NEBB, or TABB Procedural Standards for Testing, Adjusting and Balancing of Environmental Systems.
- E. Verification: The Test and Balance Agency shall recheck 10 percent (minimum 10) of the measurements listed in the report. The locations shall be selected by PROJECT INSPECTOR or OAR. The recheck will be witnessed by PROJECT INSPECTOR or OAR. If 20 percent of the measurements that are retested differ from the report and are also out of the specified range, an additional 10 percent will be tested. If 20 percent fall outside the specified range, the report will be considered invalid and all test and balance work shall be repeated.
- F. Due to more stringent acoustical requirements in the educational environment, the Test and Balance Agency shall recheck the air systems where the sound level is higher than the specified requirements and demonstrate compliance with the methodology specified in this document with emphasis on fan speed adjustment and balancing for optimum acoustical performance. The recheck will be witnessed by PROJECT

INSPECTOR or OAR. When there are multiple air systems, a system selected by PROJECT INSPECTOR or OAR shall be rechecked. If this system is found to be not in compliance, a second system shall be checked. If the second system if also found to be not in compliance, the report will be considered invalid, and all test and balance work shall be repeated.

3.03 SUBMITTALS

- A. Submit name of agency to perform the Work. Include in the submittal the certified qualifications of all persons responsible for supervising and performing actual Work of this Section. Agency shall submit a minimum of five commercial or industrial HVAC system TAB projects of similar type, size, and degree of difficulty completed within the last two years. Agency shall provide name and telephone number of contact person for each listed project.
- B. Submit, for approval, 6 copies of the Agenda as indicated in Article 3.06 to test and balance all mechanical and relevant plumbing systems.
- C. Preliminary Report: Review the Contract Documents, examine Work installations and submit a written report to ARCHITECT, PROJECT INSPECTOR and OAR indicating deficiencies in Work precluding proper testing and balancing of the Work.
- D. Final TAB Report: Submit the final TAB report for review by ARCHITECT, PROJECT INSPECTOR, and OAR outlining the conditions and Work completed on each HVAC system. All outlets, devices, HVAC equipment, etc. shall be identified, along with a numbering system corresponding to report unit identification.
- E. Submit an AABC “National Project Performance Guaranty” or “NEBB Quality Assurance Certification”, assuring the Project systems were tested, adjusted, and balanced in accordance with the Specifications and AABC, NEBB, or TABB National Standards.
- F. CAD PDF drawings: Submit single line, multi-color CAD drawings indicating outside return and supply air, volume control boxes, each outlet and inlet, room numbers, duct sizes at traverse locations, temperatures and pressures, systems balanced, components changed, and CONTRACTOR installed access points. In addition, drawings shall identify controls, equipment settings, including manual damper quadrant positions, manual valve indicators, fan speed control levers, and similar controls, and devices shall be marked on the drawings to show final settings. CAD files shall be submitted on CD-ROM upon final submittal of TAB report. Reports shall identify discrepancies between completed Work and the Contract Documents affecting the performance and longevity of the system.

3.04 GENERAL SCOPE OF WORK

- A. The general scope of Work shall include but not be limited to the following:
 - 1. Measure airflow rates of HVAC systems and make adjustments to achieve design airflow rates, tabulate results, and submit reports.

2. Measure flow velocities, temperatures, static pressures or head, rotational speed, and electrical power demand of fans, pumps, and other related HVAC system components, tabulate results, and submit reports.
3. Measure sound levels in each conditioned space, tabulate results, and submit reports.
4. Measure ambient sound levels of outdoor HVAC units and system components such as chillers and cooling towers, tabulate results, and submit reports.
5. Reports shall contain sufficient data for the system designer to evaluate system performance and solve installation problems such as system pressure profiles and pressure drops across system components

3.05 SPECIFIC SCOPE OF WORK

- A. The specific scope of Work shall include the following HVAC system components as indicated on the Drawings:
 1. Air conditioning units and their supply, return, relief and exhaust fans.
 3. Outside Air and Return Air Plenums.
 4. Outside Air Intakes.
 5. All Supply, Return and Exhaust Ductwork.
 6. All associated Air Terminal Devices, i.e. Supply Diffusers, Return Registers, etc.

3.06 TESTING, ADJUSTING, AND BALANCING AGENDA

- A. Provide proposed materials, methods, procedures, forms, diagrams, and reports for test and balance Work.
- B. Agenda to be completed by the test and balance agency and submitted to ARCHITECT, PROJECT INSPECTOR, and OAR for review and approval.
- C. Agenda shall include one complete set of AABC, NEBB, or TABB publications listed in Sub-paragraph 3.02.B.2, applicable publications, or, in case of other test and balance agencies and or organizations, comparable publications to establish an approved, systematic, and uniform set of procedures.
- D. Agenda shall also include the following detailed narrative procedures, system diagrams, and forms for test results:
 1. Specific standard procedures required and proposed for each system of the Work.
 2. Specified test forms for recording each procedure and for recording sound and vibration measurements.
 3. Systems diagrams for each air, water, and steam system. Diagrams may be single line.
- E. In addition to information recorded for standard AABC, NEBB, or TABB procedures, the following information is required:

Department of Neighborhood Services and Public Safety
GOLETA TRAIN DEPOT PROJECT

1. Fan data.
 2. System number, location, manufacturer, model, and serial number.
 3. Fan wheel type and size.
 4. Motor horse power, type, and rpm.
 5. Sheave size, type, number of grooves, and open turns on Variable Pitch Sheave.
 6. Number and size of belts, motor and fan shaft sizes, center-to-center of shafts in inches, and adjustment available motor data, including nameplate data, actual amps, rated, and actual motor rpm, volts, phase, hp, kW, starter heater size, and capacity.
 7. Fan design airflow and service (supply, return, outdoor air or exhaust).
 8. Fan static pressure, suction/discharge, static profile, and static control point.
- F. The following traverse data is required:
1. Traverse location, size of duct (inside dimensions), and area of duct in square feet.
 2. Column for each hole traversed/lines for each reading.
 3. Barometric pressure.
 4. Temperature/Static pressure in the duct.
 5. Actual CFM corrected to SCFM.
 6. Notes.
- G. The following air distribution data is required:
1. Room identification.
 2. Outlet or intake balance sequence number.
 3. Size of outlet or inlet.
 4. AK Factor.
 5. Design and Actual FPM and CFM.
 6. Notes.

3.07 PROCEDURES

- A. Schedule the Work of this Section in order for test and balance activities to be completed prior to the date of Substantial Completion. CONTRACTOR shall place all heating, ventilating, and air conditioning equipment into operation during each day and until all HVAC adjusting, balancing, testing, demonstrations, and instructions on systems are completed. Agency shall prepare and submit reports within ten (10) days from completion of the Work of this Section to allow sufficient time for corrective measures to be completed before Substantial Completion of the Work. When an individual building or portion thereof is ready for occupancy, all equipment relative to such portion of Work shall be put into service, tested, and balanced.
- B. Prior to the date of Substantial Completion, and upon completion of test and balance Work, place all exhaust fans in operation, force all air handling units, and air conditioning units into a 100 percent outdoor air economizer mode with heating and cooling locked out and flush the building continuously for a period of fourteen (14) days.
- C. Coordinate test and balance procedures with any phased Project requirements so test and balance procedures on each phased portion of the Work will be completed prior to completion of said designated phase.

3.08 FIELD EXAMINATION

- A. Before the commencement of test and balance Work, CONTRACTOR shall ascertain that following conditions are fulfilled:
 - 1. Refrigerant systems are fully charged with specified refrigerant.
 - 2. Over-voltage and current protection have been provided for motors.
 - 3. Equipment has been labeled as required.
 - 4. Curves and descriptive data on each piece of equipment to be tested and adjusted are available as required.
 - 5. Operations and maintenance manuals have been supplied.
 - 6. Controls manufacturer and boiler-burner representatives shall be available for consultation and supervision of adjustments during tests.
 - 7. Verify that heating and cooling coil fins are cleaned, combed and air filters clean, and installed.
 - 8. Verify that duct systems are clean of debris and leakage is minimized, access doors are closed and duct end caps are in place, and fire and volume dampers are in place and open.
 - 9. Automatic control systems are completed and operating.
 - 10. Start up and initial commissioning of all HVAC equipment except fans shall be by the manufacturer.
- B. In addition to the above, CONTRACTOR shall establish a specific, coordinated plan which details how each area of existing building will be balanced during the various

phases of the Work. The evaluation shall address, at a minimum, the following concerns:

1. OWNER operations.
2. Building safety and security policies. Prior to any fire safety or security systems shutdown at any time during the Work, CONTRACTOR shall first advise and coordinate with OWNER to ensure all concerned parties are notified.
3. Protecting fixtures and equipment.
4. Concerns specific and unique to building related issues.
5. Downtime required for each Air Handling Unit including projected time to return each portion of the building back to its normal occupancy temperature and humidity.
6. Shutdown and reactivation of the fire alarm system to avoid accidental alarms during test and balance and related Work.

3.09 TEST AND BALANCE

A. For each heating, ventilating, or air conditioning system the following shall be performed, recorded, and submitted in an approved format for review. Make, type, and model of unit, and location of each piece of equipment shall be included in the report. Readings shall include but not be limited to following:

1. Air Systems:
 - a. General
 - 1) Verify all ductwork, dampers, grilles, registers, and diffusers have been installed per design and set in the full open position. Agency shall perform the following TAB procedures in accordance with AABC or NEBB National Standards. Where the requirements of the two standards are different, the more stringent requirements shall prevail. Also, if the Contract Documents impose a more stringent standard then the Contract Documents shall prevail.
 - b. Zone, Branch, and Main Ducts:
 - 1) Adjust ducts to within design CFM requirements by means of Pitot-tube duct traverse.
 - c. Supply Fans:
 - 1) Fan Speeds: Test and adjust fan RPM to achieve maximum or design CFM. CONTRACTOR shall provide new belt pulleys when required.
 - 2) Current and Voltage: Test and record motor voltage and amperage, and compare data with the nameplate limits. Ensure

- fan motor is not in or above the service factor as published by the motor manufacturer.
- 3) Pitot-Tube Traverse: Perform a Pitot-tube traverse of main supply and return ducts, record total CFM.
 - 4) Outside Air: Test and adjust the outside air using Pitot-tube traverse.
 - 5) Static Pressure: Test and record system static profile of each supply fan.
 - 6) Current and Voltage: Test and record motor voltage and amperage, and compare data with the nameplate limits. Ensure fan motor is not in or above the service factor as published by the motor manufacturer.
- d. Return, Relief, and Exhaust Fans:
- 1) Fan Speeds: Test and adjust fan RPM to achieve maximum or design CFM. CONTRACTOR shall provide new belt pulleys where required.
 - 2) Pitot-Tube Traverse: Perform a Pitot-tube traverse of the main return ducts to obtain total CFM.
 3. Static Pressure: Test and record system static profile of each fan.
- e. Diffusers, Registers and Grilles:
- 1) Tolerances: Test and balance each diffuser, grille, and register to within 5 percent of design requirements.
 - 2) Identification: Identify the type, location, and size of each grille, diffuser, and register. This information shall be recorded on air outlet data sheets.
- g. Coils: Air Temperature: Once airflow is set to acceptable limits, agency shall take wet bulb and dry bulb air temperatures on the entering and leaving side of each cooling coil. Dry-bulb temperature shall be taken on the entering and leaving side of each heating coil.
- h. Duct Leakage Testing:
- 1) Every section of the entire air distribution system (all supply, return, exhaust, and relief ductwork) shall be tested at 1.5 times design static pressure, unless the duct sealant is complete per SMACNA Seal Class A completely airtight, and then no duct pressure test is required. All ducts shall demonstrate 1 percent leakage maximum (per CBC).
- i. Air Conditioning Units:

- 1) Prepare pressure profile and show design and actual CFM (outside air, return air, and supply air).
 - 2) Measure and record each mode (minimum OA and 100 percent OA) where economizer cycle is specified.
 - 3) Record pressure drops of all components (coils, filters, sound attenuators, louvers, dampers, and fans) and compare with design values.
 - 4) Pressure profile and component pressure drops are performance indicators and are not to be used for flow measurements.
- j. System Pressure Profiles:
- 1) Prepare pressure profiles from fan (supply, return, and exhaust) or air handling unit to extremities of system.
 - 2) As a minimum, show pressure at each floor, main branch, and airflow measuring device.
 - 3) Make pitot-tube traverses of all trunk lines and major branch lines where required for analysis of distribution system. Airflow measuring devices installed in ductwork, if available, may be utilized.
 - 4) Record residual pressures at inlets of volume controlled terminals at ends of system.
 - 5) Show actual pressures at all static pressure control points utilized for constant or variable flow systems.
- k. Fan speed adjustments and balancing for optimum acoustical performance:
- 1) As the very first step, the speed of all fans (supply, return, and exhaust inside packaged equipment or air handling units) shall be adjusted to deliver the required fan total air quantity with all volume dampers and other flow rate control devices fully open. Adjustments shall be made with the outdoor air intake dampers, return air dampers, and relief air dampers in the minimum outdoor air position. The adjustments shall be made again in the 100 percent outdoor air position in systems with 100 percent outdoor air economizers.
 - 2) The above adjustment shall be done with wet cooling coils, where cooling coils are provided.
 - 3) The airflow rates at each branch duct shall be adjusted as the second step with air with all volume dampers and other flow rate control devices fully open.
 - 4) The airflow rates at each air inlet and outlet shall be adjusted as the final step. The volume damper in the branch duct shall be

used for balancing. Opposed blade dampers at air inlets and outlets where provided shall only be used for fine adjustments and shall not be closed beyond 60 percent open or when the dampers start to generate audible noise.

- 5) CONTRACTOR shall provide the labor and materials for all dampers, pulleys, and belt changes required for balancing. The design documents indicate the worst-case scenario with safety factors in fan static pressures for contingency. Properly coordinated and installed air systems may require a lower static pressure and a reduction in fan speed.

3.10 VERIFICATION OF HVAC CONTROLS

- A. Agency shall verify in conjunction with CONTRACTOR all control components are installed in accordance with the intent of the Contract Documents and are functioning according to the design intent, including all electrical interlocks, damper sequences, air and water resets, fire stats, and other safety devices.
- B. CONTRACTOR shall verify all control components are calibrated and set for design operating conditions and intent.

3.11 TEMPERATURE TESTING

- A. To verify system control and operation, agency shall perform a series of three temperature tests taken at approximately two hour intervals in each separately controlled zone. The resulting temperatures shall not vary more than two degrees Fahrenheit from the thermostat or control set point during the tests. Outside temperature and humidity shall also be recorded during the testing periods.

3.12 BUILDING/ZONE PRESSURIZATION

- A. Agency shall test and adjust building/zone pressurization by setting the design flows to meet the required flow direction and pressure differentials. Positive/Negative area(s) supply air shall be set to design flow and exhaust air rates adjusted to obtain the required pressure differential(s).

3.13 FINAL TABULATION

- A. After heating, ventilating, and air conditioning components are satisfactorily tested and balanced, entire system shall be put into operation and all pressures, temperatures, gpm, cfm, velocities, etc., shall be recorded and checked against design schedules. Design requirements shall be listed on reports and final tabulation shall be within a tolerance of plus or minus five percent of design requirements.
- B. Readings at various locations as described herein will be made every hour for four (4) hours, during normal working hours for three (3) days. Boilers, forced air furnaces, and chillers shall be started up far enough in advance to meet design conditions during period of testing.

3.14 VIBRATION TESTING

- A. Furnish instruments and perform vibration measurements if specified in Division 23. Provide measurements for all rotating HVAC equipment half horsepower and larger, including reciprocating/centrifugal/screw/scroll compressors, pumps, fans, and motors.
- B. Record initial and final measurements for each unit of equipment on test forms. Where vibration readings exceed allowable tolerance and efforts to make corrections have proved unsuccessful, forward a separate report to ARCHITECT.

3.15 SOUND TESTING

- A. Perform and record sound measurements as specified in this Section and in Section 23 0548: HVAC Sound, Vibration and Seismic Control. Take additional readings if required by ARCHITECT.
- B. Measuring equipment and methods shall comply with the current requirements of the AABC, NEBB, TABB and ANSI S12.60. Take measurements with a calibrated Type 1 sound level meter and octave band analyzer.
- C. Sound reference levels, formulae, and coefficients shall be according to ASHRAE Handbook: HVAC Applications, Chapter on Sound and Vibration Control.
- D. Where sound pressure levels are specified as noise criteria or room criteria in Section 23 0548: HVAC Sound, Vibration and Seismic Control determine compliance with the Contract Documents as follows:

- 1. Reduce background noise as much as possible by shutting off unrelated audible equipment.
- 2. Measure octave band sound pressure levels with specified equipment "off".
- 3. Measure octave band sound pressure levels with specified equipment "on".
- 4. Use difference in corresponding readings to determine sound pressure due to equipment. Sound pressure level, due to equipment equals sound pressure level with equipment "on" minus factor.

DIFF.:	0	1	2	3	4	5	9-10 or More
FACTOR:	10	7	4	3	2	1	0

- 5. Plot octave bands of sound pressure level due to equipment for typical rooms, on a graph, which also shows, noise criteria (NC) curves.
- E. Where sound levels are required in dbA, measure sound levels using the A-frequency-weighting of meter. Single value readings will be used instead of octave band analysis.
- F. Measure sound levels at each octave band as NC or RC (room criteria) if indicated in the Drawings or other Spec Sections. Where measured sound levels exceed specified level, CONTRACTOR shall take all remedial action and necessary sound tests shall be repeated. Sound tests after remedial action shall be in octave band in NC or RC for the room and also at each diffuser, grille, or register in occupied areas. Sound levels shall be measured approximately five feet above floor on a line approximately 45 degrees to center of opening, on the A- and C-frequency-weighting of the measuring instrument.
- G. Measure and record sound levels in decibels for each room per current ANSI S12.60.

Department of Neighborhood Services and Public Safety
GOLETA TRAIN DEPOT PROJECT

- H. Report shall include ambient sound levels, taken without air-handling equipment operating, of rooms in which above openings are located. A report shall also be made of any noise caused by mechanical vibration.

END OF SECTION

SECTION 23 30 00

HVAC AIR DISTRIBUTION

PART 1 – GENERAL

1.01 SUMMARY

- A. Section Includes: Ductwork and appurtenances required for a complete air distribution system for the heating, ventilating, and air conditioning systems indicated on Drawings and as specified.
- B. Related Requirements:
 - 1. Division 01: General Requirements.
 - 2. Section 23 05 00: Common Work Results for HVAC.
 - 3. Section 23 08 00: HVAC Systems Commissioning.
 - 4. Section 23 05 13: Basic HVAC Materials and Methods.
 - 5. Section 23 07 00: HVAC Insulation.
 - 6. Section 23 09 00: HVAC Controls.
 - 7. Section 23 80 00: Heating, Ventilating and Air Conditioning Equipment.

1.02 SUBMITTALS

- A. Provide in accordance with Division 01 and Section 23 05 00: Common Work Results for HVAC.
- B. Manufacturer's Data:
 - 1. Complete list of items to be furnished and installed under this Section. Material lists that do not require performance data shall include manufacturer names, types and model numbers.
 - 2. Manufacturer's specifications and other data required to demonstrate compliance with specified requirements.
 - 3. Literature shall include descriptions of equipment, types, models, sizes, capacity tables or curves marked to indicate performance characteristics, electrical requirements, options selected, space requirements, including allowances for servicing, and other data. Data shall include name and address of nearest service and maintenance organization that regularly stocks repair parts. Listings of items that function as parts of an integrated system shall be furnished at one time.
 - 4. Submit complete acoustical test reports showing that proposed products have been tested in accordance with latest editions of relevant ASHRAE and AHRI Standards (ANSI/ASHRAE Standard 70 for air inlets and outlets; ANSI/ASHRAE Standard 130 and AHRI 880 for terminal units) and will be suitable for operation in Project spaces with specified maximum noise criteria

(NC) requirements. The results of all testing shall be certified by an independent testing agency and submitted to the ARCHITECT for approval. The submittal shall include a complete description of the test conditions, methods and procedures.

5. Submittals shall include a tabulation of proposed products, identification of Project spaces where proposed products are to be installed, maximum allowable NC for all Project spaces, and product NC (at specific design air volume) for all Project spaces.
6. Shop Drawings: Shop Drawings indicating methods of installation of equipment and materials, sizes and gages of ducts, and details of supports. Items to be covered shall include but not be limited to following:
 - a. Layout of ductwork and equipment drawn to scale to establish that equipment will fit into allotted spaces with clearance for installation and maintenance. Indicate proposed details for attachment, anchoring to, and hanging from structural framing of building. Indicate vibration isolation units, foundations, supports, and openings for passage of pipes and ducts.
 - b. Drawings indicating locations and sizes of sleeves and prepared openings for pipes and ducts.
 - c. Typical details of supports for equipment and ductwork.

1.03 QUALITY ASSURANCE

- A. Installer's and Manufacturer's Qualifications: Comply with provisions stated under Section 23 05 00: Common Work Results for HVAC.
- B. Sound power level measurements and Manufacturers' NC value calculations shall be conducted in complete accordance with the latest version of ANSI/ASHRAE Standards 70 and 130 and AHRI 880.

1.04 DELIVERY, STORAGE AND HANDLING

- A. Comply with provisions stated in Section 23 05 00: Common Work Results for HVAC.
- B. Ensure ducts are clean and free of dirt, dust, moisture, oils and other contaminants that can lead to poor air quality. During construction, cover openings of ductwork with a self-adhering protective film. Film shall not leave a residue on metal after removal, and shall be highly resistant to tears and punctures.

PART 2 – PRODUCTS

2.01 GENERAL

- A. Unless otherwise noted, provisions, including amendments thereto, of the latest edition of the HVAC Duct Construction Standards of Sheet Metal and Air Conditioning Contractor's National Association (SMACNA) and the California Mechanical Code (CMC), are hereby made part of this Section.

- B. Rectangular, round and flat oval ducts shall be manufactured and installed in accordance with requirements of the latest edition of the HVAC Duct Construction Standards – Metal and Flexible of SMACNA.
- C. Sheet metal ducts shall be fabricated from galvanized steel, aluminum or stainless steel.
- D. Galvanized steel ducts shall be fabricated of galvanized steel sheet, lock forming grade, conforming to ASTM A653 and A924.
- E. Galvanized steel ducts gage thickness and permissible joints and seams of ductwork shall conform to requirements of the latest edition of the HVAC Duct Construction Standards – Metal and Flexible of SMACNA and the CMC unless noted otherwise on the drawings. The more stringent requirements shall prevail.
- F. Button punch snap-lock seams, using Lockformer or equal, shall be permitted only in concealed areas using 20 and 22 gage galvanized steel ducts with screws added at the ends. Button punch snap-lock is not permitted for aluminum or duct lighter than 22 gage.
- G. Ducts shall be reinforced in accordance with the latest edition of the SMACNA HVAC Duct Construction Standards: Cross-broken Duct: Duct sizes 19 inches wide and larger which have more than 10 square feet of unbraced panel shall be beaded or cross-broken. This requirement is applicable to 20 gage or less thickness and 3 inches w.g. or less pressure. For details, refer to SMACNA manual.
- H. Round and Oval Galvanized Steel Ducts:
 - 1. Round Spiral Ducts and Fittings: Fabricated from galvanized sheet steel shall be machine-formed spiral pipe with sealed spiral locking joints. Fittings shall be furnished with continuous corrosion-resistant welds. Provide gages of ducts and fittings recommended by manufacturer.
 - 2. Details of seams and transverse joints for round duct and fittings shall conform to SMACNA standards.
 - 3. Flat oval ducts shall be provided as indicated on the Drawings. Reference standard details in SMACNA manual.
 - 4. Minimum duct wall thickness, and permissible joints and seams of ductwork for flat oval duct construction shall conform to requirements in the latest edition of the HVAC Duct Construction Standards – Metal and Flexible of SMACNA and the CMC. The more stringent requirements shall prevail.
- I. Flexible Ducts
 - 1. Flexible duct shall be non-metallic, insulated for conditioned air supply and return. The flexible ducts shall be factory fabricated with exterior reinforced laminated vapor barrier, 1 ½-inch thick fiber glass insulation (K = 0.25 at 75 degrees F), encapsulated zinc-coated spring steel wire helix and impervious, smooth, non-perforated interior vinyl liner and factory fabricated steel connection collars. For the composite assembly, including insulation and vapor barrier, comply with NFPA Standard 90A or 90B and tested in accordance with

- UL Standard, UL 181. Non-insulated metallic ducts shall be provided for exhaust only.
2. Maximum flexible duct length shall be 5 feet in length.
 3. Methods of installations, standards for joining and attaching, and supporting flexible duct shall conform to applicable provisions of SMACNA manual.
 4. Specifications herein shall not supersede installation requirements by flexible duct manufacturer if those are more stringent.
- J. Fittings and Other Construction Details: Details of fittings such as elbows, turning vanes, branch take-off and connections, duct access doors, connections for grilles, registers and ceiling diffusers, flexible connector at fan, etcetera, shall conform to applicable provisions of this Section or SMACNA manual.
1. Duct Seam and Joint Sealant: Provide SMACNA Seal Class A sealant (sealing with duct sealant all joints and seams) for all metal ducts to be completely airtight. Spiral lock seams in factory fabricated round or oval ducts are excluded. Note that with the incorporation of SMACNA Class A sealant application, the requirement for on-site duct pressure testing will be waived, as the ducts are sealed virtually airtight.
 2. Sealant shall be: Design Polymeric DP1010 or DP1020, Childers CP-145A/CP-146 Chil-Flex, Foster's 32-19 Duct-Fas, Miracle-Kingco Glenkote Seal-Flex, Ductmate Industries PROseal or FIBERseal, or equal.
 3. Sealant materials shall comply with the flame spread and smoke developed rating of current CMC when tested in accordance with ASTM E84.
 4. Sealant for exposed to weather ducts shall pass the Weather Resistance Test per ASTM G154 at 2000 hours QUV.
- K. Restrictions:
1. Zinc-coated steel duct shall not be installed for ductwork transporting moisture-laden air. Flexible duct may only be furnished where specifically indicated on Drawings. Aluminum ducts shall not be installed for internal pressures above 2 inches of water.
 2. Fiberglass duct is not permitted as a substitute for sheet metal duct.

2.02 DAMPERS

- A. Manual Volume Control Dampers:
1. Rectangular: Multi-blade type, opposed blade operation, 16 gage galvanized steel blades; center pivoted on 3/8 inch diameter steel trunnions; interlocking edges; dampers shall be in own angle frame, full duct size as indicated on Drawings; frame of minimum 16 gage steel channel construction. Provide with damper operator and axles positively locked to blade. Ruskin MD35, Pottorff MD-42, Greenheck MBD-15 or equal.
 2. Round: Frame shall be constructed of not less than 20 gage galvanized steel, blades of not less than 20 gage galvanized steel channel construction with

factory neoprene seals, ½ inch diameter axle shafts and locking hand quadrant. Ruskin MDRS25, Greenheck MBDR-50, or equal.

3. Oval: Frame shall be constructed of not less than 14 gage galvanized steel channels with factory blade seals of not less than 12 gage galvanized steel with not less than ½ inch diameter axle shafts. Provide Ruskin standard construction for frame, blade and axle size, thickness and material variation. Provide adjustable locking hand quadrant. Ruskin CDO25, or equal.

B. Manual Fire Dampers:

1. FD, Fire Dampers: Shall conform to requirements of and be listed by State of California Fire Marshal and NFPA 90A. Dampers shall provide airflow resistance not to exceed 0.05 inch water gage static pressure at 900 fpm or 0.25 inch water gage at 2,000 fpm. Dampers shall be installed in required steel sleeve at each penetration of a rated partition.
 - a. Vertical-mounted fire dampers: Fire damper shall be curtain type with blades completely removed from the air stream to allow for maximum free area. Dampers will be provided in factory sleeves as tested and listed by manufacturer. Dampers shall be rated for 1 ½ hours for installation in one or 2-hour partitions. Provide UL listed fusible links of adequate size and temperature rating. Dampers will be installed according to the manufacturer's recommended installation instructions provided with units. Provide suitable access for inspection and servicing of each damper. Pottorff VFD-10/VFD-10D Series, Ruskin IBD/DIBD Series, Greenheck FD/DFD Series, or equal.

- C. Duct Access Panels: Provide factory fabricated access panels in ducts where required for servicing fire or smoke dampers, and at other locations as specified in this Section. Units shall consist of removable panel, gasketed and pressure sealed by controlled spring tension locks. Construct unit, including interior parts, of same material as duct. Units shall be constructed to be suitable for installation in systems of up to 5 inches water gage static pressure.

2.03 AIR DISTRIBUTION DEVICES

A. General:

1. Grilles, registers, diffusers and appurtenances shall conform to requirements specified herein and shall be of type and sizes as specified and indicated on Drawings. Performance shall be in accordance with ANSI/ASHRAE Standard 70 including airflow velocity, pressure, temperature, and sound measurements.
2. Sponge neoprene, rubber, vinyl or felt border gaskets shall be provided for surface-mounted registers, grilles or diffusers.
3. The noise generating characteristics of all specified grilles, registers, and diffusers shall be tested to, and comply with, all requirements of this specification. Representative samples shall be subjected to tests in accordance with applicable standards and procedures in order to demonstrate such

compliance. A special test for this project is not required if the manufacturer has previous certified test results that can be made applicable to this project. Maximum Sound Levels of diffusers, grilles and registers shall be as follows:

General: NC 35

4. Provide suitable frame types to match the ceiling types as specified or indicated on the Architectural Drawings.
 5. Ceiling diffusers shall be provided with equalizing grids.
 6. Ceiling mounted grilles, registers and diffusers shall be provided with a factory applied, baked enamel, dull finish, bone white to match acoustical ceiling tile.
 7. Grilles or registers mounted on painted walls or other surfaces shall be furnished with a baked prime coat and finish painted in accordance with Section 09 9000: Painting and Coating.
 8. Do not provide opposed blade dampers inside supply connection necks at diffusers and registers to balance the airflow, as they tend to create noise. Provide a manual volume damper at each branch take-off and also at branch duct to each diffuser and register upstream of the flexible duct connections. Air throw patterns shall be as indicated on the drawings.
 9. Diffusers, registers and grilles indicated or scheduled on the drawings to comply with special requirements shall take precedence over the standard items specified.
- B. Diffusers, Grilles And Registers
1. Acceptable Manufacturers: Anemostat, Krueger, Price, Titus, or equal.
 2. See plan schedule for diffuser types.

PART 3 – EXECUTION

3.01 EXAMINATION

- A. Examine areas and conditions under which Work of this Section will be performed. Correct conditions detrimental to proper and timely completion of Work. Do not proceed until unsatisfactory conditions have been corrected.

3.02 DUCTWORK

- A. Construct ductwork according to details of fabrication and methods of support, as indicated in the SMACNA manuals and CMC, unless specified or indicated otherwise in this Section or on Drawings. In event of conflict, the most stringent requirement shall be provided.
- B. Unless otherwise required, construct ducts to conform accurately to dimensions indicated and to be straight and smooth on inside, with joints neatly finished.
- C. Duct dimensions indicated are net inside dimensions.

- D. Anchor ducts to building structural slab, framing and roof decking and detail method of anchoring and fastening if not indicated on Drawings. Supports shall be seismically constructed as required by the latest edition of the SMACNA guidelines.
- E. Construct and install ducts to be completely free from vibration under operating conditions.
- F. Indicate on layout drawing, required for suspended ductwork, location of supports, loads imposed on each fastening or anchor, typical details for anchorage, and details for special anchorage for supports attached to metal roof decking.
- G. Attach supports only to building structural framing members and concrete slabs.
- H. Where supports are required between structural framing members, detail and install suitable intermediate metal framing.
- I. Ducts transporting air-conditioned or heated supply air shall be insulated in accordance with requirements of Section 23 0700: HVAC Insulation.
 - 1. All outside ducts exposed to weather shall be acoustically-lined from HVAC equipment through building envelope.
- J. Ferrous angles and structural members and joining collars specified for construction and support of ductwork and plenums shall be primed with one heavy coat of required asphaltic aluminum paint before installation or fabrication. Metal surfaces shall be thoroughly cleaned before installation of paint. Galvanizing may be provided instead of painting. Installed duct hanger rods concealed in furred ceilings and walls are not required to be primed or painted.
- K. Broken places in galvanized coating shall be acid washed and then completely soldered over or painted with galvanizing paint.

3.03 DUCT CONSTRUCTION

- A. Minimum ductwork gages, joints, reinforcing, and bracing of ductwork shall conform to SMACNA and CMC. The most stringent standards shall prevail. Additional bracing shall be provided to prevent objectionable panel vibration.
- B. Button punch snap-lock seams, using Lock-former or equal, shall be permitted only in non-accessible areas using 20 and 22 gage galvanized steel ducts with screws added at the ends. Button punch snap-lock is not permitted for aluminum or duct lighter than 22 gage.
- C. Provide longitudinal seams of the grooved snap lock, or Pittsburg and standing, sealed spiral or continuously welded.
- D. Ferrous angles and structural members and joining collars specified for the construction and support of ductwork and plenums shall be primed with one heavy coat of asphalt aluminum paint before installation or fabrication. The metal surface shall be thoroughly cleaned before application of the paint. Galvanizing may be provided instead of painting. Installed duct hanger rods concealed in furred ceilings and walls is not required to be primed or painted.

- E. Broken places in galvanized coating shall be acid washed and then completely soldered over or painted with galvanizing paint.
- F. S-type or drive-slip type girths or longitudinal seams shall not be furnished for ductwork installed outdoors or mounted on roofs.
- G. Broken places in galvanized coating shall be acid washed and then completely soldered over or painted with galvanizing paint.

3.04 DUCT ELBOWS AND TURNING VANES

- A. Duct elbows, including supply, exhaust, and return, shall be provided with a centerline radius of 1.5 times duct width parallel to radius whenever possible; centerline radius shall not be less than width of duct parallel to radius.
- B. Where space does not permit above radius, or where square elbows are indicated on Drawings, turning vanes shall be installed whether indicated on Drawings or not.
- C. Turning vanes shall conform to SMACNA and CMC.

3.05 DUCT JOINTS AND SEAMS

- A. Conditioned air supply and return ducts shall be furnished with completely joints and seams sealed, welded for air tightness, except spiral seam factory machine formed duct components. Spiral seam is exempted. Joints between slip-fit components may be assembled with all seams and joint connections fastened with screws.
- B. Other ducts shall be furnished with joints and seams sealed by using sealant, taping, soldering, or welding.
- C. S-slip or drive-slip type girths or longitudinal seams are not permitted on exterior or exposed rooftop mounted ductwork.
- D. Caulking, taping, or other joint or seam treatment shall be provided per SMACNA Seal Class A in accordance with recognized standards.
- E. Seams around fan, coil housing and plenums shall be sealed with gaskets or sealing compound to provide an airtight assembly.
- F. Alternative duct connectors such as Ductmate Industries, Mez Industries, or equal may be used if the following conditions are met:
 - 1. One of the specifically listed connectors is submitted and approved by the ARCHITECT and OAR.
 - 2. The correct size connector, application, and gage of material conform to SMACNA Standards.
 - 3. The connector is installed per manufacturer's specifications.

3.06 DUCT TRANSITION

- A. Slopes in sides of transition pieces shall be no greater than 1 to 5. Abrupt changes or offsets in duct system are not permitted, except when reviewed by the ARCHITECT.

3.07 FLEXIBLE CONNECTIONS (At AC Unit Duct Connections)

- A. At points where sheet metal connections are installed to fans or air handling units, or where ducts of dissimilar metals are connected, a flexible connection of commercial grade, Duro Dyne Durolon, Ventfabrics Ventglas, Ductmate Industries Proflex, or equal, non-combustible material shall be installed and securely fastened by zinc-coated steel clinch-type bands or a flange type connection. Inlet and outlet openings shall be axially in-line, maximum deviation of centerline shall be less than 5 percent of diameter or shortest dimension of a rectangular inlet of fan or air handling unit, with system at rest. Duct end of connection shall be seismically restrained if more than 4 feet from last support.

3.08 AIR DIFFUSERS AND GRILLES

- A. General: Install supply devices after ducts, plenums, and casings have been cleaned and blown free of small particles, as specified. Devices shall be aligned to be parallel to ceiling construction or walls and ceiling surfaces, and shall be pulled tightly to compress gaskets and to fit neatly against surfaces.
- B. Diffusers: Support surface mounted ceiling diffusers from angles or channels resting on and fastened to ceiling construction. Do not support from ducts. Install lay-in diffusers on T-bar ceilings with hanger wires from each corner and not supported by ceiling structure. Provide sheet metal adaptor box above each diffuser to allow space for volume controller with round collars for connection to round ducts where indicated on Drawings. Fasten duct-mounted diffusers to duct collars.
- C. Registers and Grilles:
1. Fasten wall mounted and duct mounted registers and grilles to flanges of duct collars.

3.09 VOLUME DAMPERS

- A. Manually operated dampers, gravity dampers, fire dampers, and motor operated dampers shall be furnished and installed as specified and indicated. Upon completion of installation, dampers shall be checked, lubricated, and adjusted so that they operate freely, without binding. Dampers shall be of standard commercial manufacture, complete with damper frame. Where painting is required, they shall be shop finished unless otherwise noted.
1. Provide and install manual volume dampers per SMACNA standards to allow balancing per AABC, NEBB or TABB Procedures and Standards whether indicated on the drawings or not.
 2. Balancing dampers shall be installed in main supply ducts from fan discharge plenums, where two or more ducts are connected to each plenum, although such balancing dampers may not be indicated. Each zone shall be provided with a manual volume damper. Sheet metal screws shall be installed through handles and into ducts to lock damper in place after test and balance.

3. Each supply, return, and exhaust branch shall be provided with manual volume dampers.
4. Do not provide opposed blade dampers at air inlets and outlets, except where indicated.
5. Each supply, return, and exhaust inlet or outlet shall be provided with a manual volume damper. This damper shall be a minimum of 5 feet upstream of the air outlet and inlets. An acoustic flexible duct should be provided between the outlet and inlet and the damper for concealed ducts.
6. Dampers installed in accessible locations shall be provided with locking and indicating quadrants. Ventfabrics Ventlok, Duro Dyne, Young Regulator Co., or equal.
7. Dampers installed in ductwork in furred ceiling spaces or in roof spaces with less than 30 inches of clearance below beams, joists, or other construction, and where access panels are not provided shall be furnished with damper rods extended below ceiling and terminated with a concealed damper regulation. Ventfabrics Ventlok, Young Regulator Co., Duro Dyne, or equal.
8. Dampers not identified as splitter, extractor, or butterfly dampers shall be of multi-louver type arranged for opposed blade operation. Damper shall be same dimension as adjoining duct and be tight closing. Blades shall not be greater than 9 inches. Dampers shall be not less than 18 gage steel.
9. Motor operated dampers shall be furnished by temperature control manufacturer as part of temperature control equipment and shall conform to requirements of Section 23 0900: HVAC Instrumentation and Controls.
10. Dampers shall be provided with accessible operating mechanisms. Where operators are exposed in finished portions of building, operators shall be chromium-plated with exposed edges rounded. Splitter dampers are not permitted unless specified and reviewed by the ARCHITECT.
11. Access panels shall be installed for access at each damper's operating mechanism.

3.10 DUCT SLEEVES AND PREPARED OPENINGS

- A. Furnish duct sleeves for 15-inch diameter ducts or less passing through floors, walls, ceilings, or roof and install during construction of the floor, wall, ceiling, or roof. Install round ducts larger than 15 inches diameter and square and rectangular ducts passing through floors, walls, ceilings or roof through prepared openings. Provide duct sleeves and prepared openings for duct mains and duct branches.
- B. Provide one inch clearance between duct and sleeve or between insulation and sleeves for insulated ducts, except at grilles, registers and diffusers.
- C. Provide prepared openings for round ducts larger than 15 inches in diameter and for square and rectangular ducts with one inch clearance between duct and openings or

between insulation and opening for insulated ducts, except at grilles, registers and diffusers.

- D. Provide closure collar of galvanized sheet metal not less than 4 inches wide unless otherwise indicated on Drawings on each side of walls or floors where sleeves or prepared openings are provided except where grilles or diffusers are installed. Install collar tight against surface. Fit sharp edges of collar installed around insulated duct to preclude tearing or puncturing insulation covering vapor barrier. Fabricate collars from round ducts in steel. Provide not less than 4 nails to attach collar where openings are 12 inches in diameter or less and not less than 8 nails where openings are 20 inches in diameter or less.
- E. Pack space between sleeve or opening and duct or duct insulation with commercial grade packing yarn.

3.11 FLEXIBLE DUCT RUNOUTS

- A. Runouts from branches, risers or mains to air terminal units and outlets may be pre-insulated, factory fabricated flexible ducts complying with NFPA 90A. Flexible ductwork shall not exceed 5 feet in length. When required to suspend flexible ducts, furnish hangers of type recommended by manufacturers of pre-insulated flexible duct and install at intervals recommended. Method of attachment to other components of air distribution system for a vapor-tight joint shall be in accordance with printed instructions of flexible duct manufacturer. Bend radius shall be 1-1/2 times diameter of duct, measured from centerline. Bends greater than 90-degree angle are not permitted. Non-metallic flexible duct shall be permitted only in T-bar suspended ceilings.

3.12 DUCT HANGERS AND SUPPORTS

- A. Exposed or easily accessible ductwork: All exposed ducts shall be supported by all-thread Rod as a single hanger and or a trapeze support for rectangular duct work in accordance with requirements of the latest edition of the HVAC Duct Construction Standards – Metal and Flexible of SMACNA.
- B. Non-accessible ductwork: Non-exposed and hidden from sight during regular school operations ductwork, rigid round, rectangular, and flat oval metal ducts, shall be installed with support systems conforming to SMACNA Standards.
- C. Where ducts are installed one above the other, they shall be individually supported on a trapeze of steel angles with 3/8 inch supporting steel rods securely fastened to overhead construction. A minimum distance of 3 inches shall be maintained between ducts wherever possible, but in no event shall distance be less than 2 inches. Minimum sizes of steel angles shall be 1 1/2-inch by 1 1/2-inch by 1/8 inch for duct sizes through 60 inches in greatest dimension, 2-inch by 2-inch by 1/8 inch for duct sizes 61 inches through 84 inches, 2-inch by 2-inch by 3/16 inch for duct sizes 85 inches through 96 inches, and 2-inch by 2-inch by 1/4 inch for duct sizes over 97 inches.

- D. Ducts six square feet area and greater and or minimum 28” round or greater shall be seismically restrained. Refer to Section 23 0548: HVAC Sound, Vibration and Seismic Control.
- E. Hangers shall not be supported by, or fastened to, non-structural members including blocking. Toggle or Molly type bolts are not permitted.
- F. Roof-mounted ductwork shall be installed a minimum 12 inches above roof and shall be supported by galvanized welded pipe, one on each side, fastened to roof structure, flashed and sealed to roof membrane. Install supports at each turn, unit connections, and each penetration, and space at maximum 6 feet off-center in general. Pitch pockets are not allowed.

3.13 ACCESS PLATES AND DOORS

- A. Access plates and doors shall be furnished and installed where stops, valves, fire dampers, fusible links, coils, damper operating mechanism, control equipment, lubrication fittings, air filters, air handling equipment and similar items normally requiring adjustment or servicing are installed in concealed spaces.
- B. Access plates and doors shall be located to permit convenient access to equipment sized to permit removal of equipment for servicing. Access plates shall be no less than 12-inch by 12-inch in clear opening. Proper servicing of equipment requires adequate access for maintenance personnel. Access doors shall not be less than 24-inches by 24-inch, unless otherwise detailed. Two or more valves shall not be located in same access area unless sufficient clearance is provided for operation, servicing and removal of each valve.
- C. Openings in ducts or plenums whose longer dimension does not exceed 12 inches may be covered by a plate of same material as duct, gasketed and fastened to duct or plenum with sheet metal screws.
- D. Access plates and doors in walls and ceilings of finished rooms and in locations normally accessible to the public shall be furnished with continuous piano hinges, unless otherwise specified, and a special flush type spring-loaded latch requiring an Allen wrench to operate. Access devices shall be installed after plastering in plaster ground openings.
- E. Access panels or doors penetrating one-hour fire resistive ceilings shall meet code requirements for such openings.
- F. Access panels shall be fire-rated; Milcor, or equal. Access doors shall be as required for installation in openings penetrating one-hour fire resistive ceilings. Access doors shall be furnished with a flush, key-operated cylinder lock, furnished with two keys each, instead of Allen headlock for non-rated ceilings.
- G. Other access panels, except those specified above, shall be furnished with suitable hinges and one or more sash fasteners.

- H. Panels located in ducts and plenums shall be installed with gaskets made of synthetic rubber, felt, or similar material to provide an airtight installation. Panels shall be constructed and reinforced to prevent vibration.
- I. Label the words "FIRE DAMPERS" on panels over fire dampers and words "DO NOT OPEN - HEATER IS OPERATING" on panels located in heater or equipment rooms. Letters shall be approximately 3 inches high, if space is available.
- J. Furnish a key to operate latch access plates, one for each access plate, but not to exceed five keys for any one Project.
- K. Access plates and panels shall be furnished with manufacturer's name or trademark and model number cast or stamped thereon, or upon a label permanently affixed thereon.
- L. Provide duct through roof flashing as detailed in the SMACNA standards or as indicated on Drawings.
- M. Refer to SMACNA for access plate and door construction.

3.14 PAINTING OF EXTERIOR SUPPLY AND RETURN DUCTWORK

- A. Exterior exposed supply and return ductwork connected to the ac units are to be painted by the Div. 23 contractor, if work is not provided by the General Contractor. Bottomline, the exterior ductwork is to be painted to prevent rust.

3.15 CLEANUP

- A. Remove rubbish, debris and waste materials and legally dispose off the Project site.

3.16 PROTECTION

- A. Protect the Work of this Section until Substantial Completion.

END OF SECTION

SECTION 23 80 00

HVAC EQUIPMENT

PART 1 – GENERAL

1.01 SUMMARY

- A. Section Includes: Air conditioning and air handling equipment including but not limited to:
 - 1. Rooftop Packaged Air Conditioning Units.
 - 2. Exhaust Fans.
- B. Related Requirements:
 - 1. Division 01: General Requirements.
 - 2. Section 07 60 00: Flashing and Sheet Metal.
 - 3. Section 23 05 00: Common Work Results for HVAC.
 - 4. Section 23 05 13: Basic HVAC Materials and Methods.
 - 5. Section 23 09 00: HVAC Instrumentation and Controls.
 - 6. Section 23 30 00: Air Distribution.

1.02 DESIGN REQUIREMENTS

- A. Work of this Section is based on HVAC equipment units indicated as Basis of Design in Part 2 of this Section. Products from different HVAC equipment manufacturers listed are never identical, although equivalent in similar capacity, performance and quality. In the cases where dimensions, weight, configuration and utility requirements differ from the products used as a basis of design, the Contractor, at no additional cost to the Owner, shall coordinate and submit, for Architect review, revisions to the design. Service clearances shall be verified following manufacturer recommendations prior to selection and submittal.

1.03 SUBMITTALS

- A. Provide in accordance with Division 01 and Section 23 05 00: Common Work Results for HVAC.

1.04 QUALITY ASSURANCE

- A. Provide submittals in accordance with Section 23 05 00: Common Work Results for HVAC.

1.05 PROJECT RECORD DOCUMENTS

- A. Provide Owner instructions on equipment operation and maintenance procedures, as indicated in Section 23 05 00: Common Work Results for HVAC.

1.06 WARRANTY

- A. Compressors shall be provided with manufacturer's five year warranty, replacement only.
- B. Manufacturer shall warrant parts, except heat exchangers, for a period of five years.
- C. Heat exchangers shall be provided with manufacturer's ten year warranty, replacement only.

PART 2 – PRODUCTS

2.01 EQUIPMENT

- A. Capacities of air conditioning equipment indicated on Drawings are minimum net capacities actually required. Standard catalog ratings shall be adjusted to actual Project site environmental conditions.

2.02 ROOFTOP GAS-FIRED HEATING AIR CONDITIONING UNITS

- A. Manufacturers: Carrier, Trane, York, or McQuay,
- B. Furnish packaged air conditioning unit with gas heating for roof top installation. Unit shall be self-contained, completely factory assembled, with complete internal wiring and controls. Unit shall also be provided with a fully piped refrigerant circuit, fully charged with an environmentally friendly refrigerant that is not scheduled for phase out. Unit shall be field configurable for horizontal discharge. Cooling and heating capacities, electrical characteristics, and operating conditions shall be as indicated on Drawings.
- C. Quality Assurance:
 - 1. Units shall be CSA certified for outdoor installation.
 - 2. Cooling capacity shall be rated in accordance with current ANSI/AHRI Standard 210/240.
 - 3. Unit shall be UL or ETL listed and designed to conform to ANSI/ASHRAE Standard 15 Safety Code for Mechanical Refrigeration and ANSI Z21.47-2016/CSA 2.3-2016 Gas
 - 4. ANSI/NFPA 70: National Electrical Code.
 - 5. Unit cooling efficiency EER/SEER ratings shall comply with CCR, Title 24, Building Energy Efficiency Standards for Residential and Nonresidential Buildings, and shall not be less than ratings indicated on drawings.
 - 6. Unit heating efficiencies AFUE ratings shall comply with current CCR, Title 24, Building Energy Efficiency Standards for Residential and Nonresidential Buildings, and shall not be less than ratings indicated on drawings.
 - 7. Unit shall comply with California Maximum Oxides of Nitrogen (NOX) Emission Regulations and current SCAQMD regulations.
 - 8. The unit roof curbs shall conform to NRCA standards. Provide shimming to maintain level bottom of rail installation.
 - 9. Insulation and adhesive shall meet NFPA 90A and 90B requirements for flame spread and smoke generation.

10. Unit casing shall be capable of withstanding ASTM B117 500-hour salt spray test.
11. Each unit shall be run tested at factory per ANSI/ASHRAE 37 and provided with a certificate indicating tested pressures, amperages, dates, and inspector.

D. Unit Cabinet:

1. Galvanized steel with baked enamel finish on external surfaces that are exposed to weather.
2. Interior surfaces exposed to conditioned and return air streams shall be insulated with a minimum ½-inch thick, 1 pound density foil-faced cleanable insulation.
3. Cabinet top cover shall be of one piece construction or where seams exist, shall be double hemmed and gasket sealed.
4. Cabinet panels shall be hinged access panels for filter, compressors, evaporator fan, control box and heat section areas. Each panel shall use multiple quarter-turn latches. Each major external hinged access panel shall be permanently attached to rooftop unit. Panels shall also include tiebacks.
5. Return air filters shall be accessible through a hinged access panel and be on a slide-out track using standard size filters.
6. Holes shall be provided in base rails (minimum 16 gage) for rigging shackles and level travel and movement during overhead rigging operations.
7. Unit shall have a factory-installed internally sloped condensate drain pan, providing a minimum ¾-inch-14 NPT connection to prevent standing water from accumulating. Pan shall be fabricated of high impact polycarbonate material, epoxy powder coated steel or stainless steel and shall slide out for cleaning or maintenance. An alternate vertical drain (¾-inch NPT) connection shall also be available. Drain pans shall conform to ASHRAE 62 self-draining provisions.

E. Compressors:

1. Unit shall be furnished with single (If single compressor is used, then it shall be two stage type) or multiple fully hermetic scroll compressors with internal vibration isolators.
2. Dual electrically and mechanically independent refrigerant circuits for 7.5 tons and above.
3. Compressors shall be provided with service access valves.
4. Compressor motors shall be cooled by refrigerant passing through motor windings.
5. Compressors shall be provided with line break thermal and current overload protection.
6. Compressors shall be provided with crankcase heaters, internal high-pressure and temperature protection.
7. Compressors on unit rated 90,000 BTU and below shall be of two stage types.

F. Refrigerant circuit components:

1. Thermostatic expansion valve (TXV) with removable power element.

2. Refrigerant strainer.
 3. Service gage connections on suction, discharge, and liquid lines.
 4. Solid core refrigerant filter driers.
- G. Coastal Evaporator and Condenser Coils Protection: Evaporator and condenser coils shall be furnished suitable for the Goleta corrosion-rich coastal environment with:
1. A flexible epoxy polymer coating uniformly applied to all coil surface areas without material bridging between fins.
 2. Coating process shall ensure complete coil encapsulation of tubes, fins and headers.
 3. Color shall be high gloss black with gloss per ASTM D523-89.
 4. Uniform dry film thickness from 0.8 to 1.2 mil on all surface areas including fin edges.
 5. Superior hardness characteristics of 2H per ASTM D3363-92A and cross-hatch adhesion of 4B-5B per ASTM D3359-93.
 6. Impact resistance shall be up to 160 in.-lb (ASTM D2794-93).
 7. Humidity and water immersion resistance shall be up to minimum 1000 and 250 hours respectively (ASTM D224-92 and ASTM D870-92).
 8. Corrosion durability shall be confirmed through testing to be no less than 6000 hours salt spray per ASTM B117-90.
- H. Fans and Motors:
1. Direct -drive indoor fans shall be provided for the AC Units with the cooling capacity of less than or equal to 60,000 BTU/H.
 2. Belt drive indoor fan shall be provided on AC Units with the cooling capacity of greater than 72,000 BTU/H include an adjustable-pitch motor pulley. Fans shall accommodate from 0.6 inch to 1.6-inch external static pressure without changing drives or motors.
 3. Condenser fan shall be a dynamically balanced, propeller type, fabricated of aluminum blades riveted to corrosion resistant steel spiders and direct-driven by a totally enclosed motor. Condenser air shall be discharged vertically. Condenser fan motor shall be ECM type motor and provide cooling operation down to 25 degrees F outdoor temperature with automatic-reset thermal overload protection.
- I. Heating Section:
1. Induced draft combustion type with energy saving direct spark ignition system, redundant main gas valve, and 2-stage heat.
 2. The heat exchanger shall be of tubular section type fabricated of a minimum of 20 gage steel coated with a nominal 1.2 mil aluminum-silicone alloy or 20 gage type 409 stainless steel, including stainless steel tubes, vestibule plate.
 3. Burners shall be of in-shot type fabricated of aluminum coated steel or stainless steel.
 4. Gas piping shall enter unit cabinet at a single location.
 5. Integrated Controls shall provide following:

- a. Timed control of evaporator fan functioning and burner ignition,
 - b. Anti-cycle protection for gas heat operation (after one cycle on high temperature limit switch and one cycle on flame rollout switch).
 - c. Diagnostic information.
6. Induced draft motor shall be provided with permanently lubricated, sealed bearings and inherent automatic reset thermal overload protection.
- J. Controls, Safeties and Diagnostic Points:
1. Unit Controls: Unit shall be furnished with self-contained, BACnet MS/TP Direct Digital Controls.
 - a. Controls shall be factory-installed.
 - b. Controls shall operate with zone control systems.
 - c. Controls shall furnish built-in diagnostics for thermostat/sensor commands for staged heating and cooling, evaporator-fan operation, and economizer operation.
 - d. Controls shall be furnished with a 5-minute time delay between modes of operation.
 - e. Control circuit shall be protected by a fuse on 24-V transformer side.
 - f. Control shall incorporate passive infrared detection for sensing occupancy in space serve.
 2. Compressor high temperature, high current, internal overloads, internal thermostat.
 - a. Compressor reverse rotation protection.
 - b. Loss-of-charge/low-pressure switch.
 - c. Freeze-protection thermostat, evaporator coil.
 - d. High-pressure switch.
 - e. Internal relief valve.
 - f. Anti-recycle relay, or time cycle device to prevent rapid cycling of compressor after any off cycle.
 3. Heating section shall be provided with following minimum protections:
 - a. High-temperature limit switches.
 - b. Induced draft motor speed sensor.
 - c. Flame rollout switch.
 - d. Flame proving controls.
 - e. Redundant main gas valve.
 - f. Heating controls shall consist of:
 - 1) 2-stage automatic combination gas valve.
 - 2) Pressure regulator.
 - 3) Electric spark intermittent ignition system or hot surface ignition system.
 - 4) Time delay fan control.
 4. Operating Characteristics:

- a. Unit shall be capable of starting and operating at 125 degrees F ambient outdoor temperature, meeting maximum load criteria of AHRI Standard 210/240 or 360 at plus or minus 10 percent voltage.
 - b. Compressor with standard controls shall be capable of operation down to 25 degrees F ambient outdoor temperature.
5. EMS Diagnostic Points: Provide diagnostic points for units, including those at projects with no EMS.
- a. Supply air temperature.
 - b. Return air temperature.
 - c. Space temperature.
 - d. Outdoor air temperature.
 - e. CO2 levels.
 - f. Filter status, via pressure transducer on analog point.
 - g. Fan status (air flow switch or proof of flow for supply fan for LEED credits).
 - h. Compressor status.
 - i. Economizer damper current position.
 - j. Other diagnostic point required by current Title 24, automated fault detection and diagnostics (FDD).
- K. Filter Section:
1. Provide filter section with factory-installed low-velocity, throwaway, 4-inch or 2-inch thick high capacity, MERV 13 (LEED requirement) Class 2, filters of commercially available sizes. Provide 2 sets of filters, the 2nd set for change out at project acceptance.
 2. Filter face velocity shall not exceed 300 fpm at nominal airflows.
 3. Filter section shall allow installation of standard size air filter.
- L. 100% Outdoor Air Economizer with Modulating Power Exhaust:
1. Provide 100 percent outdoor air economizers. Electrical power to the power exhaust module to be provided by Div. 23 if exhaust module is separate from the AC unit module (rather than integrated).
 2. Gear-driven integrated economizers.
 3. Integrated integral-modulating type capable of simultaneous economizer and compressor operation.
 4. Furnish hardware and controls to provide cooling with outdoor air.
 5. Low-leakage dampers not to exceed 3 percent leakage, at one inch wg pressure differential (variable sliding economizer).
 6. Relief damper. Damper shall close upon unit shutoff.
 7. Differential temperature and enthalpy controller unless indicated otherwise on drawings.
 8. Building Pressure Control: Provide units with power exhaust controlled by a pressure sensor in space or outdoor air measurement and tracking as indicated on drawings. The controller shall modulate VFD in power exhaust to maintain

a positive pressure differential of 0.03 inch of water between indoor and atmospheric pressure. Furnish field wiring to power exhaust and install tubing in space. Provide other accessories as required to comply with UL or ETL requirements.

9. Base Rail: Factory installed on AC units.
10. Dampers Using Electronic Actuators:
 - a. Manufacturer: Belimo, Honeywell, Invensys, Johnson Controls, or equal.
 - b. Size for torque required for damper seal at load conditions.
 - c. Coupling: V-bolt dual nut clamp with a V-shaped, toothed cradle.
 - d. Overload Protection: Electronic overload or digital rotation-sensing circuitry without the use of end switches to prevent damage to the actuator during a stall condition.
 - e. Fail-Safe Operation: Mechanical, spring-return mechanism.
 - f. Actuators shall be listed by ISO 9001, ULC, and CSA C22.2.

M. Unit Accessory Options To Be Provided for each AC Unit:

1. Unit-mounted integral non-fused disconnect with single point power connection,
2. Horizontal duct connections,
3. 100% Modulating Economiser power exhaust (or remote mounted in return horizontal ductwork with all assoc. Elec. Work to be provided by Div. 23 contractor).
4. Low gas heat option.
5. Corrosion-resistant epoxy-phenolic coated condenser and dx cooling coils for ocean coastal environment.
6. Integral powered convenience electrical outlet for servicing,
7. 2-inch min. Merv 13 air filters (LEED requirement) with remote dirty filter maintenance indicator thru Ethernet connection.
8. Remote DDC system Comfortlink (or equivalent) interface card for remote ethernet status and monitoring by Amtrak/city of Goleta and building service personnel.
9. Demand control ventilation (DCV) CO2 interface control provisions regulating OA introduction during occupancy and wall-mounted CO2 sensors.
10. Foil faced internal insulation, hinged access panels.
11. Thru the base connections for electrical, gas, & control wiring.
12. 14-inch high roof curb. Provide sloped pre-manufactured roof curb, or shim standard roof curb to accommodate roof slope.

N. Furnish programmable digital thermostat and CO sensor functionality (separate CO2 sensor if required) with following features for single zone:

1. 7-day time clock.
2. Heat, cool, automatic changeover.
3. Occupied/unoccupied modes.

2.04 INLINE CABINET EXHAUST FANS

- A. Acceptable Manufacturers: Greenheck, PennBarry, Twin City or approved equal.
- B. Provide inline type fans of sizes, capacities and configurations indicated on drawings, complete with accessories for installation of fans. Also, provide accessories for proper operation and balancing of fans in accordance with design intent and sequence of operation.
- C. Certification: Fan shall be listed by Underwriters Laboratories (UL 705). Fan shall bear AMCA certified ratings seal for sound and air performance.
- D. Housing: The fan shall be of bolted and welded construction utilizing corrosion resistant fasteners. The housing shall be of minimum 12 gage steel. Bearing supports shall be minimum 10 gage welded steel. Lifting eyes shall be provided for ease of installation. Unit shall bear an engraved aluminum nameplate.
- E. Finish: Steel fan components shall be coated with polyester powder coating to exceed 1,000 hour salt spray test under ASTM B117 test method.
- F. Wheel: Wheel shall be of mixed flow type with a wheel cone, spherical back plate and single thickness cambered blades, or formed hollow airfoil blades continuously welded to back plate. Hub shall be keyed and securely attached to fan shaft. Wheel shall overlap an aerodynamic aluminum inlet cone to provide maximum performance and efficiency. Wheel shall be balanced in accordance with AMCA Standard 204, Balance Quality and Vibration Levels for Fans.
- G. Motor: Motor shall be ECM type, voltage and phase, as indicated on drawings. Provide permanently lubricated sealed ball bearings. Option: Energy efficient motor meets EPAct and NEMA Table 12-10.
- H. Shaft: Blower shaft shall be AISI C1045/SAE 1045, or 1040 hot rolled and accurately turned, ground, and polished. Shafting shall be sized for a critical speed of at least 143 percent of maximum RPM.
- I. Bearings: Bearings shall be designed and tested specifically for use in air handling applications. Construction shall be heavy-duty regreasable ball or roller type in a cast iron pillow block housing and selected for a minimum L50 life in excess of 200,000 hours at maximum cataloged operating speed.
- J. Drive: Fans shall be direct drive or belt driven as indicated on drawings.
- K. Belts and Drives: Belts shall be oil and heat resistant, non-static type. Drives shall be precision machined cast iron type, keyed and securely attached to wheel and motor shafts. Drives shall be sized for 150 percent of installed motor horsepower. The variable pitch motor drive must be factory set to specified fan RPM.

PART 3 – EXECUTION

3.01 GENERAL

- A. Uniformity: Unless otherwise specified, equipment of same type or classification shall be product of same manufacturer.
- B. Equipment Installation: Equipment installation shall be in strict accordance with these Specifications, and installation instructions of manufacturers. Equipment installed on concrete foundations shall be grouted before piping is installed. Piping shall be installed in such a manner as not to place a strain on equipment.
 - 1. Install equipment in a neat and skillful manner, properly aligned, leveled, and adjusted for satisfactory operation.
 - 2. Install so connecting and disconnecting of piping and accessories can be readily accomplished, parts are readily accessible for inspection, service and repair. Space shall be provided to readily remove filters, coils, compressors and fan wheels. Access doors shall be hinged with cam lock door handles.
 - 3. Provide flexible connections for duct, pipe and conduit connections at moving equipment.

3.02 ROOF-TOP EQUIPMENT MOUNTING

- A. Horizontal Flow Packaged Units: Install unit on prefabricated mounting curb secured directly to roof designed to suit roof conditions and requirements of provided unit. Submit Shop Drawings for review.

3.03 NOISE AND VIBRATION

- A. Operation of Equipment: Mechanical equipment and piping systems shall operate without exceeding specified noise and/or vibration levels.
- B. Corrective Measures: If specified noise and/or vibration levels are exceeded, provide necessary changes to reduce noise and/or vibration levels to within specified levels.

3.04 FIELD TESTS AND INSPECTION

- A. General: Perform field inspections, field tests, and trial operations as specified in Section 23 0500: Common Work Results for HVAC. Provide labor, equipment and incidentals required for testing. The Project Inspector will witness field tests and trial operations as specified in Section 23 0500: Common Work Results for HVAC.
- B. Equipment and Material: Equipment and material certified as being successfully tested by manufacturer, in accordance with referenced Specifications and standards, will not require re-testing before installation. Equipment and materials not tested at place of manufacture will be tested before or after installation, as applicable or necessary, to determine compliance with reference Specifications and standards.
- C. Start-Up and Operational Test: System shall be started up and initially operated with components operating. During this test, various strainers or filters shall be periodically cleaned until no further accumulation of foreign material occurs. Adjust safety and automatic control instruments as required to provide proper operation and control sequence. Refer to Section 23 0500: Common Work Results for HVAC.

- D. Operation and Maintenance Data: Provide required operation and maintenance data as specified in Section 23 0500: Common Work Results for HVAC.
- 3.05 CLEANUP
- A. Remove rubbish, debris and waste materials and legally dispose of off Project site.
- 3.06 PROTECTION
- A. Protect Work of this Section until Substantial Completion.

END OF SECTION

SECTION 26 05 00
COMMON WORK RESULTS FOR ELECTRICAL

PART 1 - GENERAL

1.01 SUMMARY

- A. This Section specifies the basic requirements for electrical installations and includes requirements common to more than one section of Division 26. It expands and supplements the requirements specified in sections of Division 01.
- B. Related Requirements:
 - 1. Division 01 – General Requirements.
 - 2. Section 03 30 00 – Cast-in-Place Concrete.
 - 3. Section 09 90 00 – Painting and Coating.
 - 4. Division 14 – Conveying Equipment.
 - 5. Division 23 – HVAC.
 - 6. Division 26 – Electrical.
 - 7. Division 27 – Communications.
 - 8. Division 28 – Electronic Safety and Security.
 - 9. Division 31 – Earthwork.
 - 10. Division 32 – Exterior Improvements.
 - 11. Division 33 – Site Improvements.
- C. Related Industry Standards: The most current version of the following industry standards.
 - 1. ASTM D 709 – Laminated Thermosetting materials.
 - 2. ANSI/NEMA FB-1 – Fittings, Cast Metal Boxes, and Conduit Bodies for Conduit, Electrical Metallic Tubing, and Cable.
 - 3. ANSI/NEMA 250 – Enclosures for Electrical Equipment (1000 Volts Maximum).
 - 4. California Electrical Code (CEC).

5. IEEE C57.12.28 – Standard for Pad-Mounted equipment Enclosure Integrity.
6. IEEE 1584 – Performing Arc-Flash Hazard Calculations.
7. UL/ANSI 1 – Standard for Flexible Metal Conduit.
8. UL/ANSI 1242 – Standard for Electrical Intermediate Metal Conduit.
9. UL/ANSI 506 – Standard for Specialty Transformers.
10. UL/ANSI 6 – Electrical Rigid Metal Conduit-Steel.
11. UL/ANSI 6A – Electrical Rigid Metal Conduit-Aluminum, Red Brass, and Stainless Steel.
12. UL 797 – Electrical Metallic Tubing-Steel.
13. UL/ANSI 870 – Standard for Wireways, Auxiliary Gutters, and Associated Fittings.
14. UL/ANSI 891 – Standard for Safety Switchboards.

1.02 BASIC ELECTRICAL REQUIREMENTS

A. Quality Assurance:

1. Work shall be performed by CONTRACTOR'S personnel possessing the skills and experience obtained in performing work of similar scope and complexity.
2. Refer to related division(s) specifications for other requirements.

B. Drawings and Specifications Coordination:

1. For purposes of clearness and legibility, Drawings are essentially diagrammatic, and the size and location of equipment is indicated to scale whenever possible. Verify conditions, dimensions, indicated equipment sizes, and manufacturer's data and information as necessary to install the Work of this Division. Coordinate location and layout with other Work.
2. Verify final locations for rough ins with field measurements and with the requirements of the equipment to be connected.
3. Drawings indicate required size and points of termination of conduits, number and size of conductors, and diagrammatic routing of conduits. Install conduits with minimum number of bends to conform to structure, avoid obstructions, preserve headroom, keep openings and passageways clear, and comply with applicable code requirements.

4. Routing of conduits may be changed provided that the length of any conduit run is not increased more than 10 percent of length indicated on the Drawings.
5. Outlet locations shall be coordinated with architectural elements prior to start of construction. Locations indicated on the Drawings may be distorted for clarity; CONTRACTOR shall coordinate in the field prior to rough-in work.
6. Coordinate electrical equipment and materials installation with building components and the Work of other trades.
7. Equipment disconnects shall be readily accessible and free of obstructions.
8. When extending or intercepting existing electrical facilities, CONTRACTOR shall Coordinate and verify existing conditions.

C. Terminology:

1. Signal Systems: Applies to clock, bell, fire alarm, annunciator, sound, public address, buzzer, telephone, television, inter-communication, elevator access controls, lighting control systems and security systems.
2. Low Voltage: Applies to signal systems operating at 120 volts and less, and power systems operating at less than 600 volts. Medium voltage: Applies to power systems operating at more than 600 volts.
3. UL: Underwriter's Laboratories Inc, Nationally Recognized Testing Laboratory (NRTL), or equal.

D. Regulations: Work shall comply with the requirements of authorities having jurisdiction and the California Electrical and Building Codes. Material shall conform to regulations of the National Board of Fire Underwriters for electrical wiring and apparatus. Materials shall be new and listed by UL, or another NRTL.

E. Structural Considerations for Conduit Routing:

1. CONTRACTOR shall provide calculations and drawings as necessary for any construction and/or alterations requiring conduits to pass through or interfere with any structural members, or where notching, boring or cutting of the structure is necessary, or where special openings through walls, floors, footings, or other buildings elements, or where notches and bored holes in wood or steel are required. All work shall conform to CBC, Part 2, Title 24 requirements.
2. Concrete encasement for underground conduits that abuts a foundation wall or underground structure shall rest on a haunch integral with wall or structure, or shall extend down to footing projection, or shall be doweled into structure unless

otherwise indicated. Underground structures shall include maintenance holes; pull boxes, vaults, and buildings.

F. Electrically Operated Equipment and Appliances:

1. Furnished Equipment and Appliances:

- a. Work shall include furnishing and installing wiring enclosures and complete connections of electrically operated equipment, appliances and electrical control devices, which are specified to be furnished and installed in this or other sections of the Specifications. Wiring enclosures shall be concealed except where exposed work is indicated on the drawings.
- b. Provide all connections necessary for installation of equipment.
 - 1) Equipment shall be tested for proper operation, including proper rotation of motorized equipment.
 - 2) If outlets are of incorrect electrical characteristics, or any specified equipment fails to operate properly, CONTRACTOR shall repair and/or replace the outlet and/or equipment.
 - 3) Utility connections (electrical, controls, gas, etc.) to roof mounted mechanical equipment shall be made through the side of the equipment and not from beneath the unit to facilitate future replacement.

2. Equipment and Appliances Furnished by Others:

- a. Equipment and appliances indicated on Drawings as "not in contract" (NIC), "furnished by others," or "furnished by the OWNER," will be delivered to the Project site. Required electrical connections shall be performed for such equipment and appliances. Motorized equipment will be furnished factory-wired to a control panel or junction box unless otherwise indicated. Appliances will be furnished equipped with portable cord and cap. Provide disconnect switches where required.
- b. Connections to equipment furnished under this Division shall be part of the Work of this section. Work shall include internal wiring, installation, connection and adjustment of bolted drive motors in which the motor is supplied as a separate unit, and connections only for equipment furnished with factory installed internal wiring, except as further limited by Drawings and this Specification. Work shall include furnishing and installing suitable outlets, disconnecting devices, starters, push-button stations, selector switches, conduit, junction boxes, and wiring necessary for a complete electrical installation. Work shall also include furnishing

- and installing conduit and boxes for HVAC control systems, furnished under Division 23. Devices and equipment furnished shall be of same type used elsewhere on the Work or as specified.
- c. Electrical equipment furnished under other sections, for installation and connection under Work of this section, will be delivered to the Project site ready for installation.
 - d. Mechanical equipment furnished under other sections, and requiring electrical connection under this section, will be set in place as part of the Work of the section furnishing such equipment unless noted otherwise.
 - e. Suitability and condition of equipment furnished under other sections shall be determined in advance of installation. Immediate notice of damage, unsuitability, or lack of parts shall be given to the entity providing such equipment.
- G. Power Distribution System Reports: For fault current, coordinatization and Arc-Flash system report requirements refer to applicable electrical distribution equipment sections. for specific requirements.
- H. Protection of Materials:
- 1. Protect materials and equipment from damage and provide adequate and proper storage facilities during progress of the Work. Damaged materials and/or equipment shall be replaced.
- I. Cleaning:
- 1. Exposed parts of Work shall be left in a neat, clean, usable condition. Finished painted surfaces shall be unblemished and metal surfaces shall be polished.
 - 2. Thoroughly clean parts of apparatus and equipment. Exposed parts to be painted shall be thoroughly cleaned of cement, plaster, and other materials. Remove grease and oil spots with solvent. Such surfaces shall be wiped, and corners and cracks scraped out. Exposed rough metal shall be smooth, free of sharp edges, carefully steel brushed to remove rust and other spots, and left in proper condition to receive finish painting.
 - 3. Remove rubbish, debris, and waste materials and legally dispose of off the Project site.
- J. WARRANTIES
- 1. Provide one-year warranty on all material and labor performed, unless noted otherwise in specific sections.

PART 2 - PRODUCTS - NOT USED

PART 3 - EXECUTION

3.01 GENERAL REQUIREMENTS

- A. Advise the Inspector before starting the Work of this Division.
- B. Exposed conduits shall be painted to match the surfaces adjacent to installation.
- C. Salvaged materials removed from buildings shall be removed from the Project site as required by the OAR.
- D. Trenches outside of barricade limits shall be backfilled and paved within 24 hours after being inspected by the Inspector. Provide traffic plates during the time that trenches are open in traffic areas and in areas accessible to the public.
- E. Where existing structural walls are cored for new conduit runs, separation between cored holes shall be three inches edge to edge from new or existing holes, unless otherwise required by the Architect. All coring to be laid out and reviewed by Architect prior to drilling. CONTRACTOR to verify location of structural steel, rebar, stress cabling or similar prior to lay out.
- F. Electrical equipment shall be braced and anchored for CBC Seismic Design requirements, or as otherwise indicated on the Drawings.

3.02 DELIVERY STORAGE AND HANDLING

- A. Deliver products to project site with proper identification, which shall include names, model numbers, types, grades, compliance labels, and similar information needed for District identification; all products and materials shall be adequately packaged and protected to prevent damage during shipment, storage, and handling.
- B. Coordinate deliveries of electrical materials and equipment to minimize construction site congestion.

3.03 CUTTING AND PATCHING

- A. Cutting and patching of electrical equipment, components, and materials shall include the removal and legal disposal of selected materials, components, and equipment.
- B. Do not endanger or damage installed Work through procedures and processes of cutting and patching.
- C. Repair or restore other work or surfaces damaged as a result of the work performed under this contract.

3.04 CLEANUP

- A. Remove rubbish, debris and waste materials and legally dispose off the Project site.
- B. Remove equipment and implements of service, and leave entire work area neat and clean, to the satisfaction of the OWNER Authorized Representative.

3.05 PROTECTION

- A. Protect the Work of this section until Substantial Completion.

END OF SECTION

SECTION 26 05 13

BASIC ELECTRICAL MATERIALS AND METHODS

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Boxes, enclosures, keys and locks.
2. Receptacles and switches.
3. Identifications and signs.

B. Related Requirements:

1. Division 01 - General Requirements.
2. Division 26 – Electrical.
3. Division 27 – Communications.
4. Division 28 - Electronic Safety and Security.

PART 2 - PRODUCTS

2.01 BOXES, ENCLOSURES, KEYS AND LOCKS

A. Outlet Boxes and Fittings:

1. Outlet boxes installed in concealed Work shall be galvanized steel, pressed, or welded type, with knockouts.
2. In exposed Work, where conduit runs change direction or size, outlet boxes and conduit fittings shall be cast metal with threaded hubs cast integral with box or fitting.
3. Fittings shall be cast metal and non-corrosive. Ferrous metal fittings shall be cadmium-plated, or zinc galvanized. Castings shall be true to pattern, smooth, straight, with even edges and corners, of uniform thickness of metal, and shall be free of cracks, gas holes, flaws, excessive shrinkage, and burnt-out sand.
4. Covers for fittings shall be galvanized steel or non-corrosive aluminum and shall be designed for particular fitting installed.

5. Light fixture outlets shall be 4-inch octagon, 4-inch square, 2 1/8-inch deep or larger, depending upon number of conductors or conduits therein. Plaster rings shall be furnished with round opening with two ears drilled 2 23/32 inches center to center.
 6. For local device outlets provide 4-inch square 2 1/8-inch deep, boxes for single gang, 5-inch square boxes for two-gang, and special solid gang boxes with gang plaster ring for more than two switches.
- B. Junction and Pull boxes:
1. Junction and pull boxes, in addition to those indicated, shall only be used in compliance with codes, recognized standards, and Contract Documents.
 2. Interior and non-weatherproof boxes shall be constructed of blue or galvanized steel with ample laps, spot welded, and shall be rigid under torsion and deflecting forces. Boxes shall be furnished with auxiliary angle iron framing where necessary to ensure rigidity.
 3. Covers shall be fastened to box with enough machine screws to ensure continuous contact all around. Flush type boxes shall be drilled and tapped for cover screws if boxes are not installed plumb. Surfaces of pull and junction boxes and covers shall be labeled in black marker ink designating system, panelboard and circuit designation contained in box. In exposed Work, designation shall be installed on inside of pullbox or junction box cover.
 4. Weatherproof NEMA 3R pull and junction boxes shall conform to foregoing for interior boxes with following modifications:
 - a. Cover of flush mounting boxes shall be furnished with a weather-tight gasket cemented to, and trimmed even with, cover all around.
 - b. Surface or semi-flush mounting pull and junction boxes shall be UL, or another Nationally Recognized Testing Laboratory (NRTL) listed as rain-tight and shall be furnished complete with threaded conduit hubs.
 - c. Exposed portions of boxes shall be galvanized and finished with one prime coat and one coat of baked-on gray enamel, unless already furnished with factory baked-on finish.
 5. Junction and pull boxes shall be rigidly fastened to structure and shall not depend on conduits for support.
 6. Underground Concrete Pull Boxes:
 - a. Pre-cast concrete pull boxes. Concrete pull boxes shall be traffic type, reinforced for H-20 wheel loading, pre-cast concrete. Pull boxes with inside dimensions of 2 feet by 3 feet by 3 feet deep shall consist of a base section, top ring, and cover. Base section shall be furnished with 2

knockouts measuring 10 inches by 10 inches in each 3 feet side, and one 20 inches by 20 inches knockout in each 2-foot side. Pull boxes with inside dimension 4 feet by 4 feet by 4 feet deep shall consist of a base section, midsection, topping, and cover. Base section shall be furnished with 2 knockouts measuring 8-inch by 16-inch on each of two opposite sides, and one 20-inch by 20-inch knockout on each of other two opposite sides. Pull boxes shall be furnished with a minimum of 6-inch diameter sump knockout and one-inch diameter ground rod knockout. In pull boxes, furnish and install cable racks on walls. Racks shall be furnished with 3 porcelain cable holders on vertical steel mounting bars. Pull boxes shall be furnished with 3/4-inch diameter pull irons. Covers shall be traffic-type consisting of steel safety plate bolted to frame. Covers shall be marked as electrical, power, or signal as required.

- b. Provide end bells in duct entrances. Terminate each metal conduit with insulated bushing provided with a grounding terminal.
 - c. Provide 6-inch deep sand base under pull boxes.
 - d. Identify power and signal cables by tagging in manholes and pull boxes. Tie securely to cables with nylon cord.
 - e. Top of steel plate shall provide a minimum coefficient of static friction of 0.5 for either wet or dry locations, when tested for any shoe sole material. Test shall comply with ASTM D 1047 or F 489 or F 609 standards. Submit manufacturer's test results for Architect's review as part of materials and equipment submittals.
 - f. The use of underground extension boxes shall be limited to not more than 1 times the original depth of pull box.
 - g. Approved Products: Oldcastle Precast, Jensen Precast, Kistner, Western Precast, or OWNER approved equal.
7. Underground utility boxes shall be reinforced concrete with non-setting shoulders to prevent settlement following installation. Boxes shall be furnished with cast iron cover with finger hole, size as indicated on Drawings. Utility boxes shall be as manufactured by Oldcastle, Jensen, Kistner, Western Precast, or equal.
 8. Manholes, vaults, and pull boxes required by a utility company, and installed as part of this Contract, shall meet requirements of servicing utility company.

C. Floor Outlets:

1. Floor Outlets (except for extension outlets) shall be cast iron, watertight floor boxes with flush brass floor plates, and shall be set to finish flush with finish floor covering, whether it be carpeted, wood, resilient floor covering, or other finish materials.

Department of Neighborhood Services and Public Safety
GOLETA TRAIN DEPOT PROJECT

- a. Floor boxes shall be used in offices, classrooms, and in library areas only.
 - b. Approved Products: Harvey Hubbell Inc. B-2503, Thomas & Betts 640 series, Legrand Omnibox, or OWNER approved equal.
2. Telephones above floor outlets, where not subject to water, shall be provided with Harvey Hubbell Inc. SC-3098 pedestals with SC309T plates. Refer to other Division 26 sections. Floor boxes shall be used in offices, classrooms and in Library areas only.
 - a. Approved Products: Legrand 525 series, Thomas & Betts FPT-400 Series, or OWNER approved equal
 3. Plugs above floor outlets where not subject to water shall be provided with pedestal s and device plates. Refer to other Division 26 sections. Floor boxes shall be used in offices, classrooms, and library areas only.
 - a. Approved products: Pedestals shall be Legrand 525 series, Thomas & Betts FPT-400 Series, Harvey Hubbell Inc. SC-3098; Device plates shall be Hubbell SS309D, or District approved equal.
 4. Two gang and single box pedestal boxes shall be listed for wet locations where subject to water. Provide required cover plates.
 - a. Floor outlets shall be used in Cafeteria, Cafeteria serving areas, or any areas where floors are subjected to water.
 - b. Approved products: Single gang boxes - Hubbell SA-6687. Two gang boxes shall be Hubbell SA-6885, or OWNER approved equal.
 5. Extension floor outlets shall be cast iron with cast iron covers, and 1/2-inch offset entries for above-floor conduit extensions; Boxes shall be designed to permit access to wiring without disturbing above-floor extensions and shall be set flush with finish floor.
 6. Above floor service fittings for data outlets and surge suppression receptacles shall be faceplate interchangeable, die cast aluminum.
 - a. Approved products: Hubbell SC3098 with cover plates SS309DS, Legrand 525 series, Thomas & Betts FPT-400 Series, or OWNER approved equal.
- D. Floor Pockets – Plugging Boxes:
1. Three-Gang floor lighting pockets shall be flush floor type recess floor mounted enclosure, with cast iron floor plate and hinged cast iron door notched for cables.

- a. Each floor pocket shall be provided with three 20-amp, 3 wire, 125-volt receptacles with matching caps.
- b. Approved products: Legrand or Hubbell Recessed Floor Boxes, C.W. Cole TLS 353-6, or equal, for wood floors and C.W. Cole TLS-353-6-C, or OWNER approved equal for concrete slabs.

2. Single Gang:

- a. Receptacle floor pockets shall be single gang, flush floor type, with cast iron floor plate, hinged cast iron door notched for cable and cast-iron box. Provide each pocket with a standard, single grounding type receptacle unless otherwise indicated.
 - 1) Approved Products: C.W. Cole TLA-362-1-FE, or OWNER approved Legrand or Hubbell recessed floor box, or OWNER approved equal. For wood floors provide C.W. Cole TLS-362-1, or OWNER approved equal.
- b. Microphone or projector floor pockets shall be single gang flush floor type with cast iron floor plate, hinged cast iron door, notched for cable and cast-iron box.
 - 1) Approved Products: Legrand or Hubbell recessed floor box, C.W. Cole TLA-362-3-FE, C.W. Cole TLS-362-3, in wood floors, or OWNER approved equal.

E. Keys and Locks:

1. Provide two keys with furnished door locks, including cabinet door locks and switchboard locks, two keys for lock switches on switchboards or control panels, and two keys with interlocks or other furnished lock switches. Deliver keys to OAR.
2. Special keys and locks shall only be provided where specified. Locks shall be keyed to Corbin No. 60 or 70 as follows:
 - a. Access to operate equipment shall be keyed to Corbin 60.
 - b. Access to service areas shall be keyed to Corbin 70.

2.02 RECEPTACLES AND SWITCHES

A. Receptacles:

1. Duplex receptacles shall be heavy-duty specification grade, grounding type. Terminal screws shall be wired on the side and back with internal screw pressure plates. Mounting strap shall feature heavy-duty brass construction. Receptacle

back body shall be PVC. Receptacle face shall be ivory, impact resistant nylon. Receptacles shall have triple wipe brass power contacts.

a. Approved products:

<u>NEMA #</u>	<u>Pass & Seymour</u>	<u>Hubbell</u>	<u>Leviton</u>
(20 amps) NEMA 5-20	PS5362-I	HBL5362-I	5362-I
(15 amps) NEMA 5-15	PS5262-I	HBL5262-I	5262-I

Equal products approved by OWNER may be acceptable.

2. Duplex receptacles on circuits supplied by panel boards with integral surge suppression shall be Pass & Seymour model number PS5262BL (blue), Hubbell DRUBTVSS15, Leviton 5262-SBU, 15-amps, 120-volts, or OWNER approved equal.

3. Single receptacles shall be heavy-duty specification grade, grounding type. Terminal screws shall be back and side wire with internal screw pressure plates. Mounting strap shall feature heavy-duty brass construction. Receptacle back body shall be thermoplastic. Receptacle face shall be ivory, impact resistant nylon. Receptacles shall have triple wipe brass power contacts. For circuits consisting of one single receptacle only, ampere rating of receptacle shall be same as circuit breaker or fuse.

a. Approved products:

<u>NEMA #</u>	<u>Pass & Seymour</u>	<u>Hubbell</u>	<u>Leviton</u>
(20 amps) NEMA 5-20R	5361-I	HBL5361-I	5361-I
(15 amps) NEMA 5-15R	5261-I	HBL5261-I	5261-I

Equal products approved by OWNER may be acceptable.

4. Single 15 and 20-amps receptacles on circuits supplied by panel boards with integral surge suppression shall be blue in color.

a. Approved products: Pass & Seymour NEMA 5-20R model number 5361-BL (blue), NEMA 5-15R model number 5261-BL (blue), or OWNER approved equal.

5. Provide specification grade ground-fault circuit interrupter (GFCI) type receptacles in accordance with 2010 UL standards. GFCI receptacles shall have a trip indication light. Receptacle terminal screws shall be back and side wire with internal screw pressure plates. Test and reset buttons shall match device body and shall be ivory. GFCI receptacles shall be manufactured in standard configuration for installation with stainless steel smooth plates. Exterior mounted receptacles shall be mounted inside weatherproof enclosure.

6. Provide weatherproof receptacles, except where otherwise indicated or specified, consisting of GFCI receptacles, as specified herein, and metal plates with die-cast lockable hinged lids and weatherproof mats;

Tamper-resistant receptacles with thermoplastic dual mechanism shutter system to help prevent insertion of foreign objects. Receptacles shall have extra heavy-duty brass, one-piece mounting strap with integral ground. Receptacles shall be ivory color, impact resistant nylon face and back body.

B. Switches

1. Local Switches:

- a. Local switches shall be high strength thermoplastic toggle, industrial grade, rated 20 amps at 120-277 volts AC only, with plaster ears, external screw pressure plate back and side wired, and standard size composition cups which fully enclose mechanism. Switches shall be approved for installation at currents up to full rating on resistive, inductive, tungsten filament lamp and fluorescent lamp loads, and for up to 80 percent of rating for motor loads. Switches shall have oversized silver alloy contacts for long life and better heat dissipation. Provide switches as single pole, double pole, 3-way, 4-way, non-lock type. Provide non-lock type switches with ivory handles;

	<u>Pass & Seymour</u>	<u>Hubbell</u>	<u>Leviton</u>
Single pole	PS20AC1I	HBL1221I	1221-2I
Double pole	PS20AC2I	HBL1222I	1222-2I
Three-way	PS20AC3I	HBL1223I	1223-2I
Four-way	PS20AC4I	HBL1224I	1224-2I

Equal products approved by OWNER may be acceptable.

2. Emergency Lighting Control Unit

- a. The Emergency Lighting Control Unit shall provide all required functionality to allow a standard lighting control device to control emergency lighting in conjunction with normal lighting in any area within a building.
- b. The emergency lighting control unit shall allow control of emergency lighting fixture in tandem with normal lighting in an area while ensuring that emergency lighting will turn on immediately to full brightness upon loss of normal power supplying the control device. Emergency lighting operation shall be independent for each controlled area and shall not require a generalized power failure for proper operation.
- c. The device shall have normally closed dry contacts capable of switching 10-amp emergency ballast loads at 120-277 VAC, 60 Hz., 2-amp tungsten loads at 120 VAC, 60Hz., LED loads at 120-277V VAC, 60 Hz
- d. The device shall have universal rated voltage inputs provided for normal power sense and normal switched power at 120-277 VAC, 60 Hz.

- e. The device shall provide separate LEDs to indicate the presence of normal and emergency power sources. The LEDs shall indicate the unit's current operational mode (normal or emergency)
- f. The device's normal power input terminal shall be connected to the line side of the control device such that any upstream fault causing a loss of power, including the tripping of the branch circuit breaker, will force the unit into the emergency mode and turn on the emergency lighting.
- g. The unit shall automatically switch emergency lighting on and off as normal lighting is switched. When normal power is not available, the unit shall force and hold emergency lighting on regardless of the state of any external control device until normal power is restored.
- h. Approved products: WattStopper ELCU-100 Emergency Lighting Control Unit, LVS #EPC-PM Series, Lighting Control Design #GR 2001 series, or OWNER approved equal.

3. School Main Entrance Intercom Station: Refer to specification section 28 1000 – Access Control System.

2.03 IDENTIFICATION AND SIGNS

A. Identification Plates:

1. Provide identification plates for the following unless otherwise specified, for switchboards, unit substations, motor control centers, control panels, push-button stations, time switches, contactors, motor starters, motor switches, panelboards, and terminal cabinets.
2. Identification plates shall be of plastic stock and shall adequately describe function, voltage and phase of identified equipment. Where identification plates are detailed or described on Drawings, inscription and size of letters shall be as indicated. For lighting and power panels, identification plates shall indicate panel designation, voltage, and phase of panel. For terminal cabinets, identification plates shall indicate system contained in terminal cabinet.
3. Identification plates shall be black-and-white nameplate stock of bakelite with characters cut through black exposing white. Plates shall be furnished with beveled edges and shall be securely fastened in place with No. 4 Phillips-head, cadmium-plated steel, self-tapping screws. Characters shall be 3/16 inch high, unless otherwise indicated.

B. Markings:

1. Install identification markings to surface-mounted starters, switches, disconnect switches, contactors, and other devices controlling motors and appliances. Provide abbreviations required along with an identifying number. Markings to be provided with locking type stencils using paint of a contrasting color. Figures

shall be 3/8 inch high unless otherwise indicated. Dymo Industries Inc., self-sticking plastic labels, with embossed characters made with a typewriter may be installed instead of stencils and paint; p-touch self adhesive plastic, or Brother P-Touch self sticking laminated plastic labels may be installed.

2. High Voltage: High voltage switchboards, cabinets, boxes, and conduits exposed in accessible locations, including under buildings and in attics, are required to be marked "WARNING-HIGH VOLTAGE – ABOVE 600 VOLTS". Markings for switchboards shall consist of 18 gage steel, porcelain enamel sign of standard manufacture. Markings for boxes, cabinets, and conduits shall be by means of stenciling or printed self-adhesive markers, Westline Tel-A-Pipe, or equal. Provide letters of black on orange background and not less than 1-7/8 inches high. On conduit runs, install markings at intervals not exceeding 10 feet in any individual area. Markings shall be installed after other painting Work is complete.

C. Warning Signs:

1. Provide a warning sign on outside of each door or gate to rooms or enclosures containing high voltage equipment. Signs required reading, "WARNING - HIGH VOLTAGE - KEEP OUT". Provide 2-inch high lettering.
2. Provide a warning sign on each high-voltage non-load break disconnect and fused cutout (not oil filled). Signs required reading, "DO NOT OPEN UNDER LOAD". Provide 2-inch-high lettering.
3. Provide signs of standard manufacture, 18 gage steel, with porcelain enamel finish. Provide red lettering on a white background.

PART 3 - EXECUTION

3.01 INSTALLATION AND SUPPORT OF BOXES

- A. Install outlet boxes flush with finished surface of wall or ceiling. Install plumb and securely fastened to structure, independent of conduit. Except where otherwise indicated, provide factory-fabricated adjustable attachment bar hangers between studs to support outlet boxes. When installation is performed in fire rated walls, maintain the wall's rating integrity by means of approved fire stop methods.
- B. Outlet boxes installed in suspended or furred ceilings with steel runner or furring channels shall be supported, except where otherwise indicated, by a Unistrut P-4000 Tessco A1200HS-10, Cooper B-Line B22s-HG, or OWNER approved equal channel spanning main ceiling runner channels. Each box shall be supported from its channel by a 3/8-inch 16 threaded steel rod with a Unistrut P-4008, Fastenal #48604, Copper B-Line 78101140346 or OWNER approved equal; nut and a Tomic No. 711-B Adapta-Stud, or OWNER approved equal. Rod shall be tightened to a jamb fit with channel and its nut. Box shall be locked to rod by means of a 1/2-inch locknut on stud and a 3/8-inch 16 hex nut locking stud to rod.

- C. Heights of outlets and equipment indicated on Drawings shall govern. In absence of such indications, following heights shall be maintained with heights measured to centerline unless otherwise noted:
1. Install wall-mounted switches at 48 inches above finished floor.
 2. Outlet boxes for fire alarm pull stations shall be mounted at a mounting height above finished floor that ensures that the operating handle of the initiating device is no higher than 48 inches from finished floor.
 3. Wall mounted fire alarm strobe or horn/strobe devices shall be mounted such that the entire lens is not less than 80 inches above finished floor. If ceiling heights allow, wall mounted appliances shall have bottom of lens a minimum of 80 inches but not more than 96 inches to the top of lens.
 4. Install outdoor fire alarm audible devices or fire alarm sprinkler flow bells at least 10 feet but not more than 12 feet above finished floor to center. Provide STI or other OWNER approved protective covers as required in plans.

3.02 COVER PLATES

- A. Provide a plate on each switch, plug, pilot light, data, interphone, public telephone, and television outlet, and on existing and reset outlets where so indicated or required. Plates shall be of stainless steel unless otherwise specified.
- B. Flush wiring device and signal system outlets indicated to be blank covered, shall be covered with blank stainless-steel plates. Flush lighting outlets to be blanked shall be covered with Wiremold 5736 steel covers, or equal, painted to match surrounding finish. Provide stainless steel covers to blank indicated or required surface-mounted outlets.
- C. In the following cases, and at required locations. Switch and receptacle plates shall be engraved with the device(s), or fixtures being controlled, or as indicated:
1. Three-gang and larger gang switches in locations other than classrooms.
 2. Lock switches.
 3. Pilot switches.
 4. Switches so located that operator cannot see fixtures, or items of equipment controlled while his hand is on the switch.
 5. Switches not in same room with fixtures or items of unit heaters, air curtains, fly fans, etcetera.
 6. Receptacles operating at other than 120 V shall be identified with the operating voltage.
 7. Switches operating on 277 V shall be identified with the operating voltage.

8. Where indicated on Drawings.

- D. Designations shall be as indicated on Drawings or as specified by Architect.
- E. Standard GFI cover plates shall be Pass & Seymour 4600, Raco 5028-0, or equal. GFI cover plates shall be provided with a CAM lock mechanism with two keys or a padlock hasp that does not protrude through the face of the cover and will allow the shank of locks keyed Corbin No. 60 keys.

3.03 IDENTIFICATION OF CIRCUITS AND EQUIPMENT

- A. Provide descriptive nameplates or tags permanently attached to switchboards, motor control centers, transformers, panelboards, circuit breakers, disconnect switches, starters, pushbutton control stations and other apparatus installed for operation or control of circuits, appliances, fire alarm control panel(s), fire alarm annunciator(s), power supplies, terminal cabinets, energy management control units, and Information technology system backbone and distribution equipment points.
- B. Provide nameplates of engraved laminated plastic, or etched metal. Submit Shop Drawings denoting dimensions and format to Architect before installation. Fasten to equipment with escutcheon pins, rivets, self-tapping screws, or machine screws. Self-adhering or adhesive backed nameplates are not permitted.
- C. Fasten tags to feeder wiring in conduits at every point where runs are broken or terminated, including pull wires in empty conduits. Indicate circuit, phase, and function. Tag branch circuits in panel boards and motor control centers. Tags may be manufactured of pressure-sensitive plastic or embossed self-attached stainless steel or brass ribbon.
- D. Provide circuit identification cards and cardholders in all panel boards. Cardholders shall consist of metal frame retaining a clear plastic cover permanently attached to inside of panel door. List of circuits shall be typewritten on a card. Circuit description shall include name or number of circuit's area and connected load.
- E. Junction and pull boxes shall have covers stenciled with box number when indicated on Drawings, or circuit numbers according to panel schedules. Data shall be lettered in a conspicuous manner with a color contrasting with finish.
- F. Name shall be correctly engraved, with a legend indicating function or areas, when required by codes or indicated on Drawings.

3.04 PROTECTION

- A. Protect Work of this section until Substantial Completion.

3.05 CLEANUP

- A. Remove rubbish, debris, and waste materials and legally dispose of off Project site.

Department of Neighborhood Services and Public Safety
GOLETA TRAIN DEPOT PROJECT

END OF SECTION

SECTION 26 05 19 LOW-VOLTAGE WIRES (600 VOLT AC)

PART 1 - GENERAL

1.01 SUMMARY

- A. Provisions of Division 01 apply to this section.
- B. Section Includes: Low-voltage wire, splices, terminations and installation.

1.02 SUBMITTALS

- A. Provide in accordance with Division 01.
- B. List of Materials: Submit a complete list of proposed materials.
- C. Shop Drawings: Provide detailed and dimensioned Shop Drawings indicating kind, weight and thickness of materials, insulation type, resistivity, conductivity, impedance, and conductance. Drawings shall contain sufficient information to assemble and install equipment at the Project site without further instructions.
- D. Prior to start of construction; provide letter from wiring and electrical cables manufacturer certifying that the products are qualified/ listed as low electromagnetic field products.

1.03 SUBSTITUTIONS

- A. Deviations/Substitutions from these requirements shall not be accepted without written approval from OWNER'S Design Standards Section and Maintenance and Operations Technical Unit. When deviating are proposed the following information shall be submitted:
 - 1. Substitution request form stating reasons and benefits to OWNER.
 - 2. OWNER'S approval shall be obtained for any equipment or materials substitutions.
 - 3. Proposed substitutions requests shall provide proof of compliance with OWNER'S requirements and applicable standards.
- B. Submittals must comply with contract general provisions.

1.04 QUALITY ASSURANCE

- A. Components and materials shall be listed and approved for the intended application by Underwriter's Laboratories (UL), or other Nationally Recognized Testing Laboratory (NRTL), and in compliance with applicable industry standards and codes.
- B. Wiring installation shall be performed under the supervision of state certified electricians. Contractor or Installer's electricians shall be certified in accordance with Labor Code sections 3099, and 3099.2 and section 209.0 of the California Code of Regulations.
- C. Contractor shall have adequate experience installing systems of similar size and complexity.
 - 1. Qualifications of Installer: Minimum five years of experience installing products and systems of similar scope and complexity.
 - 2. Installer shall have completed at least five projects of equivalent scope and complexity.
 - 3. Contractor shall have completed and commissioned a minimum of five service agreements that provide similar support services to those needed for this project.
 - 4. System startup and testing shall be performed under direct observation of the Project Inspector and OAR.
- D. The Project Inspector will observe installation of feeder cables. Notify the Project Inspector not less than two working days in advance of the proposed time of feeder installation.

1.05 WARRANTY

- A. Provide a one year labor warranty.
- B. Provide material warranty of no less than 10 years.
- C. Warranty period begins at substantial completion or project acceptance for beneficial occupancy.
- D. CONTRACTOR shall warranty all products and materials. Multiple warranty sources is not acceptable.

PART 2 - PRODUCTS

2.01 WIRES

- A. Pressure cable connectors shall be pre-insulated 3M Scotchlok, Ideal Wing Nut, O-Z/Gedney or equal.
- B. Wires shall be single conductor type THHN or THWN insulated with polyvinyl chloride and covered with a protective sheath of nylon, rated at 600 volts. Wires may be operated at a maximum continuous conductor temperature in dry locations of 90 degrees C. and 75 degrees C. in wet locations. Wires and cables shall be listed by Underwriter's Laboratories (UL) Standard 83 for thermoplastic insulated wires, and listed for installation in accordance with Article 310 of the California Electrical Code (CEC).
- C. Conductors shall be solid copper for 12 AWG and smaller conductors, and stranded copper for 10 AWG and larger conductors.
- D. Conductors shall be insulated with PVC and sheathed with nylon.
- E. Wires shall be identified by surface markings indicating manufacturer's identification, conductor size and metal, voltage rating, UL symbol, type designations and optional rating. Indentations for lettering are not permitted.
- F. Wires shall be tested in accordance with the requirements of UL standard for types THWN and THHN.
- G. Conductors shall be solid Class B or stranded Class C annealed uncoated copper in accordance with UL standards, or another Nationally Recognized Testing Laboratory (NRTL).

2.02 STANDARDS

- A. THWN/THHN wires shall comply with the following standards:
 - 1. UL 83 for thermoplastic insulated wires.
 - 2. UL 1063 for machine tool wires and cables.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Wires shall not be installed until debris and moisture is removed from conduits, boxes, and cabinets. Wires stored at site shall be protected from physical damage until they are installed and walls are completed.
- B. Wire-pulling compounds furnished as lubricants for installation of conductors in raceways shall be compounds approved and listed by UL, NRTL, or equal. Oil, grease, graphite, or similar substances are not permitted. Pulling of 2 AWG or larger conductors shall be performed with a cable pull machine. Any runs shorter than 50

feet are exempt. When pulling conductors, do not exceed manufacturer's recommended values

- C. At outlets for light, power, and signal equipment, pigtail splices with 8-inch circuit conductor leads for connection to fixtures, equipment, and devices.
- D. Pressure cable connectors, Yellow, Red, or Blue spring-loaded twist-on type, may be furnished in splicing number 8 AWG or smaller wires for wiring systems. Listed Push-in spring clamp wire connectors, Ideal In-Sure, or equal may be used in luminaires for fixture wiring.
- E. Joints, splices, taps, and connections to switchboard neutral, bonding or grounding conductors, conductors to ground busses, and transformer connections for wires 6 gage and larger shall be performed with high-pressure cable connectors approved for installation with copper conductors. Connectors shall be insulated with heavy wall heat shrink WCSM, or cold-applied roll-on sleeve RVS. Insulation level shall be a minimum of 600V and joints, splices, and taps shall be qualified to ANSI C 119.1, UL, NRTL, or equal listed mechanical pressure connections.
- F. Connections to any bussing and high-press cable connectors shall be securely bolted together with corrosion-resistant plated carbon steel, minimum grade five machine screws secured with constant pressure-type locking devices.
- G. Connection of any bonding or grounding conductors shall be securely bolted together with corrosion-resistant plated carbon steel, minimum grade five machine screws secured with constant pressure-type locking devices.
- H. Wire switchboards, panel cabinets, pull boxes, and other cabinets except public address, shall be neatly grouped and tied in bundles with nylon ties at 10-inch intervals. In switchboards, panels and terminal blocks, wires shall be fanned out to terminals. If bundles are longer than 24 inches, a maximum of nine current carrying conductors may be bundled together.
- I. Install conductor lengths with a minimum length within the wiring space. Conductors must be long enough to reach the terminal location in a manner that avoids strain on the connecting lug.
- J. Maintain the conductor required bending radius.
- K. Neutral conductors larger than 6 gage, which are not color identified throughout their entire length, shall be taped, painted white or natural gray, or taped white where they appear in switchboards, cabinet, gutters or pull boxes. Neutral conductors 6 gage and smaller shall be white color identified throughout their entire length.
- L. Fire alarm and clock wiring shall be continuous from terminal cabinets or from equipment to each device. Splices are not permitted between devices and/or terminal

cabinets at junction and pull boxes. Wiring shall be terminated at terminal blocks or devices only.

- M. Wiring systems shall be free from short circuits and grounds, other than required grounds. The contractor shall be responsible for the testing of feeder and branch circuit conductor's insulation resistance. The insulation of the conductors shall be tested prior to connections to any panelboards, switchboards, variable frequency drives, lighting control systems, ballasts, and wiring devices such as but not limited to GFI receptacles, TVSS receptacles, or equipment. Insulation testing of panelboards and switchboards shall be independently performed from the insulation testing of any conductors as specified in other sections of this specification.
1. Utilize the services of an approved independent testing laboratory to perform megger time-resistance insulation testing of feeder conductors. Tests must be conducted with wires disconnected at both ends.
 - a. Provide calibration program records to assure the testing instrument to be within rated accuracy. The test equipment accuracy shall be in accord with the requirements stated by the National Institute of Standards and Technology (NIST).
 - b. Test equipment shall be provided with a label stating the date of last calibration. As a minimum the equipment shall have been calibrated within the past 12 months.
 - c. Test reports shall include the following:
 - 1) Identification of the testing organization.
 - 2) Equipment identification.
 - 3) Ambient conditions.
 - 4) Identification of the testing technician.
 - 5) Summary of project.
 - 6) Description of equipment being tested.
 - 7) Description of tests.
 - 8) Test results.
 - 9) Analysis, interpretation and recommendations.
 2. Utilize the services of an approved independent testing laboratory or a qualified contractor's employee (Technician certified in accordance with ANSI/NETA ETT-2000 Standard for Certification of Electrical Testing Personnel) to perform megger time-resistance insulation testing of branch circuit conductors. Tests must be conducted with wires disconnected at both ends.

- a. Test equipment and report requirements stipulated under paragraph 3.01.N.1 apply to branch circuit testing.
- 3. Tests shall be performed in the presence of the Project Inspector.
- 4. Insulation resistance shall not be less than 100 mega-ohms.

3.02 COLOR CODES

A. General Wiring:

- 1. For phase and neutral conductors 6 gage or larger, permanent plastic-colored tape may be furnished to mark conductor end instead of coded insulation. Tape shall cover not less than 2 inches of conductor insulation within enclosure.
- 2. Color code conductor insulation as follows:

SYSTEM VOLTAGE		
Conductor	208Y/120	480Y/277
Phase A	Black	Brown
Phase B	Red	Orange
Phase C	Blue	Yellow
Neutral	White	Natural Gray

Neutrals shall be colored-distinguished if circuits of two voltage systems are used in the same raceway.

- 3. Where two voltage systems are combined in an enclosure; CONTRACTOR shall apply a permanent color code label where the circuits originate.
- B. Signal Systems: Wires for signal systems shall be color-coded and installed under observation of the Project Inspector. Except where otherwise specified, color-coding shall be as follows:

EDIT NOTE: IN NEW SCHOOLS AND SOME EXISTING SCHOOLS THE PROGRAM SIGNAL IS THROUGH THE PA SYSTEM; PROGRAM BELLS ARE NOT PRESENT. DELETE REFERENCE TO PROGRAM BELLS AS NEEDED.

<u>SYSTEM</u>	<u>COLOR CODE</u>
Clocks	Pink, Gray and Orange
Program Bells (some existing elementary schools)	White (Common)Black

Initiating Devices (Non-Addressable)	Red (+) and Black (-)
Program Bells (some existing secondary schools)	White (120 volt, common) Black (C.R. program) Blue (Shop program) Brown (Gym program) Yellow (Auditorium fire alarm)
Fire Alarm Horns	Pink (+) and Gray (-)
Fire Alarm Strobes	Orange (+) and Blue (-)
Un-Interruptible 24 Volt Power (Annunciator, Water Flow, and Audible Device)	Yellow (+) and White (-) Note: A single white wire may be common to both
Interruptible 24 Volt Power (4 wire smoke detectors, duct detectors)	Brown (+) and White (-) Note: A single white wire may be common to both
Switch-Leg Sprinkler Bell (Between water flow and audible device)	Violet (+) and White (-)
Door Holding Magnets (Non Power Limited)	Black (+) and White (-)

3.03 FEEDER IDENTIFICATION

- A. Feeder wires and cables shall be identified at each point the conduit run is broken by a cabinet, box, gutter, etc. Where terminal ends are available, identification shall be by means of heat shrink wire markers, which provide terminal strain relief. Markers shall be by Tyco Electronics, Panduit, Brady Perma-Sleeve, or equal. Identification in other areas shall be by means of wrap-around tape markers from Tyco Electronics, Panduit, Brady Perma-Code or equal. Markers shall include feeder designation, size, and description.

3.04 TAPE AND SPLICE KITS

- A. Splices, joints, and connectors joining conductors in dry and wet locations shall be covered with insulation equivalent to that provided on conductors. Free ends of conductors connected to energized sources shall be taped. Voids in irregular connectors shall be filled with insulating compound before taping. Thermoplastic insulating tape approved by UL, NRTL, or equal for installation as sole insulation of splices shall be furnished and shall be installed according to manufacturer's printed specifications.

3.05 PROTECTION

- A. Protect the Work of this section until Substantial Completion.

3.06 CLEANUP

Department of Neighborhood Services and Public Safety
GOLETA TRAIN DEPOT PROJECT

- A. Remove rubbish, debris and waste materials and legally dispose of off the Project site.

END OF SECTION

SECTION 26 05 26 GROUNDING AND BONDING

PART 1 - GENERAL

1.01 SUMMARY

- A. Provide and install an effective grounding and bonding system.
- B. Related Requirements:
 - 1. Refer to related sections for their system grounding requirements.
 - 2. Division 01 - General Requirements.
 - 3. Division 26 – Electrical.
 - 4. Division 27 – Communications.
 - 5. Division 28 - Electronic Safety and Security.

1.02 QUALITY ASSURANCE

- A. Reference Standards:
 - 1. IEEE 142 Green Book.
 - 2. Underwriter's Laboratories (UL).
 - 3. California Electrical Code.
 - 4. Building Industry Consultant Services International (BICSI).
 - 5. EIA/TIA (Signal and power).
 - 6. Nationally Recognized Testing Laboratory (NRTL).

1.03 SYSTEM DESCRIPTION

- A. Equipment, components, or materials that enclose electrical conductors, or are likely to be energized by electrical currents shall be effectively grounded.
- B. Metal equipment parts such as switchboards, panelboards, metal enclosures, raceways, equipment grounding conductors, and earth grounding electrodes shall be effectively bonded into a continuous grounding path.

- C. Metallic systems or electrically conductive materials shall be effectively bonded to the building's grounding electrode system.
- D. A separately derived AC system shall be grounded to the equipment grounding conductor and to a separate "made" electrode of building grounding electrode system.
- E. Provide effective electrical equipment bond continuity to all metal raceways and enclosures. Grounding shall be achieved through a code sized green insulated grounding conductor provided within each raceway.
 - 1. Each flexible conduit over six feet in length shall be provided with a green insulated grounding conductor of required size.
 - 2. Provide code sized equipment grounding conductor in all flexible conduits as required by CEC.
 - 3. The length of flexible conduit installations shall not be less than six feet.
 - 4. Effectively ground metal raceways and enclosures at each end.
- F. Cold water, or other utility piping systems, shall not be utilized as grounding electrodes. In addition to bonding to cold water pipe provide at least one of the following made grounding electrodes:
 - 1. A dedicated "made" electrode, fabricated of at least 20 feet of uncoated galvanized 1/2 inch diameter rebar encased by at least two inches of concrete, and placed next to the bottom of a concrete foundation, or footing in direct contact with earth. A welded extended portion shall surface at the location of the common grounding electrode bus bar and be extended by a 3/0 exothermic welded bare copper cable, or be welded directly to the bus. The exothermic weld shall be at least four inches above finished floor in a dry location. The main grounding electrode and associated grounding conductors shall be in an enclosure and in conduit.
 - 2. Concrete enclosed electrode, fabricated of at least 20 feet of No. 2 AWG, minimum size, bare copper conductor, encased by at least two inches of concrete, located within or near bottom of a concrete foundation, or footing, which is in direct contact with earth. Footing rebar shall be connected to copper wire with approved connectors.
 - 3. An external grounding electrode, as specified hereafter or as required by the CEC shall be installed and connected to foundation or footing rebar.
 - 4. Extend the ground connections to the reinforcing steel of the concrete pads. Connect ground connections to 20 feet minimum of one or more of concrete pad reinforcing steel bars not less than 1/2 inch diameter. Provide a concrete

- encased electrode consisting of 20 feet of bare copper conductor not smaller than No. 4 AWG.
5. Ground metal sheathing and any exposed metal, vertical structural elements of buildings. Ground metal fences enclosing electrical equipment. Bond any metal equipment platforms which support electrical equipment to that equipment. Provide good electrical contact between metal frames and railings supporting push button stations, receptacles, instrument cabinets, etc., and raceways carrying circuits to those devices.
- G. Non-current carrying metal parts of high-voltage (1000 Volts or more) equipment enclosures, signal and power conduits, switchboard and panelboard enclosures, motor frames, equipment cabinets, and metal frames of buildings shall be permanently and effectively bonded to the grounding system. Provide a CEC sized equipment grounding conductor in every raceway.
- H. Metallic or semi-conducting shields and lead sheaths of cables operating above 1000 Volts shall be permanently and effectively grounded at each splice and termination.
- I. Neutral of service conductors shall be grounded as follows:
1. Neutral shall be solidly grounded at only one point within the Project site for that particular service. Preferable location of grounding point shall be at the service switchboard, or main switch.
 2. Equipment and conduit grounding conductors shall be bonded to that grounding point.
 3. If other buildings or structures on the Project site are served from a switchboard or panelboard in another building, power supply is classified as a feeder and not as a service.
 4. Equipment grounding conductor shall be installed from switchboard to each individual building. At building, grounding conductor shall be bonded with power equipment enclosures, metal frames of building, etc., to “made” electrode for that building.
 5. Feeder neutrals shall be bonded at service entrance point only; neutrals of separately derived systems shall be bonded at the source only.
- J. If there is a distribution transformer at a building the secondary neutral conductor shall be grounded to “made” electrode serving the building.
- K. Within every building, the main switchboard or panelboard, shall be bonded to the cold water line. Metallic piping systems such as gas, fire sprinkler, or other systems shall be bonded to the cold water line.

1.04 SUBMITTALS

- A. Provide in accordance with Division 01.

PART 2 - PRODUCTS

2.01 MATERIALS

- A. Furnished yard boxes shall be precast concrete and shall be approximately 14 inches wide by 19 inches long by 12 inches deep or larger.
- a. Boxes shall be furnished with bolt-down, checkered, cast iron covers and cast-iron frames cast into the yard boxes.
 - b. Provide yard boxes with hinged Frame Locking Cover.
 - c. Approved products include Brooks No. 36 HFL, Jensen Precast, Oldcastle Precast, Western Precast, Kistner, or equal.
- B. External ground electrodes shall be copper-clad steel ground rods, minimum 3/4-inch diameter by ten feet long.
- C. Clamps and fittings used in ground boxes below grade shall be listed for direct burial.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Grounding electrodes shall be installed in the nearest suitable planting area, where not otherwise indicated on Drawings, and each electrode shall terminate within a concrete yard box installed flush with finish grade. In planting areas, finish elevation of concrete yard boxes shall be two inches above planting surfaces.
- B. If concrete enclosed electrode is provided, grounding wire shall be terminated to a suitable copper plate with grounding lugs and must be enclosed in a raceway or box.
- C. Grounding rods shall be driven to a depth of not less than eight feet. Permanent ground enhancement material, (GEM) as manufactured by Erico Electrical Products, Loresco Powerset, Tessco Ultrafil or equal, shall be installed at each ground rod to improve grounding effectiveness. Install in accordance with manufacture's installation instructions.
- D. Grounding electrodes shall provide a resistance to ground of not more than 25 ohms.

- E. When installing grounding rods, if resistance to ground exceeds 25 ohms, two or more rods connected in parallel, or coupled together shall be provided to meet CEC grounding resistance requirements.
- F. Ground rods shall be separated from one another by not less than ten feet.
- G. Parallel grounding rods shall be bonded together with listed fittings and grounding conductors in galvanized rigid steel conduit, buried not less than 12 inches below finish grade.

3.02 TESTING

- A. Provide the services of an approved independent testing laboratory to test grounding resistance of “made” electrodes, ground rods, bonding of building steel, water pipes, gas pipes and other utility piping. Tests shall be performed as follows:
 - 1. Visually and mechanically examine ground system connections for completeness and adequacy.
 - 2. Perform fall of potential tests on each ground rod or ground electrode where suitable locations are available per IEEE Standard No. 81, Section 8.2.1.2. Where suitable locations are not available, measurements will be referenced to a known dead earth or reference ground.
 - 3. Perform the two-point method test per IEEE No. 81, Section 8.2.1.1 to determine ground resistance between ground rod and building steel, and utility piping - such as water, gas and panelboard grounds. Metal hand railings at building entrances and at handicapped ramps shall also be tested.
 - 4. Test shall be performed in the presence of the Inspector.
- B. Submit 3 copies of test results to the Architect. Test results shall be submitted on an official form from the independent testing laboratory recording Project location, test engineer, test conditions, test equipment data, ground system layout or diagram, and final test results.

3.03 PROTECTION

- A. Protect the Work of this section until Substantial Completion.

3.04 CLEANUP

- A. Remove rubbish, debris, and waste materials and legally dispose of off the Project site.

END OF SECTION

SECTION 26 05 33
RACEWAYS, BOXES, FITTINGS, AND SUPPORTS

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Raceways and wire ways.
2. Conduit installation.
3. Underground requirements.

B. Related Requirements:

1. Section 26 05 00: Common Work Results for Electrical.
2. Section 26 05 13: Basic Electrical Materials and Methods.
3. Division 27: Communications.
4. Division 28 - Electronic Safety and Security.

C. Applicable Standards and Codes.

1. EIA/TIA 569 Standards.
2. National American Standards Institute (ANSI).
3. National Electrical Manufacturer's Association (NEMA).
4. Nationally Recognized Testing Laboratory (NRTL).
5. California Electrical Code (CEC).
6. Uniform Building Code (UBC).
7. Underwriters Laboratory (UL).

1.02 SUBMITTALS

- A. Materials List: Provide in accordance with Division 01.**

PART 2 - PRODUCTS

2.01 RACEWAYS

A. Conduit Materials:

1. Metallic conduit, and tubing shall be manufactured under the supervision of an UL, or another NRTL factory inspection and label service program. Each ten-

- foot length of conduit and tubing shall bear the UL or another NRTL label and manufacturer's name.
2. Rigid metallic conduit shall be rigid steel, heavy wall, mild steel, zinc-coated, with an inside and outside protective coating manufactured in accordance with ANSI C 80.1. Couplings, elbows, bends, conduits, bushings and other fittings shall be the same materials and finish as the rigid metallic conduit. Fittings, connectors, and couplings shall be threaded type, manufactured in accordance with ANSI C 80.1 and UL 6.
 3. Electrical metallic tubing shall be steel tubing, zinc-coated with a protective enamel coating inside, manufactured in accordance with NEMA C 80.3. Fittings, couplings, and connectors shall be gland compression type, set screw couplings and connectors not permitted. All parts shall be manufactured in accordance with NEMA C80.3 and UL 6A Electrical metallic tubing is designated hereinafter as EMT. Steel and rain tight fittings shall be approved and listed for the intended application.
 4. Flexible steel conduit shall be of flexible interlocking strip construction with continuous zinc coating on strips, manufactured in accordance with UL 1.
 - a. Connectors and couplings shall be required fittings of the type, which threads into convolutions of flexible conduit.
 5. Liquid-tight flexible metal conduit shall be galvanized heavy wall, flexible locked steel strip construction, UV rated, with smooth moisture and oil-proof, abrasion-resistant, extruded plastic jacket. Connectors shall be as required for installation with liquid-tight flexible conduit and shall be installed to provide a liquid-tight connection.
 6. Non-metallic conduit shall be rigid PVC electrical conduit extruded to schedule 40 dimensions of Type II. Grade 1 high impact, polyvinyl chloride, sweeps, couplings, reducers and terminating fittings shall be listed under the UL, or another NRTL, and shall bear the manufacturer's listed marking.
 7. Multi-cell raceway shall be four inch PVC, Type 40, UL or another NRTL listed for underground use with optical fiber and signal system cables. Raceway shall be furnished with 3-1/2 inch factory installed inner ducts with required internal spacers, and required couplers, sweeps, and end bells. Multicell raceway shall be Carlon Multigard, or District approved equal.
 8. Metal Clad (MC) cable system is not allowed.
- B. Sleeves for Conduits: Sleeves shall be adjustable type by Carlon, U.S. Plastic, PEP Plastic or equal.

- C. Where conduit enters a building through a concrete foundation below grade, or ground water level, or where it is necessary to seal around a conduit where it passes through a concrete floor or wall, provide O-Z/Gedney Type FSK Thru Wall and Floor Seal, equivalent Cooper Crouse Hinds Thru-Wall, Legrand Thru-Wall, or equal.
- D. Expansion Joints-Seismic Separations between building(s) and other locations as indicated on drawings:
1. Provide Thomas & Betts XJG-TB, O-Z/Gedney. type AX with bonding strap and clamps, Cooper XJGD or equal. At exterior locations, provide Thomas & Betts XJG-TB, O-Z/Gedney type EX, Cooper XJGD, or equal. Provide O-Z/Gedney type AXDX, or equal combination deflection/expansion fittings at all seismic separations. Provide manufacture's internal and external bonding jumpers at all locations. Liquid-tight metal conduit or flexible metal conduit shall not be approved at expansion joints, separations between buildings or seismic separations.
 2. Provide expansion fittings at intervals not exceeding 100 feet in conduits exposed to direct sunlight. Fittings may be installed in the conduit run or where conduit attaches to junction or pull boxes. OZ/Gedney type AX, TX or EXE series, or equivalent by Thomas and Betts, Crouse-Hinds or approved equal.
- E. Conduit Seal Fittings:
1. Provide conduit seal fittings where indicated on the Drawings. Conduit seals shall be of rigid galvanized steel. Seals in horizontal conduit installations shall be Thomas & Betts EYS, Appleton Type ESU, Crouse Hinds Type EYS, or equal. Seals in vertical conduit installations shall be Thomas & Betts EYD, Appleton Type SF, Crouse Hinds Type EYD, or equal, with continuous drain. When installing conduit seals make provision for percent fill space reduction in accordance with CEC.
 2. Install sealing compound after wire has been installed. Ensure drain is not blocked in vertical seals when installing compound. Where conduit seals are installed in hazardous area applications, there shall be no conduit coupling, fitting, etc., between seal and boundary of hazardous area.
- F. Surface Steel Raceway:
1. The surface steel raceway system for branch circuit wiring, data network, voice, video, and other low voltage wiring shall be as manufactured by the Wiremold Company, Hubbell, or Mono-Systems, Inc. or equal. The raceway system may be supplied pre-wired in accordance with all sections of these specifications and requirements herein, and shall be UL or another NRTL listed. Computer data installation shall be as required by other sections of this Division.

- G. Factory Pre-Wired Surface Metal Raceway:
 - 1. Standard non-OEM wiring devices shall be used as specified.

PART 3 - EXECUTION

3.01 CONDUIT INSTALLATION

- A. General Requirements:
 - 1. Provide complete and continuous systems of rigid metallic conduit, outlet boxes, junction boxes, fittings and cabinets for systems of electrical wiring including lighting, power, and signal systems, except as otherwise specified.
 - 2. EMT may be installed in interior concealed applications and in areas approved by owner. EMT shall not be installed in concrete, directly buried underground, outdoors, in boiler rooms, elevator pits, or where subject to damage.
 - 3. Within buildings, flexible steel conduit may be installed instead of rigid steel conduit where permitted by code. Flexible steel conduit shall be installed:
 - a. For continuous lengths not exceeding more than 50 feet between pull points (pull boxes, outlet boxes, etcetera).
 - b. With no maximum total raceway length located within a building interior when the flex is located in concealed locations.
 - 4. Flexible Steel conduit shall not exceed 1-1/2 inches in size.
 - 5. Liquid-tight flexible steel conduit shall only be installed, except where otherwise specified, for final connection of motor terminal boxes, shop equipment, cafeteria equipment, HVAC equipment and other equipment, or for frequent interchange, and shall be of sufficient length, not exceeding 36 inches, to permit full travel or adjustment of motor on its base. Liquid-tight flexible conduit shall not be used for equipment not requiring adjustment or frequent interchange.
 - 6. Connectors for flexible metal conduit shall be made of steel, and of the types which threads into convolutions of conduit. Connectors for watertight flexible metal conduit shall be as required for installation and shall be installed to provide a watertight connection.
 - 7. Exposed conduit shall be installed vertically and horizontally following the general configuration of the equipment, using cast threaded hub conduit fittings where required and shall be clamped to equipment with suitable iron brackets and one hole pipe strap.
 - 8. If connection is from a flush wall-mounted junction box, install an approved extension box.
 - 9. Underground feeder distribution conduits for systems may be non-metallic conduit instead of rigid conduit except where otherwise specified or indicated.

10. Conduit shall be concealed unless otherwise indicated. Conduits exposed to view, except those in attic spaces and under buildings, shall be installed parallel or at right angles to structural members, walls, or lines of building. Conduits shall be installed to clear access openings.
11. Bends or offsets will not be permitted unless absolutely necessary. Radius of each conduit bend or offset shall be as required by ordinance. Bends and offsets shall be performed with standard industry tools and equipment or may be factory fabricated bends or elbows complying with requirements for radius of bend specified. Heating of metallic conduit to facilitate bending is not permitted. Public telephone conduit bends and offsets shall be provided with a radius which is not less than ten times trade size of conduit unless otherwise permitted. Refer to underground installation, specified in this section, for radius of bends and offsets required for underground installations.

B. Underground Requirements:

1. Conduits and multicell raceways installed underground shall be entirely encased in three inch thick concrete on all sides , except where otherwise specified. Provide required spacers to prevent any deflection when concrete is placed and to preserve position and alignment. Conduits and raceways shall be tied to spacers. Anchors shall be installed to prevent floating of conduits and raceways during placing of concrete. Provide red colored concrete to encase conduits of systems operating above 600 volts.
2. Underground conduits and raceways shall be buried to a depth of not less than 24 inches below finished grade to top of the concrete envelope, unless otherwise specified.
3. Assemble sections of conduit with required fittings. Cut ends of conduit shall be reamed to remove rough edges. Joints in conduits shall be provided liquid-tight. Bends at risers shall be completely below surface where possible.
4. Conduits and raceways in a common trench shall be separated by at least three inches of concrete. Electrical power and/or lighting conduit runs installed in a common trench with conduits containing signal system wiring such as public address, telephone, intrusion detection, fire alarm, television, computer networking, and clock systems shall maintain a separation of a minimum of six inches from these types of signal system conduits and raceways. Electrical power, lighting and signal conduits and raceways installed in a common trench with other utility lines such as gas, water, sewer and storm lines shall maintain 12 inches separation from these types of utility lines.
5. Non-metallic conduit installations shall comply with following additional requirements. Joints in PVC conduit shall be sealed by means of required solvent-weld cement supplied by conduit manufacturer. Non-metallic conduit bends and deflections shall comply with requirements of applicable electrical

- code, except that minimum radius of any bend or offset for conduits sized from 1/2 inch to 1 1/2-inch inclusive shall not be less than 24 inches. Bends at risers and risers shall be PVC-coated rigid steel conduit. Radius of curve of bends or offsets in non-metallic conduit for public telephone system shall be not less than ten times trade size of conduit, unless otherwise specifically permitted.
6. Underground conduit systems provided for utility companies shall be furnished to meet the requirements of the utility companies requiring service.
 7. Protect inside of conduit and raceway from dirt and rubbish during construction by capping openings.
 8. Add bell-end bushings for conduit stub-up including underground entries to pull boxes, and manholes. Under floor standing switchboards and motor control centers provide a four-inch galvanized nipple with ground bushing.
- C. Rooftop conduit shall be supported from channels, stands, clamps, trapezes, rollers, or structures mounted on 100% rubber, UV resistant rooftop supports with reflective strips, Dura-Blok, or equal. Roller type supports shall be provided below and above conduit to prevent its dislodgement. Bottom of conduits shall clear the roof surface by 10 inches.
1. At PVC roofing provide walk tread, polyester reinforced, UV resistant, with surface embossment at rooftop supports. Heat welding of walk pads shall only be done by manufacturer certified installers.
 - a. Sika-Sarnafil and Carlisle: Walk tread shall be no more than one inch larger than the plan area of the pipe support blocks and adhered to the roof membrane with Sika 1A or Carlisle Universal Single-Ply sealant, as applicable.
 - b. Johns Manville: Walk tread shall be installed under the pipe support blocks and adhered to the blocks, if possible, and left loose laid on top of the PVC roof system. Walk-pad shall have a minimum of 4 inches of material past perimeter on all 4 sides of block.
 2. Built-up roofing: Provide APP granulated modified torch-down at each pipe support block. Torch-down shall extend 2 to 4 inches beyond the edges of the block and adhered by torch application over existing cap sheet membrane. This work shall be performed by a certified roofer.
- D. Slabs on Grade:
1. Unless specifically reviewed by the Architect, conduits 1 1/4-inches and larger are not permitted to be installed in structural concrete slabs. Where conduits are permitted, and are installed in concrete slabs on grade, slabs shall be thickened at

bottom where conduits occur to provide three inches of concrete between conduit and earth. Required excavation shall be part of the Work of this section.

2. If concrete slab is five inches or more in thickness with a moisture barrier plastic sheet between earth and slab, one inch and smaller conduits shall be installed in the slab with a minimum of one inch concrete between earth and conduit.

- E. Concrete Walls, Beams, and Floors: Provide sleeves where conduits pierce concrete walls, beams, and floors, except floor slabs on grade. Sleeves shall provide 1/2 inch clearance around conduits. Sleeves shall not extend beyond exposed surfaces of concrete and shall be securely fastened to forms. Where conduits pass through walls below grade, seal with required sealant and backer materials between conduit and sleeve to provide a watertight joint. Sealant shall be as indicated in Section 07 92 00: Joint Sealants.

3.02 STUBS

- A. Floor: At points where floor stubs are indicated in open floor areas, for connections to machines and equipment, conduits shall be terminated with couplings, tops flush with finished floor. Stubs shall extend above couplings the indicated distance. Where capped stubs are designated, couplings shall be closed with cast iron plugs with screw drive slots

- B. Underground:

1. Underground conduit stubs shall be terminated at locations indicated, and shall extend five feet beyond building foundations, steps, arcades, concrete walks and paving. Rigid metallic conduit stubs and non-metallic conduit stubs shall be capped by installing a coupling flush in end wall of concrete encasement and plugging with a permitted plug. Project record drawings shall indicate location of ends of underground conduit stubs fully dimensioned and triangulated with reference to buildings or permanent landmarks. These dimensions, including depth below finished grade, shall be marked on project record drawings in presence of the Inspector before backfilling trench. Where extending existing concrete encased stubs, clean, chip and wire brush end of existing concrete and brush on a heavy coat of neat cement paste or epoxy bonding agent.
2. Over ends of individual underground conduit stubs or groups of conduit stubs, install four-inch by 18-inch deep PVC filled with concrete, flush with finished grade in asphaltic concrete or lawns, and two inches above finished grade in planting areas. Cast a three-inch by three-inch brass plate engraved "ELECT" flush in top of concrete. Secure plate to concrete with brass dowels or as indicated on drawings.

3.03 PROTECTION

- A. Protect the Work of this section until Substantial Completion.

3.04 CLEANUP

Department of Neighborhood Services and Public Safety
GOLETA TRAIN DEPOT PROJECT

- A. Remove rubbish, debris and waste materials and legally dispose of off the Project site.

END OF SECTION

SECTION 26 05 86 MOTORS AND DRIVES

PART 1 - GENERAL

1.01 SUMMARY

- A. Section Includes: Furnishing and installation of electric motors, machinery drives, and equipment as indicated. Sizes, capacities, and operating conditions shall be as tabulated on equipment schedules.
- C. Related Requirements:
 - 1. Division 01 - General Requirements.
 - 2. Section 23 05 48: HVAC Sound, Vibration and Seismic Control.
 - 3. Section 23 20 13: HVAC Piping.
 - 4. Section 23 60 00: Central Cooling Equipment.
 - 5. Section 23 80 00: Heating, Ventilating and Air Conditioning Equipment.
 - 6. Section 23 09 00: HVAC Instrumentation and Controls.

1.02 ELECTRICAL REQUIREMENTS

- A. Except where modified by specific requirements of an individual mechanical section, the following electrical Work required by Division 23 is included under Division 26, 27 and 28, and as indicated on Drawings:
 - 1. Motor starters and disconnect switches for motors.
 - 2. Line voltage wiring and conduit to motors, motor starters and controls.
 - 3. Installation of line voltage wall-mounted electric controls.
- B. Power Supply: Provide necessary power supplies for the intended operation and application as indicated on the Drawings. Verify indicated power supplies with Architect/Engineer prior to ordering equipment.
- C. Pre-wired Control Panels: Where pre-wired control panels or equipment are provided under Division 23, internal wiring shall extend neatly to a terminal strip which shall have same designation for terminals that are indicated on wiring diagrams. Pre-wired panels shall be listed and labeled by UL, or other Nationally Recognized Testing Laboratory (NRTL).

- D. Workmanship: Where Work of Division 23 includes either factory or field wiring, materials and workmanship shall conform to requirements of Division 26, 27 and 28 Specifications and governing codes.

1.03 SUBMITTALS

- A. Provide in accordance with Division 01 and 23 05 00: Common Work Results for HVAC.
- B. Manufacturer's Data
 - 1. Complete material list of items proposed to be provided under this section.
 - 2. Manufacturer's specifications and other data required to demonstrate compliance with specified requirements.
 - 3. Shop Drawings indicating complete system layout, diagrams, and schedules.
 - 4. Manufacturer's recommended installation procedures.
- C. Manufacturer's recommended installation procedures, when reviewed by the Architect, will become basis for inspecting actual installation procedures.

1.04 QUALITY ASSURANCE

- A. Manufacturer and Installer Qualifications: Comply with provisions stated under Section 23 05 00: Common Work Results for HVAC.
 - 1. Qualifications of Manufacturers: Products furnished for the Work of this section shall be produced by manufacturers regularly engaged in manufacture of similar items and with a five-year history of successful production.

1.05 PRODUCT HANDLING

- A. Protection, Replacement, Delivery, and Storage: Comply with provisions stated under Section 23 05 00: Common Work Results for HVAC.

PART 2 - PRODUCTS

2.01 EQUIPMENT

- A. Electrical Motors: Motors shall provide adequate starting torque to bring driven equipment up to rated speed in the stipulated time intervals:
 - 1. In general, motors 1/2 horsepower and larger shall be squirrel cage induction type for 3-phase, 60 cycle power supply.

2. Motors below 1/2 horsepower shall be capacitor start, induction run type or split-phase type for single phase, 60 cycle power supply.
- B. Motors Furnished with Equipment: Where motors are an integral part of equipment, motors shall be as recommended by the equipment manufacturer.
- C. Motor Operation Criteria:
1. Motors that are not directly exposed to weather, and are located in non-hazardous spaces, shall be furnished with drip-proof enclosures and shall be continuous duty rating of 100 degrees F.
 2. Motors installed unprotected in outdoor locations shall be totally enclosed, fan-cooled, and continuous duty rating at 130 degrees F.
 3. Single phase motors shall be furnished with built-in overload protection. Overload protectors shall be single pole automatic reset type, except where frequent start/stop may constitute a hazard, reset shall be manual.
 4. Hermetic polyphase motors shall be furnished with built-in hermetic thermostatic protection devices, which shall interrupt the control circuit to protect the motor from overheating.
 5. Motors shall be furnished with UL, or other NRTL approved terminal boxes. All motors including mountings and shaft sizes, shall be built to NEMA standard dimensions; except where integral with hermetic equipment
 6. Where application is unique, or location is contaminated or hazardous, high starting torque totally enclosed or explosion-proof motors shall be provided.
 7. Where Drawings schedule 3-phase for motors smaller than 1/2 horsepower or single phase for motors larger than 1/2 horsepower, specifically verify schedule with the Architect before ordering motors.
 8. Two-speed motors shall be separately wound if speeds required are not a two-to-one ratio. If two-to-one speed ratio is required, motors shall be single wound. Two-speed motors shall be furnished with variable horsepower.
 9. Motors shall be furnished with sealed lifetime lubricated ball bearings.
 10. Motors shall be energy efficient complying with NEMA standards.
- D. Machinery Drives:
1. Couplings: Where couplings are specified for direct drive, non-lubricated types shall be furnished and rating shall be at least 125 percent motor horsepower rating.

- E. Machinery Accessories:
 - 1. Lubricating Devices: Provide level gages, oil pressure gages, grease cups, and grease gun fittings as required by the equipment. Extend lubricating fittings to readily accessible locations.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Install equipment as indicated on Drawings and in compliance with manufacturer's recommendations, with vibration isolation, mounting pads or foundations as specified in other sections.

3.02 PROTECTION

- A. Protect the Work of this section until Substantial Completion.

3.03 CLEANUP

- A. Remove rubbish, debris and waste materials and legally dispose of off the Project site.

END OF SECTION

SECTION 26 08 00 ELECTRICAL SYSTEMS COMMISSIONING

PART 1 - GENERAL

1.01 SECTION INCLUDES

A. Section Includes:

1. General requirements for Commissioning (Cx) of lighting systems components, lighting controls and HVAC systems line voltage interconnection components, including installation, start-up, testing and documentation according to construction documents and Commissioning Plan (CxP).
2. Standard procedures for the execution of commissioning work shall be in conformance with Division 1. Coordinate work with the Commissioning Services Provider (CxSP).

1.02 RELATED REQUIREMENTS

- A. Division 01 - General Requirements.
- B. Section 01 91 13: General Commissioning Requirements.
- C. Section 01 79 00: Maintenance and Operations Staff Demonstration and Training.
- D. Section 23 80 00: Heating, Ventilation, and Air Conditioning Equipment.
- E. Section 23 08 00: HVAC Systems Commissioning.
- F. Section 23 09 23: Environmental Control and Energy Management Systems.
- G. Section 23 08 13: Environmental Controls and Energy Management System Commissioning.
- H. Section 26 05 00: Common Work Results for Electrical.
- I. Section 26 05 13: Basic Electrical Materials and Methods.
- J. Section 26 05 26: Grounding and Bonding.
- K. Section 26 05 86: Motors and Drives.

1.03 REFERENCES

- A. Applicable codes, standards, and references: inspections and tests shall be in accordance with the following applicable codes and standards:
 1. National Electrical Testing Association – NETA.
 2. National Electrical manufacturer’s Association – NEMA.
 3. American Society for Testing and Materials – ASTM.

4. Institute of Electrical and Electronic Engineers – IEEE.
5. American National Standards Institute – ANSI.
6. National Electrical Safety Code – NESC.
7. California Building Code – CBC.
8. California Electrical Code – CEC.
9. California Green Building Standards Code (CalGreen).
10. Conglomerate for High Performance Schools (CHPS).
11. Insulated Power Cables Engineers Association – IPCEA.
12. Occupational Safety and Health Administration – OSHA.
13. National Institute of Standards and Technology – NIST.
14. National Fire Protection Association – NFPA.
15. California Electrical Code.
16. ANSI/NFPA 70B – Electrical Equipment Maintenance.
17. NFPA 70E – Electrical Safety Requirements for Employee Work Places.
18. ANSI/NFPA 101– Life Safety Code.

PART 2 - PRODUCTS

2.01 TEST EQUIPMENT

- A. Equipment to be utilized in the commissioning process shall meet the following requirements:
 1. Provide test equipment as necessary for the equipment and systems to be commissioned.
 2. Provide testing equipment and accessories that are free of defects and certified for use.
 3. Provide testing equipment with current calibration labels per NIST Standards.
 4. Testing equipment shall be UL Listed.

PART 3 – EXECUTION

3.01 COMMISSIONING PROCESS REQUIREMENTS

- A. Work to be performed prior to commissioning:
 1. Complete all phases of the work so the system(s) can be started, tested, adjusted, balanced, and otherwise commissioned.

2. Start-up services required to bring each system into full operational state and ready for functional performance testing:
 - a. Completion of authorized manufacturer representative's start-up procedures and recommendations.
 1. Provide Manufacture's start-up completed forms.
 - b. Completion of pre-functional checklists.
 - c. Copy of required manufacturer and field testing.
 - d. Motor rotation check.
 - e. Control sequences of operation.
 - f. Full and partial load performance.
 3. If modifications or corrections to the installed systems are required to bring the system(s) to acceptance levels due to CONTRACTOR's incorrect installation or defective materials, such modifications or corrections shall be made at no additional cost to the OWNER.
 4. Functional tests shall not start until each system is complete and the above items have been documented and submitted to the Engineer of Record, Cx Services Provider and OWNER for review.
- B. Pre-commissioning Responsibilities: Inspection, calibration and testing of the equipment and devices necessary to commission the following systems:
1. Electrical Lighting Systems.
 2. Lighting Controls.
 3. HVAC line voltage electrical components.
 4. Line voltage interface of Environmental Controls and Energy Management System with other systems.
 5. Photovoltaic Systems.
- C. Commissioning Process Requirements: Refer to Section 01 9113 General Commissioning Requirements, related sections and Cx Plan for information on meetings, start-up plans, Pre-Functional and Functional Performance Testing (FPT), operations and maintenance data, and other Commissioning activities.
- 3.02 PREPARATION
- A. Provide certified electricians and/or qualified personnel as required with adequate tools and equipment necessary to perform Cx activities.
 - B. Provide all equipment required for the commissioning of equipment and systems indicated in article 3.01.B.
 - C. Provide certified testing agency personnel or report(s) as required in the Cx Plan.

3.03 TESTING

- A. Testing documentation shall include the following minimum information:
1. Test number.
 2. Equipment used for the test, with manufacturer and model number and date of last calibration.
 3. Date and time of the test.
 4. Indication of whether the record is the first commissioning test, or a retest following correction of a previously identified issue.
 5. Identification of the system, subsystem, assembly, or equipment.
 6. Conditions under which the test was conducted, including (as applicable) ambient conditions, set points, override conditions, and status and operating conditions that impact the results of the test.
 7. Systems and assemblies test results, performance and compliance with contract requirements.
 8. Issue number and description of corrected issue that prompted retesting.
 9. Name and signature(s) of witnesses and the person(s) who performed the test(s).
- B. Test lighting and controls systems to verify performance, operation, functionality, light levels, energy usage, and compliance with construction documents.
1. Start up, test and document results under the observation of the CxSP.
 2. Execute the Functional Performance Test (FPT) under the observation of the CxSP.
 3. Provide completed and signed FPTs to CxSP for inclusion in the commissioning report.
 4. Functions and Testing Conditions:
 - a. Occupancy sensors and timer controls for lighting:
 - 1) Verify that specified functions and features are set up, debugged and fully operable at time of test.
 - 2) Verify that occupant override feature functions as intended in the contract documents.
 - 3) Verify that sensors response times/durations are set properly.
 - 4) Test the sequence of operation for features and modes and confirm that adjustable times match the design specifications and contract documents.
 - 5) Verify that sensors are located per manufacturer's recommendations.

- b. Electric lighting dimming, photocells and controls:
 - 1) Test the dimming controls during daytime when conditions are such that controls should be dimming electric lighting.
 - 2) Verify that amperage changes in light fixtures are proportional to external light changes. Verify that dimmed light levels uniformity at the specified work plane remain within specified limits.
 - 3) Verify that delays and ramp times are set and functioning so that the speed of change of light fixture output is slow enough to not bother occupants, and in compliance with the specifications.
 - 4) Verify that dimming does not cause lower than specified light levels in adjacent “non-dimmed” spaces.
 - 5) Verify that the controls and sensors cannot be easily overridden or disabled by occupants.
 - c. Illumination Levels, Night Conditions:
 - 1) Verify that lighting throughout the building is operating automatically.
 - 2) Test with doors closed (to simulate actual occupancy) and after finishes are complete.
 - d. Illumination Levels, Day Conditions:
 - 1) Verify that lighting levels comply with average maintained foot-candle levels shown on plans.
 - e. Emergency Lighting System: Verify that the system operates automatically under any condition, without human intervention, and that it resets back to normal operations after the power failure or emergency condition is over or cleared.
5. Acceptance Criteria:
- a. Lighting Controls: For the conditions, sequences and modes tested; dimming, occupancy, photocell, and timing controls, integral components and related equipment shall respond to changing conditions and parameters defined in the Contract Documents.
 - b. Illumination Levels: Average light levels in the tested space at the work plane elevation shall be in the range of plus or minus 10% of the specified light level range for the space.
 - c. Power factors on lighting circuits shall be greater or equal to 0.95, or as required by lighting fixture specifications.

- d. Electrical equipment AIC ratings shall be as indicated in construction drawings.
 - e. Feeders % voltage drop. Flag feeders with voltage drop greater than 3%.
 - 6. Sampling Strategy for Identical Units:
 - a. Lighting Controls: Test all automatic interior lighting controls.
 - b. Illumination Levels: Test all spaces, zones and rooms to verify as proper light levels.
 - C. HVAC Electrical Component Testing
 - 1. Document HVAC Division 23 electrical components using the startup procedure submitted by CONTRACTOR and accepted by the CxSP.
 - 2. Complete and submit Start-up, Pre-functional, and Functional Checklists.
 - 3. Verify the following information prior to HVAC system equipment startup.
 - a. Voltage.
 - b. Phase.
 - c. Motor Size.
 - d. Lock Rotor Amperage.
 - e. Full Load Amperage.
 - f. Minimum and Maximum Circuit Ampacity.
 - g. Feeder protection or branch circuit protection, breaker or fuse size as applicable.
 - 4. Coordinate and check corresponding unit electrical protection.
- 3.04 ADJUSTING
- A. Incorrect installations, including improper adjustments may result in additional work being required for Cx acceptance.
 - 1. Perform work required to correct installations not meeting contract requirements at no additional cost to the OWNER.
 - B. Corrective work shall be completed in a timely manner to permit completion of the Cx process.
 - 1. Refer to the Cx Plan for retesting requirements necessary to achieve required system performance.
 - 2. If the systems' Cx deadline, as defined in the Cx Plan, goes beyond the scheduled completion of commissioning without resolution of the problem, the OWNER reserves the right to obtain supplementary services or equipment to resolve the problem.

- a. The cost of additional and/or supplementary services inquired by OWNER as a result of CONTRACTOR's lack of performance, or inability to resolve identified issues will be solely the responsibility of the CONTRACTOR.

3.05 TRAINING

- A. Provide training and documentation as required in construction documents.

END OF SECTION

SECTION 26 09 23 LIGHTING CONTROL SYSTEM

PART 1 – GENERAL

1.01 SECTION INCLUDES

- A. Lighting control system requirements.

1.02 RELATED SECTIONS

- A. Section 26 05 26, Common Work Results for Electrical
- B. Section 26 05 19, Low Voltage Wires and Cables
- C. Section 26 24 16, Panelboards
- D. Section 26 50 00, Lighting

1.03 MEASUREMENT AND PAYMENT

- A. General: Lighting control system, as specified herein, will not be measured separately for payment but will be paid for as part of the Contract lump-sum price for Electrical Work as indicated in the Bid Schedule of the Bid Form.

1.04 REFERENCES

1.05 SUBMITTALS

- A. Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.
- B. Submit product data including the following:
 - 1. Catalog sheets and specifications
 - 2. Ratings, configurations, wiring diagrams, dimensions, service conditions, options, and features
- C. Submit shop drawings including the following:
 - 1. Single line, schematic, block, and wiring diagrams
 - 2. Equipment layout of lighting control system components
 - 3. Plan view details and component topologies
 - 4. Photometric drawings and network riser diagrams
 - 5. Hard copy of lighting control programming, program flow chart, and time schedule matrix
- D. Installation procedures: Include tools and materials list, mounting templates, and dimensions.

- E. Submit test reports including the following:
 - 1. Certified test reports of factory and field tests performed
 - 2. Title 24 Acceptance Testing Documentation in accordance to Title 24, Part 6
 - 3. Seismic analysis report
- F. Software: Include copy of lighting control software on USB drive with user manual.
- G. Manufacturer's certificates: Include certificate ensuring products meet or exceed specified requirements.
- H. Submit the operation and maintenance manual, in accordance with Section 01 78 23, Operations and Maintenance Data, including the submittal items mentioned above and the following:
 - 1. Sequence of operation identifying control operation for each room or space
 - 2. Preventive maintenance procedure
 - 3. Spare parts list and ordering form
 - 4. Troubleshooting guide for common issues

1.06 QUALITY ASSURANCE

- A. Manufacturer requirements: The manufacturer of the equipment shall have a minimum of five years manufacturing experience and be the manufacturer of the major components within the assembly.
- B. Manufacturer's Certification: A qualified factory-trained manufacturer's representative shall certify in writing that the equipment has been installed, adjusted and tested in accordance with the manufacturer's recommendations. The Contractor shall provide three copies of the manufacturer's representative's certification.
- C. Installer requirements: The installer shall be a certified lighting control professional or technician with experience performing the Work of this section.
- D. Performance requirements: System components shall be manufactured, assembled, and installed to maintain performance criteria stated by the manufacturer that is free from defects, damage, or failure.
- E. Code and certification requirements:
 - 1. System components shall be UL listed and certified.
 - 2. Installed system components shall comply with the latest National Electrical Code (NEC).
 - 3. The manufacturer shall be ISO 9001 and Restriction of Hazardous Substances

Directive (RoHS) certified.

- F. Coordination requirements: The lighting control system shall be comprised of non-proprietary hardware and software and shall be capable of integrating with existing lighting control systems.
- G. Seismic requirements: Provide submittals in accordance with Section 20 30 14, Seismic Performance Requirements for Equipment.

1.07 DELIVERY, HANDLING, AND STORAGE

- A. Equipment shall be delivered, handled and stored in accordance with manufacturer's instructions until ready for installation.

1.08 PROJECT CONDITIONS

- A. Maintain environmental conditions for temperature, humidity, and ventilation within limits recommended by the manufacturer. Products shall not be installed under environmental conditions outside manufacturer's specifications.

1.09 WARRANTY

- A. The manufacturer shall provide a five year warranty beginning after the date of Acceptance, which include repair, parts, labor, travel, and living expenses for the manufacturer's certified technician.

PART 2 – PRODUCTS

2.01 MANUFACTURERS

- A. Manufacturers:
 - 1. Wattstopper
 - 2. Lutron
 - 3. Or equal

2.02 SYSTEM REQUIREMENTS

- A. The lighting control system (LCS) shall include hardware, software, control devices, networking devices, and associated items required for complete operation. The LCS shall be configured based on site-specific requirements for normal or emergency use as indicated. Refer to Standard Drawings ES87 and ES88 for typical network lighting control systems and sequence of operation.

B. General Requirements:

1. Input Voltage: 120/277 VAC plus or minus ten percent
2. Input frequency: 60 hertz
3. Enclosure: As indicated
4. LCS configuration: Normal Lighting: Network Based
Emergency lighting: Relay Bypass Module
5. The LCS shall comply with Title 24, Section 110.9, Mandatory Requirements for lighting control systems, devices and Luminaires.
6. The LCS shall be capable of monitoring and controlling lighting control zones based on time-of-day scheduling, astronomical time, daylight savings, holidays, and support control inputs for photocells, control switches, dimmers, and occupancy sensors.
7. The LCS shall facilitate remote and local configuration, monitoring, reporting for operation of groups, channels, zones, schedules, and general system information of luminaires and devices.
8. The LCS shall be capable of interfacing with existing LCS and equipment on the same network.
9. The emergency LCS shall be fail-safe. In conditions where failure is detected within the system, functional luminaires will bypass ON, regardless of pre-programmed operating conditions.
10. Scheduled events for time schedules, photocells, and other control devices shall run autonomously.
11. Self-contained emergency lighting control relays shall be UL-924 listed and provide control that is independent of the LCS. Self-contained units shall only be permitted for luminaires in difficult access areas or on switched circuits and shall be equipped with auxiliary contacts for remote testing with a push to test button on the unit for local testing.
12. The LCS shall be equipped with a maintenance test switch to bypass lighting under scheduled sequence of operation to full ON. Surface of enclosure shall be equipped with LED indicators for input power and system bypass indication.
13. The use of wireless based controls is not permitted in passenger stations or areas that may interfere with train control communications operations under 2.4GHz frequency.

C. Network Lighting Control System:

1. Network Manager: The network manager shall locally manage network communications of lighting and devices over RS-485 (MS/TP) via network bridge.

The network manager shall include an IP addressable port, Ethernet (TCP/IP), and be compatible with Modbus TCP/IP network protocols for remote management of the system. Access to lighting control settings shall be controlled through log in security with user-defined name and password.

2. Network Bridge: The network bridge shall connect devices under a local network to the network device manager via optically isolated RS-485 (MS/TP) transceiver. The network bridge shall include spare RJ45 ports for communication with daisy chained communication devices as indicated.
3. Area Controller: The area controlled shall be Class 2.0-10V dimming for lighting loads.
4. Control Device: Control devices for automatic or manual control of lighting shall be self-configuration, and digitally addressable.
5. Input Module: Provide input module for conversion of photocell signal or addition of externally mounted manual bypass switch.
6. Handheld Device: The handheld device shall be capable of two-way infrared communications between the LCS and operator with the ability to read and modify parameters for lighting control sequence of operation.
7. Daisy chain connections for network bridge, area controller, control device, and input module, shall utilize manufacturer pre-terminated communication cables that support both power and data. Cables not derived from the manufacturer shall be individually tested and observed by an authorized service representative prior to use.

D. Relay Bypass Module:

1. General Requirements:
 - a. Input Voltage: 120/277 Vac plus or minus ten percent
 - b. Testing: Push-to-test button
 - c. Inputs: Auxiliary contracts
2. The device shall be UL 924 listed, din-rail mounted, equipped with a button for testing emergency lighting circuits, and include auxiliary contacts for receiving remote commands or interfacing with external devices.
3. The relay bypass module shall bypass pre-programmed sequence of operation for designated emergency lighting to full ON upon loss of normal power or activation of the fire alarm system.
4. The relay bypass module shall work in tandem with normal lighting controls for sequence of operations of normal and emergency lighting.
5. The relay bypass module is permissible for use on switched circuits, difficult access areas, or lighting designed for 24-hour operation as indicated on the

lighting control sequence of operation.

E. Network:

1. Ethernet (TCP/IP) communication cable shall be CAT 6A type, RJ45 connector, shielded, with drain wire. Refer to Section 27 13 01, Communication Cables and Related Equipment, for details and grounding requirements.
2. The IP addressable, Ethernet (TCP/IP) control and parameters shall be made available locally and remotely with compatibility to Modbus (TCP/IP) protocol.

F. Control Devices:

1. Photocell

- a. Exterior photocells shall be mounted in an area free from obstruction, facing north, with no direct exposure to nighttime illumination.
- b. Interior photocells shall be mounted above existing luminaires and located central to the area requiring control.
- c. The photocell shall include an internal time delay and dead band to preclude cycling of luminaires.
- d. The photocell shall be capable of overriding time-of-day, astronomical time schedules due to unforeseen overcast conditions, and in response to parking structure daylighting requirements.

2. Area Control Switch

- a. The area control switch shall be single-pole, 20A, 120V, toggle type or user programmable, wall mounted, momentary push-button type, offered in 1 through 8 button configurations, and shall be mounted adjacent to the lighting control panelboard.
- b. Area control switches located in spaces accessible to patrons shall be equipped with a lockable, hinged cover plate, in brushed stainless steel finish.
- c. Bypass switch: The bypass switch shall allow manual control of overriding existing programmed lighting control functions. Luminaires shall be commanded ON or OFF contingent upon emergency, maintenance, or demand response requirements as indicated.
 - 1) Install bypass switches adjacent to lighting control equipment or enclosure surface, station agent booths, and additional areas as indicated.
 - 2) Bypass switch installed on enclosure surface shall be rotary type, two-position, maintained, 20A. Include adhesive labeling indicating rotary position for auto and bypass modes.

d. Dimmer switch: The dimmer switch shall be compatible with 0-10V dimmable drivers with lighting loads in single or multi-way applications.

3. Occupancy Sensor

- a. Occupancy sensors shall be passive infrared (PIR) or dual-technology PIR/Ultrasonic with 360-degree coverage. Utilize multiple segmented lens with internal grooves to eliminate dust and residue build-up.
- b. The occupancy sensor shall turn luminaires off or reduce light levels automatically through a time delay when a room or area is vacated.

G. Software:

1. LCS software shall include:

- a. Time-of-day, astronomical time, daylight savings, and holiday scheduling
- b. Monitoring and control of luminaries and control devices
- c. Status indications for alarm conditions
- d. Modification of control logic for sequence of operation
- e. User interface for local and remote connections.
- f. Data logging

2. The software shall be compatible with the latest Windows operation system.

3. Software license encryption through an external device is not permitted.

2.03 FACTORY TESTING

- A. The factory service shall provide adequate testing of the supplied equipment and software to ensure that the system performs as intended by the specification.

PART 3 – EXECUTION

3.01 INSTALLATION

- A. The Contractor shall furnish, install and terminate conductors and associated conduits external to any factory supplied equipment.
- B. Conductors wiring and routing shall be per the manufacturer's recommendations and as shown on the Contract Drawings.

3.02 FIELD QUALITY CONTROL

- A. Provide the services of a qualified factory-trained manufacturer's representative to assist the Contractor in starting-up and programming the system for a period of two working days. The manufacturer's representative shall be factory-trained and shall have a thorough knowledge of the software, hardware and system programming.
- B. The Contractor shall provide three copies of the manufacturer's field startup.
- C. The following system programming shall be provided by the factory trained manufacturer's representative:
 - 1. Assist the owner in developing a practical control scenario for each application
 - 2. Program the owner supplied control scenario
 - 3. Explain the operation of the control program to the owner
- D. Verify complete system operation including hardware, software and communication devices.
- E. Verify networking performance with interfacing systems by other manufacturers.

3.03 TRAINING

- A. Training shall consist of in classroom and on-site training.
- B. The training session shall be conducted by a manufacturer's qualified representative. Training program shall include instructions on the control system, programming, and other major components.
- C. The training program shall include:
 - 1. System review of system components and their function
 - 2. System review of management software and its function
 - 3. Hands-on training with the lighting controller and related programming devices to develop experience with software and control applications.

END OF SECTION

SECTION 26 24 16 PANELBOARDS

PART 1 - GENERAL

1.01 SUMMARY

- A. Section Includes: Lighting and power distribution facilities, including panelboards.
- B. Related Requirements:
 - 1. Division 01 - General Requirements.
 - 2. Section 26 05 00: Common Work Results for Electrical.
 - 3. Section 26 05 13: Basic Electrical Materials and Methods.
 - 4. Section 26 26 00: Power Distribution Units.
 - 5. Section 26 50 00: Lighting.
 - 7. Division 28: Electronic Safety and Security.

1.02 SUBMITTALS

- A. Provide in accordance with Division 01.
- B. Shop Drawings: Include a front elevation indicating cabinet dimensions, make, location and capacity of equipment, size of gutters, type of mounting, finish, and catalog number of locks. General layout of internal devices, wiring drawings with wire numbers and device connections, vendor cut sheets of devices in enclosure and bill of materials listing description, manufacturer, part number, and quantity of items shall be included.
- C. Installation Instructions: Submit manufacturer's written installation instructions.

1.03 DESIGN REQUIREMENTS

- A. Panelboards:
 - 1. Panelboards shall be wall-mounted, enclosed safety type with 120/240 volt, three-wire solid neutral 277/480 volt, four-wire or 120/208 volt, four-wire solid neutral mains as indicated on Drawings or specified. First panelboard of each building shall be provided with main or sub-feeder circuit breakers where so indicated.

2. Single pole branches shall be molded case, thermal magnetic circuit breakers with inverse time delay, trip free, quick-make, quick-break mechanism and silver alloy contacts. Circuit breakers shall be fully rated, with ampere rating marked on handle and shall indicate on/off and tripped positions. Ground fault interrupters shall be incorporated into circuit breakers where indicated. They shall be listed by UL, or other NRTL as ground fault devices. Provide appropriate lug kit of sufficient size to accommodate the feeders.
3. Two- and three-pole branches shall be enclosed, and shall be thermal magnetic circuit breakers with inverse time delay, tamper-proof, ambient compensated, single handle, internal common trip, and quick-make, quick-break mechanism with silver alloy contacts. Circuit breakers shall be fully rated or as otherwise indicated on the Drawings.
4. Main and subfeeder circuit breakers shall be enclosed, thermal magnetic type with inverse time delay, single handle common trip, quick-make, quick-break mechanism, corrosion-resistant bearings and silver alloy contacts. Ampere frame size and trip rating shall be as indicated on Drawings. Breakers over 225 amperes shall be furnished with interchangeable trip units. Handles of main and subfeeder circuit breakers shall be provided cabinet door. Voltage rating shall be as indicated on Drawings.
5. Circuit breakers shall be fully rated and of one-piece, bolt-on type and shall meet short-circuit interrupting capacity requirements indicated on Drawings. Series rated circuit breaker combinations are not acceptable.
6. Internal connections shall be fabricated with plated copper bus bars and the busses shall extend for full length of space available for branch circuit breakers. Feeder cable connectors shall be installed at point of feeder entrance. Terminals shall be furnished with copper conductors. Panelboards fed by conductors having over-current protection greater than 200 amperes shall be protected on supply side by over-current devices having a rating not greater than that of panelboards. Copper bussing shall be fully rated. Heat rated bussing is not acceptable.
7. Except where otherwise indicated, circuit breakers shall be in two vertical rows connected to bus bars in a distributed phase arrangement. Two-pole branches shall be balanced on busses. Single pole branches shall be numbered adjacent to its circuit breaker, with odd numbers on left and even numbers on right.
8. Specified circuit breaker spaces shall be furnished with hardware required for future installation of circuit breakers.
9. Provide locking devices for individual circuit breakers. Padlocking devices shall be secured to circuit breakers and by panel dead front plates.

B. Panelboard Cabinets:

1. Panelboard cabinets shall be code gage galvanized steel or blue steel; fronts, doors, and trims shall be code gage furniture steel. Cabinets shall be furnished with at least six-inch high gutters at top and bottom where feeder cable size exceeds four gage or where feeder cable passes through cabinet vertically. Cabinets shall be furnished with top and bottom gutters sized as required by inspection department having jurisdiction, but never less than six inches where more than one feeder enters top or bottom of cabinets. Side gutters shall not be less than four inches wide. Width of cabinets shall be 20 inches, unless otherwise indicated on Drawings.
2. Doors shall be cut true, shall accurately fit opening and finish smooth across joints. Rabbets shall be inside. Hinges shall be entirely concealed except for barrels and pins. Hinge flanges shall be welded to door and trim. Doors shall be equipped with flush type, spring-latching, Corbin locks for metal doors, keyed to Corbin No. 60 keys.
3. Where contactors, time switches, and control devices are specified or indicated to be installed within panelboard cabinets, a separate compartment and door shall be provided at top of cabinet for such devices. Door shall be sized as required to permit removal of contactor and other devices intact. Gutters shall be provided at sides and top of compartment. Doors shall be equipped with flush type, spring-latching, Corbin locks for metal doors keyed to Corbin No. 60 keys.
4. Provide and install panelboard manufacturer's permanent circuit number kit option.
5. Panelboards with control devices in compartment shall arrive at the Project site completely assembled with control devices installed and wired.

C. Panelboard Schedule: Provide a neatly typewritten schedule with number or name of room or area, or load served by each panelboard circuit. Room numbers or names shall be determined at the Project site and shall not necessarily be those indicated on the Drawings. Schedule shall also indicate panel designation, voltage and phase, building and distribution panel or switchboard from which it is fed. Schedule shall be installed in a frame under transparent plastic 1/32 inch thick on inside of each panelboard cabinet door.

D. Panelboard nameplate: Provide a nameplate identifying panelboard. Plates shall be black and white plastic nameplate stock, with character cut through black exposing white and shall bare designation of service. Name plate shall be mechanically fastened to switchboard.

- E. Provide additional labeling on dead-front of panelboard. Label shall be a P-Touch or equal with a minimum width of 3/8 inch with black letters on white background. Label shall re-identify panelboard and also identify name and location of power source feeding this panel. Location information shall include building name if located in different building and name or room location. If power source is installed in same room, label should indicate source name and “In this Room”
- F. Panelboard Standards: Panelboards shall be UL, or other NRTL listed and labeled. Panelboards shall meet latest revisions of following standards:
 - 1. California Electric Code, Article 384.
 - 2. UL 67, Panelboards.
 - 3. UL 50, Cabinets and Boxes.
 - 4. UL 943, GFCI.
 - 5. UL 489, Molded Case Circuit Breakers.
 - 6. NEMA PB1.
 - 7. Federal Specifications W-P- 115C and WC-375B.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

- A. Panelboards shall be manufactured by Siemens, W.A. Benjamin, General Electric, Cutler Hammer, Square D or equal.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Panelboards shall be located so they are readily accessible and not exposed to physical damage.
- B. Panelboard locations shall provide sufficient working space around panels to comply with the California Electrical Code.
- C. Panelboards shall be securely fastened to structure and mounted on surface by at least four points.

- D. Unused openings in cabinets shall be effectively closed as required by the manufacturer.
- E. Cabinets shall be grounded as specified in Article 250 of the California Electrical Code.
- F. Conduits shall be installed so as to prevent moisture or water from entering and accumulating within the enclosure.
- G. Lugs shall be suitable and listed for installation with the conductor being connected.
- H. Conductor lengths shall be maintained to a minimum within the wiring gutter space. Conductors shall be long enough to reach the terminal location in a manner that avoids strain on the connecting lugs.
- I. Maintain the required bending radius of conductors inside the cabinet.
- J. Clean the cabinet of foreign material such as cement, plaster, and paint.
- K. Distribute and arrange conductors neatly in the wiring gutters.
- L. Use the manufacturer's torque values to tighten lugs.
- M. Before energizing panelboards, the following steps shall be taken:
 - 1. Retighten connections to the manufacturer's torque specifications. Verify that required connections have been provided.
 - 2. Remove shipping blocks from component devices and panelboard interiors.
 - 3. Manually exercise circuit breakers to verify they operate freely.
 - 4. Remove debris from panelboard interior.
- O. Follow manufacturer's instructions for installation.
- P. Do not install in highly corrosive environments, unless rated for the application.

3.02 PROTECTION

- A. Protect the Work of this section until Substantial Completion.

3.03 CLEANUP

- A. Remove rubbish, debris, and waste materials and legally dispose of off the Project site.

END OF SECTION

SECTION 26 26 00

SWITCHBOARDS

PART 1 - GENERAL

1.01 SUMMARY

- A. Section Includes: Power distribution units, main circuit breaker and all associated work.
- B. Related Requirements: Drawings and general provisions of the Contract, including General and Supplementary Conditions, Division 01 and other applicable specification sections, including:
 - 1. Division 01 - General Requirements.
 - 2. Section 03 30 00: Cast-In-Place Concrete.
 - 3. Section 05 50 00: Metal Fabrications.
 - 4. Section 26 05 13: Basic Electrical Materials and Methods.
 - 5. Section 26 05 26: Grounding and Bonding.
 - 6. Section 26 24 16: Panelboards and Signal Terminal Cabinets.
 - 7. Section 26 08 00: Electrical Systems Commissioning.
- C. RELATED STANDARDS
 - 1. ANSI/NEMA 250 – Enclosures for Electrical Equipment (1000 Volts Maximum).
 - 2. California Electrical Code (CEC).
 - 3. IEEE C57.12.28 – Standard for Pad-Mounted equipment Enclosure Integrity.
 - 4. IEEE 551 - Recommended Practice for Calculating AC Short-Circuit Currents in Industrial and Commercial Power Systems.
 - 5. IEEE 1584 – Performing Arc-Flash Hazard Calculations.
 - 6. NETA-ATS – Standard for Acceptance Testing for Electrical Power Equipment and Systems.
 - 7. UL/ANSI 891 – Standard for Safety Switchboards.

1.02 SUBMITTALS

- A. Provide in accordance with Division 01.
- B. Shop Drawings:
 - 1. Indicate dimensions, finish, elevations, and locking devices.
 - 2. Indicate equipment make, catalog number, size and/or capacity, line and load conduit entrance location. Layout shall indicate locations of equipment.
 - 3. Indicate size and/or capacity of bussing, barriers, catalog numbers of locks, nameplate inscriptions, and interlocking facilities.
- C. Fault Current, Coordination and Arc-Flash Reports: the following reports shall be prepared using SKM Systems Analysis, ETAP Powering Success, EasyPower, or equal.
 - 1. Provide a short-circuit and coordination report signed and stamp by a registered electrical engineer. Studies shall be in accordance with applicable IEEE guidelines. Submit two copies of each study for review prior to ordering and installing equipment.
 - 2. Provide a system coordination report for main and branch circuit protective devices including transformers secondary protective devices. Study shall be recorded on log paper. The circuit protective devices shall be set based on the coordination study. A final written record of protective device settings shall be submitted.
 - 3. Provide a complete arch-flash report based on installed equipment, and feeders' sizes and lengths. Prepare the report in accordance with code requirements and IEEE 1584 standard. The report shall indicate trip times for protective device(s) settings, arcing fault current values, and incident energy and flash boundaries. The arc-flash report shall indicate clothing requirements for each piece of equipment.
 - 4. Provide installation detail and seismic anchorage notes for switchboards.

PART 2 - PRODUCTS

2.01 EQUIPMENT

- A. Power center shall consist of a transformer, a primary main circuit breaker and/or a panel and a secondary distribution panel with a main circuit breaker.

- B. As indicated on construction drawings distribution units shall be provided with multifunctional digital meter(s) with true RMS measured Amperes (each phase and neutral) Volts (line-to-line and line-to-neutral), Power Factor, VA, VAR, Watts, and KWH. Meter(s) shall be Veris Industries 8163 Energy series or equal.
 - 1. Meter communication protocol shall match those of the site's energy management system.
 - 2. Meter with peripheral devices and equipment shall be integral to the power center enclosure and be installed by the manufacturer of the power distribution equipment.
- C. Power Center Enclosures:
 - 1. Weatherproof formed sheet steel. Provide with catch and lock on doors of breakers and panels; furnish with padlocks.
 - 2. Manufactured by Siemens, Benjamin Electric Company, Square D Company, General Electric, Cutler-Hammer, or equal.
- D. Panelboards: Panelboards shall comply with Section 26 2416-Panelboards and Signal Terminal Cabinets.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Isolate and separate primary main circuit breaker and distribution panel from transformer by means of steel barrier. Bolt circuit breakers to panel with panel manufacture's machine bolts, or equal. Self-tapping screws are not allowed.
- B. Install two, 2-inch underground conduit stub-outs, from each panel to outside edge of concrete pad. Refer to Section 26 0533: Raceways and Boxes Fitting and Supports.
- C. Functional operation of the power center shall be demonstrated to Project Inspector.
- D. Do not install in highly corrosive environments, unless rated for the application and approved by Project Inspector.
- E. Distribution equipment and system components shall be free from short circuits and grounds, other than required grounds. The contractor shall be responsible for the testing of bolted electrical connections, perform insulation resistance tests on each bus section, phase-to-phase and phase-to-ground for one minute in accordance with requirements stated in NETA-ATS 2021 table 100.

1. Utilize the services of an approved independent testing laboratory to perform megger time-resistance insulation testing of bussing, circuit breakers and/or fused switches. The fused switches shall be equipped with fuses or temporary jumpers in place of fuses. Breaker and fused switches shall be tested in the closed position. No wiring shall be connected to the line or load side of the power distribution unit during testing.
 - a. Provide calibration program records to assure the testing instruments to be within rated accuracy. The test equipment accuracy shall be in accord with the requirements stated by the National Institute of Standards and Technology (NIST).
 - b. Test equipment shall be provided with a label stating the date of last calibration. As a minimum the equipment shall have been calibrated within the past 12 months.
 - c. Test reports shall include the following:
 - 1) Identification of the testing organization.
 - 2) Equipment identification.
 - 3) Ambient conditions.
 - 4) Identification of the testing technician.
 - 5) Summary of project.
 - 6) Description of equipment being tested.
 - 7) Description of tests.
 - 8) Test results.
 - 9) Analysis, interpretation and recommendations.
2. Tests shall be performed in the presence of the Project Inspector.
3. During testing, provisions shall be made to prevent damage to any solid-state components, or electronic equipment such as TVSS equipment that may be tied onto power distribution unit bussing.
4. Test results shall meet manufacturer's recommendations or NETA ATS-2017 recommendations, whichever is more stringent.

3.02 PROTECTION

Department of Neighborhood Services and Public Safety
GOLETA TRAIN DEPOT PROJECT

- A. Protect the Work of this section until Substantial Completion.

3.03 CLEANUP

- A. Remove rubbish, debris, and waste materials and legally dispose of off the Project site.

END OF SECTION

SECTION 26 31 00

PHOTOVOLTAIC (SOLAR) ROOF SYSTEMS

PART 1 - GENERAL

1.01 SUMMARY

- A. These specifications cover Photovoltaic (PV) Systems requirements including, but not limited to PV roof tiles (modules), non-PV roof tiles, equipment, hardware, software, all accessories required for complete (PV) systems installation and operation of the system. Using manufacturer's installation methods, the work includes moisture protection, flashings, roof penetration sealing documentation, including labor, materials, and supervision required for the installation of grid-connected PV systems.
- B. Section Includes, but is not limited to the following:
 - 1. Infrastructure, wiring, connections, and testing.
 - 2. Solar tiles and panel arrays.
 - 3. Non-solar tile roofing.
 - 4. Disconnects.
 - 5. DC combiners.
 - 6. Inverters.
 - 7. Monitoring equipment and Control software.
 - 8. Metering equipment and interfacing with utility company meter.
 - 9. Identifications and signs.
 - 10. Training.

1.02 RELATED REQUIREMENTS

- A. Division 01 - General Requirements
- B. Division 05: Metals.
- C. Division 06: Woods, Plastics, and Composites.
- D. Division 07: Thermal and Moisture Protection.
- E. Section 26 05 00: Common Work Results for Electrical.

- F. Section 26 08 00: Electrical Systems Commissioning.
- G. Section 26 05 13: Basic Electrical Materials and Methods.
- H. Section 26 05 19: Low Voltage Wires (600 Volt AC).
- I. Section 26 05 26: Grounding and Bonding.
- J. Section 26 05 33: Raceways, Boxes, Fittings, and Supports.
- K. Section 26 26 00: Power Distribution Units.
- L. Division 32: Exterior Improvements.

1.03 REFERENCES

- A. Installation, inspections and tests shall be in accordance with the most current applicable codes and standards.
 - 1. ANSI Z21.83 – Solar Photovoltaic Performance and Safety.
 - 2. ANSI C2-1999 – National Safety Code.
 - 3. AMSE PTC 50 – Solar Photovoltaic Performance.
 - 4. ASCE 7-05 – Standard for Minimum Design Loads for Buildings and Other Structures, Chapter 13.
 - 5. ASTM D3161 – Wind Resistance of Shingles
 - 6. CBC – California Building Code.
 - 7. CEC – California Electrical Code.
 - 8. IEEE 929-2000 – Recommended Practice for Utility Interface of Photovoltaic Systems.
 - 9. IEEE 1262-195 – Recommended Practice for Qualification of Photovoltaic (PV) Modules and Panels.
 - 10. IEEE 1537 – Standards for Interconnecting Distributed Resources with Electric Power Systems.
 - 11. NFPA72 – National Fire Code.
 - 12. NFPA 853 – Solar Photovoltaic near Buildings.
 - 13. NRTL – Nationally Recognized Testing Laboratory.

14. TAS 100 – Standard Test Method for Wind and Wind Driven Rain
15. UL 790 Class A – Fire Test of Roof Covering
16. UL 1703 – Flat-Plate Photovoltaic Modules and Panels.
17. UL 1741 – Standard for Static Inverters and Charge Controllers for Use in Photovoltaic Systems.
18. UL 2900 – Standard for Software Cybersecurity for Network-Connectable Products, Part 1: General Requirements.
19. UL 9703 – UL LLC Outline of Investigation for Distributed Generation Wiring Harnesses.
20. UL 61730 – PV Module Safety Standards
21. SCE Solar Program Guidelines.

1.04 SUBMITTALS

- A. Shop Drawings on standard 24 inches by 36 inches size shall include but not be limited to:
 1. Cover page with legend, common notes, symbol schedule, vicinity and key map, code compliance, contractor and engineer's names and contact information and drawing index.
 2. Plan showing infrastructure layouts, PV arrays locations, and identifiable features.
 3. Riser diagram and General Notes:
 - a. Connection to utility AC disconnects and main electrical switchboard.
 - b. Indicate conduits, power and communication wires, and combiners, disconnects, inverters, meters, etc.
 - c. Provide PV system(s) power production calculations and total system(s) rating.
 4. Complete point to point PV System interconnection diagram(s):
 - a. Identify DC and AC components.
 - b. Indicate conduit and wire characteristics, sizes and quantities.
 - c. Indicate conduit fills and voltage drops.

Department of Neighborhood Services and Public Safety
GOLETA TRAIN DEPOT PROJECT

- d. Provide combiner box schedule.
- e. Provide bill of materials.
5. Floor plans and roof plan, PV arrays, inverters, combiner boxes, disconnects, edge zones, electrical equipment room, roof access hatches, skylights, etcetera.
 - a. Plan showing tile layout including PV modules, full roofing tiles and partial roofing tiles. Manufacturer shall calculate and determine the required area for PV modules for the project.
 - b. Indicate system(s) interface connections.
 - c. Provide AC and DC wiring plans.
 - d. Provide electrical equipment room layouts and equipment elevation details.
6. Assembly Details. Provide as minimum the following details:
 - a. Array attachment details.
 - b. Structural support details and spacing dimensions.
 - c. Deflector attachment details.
 - d. Module to module wiring diagrams.
 - e. DC wire tray attachment and DC combiner mounting details.
 - f. Data acquisition System (DAS) wiring details.
 - g. Roof mounted conduit supports, stub ups, and roof penetrations.
 - h. Grounding connection details.
 - i. Warning typical signs details.
 - 1) Utility lockable AC disconnects sign.
 - 2) Interactive system point of interception sign.
 - 3) DC switches warning sign.
 - 4) Solar array warning sign.
7. Roofing Details. Provide as minimum the following:

- a. Moisture protection underlayment.
 - b. Flashing and trim details – rake, eave, rake, cap, valley, ridge, etc..
 - c. Roof penetrations.
8. Operations and Maintenance Manuals.
 9. Installation Instructions of each control device.
 10. PC monitoring Workstation.
 11. Software licenses and electronic keys.
 12. Supplemental local or factory training schedule for post warranty support.
 13. A complete list of recommended spare parts with pricing for the OWNER’s use in keeping the PV system downtime to a minimum.

1.05 QUALITY CONTROL

- A. The contractor shall have a California Solar or Electrical contractor’s license.
 1. Components and interconnection wiring shall be installed by PV systems certified electricians. Contractor or Installer’s electricians shall be certified in accordance with Labor Code sections 3099, and 3099.2 and section 209.0 of the California Code of Regulations.
- B. Contractor shall have adequate experience installing systems of similar size and complexity.
 1. Qualifications of Installer: Minimum five years experience installing products and systems of similar scope and complexity.
 2. Installer shall have completed at least five projects of equivalent scope and complexity.
 3. Installer shall submit PV systems installation certification from the product/s manufacturer, indicating that installer meets the minimum qualification requirements for the installation of PV equipment.
 4. Installer shall maintain a fully equipped service organization capable of furnishing repair services for the equipment installed.
 5. Installer shall furnish a letter from manufacturer of equipment certifying equipment has been installed according to factory standards and that system is operating properly.

6. Contractor shall have completed and commissioned a minimum of five service agreements that provide similar support services to those required for this project.
 7. System startup and testing shall be performed under the direct observation of the Project Inspector, OAR, and Commissioning Services Provider.
- C. Materials and equipment installed shall be new and listed as an approved technology by the California Energy Commission (CEC) Emerging Technology Buydown Program.
- D. The installer shall provide the system components required by code for safety of the OWNER's service personnel.
- E. System components shall operate per industry standards.
- F. Comply with requirements for system commissioning.

1.06 WARRANTY

- A. Solar Roof System shall be warranted as follows:
1. Product/s warranty: Protection against manufacturer defects in design and/or material for 25 years.
 2. Weatherization warranty: Protection against damage from wind and rain for 25 years.
 3. Performance warranty: PV (Solar) Roof's performance won't fall to less than 95% in five years and won't decrease more than 0.5% per year for the following 20 years.
- B. System components (other than PV modules) shall be guaranteed against defects in materials, fabrication and execution for a minimum of 10 years from date of system acceptance. Provide labor and materials to repair, reprogram, or replace components at no charge to the OWNER during the warranty period. Corrective work or system modifications shall be updated on user documentation and archived software disks.
1. Warranty shall include annual on-site inspection, including system testing (operating current of each electrical system), system adjustments and routine maintenance.
 2. Repair or replacement of defective parts.
 3. System performance monitoring and historical data access for customer via secure website. Data is required to include system energy and power production, ambient temperature, wind speed, and insolation.

- a. At Owner's direction, the system shall be connected ahead of the facilities computer network firewall. Provide necessary work, materials and installation to connect the system to the MPOE.
4. Daily system monitoring by vendor, including reporting of problems to customer and dispatch of resources for expeditious resolution of problems.
5. The maintenance agreement shall include a response time of four hours for major system failures (emergency service), and 48 hours for minor repairs (routine service). Proposed agreement shall include biannual site visits for preventative maintenance inspection so that systems are validated prior to the warranty expiration date.
- C. Provide a list of applicable warranties for equipment and components, this list shall include warranty information, names, addresses, telephone numbers, and procedures for filing a claim and obtaining warranty services.
- D. Respond to the OWNER's request for warranty service within four hours during normal business hours. For calls, submit records of the nature of the call, the work performed, and the parts replaced, or service rendered.

1.07 TRAINING

- A. Provide a factory employed instructor to provide full instructions to designated OWNER personnel in the system's operation, maintenance, and programming. Training shall be specifically oriented to installed equipment and systems.
 1. The instruction period shall be scheduled and coordinated by the OAR.
 2. Provide four hours of onsite OWNER familiarization and training for the installed system. Training shall include system overview, override commands, normal and emergency operation and response, programming features and report generation. OWNER employees attending this training session shall be provided with the following documentation:
 - a. System layout point to point connection diagram.
 - b. System components cut sheets.
 - c. Operations and maintenance data.
 - d. Safety rules for the operations and maintenance of PV systems.
 3. Programmer and maintenance training shall include database entry; trend logs application programs, diagnostic routines, reporting, failure recovery and calibration.

- a. Provide a 40 hours training session as follows:
 - 1) Training session shall accommodate a minimum of 20 OWNER's personnel and be facilitated at a location no more than 50 miles from the OWNER's Headquarters. Contractor shall obtain OWNER's approval for training locations exceeding 50 miles from OWNER's headquarters; in such cases, the contractor shall be responsible for OWNER's personnel transportation expenses.
 - 2) Training shall cover instruction, theory, and expose the trainees to system's features, components, architecture, operations, programming, report generation, communications, and any other pertinent information required for the operations and maintenance of the system.
 - 3) Instructor(s) shall give the trainees the opportunity to practice on a simulated or actual (installed) system.
 - 4) The training session shall cover, but not be limited to the following instruction modules or sessions:
 - a) System Architecture:
 - (1) System layout and components interrelations and hierarchical structure.
 - (2) Controllers interfacing and functions.
 - (3) Server functionality and data management, error messages, and alarm conditions.
 - (4) Connectivity and communication losses.
 - b) User Operations:
 - (1) Familiarization and system operability.
 - (2) Windowpanes, menus, navigation buttons, alarm response windows, system passwords and accessibility features and options, monitoring and managing data points (inputs, outputs, numeric values, time and date, strings).
 - (3) Views: Provide sufficient information as to train OWNER staff on how and where to access

programs, functions, adjust or alter diagnostic points and related data, override messages, reports creation.

- c) Trending: Setting trend(s) intervals, accessing data trends and history logs for diagnosis of system performance and reporting. Working with trended data graphical displays, including but not limited to hiding points, setting display types and colors, viewing and setting scales.
- d) Graphics: Standard symbols and color codes, graphics customization, how and where to access and manage the system with the graphic displays, including changing points and values, viewing results, mapping to or with other graphic sources and functions, including groups, navigation, sequence of operations, and displays and reports.
- e) Alarms: Reading and interpreting alarms, acknowledging and silencing alarms, routing and setting priorities, viewing and responding e-mailed and paged alarms.

PART 2 – PRODUCTS

2.01 MANUFACTURER

- A. Basis of Design: Model #SR60T1 14-Cell Module as manufactured by Tesla Inc., 3500 Deer Creek Road Palo Alto, CA 94304, website: www.tesla.com/teslaaccount, telephone: (877)373-7652. Substitution is not allowed.
- B. Solar Roof System tiles shall be made of Glass, Polymers, Fiberglass and Silicon materials.
 - 1. Types of Tiles:
 - a. PV Modules
 - b. Full Roofing Tiles
 - c. Partial Roofing Tiles
 - 2. The array shall achieve the required kWp DC STC output for the entire system under peak sun conditions.

3. PV modules shall be California Energy Commission standards compliant.
4. DC Photovoltaic Panel Output:
 - a. PV Module Open-Circuit Voltage per manufacturer.
 - b. PV String Open-Circuit Voltage shall be 600V or less.
- C. Integrated Solar and Battery System:
 1. Model: Powerwall 3.
 - a. Number of units as required to power up the facility demand.
- D. Inverters:
 1. Inverters shall be California Energy Commission standards compliant.
 2. The PV system shall have at least one inverter. Inverter units shall be solid state device capable of accepting the output of the photovoltaic panels and providing rated output as indicated in construction documents.
 - a. The inverter shall be equipped with the following items:
 - 1) DC input disconnect.
 - 2) Surge protection.
 - 3) Ground fault interrupter.
 - 4) Isolation transformer.
 - 5) AC output circuit breaker.
 - 6) Data Monitoring System.
 3. The inverter shall be able to sustain an overload across its output terminals up to 150 percent load, while supplying any load within its rating and without reducing its output voltage.
 4. The inverter shall be capable of at least 300 percent current for short circuit conditions. If the short circuit is sustained, the inverter shall shutdown and disconnect automatically from the load bus.
 5. Each inverter unit shall be equipped with fault sensing and static isolation, and with an output circuit breaker for removal of faulted module(s) from the system.

6. Power semiconductors in the inverter shall be fused with fast acting fuses to prevent cascading failures. Each fuse shall be provided with a blown fuse and alarm indicating diodes on the control panel.
 7. AC Inverter System Output:
 - a. Voltage regulation plus or minus 0.5 percent balance load. Plus, or minus two percent for 50 percent unbalanced load.
 - b. Voltage adjustment range plus or minus five percent manually.
 - c. Frequency regulation 0.1 percent.
 - d. Phase Displacement:
 - 1) Balanced load, 120 percent plus or minus one percent.
 - 2) Fifty percent unbalanced, 120 percent plus or minus three percent.
 8. Approved products: As manufactured by Delta Electronics LTD. or approved product recommended by manufacturer.
 9. Equal or better Energy Commission approved inverters may be submitted for review by the OWNER. Installations shall not be allowed without written consent from the OWNER. Proposed inverters shall have equal or smaller footprint.
- C. Combiner Box: As recommended by the PV modules manufacturer.
1. The system shall have at least a terminal box or boxes, providing the electrical the electrical string(s) a waterproof entry to the conduit leading to the combiner box(es).
 2. The terminal box and combiner box can be one physical unit.
 3. The PV system shall have a combiner box(es), containing fuses and a bus to combine the outputs of the strings. A set of wires shall run from the combiner box to the inverter(s).
 4. Combiner output shall be compatible with inverter input.
- D. Edge Connector: As indicated by the PV module manufacturer.
1. Method of electrical interconnection for PV laminates shall be by means of a factory supplied plug connecting cable.

2. Cables measuring 12 to 18 inches shall be supplied with a male-type connector on each end, or with newer technology as recommended by the solar manufacturer.
 3. Each laminated light for PV modules shall be provided with a factory supplied female-type connector.
- E. Accessories: Junction boxes, anchors, wiring lugs and other accessories shall be provided in accordance with Division 26 requirements, and in compliance with California Electrical Code requirements and the PV modules manufacturing recommendations.
- F. Data Acquisition System: System approved by the California Energy Commission that meets applicable state regulations.
- G. System Performance Meters: Provide revenue grade Interval Data Recording (IDR) meters complete with industry standard telemetry for communication with Ethernet, cellular or other common output capabilities. Refer to contract drawings for meter(s) location(s).
1. Provide connection to a password protected website accessible by OWNER's personnel for the purposes of metering, monitoring and data collection of solar production.
 2. Meters shall be connected to a monitoring or data collection recording solar production through Time of Use (TOU) increments applicable to the local utility standards, with a minimum 15-minute intervals.
 3. Equal or better meters listed by the California Energy Commission could be submitted for review. No installations shall be allowed without written consent from the OWNER.

2.02 SYSTEM RATING

- A. System shall be sized to provide the KW system output required, unless indicated on drawings otherwise at full load rated power.
- B. The systems shall be rated for outdoor installation. The system equipment shall be capable of operating under the locations maximum and minimum documented temperatures during summer and winter times. The entire system must be rated and warranted to withstand and operate under these conditions.
- C. Rated PV system capacity shall be specified in direct current (DC) kilowatts peak under both STC and PTC conditions.

1. The STC or Standard Test Conditions rating assumes direct current referred as “kWdc-stc”. It is also referred as kilowatts peak, or “kWp”. Specific PV module manufacturer maximum and minimum power data must be specified for this rating.
2. The PTC rating or PV USA Test Conditions rating is based on 1,000 Watts per square meter solar irradiance, 20-degree Celsius ambient temperature and one meter per second wind speed.

2.03 STRUCTURAL IMPACT AND WIND LOADING

- A. The PV array weight shall add no more than eight pounds per square foot to the facility roof structure in the array area.
- B. The system shall be installed as part of a structural support system designed for the application.
- C. Deviations from approved construction drawings shall be documented with structural calculations and construction details; these engineering data shall be submitted for Architect's approval prior to commencing any work.
- D. PV arrays shall be seismically restrained from falling off the roof or excessive movement on the roof. Panels shall be installed to resist sliding and pop-up resulting from lateral and vertical seismic forces and displacements per CBC.

2.04 MOISTURE PROTECTION

- A. Underlayment to prevent moisture and water infiltration shall be provided over the roof substrate as part of the Solar Roof system installation.

PART 3 – EXECUTION

3.01 GENERAL

- A. PV system shall not be used for any purpose other than its intended functions.
- B. Where occurs, equipment mounted in exterior locations shall be rated NEMA 3R.
- C. Semiconductor devices shall be hermetically sealed. Vacuum tubes shall not be used.
- D. Relays shall be dust tight.
- E. Wiring methods for power distribution and controls shall be as defined in the Division 26 specifications. Wire types shall conform to manufacturers' recommendations.

- F. Bolted connections of bus bars, lugs, and cables shall be in accordance with applicable codes and industry standards.
- G. Power connection shall be marked and torque to the required value.
- H. Commissioning requirements of Divisions 01 and 26 apply to this section.
- I. Contractor shall coordinate the Work with other aspects of roofing, mechanical, structural, and electrical systems to obtain a complete and operating system.

3.02 SYSTEM INSTALLATION

- A. Contractor shall provide all equipment and required wiring with required conductor terminations to devices for the PV system to function as specified and indicated on Drawings. Refer to Section 26 05 19: Low-Voltage Wires (600 Volt AC), for installation and color-coding requirements.
- B. Terminations shall be in terminal cabinets or on equipment terminals.
- C. Conductors shall be installed within conduits, boxes, and terminal cabinets in a totally enclosed installation. Provide conductors required to connect incoming and outgoing circuits.
- D. Wiring within equipment and terminal cabinets shall be installed to conform to contract documentation and NFPA 72 standards. Wiring shall be cabled, laced, and securely fastened in place so that no weight is imposed on equipment or terminals.
- E. Conductors shall be color-coded per specification section 26 05 19 Low Voltage Wires (600 Volt AC) and tagged with code markers at terminal cabinets, and equipment. A wire index shall be typed and installed on terminal cabinet doors. Index shall be covered with clear plastic adhesive covers. Wiring shall be identified as to building and location of devices.
- F. Complete installation shall comply with local building codes, manufacturer's instructions, and applicable industry standards.
- G. Location of boxes and raceways on Drawings is approximate, unless dimensions are indicated. Do not scale Drawings to determine locations and routing of conduits. Location of the infrastructure and equipment shall conform to architectural features of the building and other Work already in place and must be ascertained in the field before the start of Work.
- H. Drawings generally indicate Work to be provided, but do not indicate all bends, transitions or special fittings required to clear beams, girders or other Work already in

place. Investigate conditions where conduits are to be installed and furnish and install required fittings.

- I. The roof shall be inspected prior to start of any work. Any observed deficiencies shall be brought up to the attention of the OAR prior to commencing any work.
- J. Prepare substrate to receive PV modules in accordance with manufacturer's recommendations and in compliance with accepted shop drawings.
- K. Provide trims and flashings on roof penetrations to ensure water-tight installation using PV manufacturer's flashing system.
- L. Adequate ventilation shall be provided to ensure that system components are operated within their environmental ratings.
- M. Temperature sensors shall be provided to monitor the temperature of indoor system components, such as Inverters and power monitoring system. Upon detection of temperatures in excess of the manufacturer's recommended operating temperature range, the sensor shall trigger local audible and visual alarms, and send a message to OWNER designated M&O group and Integrator in charge of the projects' maintenance.
- N. Provide warning signs as required by applicable codes.

3.03 MONITORING

- A. Provide an on-site Data Acquisition System (DAS). The DAS shall be equipped to log the information critical to the evaluation of system performance, including AC current energy production, solar irradiance, ambient temperature, and wind speed.
- B. The information shall be stored on the logger at 15-minute intervals and transmitted to an OWNER designated processing facility. Information shall be stored and backed-up per CEC and utility company requirements.
- C. For the duration of the service agreement between OWNER and the third-party monitoring company, data services shall include the processing, quality assurance, storage, and daily backup of system performance data.
- D. Provide annual reports of system's performance on the anniversary of the system.
 - 1. The report shall include a full-color chart showing the predicted energy output for a typical year, the predicted energy output for the current year, and the actual energy produced in each month of the year.
 - 2. The report shall be prepared for each individual system in the site, and as an aggregate for the entire site's electrical energy production.

3. The DAS shall include a data logger, modem for data retrieval, NEMA 4 enclosure, dry bulb measuring device, anemometer, solar sensor and radiation shield.

3.04 TESTING

- A. A 48-hour notice shall be provided to the OWNER authorized Representative (OAR), Engineer of Record (EOR), Project Inspector, and Commissioning Agent before final testing.
- B. Demonstrate in presence of the Project Inspector, and Commissioning Agent that circuit and wiring tests are free of shorts and grounds and that installation performs as specified herein and within manufacturer's guidelines.
- C. PV modules shall be factory tested for design performance.
- D. Inverter shall be factory tested for performance; results shall be included in the Operation and Maintenance Manual.
- E. Provide commissioning and system startup, pre-functional and functional tests report as part of the commissioning process. Perform all tests in the presence of the OWNER Commissioning Agent.
- F. Installer is responsible for identifying required tests, coordinating, scheduling, and conducting tests before Substantial Completion. Tests shall include the following:
 1. System response, data logging and transmission, and performance.
 2. System features and components under normal operation.
 3. System shutdown from utility override switches.
 4. Before energizing the cables and wires, check for correct connections and test for short circuits, ground faults, continuity, and insulation.
 5. When the system is equipped with optional features, consult the manufacturer manual to determine proper testing procedures.
- G. Defects resulting from tests shall be corrected prior to substantial completion.
- H. Software Modifications:
 1. Provide the services of a factory trained and authorized technician to perform system software modification, upgrades or changes. Response time of the technician to the Project site shall not exceed 24 hours.

3.05 SERVICE MANUALS

- A. Contractor shall deliver to OAR, three copies of the service manuals. Each manual shall include the following:
1. Installation manuals, programming manuals, user manuals, and part numbers if applicable for every major system component. Catalog cut sheets are not acceptable.
 2. A printed copy of the system configuration, including system labeling codes, and passwords.
 3. An electronic copy of the system configuration program on compact disk.
 4. Final test report.
 5. Detailed explanation of the operation of the system.
 6. Instructions for routine maintenance.
 7. Detailed wiring diagrams and updated shop drawings that include revisions made in the field via plan changes, RFC's, Field Change Directives, and any other construction change documents including interface details with other systems.
 8. Provide an electronic copy of the updated system As-Built Drawings to the OAR, prepare this copy in the latest version of AutoCAD; along with the electronic copy provide a full-size bond copy. Include one external drive with a copy of the up-dated As-Built Drawings into each of the Service Manuals. flash drive and folded drawings shall be secured and inserted into the Service Manuals in appropriate drawings and flash drive holders.
 9. Materials and required deliverables shall be submitted to the OAR.

3.06 PROTECTION

- A. Protect the Work of this section until Substantial Completion.

3.07 CLEANUP

- A. Remove rubbish, debris, and waste materials and legally dispose of off Project site.

END OF SECTION

SECTION 26 50 00

LIGHTING

PART 1 – GENERAL

1.01 SECTION INCLUDES

- A. Lighting fixtures.
- B. Fixture mounting hardware.
- C. Lamps.
- D. Emergency Lighting.
- E. Lighting control equipment.
- F. Source quality control.
- G. Standard fixtures.

1.02 RELATED SECTIONS

- A. Lighting control panel boards (addressable panels) are specified in Section 26 09 26, Lighting Control Systems.
- B. Refer to Section 20 70 26, Common Materials and Methods for Electrical Systems, for requirements.

1.04 REGULATORY REQUIREMENTS

- A. Federal Communications Commissions (FCC):
 1. Title 47 Rules and Regulations
- B. California Code of Regulations (CCR):
 1. Title 8 Industrial Relations
 2. Title 22 Social Security
 3. Title 24, Part 2 California Building Code
 4. Title 24, Part 3 California Electrical Code
 5. Title 24, Part 6 California Energy Code

6. Title 24, Part 11 California Green Buildings Standards Code

1.05 SUBMITTALS

- A. Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.
- B. Submit product data including the following:
 - 1. Catalog sheets and specifications
 - 2. Ratings, configurations, wiring diagrams, dimensions, service conditions, options and features
 - 3. Table matrix showing the specification requirement and the product data showing specifications are met
- C. Submit Shop Drawings including the following:
 - 1. Single line, schematic, block, and wiring diagrams
 - 2. Equipment layout of lighting system components
 - 3. Plan view details and component topologies
 - 4. Photometric drawings and network riser diagrams
 - 5. Luminaire marking and labeling
- D. Installation procedures: Include tools and materials list, mounting templates, and dimensions.
- E. Calculations:
 - 1. Lighting photometric analysis shall reference the IES recommended calculations using a lighting software tool. Report shall include the following:
 - a. Calculations at L70 and another at initial lumens.
 - b. Lighting fixture schedule shall include symbol, quantity, arrangement, lighting loss factor (LLF), manufacturer and luminaire name, luminaire type, wattage, color correlated temperature (CCT), house shield if any, distribution type, color rendering index (CRI).
 - c. Calculation areas shall include visible lighting luminaire pattern, area dimensions, and calculation points.

- d. Calculation and statistical summary shall be separate for each area as indicated. Each statistical area shall be highlighted differently.
 - e. Rendering view of calculated areas.
 - f. Contract number and title, Contractor name, revision, date.
 - g. Surface reflectance.
2. Submit details of lighting pole, foundation, and anchorage with supporting loads and structural design calculations.
 3. Submit details of luminaire mounting and bracket with supporting loads and structural design calculations.
- F. Submit test reports including the following:
1. Certified test reports of factory and field tests performed.
 2. Title 24 Acceptance Testing Documentation in accordance to Title 24, Part 6, as indicated.
 3. Seismic analysis report.
 4. LM-79, LM-80, and TM-21.
 5. Testing and Commissioning Testing Results.
- G. Manufacturer's certificates: Include certificate ensuring products meet or exceed specified requirements.
- H. Submit the operation and maintenance manual, in accordance with Section 01 78 23, Operation and Maintenance Data, including the submittal items mentioned above and the following:
1. Sequence of operation
 2. Preventive maintenance procedure
 3. Spare parts list and ordering form
 4. Troubleshooting guide for common issues
- 1.06 *LABELING*
- A. Lighting fixtures, light poles, lighting control equipment shall be labeled. Labelling shall be approved by the Engineer.

- B. Emergency lighting luminaire shall be identified.
- C. Luminaire labeling information shall include panel and circuit number, and contract number.

1.07 *NAMEPLATE*

- A. Mark fixtures clearly with manufacturer's name, voltage, wattage, UL listings.

1.08 *DELIVERY HANDLING AND STORAGE*

- A. Deliver luminaries and lighting equipment to the Jobsite complete with related items, completely wired and assembled.

PART 2 – PRODUCTS

2.01 LIGHT EMITTING DIODE (LED) LIGHTING

A. LED Luminaire

1. LED fixture requirements are as described below:

- a. The LED fixture shall consist of LED lamps, driver, assembly, and mounting hardware.
- b. Each fixture shall have its own LED driver. LED drivers shall be placed within LED fixture, unless otherwise specified.
- c. Input voltage and frequency: 120 VAC to 277 VAC plus or minus 10 percent, 60Hz.
- d. Efficacy: as indicated.
- e. NEMA Rating: as indicated.
- f. Brightness and glare: Lighting systems shall be free from distracting and uncomfortable glare.
- g. Warranty: minimum 5 years.
- h. Cooling System: Cooling system shall not have fans, pumps, or liquids and shall be resistant to debris and dust buildup.
- i. LED fixtures shall be rated for Class I Division II Hazardous Locations, as indicated.
- j. Lens: as indicated.
- k. Shields: as indicated.
- l. LM-80 and TM-21 shall be used to determine lifespan outside L70 controlled lab settings.
- m. Outdoor LED Luminaires shall comply with Title 24 Part 6 – 130.2(b) for luminaire cutoff requirements.
- n. Fixture shall be UL Listed.

B. LED lamp

1. LED lamp requirements are as described below:
 - a. Definition: LED lamp Assembly is the LED assembly without LED driver.
 - b. Correlated Color Temperature (CCT): 3000K to 3500K indoor, 4000K to 4500K outdoor and tunnels.
 - c. Color Rendering Index (CRI): greater than or equal to 80, except for parking lots where it shall be greater than or equal to 70.
 - d. Operating hours shall be determined by LM-80 and TM-21. Reported L70 hours shall be minimum 50,000 hours.
 - e. Difficult access areas such as on top of escalators and stairs shall have reported L70 of 60,000 hours, minimum.

C. LED Driver General Requirements:

1. LED driver general requirements as described below:
 - a. Input voltage: 120 VAC to 277 VAC (plus or minus 10 percent).
 - b. Frequency: 60Hz.
 - c. Operating temperature: minus 20 degrees Celsius to plus 50 degrees Celsius.
 - d. Minimum efficiency: 85 percent.
 - e. Driver shall be dimmable.
 - f. LED dimmable driver requirements are as described below:
 - 1) There shall be no visible change in light output with a variation of plus or minus 10 percent line voltage input.
 - 2) Driver shall provide step-free, continuous dimming from 100 percent to 10 percent; and shall respond similarly when rising from 10 percent to 100 percent.
 - 3) LED dimming driver shall provide continuous step-free, flicker free dimming over the operating range, with "Fail-Safe" 0 to 10 V dimming standard.
 - g. Driver shall be self-protected, including surge protection and short circuit protection and shall comply with ANSI or IEEE standards.
 - h. Comply to FCC CFR, Title 47, Section 15.
 - i. LED driver shall have a minimum of 50,000 operating hours under warranty.
 - j. Power Factor (PF) greater than or equal to 0.90.
 - k. Each fixture shall have its own LED driver. LED drivers shall be placed within LED fixture, unless otherwise specified.

2.02 FIXTURE MOUNTING HARDWARE

A. Requirements:

1. Luminaire mounting hardware shall be in accordance to the luminaire

manufacturer's recommended requirements.

2. When exposed to public view, fabricate and finish hardware in material matching the fixture body.

B. Light poles:

1. Provide the type, configuration, and dimensions indicated. Light pole shall resist wind loads in accordance with the California Building Code,. Maximum deflection of pole shall be five percent when fully loaded. Furnish poles as indicated with handhole and flush cover with tamper proof screw and grounding stud, luminaire mounting tenon/bracket, base cover and mounting hardware including anchor bolts, nuts, washers, and baseplate to permit accurate alignment and installation of pole and luminaire as indicated. Light pole anchor bolt covers shall have tamper proof screw.
2. Light pole ladder and safety cable shall conform to CCR Title 8, Industrial Relations, Division 1, Chapter 4, Subchapter 7, Group 1, Article 4, Section 3277(m), Ladder Safety Systems, and CAL/OSHA.
3. Lowering types pole specifications shall be as follows:
 - a. Poles shall be 50 feet galvanized round tapered steel and shall include pole shaft, hand hole, support plate, anchor base, anchor bolts with washers and nuts, and brackets to mount camera box.
 - b. The pole shall resist wind loads in accordance with the California Building Code.
 - c. Pole shall be equipped with a hand hole with cover plate. Hand hole shall allow adequate clearance for installing, servicing, and maintaining the lowering device system. Hand hole shall include a steel cover plate and shall be sealed and feature covered pulldowns to ensure weather tight protection. The hand shall be lockable for added safety and security. Hand hole rim shall conform to ASTM standards. Designation, Hand hole cover shall conform to ASTM standards.
 - d. Base plate, support plate, and anchor bolts shall be per ASTM standards.
4. Lowering device specifications shall be as follows:
 - a. Lowering device shall have internal motor with a minimum of 1 hp heavy reversing type electrical motor with a stalled torque at least twice that required to operate the lowering device.
 - b. Lowering device shall have internal winch assembly. Lowering device shall consist of spun aluminum copper free cover, cast high strength copper free aluminum latch barrel, stainless steel latch pin, galvanize steel luminaire ring, stainless steel centering spring and steel adjustment nut, stainless steel wire rope

grip, on-marking guide arm roller and cast aluminum iris guide arm, junction box and reflection latch indicator.

- c. Lowering device shall be top latching, centering arm unit with an internal winch. Internal drive lowering device shall be able to hold multiple luminaires, 50 foot pole height, stainless steel hoist, winch cable, with camera ready provisions, and with special arm assemblies on frame.

2.03 LIGHTING CONTROL EQUIPMENT

- A. Refer to Section 26 09 26, Lighting Control System for lighting control equipment requirements.

2.04 EMERGENCY LIGHTING

- A. Emergency lighting system shall be as indicated.
- B. Emergency lighting system shall comply with CBC, CEC, UL924, NFPA 101, NFPA 110, and NFPA 130.

2.05 SOURCE QUALITY CONTROL

- A. The lighting fixture to be tested shall be typical of the unit it represents, clean and free from mechanical defects, equipped with the proper fittings, and with the lamp of the size and type in the position recommended for service operation.
- B. Test UL-listed material, equipment, and components in accordance with UL standards. Test material, equipment, and components not covered by UL standards in accordance with nationally recognized standards. Provide material, equipment, and components bearing a label tag or certification of such inspection.
- C. Perform and report tests for photometric performance in accordance with the approved methods outlined by the IES Lighting Handbook for photometric testing, and include data on candlepower, distribution, zonal lumens, maximum luminance values, and luminaire efficiency, including complete coefficients of utilization tables to indicate compliance with performance requirements.
- D. Test data shall be reported on 8-1/2 inch by 11-inch sheets and shall be certified by a nationally recognized independent testing laboratory.

2.06 STANDARD FIXTURES

- A. Tunnel Fixtures: Provide fixtures that are UL listed for wet locations, and that include the following features, appurtenances, and accessories:

1. Housing shall be 0.125 inch extruded aluminum with anodized finish. Housing

upper portion shall have an integral continuous clevis on each side, accommodating a slide grip hanger assembly, eliminating all mounting hole requirements.

2. End caps shall be 0.150 thick cast aluminum with service entry hubs on each end for 1/2-inch conduit. End caps and hub assembly shall be firmly held against the extruded housing and lens by a cast aluminum bracket on each end.
 3. Reflector/driver cover shall be of 0.05 inch aluminum and chain hinged for ease of access with baked-on white enamel finish.
 4. Provide gasket continuous along the length of lens/housing intersection with one piece 0.250 inch close celled neoprene gasket. Gasket the entire inner wall of each end cap with 0.250 inch close celled neoprene gasket.
 5. Provide wall-mounting bracket for 45 degree mounting tilt. Bracket shall be galvanized plate steel and moveable along the entire length of fixture housing. Two brackets per fixture are required.
 6. Diffuser shall be of 0.125 acrylic with internal prisms for low brightness and smooth external surface for minimizing dirt collection.
 7. Tunnel lighting fixtures and mounting devices shall be designed to withstand air pressure waves ranging from plus 80 psf to minus 80 psf repetitively with each passing train.
- B. Emergency Trip Station Blue Light: Provide fixtures that are UL listed for wet locations, and that include the following features, appurtenances, and accessories:
1. Provide housing and outlet box of glass reinforced (30 percent) polyester material conforming to UL 94V-0. Polyester housing and box shall be nonfading, permanent gray color, ultraviolet resistant.
 2. Provide blue enclosing globe of heat-resistant glass with integral male threads for mounting into housing with white LED lamp and metal guard.
 3. Boxes shall be tapped for 3/4-inch conduit. Plugs shall be of same polyester material. Provide box with mounting ears, as indicated.
 4. The blue light shall be composed of two ultra-bright, long lasting LED lamps and shall be visible at any point within 250 feet from its designated mounting location.
 5. The blue light LED lamp shall provide a minimum of 750 effective lumens.

- C. Operator's Access Aisle Fixture: Provide fixtures that are UL listed for wet locations, and that include the following features, appurtenances, and accessories:
1. Provide one piece housing of die cast aluminum with integral cooling fins over the optical chamber and electrical compartments and double thick gussets on the support arm-mounting end. Housing shall form a half-cylinder shape with 55 degree front face plane providing a recess to allow a flush single-latch detail. All hardware shall be stainless steel.
 2. Provide lens frame and cam-latch of die cast aluminum and mate with 1 inch minimum depth around the gasket flange. Provide integral cast hinges with stainless steel pins that allow removal, without tools, from the housing. Cam-latch shall provide positive locking and sealing of the optical chamber.
 3. Provide clear tempered glass lens 3/16-inch thick with one piece molded perimeter gasket seal retained by eight stainless steel clips.
 4. Provide reflector assembly of specular alzak aluminum mounted in an aluminum frame attaching to fixture housing as a one piece module. Reflector module shall be field rotatable in 90 degree increments.
 5. Provide factory pre-wired electrical module components on a single plate with a socket to a quick-disconnect plug and include a wire seal through the barrier wall. Attach module to housing with no-tool hinges and latches, accessible by opening the lens frame only.
 6. Support arm shall be one piece extruded aluminum, fully radiussed internal bolt guides top and bottom and circular cut for specified round pole. Provide luminaire to pole attachment by internal draw bolts and include a pole reinforcement plate with wire strain relief.
 7. Provide finish housing, lens frame, latch and support arm with thermoset polyester powder coat paint in natural aluminum color. Components shall be thoroughly cleaned and primed with protective chromate conversion coating prior to powder coating. Powder coating shall be 2.5 mils nominal thickness.
 8. Provide LED lamp, 277 VAC.
- D. Cross Passage Yellow Light: Fixture shall be identical to emergency trip blue light fixture. It shall be equipped with amber or yellow enclosing globe. Enclosing globe shall be of heat-resistant glass with integral male threads for mounting into housing.
- E. Wet Standpipe Valve White Light: Fixture shall be identical to emergency trip blue light fixture. It shall be equipped with white enclosing globe.

2.07 SPARE PARTS

- A. General: Refer to Section 01 78 44, Spare Parts and Maintenance Materials, for spare part requirements.
- B. Luminaire: Furnish 2 percent of each style of lighting luminaire, or a minimum of 5 each, whichever is greater.
- C. Light Poles: Furnish 1 percent of each style of light pole assembly, or a minimum of 2 each, whichever is greater.

PART 3 – EXECUTION

3.01 INSTALLATION OF LIGHTING FIXTURES

- A. Install lighting fixtures as indicated and in accordance with the manufacturer's installation instructions and recommendations, complete with lamps, hangers, brackets, poles, fittings, and accessories, ready for operation.
- B. Align, mount, and level lighting fixtures uniformly.

Avoid interference with, and provide clearance for, the equipment. Where the indicated locations for the lighting fixtures conflict with the locations for other equipment, change the locations for the lighting fixtures by the minimum distances necessary and as approved by the Engineer.
- C. For suspended lighting fixtures, provide the indicated mounting height clearances between the bottoms of the fixtures and the finished floors.
- D. Anchor lighting fixture supports to the structural slab or to structural members as indicated. Supports shall maintain the fixture positions after cleaning and re-lamping. Provide supports for seismic loading in accordance with applicable requirements of the California Building Code and the California Electrical Code.
- E. Surface-mounted lighting fixtures shall be bracketed rigidly from the mounting surfaces. Provide 1/4-inch clearance between surfaces when the fixture is flat-mounted against concrete surfaces. Install fixtures with a non-cumulative dimensional alignment tolerance of 1/16-inch when mounted in continuous runs with one inch spacing between individual fixtures. Nipples carrying wires between fixtures shall be watertight.
- F. Where aluminum is placed in contact with dissimilar materials, except galvanized steel, zinc, and stainless steel, treat contact surfaces as follows:

1. Dissimilar metals: Apply a prime coat of zinc chromate primer followed by two

coats of aluminum and masonry paint.

2. Concrete, masonry, and plaster: Apply zinc chromate primer, bituminous paint, aluminum and masonry paint, or pressure-sensitive tape to aluminum contact surfaces.
 3. Wood or other absorptive materials: Apply two coats of aluminum house paint, and protect aluminum contact surfaces with bituminous paint.
- G. Provisions for coating and electrically isolating aluminum and stainless steel, or any other dissimilar metals in contact, when exposed to salt water, water immersion, or burial shall be provided.
- H. Welding:
1. Locate welds in assemblies to be anodized so as to conceal visible discoloration in the heat-affected zone.
 2. Where weld metal will be exposed after anodizing, select filler alloys to closely match composition of base metal. Follow manufacturer's recommendations for such filler alloys.

Provide pendant fixtures with stem swivel hangers to assure a plumb installation with a minimum 45-degree swing from horizontal in all directions. Where 45-degree movement of fixture is not possible due to field conditions, provide, in addition to above, cross bracing of aircraft cable to restrict movement in direction of potential contact. Tubing shall be not less than 3/16-inch diameter. Motion of swivels or hinged joints shall not cause sharp bends in conductors or damage to insulation. For heavy pendant-mounted fixtures, where support is to be independent of the outlet box, provide stem swivel hangers with fixture studs.

- I. Install fixtures to be pole-mounted in accordance with the manufacturer's installation instructions.

3.02 INSTALLATION OF DRIVERS

- A. Install drivers, other than those mounted integrally within luminaries, in such a manner that the driver is protected from weather, moisture, and other atmospheric conditions, and in ambient temperatures that will not cause the temperature of the driver housing hot-spot to exceed UL requirements.
- B. Voltage drop to lamp, due to remote driver mounting, shall not exceed one percent of the nominal lamp voltage. Provide secondary driver conductors with 600 V insulation. When more than one driver is mounted at one location, the minimum spacing between

driver shall be 6 inches in a horizontal direction and 12 inches in a vertical direction. Mount driver components securely in such a manner as to obtain the necessary heat dissipation.

3.03 INSTALLATION OF LIGHT POLES

- A. Determine surface and structure load ratings prior to installation of equipment.
- B. Install light poles as indicated and in accordance with the manufacturer's installation instructions and recommendations. Light poles shall be grounded as indicated on the Contract Drawings.

3.04 CONCRETE BASES

- A. Provide necessary templates and anchor kits before starting work, and coordinate installation of anchors in concrete with the work specified under Division 3 - Concrete.

3.05 INSTALLATION OF EXPOSED PARTS OF FIXTURES

- A. Install exposed parts of fixtures after construction, painting, and general cleanup of completed area.

3.06 FIELD QUALITY CONTROL

- A. Inspect luminaries, lamps, and associated hardware before and after installation to ensure that they are of the quality and type specified and indicated, and are free of defects and damage.
- B. Whenever practicable, test lighting systems at the same time that the distribution panelboard or switchboard is tested.
- C. Replace lamps that fail within 90 Days after final acceptance without additional cost to the District.
- D. Test light poles for continuity to the grounding system.
- E. Inspect lighting fixtures, light poles, and lighting control equipment for labelling.

3.07 TESTING AND COMMISSIONING

- A. Contractor shall test and commission installed system per testing and commissioning procedures.

1. Provide checklist of individual lighting fixtures with verification that

Department of Neighborhood Services and Public Safety
GOLETA TRAIN DEPOT PROJECT

lighting fixtures are functioning.

2. Provide lighting level measurements per IES or as indicated in Contract Drawings.

END OF SECTION

SECTION 28 16 00 INTRUSION DETECTION SYSTEMS

PART 1 - GENERAL

1.01 SUMMARY

- A. This section includes fully functional, state-of-the-art, digital Intrusion Detection System (IDS) including control panels, sub-panels, wiring, keypads, system control devices, and an appropriate array of zones and sensors that provide effective security coverage.
- B. Principal items of Work in this Section include but are not limited to:
1. Infrared motion detectors and associated power supplies, batteries, and cables.
 2. Door switches and cables.
 3. Controller, annunciator, expansion modules, power modules, TCP/IP network modules and batteries.
 4. Connect Intrusion Detection System equipment to adequate electrical grounding in accordance with manufacturer's specifications.
 5. Installation of power and signal circuits for all equipment, including associated raceway, wiring and terminal cabinets as required for a complete and operable system.
- C. Related Requirements:
1. Division 01- General Requirements.
 2. Section 26 05 00: Common Work Results for Electrical.
 3. Section 26 05 13: Basic Electrical Materials and Methods.
 4. Section 26 05 26: Grounding and Bonding.
 5. Section 26 05 19: Low-Voltage Wires (600 Volt AC).
 6. Section 26 05 33: Raceways and Boxes Fitting and Supports.
 7. Section 26 24 16: Panelboard and Signal Terminal Cabinets.

 - 4. EIA/TIA-607: Commercial building grounding and bonding requirements for telecommunications.
- B. California Electrical and Fire Codes.
- C. Building Industry Consultant Service International (BICSI):
 - 1. Telecommunications Distribution Methods Manual
- D. Federal Trade Commission (FTC):
 - 1. Green Guides, 16 CFR Part 260, Guides for the Use of Environmental Marketing Claims.
- E. Underwriters Laboratory listings and other labels
- F. ANSI, ASTM, UL, NEMA, IEEE and FCC standards as applicable.

1.03 SUBMITTALS

- A. Materials list: Submit a complete material list for the materials and products of this section. Each submittal shall be bound and shall contain an index organized vertically by assembly and item number and horizontally by columns. The first assembly shall be the major head end equipment. The leftmost column shall be the item number; next shall be the description, followed by the applicable Specification section number, followed by the specified item, which is followed by the submitted item. The rightmost column shall be for notes, which shall be used to reference the reason for submitting items, other than as specified.
- B. Product Data: Include Product Data sheets and catalog cut sheets for items listed in index. Items shall be arranged in the same order as the index and if more than one item is indicated, the submitted items shall be highlighted or marked appropriately. Product Data shall be sufficiently detailed to allow the Architect to review the product and to allow other trades to provide necessary coordination.

C. Shop Drawings:

1. Provide Shop Drawings, in the same size as the Drawings. Shop Drawings shall be prepared in latest version of AutoCAD with three electronic copies submitted along with full sized Shop Drawings.
2. Shop Drawings shall indicate typical wire connections and cable types for detectors and detector wiring, single gang deep box location for security key switch and keypad locations for all main and remote security panels. Provide wiring schematics including point-to point, terminal blocks, connections to batteries, and power supplies, including the estimated anticipated wiring lengths required for all connection points (i.e., zone and system communications bus runs) within the system. Indicate interfaces to equipment furnished by others.
3. Submit dimensioned Shop Drawings indicating mechanical layout of all intrusion detection equipment, including cabinets and interconnecting conduit for the main security panel, typical remote security panel and single gang deep box for security key switch, keypad and indicator locations, identifying all parts by manufacturer and part number. Indicate mounting details for the motion detectors appropriate to each ceiling type.
4. Shop Drawings shall be accompanied by engineering documentation including:
 - a. Floor Plans indicating components, raceways, and terminal boxes and cabling.
 - b. Riser diagram indicating connections in a manner following the floor plan layout.
 - c. Cabling diagram indicating the CONTRACTOR's designed routing and number of cables in specific raceways or conduits, from the main alarm panel connecting to other sub-panels, modules or devices. Diagram shall include length, in wire feet, and capacitance calculation charts for all Bus cables.
 - d. Zone schedule indicating code numbers and its protected areas.
 - e. Infrared motion detector mounting and all other necessary details.
5. Submit preliminary design calculations and system architecture plan For OWNER's review prior to the start of work. Installation shall not commence prior to CONTRACTOR receiving OWNER's acceptance of design and architecture.
6. Installation and coordination drawings for items in other sections shall be included with Shop Drawings submittals.

- D. Permits and Inspections: CONTRACTOR shall obtain and pay for required permits and inspections; deliver certificates of inspection to the PROJECT INSPECTOR.
- E. Burglar Alarm Licensing: Provide evidence that the CONTRACTOR is properly licensed by the Bureau of Security and Investigative Services of the State of California Department of Consumer Affairs, including, but not limited to the following licenses: Alarm Company Operator, Qualified Manager, and/or Alarm Agent.
- F. CONTRACTOR shall have completed at least five projects of equal scope to systems described herein and shall have been in the business of supplying and installing specified type of systems for at least five years.
- G. Include in the Material List Submission copies of the manufacturers' certifications that the CONTRACTOR is an authorized distributor and service provider of the submitted manufacturers' products and CONTRACTOR's staff has been adequately trained and certified in the installation of those products.
- H. Provide a letter from the Manufacturer guaranteeing the availability of spare parts common to proposed system for a period no less than five years on all components.
- I. Provide Samples of material and equipment as required by the ARCHITECT. If Samples are requested, they shall be submitted within 10 days from date of request.

1.04 SUBSTITUTIONS

- A. Equipment and materials that deviate from these requirements shall not be accepted without written approval from OWNER'S ITD project manager. When deviating or substituting equipment, the following information shall be submitted:
 - 1. Substitution request form substantiating reasons and benefits to OWNER.
 - 2. OWNER'S approval shall be obtained for any equipment or materials substitutions. Proposed substitutions requests shall provide proof of compliance with OWNER'S criteria described in this specification.
 - 3. Submittals must comply with contract general provisions.

1.05 QUALITY ASSURANCE

- A. Use adequate numbers of skilled personnel who are manufacturer certified, trained and experienced on the necessary crafts and familiar with the specified requirements and methods needed for the proper performance of the work.
- B. Only a qualified CONTRACTOR holding licenses required by legally constituted authorities having jurisdiction over the work, shall do the work.

- C. Only persons skilled in trade represented by work, and in accordance with all applicable building codes, shall install system in accordance with best trade practice.
- D. Burglar Alarm Licensing: Provide evidence that the CONTRACTOR is properly licensed by the Bureau of Security and Investigative Services of the State of California Department of Consumer Affairs, including, but not limited to the following licenses: Alarm Company Operator, Qualified Manager, and/or Alarm Agent.
- E. CONTRACTOR shall have completed at least five projects of equal scope to systems described herein and shall have been in the business of supplying and installing specified type of systems for at least five years.
- F. Include in the Material List Submission copies of the manufacturers' certifications that the CONTRACTOR is an authorized distributor and service provider of the submitted manufacturers' products and CONTRACTOR's staff has been adequately trained and certified in the installation of those products.
- G. Provide a letter from the Manufacturer guaranteeing the availability of spare parts common to proposed system for a period no less than five years on all components.
- H. Provide Samples of material and equipment as required by the Architect. If Samples are requested, they shall be submitted within 10 days from date of request.
- I. Coordinate cable runs, and equipment locations with OWNER's Authorized Representative prior to the start of installation. CONTRACTOR and OWNER representative must agree as to the final location of all devices and the cable plant design.
- J. Provide sufficient personnel and tools required to participate in OWNERs Quality Assurance testing as detailed in Attachment A of this specification.
 - 1. Items on check list of Attachment "A" will be examined as a minimum at the Alarm Head End and one remote security panel. Should the examination show deficiencies related to items in the checklist, OWNERs acceptance testing will be discontinued until corrections have been made. When the CONTRACTOR has completed the corrections, a subsequent Quality Assurance test shall be initiated. This procedure is in addition to the system functionality testing required below.

1.06 PROJECT RECORD DOCUMENTS

- A. Operation and Maintenance Manual: Supply, as a condition of final payment and acceptance, three complete bound sets containing the following documentation:

1. Each manual shall include a page with Project site and Project name, date of Substantial Completion, CONTRACTOR name, address, telephone, and fax numbers.
2. Each manual shall contain a letter, signed by an officer of the company indicating the beginning and ending date of any warranties described in Article 1.07 of this section and shall describe the companies' commitment to service the warranty during the terms specified.
3. One page shall contain a list describing all furnished materials by Manufacturer and model number.
4. Site and building zone maps and zone codes indicating areas served, materials, brochures, wiring and connection diagrams of equipment, plot plan of Project site indicating conduit and cable runs and cable counts between termination points, and cable identification. A sample of a typical site plan zone map is included in this specification as an example of the required finished product.
 - a. The project site plan zone map shall be supplied in a single drawing on two USB drives that include all project drawings in AutoCAD format as well as three paper copies, and shall contain the following information:
 - 1) Site layout of buildings indicating the physical locations of all buildings on the campus. The drawing shall coincide with the architectural as built of the project as constructed.
 - 2) Each building shall be labeled with hardware zones of coverage as built. (An example of typical labels is: Administration Building – Z1-8).
 - 3) Site Zone maps shall show School Location Code, School Name and School Address on the upper right side of Drawing. Refer to Attachment C for sample.
 - b. Floor Plans on separate drawings shall show each building, all equipment placement locations with: areas of coverage, room numbers or other designators if numbers are not available, and the individual hardware zones for each room or covered area. Each device and its location, including but not limited to PIR's, all modules, point to point cabling and all panels, shall be clearly shown.
 - c. AutoCAD files (software copies) supplied shall be multi-layer drawings with the following layers as a minimum:
 - 1) Layer 1 shall contain title blocks only.

- 2) Layer 2 shall contain building or site plan backgrounds only.
 - 3) Layer 3 shall contain hardware zone identifiers only.
 - 4) Layer 4 shall contain all devices and cabling only.
 5. One complete riser, site and building drawing set. Size A (8-1/2 inch by 11 inch) and size B (11 inch by 17 inch) shall be bound into the manual. Larger drawings shall be folded and inserted into transparent envelopes and bound into the manual.
 6. A block diagram showing how the LX/Keypad-Bus (es) feeds from the main panel controller to re-power modules, with modules numbered in enrollment sequence, and labeled as to physical location. Diagram should also include how the re-power module(s) feed(s) LX-Keypad-Bus (es) to keypad, Expansion modules and any other modules.
 7. Index of material in bound set including page numbers.
 8. Manufacturer maintenance brochures.
- B. Record Drawings: Prior to start of system Testing, submit three paper record copies on "E" size, and two copies of drawing representations on a labeled USB drive (DWG drawing format prepared with current Microsoft Windows version of AutoCAD). Layer information shall be organized as required in section 3.04 of this specification.

1.07 WARRANTY

- A. Warranty that materials and workmanship provided are free from defects of material for a period of three years excluding specific items of work that require a warranty of a greater period.
- B. Immediately upon receipt of written notice from the OWNER, repair or replace at no expense to the OWNER, defective material or work discovered before final acceptance of work or within the warranty period; material or work damaged thereby; and adjacent material or work that may be displaced in repair or replacement. Examination of or failure to examine work by the OWNER shall not relieve CONTRACTOR from these obligations.
- C. Equipment or materials failure rates of 10% or more during the warranty period:
 1. The OWNER will monitor the performance and reliability of the installed base of Equipment and Materials installed in this Contract. Any deficiencies or malfunctions will be referred to the CONTRACTOR for repairs or equipment replacement.

- D. If the OWNER detects a defect within a warranty period as defined here in, it shall notify the CONTRACTOR Representative in writing (“Notice of Defect”). The CONTRACTOR shall make available and provide the OWNER with the telephone number of a fax machine and email address to receive Notices of Defect. This fax machine and email address shall be available to receive faxes and emails 24 hours per day 7 days per week, including all weekends and holidays.
- E. Upon receipt of written notice from the OWNER of any failure or defect (“Defect”) in any such Equipment or Work, the CONTRACTOR shall diligently perform all work necessary to determine the cause thereof, and the time necessary to remedy the Defect, and shall propose in writing to the OWNER how and in what manner it will remedy the Defect. If the OWNER determines that the proposal complies with the terms of the Contract, it shall authorize CONTRACTOR to proceed to redesign, repair, or replace the defective or failed Equipment or Work within the agreed time period.
- F. In determining the cause of the Defect, the CONTRACTOR shall perform such investigations and tests as may be required to determine the cause, and to verify that such redesign, repairs, and replacements comply with the requirements of the Contract Document. All cost associated with such investigation, redesign, repair, replacement, and testing, including, but not limited to, the removal, replacement, and reinstallation of equipment and materials necessary to gain access to defective Equipment, shall be borne by the CONTRACTOR. Should the CONTRACTOR fail to promptly make the necessary investigations, redesign, repair, replacement, and test, the OWNER may perform or cause to be performed the same at the CONTRACTOR’s expense.
- G. The CONTRACTOR will warrant the redesigned, repaired, or replaced Equipment against defective design, materials, and workmanship for the remainder of the warranty period or a period of to five (5) years from and after the date of acceptance of the redesigned, repaired or replaced Equipment thereof, whichever occurs later.
- H. The CONTRACTOR shall be liable for the satisfaction and full performance of the warranties as set forth herein.
- I. All warranties hereunder are deemed and acknowledged to explicitly extend to the future performance of the Equipment warranted.
- J. The rights and remedies provided for herein are cumulative, and shall not be exclusive and are in addition to any other rights and remedies provided by law, whether in contract or tort, or under this Contract.
- K. CONTRACTOR is deemed and acknowledged to be a merchant with respect to all components and replacement parts furnished pursuant hereto, and the OWNER is acknowledged not to be a merchant with respect thereto.

- L. In the event any Supplier or manufacturer offers any extended warranty not specified herein, CONTRACTOR shall state the terms of such warranty or warranties in writing and shall extend the same to the OWNER without additional cost to the OWNER.
- M. All warranties and guarantees of Suppliers of any tier and Manufacturers, whether expressed or implied, are deemed to be made for the benefit of the OWNER regardless of whether stated as such, and CONTRACTOR shall enforce such warranties and guarantees for the benefit of the OWNER.
- N. CONTRACTOR shall include a letter signed by a corporate officer, partner, or OWNER of the contracting company describing their service organization, its capabilities and commitment to servicing the warranty on all work executed and materials furnished.

PART 2 – PRODUCTS

2.01 MATERIALS

- A. Detectors/ Sensors:
 - 1. Shall support passive infrared and microwave motion detection.
 - 2. Shall be tightly integrated with OWNER's Integrated Security Management System (ISMS) platform. Refer to Specification Division 28 0500 Integrated Security Management System for compliance.
 - 3. UL listed.
 - 4. All motion detectors shall be field adjusted for sensitivity and correct aim per manufacturer's specification.
 - 5. Wall mounted detectors shall be used only if shown on Drawings or as directed by OWNER Authorized Representative (OAR).
- B. Glass Break Detectors:
 - a. Shall detect shattering of framed glass by direct impact.
 - b. Contractor shall test the installed detectors for true range with an FG-701 glass break simulator/tester.
 - c. Glass break detectors shall be ceiling mounted adjacent to windows and store fronts that are accessible from the exterior.
- C. Contacts:
 - a. Operational up to 5 years using a single user replaceable AAA lithium battery.
 - b. Provide contacts at Café refrigerator doors and Café freezer doors.
 - c. The door switches shall be concealed recessed units mounted at the top of each leaf, opposite the hinge side, 12 inches from outer edge of door.

- D. Cables: Zone cables shall be, as follows:
1. Shall be in conformance with equipment manufacturer products specifications.
 2. Four-conductor, #22 West Penn 240 or equal, for power and detector contact for indoor applications.
 3. Four-conductor, #22 West Penn AQC240 or equal for detector contact and power for outdoor and underground applications.
 4. Two conductor door switch cables, #22 West Penn 221, or equal. Larger size conductor shall be furnished when higher mechanical strength is required.
 5. Four conductor bus cables, #22 West Penn 240, or equal, for indoor applications and West Penn AQC 240 or equal for outdoor applications, in accordance with Intrusion System Manufacturer's specifications and installation practices, unless otherwise noted herein.
 6. Power cable shall be 2 #12 for 120 VAC and 2 #18 for 16 VAC.
 7. Wire and cables shall meet FR-1 Flame Test and shall be UL listed.
 8. Wire and cables shall be indexed with a code marker and identified on a sheet, one copy of which shall be left in each equipment cabinet and one copy placed in as-built data.
 9. Wire and cables shall be installed in raceway, partitioned cable tray or conduit.
 10. Cable not directly connected to circuit board or terminal equipment shall be terminated on 66M blocks mounted on 89B mounting spacers.
 11. Cabling Topology: Loop or Hierarchical Star as indicated on drawings.
- E. Locks/Keys:
1. Each panel door shall be furnished with a flush type lock, Corbin or equivalent, keyed for CCL Cat. 102 key.
 2. Provide raceway, deep box, and cable for OWNER-furnished, OWNER-installed bypass key switch as required on Drawings.
- F. Component Enclosure: Housings; power supply enclosures, terminal cabinets, control units, and other component housings, collectively referred to as enclosures shall be so formed and assembled as to be sturdy and rigid. If sheet steel is used in the fabrication of enclosures, it shall be not less than an 18 gauge door with a 20 gauge box frame. Where exposed pins, the hinges shall be of the tight pin type or the ends of hinge pins shall be tack welded to prevent ready removal. Doors having a latch edge length of less

than 24 inches shall be provided with a single lock. Where the hinged door latch edge is 24 inches or more in length, doors shall be provided with three-point latching device with lock; or alternatively with two locks, one located near each end.

G. Electronic Components

1. All system electronic components shall be solid-state type, mounted on printed circuit boards. Light duty relays and similar switching devices shall be solid-state type or electromechanical.
2. The panel shall have an over current notification LED that lights when devices connected to the Keypad Bus and Loop Expansion LX-Bus(es) draw more current than the panel is rated for. When the over current LED lights, the Loop Expansion LX-Bus (es) and Keypad bus are shut down.

H. Main Security Panel (MSP):

1. A battery test shall be automatically performed to test the integrity of the standby battery. The test shall disconnect the standby battery from the charging circuit and place a load on the battery. This test shall be performed no more than every 180 seconds.
2. The control unit shall be capable of operating and supervising notification appliance devices as well as addressable initiating detection devices and an integrated supervised dual line digital communicator.
3. Control unit must be “Flash ROM” updatable, and program must be held in non-volatile RAM. The panel shall be able to function while the update is in process.
4. Control unit shall be capable of operating using an optional built in Encrypted Alarm Router application that is certified by NIST (National Institute of Standards and Technology) for 128-bit or 256-bit AES (Advanced Encryption Standard) Encryption communications.
5. The optional built-in Encrypted Alarm Router shall be capable of compliance with and UL 2050 standards.

I. Remote Security Panels:

1. The system shall support a maximum of sixteen (16) supervised remote annunciators with the identical capabilities, functions and display layout. Operation of the remote annunciators shall be limited to authorized users by the use of a code or key.
2. The remote annunciators shall be capable of operating at a maximum wiring distance of 15,000 feet from the control unit on unshielded, non-twisted cable.

- J. Control Designations: Controls shall be provided to ensure ease of operation of all specified characteristics. Where applicable, clockwise rotation of controls shall result in an increasing function; controls, switches, visual signals and indicating devices, input and output connectors, terminals and test points shall be clearly marked or labeled on the hardware to permit quick identification of intended use and location.
- K. Test Function:
1. The system shall include a provision that permits testing from any alphanumeric keypad. The test shall include standby battery, alarm bell or siren, and communication to the central station.
 2. The system shall include a provision for an automatic, hourly, daily, weekly, thirty (30) day, or up to sixty (60) day communication link test from the control panel installation site to the central station.
 3. The system shall include a provision for displaying the internal system power and wiring conditions. Internal monitors shall include the bell circuit, AC power, battery voltage level, charging voltage, panel box tamper, phone trouble line 1 and trouble line 2, transmit trouble, and network trouble.
- L. Power Supplies:
1. Power supplies for the control unit shall operate from 120V AC, supplied at the respective protected areas. Standby batteries shall be supplied to power the system in the event of a utility power failure. Batteries shall be sized to provide 105% capacity for eight hours. Standby batteries shall be sealed lead-acid. Power supplies shall be all Solid State.
 2. Controls shall be designed to maintain full battery charge when alternating current is available. Batteries shall be recharged to 85% capacity within 24 hours from battery use. The system shall be automatically transferred to battery power upon loss of alternating current power and return to alternating current power upon restoration. Intrusion alarms shall not be initiated during switch over; a signal shall be initiated upon failure of battery or alternating current power.
- M. Software:
1. The system shall interface with computer software with the capability to fully program the panel by connecting to the panel through:
 - a. Direct cable connection interface card.
 - b. Receiver phone line connection.
 - c. Standard phone line connection.

- d. Ethernet network connection.
 - e. Network connection across the Internet.
 - f. Cellular network connection using the 263C or 263H Cellular Communicators.
2. The system shall interface with computer software capable of locking down all controlled doors.
 3. The system shall interface with computer software capable of monitoring and logging all events.
 4. The system shall interface with computer software capable of exporting reports in the following file formats:

Excel spreadsheet (*.xlsx)	Text (*.txt)
Rich Text (*.rtf)	Comma-separated (*.csv)
Windows Metafile (*.wmf)	HTML document (*.htm)
QuickReport (*.grp)	

5. The system shall interface with computer software capable of printing custom, filtered reports including:

All Events	Door Access Granted
Zone Action	Door Access Denied
Arming/Disarming	Opening/Closing Schedule Changes
Area Late to Close	System Monitors
User Code Changes	System Events

N. Control Panel Capability

1. The minimum requirements for the control panel are as follows:
 - a. Zone Requirement:
 - (1) Programmable zones: 500
 - (2) Control panels zones: 8
 - (3) Control panel fire zones: 2
 - (4) Hardwired expansion zones: 500
 - (5) Wireless expansion zones: 500

- (6) Powered smoke zones up to: 200
- (7) Shall be capable of zone expansion buses
- (8) Shall be capable of zone expander modules
- b. Keypad Requirement:
 - (1) Minimum supervised keypad: 16
 - (2) Minimum access doors: 8
 - (3) Shall be full keypad programmable
- c. User Information Requirement:
 - (1) User codes/access cards: 100
 - (2) Event memory: 1,000
 - (3) Zone monitor.
- d. System Information Requirement:
 - (1) Shall support Contact ID (CID) format
 - (2) Reporting paths: 4
 - (3) Shall be Remote Access Compatible.
- e. Communication Requirement:
 - (1) LAN/WAN/IP Network Communication
 - (2) Cellular Communications
- f. False Alarm Reduction Requirement:
 - (1) Cross zoning
 - (2) Abort reporting
 - (3) Programmable Entry/Exit delay
 - (4) Transmit delay

- (5) Swinger zone bypassing
 - (6) Report bypass to central station
 - (7) Unique duress code
 - (8) Support applications for IOS and Android mobile devices
- g. Security Features Requirement:
- (1) Encryption: AES 128 or 256 bit
 - (2) Two-Man rule
 - (3) Card plus pin by areas
 - (4) Early morning ambush
- h. Compliance Requirement:
- (1) ANSI/UL 365 Police Connected Burglar
 - (2) ANSI/UL 609 Local Burglar
 - (3) ANSI/UL 1610 Central Station Burg
 - (4) SIA-CP-01-2010 False Alarm Reduction
 - (5) ULC-S304 Standard for Central and Monitoring Station Burglar Alarm Units

2.02 FUNCTIONAL DESCRIPTIONS

A. System Description

1. The system areas and zones shall be programmable, and the system shall store, log, display, and transmit specific custom designations for system areas, zones, and user names.
2. To ensure continued, one-call support, the system shall be constructed of sensing components provided directly by the system manufacturer or manufacturer's authorized VARs, such as power supplies, motion detectors, door and window position switches, glass break detectors, or other sensing devices that the manufacturer offers.
3. The system controller, user interfaces, zone input devices, relay output devices, and the system signal receiving equipment shall be engineered, manufactured,

assembled, and must be distributed from a location within the United States of America.

4. The system shall support user interaction by way of a keypad, web browser, system software, key switch, or radio frequency wireless control, text messaging, or smart phone application using integrated or auxiliary devices provided by the system manufacturer.
5. The system shall support controller zone input connections, system keypads, system zone expansion modules, and wireless zone input modules, and must support zone input connections by way of at least two competitive products.
6. The system shall provide capability for addressable modules.
7. System relay outputs shall have the capability of being triggered as a result of a command from the user interface, changes in system status, changes in zone status, or by a programmable schedule.
8. System relay output states shall be programmable for momentary, maintained, pulsed, or must follow the state of an associated system zone input.
9. The system shall be completely programmable either locally from a keypad or remotely through a standard dial-up, and network connections by way of a LAN, WAN, and/or by way of the Internet, cellular communications paths.
10. The control unit shall be completely programmable using remote annunciators, and/or using upload/download software that communicates using SDLC or IP addressed data network.
11. The control unit shall be equipped with an anti-reversing circuit breaker to prevent damage due to accidental reversal of battery leads.

B. Zone Configuration

1. Each zone shall function in any of the following configurations: Night, Day, Exit, Supervisory, Emergency, Panic, Auxiliary 1, Auxiliary 2, Fire Verification, Cross Zone, Priority, and Key Switch Arming.
2. The digital SLCs and the annunciator/keypad bus shall be able to operate from the control panel. All related cabling shall be in conformance with manufacturer equipment specifications.
3. Each zone shall function in any of the following configurations:

Night	Supervisory	Auxiliary 1	Cross-Zone
Day	Emergency	Auxiliary 2	Priority
Exit	Panic		Arming

C. Communication

1. The system shall be capable of signaling to 4 remote monitoring station receivers. Paths shall be capable of being assigned as either a “primary” or

“backup” path. In such a manner the system shall have multiple primary paths to multiple remote monitoring stations as well as multiple backup paths to multiple monitoring stations.

2. The system shall allow a backup communication path programmed for Network or Cellular to switch to the backup path should the Primary path become unavailable and automatically reverse back to the Primary path upon restoration of service.
3. The system shall leverage the enterprise IP infrastructure which may include, but not limited to, PSTN, existing data networks, satellite communication, fiber optic networks, LAN, Wireless LAN, WAN, cellular communication, and retail data networks.

D. Network Communication

1. The control panel shall be capable of asynchronous network communication with a retry time between 2 and 240 minutes and a fail time of 2 and 240 minutes. If communication is unsuccessful the control panel shall be capable of attempting backup communication through any of the available communication methods to the same receiver or a backup receiver.
2. Network communication between the control panel and the receiver shall be in a proprietary communication format.
3. The control panel shall be capable of supporting Dynamic Host Communication Protocol (DHCP) Internet Protocol (IP) addressing.
4. Underwriters Laboratories (UL) shall list network communication by the control panel for Standard or Encrypted Line Security.
5. The control panel shall be capable of two-way network communication using standard Ethernet 10/100 BaseT in a LAN, WAN, or Internet configuration.
6. The control panel shall be capable of communication by means of a 128-bit or 256-bit AES (Advanced Encryption Standard) Encryption.
7. The control panel shall be UL listed.

2.03 INTEGRATED INTRUSION ALARM AND ACCESS CONTROL OPERATION

- A. Access Authority Levels: The system shall be capable of programming access credentials authority levels to check whether the user has access to a specific area and also has the authority to disarm or arm the area. If the user access credential has access and disarm/arm authority the system shall provide the user the option to disarm the area simultaneously upon opening the door, or to open the door and begin an entry delay timer. With the timer option the user then disarms the area using an intrusion control keypad inside the area. If the user only has access authority to the area and the area is in an armed condition, the user is denied access to the area.

- B. Common Area: The system shall be capable of programming a common area to be armed when the last area in the system is armed and disarmed when the first area in the system is disarmed. To ensure the common area works properly it shall not have any user codes assigned to the common area. The system shall also be capable of programming multiple common areas.
- C. Area Access Control
 - 1. The system shall be capable of integrating area access control capability where specified into the same control panel with the ability to have up to 10,000 user credentials. User access is limited to custom profiles and/or schedules. Anti-passback shall be available. The networked version shall support a Two-Man Rule feature. The system shall support up to sixteen (16) access doors, connected to the system using a manufacturer-approved interface module.
 - 2. The System shall support a minimum of eight (8) access doors connected to the system using a manufacturer-approved interface module.
- D. Access Control Equipment: Access Control equipment shall communicate to the system by way of the control panel keypad bus.
- E. Use designated special code to test the system. The One-Man Walk Test feature allows a single technician to check the panel response to burglary, fire, panic, and supervisory zones.
- F. Multi-lingual Display Option: The system shall be programmed to display the User Menu and Status Display text in multiple languages.
- G. User Inactivity Audit: System shall allow user code inactivity to notify the central station after a programmable period of days of no activity. The system shall be programmable from 0-365 days.
- H. Communication Function Diagnostics: The system shall have enhanced diagnostic menu that enables technicians to check network and cellular communication status and cell signal strength from the keypad.
- I. GUEST Operation: The system shall be capable of in the Home/Sleep/Away with Guest House operation, create up to three separate systems (main and two guests).
- J. Keypads in each system can selectively arm the perimeter, interior, or bedrooms for only their protected areas. Main system users can add authorized users to all protected areas, but guests can add users only for their protected system.

2.04 CERTIFICATION AND TESTING

- A. Overview: Intrusion detection system shall detect entry through a door-switched door or motion of a body taking no more than two steps in an area secured with motion detection equipment.
- B. Prior to calling for a walk test, the following shall be completed:
 - 1. Submit to the ARCHITECT the Project Site Map and Installation Worksheets described below.
- C. Alarm System Initialization:
 - 1. Upon notification from the CONTRACTOR, the PROJECT INSPECTOR will contact the OWNER and request a pre-walk test meeting and a two-day system test buffer report.
 - 2. System shall be complete and properly operating. In addition to other completion criteria, the event buffer shall be free of unexplainable false alarm reports and system errors.
- D. Walk Test:
 - 1. Prior to start of system Testing, complete and submit to the PROJECT INSPECTOR the six program sheets referred to as Attachment B.
 - 2. Walk the system with the PROJECT INSPECTOR before or after normal building hours, holidays or Saturdays at OWNER's option. Coordinate time of test with the PROJECT INSPECTOR. A "Walk Test" shall be performed with the PROJECT INSPECTOR present to verify correct programming and functionality of each zone. Any improperly placed or malfunctioning equipment shall be noted. Upon repair of discrepancies, system shall be walk-tested again, until no further problems exist. The PROJECT INSPECTOR will keep a record of problems noted, and the date they were repaired. A copy of this log shall be supplied to OWNER and ITD Project Manager upon successful resolution of discrepancies.
 - 3. Provide minor necessary adjustments to system in presence of the PROJECT INSPECTOR.
 - 4. Upon completion of a successful walk test and prior to time testing, provide the programming sheets included within this specification and AutoCAD files, showing all areas of coverage and the corresponding hardware zones as delineated in section 3.04 of this specification. Time testing will not begin until these files have been delivered to the OWNER and the accuracy of the files has been ascertained.

5. Upon completion of the walk test and delivery of zone maps, a time test shall be performed by connection to the alarm test bed of the OWNER. During the test, the OWNER shall remotely monitor the system for a period of not less than one week. At the conclusion of the test, correct unexplained errors or false notifications. Upon completion of the test and any required adjustments, OWNER shall provide a statement of acceptance based on Substantial Completion.

2.05 BURGLARY CONTROL

- A. Burglary Standards: The Burglary system shall be listed as a Power Limited Device and be listed under the standards below. Each system shall be supplied with complete details on all installation criteria necessary to meet the following listings:
 1. ANSI/UL 1076; ANSI/UL 1610
 2. SIA CP-01-2010 False Alarm Reduction
 3. UCL-S304 Standard for Central and Monitoring Station Burglar Alarm Units
- B. Area System Mode
 1. The system user shall be capable of selectively arming and disarming any one or more of 32 areas within the intrusion detection system based on the user PIN code and/or keypad used.
 2. The system user shall be capable of assigning an opening and closing schedule to all areas or to each area separately. Each area shall be able to arm or disarm automatically by a schedule. The system shall have the capacity for common areas that automatically disarm when any other area disarms and that automatically arm when all others areas arm.
- C. All/Perimeter Mode: The system shall be capable of being configured into the All/Perimeter configuration to enable the selective arming of both the interior and perimeter when armed "All" or arming just the perimeter devices if arming "Perimeter".

PART 3 - EXECUTION

3.01 INSTALLATION

- A. System Component Installation: Materials shall be installed in strict compliance with all local, state, county, province, district, federal and other applicable building, safety, and fire standards, laws, codes, regulations, and guidelines including, but not limited to, all appendices and amendments and the requirements of the local authority having

jurisdiction (AHJ). Installation shall be in accordance with manufacturers' instructions and best practices.

1. Motion Detectors:

- a. End of Line resistors shall be installed on the motion detectors.
- b. Motion Detectors shall be "ON" at all times, unless noted otherwise. Main security keypad turns zone alarms Partitions on and off and reports to OWNER School Police. Alarms are annunciated at all times in the Project site annunciator when the system is either in the "Armed" or "Disarmed" condition, but will not report to the OWNER School Police when the system is in the "Disarmed" condition.
- c. A 90-degree motion detector shall be installed in the corner of a room, facing away from sunlight, heating elements, HVAC outlets and any turbulent air movements. All 360-degree motion detectors shall be installed in the center of the room. The PROJECT INSPECTOR shall confirm these locations on site. All motion detectors shall be field adjusted for sensitivity and correct aim per manufacturer's specifications.

2. Glass Break Detectors:

- a. End of Line resistors shall be installed on the glass break detectors.
- b. Glass Break Detectors shall be "ON" at all times, unless noted otherwise. Main security keypad shall turn zone alarms partitions on and off and report to OWNER School Police. Alarms shall be annunciated at all times in the Project site annunciator when the system is either in the "Armed" or "Disarmed" condition, but will not report to the OWNER School Police when the system is in the "Disarmed" condition.
- c. Install glass break detectors in ceilings at a distance of fifteen (15) feet away from windows or glass store fronts.

3. Door Switches:

- a. End of Line resistors shall be installed on the door switch.
- b. Perimeter Doors: Install J-Box (es) six inches above door switch facing inside of a room. Door switches shall be installed at top of door, opposite the hinge side, 12 inches from outer edge of door.
- c. Café refrigerators and Freezers: A J-box shall be installed six inches above each door switch facing inside of a room. Door switches to be

installed at top of door, opposite the hinge side, 12 inches from outer edge of door. Special surface-mounted, watertight aluminum boxes shall be provided to accommodate surface mounted magnetic door switch on outside of walk-in freezer and refrigerator.

4. Main Security Controller:
 - a. Controller shall be powered by a dedicated, unswitched 120 VAC power source. The circuit number shall be clearly identified and noted on both Electrical panel directory, record drawings, and on alarm panel.
5. LCD Keypad:
 - a. The Main display keypad for each controller shall be installed in the Main Office as shown on drawings. An additional service keypad shall be installed immediately adjacent to each Controller if the controller is not located in the Main Office.
 - b. The location and distance from the main system panel along with the total quantity of keypads must be considered in the wiring capacitance calculations. LCD display keypad locations may be placed in some or all of the following locations, as specified in the project design drawings.
 - 1) Main office.
 - 2) Kitchen.
6. Provide lock-on device on all circuit breakers serving security equipment. Switch panel locations shall be as indicated on Drawings.
7. Main and remote security panels shall be placed only in telecommunications equipment rooms unless otherwise indicated on Drawings.
8. Graphic Annunciator:
 - a. The system should support a Graphic Annunciator panel, using a computer generated map overlay shall display an outline of coverage areas, with a single LED indicating each zone. Map overlay shall be produced using a method that will not fade or wash out, on a media that will not yellow or degrade from natural light exposure. Laser printing, Silkscreen, or Archival Ink, on UV stabile Vellum or other translucent material shall be used to create the map overlay. Where there are large quantities of zones on a single map, it is permissible to combine two or more zones onto a single indicator, provided these zones cover the same localized area of the map. As an example, two separate zones that provide adjacent coverage to the same entrance area of a building, or

cover areas of large room, may display status on a single LED of the annunciator to represent the general area of coverage.

- b. On small zone systems (12 or fewer zones), provide a durable, written zone description mounted on the face of the GA in lieu of a map overlay.

9. Batteries:

- a. Calculations shall be made and submitted to guarantee that the batteries in each panel location are sized for a minimum of eight (8) hours back-up protection for all modules powered at that location.
- b. Battery installation date shall be clearly marked on each battery in a location easily read upon opening cabinet.
- c. Battery shall be located in the same cabinet housing the control module or in a NEMA box adjacent to the control module cabinet.

3.02 RELATED SYSTEMS INSTALLATION

A. Wiring Installation: Provide 120V wiring in conduit, as required, for all equipment. 120V outlets shall be located in a separate NEMA enclosure adjacent to required device cabinets. This NEMA enclosure shall be sized to allow any required power adapters. Low voltage wiring from power adapter to controller shall be in raceway or conduit. Wiring from sensor to controller or terminal cabinet shall be in raceway, cable tray or conduit. Wiring shall conform to the California Electrical Code.

B. Labeling and Marking:

1. Mark all panels, devices and cables with laser printer generated labels.
2. Each system panel shall have a comprehensive index placed in a plastic envelope secured to the inside of the panel door. Final system test and acceptance shall not commence until all completed index cards are installed.
3. At the Main Security Panel, the index shall indicate zones that are covered by the MSP, cross-referenced to cable labels, Remote Security Panels connected, and LX/Keypad cable identifiers for cables entering and leaving the cabinet. This identification shall include all cable references including those to telecommunication or networking connections.
4. At Remote Security Panels, the index shall indicate zones that are covered by the respective RSP, cross-referenced to cable level, the cable connecting to MSP, and the LX/Keypad cable identifiers for cables entering and leaving the cabinet. This identification shall include all cable references including the telecommunication or networking connection.

5. Each cable shall be labeled with the same identifier on the cable at the terminal device, on the cable at the alarm panel, and at all other cable and device termination points. Cable markers shall be located within two inches of the end of the cable jacket and shall be directly readable. All labels shall be printed by a laser printer.
6. Each device shall be labeled to indicate the associated zone. Labels shall be TBD

C. Wire Terminating:

1. Conductors shall be terminated on Terminal blocks that shall be solderless push-on (#20 to 22 gage solid) with integral fanning strip. Solderless push-on type blocks shall be Siemon Company 66-Series or equivalent. Terminals for connections to external circuits shall be properly labeled. 66B blocks shall be mounted directly to terminal location without use of mounting legs. 66M blocks shall be mounted on 89B mounting spacers. Install the required terminal blocks as necessary within a NEMA 3R with hinged cover, wooden backboard, and flush type lock, Corbin or equivalent, keyed for CCL Cat. 60 key.
2. Terminal blocks shall be installed on back of cabinets only, not on sides. Incoming cables shall be terminated on outside pins of terminal blocks and outgoing cables shall be terminated on second pin from buttside edge. This method shall be provided at satellite terminal locations.
3. Wires shall be consistently color-coded. Wire nuts, shall not be installed.
 - a. Wires shall be provided with code marker tags and be indexed to equipment and noted on as-built Drawings, and on index sheet or cards placed in all equipment cabinets and in as-built data folder.
 - b. Provide wire termination index sheets or cards in all terminals and equipment cabinets and include a Project site zone plot plan in relay cabinets.
4. Provide all terminal boxes with screw type terminals allowing sufficient terminals for all conductor termination.

3.03 PROTECTION

Protect the Work of this section until Substantial Completion. Material or work damaged during the planning, installation, testing, and clean-up of this project must be replaced or repaired, at no expense to the OWNER, to meet Project specifications before final acceptance of work.

3.04 CLEANUP

CONTRACTORS work for each school installation shall be considered complete when all of the aforementioned requirements specified in this document have been met. This includes (but is not limited to) the following:

1. Ceiling panels previously removed have been put back in place.
2. System labels have been put in place.
3. Construction and installation debris and scrap materials have been removed and legally disposed of from project site.
4. System testing has been completed, CONTRACTOR certifies that entire system is in working order, and Test Forms and Project Record Documents have been submitted and approved by the OWNER.
5. Marked up, project record documents have been returned to the OWNER.
6. Unused customer material has been returned to the OWNER.
7. The OWNER has successfully completed acceptance testing of the network installation.
8. The PROJECT INSPECTOR has inspected and accepted the installation.
9. Documentation, to include as-builts, Zone Maps and Programming sheets along with required soft copies has been turned over to the OWNER.

END OF SECTION

SECTION 28 31 00
FIRE DETECTION AND ALARM SYSTEM

PART 1 – GENERAL

1.01 SECTION INCLUDES

- A. Fire alarm control unit (FACU).
- B. Manual fire alarm stations.
- C. Automatic smoke detectors.
- D. Automatic heat detectors.
- E. Waterflow and valve position supervisory switches.
- F. Fire alarm occupant notification appliances.
- G. Auxiliary fire alarm equipment and initiating devices.
- H. Fire alarm wiring and cables.
- I. Enclosures for FACU panels.
- J. Power supply 120V.
- K. Fire alarm system installation.
- L. Training sessions.
- M. Training manuals and training aids.

1.02 RELATED SECTIONS

- A. Section 07 84 13, Penetration Firestopping
- B. Section 09 91 00, Painting

1.03 REFERENCES

- A. National Fire Protection Association (NFPA):
 - 1. NFPA 70 National Electrical Code
 - 2. NFPA 72 National Fire Alarm and Signaling Code
 - 3. NFPA 101 Life Safety Code
 - 4. NFPA 130 Standard for Fixed Guideway Transit and Passenger Rail Systems
- B. Americans with Disabilities Act (ADA)
- C. Underwriters Laboratories, Inc. (UL):
 - 1. UL 268 Smoke Detectors for Fire Protective Signaling Systems
- D. Factory Mutual System (FM)
- E. National Electrical Manufacturers Association (NEMA)

1.04 REGULATORY REQUIREMENTS

- A. California Code of Regulations (CCR):
 - 1. Title 8, Cal OSHA
 - 2. Title 19, Public Safety
 - 3. Title 24, Part 2, California Building Code
 - 4. Title 24, Part 3, California Electrical Code
 - 5. Title 24, Part 9, California Fire Code

1.05 SUBMITTALS

- A. General: Refer to Section 01 33 00, Submittal Procedures; Section 01 33 23, Shop Drawings, Product Data and Samples; and Section 01 78 23, Operation and Maintenance Data Manual for submittal requirements and procedures.
- B. Shop Drawings: Submit Shop Drawings including but not limited to the following:
 - 1. Complete descriptive data indicating UL listing for system components.
 - 2. Complete sequence of operation of the system (system logic).

3. Control unit general arrangement, and connection wiring with individual wire numbers, and color code. Module legends shall show the module type and the input and output connections.
 4. Layout plan view showing location of initiating devices and notification appliances with zone and device numbers. Conduit size, and routing with wire fill must be shown on the same drawing.
 5. Connection details typical for each device to be installed.
 6. Nameplate schedules indicating text for annunciation and labeling.
 7. Area coverage drawings with spacing requirements for the initiating and indicating/notification appliances in accordance with the requirements and criteria specified in the applicable Codes and Standards.
 8. Standby Battery size calculations.
 9. Provide California State Fire Marshall (CSFM) Listing numbers for system components.
- C. Product Data: Provide electrical characteristics and connection requirements.
- D. Spare Parts List: The Supplier shall provide a recommended spare parts list for one-year operation, and pricing good for 90 Days from date of equipment delivery.
- E. Reports: A certificate of compliance and other documentation, as required by latest NFPA 72, shall be provided at the times indicated therein. Complete and submit for acceptance the applicable and required information in the System Record of Completion as required by NFPA 72, Section 7.5.6.
- F. FACU program and software for maintaining the fire alarm system and for making modifications to the system for the addition or removal of devices, control function changes, etc.
- G. Testing Plan: Provide a testing plan for quarterly, semiannual, and annual maintenance with detailed instructions in accordance with NFPA 72, Chapter 14.
- H. Record Documents: Submit Record Documents in accordance with Contract Specifications Section 01 78 39, Record Documents.

1.06 QUALITY ASSURANCE

- A. General: Refer to Section 01 43 00 for Quality Assurance requirements and procedures.
- B. Items of the fire alarm system shall be listed as a product of a single fire alarm system manufacturer under the appropriate category by the Underwriters Laboratories Inc. (UL), and shall bear the “UL” label. Control equipment shall be listed under UL category UOJZ as a single control unit. Partial listing will not be acceptable.
- C. In addition to the UL-UOJZ requirement specified above, the system controls shall be UL listed for Power Limited Applications in accordance with California Electrical Code, Article 760. Circuits shall be marked in accordance with California Electrical Code, Article 760-22.
- D. Components of the fire alarm system shall be listed by the California Department of Forestry and Fire Protection Office of the State Fire Marshal (CSFM).
- E. When more restrictive requirements have been adopted by the local authority having jurisdiction (AHJ), the system shall comply with the local requirements.

1.07 INSTALLER AND MANUFACTURER QUALIFICATIONS

- A. A company licensed by State of California as a fire alarm installer with a C-10 Contractor's license and specializing in installing the products specified in this Contract Specification with a minimum of five years documented experience.
- B. Principal installation personnel shall have completed the system manufacturer's training courses on the equipment to be installed.
- C. The fire alarm system supplier (FASS) shall be a specialty contractor or a manufacturer regularly engaged in the design and the installation of fire alarm systems and their related subsystems. For the purposes of this Section, a specialty contractor shall be interpreted to mean an organization that complies with the following criteria:
 - 1. Employs personnel on this project who have successfully completed NFPA, National Institute for Certification in Engineering Technologies (NICET), or manufacturer’s training courses on general fire protection principles and practices.
 - 2. Has performed work (including design, installation, startup, testing and maintenance) of similar or greater complexity on at least five previous projects.
 - 3. Has been actively engaged in the type of work specified in this section for

a minimum of five years.

D. For the purposes of this section, a manufacturer shall be interpreted to mean an organization that complies with the following criteria:

1. Manufactures at least 75 percent (as measured by equipment cost) of the hardware specified in this section and which is furnished for this project.

E. Complies with the preceding criteria established for a specialty contractor. The FASS shall maintain a permanent, fully staffed and equipped service facility within 100 miles of the Jobsite. The service facility shall have full-time, NICET-certified employees qualified in the design, installation, testing, and servicing of the equipment and systems specified herein.

F. The FASS as a minimum shall be responsible for the technical supervision of the installation by providing on site supervision to the installers of the system.

1.08 MANUFACTURER’S FIELD SERVICES

A. Include services of factory or NICET (National Institute for Certification in Engineering Technologies) certified technician to supervise installation, adjustments, final connections, and system testing.

1.10 SPARE PARTS LIST

A. Provide the following spare parts list. Percentages will be taken from the total quantity installed for that device. The list will include but is not limited to the following:

	Part	Quantity
1	Automatic smoke detector	15 percent
2	Automatic heat detector	15 percent
3	Automatic smoke and heat detector base	15 percent
4	Automatic smoke detector tamper cover	10 units
5	Manual fire alarm pull station	15 percent
6	Manual pull station tamper resistant cover	10 units
7	Ceiling mounted speaker/strobe notification appliance	10 percent
8	Ceiling mounted speaker notification appliance	10 percent
9	Wall mounted speaker/strobe notification appliance	10 percent

10	Wall mounted strobe notification appliance	10 percent
11	Occupant notification tamper resistant cover	10 units
12	Monitor module	15 percent
13	Control module	15 percent
14	Six relay control module	3 units
15	Fire Alarm Control Unit with programming	1 unit
16	Keys of each type	12 units each

PART 2 – PRODUCTS

2.01 GENERAL REQUIREMENTS AND OPERATION

- A. Provide an addressable, electrically supervised, manual and automatic, fire alarm and detection system, including proprietary and local alarm units, and occupant notification appliances.
- B. Power supplies: Adequate to serve control unit modules, remote detectors, remote annunciators, smoke dampers, relays, alarm notification appliances, and other appurtenances as specified. Battery-operated emergency power supplies shall be furnished and sized with minimum 25 percent over the capacity required for the operating system in standby mode for minimum of 24 hours followed by alarm notification mode for 15 minutes per NFPA 72.
- C. Performance and capacities of signaling line circuits shall be in accordance with NFPA 72, Class A; printer circuit in accordance with NFPA 72, Class E; initiating device circuits shall be in accordance with NFPA 72, Class A; and occupant notification circuits shall be in accordance with NFPA 72, Class A.
- D. System Supervision: Alarm, trouble, and supervisory signals from intelligent reporting devices shall be encoded onto NFPA Class A Signaling Line Circuit (SLC). Alarm signals arriving at the fire alarm control unit shall not be lost following a power failure (or outage) until the alarm signal is processed and recorded.
- E. Initiating Device Circuits (IDC): Supervised zone module with alarm and trouble indication; occurrence of an open condition shall place the circuit in trouble mode but shall not disable that circuit from initiating an alarm. Initiating device circuits shall be provided with Class A wiring.
- F. Sprinkler system supervision circuits shall connect to the proprietary system transmitter via supervisory module for the tamper switches and valve position

supervision switches with Class A wiring.

- G. Occupant Notification Appliance Circuits: Supervised signal modules, sufficient for the indication/notification appliances connected to system; occurrence of an open or ground fault condition shall place the circuit in trouble mode but shall not disable any device on that circuit from signaling an alarm. Indicating appliance circuits shall be Class A wiring.
- H. Auxiliary Relays: Provide sufficient double throw auxiliary relay contacts for each accessory function as indicated.
- I. Trouble Sequence of Operation: System or circuit trouble shall place the system in the trouble mode, which shall cause the following system operations:
 - 1. Visual and audible trouble alarm indicated by address at fire alarm control unit.
 - 2. Manual acknowledge function at the fire alarm control unit shall silence the audible trouble alarm; visual alarm shall continue to be displayed and notification shall be maintained until initiating device failure or circuit trouble is cleared.
- J. Alarm Sequence of Operation: Actuation of initiating device shall place the circuit in alarm mode, which shall cause the following system operations:
 - 1. Sound and display local fire alarm notification appliances.
 - 2. Transmit address alarm signal to control unit.
 - 3. Indicate location of alarm address and type of device on fire alarm control unit.
 - 4. Transmit signal by function to building mechanical systems as necessary and required for elevator control, escalator control, and other identified functions.
 - 5. Alarm silence function at the fire alarm control unit shall silence audible alarm signaling devices; visual alarm shall continue to be displayed at the local fire alarm control unit, and notification via the network shall be maintained until alarm reset occurs. Actuation of a second initiating device shall cause the alarm to re-activate in accordance with this section.
- K. Alarm Reset: System shall remain in the alarm mode until manually reset with key-accessible reset switch; system shall reset only if initiating circuits are out of alarm mode.
- L. Lamp Test: Manual lamp test function shall cause alarm indication at each zone at

fire alarm control unit.

- M. Addressing: Actual room numbers and/or names will be assigned by the District and shall be shown on the Drawings. Control unit addressing shall include the address, room number or room/space name, type of address, and functions associated with the address.
- N. Each fire alarm control unit shall have a minimum of 20 percent additional space for future expansion.
- O. Each system shall be electrically supervised against open wire, shorts and ground faults in the initiating, and indication/notification circuits.

2.02 MANUFACTURERS

- A. Acceptable Manufacturers:
 - 1. Products described below and identified by product name, model number, or other manufacturer designation, are Basis of Design Products. Basis of Design Products establish the standards of type, function, dimension, in-service performance, physical properties, appearance, warranty, cost, and other characteristics required by the Contract.
 - 2. Products of manufacturers not listed may be proposed for substitution, provided they are comparable to the products specified.
 - a. If “No substitutions” is indicated next to the product name, provide only products of listed manufacturers.
 - b. The burden of proof of equality of proposed products is on the Contractor.

2.03 CONTROL UNITS

- A. The main FACU and associated sub-assemblies shall be Notifier NFS2-3030 or equal, complete with power supply and the necessary components as shown below:
 - 1. Central Processing Unit and Display.
 - 2. Digital Voice Command.
 - 3. Loop Control Module.
 - 4. Loop Expander Module.
 - 5. 75 Watt Amplifier.

6. Control Unit Power Supply.
 7. Power Supply.
 8. Batteries.
 9. Enclosure.
 10. Battery Box.
 11. Seismic Mounting Kit.
- B. The sub-fire alarm control unit (sub-FACU) and associated sub-assemblies shall be Notifier NFS-320 or equal. The sub-FACU shall be capable of being networked to the main FACU. The sub-FACU shall be addressable, capable of Class A SLC and NAC configuration, and have an 80-character display. The sub-FACU shall be equipped with a power supply and the required components to perform the functions specified and shown in the design, including but not limited to:
1. Control unit complete with backbox and power supply
 2. Batteries
 3. Seismic Mounting Kit
- C. The FACU shall communicate with and control the intelligent detectors, intelligent manual pull stations, addressable modules, and other system controlled devices. The FACU shall perform the following functions:
1. Supervise and monitor the appropriate intelligent addressable detectors and addressable modules connected to the system for normal, trouble and alarm conditions.
 2. Supervise the appropriate signaling and notification circuits.
 3. Detect the activation of any initiating device and the location of the alarm condition for devices on the circuit. Operate notification appliances and auxiliary devices as programmed.
 4. Visually and audibly annunciate any trouble, supervisory, or alarm condition on the unit display. Communicate such alarms via the fire alarm communication network.
 5. Cause the signals, annunciation, and control of HVAC fans, elevators,

escalators, and other equipment, as indicated in the Drawings.

D. System Capacity and General Operation

1. The FACU shall provide or be capable of expansion to 3,180 intelligent addressable devices, with up to 318 intelligent/addressable devices per loop. Each addressable loop shall have a minimum of 15 percent spare capacity and the FACU shall have a total of 30 percent spare capacity.
2. The FACU shall communicate with, monitor, and control other modules within the FACU. Removal, disconnection, or failure of any control unit module shall be detected and reported to the system display.
3. The FACU shall contain and execute control-by-event programs for specific action to be taken if an alarm condition is detected by the system. Such control-by-event programs shall be held in non-volatile programmable memory and shall not be lost with system primary and secondary power failure.
4. Each peripheral device connected to the FACU shall be continuously scanned for proper operation. Data transmissions between the FACU and peripheral devices shall be reliable and error free. The transmission scheme used should employ dual transmission or other equivalent error checking techniques. Failure of any peripheral device to respond to an interrogation shall be annunciated as a trouble condition.

E. Display

1. The complete system display shall provide the controls and indicators used by the system operator and may also be used to program system operational parameters.
2. The display shall be minimum 16 line, 640 character LCD backlit with a minimum of 11 LED indicators for system status and alarm conditions.
3. The display assembly shall contain, and display as required, custom alphanumeric labels for intelligent detectors, and addressable modules.

F. Signaling Line Circuit (SLC) Interface

1. Notifier Loop Control and Expander Modules: LCM-320 and LEM-320, or equal. The FACU SLC interface shall monitor and control intelligent addressable devices, including intelligent detectors and monitor or control modules.

2. The SLC interface shall not require any jumper cuts or address switch settings to initialize operations.
3. The SLC interface shall provide power and communicate with intelligent addressable detectors and modules on a single pair of wires. This SLC Loop shall be Class A wiring.
4. The SLC interface shall receive information from intelligent detectors and shall process this information to determine whether normal, alarm, or trouble conditions exist for that particular detector. The FACU/SLC interface shall include software to automatically maintain the detector's desired sensitivity level by adjusting for the effects of environmental factors, including the accumulation of dust in each detector. The analog information may also be used for automatic detector testing and for the automatic determination of detector maintenance requirements.
5. The SLC interface board shall communicate with each intelligent addressable detector and addressable module on its SLC loop and verify proper device function and status. Communication with intelligent devices shall be performed at time intervals consistent with the FACU Listing/Approval.

G. FACU/AMP Enclosure:

1. Notifier CAB-4 or equal. The control unit shall be housed in a UL listed cabinet. Enclosure and front shall be corrosion protected, given a rust-resistant prime coat, and manufacturer's standard finish.
2. The back box and door shall be constructed of steel with provisions for electrical conduit connections into the sides, top, and bottom.
3. The door shall provide a key lock and shall include a glass or other transparent opening for viewing of all indicators.
4. The control unit shall be modular in structure for ease of installation, maintenance, and future expansion.
5. The FACU and associated equipment shall be protected from the effects of voltage surges or line transients in accordance with UL 864 standards.
6. Each peripheral device connected to the FACU shall be continuously scanned for proper operation. Data transmissions between the FACU and peripheral devices shall be reliable and error free. The transmission scheme used shall employ dual transmission or other equivalent error checking techniques.

7. Provide seismic certification from manufacturers for equipment and enclosures. (Refer to ASCE7-10 section 13.2.2 2.)
 8. Provide anchorage calculations and design details for enclosures and panels. (Refer to ASCE7-10 section 13)
- H. FACU Power Supply
1. Notifier AMPS-24 or equal. The main power supply shall operate on 120 VAC, 60 Hz, and shall provide necessary power for the FACU.
 2. It shall provide power necessary for proper operation of the occupant notification appliances. External power supplies shall be used to power the occupant notification appliances (strobes) as necessary.
 3. It shall provide a battery charger and batteries for 24 hours of standby using dual-rate charging techniques for fast battery recharge.
 4. It shall provide a very low frequency sweep earth detect circuit, capable of detecting earth faults on sensitive addressable modules.
 5. It shall be power-limited per current UL 864 requirements.
 6. It shall provide meters to indicate battery voltage and charging current.
 7. A separate power supply shall be provided for externally controlled devices such as smoke dampers, remote relays, door holders, etc.
- I. FACU Digital Voice Command
1. Notifier DVC-EM or equal. The digital voice command center located with the control unit, shall contain equipment required for audio control, emergency microphone system control, signaling, and supervisory functions. This shall include speaker zone indication and control, telephone circuit indication and control, digital voice units, microphone and main telephone handset.
 2. The voice command center equipment shall perform the following functions:
 - a. Operate as a supervised multi-channel emergency voice communication system. Audibly and visually annunciate the active or trouble condition of every speaker circuit.
 - b. Audibly and visually annunciate any trouble condition for digital tone and voice units required for normal operation of the system.
 - c. Provide all-call emergency paging activities through activation of a

single control switch.

- d. Provide a factory recorded library of voice messages and tones in standard WAV. File format, which may be edited and saved on a PC running a current Windows® operating system.
- e. The digital voice command shall be modular in construction and shall be capable of being field programmable without requiring the return of any components to the manufacturer and without requiring use of any external computers or other programming equipment.
- f. The digital voice command and associated equipment shall be protected against unusually high voltage surges or line transients.

J. System Circuit Supervision

1. The FACU shall supervise circuits to intelligent devices, modules, horns, strobes, horn/strobes, speakers, speaker strobes, and any remote power supplies and shall annunciate loss of communications with these devices/appliances. The FACU shall continuously scan the devices for proper system operation. Upon loss of response from a device, an audible trouble shall sound.
2. Fire protection system valves shall be supervised for off-normal position.

K. Field Wiring Terminal Blocks

1. For ease of service, wiring terminal blocks shall be the plug-in type and have sufficient capacity for 16 to 12 AWG wire. Terminal blocks permanently fixed are not acceptable. The number of wires at each terminal shall not exceed two.

L. FACU Programming Features

1. The Contractor shall retain the services of factory certified technician for programming the FACU.
2. The system shall be programmable, configurable, and expandable in the field without the need for special tools or electronic equipment and shall not require field replacement of electronic integrated circuits.
3. Programming or editing of the program in the system shall be achieved without special equipment and without interrupting the alarm monitoring functions of the FACU.
4. Programming shall be accomplished through the standard FACU keyboard or through the video terminal.
5. Field defined programs shall be stored in non-volatile memory. The control

unit shall maintain a history file of the last 4000 events, each with a time and date stamp. History events shall include all alarms, troubles, operator actions, and programming entries. The control panels shall maintain a 1000 event alarm history buffer, which consists of the 1000 most recent alarm events from the 4000-event history file.

6. The programming function shall be enabled with a password that may be defined specifically for the system when it is installed. Two levels of password protection shall be provided in addition to a key-lock cabinet. One level shall be used for status level changes such as zone disable or manual on/off commands. A second (higher-level) shall be used for actual change of program information.

System programming shall be capable of being backed-up on approved removable digital media (i.e. USB flash drive). This system back-up shall be capable of being downloaded to a replacement FACU system should the system be damaged due to fire or other event.

7. The Contractor shall turn over FACU passwords at the completion of programming or editing.

2.04 POWER SUPPLY FOR SPEAKERS

- A. Notifier DAA2-7525 or equal. The digital amplifiers shall provide a minimum of 75 watts total output power at 25 VTMS and support two Class A high-level outputs.
- B. Multiple audio amplifiers may be mounted in a single enclosure, either to supply incremental audio power, or to function as an automatically switched backup amplifier(s).
- C. The audio amplifier shall include an integral power supply and shall provide built-in LED indicators to signal all required status, faults, operation, and alarm conditions.

2.05 POWER SUPPLY FOR STROBES

- A. Notifier ACPS-610 or equal. The notification appliance power supply shall operate on 120 VAC, 60 Hz, and shall provide necessary power for the power supply.
- B. It shall provide power necessary for proper operation of the occupant notification appliances (strobes). The power supply shall have a minimum of four (4) Class A, individually addressable outputs, each with a minimum output of 1.5 amps per circuit/output.
- C. It shall provide a battery charger and batteries for 24 hours of standby using

dual-rate charging techniques for fast battery recharge.

- D. It shall provide supervision of the power supply and the associated circuits and communicate with the FACU via monitoring modules or similar devices.
- E. It shall be power-limited per current UL 864 requirements.

2.06 ANNUNCIATOR

- A. Notifier LCD-160 or equal. The annunciator shall be equipped with one (1) Notifier Annunciator Control Module ACM-24AT and with one (1) Notifier Annunciator Expander Module AEM-24AT, or equal.
- B. The annunciator (including ACM and AEM modules) shall be housed in a secure, lockable enclosure with the screen and indicators visible without opening the door, Notifier ABS-4D(C), or equal.
- C. The annunciator shall have a 640-character liquid crystal display with backlit control; be capable of remote control of the FACU; be capable of providing events and preprogrammed custom messages as displayed on the FACU; and a full screen with soft key functions.

2.07 SYSTEM COMPONENTS

- A. Addressable Devices (General)
 - 1. Addressable devices shall provide an address-setting means.
 - 2. Alarm initiating devices shall be intelligent and addressable, shall be compatible with the FACU, and shall connect to the FACU signaling line circuits.
 - 3. Addressable devices shall provide an address setting means.
 - 4. Detectors shall be intelligent and addressable, shall be compatible with the FACU, and shall connect to the FACU signaling line circuits.
 - 5. Smoke detector sensitivity shall be set through the FACU and shall be adjustable in the field through the field programming of the system.
 - 6. Detectors shall automatically compensate for dust accumulation and other slow environmental changes that may affect their performance. The detectors shall be listed by UL as meeting the calibrated sensitivity test requirements of NFPA 72.
 - 7. The detectors shall be ceiling-mounted and shall include a separate twist-lock

base that includes a tamper proof feature.

8. The detectors shall provide a test means whereby they will simulate an alarm condition and report that condition to the FACU. Such a test may be initiated at the detector itself or initiated remotely on command from the control unit.
9. Detectors shall store an internal identifying type code that the control unit shall use to identify the type of device.

B. Addressable Manual Pull Station

1. Manual pull stations shall be Notifier NB-12LX, Notifier N-MPS, or equal, compatible with the FACU. Manual pull stations shall, on command from the FACU, send data to the control unit representing the state of the manual switch and the addressable communication status. They shall use a manually operated test-reset keylock and shall be designed so that after actual emergency operation, they cannot be restored to normal use except by the use of a hex key wrench or similar tool. Manual pull stations shall be provided with a non-alarming anti-tampering assembly, Safety Technology International (STI) Stopper II, or equal.
2. Manual stations shall be constructed of cast metal or plastic with clearly visible operating instructions provided on the cover. The word FIRE shall appear on the front of the stations in raised letters.
3. Stations shall be suitable for flush or semi-flush mounting as shown on the plans and shall be installed such that the operable part is 42 inches to 48 inches on center above the finished floor.
4. A permanent label identifying the pull station address shall be provided on each pull station.

C. Addressable Photoelectric Smoke Detector

1. Photoelectric detectors shall be Notifier FSP-851 or equal, compatible with the FACU. The detectors shall use the photoelectric principal to measure smoke density and shall, on command from the control unit, send data to the control unit representing the analog level of smoke density. Smoke detectors installed in public restrooms shall be provided with an anti-tampering and protective assembly, Safety Technology International (STI) Smoke Detector Damage Stopper-Steel, Steel Web Stopper for Smoke Detectors, or equal.
2. The smoke detectors shall be profiled for office or duct (as necessary and appropriate).
3. A permanent label, legible from the floor level, identifying the detector

address shall be provided on each detector base.

D. Addressable Heat Detector

1. Heat detectors shall be Notifier FST-851 or equal, compatible with the FACU. The detectors shall use the rate-of-rise and fixed temperature principals to measure heat.

EXCEPTION: Heat detectors installed in escalator machinery spaces accessed from the exterior of the Station shall be Notifier 302-AW-135 Rate Anticipation, all weather vertical mounting 135 degrees Fahrenheit, or equal, mounted in a NEMA 4 box. The device shall be capable of immediate response; self-restoring; hermitically sealed, shock resistant, corrosion resistant, and tamper-proof.

2. The heat detectors shall be fixed temperature of 135 degrees Fahrenheit and 15 degrees Fahrenheit per minute rate-of-rise.

EXCEPTION: Heat detectors installed in escalator machinery spaces accessed from the exterior of the station.

3. A permanent label, legible from the floor level, identifying the detector address shall be provided on each detector base.

E. SUB-FACU Photoelectric Smoke Detectors

1. Photoelectric detectors shall be System Sensor i3 2W-B, or equal, compatible with the FACU. The detectors shall use the photoelectric principal to measure smoke density.
2. A permanent label, legible from the floor level, identifying the detector zone and device number shall be provided on each detector base.
3. Photoelectric smoke detectors shall be arranged in a cross-zone fashion using two alarm initiating device circuits.

F. Sprinkler Waterflow and Valve Position Supervisory Switches

1. Existing waterflow and valve position supervisory switches for the sprinkler system shall be connected to the FACU using compatible monitor modules.
2. When operated, an alarm signal shall be initiated at the FACU.
3. A permanent label, legible from the floor level, identifying the address shall be provided on each device as shown on the Drawings.

G. Monitor Modules

1. Monitor modules shall be Notifier FMM-1, FDM-1, or equal, compatible with the FACU. Modules shall, on command, from the FACU, send data to the control unit representing the state of the module and the addressable communication status.
2. Monitor modules shall be mounted on the wall, adjacent to the monitored device.
3. A permanent label, legible from the floor level, identifying the address shall be provided on each device as shown on the Drawings.

H. Control Modules

1. Control Modules shall be Notifier FRM-1, FCM-1, FDRM-1, XP6-R, or equal, compatible with the FACU. Modules shall, on command, from the FACU, send data to the control unit representing the state of the module and the addressable communication status and perform the intended function.
2. Control modules shall be located no greater than 3 feet from the component controlling the device.
3. A permanent label, legible from the floor level, identifying the address shall be provided on each device.

I. Occupant Notification Appliances

1. Occupant notification appliances shall be System Sensor, L-Series, or equal, compatible with the FACU. Strobes shall have a plug-in design; protective cover to reduce ground faults; mounting plate with onboard shorting spring for testing wiring continuity; and field selectable candela settings of 15, 30, 75, 95, 110, 135, and 185 candelas. Speakers shall have a plug-in design; protective cover to reduce ground faults; mounting plate with onboard shorting spring for testing wiring continuity; and a rotary switch to control speaker power with settings of 1/4, 1/2, 1, and 2 watts.
2. Strobes: ADA and NFPA 72, compatible with the FACU, field selectable candela values, strobe light with red lettered "FIRE" on white cover plate, System Sensor L-Series, SCWL, SWL, or equal.
 1. Combination horn/strobes: ADA and NFPA 72, compatible with the FACU, field selectable candela values, strobe light with red lettered "FIRE" on white cover plate, System Sensor L-Series, P2WL, PC2WL, or equal.
 2. Speakers: ADA and NFPA 72, compatible with the FACU, field selectable candela values, strobe light with red lettered "FIRE" on white cover plate, System

Sensor L-Series, SPCW8, SPWL, or equal.

3. Combination speaker/strobes: ADA and NFPA 72, compatible with the FACU, field selectable candela values, strobe light with red lettered "FIRE" on white cover plate, System Sensor L-Series, SPSCWL, SPSWL, or equal.
4. A permanent label, legible from the floor level, identifying the address shall be provided on each appliance.
5. Notification appliances installed in public restrooms shall be provided with an anti-tampering and protective assembly, Safety Technology International (STI) Smoke Horn/Strobe/Speaker Damage Stopper, Stopper Dome, or equal.

2.08 BATTERIES AND POWER SUPPLY

A. Battery

1. Notifier BAT-12550 or equal. Batteries shall be 12V.
2. Battery shall have sufficient capacity to power the fire alarm system for not less than twenty-four hours plus 15 minutes of alarm upon a normal AC power failure.

B. Power Supply

1. Provide Power Supplies as specified in Articles, 2.02H, 2.03, and 2.04.
2. Shall be completely automatic, with constant potential charger maintaining the battery fully charged under all service conditions. Charger shall operate from a 120V 60Hz source.
3. Shall be rated for fully charging a completely discharged battery within 48 hours while simultaneously supplying any loads connected to the battery.
4. Shall have protection to prevent discharge through the charger.
5. Shall have protection for overloads and short circuits on both AC and DC.

2.09 FIRE ALARM WIRE AND CABLE

- A. Wiring shall be installed in a continuous galvanized rigid steel (GRS) conduit system. Conduits shall be concealed, to the extent practical and feasible. Conduit and wire shall be in accordance with the California Electrical Code (CEC), NFPA 72, and NFPA 130, Chapter 12.

1. Cable and wiring meeting the requirements of NFPA 72, Chapter 12 of NFPA 130, and the California Electrical Code may be installed in concealed spaces (e.g. above ceilings). Cable and wire shall not be installed in ventilation ducts. Fire alarm cabling and wiring shall be in GRS conduit.
2. Conductors shall be fire/smoke rated in accordance with the requirements of Chapter 12 of NFPA 130.
3. Conductors shall be labeled at each end.

B. Conduit/Raceway:

1. Wiring shall be installed in conduit or raceway. Raceway fill shall not exceed 40 percent of interior cross-sectional area where three or more cables are contained within a single conduit.
2. A fire alarm riser diagram indicating type and quantity of devices and size and quantity of conductors and conduits, shall be submitted for approval.
3. Cable must be separated from any open conductors of Power, or Class 1 circuits, and shall not be placed in any conduit, junction box or raceway containing these conductors, as per NEC Article 760-29.
4. Wiring for 24V control, alarm notification, emergency communication, and similar power limited auxiliary functions may be run in the same conduit as initiating and signaling line circuits. Circuits shall be provided with transient suppression devices and the system shall be designed to permit simultaneous operation of circuits without interference or loss of signals.
5. Conduit shall not enter the fire alarm control unit, or any other remotely mounted control unit equipment or back boxes, except where conduit entry is specified by the manufacturer.
6. New conduit shall be 3/4 inch minimum.
7. No conductor or cable splices shall be permitted.
8. Provide type and spacing of the fasteners specified/designed for installation of fire alarm devices and conduit installation so that it is within the exception limit of seismic requirements. (Refer to ASCE7-10 section 13.4.5.)

C. Wire

1. Fire alarm system wiring shall be new.

2. Wiring shall be in accordance with the California Electrical Code, Article 760, NFPA 72, Chapter 12 of NFPA 130, and as recommended by the manufacturer. Number and size of conductors shall be as recommended by the fire alarm system manufacturer.
 3. Wire and cable shall be CSFM listed for use with a protective signaling system. Wire and cable not installed in conduit shall have the fire resistance rating suitable for the installation as indicated in the California Electrical Code and shall be supported and protected in accordance with the California Electrical Code and the manufacturer's requirements.
 4. Field wiring shall be supervised. In the event of a primary power failure, disconnected standby battery, removal of any internal modules, or any open circuits in the field wiring; a trouble signal will be activated until the system and its associated field wiring are restored to normal condition.
- D. Terminal Boxes, Junction Boxes, and Cabinets
1. Boxes and cabinets shall be UL listed for their use and purpose.
 2. Fire alarm boxes, conduit body covers, and cabinets shall be painted red.
- E. The FACU shall be connected to a separate dedicated branch circuit with a maximum 20 amperes. This circuit shall be labeled at the main power distribution panel as FIRE ALARM. Fire alarm control unit primary power wiring shall be 12 AWG.

2.10 SCADA INTERFACE, DRY CONTACTS, AND REMOTE MONITORING

- A. **SCADA Points to Operation Control Center (OCC).** Provide an interposing relay cabinet (IRC) with 3 six-relay modules XP6-C next to CAB44. The relays shall be programmed to send the following signals to OCC:
1. Fire Alarm Summary
 2. Fire Alarm System Malfunction
 3. Manual Pull Station
 4. Waterflow
 5. Water Valve Closed
 6. 480V Switchgear Room

7. Train Control Room
8. Concourse Level
9. Upper Platform Level or Platform if only one level
10. Lower Platform Level (If applicable)
11. Substation (If applicable)
12. Public Address (PA) Preemption

The public address preemption relay shall suppress all automatic messages, but continue to allow manually operated messages through the PA system.

- B. **Dry Contact to Station Agent Booth (SAB).** Provide 1-relay module next to the Supervisory Cabinet in the SAB. The relay shall be programmed to activate on a fire alarm for fare gate and emergency barrier release.
- C. **Remote Monitoring System (RMS).** Provide all infrastructure for remote monitoring of the fire alarm system between the FACU and the train control room. Provide an ethernet connection when the distance is less than 250 feet or else provide 6 strands multimode fiber connected to the fiber entry cabinet. Coordinate with the District for connection to CAB100.

2.11 ENCLOSURES FOR FACU/AMP PANELS

Additional enclosures for main fire alarm panels and control equipment are required due to the dusty environment conditions within the control rooms.

- A. Additional Enclosures for FA Control Units and Relay boxes:
 1. Standard wall-mounted electrical enclosures from sheet metal shall be provided for additional protection.
 2. For locations with size restrictions the internal battery enclosures can be mounted outside next to the main enclosure for the FA control units and the main enclosure can be reduced in size to utilize the space only needed for the main FA control units.
 3. NEMA Rating shall be at minimum NEMA 4. (Due to the very dusty environment enclosures with gasket sealing and tight doors are required.)
 4. Viewing Windows: Each door of the main control unit enclosures shall be

equipped with a window big enough to view the main control panels annunciators and status monitors and to show the general content of the enclosures. (Relay boxes and Interposing Relay Cabinet (IRC) enclosures do not require additional windows)

5. Color: FA enclosures shall be painted red.
6. Provide seismic certification from manufacturers for equipment and enclosures. (Refer to ASCE7-10 section 13.2.2 2.)
7. Provide anchorage calculations and design details for enclosures and panels. (Refer to ASCE7-10 section 13)

2.12 POWER SOURCE

A. Distribution Panel Boards:

1. Power supply shall be 120V single phase out of existing nearby panel boards.
2. Connect to 3-phase 208/120V or 1-phase 240/120V power source.

B. Power Supply Circuit and Breaker:

1. Each FACU and AMP panel must be labeled with the dedicated electrical panel board and circuit breaker.
2. A dedicated circuit branch shall be only used for the fire alarm system.
3. Breaker shall be new even if the existing breaker space for the FA system is utilized.
4. Breaker shall be 120V single phase, 20A, and must match the panel manufacturer's specification.
5. Each breaker for the FA system shall be equipped with a breaker locking device (according NFPA 72, Section 10.6.5.4).
6. Contractor shall verify exact breaker space depending on panel condition and spare availability.
7. Each circuit must be labeled with red placard "FIRE ALARM SYSTEM" (according NFPA 72, Section 10.6.5.2.2).
8. Conduit shall be minimum 3/4 inch.

9. Provide type and spacing of the fasteners specified/designed for installation of fire alarm devices and conduit installation so that it is within the exception limit of seismic requirements (Refer to ASCE7-10 section 13.4.5.).

2.13 FACTORY TEST

- A. Perform final checkouts and test. Ship panels only after required factory tests are performed and required modifications or corrections are made. A factory certificate of inspection is required before shipment and shall accompany the shipping documents.

PART 3 – EXECUTION

3.01 INSTALLATION

- A. Install initiating devices, control units, audible signals, connections to equipment provided under other sections and related work following equipment manufacturers' requirements for a complete and properly functioning system that will perform specified functions.
- B. Interface and Coordination: Indicated diagrams and details show the general location and arrangement of equipment, conduit, wiring, and devices. Provide outlets, control and detection devices, and equipment properly located and readily accessible. Control and detection devices, equipment, and outlets shall be located to avoid interference with mechanical, architectural, and structural features.
- C. Control and other panels shall be mounted with sufficient clearance for observation and testing. Fire alarm junction boxes shall be clearly marked for distinct identification.
- D. Wiring Methods:
 1. Wiring shall be installed in a continuous GRS conduit system. Conduits shall be concealed.
 2. Prepare and submit a fire alarm riser diagram indicating type and quantity of devices and size and quantity of conductors and conduits.
 3. No wiring other than that directly associated with fire alarm detection, alarm, or auxiliary functions shall be permitted in fire alarm conduits. Wiring splices shall be avoided to the extent possible and if needed, they shall be made only in junction boxes and shall be connected with crimp-type connectors. Wire nut type connections are not acceptable.

4. Transposing or changing color-coding of wires will not be permitted. Conductors in conduit containing more than one wire shall be labeled on each end with wire markers conforming to the requirements of Specifications Section 26 05 24, Low Voltage Wires and Cables. Conductors in cabinets shall be carefully formed and harnessed so that each drops off directly opposite to its terminal. Cabinet terminals shall be numbered and coded. Controls and function switches shall be clearly labeled on equipment panels.
 5. Wiring shall be checked and tested to ensure that there are no grounds, opens, or shorts. The minimum allowable resistance between any two conductors or between conductors and ground is 10 Megaohm as checked by a Megger after conduit, conductors, and detector bases have been installed, but before the detector devices are plugged into the bases or end-of-line devices installed.
 6. Conduits entering or leaving the terminal cabinets and junction boxes shall be numbered in a logical and consecutive manner. A number shall be used only once.
 7. Conductors shall be tagged, labeled, and color-coded. Color-coding shall be by wire insulation, not taping or banding. The numbering and color-coding shall be continuous for each circuit wire.
 8. Wire shall be numbered at each connection, termination, and junction point. Wire numbering tags shall be professionally manufactured wire-markers. Each group of wires shall be tagged with its destination at each panel, terminal box, or junction box.
- E. Fire alarm circuits in conduit shall be installed in dedicated raceways and shall not be mixed with any other raceway systems of any Class wiring.
- F. Provide conduit and properly looped wiring necessary for the total operational system. Conduit size and wire quantity, size, and type shall be suitable for the equipment supplied and conform to equipment Suppliers' requirements. No wiring other than fire alarm circuits shall be permitted in the fire alarm system conduits; 120V circuits shall be in separate fire alarm conduits.
- G. End-of-line devices, for either initiating or indicating/notification appliance circuits, shall be mounted in accordance with the manufacturer's requirements.
- H. Automatic detector and occupant notification appliance installations shall conform to NFPA 72.
- I. Make conduit and wiring connections to initiating devices, indicating/notification appliances, door release devices, sprinkler flow

switches, sprinkler valve tamper switches, and duct smoke detectors.

- J. Solid conductors terminated at screwed connections of any type shall be formed about the screw shank in a clockwise direction. Stranded conductors shall be terminated with a pressure-applied lug connector, applied with a tool approved for the use by the lug connector manufacturer and the Engineer.
- K. Wiring shall be checked and tested to ensure that there are no grounds, opens, or shorts.
- L. Install wiring in accordance with the California Electrical Code, NFPA 72, and Chapter 12 of NFPA 130. Pull conductors to necessary and appropriate devices and appliances.
- M. Provide necessary connections and terminations. Field and FACU wiring shall be terminated in terminal cabinets or on field devices/appliances. Connections shall be made on terminals.
- N. Provide initial system addressing. Use the District's room numbers or names for annunciation.
- O. The FACU shall be programmed to identify the specific initiating device address or number; location or room number; brief description of room or area; device type; floor level; and status for initiating devices and must match the label on the device.
- P. Notify the Engineer at least 30 Days prior to the cutover period when the existing fire alarm system is taken offline, and the new fire alarm system is made operational.
- Q. The existing fire alarm system shall remain in operation for the duration of the Work. If any portion of the existing fire alarm system is taken offline, then the Contractor must notify the District and fire watch must be provided until full operation of the fire alarm system is restored.
- R. During the cutover period, if the District is unable to provide fire watch, the Contractor shall ensure that public safety is maintained by providing one or more fire watch personnel, as required and approved by the Engineer. Fire watches shall be provided with not less than one approved means for notification of the fire department and their only duty shall be to perform constant patrols of the protected premises and keep watch for fires. Fire watch personnel shall comply with the following:
 - 1. Fire watch personnel shall remain on duty while places requiring a fire watch are open to the public, or when an activity requiring a fire watch is being

conducted.

2. On-duty fire watch personnel shall have the following responsibilities:
 - a. Identifying and controlling fire hazards, detecting early signs of unwanted fire, raising an alarm of fire and notifying the fire department.
 - b. Keep diligent watch for fires, obstructions to means of egress and other hazards.
 - c. Take prompt measures for remediation of hazards and extinguishment of fires that occur.
 - d. Take prompt measures to assist in the evacuation of the public from the structures.

3.02 FIELD QUALITY CONTROL

- A. Provide the testing program, qualified technical personnel, tools, test equipment, and other items required to perform the tests.
- B. Furnish written notice as to when installed equipment will be tested so that the Engineer and AHJ can be present to witness the tests. A minimum of 30 Days prior notice of a proposed test shall be provided.
- C. At the Contractor's option, a representative of the equipment manufacturer may be present to witness the tests and verify the results.
- D. Tests shall not alter the Contractor's guaranty of the equipment. Replace and retest work and materials found to be not in compliance with Specification requirements.
- E. Maintain test data sheets showing the results of tests performed. Provide data sheets listing the acceptable or specified test limits and the values actually measured. Furnish one set to the Engineer. Retain one set.
- E. Provide data sheets showing the test set-up, the equipment used, the names of persons performing the test, the names of witnesses, the date, the location, and the serial number of the equipment under test. The test data sheets will be reviewed by the Engineer and accepted as submitted, or additional tests may be required. If additional tests are required because initial test results do not comply with these Specifications, the retesting shall be documented and submitted as before.
- F. Perform inspection of control panel as follows:
 1. The inspection shall first cover a physical check of panels in reference to the following items:

- a. Proper model numbers.
 - b. Arrangement of instruments per Shop Drawings on panel front.
 - c. Arrangement of back-mounted accessories for proper clearance, operation, and maintenance.
 - d. Finish of panel.
 - e. Tagging of wiring.
2. A test as per Article 3.09 and checkout report shall be prepared by the technician and submitted in triplicate, one copy of that shall be registered with the equipment manufacturer. Report shall include, but not be limited to:
- a. A complete list of equipment installed and wired.
 - b. Indication that equipment is properly installed and functions and conforms with this Contract Specification.
 - c. Tests of individual zones as applicable.
 - d. Serial numbers, locations by zone, and model number for each installed detector.
 - e. Voltage (sensitivity) settings for each detector as measured in place with air conditioning system operating.
 - f. Response time on thermostats, flow switches, and flame detectors (if used).
 - g. Technician's name, certificate number, and date.
 - h. Perform sequence of operations tests as shown in Attachment A.
3. After completion of the physical inspection, perform circuit checkouts as required to verify the correct operation of the system.

G. Field Tests

1. The Contractor shall perform electrical and mechanical tests required by NFPA 72, and the equipment manufacturer's installation procedures. A sample functional test procedure is shown in Attachment B.
2. Pre-testing: The system shall be pre-tested prior to final Acceptance testing. All points shall be tested from point of initiation to the final point or points of annunciation. Circuits shall be tested for continuity and ability to transmit the required signal correctly to the FACP. Problems due to wrong wire type, wire twist, impedance, mismatches, noise filtering, or shielding shall be corrected during pre-testing and prior to any final Acceptance tests. Pre-testing shall include every device in the system. Coordinate with other trades as necessary for testing. Provide the following tests and procedures:
 - a. Sprinkler Flow Switches: Record time delay from water flow to alarm and adjust as necessary for 30 to 50 seconds delay.
 - b. Valve Tamper Switches: Verify "trouble" signal is received on closing of each valve.
 - c. Smoke Detectors: Test with actual or approved artificial smoke. Verify that reset does not occur when devices are cleared of smoke. Verify

- supervisory circuit function.
- d. Elevator Recall: Verify that elevators recall to designated floor.
 - e. Escalator: Verify that power to the driving machine motor is interrupted and brakes apply upon station fire alarm signal.
 - f. Central Notification: Verify that one set of conductors in the terminal cabinet becomes a short circuit on any “trouble” condition and that the other set becomes a short circuit on any alarm condition. Verify that the conductor groups are labeled properly.
3. The Contractor shall measure and adjust each of the detectors to the maximum stable sensitivity setting. This shall be performed at the operational location of the unit and under normal operational environmental conditions in the area. Bench settings are not acceptable.
 4. Test splice points back to previous splice or terminal points before encapsulant is placed around the splice point.
 5. Check electrical instruments and each electrical circuit for continuity either by checking entire “loops” if within panel or by simulating field conditions or operations. This test shall include instruments, alarms, relays, and pressure switches that are part of the panel circuits. When full simulation is not possible or practicable, wires shall be given a point-to-point continuity check.

3.03 FIRE ALARM NAMEPLATES

- A. Identify fire alarm equipment devices so that the address may be visible from the floor.

3.04 PROGRAMMING

- A. The Contractor shall use a factory certified technician for all programming.
- B. The District’s room numbers or names provided by the Engineer for annunciation shall be used. The Contractor shall update the Construction Drawings to reflect the addresses used.

3.05 JOB CONDITIONS

- A. Coordinate Work schedule and material deliveries with the Engineer.
- B. Minimize impairments of existing fire protection system and coordinate any proposed shutdown with the Engineer. Restore existing fire protection systems removed from service as part of this Work at the end of each working day.
- C. The Work performed occurs within existing buildings. Equipment and material

furnished and installed from the Work shall be coordinated with existing space constraints. Fabricate equipment and material such that complete systems may be broken down into sections suitable for passage through existing passageways without modification to the building unless other arrangements are made with the Engineer to provide access.

3.06 PENETRATIONS

- A. The Contractor shall be responsible for openings and penetrations required.
- B. Provide penetrations of rated assemblies with through penetration fire stop systems with T ratings equal to those of the assembly penetrated.

3.07 PAINTING

- A. Exposed conduit shall be painted to match the surrounding wall or ceiling surface. Clean exposed surfaces of oil, dirt, and other debris to the satisfaction of the Engineer prior to painting. Paint samples shall be approved by the Engineer prior to application.

3.08 DEMONSTRATION AND TRAINING

- A. General:
 - 1. Prior to Final Inspection and Acceptance, instruct and train the District's designated operating and maintenance (O&M) personnel in the operation, start-up and shut-down, adjustment, troubleshooting, servicing, and preventive maintenance of equipment and systems.
 - 2. Explain to the District's O&M personnel, in full and to their complete understanding, procedures necessary to operate and maintain equipment and systems on a continuing basis.
 - 3. Provide training manuals and other instructional materials and teaching aids as required to properly perform the required instruction and training.
 - 4. Review the contents of O&M manuals specified in Section 01 78 23, Operation and Maintenance Data, with the District's O&M personnel in full detail to explain all aspects of the manuals and the operation and maintenance of equipment and systems.
 - 5. Provide classroom and on-site instruction as most appropriate for the equipment or system.
 - 6. Training programs shall be provided by manufacturer certified personnel.

7. Operation and maintenance manuals are specified in Section 01 78 23, Operation and Maintenance Data, and may be used for student training manuals upon approval.
8. Various specific and detailed requirements for instruction and training of the District personnel are specified in this Section, and in Sections 01 35 14, Operating System Interface and 01 35 24, Construction Safety.

B. Target Audience:

1. Station Agents: Must be able to reset alarms. Training to be conducted via train-the-trainer sessions.
2. Electricians: Training shall include basic familiarization and preventive maintenance procedures: removing, cleaning, replacing and testing components, disabling and enabling components through programming and interpreting the signaling output.
3. Fire Alarm Technicians/Engineers: Must be factory certified. Training shall include how to install, operate, start-up and shut-down, adjust, maintain, inspect, troubleshoot, test and modify equipment and systems. Training must include procedures necessary for preventive maintenance on the equipment and systems on a continuing basis. Must be able to program the Fire Alarm Control Unit (FACU). Programming tasks include, but are not limited to, deleting a device or zone, recognizing a substitute or replacement device.
4. Number of participants to train are as follows:
 - a. Station Agent Trainers: 2
 - b. Electricians: 20
 - c. Fire Alarm Technicians/Engineers: 6

C. Classroom Sessions:

1. The Contractor shall provide instruction and training sessions in the operation and maintenance of equipment and systems for the District O&M personnel prior to Acceptance by the Engineer of the affected work.
2. Minimum class lengths are as follows:
 - a. Station Agent Train the Trainer: 4 hours
 - b. Electricians: 4 hours
 - c. Fire Alarm Technicians/Engineers: 40 hours
3. Contractor shall provide a detailed instructor guide for the Station Agent and Electrician courses. The instructor guide is a written record of the facts and

details taught in the training course. Instructor guide shall include a course outline broken down by topics with a description of key points covered in each topic, the method of delivery, details for conducting hands-on activities and any actions required to configure and prepare training equipment/training aids.

4. Training sessions shall be conducted by representatives of the various equipment and product manufacturers and the Subcontractors who are involved in the installation and acceptance testing of the affected equipment and systems. Training sessions shall enable a qualified service technician to troubleshoot and sustain the equipment and systems.
5. The Engineer will provide a classroom facility for such instruction and training sessions as required for Station Agent Train the Trainer and Electricians.
6. For the electrician course, a demonstration class shall be conducted to demonstrate compliance with this technical specification section and for approval of the Engineer.
 - a. The approved instructor guides, training materials and training aids shall be used in the demonstration class.
 - b. The demonstration shall be presented to an evaluation team composed for the District personnel from the group to be trained, including Employee Development Specialists, Supervisors, and Foreworkers.
 - c. The evaluation team shall prepare a list of nonconformances, and recommend either acceptance, acceptance with changes, or rejection of the training demonstration.
 - d. The evaluation team may recommend that all (when rejected) or a portion (when accepted with changes) of the training demonstration be repeated.
7. The Contractor shall schedule the training sessions through the Engineer at a time convenient to the District.
 - a. Training classes for Electricians required on shifts as follows:
 - 1) 2 classes on day shift
 - 2) 2 classes on swing shift
 - 3) 1 class on graveyard shift
 - b. The Contractor shall notify the Engineer of the proposed Station Agent and Electrician training sessions at least 30 Days before the dates the training will be held
 - c. The Contractor shall notify the Engineer of the proposed training session dates for the Fire Alarm Technician/Engineer course at least six weeks prior to those dates.

D. On-Site and Hands-on Sessions:

1. Provide on-site, hands-on training sessions as required to demonstrate actual operating and maintenance procedures on the equipment. Hands-on training shall provide District personnel with actual operating and maintenance experience. Hands on sessions will enable each student to practice on the equipment. Demonstration by the instructor is not adequate.
2. Provide equipment and training aids to enable hands-on training in a location other than where the equipment is installed.
3. Installed equipment must be sufficiently tested to confirm it operates as expected before training is conducted and to enable completion of all hands-on activities and maintenance procedures.
4. Maximum class size for hands-on training is four (4).

E. Train the Trainer

1. Contractor shall deliver two (2) classes as designed for the EDS (trainers) responsible for training Station Agents.
2. Contractor shall review the instructor guide with the EDS after delivery of the course.
3. Contractor shall walk through how to configure training equipment/training aids in accordance with the instructor guide.
4. Contactor shall observe a minimum of one delivery per EDS trained via Train the Trainer session to confirm course is delivered as designed and accurate information provided.
5. Contractor shall be available to answer questions until all staff are trained. Questions shall be answered within 48 hours (two calendar days) of submission.

F. Videotaping Rights: The Engineer shall have the right to videotape of all training sessions presented by the Contractor. The Engineer shall also have the right to use these videotapes for future District conducted training courses

3.09 TRAINING MANUALS AND TRAINING AIDS

A. The Contractor shall provide instructor guides, student training manuals and any other materials or training aids to supplement the O&M Manuals specified in

Section 01 78 23, Operation and Maintenance Data, and submit them to the Engineer for review and approval at least 60 Days before the scheduled start of training sessions. Student training manuals shall be prepared specifically for use as training aids. All materials must be approved before the start of training, including applicable demonstration class.

- B. Operation and Maintenance Manuals are specified in Section 01 78 23, Operation and Maintenance Data. O&M manuals may be used for student training manuals with approval.
- C. Provide each training-session participant with one copy of pertinent training manuals at the start of training sessions. Provide the Engineer with electronic copies of all instructor guides, student training manuals, and any other materials.
- D. Upon completion of each training session or course of instruction, instructor's manuals, O&M manuals, training manuals, training aids and special tools shall become the property of the District. Provide the Engineer with all revisions to the training manuals throughout the Contract and Guaranty periods.
- E. The District reserves the right to copy all training manuals and training aids for use in District-conducted training courses.
- F. The Contractor shall be responsible in providing all tools, equipment, training aids, and other materials required for the training of District personnel. The number of special tools and other training equipment shall be adequate for the number of participants attending the training sessions.
- G. The Contractor shall provide copies of the program user software and licenses for each individual participating in the Fire Alarm Technicians/Engineers training.

3.10 SYSTEM ACCEPTANCE

- A. Procedure for the Acceptance tests shall be submitted for the Engineer's approval. Tests shall be performed in the presence of the Engineer.
- B. The completed system shall be tested to ensure that it is operating properly. The testing shall consist of exposing the installed detection units to the standard test per requirements of NFPA 72.
- C. Acceptance of the system shall require a demonstration of the operation and stability performance of the system. This shall be adequately demonstrated if the system operates for a ninety (90) day period without any unwarranted alarms. Should an unwarranted alarm(s) occur, the Contractor shall readjust or replace the

detector(s) and begin another ninety (90) day test period.

- D. As required by the Engineer, the Contractor shall recheck the detectors using the installation standard test after each readjustment or replacement of detectors. This test shall not start until the Engineer has obtained beneficial use of the building under test.
- E. If the requirements of the above paragraphs are not completed within one (1) year after commencing the tests described therein, the Contractor shall replace the system, and the process shall be repeated until acceptance of the equipment.
- F. Perform Sequence of Operation test procedures as shown in Attachment A.

END OF SECTION

SECTION 28 31 49

CARBON MONOXIDE DETECTION AND ALARM SYSTEMS

PART 1 – GENERAL

1.01 SUMMARY

- A. Section Includes: Toxic gas detection system, including a main control panel, sensors, and audible and visual alarm devices that can be linked to a Controller or a Building Automation System (BAS).
- B. The system shall include, but not be limited to, the following:
 - 1. Future expandability.
 - 2. Display of toxic gas concentration.
 - 3. Ability to modify alarm set points.
 - 4. Automatic and manual fan start/stop.
 - 5. Display of alarm status.
- C. Related Requirements:
 - 1. Division 01: General Requirements.
 - 2. Division 26: Electrical.

1.02 SUBMITTALS

- A. Provide in accordance with Division 01 and Section 23 0500: Common Work Results for HVAC.
- B. Materials to be furnished including copies of descriptive data for products.
- C. Wiring diagram Shop Drawings.
- D. Start-Up Reports.

1.03 WARRANTY

- A. Manufacturer shall provide a two year material warranty.

1.04 QUALITY ASSURANCE

- A. Perform submittals in accordance with Section 23 0500: Common Work Results for HVAC.

PART 2 – PRODUCTS

2.01 DETECTORS

- A. Detectors shall be surface mounted or duct mounted, as indicated in the drawings.
- B. Transmitter shall be powered by the control panel power supply rated at 24 Vac. Fully addressable gas transmitter shall be capable of communicating digitally with controller through an RS-485 communication port. Gas transmitters shall be installed in a true daisy chain with an end of the line resistor on the last transmitter. The gas transmitter shall incorporate an electrochemical cell for toxic gas monitoring and catalytic bead sensor for combustible gases. Unit sensing cell shall compensate for variations in relative humidity and temperature to maintain high levels of accuracy.
- C. When placed in a network configuration the transmitter shall be capable of transmitting gas concentrations through the controller. For local activation of fans, louvers, or other equipment, an on-board DPDT relay 5 A, 30 Vdc or 250 Vac (resistive load) shall be activated at programmable set points and programmable time delays through the control panel. An LCD display shall provide gas concentration readings.
- D. Transmitter shall be capable of operating within relative humidity ranges of 5-95 percent and temperature ranges of -4 degrees F to 104 degrees F (-20 degrees C to 40 degrees C).
- E. Unit shall be certified to ANSI/UL 61010-1 label and CAN/CSA-C22.2 No. 61010-1-04. Transmitter shall be manufactured in an ISO 9001 production environment.
- F. The transmitter shall have a plug-in capability for a gas cartridge with a smart sensor capable of self-testing.
- G. For local activation of audible alarms, the transmitter shall have an on-board device able to generate an audible output of 85 dBA at 10 feet.
- H. Detector alarm levels are to be activated and the unit is to be installed in accordance with the following parameters:

TOXIC GASES	1st ALARM SET POINT (TLV-TWA)	2nd ALARM SET POINT (TLV-STEL)	3rd ALARM SET POINT	MOUNTING HEIGHT	COVERAGE RADIUS
Carbon Monoxide (CO)	25 PPM	200 PPM	225 PPM	5 feet above finished floor	50 feet

Nitrogen Dioxide (NO ₂)	0.72 PPM	2.0 PPM	9.0 PPM	1 foot from ceiling	50 feet
-------------------------------------	----------	---------	---------	---------------------	---------

2.02 CONTROLLER

- A. The control panel shall be capable of communicating digitally with the networked transmitters and relay modules through three RS-485 communication buses. Each communication bus shall be capable of accepting a combination of up to 32 addressable transmitters, relay modules, or annunciator panels at a maximum distance of 2,000 feet. The power supply shall be of either 24 Vac or 24 Vdc.
- B. The controller shall manage four internal DPDT relays at fully programmable alarm levels (and within programmable time delays) and be capable of activating multiple relay modules of eight relays each. The relay rating shall be no lower than 5 A, 30 Vdc or 250 Vac (resistive load).
- C. The controller shall include a self-test function that allows for the activation/deactivation of all the programmed outputs by simulating a continuous five percent increase/decrease value until the maximum/minimum value is reached.
- D. The controller shall include a real-time clock that enables operation of the outputs for a specific timeframe.
- E. The controller shall also include an energy saving feature that allows for output operation on alarms set at the maximum, minimum or average value of a specific group of transmitters. This feature shall also allow for the activation of outputs upon a certain number of a specific group (3/4, 1/2, 1/3 and 1/4) of transmitters reaching their alarm levels. A total of 128 groups can be assigned.
- F. The controller shall be capable of communicating with an annunciator panel that can serve as a remote display panel in a secondary control room.
- G. The controller shall indicate the exact concentration of gas, the gas detected, and the location of the sensor by sweeping through the network and displaying the detected levels at each point on a graphic LCD display.

EDIT NOTE: DELETE PARAGRAPHS 2.02.H AND 2.02.I BELOW IF NOT APPLICABLE FOR SPECIFIC PROJECT; EDIT ACCORDINGLY.

- H. BACnet option: The controller shall enable BACnet communication through its optional BACnet output using BACnet/IP protocol over twisted-pair Ethernet or BACnet MS/TP protocol.
- I. Data logging option: An optional data logging capability shall provide long-term data logging to determine trends. The controller must collect data automatically and shall store it on a digital Flash media card.

2.03 ACCESSORIES

- A. Strobe and Horn combo unit shall be capable of operating within relative humidity ranges of 0 to 100 percent and temperature ranges of -30 degrees F to 150 degrees F (-35 degrees C to 66 degrees C). Rating of horn shall be no less than 72dB at 10 feet. Intensity of light shall be no less than 40W and shall flash at a frequency of 1 per second. Provide Gentex GEH24-R or GEC3-24WR, Edwards Technology EST 757 Series, Simplex-Grinnell 4906-9127 or GEC3-24WR, or equal.
- B. Power Transformer type T100VA, T200VA, or T300VA or Class 2 devices type T100VAC2, T200VAC2 or T300VAC2. Transformer shall have an input voltage of 120 V AC and an output voltage of 24 V AC with a VA range of 50-300. Operating frequency shall be 60 Hz. Unit will provide insulation systems up to 130 degrees C (50-1300 VA). Unit to operate at sound levels of less than 40 dB. Transformers shall be of fused type.
- C. Relay Modules shall be powered by the control panel's power output or by power transformer rated at 24 Volts AC or DC. Module shall be capable of communicating digitally with the controller through an RS-485 communication port. Relay module shall have eight relays rated at no lower than 5A, 30 Vdc or 250 Vac (resistive load).
- D. Detector Guards: The grid shall be made of a 9-gage steel wire or larger. The guard shall be designed to allow calibration without removing the guards.

PART 3 – EXECUTION

3.01 INSTALLATION

- A. Install hazardous gas monitoring equipment including sensors, audible alarms, control panels as shown on Contract Drawings, and as recommended by manufacturer of equipment, and as required by authorities having jurisdiction.
- B. Install conduit and wiring from sensors to control panel and to the fan starters/HVAC control panel as recommended by manufacturer of equipment.

3.02 SEQUENCE OF OPERATION

- A. If any NO₂ sensor detects 0.72 PPM gas, the exhaust fans operate and motorized dampers open. Low Alarm indicators light for point in alarm. If hazardous gas not cleared after 30 minutes or 2 PPM is reached, High Alarm indicator lights on the main panel and remote strobe and horn activate, and Audible Alarm sounds and operates the exhaust fans.
- B. If any of the CO sensors detects 25 PPM gas, all fans operate and damper opens. Low Alarm LED lights for point in alarm. If any sensor detects 200 PPM gas, the Audible

Alarm sounds and High Alarm indicator lights on the main panel and remote strobe and horn activate.

3.03 START-UP TESTING

- A. Test and calibrate equipment to demonstrate operation of functions described above under sequence of operation by manufactures certified service technician. Submit report of test to OAR.
- B. Provide two new testing kits (including gas bottles) to Owner for testing and calibration.

3.04 TRAINING

- A. Provide four hours training on programming and overview of system.
- B. Provide eight hours of calibration training for all gas detection sensors. Supply all required calibration gases and equipments.

3.05 CLEANUP

- A. Remove rubbish, debris and waste materials and legally dispose of off the Project site.

3.06 PROTECTION

- A. Protect the Work of this Section until Substantial Completion.

1.04 SUBMITTALS

- A. Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Submit the following:

1. Systems design presented in functional block diagrams and system electrical/electronic signal flow diagrams indicating signal levels and impedance values
2. Product verification list with pictorial view and full performance specifications.
3. Detailed installation drawings to include installation configuration and methods of installation.
4. List of proposed lenses for camera installations. Calculations of coverage shall be provided for all cameras.
5. Operation and maintenance data to include operation instruction, detailed parts

list, cable and wire lists, circuit diagrams, maintenance, alignment, and troubleshooting procedures.

1.05 QUALITY CONTROL

- A. Products shall be manufactured by firms regularly engaged in manufacturing products described in this section.
- B. Field testing shall be performed by persons having five or more years of relevant testing experience.

1.06 SYSTEM DESCRIPTION

- A. Furnish a CCTV system in the passenger stations for video surveillance of areas in the station, and adjoining parking structure, pocket track, tail tracks, trans-bay tube, and vent structures as applicable, and as indicated.
- B. Provide all interfaces with other systems in the station and in the BART network operating system, as specified and indicated, to provide a completely integrated operating system.

1.07 FUNCTIONAL REQUIREMENTS

- A. General:
 - 1. An average of 100 IP-based digital cameras shall be required per station, excluding parking structures.
 - 2. Video shall be available in IEC-13818 encoding formats of Advanced Video coding (H.264), High Efficiency Video Coding (H.265), and MJPEG.
 - 3. There shall be no recording or storing of images at any stations.
 - 4. The BART video recovery unit shall have supervisory control of the video management system (VMS) and be the primary location for displaying and exporting video. Police Integrated Security Response Center (ISRC), also known as the BART Police Dispatch Center (PDC), shall have video clients for viewing and controlling cameras. The Operations Control Center (OCC) shall have two computer workstations and one large display in order to access and view video from the CCTV network.
 - 5. Video shall be stored in a storage area network (SAN) at the Lake Merritt facility. Stored video shall be limited to the most recent seven days.
- B. The CCTV system shall provide for video surveillance of areas in passenger stations, parking structures, pocket track, and end-of-line tail tracks as applicable.

1. Passenger Station Areas:
 - a. Platform and Mezzanine Areas. Cameras shall be furnished for viewing platform and mezzanine areas including rescue assistance areas and elevator entrances, as indicated. Cameras focused on elevator entrances shall be equipped with lenses having adequate coverage to allow viewing from the Station Agents Booth of patrons using the elevators. Cameras on platforms shall be oriented to allow viewing from the Station Agents Booth of the platform edges for the length of the platforms.
 2. Automatic Fare Collection Equipment:
 - a. Pan, tilt, zoom (PTZ) cameras shall be furnished to monitor automatic fare collection (AFC) equipment including the ticket vending machines, add fare machines, and bill-to-bill changers. “Door open” alarms provided with the fare collection equipment shall cause cameras to move to a position to monitor the alarmed machine. Automatic recording shall be initiated upon activation of the “door open” indication.
 - b. AFC equipment with “door-open” indications shall be monitored in order of priority.
 - c. When an AFC door is reclosed, the associated camera shall return to the normal preset position.
 3. Pocket Track and End-of-Line Tail Tracks:
 - a. PTZ cameras shall be furnished for viewing areas in the pocket and end-of-line tracks, as indicated.
 4. Parking Structures. Cameras shall be provided for viewing internal area and entry area of elevators and stairwell areas. Fixed cameras shall be furnished for viewing as directed by BART Police and BART Engineering.
- C. Interfaces of the CCTV system with other communication subsystems shall be as follows:
1. “Door open” indications of ticket vending machines, add fare machines, bill-to-bill changers, and parking machines for automatic positioning of video cameras shall be monitored by the supervisory control and data acquisition (SCADA) system. The SCADA system shall retransmit a contact closure to the associated PTZ camera to set the camera to a preset viewing position.
 2. Method of connection to the IP-based network designated for transmission of video images shall be determined by BART Engineering.

PART 2 – PRODUCTS

2.01 EQUIPMENT REQUIREMENTS

A. General:

1. CCTV equipment providing the same functions shall be uniform and have the same type and model supplied by a single manufacturer.
2. All necessary accessories, devices, wires, and cables shall be furnished for proper interconnection of the equipment specified herein to provide a completely integrated and operational CCTV system.
3. CCTV monitoring and control equipment, as indicated, herein shall be furnished to allow monitoring of selected video images in the Station Agent's Booth, Emergency Management Panel Room, and the Supervisor's Booth at end-of-line stations.
4. CCTV equipment in the Train Control Room shall be designed for mounting in standard 19-inch rack per EIA RS-310D.
5. CCTV network and storage shall support all installed IP-based cameras per station streaming data at 5Mbps/sec for 1080p cameras and 12Mbps/sec for 4K cameras.

B. Cameras:

1. Cameras shall be Designated Matching Products; refer to the Designated Matching Products (DMP) List.

C. Camera Lenses:

1. Lenses shall be auto-iris lenses directly interchangeable without electrical or mechanical modifications or adaptations. Each lens shall have a neutral density spot filter. Lenses shall be capable of mounting in a sealed environmental housing.
2. PTZ cameras shall have a minimum of 20X optical zoom and 10X digital zoom.

D. Camera Housings:

1. Cameras shall meet the Ingress Protection (IP) rating of IP66 and International Electrotechnical Commission (IEC) Standard 62262 for Impact Protection (IK) Code IK10.
2. Cameras installed outdoors shall be furnished with environmental housings. The housings shall be equipped with heater kit, blower kit, and power supply. Housings exposed to direct sunlight at any time of day shall be equipped with a sun shield.
3. Cameras monitoring AFC equipment and those installed in elevators shall use a

security housing with the following characteristics:

- a. High security, vandal resistant, and corner mount type. The enclosure shall be tamper-proof with tamper-proof design subject to District approval.
- b. The housing shall be compatible with the camera in the elevator.
- c. Security enclosures shall be domed housings suitable for outdoor service. The housings exterior surface shall be tinted to conceal the interior camera from view.
- d. The view from the housing shall encompass a 360-degree horizontal view and 45-degree vertical view. The vertical view shall extend from five degrees above the horizontal to 40 degrees below the horizontal.
- e. Security enclosures shall be tamper-proof to prevent the general public from accessing the interior of the enclosure.
- f. Tamper-proof designs shall be subject to District approval.

E. Camera Mountings:

1. Wall or Ceiling Mount: The camera mount unit shall be designed to support loads of up to 125 lbs. at the point of the camera attachment at an attitude of 90 degrees perpendicular to a wall surface. Each mount assembly shall be equipped with an adjustable head adapter that shall allow 360 degree horizontal and ± 90 degree vertical plane adjustment.
2. Pole Mount: Adapters shall be provided for placing standard wall or ceiling mount units on camera equipped poles. All parts shall be protected from corrosion.
3. The housing mounts for the elevator cab cameras shall be tamper-proof with tamper-proof design subject to District approval. The mounts shall be heavy duty that shall safely support a load of 120 pounds minimum.

F. Monitors:

1. Monitors shall be as specified in the Contract.

G. Video Servers:

1. Video servers shall meet the minimum specified hardware requirements of the VMS software manufacturer.

H. Video Storage:

1. Video shall be stored at centralized storage area network (SAN) storage facility designated by the District.
2. Systems shall utilize open application programming interfaces (APIs) and open software development kits (SDKs).

3. Storage capacity shall be sufficient for 7 days at full frame rate.
- I. Control Panel: Cameras shall be controlled through the video manager software that is furnished by the District.
- J. PTZ cameras shall have a minimum of 16 user-defined presets with a repeatable accuracy of +/- 0.2 degrees. This shall include PTZ positioning, and camera focus.
- K. A contact closure from the SCADA system signifying a “door open” indication of a vending or add fare machine shall cause the appropriate camera to point and focus to the front of the pre-designated alarmed machine.
- L. Wires and cables between equipment assemblies and termination points within each equipment enclosure shall be furnished. Wires and cables shall be listed as being resistant to the spread of fire in accordance with the National Electric Code (NEC), and shall be rated at 300 volts, minimum. Wires and cables servicing remote camera units shall be waterproof.
 1. Video Cables: Video cables shall be as specified in Section 20 70 23, Electronic Circuits, Wires, and Cables.
 2. Control Cables: Control cables shall be multi-conductor AWG No. 18 stranded copper conductors with braided shields.
 3. Power Cables: Minimum conductor size for power circuits shall be AWG No. 14.
- M. Fiber-optic transceivers for transmission of video signals from tail-track cameras shall be the small form-factor-pluggable (SFP) type. Fiber availability will be determined by BART Engineering.
 1. Where there is sufficient fiber:
 - a. Two fibers, one for transmit and one for receive, will be allocated per transceiver.
 - b. SFP style transceivers shall be used.
 - c. LC connectors shall be used.
 - d. SFP type (SX, LX, or ZX) will be designated on all drawings and documentation.
 2. Where there is not sufficient fiber:
 - a. One fiber shall be used for both transmit and receive.
 - b. The transceivers shall meet the following characteristics:
 - 1) Compatible with 50/125 low loss multi-mode glass fiber.
 - 2) Nominal operating wavelength of 850/1300 nm.
 - 3) Range up to three miles.

- 4) Category 6 UTP to fiber optic converters.
3. Multimode fiber-optic cables for the tail-track cameras shall be as specified in Section 20 70 23, Electronic Circuits, Wires, and Cables. LC type connectors with strain relief and breakout kits shall be furnished.

N. All equipment shall be mountable in a standard 19-inch rack per EIA RS-310D.

PART 3 – EXECUTION

3.01 INSTALLATION

- A. Cameras shall be mounted in locations shown on the Contract drawings.
- B. Cameras accessible to the public shall be concealed or placed in protective, tamper-proof environmental enclosures and surface mounted beyond a person's normal reach plus an additional three feet.
- C. Cameras shall be located so that their FOV is not restricted by other station installations such as walls, ceilings, columns, signs, and luminaries. Plans demonstrating the unobstructed FOV of each camera shall be submitted for District review.
- D. Cameras shall be located so that they never directly view the sun. The FOV of cameras shall be adequately illuminated either by natural light or by luminaries. Within the FOV, particular care shall be taken to avoid extremes of light and shadow.
- E. Cameras and other video surveillance equipment installed in locations accessible to the public shall be mounted using tamper-proof mounting hardware.
- F. Camera video signal cables between each camera and the associated field concentrator shall be routed as shown without any splices. All cables shall be installed complying with the requirements of Contract Specification Section 26 05 13, Basic Electrical Materials and Methods for Electrical Systems.
- G. Field concentrators and their associated power distribution and PTZ camera power supply panels shall be installed as shown in Contract drawings.
- H. Fiber optic cables between the field concentrators and the fiber distribution cabinet in each Train Control Room (TCR) shall be installed and terminated as shown in Contract drawings.

3.02 TESTING

- A. Factory and field testing shall be performed in accordance with Contract Specification Section 01 45 23, Testing Program requirements.

- B. Factory Tests: Perform a factory test consisting of one field concentrator, and one PTZ camera power supply be performed to demonstrate correct operation as shown in Contract Drawings and Specifications.
- C. Field Tests: Complete the following:
1. Perform the following camera cable tests as indicated following the approved test plan. Furnish all equipment, appliances, and labor necessary to test the installed camera cable between the camera assembly and the field concentrator. Perform the following tests before any connections are made:
 - a. Perform testing in accordance with the latest EIA/TIA-568 standard for all Category-type cables installed. Camera cable shall not exhibit any discontinuities such as opens, shorts, crimps, or defects.
 - b. Perform continuity tests on the camera cables using a meter having a minimum input resistance of 20,000 ohms per volt. Show that each conductor has a resistance of not more than 16 ohms per 1000 feet of conductor run.
 - c. Measure the insulation resistance between the conductors and between each conductor, ground, and shielding using a megger meter. Perform all resistance testing after final termination and cable installation, but prior to connection of any electronics or field devices.
 - d. Replace any cable that fails to meet these parameters, or if any testing reveals defects in the cable. Retest new cable as specified above.
 - e. Furnish all test equipment.
 2. Perform the following local field operations tests on site in accordance with the approved field test plan. Demonstrate the following after the camera controller assemblies, other camera hardware, field concentrators, power supplies and connecting cabling have been installed:
 - a. Verify physical construction has been completed in accordance with the plans and specifications.
 - b. Inspect quality and tightness of ground and surge protector connections.
 - c. Check power supply voltages and output.
 - d. Connect devices to power source.
 - e. Verify installation of specified cables and connections between camera, pan/tilt unit, and camera control receiver.

END OF SECTION

SECTION 31 10 00

SITE CLEARING

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Removal of vegetation, grass, grass roots, shrubs, tree stumps, trees, upturned stumps, weed growth, tree roots, brush, masonry, concrete, rubbish, debris and other materials.
2. Removal of concrete and bituminous surfaces.
3. Removal of existing fences and gates.

B. Related Requirements:

1. Division 01 - General Requirements.
2. Section 31 22 00 - Grading.
3. Section 31 23 00 - Earthwork.
4. Section 31 23 16 – Trenching Backfill and Compaction.
7. Section 32 11 16 – Aggregate Base
8. Section 32 31 13 - Chain Link Fencing.
9. Section 32 90 00 - Planting.

1.02 SUBMITTALS

- ###### A. Shop Drawings: Submit site plan indicating extent of site clearing.

1.03 QUALITY ASSURANCE

- ###### A. Comply with Standard Specifications for Public Works Construction, current edition, as a minimum requirement.

PART 2 - PRODUCTS - NOT USED

PART 3 - EXECUTION

3.01 TREE AND STUMP REMOVAL

- A. Remove trees and stumps indicated or required to be removed. Remove trees, together with bulk of roots, to a minimum depth of 4 feet below required grade, and within a radius of approximately 7 feet beyond perimeter of trunk at grade.
- B. Fill and compact excavation from tree and stump removal. Fill in 6 inch layers, each compacted to 90 percent of maximum density in accordance with ASTM D1557.
 - 1. Back filling shall not commence until the excavation is inspected and tested.

3.02 CONCRETE AND BITUMINOUS SURFACING REMOVAL

- A. Break up and completely remove existing concrete surfacing, curbs, gutters, walks and bituminous surfacing to indicated limits. Cutting shall be performed to a neat and even line with proper tools or a concrete cutting saw. Minimum depth of cut shall be 1 1/2-inch, unless otherwise indicated. Remove concrete broken beyond the indicated limits to the nearest joint or score line and replace with new concrete to match existing.

3.03 FENCING

- A. Existing fences scheduled to remain may be removed to facilitate the Work, provided they are installed to their original condition in accordance with requirements of Section 32 31 13 - Chain Link Fencing.
- B. Fencing indicated to be removed and not reinstalled shall be completely removed, including footings. Fill and compact excavations.
- C. Install chain link fencing indicated to be relocated or reset in accordance with applicable requirements specified under Section 32 31 13 - Chain Link Fencing.

3.04 CLEANUP

- A. Remove rubbish, debris and waste materials and legally dispose of off the Project site.

END OF SECTION

SECTION 31 22 00

GRADING

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. General exterior grading, cutting and filling, including grading for building area, paving, planting areas, banks and hillsides.

B. Related Requirements:

1. Division 01 - General Requirements.
2. Section 31 10 00 - Site Clearing.
3. Section 31 23 00 - Earthwork.
4. Section 31 23 16 – Trenching Backfill and Compaction
5. Section 32 11 16 – Aggregate Base.
6. Section 32 90 00 - Planting.

1.02 PROJECT REQUIREMENTS

A. General:

1. Fees: Pay as required by authorities having jurisdiction over the area.
2. Bonds: Post as required by authorities having jurisdiction over the area.
3. Haul Routes and Restrictions: Comply with requirements of authorities having jurisdiction over the area.
4. Before grading, contact Underground Service Alert of Southern California (USASC) for information on public buried utilities and pipelines. Retain the services of an underground utility locator for on-site utilities.

PART 2 - PRODUCTS

2.01 MATERIALS

- ###### A. Materials shall conform to requirements specified in this and related sections.

PART 3 - EXECUTION

3.01 PREPARATION

- A. Protect and maintain installed stakes until their removal is required for the Work. Provide replacement grade or location stakes lost or disturbed.
- B. Install grade stakes and compare to indicated grades. If discrepancies are found between existing grades and grades indicated on Drawings, do not proceed until discrepancies are resolved.

3.02 ROUGH AND FINE GRADING

- A. Rough grade area sufficiently high to require cutting by fine grading:
 - 1. Grade area for bituminous surfacing and other paving to the indicated grades, equal to the section of the indicated base and pavement.
 - 2. Slope banks to required finish grades as cut progresses or leave cuts full and finish grade by mechanical equipment to provide grades and soil densities indicated on the Drawings.
 - 3. Rough grade, fill and compact banks beyond indicated finish grades. Finish grade banks and slopes to indicated grades and specified soil densities.
 - 4. Grade Only Areas: In areas not indicated to receive pavement, rough grade to approximate finish grades and then scarify, moisten and roll to obtain required density and indicated finish grades.
 - 5. Tolerances: Finish grades shall be within a tolerance of 0.05 inch per foot above or below grades indicated. Provide an average grade as indicated.
- B. Base or Subgrade:
 - 1. After subgrade has been constructed to approximate required grades, scarify to a depth of at least 6 inches:
 - a. After scarifying, process loosened material to a finely divided condition and adjust moisture content to optimum condition by addition of water, addition and blending of dry suitable material, or by drying of existing material.
 - b. Subgrade material shall be compacted by tamping, sheepsfoot rollers or pneumatic tire rollers. Required relative compaction shall be [90] percent minimum for the top 6 inches below subgrade.
 - c. Install base course in accordance with Section 31 2326 - Base Course.
 - 2. Tolerance of completed grades of base or subgrade shall not vary more than 0.03 inch per foot from grades indicated. Provide an average grade as indicated.

3.03 SHORING

- A. Provide shoring as necessary to properly and safely support earth sides of excavations, and existing curbs, sidewalks, gutter, drives and stairs, against movement and collapse.
- B. Design and Calculations: Provide in accordance with requirement of CalOHSA.
- C. Remove shoring upon completion of the Work of this section or when no longer needed unless required otherwise by authorities having jurisdiction.

3.04 EXCESS MATERIAL DISPOSAL

- A. Remove rubbish, debris, and waste materials and legally dispose of off the Project site.

3.05 PROTECTION

- A. Protect the Work of this section until Substantial Completion.

END OF SECTION

SECTION 31 23 00

EARTHWORK

PART 1 – GENERAL

1.01 DESCRIPTION OF WORK

- A. Earthwork shall conform to the provisions in Section 19, “Earthwork,” of the Caltrans Standards and the Technical Specifications.
- B. Valve boxes, manhole covers, and drainage structures within the limits of any grading operation shall be adjusted to proposed finish grade.
- C. Embankment materials shall be free from organic and otherwise deleterious materials and as provided in Section 19, “Earthwork,” of the Caltrans Standards.
- D. Surplus excavated material shall become the property of the Contractor and shall be disposed of outside the right-of-way in conformance with Federal, State, and local regulations.

PART 2 – PRODUCT

2.01 IMPORTED SOIL

- A. Import materials shall have a liquid limit of 25 or less, a plasticity index of 12 or less, and be well graded with no greater than 30 percent of the particles passing the No. 200 sieve and no particles greater than 6 inches in maximum dimension. Import materials shall be non-corrosive in accordance with the following corrosive limits as provided in Section 8.1 of the Caltrans Corrosion Guidelines, Version 2.0, 2012:
 - Minimum resistivity must be greater than 2000 ohm-cm, CT 643
 - Chloride concentration must be less than 250 ppm, CT 422
 - Sulfate concentration must be less than 500 ppm, CT 417
 - pH must be between 5.5 and 10.0, CT 643

PART 3 – EXECUTION

3.01 HAZARDOUS WASTE IN EXCAVATION

- A. If the Contractor encounters hazardous waste in excavation, as defined by Section 25117 of the Health and Safety Code, the Contractor shall immediately notify the Engineer in writing. Excavation in and around the suspected hazardous material shall be suspended until the Engineer authorizes it to be resumed. The limits of excavation shall be as directed by the Engineer. If such suspension delays the current controlling

operation, the Contractor will be granted an extension of time as provided the Special Provisions.

- B. If such suspension delays the current controlling operation more than 2 working days, the delay will be considered a right-of-way delay and the Contractor will be compensated for each such delay as provided in the Special Provisions.
- C. The City of Goleta reserves the right to use other forces for exploratory work to identify and determine the extent of such material and for removing hazardous material from such area.
- D. If hazardous material is encountered the contractor shall mobilize employees with the herein designated safety and remediation training within 24 hours of the Contractor, the City or third party determining a hazardous or contaminated soils condition exists in an excavation. The contractor shall have the trained employees available prior to the start of any hazardous material excavation and at the direction of the Engineer, the Contractor shall include a hazmat training as a scheduled task in the Contract Schedule. No additional working days shall be granted for the contractor's inability to provide and mobilize trained workers within the 24 hour time limit.
- E. The employees shall be trained through an OSHA approved Hazardous Waste Operations and Emergency Response Standard (Hazwoper) 40 Hour Training class or have a Hazwoper refresher course within one year prior to the date the work is to be performed; and possess a certificate showing successful completion of the Hazwoper training. OSHA accepted Hazwoper training shall conform to all Federal, State, and Local requirements (including those specified in 29 CFR 1910.120. In addition, workers shall have additional hands-on training in use of the Personal Protective Equipment (PPE) required for their jobsite(s) in accordance with 29 CFR 1910.120.
- F. Voids resulting from excavation of hazardous material shall be backfilled in accordance with Section 19-3, "Structure Excavation and Backfill," of the Caltrans Standards and as specified in the Technical Specifications. Backfill material shall comply with Section 2.01, "Imported Soil," above.
- G. Measurement and payment for removal of hazardous waste in excavation, including training, obtaining any necessary permits, testing and analysis, disposal, and relevant disposal fees will be made in accordance with the Special Provisions.

3.02 STRUCTURE EXCAVATION AND BACKFILL

- A. Structure excavation and backfill shall conform to the provisions in Section 19-3, "Structure Excavation and Backfill," of the Caltrans Standards and as specified in the Technical Specifications.
- B. All structural backfill shall be of the type indicated and placed to the limits shown on the plans. For all subgrade of structural backfill a relative compaction of not less than 95 percent shall be obtained for a minimum depth of 6 inches below the bottom of excavation.

- C. Placement of structural backfill shall comply with Section 19-3.02C, “Structure Backfill,” of the Caltrans Standards except that compaction shall not be performed by ponding or jetting.
- D. Excavating by blasting will not be allowed.
- E. Shoring, lagging, or other bracing shall be designed, furnished, and placed by the contractor to adequately support the excavation.
- F. Steel shoring, steel and timber lagging, and other steel bracing may remain in place, subject to the following requirements:
 - 1. The amount of bracing remaining in place shall not exceed the practical minimum that is necessary to safely support the sides of the excavation.
 - 2. Bracing shall be placed in an open type arrangement with ample clearance between adjacent braces to permit the ready flow of concrete around the bracing and provide proper clearance to the reinforcement.

3.03 TRENCH EXCAVATION AND BACKFILL

- A. Excavating and backfilling for trenches shall conform to the provisions in Section 87-1.03B(3), "Conduit Installation Underground," of the Caltrans Standards.
- B. Open trenches and excavations shall be covered or barricaded to protect pedestrians and vehicles in accordance with Section 01 55 26, “Traffic Control and Access,” of the Technical Specifications. Following excavation Contractor shall minimize exposure of public to open trenches.
- C. All surplus excavation, from whatever source, shall be disposed of outside the right of way in conformance with Federal, State, and local regulations.

3.04 TESTING EXCAVATED MATERIAL

- A. Excavated soil may be tested for potential use as fill material in compliance with Section 2.01, “Imported Soil,” above. Contractor shall submit test results prior to placement. Where excavated soil is compliant Contractor shall stockpile or place excavated soil as required. Stockpiling of compliant excavated soil shall remain within limits of work or designated offsite area.

3.05 IMPORTED SOIL AS BACKFILL

- A. Where excavated soil is insufficient or does not meet soil requirements for backfill Contractor shall import suitable backfill material complying with Section 2.01, “Imported Soil,” above.

PART 4 – MEASUREMENT AND PAYMENT

4.01 MEASUREMENT

- A. No separate measurement will be made for the requirements of this section, unless otherwise stated.

4.02 PAYMENT

- A. Unless otherwise stated full compensation for complying with the requirements of this section shall be considered as included in the contract prices paid for the various items of work involved, unless otherwise stated, and no additional compensation will be allowed therefore.

END OF SECTION

SECTION 31 23 16 TRENCHING, BACKFILL AND COMPACTION

PART 1 – GENERAL

1.01 REQUIREMENTS

- A. The Contractor shall perform all earthwork and trenching operations indicated and required for construction of the work, provide advance notification of the affected residents, perform preparation work. The Contractor shall secure all necessary permits to complete the requirements of this Section of the Specifications.

1.02 RELATED WORK SPECIFIED ELSEWHERE

Section 01 55 26 – Traffic Control & Access

1.03 CONTRACTOR SUBMITTALS

- A. Where shoring is required the Contractor's attention is directed to the provisions for "Shoring and Bracing Drawings" in Section 6705 of the California Labor Code. The Contractor, prior to beginning any trench or structure excavation 5 feet deep or over shall submit to the City and shall be in receipt of the City's written acceptance of the Contractor's detailed plan showing design of all shoring, bracing, sloping of the sides of excavation, or other provisions for worker protection against the hazard of caving ground during the excavation of such trenches or structure excavation. If such plan varies from the shoring system standards established in the Construction Safety Orders of the State of California, such alternative systems plans shall be prepared by a civil or structural engineer licensed in the State of California.
- B. The Contractor shall submit a copy of the excavation permit issued by the California Department of Industrial Safety.
- C. The Contractor shall submit samples of all materials to be used in the work in accordance with the requirements in Section 01 33 00.
- D. Submit CLSM mix designs which show the proportions and gradations of all materials proposed for each type of CLSM indicated. Each mix design shall be accompanied by independent laboratory test results of the indicated properties.

1.04 CONTRACTOR SUBMITTALS

- A. It shall be the sole responsibility of the Contractor to control the rate and effect of the dewatering in such a manner as to avoid all objectionable settlement and subsidence. All dewatering operations shall be adequate to assure the integrity of the finished project and shall be the responsibility of the Contractor.
- B. Where critical structures or facilities exist immediately adjacent to areas of proposed dewatering, reference points shall be established and observed at frequent intervals to detect any settlement which may develop. The responsibility for conducting the dewatering operation in a manner that will protect adjacent structures and facilities rests solely with the Contractor. The cost of repairing any damage to adjacent structures and restoration of facilities shall be the responsibility of the Contractor.
- C. At the option of the City inspector, asphalt mix, subgrade, aggregate base course, and asphalt pavement may be tested by the City's testing laboratory and paid for by the City in accordance with Section 014200 – Reference Standards. Sample sizes shall be as determined by the testing laboratory.

PART 2 – PRODUCTS

2.01 SUITABLE FILL AND BACKFILL MATERIAL REQUIREMENTS

- A. **General:** Fill, backfill, and embankment materials shall be suitable selected or processed clean, fine earth, rock, or sand, free from grass, roots, brush, or other vegetation.
- B. Fill and backfill materials to be placed within 6 inches of any structure or pipe shall be free of rocks or unbroken masses of earth materials having a maximum dimension larger than 3 inches.
- C. **Suitable Materials:** Materials not defined as unsuitable in Section 2.3 shall be reviewed by the City and may be used in fills, backfilling, and embankment construction subject to the indicated limitations and at the City's discretion. In addition, when acceptable to the City, some of the material listed as unsuitable may be used when thoroughly mixed with suitable material to form a stable composite.
- D. Suitable materials may be obtained from on-site excavations (if applicable), may be processed on-site materials, or may be imported. If imported materials are required by this Section or to meet the quantity requirements of the project, the Contractor shall provide the imported materials at no additional expense to the City, unless a unit price item is included for imported materials in the bidding schedule.
- E. The following types of suitable materials are defined:
 - 1. **Type A (three-quarters inch minus granular backfill):** Crushed rock or gravel, and sand with the gradation requirements below. The material shall have a minimum

sand equivalent value of 28 and a minimum R-value of 78. If the sand equivalent value exceeds 35 the R-value requirement is waived.

Sieve Size	Percentage Passing
3/4-inch	100
No. 4	30 - 50
No. 200	0 - 5

- Type B (Class I crushed stone):** Manufactured angular, crushed stone, crushed rock, or crushed slag with the following gradation requirements. The material shall have a minimum sand equivalent value of 75.

Sieve Size	Percentage Passing
3/4-inch	100
No. 4	30 - 50
No. 200	0 - 5

- Type C (sand backfill):** Sand with the following gradation requirements, and with a sand equivalent value not less than 30.

Sieve Size	Percentage Passing
1/2-inch	100
No. 4	85 - 100
No. 8	70 - 95
No. 200	0 - 10

- Type F (coarse drainrock):** Crushed rock or gravel with the size gradation for Size Number 4 in ASTM C 33.
- Type G (aggregate base):** See also Section 32 11 16 for Aggregate Base Specifications.

Crushed rock aggregate base material of such nature that it can be compacted readily by watering and rolling to form a firm, stable base for pavements. At the option of the Contractor, the grading for either the 1-1/2-inch maximum size or 3/4-inch maximum size gradation shall be used. The sand equivalent value shall be not less than 22, and the material shall meet the following gradation requirements:

Percentage Passing

<u>Sieve Size</u>	<u>1-1/2-inch Max</u> <u>Gradation</u>	<u>3/4-inch Max.</u> <u>Gradation</u>
2-inch	100	-
1-1/2-inch	90 - 100	-
1-inch	-	100
3/4-inch	50 - 85	90 - 100
No. 4	25 - 45	35 - 55
No. 30	10 - 25	10 - 30
No. 200	2 - 9	2 - 9

6. **Type H (graded drainrock):** Drainrock shall be crushed rock or gravel, durable and free from slaking or decomposition under the action of alternate wetting or drying. The material shall be uniformly graded and shall meet the gradation requirements for Size Number 57 in ASTM C 33. The drainrock shall have a sand equivalent value not less than 75. The finish graded surface of the drainrock immediately beneath hydraulic structures shall be stabilized to provide a firm, smooth surface upon which to construct reinforced concrete floor slabs.
7. **Type I:** Not Used.
8. **Type K (topsoil):** Stockpiled topsoil material which has been obtained at the site by removing soil to a depth not exceeding 1 foot. Removal of the topsoil shall be done after the area has been stripped of vegetation and debris.

2.02 UNSUITABLE FILL MATERIAL

A. Unsuitable materials include the materials listed below.

1. Soils which, when classified under ASTM D 2487 - Standard Classification of Soils for engineering Purposes (Unified Soil Classification System), fall in the classifications of Pt, OH, CH, MH, or OL.
2. Soils which cannot be compacted sufficiently to achieve the density specified for the intended use.
3. Materials that contain hazardous or designated waste materials including petroleum hydrocarbons, pesticides, heavy metals, and any material which may be classified as hazardous or toxic according to applicable regulations.

4. Soils that contain greater concentrations of chloride or sulfate ions, or have a soil resistivity or pH less than the existing on-site soils.
5. Topsoil, except as allowed by Section 2.4.

2.03 USE OF FILL, BACKFILL, AND EMBANKMENT MATERIAL TYPES

- A. The Contractor shall use the types of materials as designated herein for all required fill, backfill, and embankment construction hereunder.
- B. Where these Specifications conflict with the requirements of any local agency having jurisdiction or with the requirements of a pipe material manufacturer, the City shall be immediately notified. In case of conflict between types of pipe zone bedding, the Contractor shall use the agency-specified bedding material if that material provides a greater degree of structural support to the pipe, as determined by the City. In case of conflict between types of trench or final backfill types, the Contractor shall use the agency-specified backfill material if that material provides the greater in-place density after compaction.
- C. Fill and backfill types shall be used in accordance with the following provisions:
 1. Embankment fills shall be constructed of Type I material, as defined herein, or any mixture of Type I and Type A through Type H materials.
 2. Pipe zone bedding for mortar coated steel pipe, ductile iron pipe, and PVC pipe shall be Type C backfill (pipe bedding) material. Pipe zone bedding for PVC pipe, coal tar enamel coated or tape wrapped steel pipe, and polyethylene encased ductile iron pipe shall be Type C backfill (pipe bedding) material.
 3. Trench zone and final backfill for pipelines under paved areas, as defined under "Pipe and Utility Trench Backfill," shall be Type L backfill material unless otherwise shown or specified. Trench zone and final backfill under areas not paved shall be select native material free of rocks larger than 3 inches and free of deleterious material, or Types A, C or G, backfill materials or any mixture thereof. In agricultural or landscaped areas Type K material shall be used for final backfill unless otherwise indicated.
 4. Trench backfill and final backfill for pipelines under structures shall be the same material as used in the pipe zone, except where concrete encasement is required by the Contract Documents.
 5. Backfill around structures shall be Type A through Type H materials, or any mixture thereof, except as shown.

6. Backfill materials beneath structures shall be as follows:
 - a. Drain rock materials under hydraulic structures or other water retaining structures with underdrain systems shall be Type H material.
 - b. Under concrete hydraulic structures or other water retaining structures without underdrain systems, Types G or H materials shall be used.
 - c. Under structures where groundwater must be removed to allow placement of concrete, Type F material shall be used. Before the Type F material is placed, filter fabric shall be placed over the exposed foundation.
 - d. Under all other structures, Type G or H material shall be used.
7. Backfill used to replace pipeline trench over-excavation shall be a layer of Type F material with a top layer of filter fabric to prevent migration of fines for wet trench conditions or the same material as used for the pipe zone bedding if the trench conditions are not wet.
8. The top 6 inches of embankment fills around hydraulic structures, and all other embankment fills shall consist of Type K material, topsoil.
9. Filter fabric shall be per City or agency direction.

2.04 SOIL MATERIALS TESTING

- A. All soils testing of samples submitted by the Contractor will be done by a testing laboratory of the City's choice and at the City's expense. At its discretion, the City may request that the Contractor supply samples for testing of any material used in the work.
- B. Particle size analysis of soils and aggregates will be performed using ASTM D 422 - Standard Test Method for Particle-Size Analysis of Soils.
- C. Determination of sand equivalent value will be performed using ASTM D 2419 - Standard Test Method for Sand Equivalent Value of Soils and Fine Aggregate.
- D. **Unified Soil Classification System:** References in this Section to soil classification types and standards shall have the meanings and definitions indicated in ASTM D 2487. The Contractor shall be bound by all applicable provisions of said ASTM D 2487 in the interpretation of soil classifications.
- E. The testing for chloride, sulfate, resistivity, and pH will be done in accordance with California Test Methods 417, 422 and 643 of the California Department of Transportation.

2.05 ASPHALT CONCRETE PAVING MATERIALS

- A. See Section 32 12 16 for Asphalt Paving Specifications.
- B. All materials required for asphalt concrete pavement construction as specified herein shall conform to the Caltrans Standard Specifications:
- C. Asphalt concrete for roadway pavement shall be Type B, Grade AR-4000 as specified in Section 39 with ½” mix, unless specified otherwise. Asphalt concrete for construction of sidewalks, berms, dikes, or curbs shall be Type B, Grade AR-4000 as specified in Section 39 with 3/8” mix, unless specified otherwise. Paint binder shall be SS-1h emulsified asphalt conforming requirements of Section 94. Base course shall be treated Class 2 aggregate base material. Paint for traffic stripes and pavement markings shall conform to Section 84.

PART 3 – EXECUTION

3.01 EXCAVATION - GENERAL

- A. **General:** Except when specifically provided to the contrary, excavation shall include the removal of all materials of whatever nature encountered, including all obstructions of any nature that would interfere with the proper execution and completion of the work. The removal of said materials shall conform to the lines and grades indicated or ordered.
- B. **Sheeting, Shoring and Bracing:** The Contractor shall furnish, place, and maintain all supports and shoring that may be required for the sides of the excavations and trenches. Excavations and trenches shall be sloped or otherwise supported in a safe manner in accordance with applicable CAL/OSHA requirements and the requirements of OSHA Safety and Health Standards for Construction (29CFR1926). As a minimum, lateral pressures for design of trench sheeting, shoring, and bracing shall be based on type of soil exposed in the trench, groundwater conditions, surcharge loads adjacent to the trench, and type of shoring that will be used in the trench.

3.02 PROTECTION OF EXISTING UTILITIES AND FACILITIES

- A. **General:** The Contractor shall be responsible for the care and protection of all existing sewer pipelines, water pipelines, gas mains, electrical and communications conduits, cables, storm drains, culverts, or other facilities and structures that may be encountered in or near the area of work.
- B. **Notification:** It shall be the duty of the Contractor to notify each agency having jurisdiction and make arrangements for locating each agency's facilities prior to beginning construction.

- C. **Damage:** In the event of damage to any existing facilities during the progress of the work due to the failure of the Contractor to exercise the proper precautions, the Contractor shall be responsible for the cost of all repairs and protection to said facilities. The Contractor's work may be stopped until repair operations are complete.
- D. **Storage and Disposal of Excavated Material:** During trench excavation, store excavated material only within the work area. Do not obstruct roadways, streets, bike paths, or sidewalks. Contractor shall remove and dispose of excess excavated soil material off the Project site at no additional cost to the City, in accordance with local regulations.

3.03 STRUCTURE, ROADWAY, AND EMBANKMENT EXCAVATION

- A. **Excavation Beneath Structures and Embankments:** Except where otherwise indicated for a particular structure or ordered by the City, excavation shall be carried to the grade of the bottom of the footing or slab. Where indicated or ordered, areas beneath structures or fills shall be over-excavated. The subgrade areas beneath embankments shall be excavated to remove not less than the top 6 inches of native material and where such subgrade is sloped, the native material shall be benched. When such over-excavation is indicated, both over-excavation and subsequent backfill to the required grade shall be performed by the Contractor. When such over-excavation is not indicated but is ordered by the City, such overexcavation and any resulting backfill will be paid for under a separate unit price bid item if such bid item has been established; otherwise payment will be made in accordance with a negotiated price. After the required excavation or over-excavation has been completed, the exposed surface shall be scarified to a depth of 6 inches, brought to optimum moisture content, and rolled with heavy compaction equipment to obtain 95 percent of maximum density.
- B. **Excavation Beneath Paved Areas:** Excavation under areas to be paved shall extend to the bottom of the aggregate base or subbase, if such base is called for; otherwise it shall extend to 1 inch below the existing paving thickness. After the required excavation has been completed, the top 6 inches of exposed surface shall be scarified, brought to optimum moisture content, and rolled with heavy compaction equipment to obtain 95 percent of maximum density. The finished subgrade shall be even, self-draining, and in conformance with the slope of the finished pavement. Areas that could accumulate standing water shall be regraded to provide a self-draining subgrade.
- C. **Notification of City:** The Contractor shall notify the City at least 3 days in advance of completion of any structure excavation and shall allow the City a review period of at least one day before the exposed foundation is scarified and compacted or is covered with backfill or with any construction materials

3.04 PIPELINE AND UTILITY TRENCH EXCAVATION

- A. **General:** Unless otherwise indicated or ordered, excavation for pipelines and utilities shall be open cut trenches with widths as indicated. Trenches shall be excavated to line and grade as shown on the Plans (Construction Drawings). Excavation for water lines shall be made only after pipe and other necessary materials are delivered to the project site and inspected by the Goleta Water District's inspector. Where trenching occurs in paved areas, the pavement shall be saw cut ahead of the trenching operations. The proper tools and equipment shall be used in marking and breaking so that the pavement will be cut accurately and on neat lines parallel to the trench. Material excavated from trenches shall be placed in such a way as not to endanger the health of the workers or the public. Excavated material shall not be stockpiled within the public right-of-way, or placed in areas where it could be hazardous to traffic, or block access to roads or driveways. Excavation within the public right-of-way shall be performed in compliance with the requirements of the County of Santa Barbara Department of Public Works.
- B. **Trench Geometry:** Trenches shall be constructed to allow for safe installation of pipe and structures. Trench width shall be in accordance with GWD Standard Details except when stated otherwise on the Plans and Specifications. The bottom of the trench shall be excavated uniformly to the grade of the bottom of the pipe bedding. Trench bottom shall consist of firm native soil or imported compacted soil able to evenly support pipe bedding for the full length of the pipe. Excavations for pipe bells and welding shall be made as required.
- C. **Abrasive Materials:** When rocks, concrete, or other hard and abrasive materials are encountered during excavation, it may be required that all or a portion of the material be removed to provide a minimum clearance of 12 inches below and on each side of pipe, valves and fittings. If in the opinion of the Goleta Water District damage to other systems or structures will occur by the removal of material, Contractor shall not proceed until receiving further instructions from the District.
- D. **Unsuitable Foundation:** If soft, spongy, unstable, or other similar material is encountered upon which the pipe bedding material is to be placed, an additional 12 inches in depth of this unsuitable material shall be removed and replaced with bedding material placed in the manner specified for pipe bedding material. Tree roots are to be removed.
- E. **Protection of Property:** Tree, shrubs, fences and all other property and surface structures shall be protected during construction unless the Plans and Specifications call for their removal.
- F. **Temporary Supports:** When other structures, pipes, conduits, cables, wires or any underground improvements are encountered during excavation they shall be temporarily supported as necessary to prevent damage to or disturbance of said improvements.

G. Exploratory Excavation

1. The Contractor shall excavate and expose buried points of connection to existing utilities where indicated on the Drawings. Excavation shall be performed prior to preparation of Shop Drawings for connections and before fabrication of pipe, and the data obtained shall be used in preparing Shop Drawings.
2. Data, including dates, locations excavated, and sketches, shall be submitted to the City within one week of excavation.
3. Damage to utilities from excavation activities shall be repaired by the Contractor.

H. **Open Trench:** The maximum amount of open trench permitted in any one location shall be 300 feet, or a length equivalent to the amount of pipe able to be installed in a single day, whichever is less. Trenches shall not remain open overnight. All trenches shall be fully backfilled at the end of each workday, or shall be properly shored and covered by heavy steel plates adequately braced and capable of supporting vehicular traffic in those locations where it is impractical to backfill at the end of each day. The above requirements for backfilling or use of steel plates may be waived at the discretion of the INSPECTOR in cases where the trench is located further than 100 feet from any traveled roadway or occupied structure. In such cases, however, barricades and warning lights meeting safety requirements shall be provided and maintained.

I. **Over Excavation:** Any over-excavation carried below the grade ordered or indicated, shall be backfilled and compacted to the required grade with the indicated material

3.06 EXCAVATION IN LAWN AND LANDSCAPED AREAS

- A. Where excavation occurs in landscaped areas, Contractor shall protect all trees, shrubs, sidewalk, walls, fences, and other landscape items adjacent to or within the work area unless directed otherwise by the Contract Documents. In the event of damage to landscape items, Contractor shall replace the damaged items in a manner satisfactory to the City at no cost to the City.
- B. Where excavation occurs in lawn areas, the sod shall be carefully removed, dampened, and stockpiled to preserve it for replacement. Excavated material may be placed on the lawn; provided, that a drop cloth or other suitable method is employed to protect the lawn from damage. The lawn shall not remain covered for more than 72 hours. Immediately after completion of backfilling [and testing of the pipeline], the sod shall be replaced and lightly rolled in a manner so as to restore the lawn as near as possible to its original condition. Contractor shall provide new sod if stockpiled sod has not been replaced within 72 hours.

- C. Except where trees are indicated to be removed, trees shall be protected from injury during construction operations. No tree roots over 2 inches in diameter shall be cut without express permission of the City. Trees shall be supported during excavation by any means previously reviewed by the City.

3.07 BACKFILL - GENERAL

- A. Backfill shall not be dropped directly upon any structure or pipe. Backfill shall not be placed around or upon any structure until the concrete has attained sufficient strength to withstand the loads imposed. Backfill around water retaining structures shall not be placed until the structures have been tested, and the structures shall be full of water while backfill is being placed.
- B. Except for drain rock materials being placed in over-excavated areas or trenches, backfill shall be placed after all water is removed from the excavation, and the trench sidewalls and bottom have been dried to a moisture content suitable for compaction.
- C. Immediately prior to placement of backfill materials, the bottoms and sidewalls of trenches and structure excavations shall have all loose sloughing, or caving soil and rock materials removed. Trench sidewalls shall consist of excavated surfaces that are in a relatively undisturbed condition before placement of backfill materials.

3.08 PLACING AND SPREADING OF BACKFILL MATERIALS

- A. Backfill materials shall be placed and spread evenly in layers. When compaction is achieved using mechanical equipment, the layers shall be evenly spread so that when compacted each layer shall not exceed 6 inches in thickness.
- B. During spreading, each layer shall be thoroughly mixed as necessary to promote uniformity of material in each layer. Pipe zone bedding materials shall be manually spread around the pipe so that when compacted the pipe bedding will provide uniform bearing and side support.
- C. Where the backfill material moisture content is below the optimum moisture content, water shall be added before or during spreading until the proper moisture content is achieved. Where the backfill material moisture content is too high to permit the specified degree of compaction the material shall be dried until the moisture content is satisfactory.

3.09 PLACING AND SPREADING OF BACKFILL MATERIALS

- A. Each layer of Types A, B, C, G, H, I, and K backfill materials as defined herein, where the material is graded such that 10 percent or more passes a No. 4 sieve, shall be mechanically compacted to the indicated percentage of density. Equipment that is

consistently capable of achieving the required degree of compaction shall be used and each layer shall be compacted over its entire area while the material is at the required moisture content.

- B. Each layer of Type F backfill materials shall be compacted by means of at least 2 passes from a flat plate vibratory compactor. When such materials are used for pipe zone backfill, vibratory compaction shall be used at the top of the pipe zone or at vertical intervals of 24 inches, whichever is the least distance from the subgrade.
- C. Flooding, ponding, or jetting shall not be used for backfill around structures, for final backfill materials, or aggregate base materials.
- D. Equipment weighing more than 10,000 pounds shall not be used closer to walls than a horizontal distance equal to the depth of the fill at that time. Hand operated power compaction equipment shall be used where use of heavier equipment is impractical or restricted due to weight limitations.
- E. Backfill around and over pipelines that is mechanically compacted shall be compacted using light, hand operated, vibratory compactors and rollers. After completion of at least two feet of compacted backfill over the top of pipeline, compaction equipment weighing no more than 8,000 pounds may be used to complete the trench backfill.

3.10 PLACING AND SPREADING OF BACKFILL MATERIALS

- A. **Methods:** Classification of pipe bedding and trench backfill materials shall be determined in accordance with ASTM D 2487. The density of soil in place shall be determined by the sand cone method, ASTM D 1556, or by the nuclear method, ASTM D 2922 or D 3017. When ASTM D 2922 is used and a one-sack slurry is not used to backfill the trench, the calibration curves shall be checked and adjusted using the sand cone method. ASTM D 2922 results in a wet unit weight of soil and when using this method, ASTM D 3017 (Nuclear Gauge Method for Water Content) shall be used to determine the moisture content of the soil. The calibration curves furnished with the moisture gauges shall be checked along with density calibration checks, as described in ASTM D 3017. The calibration checks of both the density and moisture curves shall be made at the beginning of the job and on each different type of material used. Copies of calibration curves, results of calibration tests, and results of laboratory tests shall be furnished to the City prior to performing any field tests. Field test results shall be furnished to the City within 48 hours of the testing. Trenches improperly compacted shall be reopened to the depth directed by the City, then filled and compacted to the density specified at no additional cost to the City.
- B. **Soil Moisture-Density Relationship:** Laboratory moisture-density relations of soils shall be determined per ASTM D 1557.

- C. **Cohesionless Materials:** Relative density of cohesionless materials by ASTM D 4253 and D 4254.
- D. **Sampling:** Sample backfill materials per ASTM D 75.
- E. **Relative Compaction:** "Relative compaction" shall be defined as the ratio, expressed as a percentage, of the in place dry density to the laboratory maximum dry density.
- F. **Compaction Compliance:** Compaction shall be deemed to comply with the specifications when none of the tests falls below the specified relative compaction. Notify the City 24-hours in advance of when backfill lifts are ready for testing to allow inspection by the City. The Contractor shall pay the costs of any re-testing of work not conforming to the Specifications.
- G. **Testing Frequency:** Testing shall be performed by a certified soils testing service. All tests shall be performed at locations specified by the City. A minimum of one soil classification and one moisture-density relation test shall be performed for each different type of soil material used for pipe bedding and trench backfill. These tests shall also be performed for every 1500 cubic yards of material placed. A minimum of one field density test shall be performed for each soil type, and at least one test for each 24" compacted thickness. These test requirements shall be repeated for every 300 feet of trench length.
- H. **Compaction Requirements:** The following compaction test requirements shall be in accordance with ASTM D 1557 - Test Method for Laboratory Compaction Characteristics of Soils Using Modified Effort (56,000 ft - lbf/ft³) (2,700 kN-m/m³) for Type A, B, C, G, H, I, K, M, and N materials and in accordance with ASTM D 4253 - Standard Test Method for Maximum Index Density and Unit Weight of Soils Using a Vibratory Table, and D 4254 - Standard Test Method for Minimum Index Density and Unit Weight of Soils and Calculation of Relative Density, for Type B, E, F, and J materials. Where agency or utility company requirements govern, the highest compaction standards shall apply.

3.11 PIPE AND UTILITY TRENCH BACKFILL

A. Pipe Zone Bedding

1. The pipe zone is defined as that portion of the vertical trench cross-section lying between the trench bottom and a plane 12-inches above the top surface of the pipe as indicated. The pipe bedding is defined as backfill material within the pipe zone. Bedding shall be placed across the entire trench extending from a minimum of four inches below the bottom of the pipe to 12 inches above the top of pipe. Bedding shall be placed in layers not exceeding six inches loose thickness for compaction by

hydraulic or hand operated mechanical compactors, and eight inches loose thickness when compacted by other mechanical compactors. Bedding shall be compacted to at least 90% of its maximum dry density as determined by ASTM D 1557. Bell holes in bedding shall be provided for each joint, but shall be no larger than necessary to allow joint assembly and to ensure that pipe will lie flat on the bedding. Contractor shall ensure that pipe is not being supported by the bell portion of the pipe at any joint and shall ensure that no less than 2 inches of bedding is provided for yokes, restraints, bells and all other extensions of fittings and joints.

2. The pipe zone shall be backfilled with the indicated backfill material. The Contractor shall exercise care to prevent damage to the pipeline coating, cathodic bonds, and the pipe itself during the installation and backfill operations
- B. Trench Zone Backfill: After the pipe zone backfill has been placed, backfilling of the trench zone may proceed. The trench zone is defined as that portion of the vertical trench cross-section from 12 inches above the top of the pipe to the bottom of the pavement zone if the trench is under pavement, or to within 12 inches of finished grade if the trench is in an unpaved area. Where slurry backfill is not used, material shall be compacted to at least 95% of maximum dry density as determined by ASTM D 1557. Trench shall be backfilled in lifts not exceeding eight inches, uncompacted depth, and then compacted by mechanical means prior to placement of succeeding lifts. Where the pipeline is located within an existing paved street within the public right of way, trench shall be backfilled with Type L backfill material as described above.
- C. Pavement Zone Backfill and Final Backfill: The pavement zone includes the asphalt concrete and aggregate base pavement section. Final backfill applies to trenches not beneath paved areas and is all backfill in the trench cross-sectional area within 12 inches of finished grade.
- D. Identification Tape: Install identification tape as indicated.

3.12 FILL AND EMBANKMENT CONSTRUCTION

- A. The area where a fill or embankment is to be constructed shall be cleared of all vegetation, roots, and foreign material. Following this, the surface shall be moistened, scarified to a depth of six inches, and rolled or otherwise mechanically compacted. Embankment and fill material shall be placed and spread evenly in approximately horizontal layers. Each layer shall be moistened or aerated, as necessary. Unless otherwise approved by the City, each layer shall not exceed 6 inches of compacted thickness. The embankment, fill, and the scarified layer of underlying ground shall be compacted to 95 percent of maximum density under structures and paved areas, and 90 percent of maximum density elsewhere.
- B. When an embankment or fill is to be made and compacted against hillsides or fill slopes steeper than 4:1, the slopes of hillsides or fills shall be horizontally benched to key the

embankment or fill to the underlying ground. A minimum of 12 inches normal to the slope of the hillside or fill shall be removed and re-compacted as the embankment or fill is brought up in layers. Material thus cut shall be re-compacted along with the new material. Hillside or fill slopes 4:1 or flatter shall be prepared in accordance with Paragraph A, above.

- C. Where embankment or structure fills are constructed over pipelines, the first 4 feet of fill over the pipe shall be constructed using light placement and compaction equipment that does not damage the pipe. Heavy construction equipment shall maintain a minimum distance from the edge of the trench equal to the depth of the trench until at least 4 feet of fill over the pipe has been completed.

3.13 FIELD TESTING

- A. **General:** All field soils testing will be done by a testing laboratory of the City's choice at the City's expense except as indicated below.
- B. Where soil material is required to be compacted to a percentage of maximum density, the maximum density at optimum moisture content will be determined in accordance with Method C of ASTM D 1557. Where cohesionless, free draining soil material is required to be compacted to a percentage of relative density, the calculation of relative density will be determined in accordance with ASTM D 4253 and D 4254. Field density in-place tests will be performed in accordance with ASTM D 1556 - Standard Test Method for Density and Unit Weight of Soil in Place by the Sand-Cone Method, ASTM D 2922 - Standard Test Methods for Density of Soil and Soil-Aggregate in Place By Nuclear Methods (Shallow Depth), or by such other means acceptable to the City.
- C. In case the test of the fill or backfill show non-compliance with the required density, the Contractor shall accomplish such remedy as may be required to ensure compliance. Subsequent testing to show compliance shall be by a testing laboratory selected by the City and paid by the Contractor.
- D. The Contractor shall provide test trenches and excavations including excavation, and trench support for the City's field soils testing operations. The trenches and excavations shall be provided at the locations and to the depths required by the City.

3.14 ASPHALT CONCRETE

- A. **General:** Furnishing, placing, shaping, rolling, and finishing asphalt concrete for resurfacing of pavement after trenching shall be performed in accordance with local jurisdiction's Standards and Section 39 of the Caltrans Standard Specifications.

- B. Wherever required by the governing agency, the Contractor shall place temporary surfacing promptly after backfilling and shall maintain such surfacing for the period of time fixed by said agency before proceeding with the final restoration of improvements.
- C. All paved areas, including curbs and berms, cut or damaged during construction shall be replaced with similar materials and of equal thickness to match the existing adjacent undisturbed areas, except where specific resurfacing requirements have been called for in the Contract Documents or in the permit of the governing agency. All temporary and permanent pavement shall conform to the requirements of the governing agency.
- D. In order to obtain a satisfactory junction with adjacent surfaces, the Contractor shall saw cut back and trim the edge so as to provide a clean, sound, vertical joint before permanent resurfacing of an excavated or damaged portion of pavement. Damaged edges of pavement along excavations and elsewhere shall be trimmed back by saw cutting in straight lines.
- E. Pavement and base shall be constructed to the line, grade and thickness shown on the Construction Drawings. All pavement restoration and other facilities restoration shall be constructed to finish grades compatible with adjacent undisturbed pavement.

3.15 BASE AND SUBGRADE BELOW ASPHALT CONCRETE

- A. The preparation of the subgrade to receive aggregate base course, and preparation and construction of aggregate base for construction of asphalt concrete paving shall conform to the requirements of the applicable sections of the Caltrans Standard Specifications.
- B. Spreading and compacting of base material shall conform to the requirements of Section 26 of the Caltrans Standard Specifications.
- C. Base course shall be maintained until asphalt pavement is placed. Areas of base course which are damaged or do not conform to the requirements herein shall be conditioned, reshaped, and recompacted in accordance with the requirements herein.
- D. Compaction tests will be performed by the City, in accordance with the requirements of the applicable sections of the Caltrans Standard Specifications

3.16 TACK COAT

- A. An asphalt tack coat shall be applied to all existing asphalt concrete or concrete surfaces upon or against which asphalt concrete is to be placed. Application of tack coat shall conform to the requirements of Section 39 of the Caltrans Standard Specifications.

3.17 ASPHALT CONCRETE PAVING

- A. Asphalt concrete paving shall be constructed in accordance with the requirements of Section 39 of the Caltrans Standard Specifications.

3.18 ASPHALT CONCRETE PAVEMENT MARKING AND STRIPING

- A. Asphalt concrete pavement shall be marked and striped to replace all markings and striping disturbed by the paving operation in accordance with Section 84 of the Caltrans Standard Specifications.

END OF SECTION

SECTION 32 01 13
ROLLED SLURRY SEAL, EXISTING PAVEMENT

PART 1 - GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Asphalt emulsion slurry seal as indicated.
- B. Related Requirements:
 - 1. Division 01 - General Requirements.
 - 2. Section 32 01 17 – Asphalt Pavement Repair.

1.02 SUBMITTALS

- A. Shop Drawings: Submit plan indicating extent of areas to be sealed.
- B. Product Data: Submit mix design.

1.03 QUALITY ASSURANCE

- A. Comply with the following as a minimum requirement: Standard Specifications for Public Works Construction, current edition.

PART 2 - PRODUCTS

2.01 MATERIALS

- A. Slurry Seal: Provide the following material grades in accordance with Section 203 - Bituminous Materials of the Standard Specification for Public Works Construction, current edition.
 - 1. Emulsified asphalt shall be slow set type grade CSS-1h.
 - 2. Grading of the combined aggregate and percentage of emulsified asphalt shall conform to Type I slurry requirements.
 - 3. Installed slurry seal shall be sufficiently cured to permit vehicle traffic within one day after application.

PART 3 - EXECUTION

3.01 REPAIRING AND ROLLED SLURRY SEAL EXISTING SURFACES

- A. Preparation of Surfaces:

1. Before starting slurry seal operations, existing bituminous surfacing shall be cleaned of loose material, oil spots, vegetation, and other objectionable material.
 2. Dampen surface to receive slurry seal with a light application of water to ensure coverage and proper bond.
 3. Provide adequate protection over manholes, yard boxes, utility vaults and other improvements adjacent to the areas to receive slurry seal. Project Inspector shall inspect surfaces before the installation of slurry seal.
- B. Repair of Existing Surfacing: Cracks more than ½ inch wide, low areas, holes or depressions in existing surfacing shall be repaired as specified in Section 32 01 17: Asphalt Pavement Repair, prior to the installation of slurry seal.
- C. Rolled Slurry Seal: Work shall be performed in accordance to Sub-section 302-4, Slurry, of the Standard Specifications for Public Works Construction, current edition.
1. Roll slurry surfacing with a 10-ton pneumatic roller with a tire pressure of 50 psi and equipped with a water spray system. Roll as soon as the surfacing is sufficiently cured and will not pick up on tires of roller. Surfaced areas shall receive a minimum of two coverage passes by roller. Provide a smooth surface free from ridges or surface variations.
 2. Depressions occurring in cracks after initial slurry seal installation shall be filled with sand slurry before rolling and seal coat installation.

3.02 CLEAN UP

- A. Remove rubbish, debris and waste materials and legally dispose of off the Project site.

3.03 PROTECTION

- A. Protect the Work of this section until Substantial Completion.

END OF SECTION

SECTION 32 01 17

ASPHALT PAVEMENT REPAIR

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Bituminous Surfacing Repair: Areas removed for utility trenches, heaved by tree roots, cracked areas, protruding areas where pavement meets hard surfaces, depressed areas, holes and areas around new structures, and raveled bituminous pavement.
2. Areas heaved by tree roots, cracked areas, holes and trenches, and areas around new structures.

B. Related Sections:

1. Division 01 - General Requirements.
2. Section 01 35 93 - Off-site Improvement Procedures.
3. Section 31 22 00 - Grading.
4. Section 31 23 00 - Earthwork.
5. Section 31 23 16 – Trenching Backfill and Compaction.
6. Section 32 11 16 – Aggregate Base
7. Section 32 01 13 - Rolled Slurry Seal, Existing Pavement.
8. Section 32 12 16 - Asphalt Paving.
9. Section 32 13 13 - Site Concrete Work.

1.02 SUBMITTALS

- A. Shop Drawings: Submit Shop Drawings indicating areas to be repaired.
- B. Product Data: Submit manufacturer's technical data for materials and products.

1.03 QUALITY ASSURANCE

- A. Comply with Standard Specifications for Public Works Construction, current edition.

PART 2 - PRODUCTS

2.01 MATERIALS

- A. Base course materials: Section 32 11 16 – Aggregate Base.
- B. Asphalt paving materials: Section 32 12 16 - Asphalt Paving.
- C. Headers: Section 32 12 16 - Asphalt Paving.

2.02 BITUMINOUS MATERIALS

- A. Provide materials and products of the class, grade or type indicated, conforming to relevant provisions of Section 203 - Bituminous Materials of the latest Standard Specifications for Public Works Construction.

PART 3 - EXECUTION

3.01 PAVEMENT REMOVAL

- A. Remove bituminous and concrete pavement in accordance with applicable provisions of Section 300 - Earthwork of the Standard Specifications for Public Works Construction.
- B. Pavement Heaved By Roots: Remove pavement to limits of distortion and expose roots. Trim roots to provide at least 12-inch clearance to pavement. Coordinate with OWNER's Tree Trimming Department for recommendations and approval prior to trimming roots.
- C. Remove protruding bituminous surfaces flush with the surrounding grade using a suitable tool or equipment so that adjacent finishes are not blackened.
- D. Remove raveled and depressed bituminous pavement to limits indicated or required.
- E. Saw cut existing improvements, trim holes and trenches in bituminous and concrete pavement to permit mechanical hand tampers to compact the fill.
- F. Remove broken concrete by saw cutting. If the required cut line is within 30 inches of a score or joint line or edge, cut and remove to the score, joint line, or edge.

3.02 EXCAVATING, BACKFILLING AND COMPACTING

- A. Conform to requirements in Section 31 23 13 - Excavation and Fill; Section 31 23 16 - Excavation and Fill for Paving; Section 31 23 19 - Excavation and Fill for Structures; or Section 31 23 23 - Excavation and Fill for Utilities, as required.

- B. Where subgrade or base is deemed to be unstable or otherwise unsuitable, excavate such materials to firm earth, and replace with a required material. Install and compact fill materials in accordance with the requirements of Section 31 23 16 Excavation and Fill for Paving.

3.03 HEADERS

- A. Install headers along edge of bituminous surfacing abutting turf, earth, or planting area, unless indicated otherwise.
- B. Install headers so the bottom surface has continuous bearing on solid grade. Where excavation for headers is undercut, thoroughly tamp soil under the header. Compact backfill on both sides of header to the density of the adjacent undisturbed grade.
- C. Fasten headers in place with redwood or Douglas fir stakes of length necessary to extend into solid earth a minimum of 12 inches. Stakes shall be of sound material, neatly pointed, driven vertically, and securely nailed to headers. Space stakes, not to exceed 4 feet on centers with top of stakes set one inch below top of header. Provide a minimum of two 12d galvanized common nails through each stake.
- D. Remove existing headers where new surfacing is installed adjacent to existing surfacing.
- E. Install temporary headers at transverse joints of paving where continuous paving operations are not maintained.
- F. Provide additional stakes and devices as required to fasten headers.

3.04 BASE COURSE

- A. Unless otherwise indicated, base course shall be crushed aggregate base, fine grade, 3 inches thick or equal to thickness of the existing base, whichever is greater.
- B. Fill grade and compact as specified in Section 31 22 00 - Grading.

3.05 RESURFACING

- A. Utility Trenches: Remove loose dirt and backfill with cement-sand slurry allowing for surfacing one inch thicker than existing. Resurface flush with existing adjoining pavement installing the same type of materials and section provided in existing improvements.
- B. Other Areas: Other surface improvements damaged or removed shall be cut to a neat even line and excavated one inch below the bottom of the existing pavement. Resurface by following the original grades and installing the same type of materials provided in existing improvements.

- C. Where bituminous surfacing abuts concrete, masonry, walks or paving, tamp joint smooth, if necessary, as described above to obtain a uniformly even joint, true to line and grade. Tamp and smooth materials before asphalt cools.

3.06 REPAIRING AND RESEALING EXISTING SURFACES

- A. Preparation of Surfaces: Prior to filling cracks, clean existing bituminous surfacing of loose and foreign materials and coat with a film of asphalt emulsion.
- B. Repair of Existing Surfacing:
 - 1. Fill cracks 1/2 inch wide and less with RS-1 emulsion and washed plaster sand or other approved crack filler material. Cracks larger than 1/2 inch wide shall be filled with Type F/Sheet Mix Asphalt Concrete as specified. Cracks shall be filled to the level of adjacent surfacing.
 - 2. Where low areas, holes, or depressions occur in existing surfacing, refer to Section 32 12 16; Asphalt Paving, Article 3.02. Use Type E Mix and feather edge joint flush to the level of adjacent surfacing.
- C. Testing: Flood test entire area in presence of the Project Inspector. Inspect area after waiting one hour. Entire area tested shall be free of standing water or puddles in excess of 0.01 foot. Practical field measurement: 0.01 foot = two quarters stacked.
- D. Surface Seal: After surface has been repaired and tested, install seal coat over entire area indicated. Surface seal shall be as specified in Section 32 12 36 - Seal for Bituminous Surfacing.

3.07 CLEANING

- A. Remove all stains on the Project site and adjacent properties caused by or attributed to the Work of this section.
- B. Remove rubbish, debris, and waste materials and legally dispose of off the Project site.

3.08 PROTECTION

- A. Protect the Work of this section until Substantial Completion.

END OF SECTION

SECTION 32 01 90 OPERATIONS AND MAINTENANCE OF PLANTING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, shall apply to all work in this Section with the same force and effect as though repeated in full herein.

1.2 SUMMARY

- A. After landscape planting and irrigation work have been completed, reviewed and accepted by OAR, furnish materials, labor, transportation, services and equipment necessary to provide landscape maintenance as indicated on Drawings and as specified herein.
- B. Work included in this Section:
 - 1. Continuous maintenance of plant material and irrigation system during specified landscape maintenance period.
- C. Work related in other Sections:
 - 1. Section 32 80 00 & Section 32 84 00 – Planting Irrigation & Planting Irrigation Drip Systems.
 - 2. Section 32 90 00 - Planting.

1.3 LANDSCAPE MAINTENANCE PERIOD

- A. Landscape Maintenance Period: 90 days from Final Acceptance by OAR. Contractor may, at discretion of OAR, be allowed to proceed into landscape maintenance period if planting and irrigation is deemed "substantially complete" by OAR.
- B. Continuously maintain areas involved in this Contract during progress of Work and during landscape maintenance period until Final Acceptance by OAR has been granted.
- C. Improper landscape maintenance or possible poor condition of planting at termination of the scheduled landscape maintenance period may cause landscape maintenance period to be continued at no cost to Owner.
- D. In order to carry out plant establishment work, furnish sufficient labor and adequate equipment to perform Work during landscape maintenance period.

- E. Request an observation of Work by OAR to begin landscape maintenance period after planting and related work has been completed in accordance with Contract Documents. A prime requirement is that groundcover areas be planted and show a consistent and healthy appearance. If such criteria are met to satisfaction of OAR, a field report may be issued to OAR recommending a start date to begin landscape maintenance period.
- F. Any day that Contractor fails to adequately perform landscape maintenance, as determined necessary by OAR, that day will not be credited as one of landscape maintenance working days.
- G. Prior to being placed on landscape maintenance, submit a schedule of activities planned during landscape maintenance period. This schedule needs to be accepted by OAR prior to start of landscape maintenance. Document scheduled changes and obtain acceptance by OAR.

PART 2 - PRODUCTS

2.1 GENERAL

- A. Provide materials used during landscape maintenance work in accordance with requirements of Section 32 90 00 - Planting. Provide fertilizer per soil's test recommendation and following:
 - 1. Shrub and Groundcover Planting Fertilizer:
 - a. Consisting of following minimum percents by weight:
 - 14% Nitrogen
 - 4% Phosphoric Acid
 - 9% Potash
 - 30% Humus
 - 6% Humic Acid
 - 3% Sulfur
 - b. Acceptable Manufacturers:
Gro-Power Hi Nitrogen; Gro-Power (909) 393-3744 or approved equivalent.
- B. Submit a list of materials that are to be used during landscape maintenance that are not specified in Section 32 90 00 in written form to OAR for review and approval.

PART 3 - EXECUTION

3.1 LANDSCAPE MAINTENANCE

- A. Keep landscape areas free of debris.

- B. Keep planted areas weed-free. Cultivate at intervals of not more than 10 days.
- C. Maintain adequate protection of Work area. Repair damaged areas.
- D. Sweep clean paved areas on once a week intervals or less, if deemed necessary.

3.2 TREE AND SHRUB CARE

- A. Watering:
 - 1. Maintain a large enough water basin around trees and shrubs so that enough water can be applied to establish moisture through major root zone.
 - 2. When hand watering, use a water wand to break water force.
 - 3. Replenish wood mulches to reduce evaporation and frequency of watering.
 - 4. Regulate irrigation watering times to minimize erosion and gullyng.
- B. Pruning:
 - 1. Trees:
 - a. Prune Trees To:
 - 1) Select and develop permanent scaffold branches that are smaller in diameter than trunk or branch to which they are attached which have vertical spacing of from 18-inches to 48-inches and radial orientation so as not to overlay one another.
 - 2) To eliminate diseased or damaged growth.
 - 3) To eliminate narrow V-shaped branch forks that lack strength.
 - 4) To reduce toppling and wind damage by thinning out crowns.
 - 5) To maintain growth within space limitations.
 - 6) To maintain a natural appearance and to balance crown with root mass.
 - b. Under no circumstances, will stripping of lower branches "raising-up" of young trees be permitted.
 - c. Retain lower branches in a "tipped-back" or pinched condition with as much foliage as possible to promote caliper trunk growth.
 - d. Cut lower branches flush with trunk only after tree is able to stand erect without staking or other support.
 - e. Remove sucker growth.
 - f. Thin evergreen trees and shape when necessary to prevent wind and storm damage.
 - 2. Shrubs:
 - a. Overall objective of shrub pruning is same as for trees.
 - b. Do not clip shrubs into balled or boxed forms unless approved initially by OAR.
 - c. Make pruning cuts on lateral branches or buds flush with trunk.
 - d. Do not "stub" branches.

- C. Tree Staking and Guying:
 - 1. Restake, tighten and repair damaged ties and guys.
 - 2. Reset to proper grades or upright position, trees that are not in their proper growing position.
 - 3. Inspect stakes and guys to prevent girdling of trunks or branches and to prevent rubbing that may cause bark wounds.

 - D. Weed Control:
 - 1. Keep planted and aggregate areas free of weeds.
 - 2. Use recommended legally approved herbicides.
 - 3. Avoid frequent soil cultivation that destroy shallow surface roots.
 - 4. Replenish lost wood mulch to reduce weed growth.

 - E. Insect and Disease Control:
 - 1. Maintain insect and disease control during landscape maintenance period.

 - F. Fertilization:
 - 1. Fertilize planting areas with application of Gro-Power Hi-Nitrogen 14-4-9, or approved equivalent. Commercial fertilizer at the rate of 7 1/2 pounds per 1,000 square feet 30 days after planting.
 - 2. Repeat fertilizer application at 30-day intervals until end of the landscape maintenance period.

 - G. Replacement of Plants:
 - 1. Replace dead, dying and missing plants of a like size and condition as to those that were originally installed at no cost to Owner.

 - H. Replacement of Soil
 - 1. Replacement of soil to maintain height of 2” below top of planter.
- 3.3 GROUND COVER CARE

- A. Weed Control:
 - 1. Control weeds with chemical systemic spray or by hand so as to cause minimal damage to planted materials.

- B. Watering:
 - 1. Water enough so that moisture penetrates throughout root zone and only as frequently as necessary to maintain healthy growth.

- C. Fertilizing:
 - 1. Fertilize as specified under Tree and Shrub care of this Specification.

- D. Edge groundcover to keep in bounds and trim top growth as necessary to achieve an overall even appearance.

- E. Replace dead, dying and missing plants of a like size and condition as to those that were originally installed.

3.4 IRRIGATION SYSTEM

- A. Provide maintenance of irrigation system consisting of cleaning and adjusting sprinkler nozzles, repairing damaged equipment, servicing valves, programming controllers and other activities required during landscape maintenance period.

3.5 FINAL WALKTHROUGH

- A. At completion of landscape maintenance period, schedule a Final Walkthrough with OAR.
- B. OAR, General Contractor and others deemed necessary by OAR may be present at Final Walkthrough.
- C. If, during Final Walkthrough OAR is of opinion that landscape maintenance has been substantially completed in accordance with this Section, written notice of recommendation to allow Contractor to be released from Project will be submitted to OAR for approval. This report will note any incomplete punch list items from Final Walkthrough and a date on which these items must be completed. Complete remaining punch list items within 5 working days after Final Walkthrough was performed by OAR.

3.6 CLEAN UP

- A. Upon completion of landscape maintenance, remove rubbish, waste and debris resulting from Contractor's operations.
- B. Repair scars, ruts or other marks in landscaped areas caused by Contractor.
- C. Remove equipment, implements of service, and leave Work area in a neat and clean condition. Sweep clean paved areas.

END OF SECTION

SECTION 32 11 16

AGGREGATE BASE

PART 1 – GENERAL

1.01 SUMMARY

- A. This Section specifies the material and work requirements for aggregate base to be furnished and place to the lines, grades, and dimensions in accordance with the Plans, Specifications and as directed by the Engineer.

1.02 RELATED SECTIONS

- A. 31 23 00 – Grading
- B. 31 23 16 – Trenching Backfill and Compaction
- C. 32 12 16 – Asphalt Paving
- D. 32 13 13 – Portland Cement Concrete Paving
- E. 32 14 00 – Unit Paving
- F. 32 16 21 – Concrete Curbs, Gutters, and Walks

1.03 REFERENCES

- A. AASHTO - M147 - Materials for Aggregate and Soil-Aggregate.
- B. ASTM C136 - Method for Sieve Analysis of Fine and Coarse Aggregates.
- C. ASTM D1557 - Test Methods for Moisture-Density Relations of Soils and Soil-Aggregate Mixtures Using 10 lb. Rammer and 18-nch Drop.
- D. ASTM D2167 - Test Method for Density and Unit Weight of Soil in Place by the Rubber Balloon Method.
- E. ASTM D2487 - Classification of Soils for Engineering Purposes.
- F. ASTM D2922 - Test Methods for Density of Soil and Soil-Aggregate in Place by Nuclear Methods (Shallow Depth).
- G. ASTM D3017 - Test Method for Moisture Content of Soil and Soil-Aggregate in Place by Nuclear Methods (Shallow Depth).
- H. ASTM D4318 - Test Method for Liquid Limit, Plastic Limit, and Plasticity Index of Soils.
- I. AASHTO - M-145 Soil Classification Standard Specifications for Public Work construction.

- J. Document Geotechnical Report, dated March 23, 2023 by ENGEO, Inc: Geotechnical Exploration report; bore hole locations and findings of subsurface materials.

1.4 SUBMITTALS

- A. Section 01 33 00 – Submittal Procedures: Procedures for submittals.
- B. Samples: Submit, in air-tight containers, 10 l. sample of each type of fill material to testing laboratory for evaluation.
- C. Submit test reports on each type of imported material.
- D. Materials Source: Submit name of imported materials suppliers and location of material source.

1.5 QUALITY ASSURANCE

- A. Perform Work in accordance with this Section and referenced standards. Maintain one copy of test results on-site.

PART 2 – PRODUCT

2.01 AGGREGATE BASE

- A. Aggregate Base Course: Caltrans Class II Base (Minimum R-Value = 78), ¾” size gradation maximum.

2.02 FIELD QUALITY CONTROL

- A. Section 01410 - Quality Control: Field testing and analysis of aggregate material.
- B. Coarse Aggregate Material - Testing and Analysis: Perform in accordance with ASTM D1557, ASTM D2167, ASTM D2922, ASTM D3017, ASTM D4318 and ASTM C136.
- C. Fine Aggregate Material - Testing and Analysis: Perform in accordance with ASTM D1557, ASTM D2167, ASTM D2922, ASTM D3017, ASTM D4318, and ASTM C136.
- D. If tests indicate materials do not meet specified requirements, excavate existing material, change material or material source, reinstall and retest.
- E. Provide materials of each type from same source throughout Project.

PART 3 – EXECUTION

3.01 AGGREGATE BASE

A. Aggregate base shall be of the type indicated and placed to the limits shown on the plans.

1. $\frac{3}{4}$ " Class 2 Base

The use of reclaimed and recycled material is permitted on this project in accordance with the Standard Specifications. Reclaimed and recycled material shall not be placed at locations where surfacing will not be placed over the aggregate base.

3.1 STOCKPILING

- A. Stockpile materials on site at locations directed by City.
- B. Stockpile in sufficient quantities to meet Project schedule and requirements.
- C. Separate differing materials with dividers or stockpile apart to prevent mixing.
- D. Direct surface water away from stockpile site so as to prevent erosion or deterioration of materials.

3.2 STOCKPILE CLEANUP

- A. Remove stockpile, leave area in a clean and neat condition. Grade site surface to prevent free standing surface water.
- B. If a borrow area is indicated, leave area in a clean and neat condition. Grade site surface to prevent free standing surface water.

PART 4 – MEASUREMENT AND PAYMENT

4.01 MEASUREMENT

A. $\frac{3}{4}$ " Class 2 Base

No separate measurement shall be made for $\frac{3}{4}$ " Class 2 Base.

4.02 PAYMENT

A. $\frac{3}{4}$ " Class 2 Base

Full compensation for $\frac{3}{4}$ " Class 2 Base shall be considered included in the contract prices paid for the various related items of work and no separate payment will be made therefore.

Department of Neighborhood Services and Public Safety
GOLETA TRAIN DEPOT PROJECT

END OF SECTION

SECTION 32 12 16 ASPHALT PAVING

PART 1 – GENERAL

1.01 SUMMARY

- A. This Section specifies the material and work requirements for asphalt paving to be furnished and place to the lines, grades, and dimensions in accordance with the Plans, Specifications and as directed by the Engineer.
- B. Asphalt paving shall include all street paving, and street rehab paving.

1.02 RELATED SECTIONS

- A. 31 23 00 – EARTHWORK
- B. 32 11 16 – AGGREGATE BASE

1.03 REFERENCES

- A. Work shall comply with the rules and regulations of the City of Goleta, Santa Barbara County and the State of California.
- B. Reference to the "Standard Specifications" shall mean the Greenbook.
- C. ASTM Standards.

1.04 PROJECT CONDITIONS

- A. The Contractor shall keep his work area clean, and in a safe and workmanlike condition so that rubbish, waste and debris do not interfere with the work of other trades.
- B. Apply prime and tack coats when ambient temperature is above 50 degrees F and when temperature has not been below 35 degrees F for 12 hours immediately prior to application. Do not apply when base is wet or contains an excess of moisture.
- C. Construct asphalt concrete surface course only when atmospheric temperature is above 40 degrees F and when base is dry. Base course may be placed when air temperature is above 30 degrees F.

1.05 COORDINATION

- A. The Contractor shall notify the General Contractor and all other contractors related to the installation of his Work in ample time, so as to allow sufficient time for those contractors to perform their portion of the Work.

PART 2 – PRODUCTS

2.01 BITUMINOUS MATERIAL

- A. HOT MIX ASPHALT (HMA)

- 1. Base Course:

- Base course shall be Grade B-PG 64-10 and shall conform to Section 203-6, “Asphalt Concrete,” of the Standard Specifications for Public Works Construction (SSPWC, “Greenbook”).

- 2. Wearing (Surface) Course:

- Wearing course shall be Grade D2-PG 64-10 and shall conform to Section 203-6, “Asphalt Concrete,” of the SSPWC.

- B. Coatings

- 1. Prime Coat:

- Prime coat shall be Grade SC-250

- 2. Tact Coat:

- Tact coat shall be Grade PG 64-10

2.02 MIXES

- A. Asphalt concrete for paving shall be in accordance with applicable provisions of the Standard Specifications and related sections and with the requirements contained in this Section.

2.03 PAVEMENT STRIPING PAINT

Provide chlorinated rubber or flat alkyd type traffic marking paint as manufactured by J. D. Bauer, Decratrend, Porter, Dunn-Edward, Sinclair or other approved equal. The color to be selected by Owner will be either yellow or white, except handicap which will be blue and white.

2.04 ASPHALT PAVING MACHINES

- A. Standard, self-propelled, self-contained units having an activated screed or strike-off assembly capable of spreading and finishing courses of bituminous plant mix material in widths compatible to the specified cross-section and thickness required.

PART 3 – EXECUTION

3.01 PROTECTION

- A. The prime coat shall not be applied on a wet surface, when the atmospheric temperature is below 50 degrees F, or when weather conditions are in the opinion of the Owner's Authorized Representative, unsuitable for its application.

3.02 SOIL STERILIZATION

- A. After all fine grading, checking, shaping, and compacting of the subgrade has been completed, and just prior to placing aggregate base course, in truck traffic areas or asphaltic concrete in pedestrian areas, all soil in the area to receive bituminous concrete pavement shall be thoroughly treated with soil sterilant and thoroughly sprinkled to distribute the chemical through the first two or three inches of the subgrade.
- B. The Contractor shall provide all necessary protection to prevent injury to animal, fish, or plant life and property occasioned by the application of the soil sterilant. The Contractor will be held responsible for all application of soil sterilant or the storage of same.
- C. Soil Sterilant shall be applied in accordance with the manufacturer's recommendations.

3.03 SUBGRADE PREPARATION

- A. After demolition and removal of existing paved areas, the ground shall be leveled and proof-rolled to 95 percent compaction. Where 95 percent compaction is not obtained by proof rolling the top 12 inches of the subgrade material shall be scarified and compacted to 95 percent relative compaction. The subgrade shall be graded to the elevations shown on the Plans. Where grade is below plan grade, approved available material selected from excavation shall be added until the appropriate grade is met. Approved material shall comply with 31 23 00, "Earthwork," of the Technical Specifications.
- B. Where the subgrade preparation extends into areas where subgrade material is unsuitable to meet compaction requirements or contains organic material, Contractor shall remove all unsuitable material to a depth of 3 feet below finished grade in accordance with the Section 300-2.2 "Unsuitable Material," of the SSPWC. Imported fill shall be placed where needed and compacted to 90 percent relative compaction. Six inches of Class 2 Base shall be placed above the imported fill and compacted to 95 percent relative compaction. Contractor shall allow time for Engineer to perform quality assurance testing of the imported fill and Class II Base prior to placing finish paving.

3.04 STREET PAVING

- A. Asphalt concrete paving shall be of the type indicated and placed to the limits shown on the plans.
- B. Placement of asphalt concrete shall be in accordance with Section 302-5, "Asphalt Concrete Pavement," of the SSPWC
- C. Should it become necessary to remove and dispose of material from the prepared earthen subgrade and to again prepare the subgrade to accommodate a thicker pavement structure than assumed on the Plans, the volume of such excavation will be measured and paid for be in accordance with Special Provisions.
- D. Should it become necessary to add earthen embankment to the prepared subgrade and to again prepare the subgrade to accommodate a thinner pavement structure than assumed on the plans, the volume for such embankment and prepared subgrade shall be measured and paid for be in accordance with the Special Provisions.

3.05 FINISHING ROADWAY

- A. The work performed in connection with finishing roadway shall conform to the provisions of Section 301, "Treated Soil, Subgrade Preparation, and placement of Base Materials," of the SSPWC and these specification.

3.06 SURFACE REQUIREMENTS

- A. The surface of the paving shall be in accordance with the lines, grades and cross-sections shown on the Drawings, and shall be free from ruts, humps, depressions and irregularities.
- B. For the purpose of testing the finished surface course, a 12-foot straight edge will be used, except that a 10-foot straight edge may be used on vertical curves. The straight edge shall be held in contact with the surface in successive positions parallel to the road centerline. The entire area will be checked from one side to the other, by advancing along the pavement in successive stages of not more than half the length of the straight edge.
- C. Except at intersections or at changes of grade, any irregularities which vary more than 1/4 inch from the lower edge of the straight edge shall be corrected at the Contractor's own expense. The transverse slope of the finished surface shall contain no depressions greater than 1/4 inch below the lower edge of the straight edge when laid transverse to the road centerline.

- D. Irregularities which may develop before the completion of rolling shall be remedied by loosening the surface mix and removing or adding materials as may be required. Should any irregularities or defects remain after the final compaction, the material shall be promptly removed and sufficient new material laid to form a true and even surface.
- E. All minor surface projections, ridges, indentations and minor honeycombed surfaced shall be corrected smooth to grade by rolling or other means as requested by Owner's Representative, at the Contractor's own expense.

3.07 PAVEMENT STRIPING

- A. Symbol striping shall be defined as indicated on the Drawings. Areas to be painted shall be cleaned with compressed air immediately prior to painting. Apply paint in (2) coats. Use mechanical applicators to ensure that lines are straight where required to be. Ensure that finished coats have a total dry film thickness of 2.5 mils. Stripes shall be 4-inches wide and shall have clearly defined edges. Deviations greater than 1/2 inch in 20 feet shall be corrected by obliterating and repainting. Paint directional arrows, traffic directions and handicap markings as indicated on the Drawings.

3.08 INSPECTIONS

- A. Pavement mixtures shall have a minimum stability of 35 per applicable state specifications. Certified laboratory tests shall be furnished to indicate compliance with these requirements.
- B. The Owner reserves the right to have measurements taken of base course and bituminous surfacing as actually installed.

3.09 TESTING FOR DRAINAGE

- A. Before final acceptance of the work, the Contractor shall, in the presence of the Owner's representative, test all paved areas for correct water runoff by flooding with water in such quantity as to prove correct shaping of the paving to the satisfaction of the Owner's representative.
- B. Pavement in areas where water remains standing after testing shall be removed and reconstructed to the correct grade. Feathered pavement edges resulting from patching will not be permitted. All costs for such work shall be borne by the Contractor.

3.10 QUALITY CONTROL

- A. Trucks used for hauling bituminous mixtures shall have tight, clean, smooth beds coated with a minimum amount of paraffin oil, lime solution, or other approved material to prevent the mixture from adhering to the beds.

- B. Should the mixture, at the plant or in place, show an excess or deficiency of bitumens how injury or damage due to burning or overheating, or show an improper combination of aggregates, as determined by Owner's Representative, the mixture shall be rejected and shall be disposed of by the Contractor at his own expense.

3.11 CLEANUP

- A. Upon completion of the work under this Section, the Contractor shall remove all rubbish, waste and debris resulting from his operations offsite or as directed by the Owner. Remove all equipment and implements of service, and leave the entire work area in a neat, clean, and Owner-accepted condition.

PART 4 – MEASUREMENT AND PAYMENT

4.01 MEASUREMENT

- A. Asphalt Paving shall be measured by the ton, determined as provided in Section 302-5.9, “Measurements and Payment,” of the SSPWC. Quantity shall be confirmed by submittal of weigh tickets for all asphalt concrete material used on the project.

4.02 PAYMENT

- A. The contract price paid per ton for Asphalt Paving shall include full compensation for furnishing all labor, materials, tools, equipment, and incidentals, and for doing all the work involved in Asphalt Paving including subgrade preparation, tact coats, mixing, placing, shaping, compacting, and finishing the Asphalt Paving, complete in place, as specified in the SSPWC and these Technical Specifications, and as directed by the Engineer.

END OF SECTION

SECTION 32 13 13 PORTLAND CEMENT CONCRETE PAVING

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, shall apply to all work in this Section with the same force and effect as though repeated in full herein.

1.02 DESCRIPTION OF WORK

- A. Furnish materials, labor, transportation, services, and equipment necessary to install portland cement concrete paving as indicated on Drawings and as specified herein.
- B. Work included in this Section:
 - 1. Decorative colored concrete paving.
 - 2. Natural colored concrete paving.
 - 3. Materials and accessories.
 - 4. Preparation of subgrade, subbase, or base.
 - 5. Formwork.
 - 6. Placing concrete reinforcement.
 - 7. Placing concrete.
 - 8. Joints.
 - 9. Finishing.
 - 10. Curing and protection.
 - 11. Installation of joint seals.
 - 12. Field quality control.
- C. Work related in other Sections:
 - 1. Section 32 14 00 – Unit Pavers.
 - 2. Section 32 84 00 – Planting Irrigation.
 - 3. Section 03 31 01 – Landscape Concrete Formwork.
 - 4. Section 03 20 01 – Landscape Concrete Reinforcement.
 - 5. Section 03 30 01 – Landscape Cast-in-Place Concrete.
 - 6. Section 05 70 01 – Landscape Decorative Metal.
 - 7. Section 07 92 01 – Landscape Joint Sealants.
 - 8. Section 32 11 16 – Aggregate Base

1.03 DEFINITIONS

- A. The Owner in this Section will refer to the City of Goleta.

- B. The Owner's Authorized Representative (OAR) in this Section will refer to CM as the Point of Contact, retained by the Owner.

1.02 REFERENCES

- A. ACI 117 - Standard Tolerances for Concrete Construction and Materials.
- B. ACI 318 - Building Code Requirements for Reinforced Concrete.
- C. ACI 211.1 - Standard Practice for Selecting Proportions for Normal, Heavyweight, and Mass Concrete.
- B. ACI 304R - Recommended Practice for Measuring, Mixing, Transporting and Placing Concrete.
- C. ACI 305R - Hot Weather Concreting.
- D. ACI 309R - Guide for Consolidation of Concrete.
- E. ASTM A 615 - Deformed and Plain Billet-Steel for Concrete Reinforcement.
- F. ASTM C 31 - Standard Specification for Making and Curing Concrete Test Specimens in the Field.
- G. ASTM C 33 - Standard Specification for Concrete Aggregates.
- H. ASTM C 39 - Standard Test Method for Compressive Strength of Cylindrical Concrete Specimens.
- I. ASTM C 94 - Standard Specification for Ready Mix Concrete.
- J. ASTM C 143 - Standard Specification for Hydraulic Hydrated Cement Concrete.
- K. ASTM C 150 - Standard Specification for Portland Cement.
- L. ASTM C 172 - Standard Practice for Sampling Freshly Mixed Concrete.
- M. ASTM C 231 - Standard Test Method for Air Content of Freshly Mixed Concrete by the Pressure Method.
- N. ASTM C 260 - Standard Specification for Air-Entraining Admixtures for Concrete.
- O. ASTM C 309 - Standard Specification for Liquid Membrane-Forming Compounds for Curing Concrete.
- P. ASTM C 494 - Standard Specification for Chemical Admixtures for Concrete.
- Q. ASTM C 1064 - Standard Test Method for Temperature of Freshly Mixed Portland Cement Concrete.

1.03 SUBMITTALS

- A. In accordance with Section 01340 - Shop Drawings, Samples and Product Data: Procedures for submittals.
- B. Provide Shop Drawings for the Following:
 - 1. Paving Jointing and Pour Sequence Plan - submit six blueprints indicating the following:
 - a. Proposed layout of contraction, construction and isolation joints. Clearly delineate the three different joint types.
 - b. Layout of paving types as indicated on Drawing Paving Schedule. Give overall dimensions of each paving type.
 - c. Concrete pour sequence. Indicated sequence of paving pour installation.
- C. Paving Mix Designs: Provide documentation for each paving type specified on Drawings that will enable Owner to better match replaced concrete:
 - 1. Laboratory and Cement Test Reports: Submit six (6) copies of laboratory test reports for concrete materials and a certificate with each concrete mixer truck, stating mix design, PSI rating, slump, water and cement quantity, cement/water ratio, fine and coarse aggregate and color additives.
 - 2. Cement:
 - a. Manufacturer and plant location.
 - b. Cement type, i.e. Type I, II or V.
 - 3. Admixtures:
 - a. Manufacturer and plant location.
 - 4. Sand:
 - a. Source and type.
 - 5. Aggregates:
 - a. Source and type.
 - 6. Signed certification from a licensed structural engineer.
- D. Submit specification data “Cut Sheets” for integral color, color hardener, release agent, plastic dowel sleeves, chemical stain,

1.04 QUALITY ASSURANCE

- A. Pre-Bid Conference: Prior to submitting bid, attend pre-bid conference with Owner and to review requirements and artistic effect desired.
- B. Mock-Ups:
 - 1. Install a 4-foot wide x 4-foot long mock-up of sample paving indicating all joint types and finishes at location as directed by The OAR.
 - 2. This mock-up will be the standard from which future work will be judged.
 - 3. Remove Mock-up completely prior to Final Payment.

- C. Concrete Manufacturer Qualifications: Manufacturer of ready-mixed concrete products complying with ASTM C 94 requirements for production facilities and equipment.
- D. Installer: Provide evidence to indicate successful experience in providing patterned concrete work similar to that specified herein and can demonstrate successful experience through past project documentation and references.
 - 1. Experience: Minimum 5 years experience in the installation of seeded concrete paving.
 - 2. Demonstration of Experience: 10 projects which have been completed within the past 36 months utilizing similar products, scope, and complexity.
 - 3. Supervision: Perform placement and finishing of concrete work under supervision of a person having a minimum of 5 years of experience in placement and finishing of products specified herein.
 - 4. Submit qualifications to Owner for information purposes. Submit a resume of Project Manager and Superintendent who will be overseeing the Work.
- E. Slip Resistance: Provide a finish surface slip resistance coefficient of friction equal or greater than 0.6 for flat surfaces and 0.8 for ramps, when tested in accordance with ASTM F 489.

1.05 DELIVERY, STORAGE, AND HANDLING

- A. In accordance with Section 01 6000 – “Products, Materials, Equipment & Substitutes ” - Product Handling and Protection: Transport, handle, store, and protect.
- B. Store materials in dry and protected locations and protect from damage.
- C. Do not change brand of cement nor source of aggregate during course of Work.

1.06 SITE CONDITIONS

- A. Do not place concrete when subbase surface temperature is less than 40 degrees F, nor when surface is wet.

1.07 COORDINATION

- A. In accordance with Section 01 3113 - Project Coordination.
- B. Ensure that irrigation sleeves, electrical conduit, outlets and other utility elements are accommodated and as-built located prior to pouring concrete.

1.08 INSPECTION OF SITE

- A. Verify conditions at site that affect Work of this Section, and take field measurements as required. Report major discrepancies between Drawings and field dimensions to Owner prior to commencing work.

PART 2 - PRODUCTS

2.01 FORMS

- A. Form Materials: Plywood, metal, metal-framed plywood, or other acceptable panel-type materials to provide full-depth, continuous, straight, smooth exposed surfaces.
- B. Provide metal forms, weighing not less than 18 pounds per linear foot for pavement 8 inches thick, not less than 20 pounds per linear foot for pavement 9 inches thick, and not less than 22 pounds per linear foot for pavement 10 inches thick, and in no case less than 7/32 inch thick.
- C. Provide side forms having a depth equal to the prescribed edge thickness of the pavement, without horizontal joints.
- D. Provide forms having a base not less than 8 inches wide and a flanged tread or top surface not less than 2 inches wide. For multiple lanes, provide base width at least equal to height.
- E. Use flexible or curved forms for curves of 200-foot or less radius.
- F. Provide forms not less than 10 feet long except where shorter forms are necessary for curves. Use metal keyway forms for the full length of roadway form to which attached. Provide wood bulkheads for the full width of pavement lane equipped with keyway form.
- G. Provide holes for bars and dowel assemblies where required.
- H. Provide at least three stake pockets to accommodate a 1-inch diameter stake in each section of form 10 feet or more in length, and at least two such pockets in each section of form less than 10 feet long.
- I. Provide each section of form with a positive locking device that will secure it tightly to the adjoining section.
- J. Provide forms free from warp and of sufficient strength to resist, without visible springing or settlement, all loads applied in the paving process.

2.02 REINFORCING MATERIAL

- A. Synthetic Fiber Reinforcement: 100% pure synthetic polypropylene fibers, engineered and designed for secondary reinforcement of concrete slabs, complying with ASTM C 1116 - Type III. Maximum length of fibers to be 3/4-inch.
 - 1. Acceptable Manufacturers:
 - a. Fibermesh: Stealth (800)348-9348.
 - b. Forta Fiber: Microfiber (800)245-0306.
 - c. W.R. Grace: Monofiliment (800)433-0020.
 - d. Bomanite; Monofiliment (800)854-2094.
- B. Reinforcing Bars and Tie Bars: ASTM A 615 - Grade 60, deformed.
- C. Plain, Cold-Drawn Steel Wire: ASTM A 82.
- D. Fabricated Bar Mats: Welded or clip-assembled steel bar mats, ASTM A 184. Use ASTM A 615, Grade 60 steel bars.
- E. Construction Joint Dowel Bars: Plain steel bars, ASTM A 615, Grade 60. Cut bars true to length with ends square and free of burrs.
- F. Epoxy-Coated Construction Joint Dowel Bars: ASTM A 775 over ASTM A 615, Grade 60 plain steel bars.
- G. Joint Dowel Alignment Sleeves: Polypropylene plastic sleeve dowel to ensure proper alignment of steel dowels.
- H. Hook Bolts: ASTM A 307, Grade A bolts, internally and externally threaded. Design hook bolt joint assembly to hold coupling against pavement form and in position during concrete operations, and to permit removal without damage to concrete or hook bolt.
- I. Supports for Reinforcement: Chairs, spacers, dowel bar supports and other devices for spacing, supporting, and fastening reinforcing bars in place. Use wire bar-type supports.
 - 1. Benches and Chairs: ACI 318
 - 2. Use supports with sand plates or horizontal runners where base material will not support chair legs.

2.03 CONCRETE MATERIALS

- A. Portland Cement: ASTM C 150 - Type I.
- B. Concrete Aggregate: ASTM C 33 - Class 4, and as follows. Provide aggregates from a single source:

- C. Water: Clean and free from injurious amounts of oils, acids, alkalis, salts, organic materials, or other substances that may be deleterious to concrete or reinforcement.

2.04 ADMIXTURES

- A. Provide concrete admixtures that contain not more than 1 percent chloride ions and no calcium chloride.
- B. Water-Reducing Admixture: ASTM 4 94, Type A.
- C. High-Range Water-Reducing Admixture: ASTM C 494, Type F or Type G.
- D. Water-Reducing and Retarding Admixture: ASTM C 494, Type D or E.
- E. Acceptable Manufacturers:
 - 1. Water-Reducing Admixtures:
 - a. ChemMasters Corp; Chemtard.
 - b. Cormix Construction Chemicals; Type A Series.
 - c. Euclid Chemical Company; Eucon WR-75.
 - 2. High-Range Water-Reducing Admixtures:
 - a. Anti-Hydro Co. Inc.; Super P.
 - b. Cormix Construction Chemicals; Cormix 2000, PSI Super.
 - c. Euclid Chemical Company; Eucon 37.
 - 3. Water-Reducing and Acceleration Admixtures:
 - a. Conspec Marketing & Manufacturing Company; Q-Set.
 - b. Cormix Construction Chemicals; Gilco Accelerator or Lub NCR.
 - c. Euclid Chemical Company; Accelguard 80.
 - 4. Water-Reducing and Retarding Admixtures:
 - a. Cormix Construction Chemicals; Type D Series.
 - b. Euclid Chemical Company; Eucon Retarder 75.
 - c. W.R. Grace Company; Daratard-17.

2.05 CURING MATERIALS

- A. Absorptive Cover: Burlap cloth made from jute or kenaf, weighing approximately 9 oz. per sq. yd., complying with AASHTO M 182, Class 2.
- B. Moisture-Retaining Cover: One of the following complying with ASTM C 171:
 - 1. Waterproof paper.
 - 2. Polyethylene film.
 - 3. White burlap-polyethylene sheeting.
- C. Clear, Waterborne Membrane-Forming Curing Compounds:

1. Provide curing materials that have a maximum volatile organic compound (VOC) rating of 350 g/l.
- D. Evaporation Control: Monomolecular film-forming compound applied to exposed concrete slab surfaces for temporary protection from rapid moisture loss.
1. Clear, Waterborne Membrane-Forming Curing Compounds Acceptable Manufacturers:
 - a. Anti-Hydro Company; Clear Cure Water Base.
 - b. The Burke Company; Spartan Cote WB.
 - c. Cormix Construction Chemicals; Sealco VOC.
 2. Acceptable Evaporation Control Manufacturers:
 - a. Conspec Marketing and MFG. Company; Aquafilm.
 - b. Euclid Chemical Company; Eucobar.
 - c. L&M Construction Chemicals; E-Con.

2.06 RELATED MATERIALS

- A. Integral Color: Integrally color concrete in colors, blending mixtures and application rates necessary to create colors, gradations, and variations to match Owner's mock-up.
- B. Bonding Agent: Acrylic or styrene butadiene.
- C. Epoxy Adhesive: ASTM C 881, two-component material suitable for dry or damp surfaces. Provide material type, grade, and class to suit requirements.
- D. Miscellaneous Materials: Miscellaneous specialty materials, acids, or other materials required to achieve the specialized effects indicated on the mock-up or as required by Owner.
- E. Acceptable Manufacturers: Subject to compliance with requirements, products that may be incorporated in Work include, but are not limited to, the following:
1. Integral Color:
 - a. L.M. Scofield Company; Chromix.
 - b. Davis; Integral Color.
 - c. Colorful; Integral Color.
 2. Clear Penetrating Sealer (water based):
 - a. L.M. Scofield; Cementone Clear Sealer.
 - b. Davis; Clear Sealer.
 - c. Lambert; Clear Sealer.
- F. Concrete Finish Retarder: Spray applied, film forming, water based top surface retarder, calibrated for specific sized aggregate and finish requirements.
1. Acceptable Materials: "Top Cast" by Grace Construction Products. Customer Service Center - 888-336-9303, www.graceconstructionproducts.com or Owner approved equivalent.

- G. Colored Aggregate Toppings: Special topically applied aggregates for all areas indicated as such on Drawings.
 - 1. Provide materials containing specific combinations of specially ground and graded colored stones, glass and aggregates for topical application and embedment on freshly placed concrete.
 - 2. Provide specific mixes and manufacturers as indicated on the Drawings and SCRRA's furnished samples when provided.
- H. Heavy-duty Metallic Aggregate Topping:
 - 1. Anvil-Top 300: by Master Builders.
 - 2. Super Euco-Top: by Euclid Chemical Co.
- I. Slip-Resistant Abrasive Topping:
 - 1. Aluminum oxide or a blend with not less than 58% aluminum oxide and approximately 14/36 mesh grading.
 - a. A-H Emery Emerundum: by AntiHydro International Inc.
 - b. Lithochrome Abrasive: by L.M. Scofield Co.
 - c. Aluminum Oxide Surface Treatment: by The Burke Company.
 - d. FricTex H: by Sonneborn Building Products.

2.07 CONCRETE

- A. Prepare design mixes for each type and strength of normal-weight concrete by either laboratory trial batch or field experience methods as specified under ACI 301.
- B. Proportion mixes according to ACI 211.1 and ACI 301 to provide normal-weight concrete with the following properties:
 - 1. Compressive Strength at 28 days: 3,000 psi.
 - 2. Maximum Water-Cement Ratio at Point of Placement: 0.55.
 - 3. Slump Limit at Point of Placement: 3-inches. Slump limit for concrete containing high-range water-reducing admixture: Not more than 8-inches after adding admixture to site-verified 2 to 3-inch slump concrete.
 - 4. Air Content: 2 1/2 to 4 1/2 percent.
- C. Synthetic Fiber Reinforcement: 1 lb. per cu. yd of mix added only at batch plant.
- D. Adjustment to Concrete Mixes: Mix design adjustments may be requested by Contractor when characteristics of materials, project conditions, weather, test results, or other circumstances warrant.

2.08 CONCRETE MIXING

- A. Ready-Mixed Concrete: Comply with requirements of ASTM C 94.
 - 1. Reduce mixing and delivery time when air temperature is between 85 degrees F and 90 degrees F and reduce mixing and delivery time from 1-1/2 hours to 75 minutes.

2. Reduce mixing and delivery time to 60 minutes when air temperature is above 90 degrees F.

PART 3 - EXECUTION

3.01 SURFACE PREPARATION

- A. Prepare subgrade per geotechnical report.
- B. Verify that paving subgrade extends 1-foot beyond the outside edge of paving or curbing and has a positive outfall for trapped water.
- C. Proof-roll prepared subbase surface to check for unstable areas and verify need for additional compaction. Do not begin paving work until such conditions have been corrected and are ready to receive paving.
- D. Remove loose material from compacted subbase surface immediately before placing concrete.
- E. Provide necessary chairs or supports, and maintain position of reinforcing bars.
- F. Wet a minimum of 2 inches of sand subgrade prior to placing concrete.
- G. Place 1" minimum of washed concrete sand over prepared subgrade.

3.02 EDGE FORMS AND SCREED CONSTRUCTION

- A. Set, brace, and secure edge forms, bulkheads, and intermediate screed guides for paving to required lines, grades, and elevations.
- B. Install forms to allow continuous progress of Work and so that forms can remain in place at least 24 hours after placing concrete.
- C. Check completed formwork and screeds for grade and alignment to following tolerances:
 1. Top of Forms: Not more than 1/8-inch in 10-feet.
 2. Vertical Face on Longitudinal Axis: Not more than 1/4-inch in 10-feet.
- D. Clean forms after each use and coat with form release agent to ensure separation from concrete.

3.03 PLACING REINFORCEMENT

- A. Comply with Concrete Reinforcing Steel Institute’s recommended practice for “Placing Reinforcing Bars” for placing and supporting reinforcement.
- B. Clean reinforcement of loose rust and mill scale, earth, ice, and other bond-reducing materials.
- C. Arrange, space, and securely tie bars and bar supports to hold reinforcement in position during concrete placement. Maintain minimum cover over reinforcement.
- D. Install fabricated bar mats in lengths as long as practicable. Handle units to keep them flat and free of distortions. Straighten bends, kinks, and other irregularities or replace units as required before placement. Set mats for a minimum 2-inch overlap to adjacent mats.

3.04 CONCRETE PLACEMENT

- A. Inspection: Before placing concrete, inspect and complete formwork installation, reinforcing steel, and items to be embedded or cast in. Notify other trades to facilitate installation of their work.
- B. Moisten subbase to provide a uniform dampened condition at the time concrete is placed. Do not place concrete around manholes and other utility structures until they are at the required finish elevation and alignment.
- C. Comply with requirements and with ACI 304R for measuring, mixing, transporting, and placing concrete.
- D. Deposit and spread concrete in a continuous operation between construction joints. Do not push, drag, or use vibrators to move concrete into place.
- E. Consolidate concrete by mechanical vibrating equipment supplemented by hand-spading, rodding, or tamping. Use equipment and procedures to consolidate concrete complying with ACI 309 R.
 - 1. Consolidate concrete along face of forms with an internal vibrator. Keep vibrator away from joint assemblies, reinforcement, or side forms. Use only square-faced shovels for hand-spreading and consolidation. Prevent dislocating reinforcing and dowels.
- F. Screed paved surfaces with a straightedge and strike off. Use bull floats or darbies to form a smooth surface plane before excess moisture or bleed water appears on surface. Do not further disturb concrete surfaces prior to beginning finishing operations.

- G. Hot-Weather Placement: Place concrete complying with ACI 305R when hot weather conditions exist.
1. Cool ingredients before mixing to maintain concrete temperature at time of placement 90 degrees F and below. Mixing water may be chilled or chopped ice may be used to control temperature, provided water equivalent of ice is calculated to total amount of mixing water.
 2. Cover reinforcing steel with water-soaked burlap if it becomes too hot, so that steel temperature will not exceed the ambient air temperature immediately before embedding in concrete.
 3. Fog-spray forms, reinforcing steel, and subgrade just before placing concrete. Keep subgrade moisture uniform without standing water, or soft or dry areas.
- H. Cold Weather Placement: Adhere to ACI 306R - Cold Weather Concreting for installing concrete paving during cold weather.

3.05 CONCRETE FINISHING

- A. General: Wetting of concrete surfaces during screeding, initial floating, or finishing operations is prohibited.
- B. Float Finish: Begin the second floating operation when bleed-water sheen has disappeared and the concrete surface has stiffened sufficiently to permit operations. Float surface with power-driven floats, or by hand floating if area is small or inaccessible to power units. Finish surfaces to true planes. Cut down high spots, and fill low spots. Refloat surface immediately to uniform granular texture.
1. Medium-to-Fine-Textured Broom Finish: Draw a soft bristle broom across float-finished concrete surface perpendicular to line of traffic to provide a uniform, fine-line texture.
 2. Medium-to-Coarse-Textured Broom Finish: Provide a coarse finish by striating float-finished concrete surface 1/16 to 1/8 inch (1.6 to 3 mm) deep with a stiff-bristled broom, perpendicular to line of traffic.
- C. Concrete Retarder Application:
1. Grace Construction Products (888) 336-9303.
 2. Provide for containment of retarder during finishing procedures so as to protect adjacent improvements. Repair damage to adjacent improvements at no cost to Owner.
 3. Perform retardant finish in two separate stages:
 - a. First Stage: Primary wash to take place within 3 days after concrete pour. Apply retarder with a low-pressure sprayer at a rate of 250-350 sq.ft./ gal. per manufacturers' requirements.
 - b. Second stage: Wash with water rinse/light broom or pressure wash with power equipment within 6 – 24 hours after the retarder is applied. Retarder removal intervals depend on strength of mix, exposed

aggregate size and desired washing techniques. Earlier washing for light etch finishes may be necessary.

D. Exposed Aggregate Finish:

1. Water-wash;
 - a. Surface layer of mortar is removed with a light, controlled spray of water and scrubbed with a stiff brush to expose aggregate fines.
2. Retardant;
 - b. Surface layer of mortar is removed by applying an approved retardant to the finished concrete, to effect the setting of the top mortar paste, and then removing it by water-wash and/or brushing to expose aggregate to the desired finish.

E. Seeded Aggregate Finish:

1. An exposed aggregate finish achieved by surface applying a decorative aggregate. Aggregate is to be uniform in size and thoroughly washed prior to installation. Evenly distribute aggregate across the surface and tamp into the concrete with a hand float or darby. Apply immediately after the concrete has been bull-floated and tamp until completely embedded in concrete surface. Expose aggregate by water-wash technique or with retardant finish process.

F. Sand Blast Finish:

1. Blasting Operations and Requirements:
 - a. Apply sandblasted finish to exposed surfaces where indicated.
 - b. Perform sand blasting at least 72 hours after placement of concrete.
2. Coordinate with formwork construction, concrete placement schedule, and formwork removal to ensure that surfaces to be blast finished are blasted at the same age for uniform results.
3. Determine type of nozzle, nozzle pressure, and blasting techniques required to match the SCRRA's control samples.
4. Abrasive-blast corners and edges of patterns carefully, using back-up boards, to maintain uniform corner or edge line.
5. Depths of Cut: Use an abrasive grit of the proper type and gradation to expose aggregate and surrounding matrix surface, to match the SCRRA's control samples as follows:
 - a. Brush Sand Blast Finish: Remove cement matrix to expose face of fine aggregate, no reveal (slab accents - must maintain non-slip coefficient for walking surfaces).
 - b. Light Sand Blast Finish: Expose fine aggregate with occasional exposure of coarse aggregate; max 1/16-inch reveal (wall accents).
 - c. Medium Sand Blast Finish: Generally expose coarse aggregate; 3/16-inch to 1/4-inch reveal.
6. Surface Continuity: Perform sand blast finishing in as continuous an operation as possible, utilizing the same work crew to maintain continuity of finish on

each surface or area of work. Maintain patterns of variances in depths of cuts as indicated.

7. Construction Joints: Use technique acceptable to the SCRRA to achieve uniform treatment of construction joints.
8. Protection and Repair:
 - a. Protect adjacent materials and finishes from dust, dirt, and other surface or physical damage during abrasive-blast finishing operations. Provide protection as required and remove from site at completion of the work.
 - b. Repair or replace other work damaged by finishing operations.
9. Clean-Up: Maintain control of concrete chips, dust, and debris in each work area. Clean up and remove such material at the completion of each day of operation. Prevent migration of airborne materials by use of tarpaulins, wind breaks, and similar containing devices.

G. Finish surface texture to match texture and pattern as indicated in Owner mock-up.

3.06 JOINTING

- A. Construct contraction, construction, and isolation joints to match irregular edge pattern of stamping tools with faces perpendicular to surface plane of concrete.
- B. Contraction Joints: Provide contraction joints as indicated on Drawings (or to not exceed 10-feet in either direction), to minimize random surface cracking and as indicated on approved Paving Jointing and Pour Sequence Plan provided by Contractor. Match irregular pattern of stamping tools, sectioning concrete into areas as indicated on Drawings. Construct contraction joints for a depth equal to at least one fourth of concrete thickness, as follows:
 1. Hand-tooled Joints: Form contraction joints in fresh concrete by grooving and finishing each joint edge with a radiused jointer tool.
 2. Machine-Sawn Joints: Machine-sawn joints are not permitted unless otherwise indicated on Drawings. Provide saw cut joints as soon as concrete has sufficient strength to support sawing equipment.
 3. Do not exceed 1/4-inch in joint width.
- C. Doweled Construction Joints: Construct doweled construction joints at end termination's of paving where paving operations are stopped for more than 1/2 hour, unless paving terminates at an isolation joint and at all edges of different paving types. Locations of doweled construction joints to adhere as closely as possible to Contractor's Paving Jointing and Pour Sequence Plan.
 1. Steel Dowels:
 - a. Provide smooth steel dowels across construction joints to reduce differential movement across the joint. Utilize smooth steel dowels based upon the following:
 - 1) 6-inch Thick Pavement:
 - (i) Diameter: 3/4-inch.

- (ii) Length: 24-inches.
 - (iii) On-center Spacing: 18-inches.
 - 2) 4-inch Thick Pavement:
 - (i) Diameter: 1/2-inch.
 - (ii) Length: 24-inches.
 - (iii) On-center Spacing: 18-inches.
 - b. To assist in correct alignment of steel dowels along construction joints use plastic dowel sleeves:
 - 1) Insure that wood edge forms are true to line and grade prior to installing plastic dowel sleeves.
 - 2) Install plastic dowel sleeves on wood forms at the specified on-center dowel spacing, centered between top and bottom of wood form.
 - 3) Contact plastic dowel sleeve manufacturer for complete installation requirement.
 2. Do not continue tie-reinforcement through sides of strip paving.
 3. Use a bond breaking agent on cured concrete edges that will be joined with fresh concrete.
 4. Immediately before new concrete is placed, wet construction joint and remove standing water.
 5. Tool edges of construction joints to match decorative field jointing.
- D. Isolation Joints: Provide isolation joints to permit horizontal and vertical movement between slab and fixed vertical edges such as building walls, steps, columns, and other vertical restraints. Locations of isolation joints to adhere as closely as possible to Contractor's Paving Jointing and Pour Sequence Plan.
 1. Provide 1/4-inch thick pre-molded asphalt impregnated fiber board, backup, and caulking along edges of isolation joints.
 2. Extend pre-molded asphalt impregnated fiber board to full-width and depth of joint, not less than 1/4-inch or more than 1-inch below finished surface of slab.
 3. Furnish pre-molded asphalt impregnated fiber board in one-piece lengths for full width being placed. Where more than one length is required, lace or clip pre-molded asphalt impregnated fiber board sections together.
 4. Protect top edge of pre-molded asphalt impregnated fiber board during concrete placement with a metal, plastic, or other temporary cap. Remove protective cap after concrete has been placed on both sides of joint to facilitate installation of caulking backup.
 5. Joints for Non-Stamped Special Flooring: Tool to profile and dimensions detailed; fill with specified grout, tool grout to a concave profile.

3.07 CONCRETE PROTECTION AND CURING

- A. Protect freshly placed concrete from premature drying and excessive cold or hot temperatures. Comply with the recommendations of ACI 305R for hot weather and ACI 306R for cold weather protection during curing.

- B. Evaporation Control: In hot, dry, and windy weather, protect concrete from rapid moisture loss before and during finishing operations with an evaporation-control material. Apply according to manufacturer's instructions after screeding and bull floating, but before floating.
- C. Begin curing after finishing concrete but not before free water has disappeared from concrete surface.
- D. Curing Methods: Cure concrete by moisture curing, moisture retaining cover curing, curing compound, or a combination of following:
 - 1. Moisture Curing: Keep surfaces continuously moist for not less than 7 days with following materials:
 - a. Water.
 - b. Continuous water fog spray.
 - c. Absorptive cover, water saturated, kept continuously wet.
 - 2. Cover concrete surfaces and edges with a 12-inch lap over adjacent absorptive covers.
 - 3. Curing Compound:
 - a. Apply uniformly in continuous operation by power spray or roller according to manufacturer's directions.
 - b. Recoat areas subjected to heavy rainfall within 3 hours after initial application.
 - c. Maintain continuity of coating and repair damage during curing period.

3.08 REPAIRS AND PROTECTION

- A. Remove and replace concrete paving that is broken, damaged, defective, or does not meet the requirements of this Section.
- B. Protect concrete from damage until Final Payment. Exclude traffic from paving for at least 14 days after placement. When construction traffic is permitted, maintain paving as clean as possible by removing surface stains and spillage of materials as they occur.
- C. Maintain concrete paving free of stains, discoloration, dirt, and other foreign material until Final Payment.

3.09 CLEANUP

- A. At completion of Work, remove concrete stains from adjacent work, including but not limited to dissimilar paving types, walls, columns, railing posts, light fixtures, plant materials, to satisfaction of Owner.

3.10 PAVING FINISH SCHEDULE

- A. Provide paving finishes, as indicated on Paving Schedule on Drawings.

PART 4 MEASUREMENT AND PAYMENT

- 1.01 General: Measurement and payment for portland cement concrete paving will be either by the lump-sum method or by the unit-price method as determined by the listing of the bid item for portland cement concrete paving indicated in the Bid Schedule of the Bid Form.
- 1.02 Lump sum: If the Bid Schedule indicates a lump sum for portland cement concrete paving, the lump-sum method of measurement and payment will be in accordance with Section 01 29 73.
- 1.03 Unit Price: If the Bid Schedule indicates a unit price for portland cement concrete paving, the unit-price method of measurement and payment will be as follows:
 - A. Measurement:
 - 1. Portland cement concrete pavement will be measured for payment by the square yard for each specified class of concrete and thickness.
 - 2. Reinforcing steel, dowels, and tie bars will be measured separately for payment as specified in Section 03 20 00 - Concrete Reinforcing.
 - 3. Subgrade paper, transverse expansion joints, weakened-plane joints, and joints sawed within 5 feet of volunteer cracks, longitudinal and transverse construction joints, and longitudinal weakened-plane joints will not be measured separately for payment, and all costs in connection therewith will be considered included in the measurement of portland cement concrete pavement.
 - B. Payment: Portland cement concrete paving will be paid for at the indicated Contract unit prices for the computed quantities as determined by the measurement Method specified in Article 1.03.C.1.

END OF SECTION

SECTION 32 14 00

UNIT PAVING

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, shall apply to all work in this Section with the same force and effect as though repeated in full herein.

1.02 SUMMARY

- A. Furnish materials, labor, transportation, services, and equipment necessary to furnish and install concrete pavers as indicated on Drawings and as specified herein.
- B. Work included in this Section:
 - 1. Sand setting bed.
 - 2. Installation of concrete pavers.
 - 3. Sand jointing.
 - 4. Cement treated base.
- C. Work related in other Sections:
 - 1. Division 1 Section "Sustainable Design Requirements" for additional LEED requirements.
 - 2. Section 32 11 16 – Aggregate Base
 - 3. Section 32 13 14 – Portland Cement Concrete Paving (Pedestrian)
 - 4. Sections 32 80 00 & 32 84 00 - Planting Irrigation & Planting Irrigation - Drip Systems.
 - 5. Section 03 10 00 – Concrete Formwork.
 - 6. Section 03 30 00 – Cast-in-Place Concrete.
 - 7. Section 07 92 00 – Joint Sealants.

1.03 REFERENCES

- A. American Society of Testing Materials (ASTM):
 - 1. C33: Specification for Concrete Aggregates.
 - 2. C67: Method of Sampling and Testing Brick and Structural Clay Tile.
 - 3. C136: Method for Sieve Analysis for Fine and Coarse Aggregates.
 - 4. C140: Method of Sampling and Testing Concrete Masonry Units.
 - 5. C936: Specification for Solid Concrete Paving Units.

1.04 SUBMITTALS

- A. In accordance with Section 01 33 00 - Shop Drawings, Samples and Product Data: Procedures for submittals.
- B. Submit five samples of each concrete paver specified.
- C. Submit sieve analysis for grading of bedding and joint sand.
- D. Submit test results for compliance of concrete pavers to requirements of ASTM C936 from an independent testing laboratory.

1.05 MOCK-UPS

- A. Install a 10-foot wide x 10-foot long mock-up of sample paving at location as directed by OAR.
- B. This mock-up will be the standard from which future work will be judged.
- C. Remove Mock-up completely prior to Final Payment.

1.06 PRODUCT DELIVERY, STORAGE AND HANDLING

- A. In accordance with Division 1.
- B. Packaging: Pavers shall be packaged on pallets in such a way as to minimize damage during transportation, delivery, storage and handling.
- C. Rate of supply: Deliver pavers to the construction site in such quantities and at such times as will assure the continuity of the installation.
- D. Storage: Place packaged pavers on firm, level, and smooth surfaces and at least 6 in. above the ground. Place stored pallets so that identification marks are visible.
- E. Damaged pavers: No paver, on part thereof, used in the permanent works shall exhibit obvious signs of damage on the top surface, including but not limited to chipping, cracking and staining. Such damage shall be grounds for rejection.
- F. Bedding sand: Deliver and stockpile bedding sand in such a way as to minimize contamination and segregation. Stockpiles are to be located on firm, level, and smooth surfaces that do not channel water into the sand.
- G. Jointing sand: Deliver jointing sand in bags and store in such a way as to minimize contamination.
- H. Joint sand stabilizer: Deliver and store in strict accordance with the manufacturer's instructions and maintain a temperature range of 50 degrees to 105 degrees F.

1.07 QUALITY ASSURANCE

- A. Pre-Bid Conference: Prior to submitting bid, attend pre-bid conference with OAR and to review requirements.
- B. Mock-Ups:
 - 1. Contractor Mock-Ups: All concrete paving shall match approved sample mock-up.
- C. Paver Manufacturer Qualifications: Manufacturer of pre-cast concrete products complying with ASTM C 936 requirements for production facilities and equipment.
- D. Installer: Provide evidence to indicate successful experience in providing patterned concrete work similar to that specified herein and can demonstrate successful experience through past project documentation and references.
 - 1. Experience: Minimum 5 years experience in the installation of patterned concrete paving.
 - 2. Demonstration of Experience: 10 projects which have been completed within the past 36 months utilizing similar products, scope, and complexity.
 - 3. Supervision: Perform placement and finishing of concrete work under supervision of a person having a minimum of 5 years of experience in placement and finishing of products specified herein.
 - 4. Submit qualifications to OAR for information purposes. Submit a resume of Project Manager and Superintendent who will be overseeing the Work.
- E. Slip Resistance: Provide a finish surface slip resistance coefficient of friction equal or greater than 0.6 for flat surfaces and 0.8 for ramps, when tested in accordance with ASTM F 489.

1.08 SITE CONDITIONS

- A. Do not install sand or pavers during rain.

1.09 COORDINATION

- A. In accordance with Division 1 - Project Coordination.
- B. Ensure that irrigation sleeves, electrical conduit, outlets and other utility elements are accommodated and as-built located prior to pouring concrete.
- C. Notify contractor's related to installation of his work in ample time, so as to allow sufficient time for those contractors to perform their portion of work.

1.10 INSPECTION OF SITE

- A. Verify conditions at site that affect Work of this Section, and take field measurements as required. Report major discrepancies between Drawings and field dimensions to OAR prior to commencing Work.

PART 2 - PRODUCTS

2.01 CONCRETE PAVERS

- A. Concrete pavers shall be in accordance with patterns as indicated on Drawings.
- B. Supply only concrete pavers that are manufactured and supplied by a member of Concrete Paver Institute.
- C. Acceptable Manufacturers:
 - 1. Belgard – (909) 355-6422
 - 2. Hanover Pavers – (800) 426-4242
 - 3. Wausau Tile – (800) 388-8728
 - 4. Techno-Bloc – (877) 832-4625
 - 5. Acker-Stone – (800) 258-2353
 - 6. Or OAR approved equivalent
- D. Refer to construction schedule on Drawings for concrete paver shape, color and thickness.
- E. Concrete used on this project to meet following requirements set forth in ASTM C936, Standard Specification for Concrete Pavers:
 - 1. Minimum average compression strength: 8,000 psi.

2.02 SAND BEDDING COURSE

- A. Clean, non-plastic, free from deleterious or foreign matter, and be natural or manufactured from crushed rock in accordance with ASTM C136.
- B. Sand particles to be sharp and conform to grading requirements of ASTM C33 as indicated below:

<u>Sieve Size</u>	<u>Percent</u>
3/8 inch	100
No. 4	95 to 100
No. 8	80 to 100
No. 16	54 to 85
No. 30	25 to 60
No. 50	10 to 30
No. 100	2 to 10

2.03 JOINT SAND STABILIZER

- A. Manufacturers: The joint sand stabilizing material shall be one of the following.
1. Surebond SB-1300 as manufactured by Surebond Inc., 500 E. Remington Road, Schaumburg, IL, 60173 (t: 847-843-1818).
 2. BP Pro, Irvine, CA 92623 (t: 866 612-7776)

2.04 CEMENT TREATED BASE

A. General

Cement Treated Base (CTB) shall consist of aggregate, cement and water uniformly mixed in a central plant, transported to the project, spread, compacted, shaped, finished and cured in accordance with these specifications. It shall conform to the lines, grades, thicknesses and typical cross-section shown on the plans.

B. Materials

1. Cement shall comply with the latest specifications for Portland cement – ASTM C150 (Type I) or Portland-Pozzolan-ASTM C595 (Type IP).
2. Water shall be free from substances deleterious to the hardening of the Cement Treated Base.
3. Aggregate may be any granular material or combinations of aggregates that will, when mixed with adequate amounts of cement and water, produce laboratory mix design Unconfined Compression Test strength of 400 psi at 7 days in accordance with the ASTM D-1633 Method “A.” The preceding tests will utilize the Moisture-Density Relation as determined by ASTM D-558: AASHTO T-134. The maximum size of aggregate shall pass a 2-inch sieve.

- C. Equipment Cement Treated Base may be constructed with any combination of machines or equipment that will produce the results meeting these specifications.

PART 3 – EXECUTION

3.01 INSPECTION

- A. Verify that sub-base is dry and ready to support sand, concrete pavers and anticipated vehicle loads.
- B. Verify that gradients and elevations of sub-base are correct.
- C. Verify location, type, installation and elevations of edge restraints around perimeter area to be paved.
- D. Beginning of concrete paver installation means acceptance of base and edge restraints.

3.02 INSTALLATION OF SAND BEDDING

- A. Spread sand evenly over sub-base course and screed to a consistent 1-inch thickness.
- B. Do not disturb screeded sand.
- C. Place sufficient sand to stay ahead of laid concrete pavers.
- D. Lay concrete pavers in patterns as indicated on Drawings. Maintain straight pattern lines, unless otherwise noted on Drawings.
- E. Joints between concrete pavers: butt joints.
- F. Fill gaps at edges of paved area with cut concrete pavers or edge units.
- G. Cut concrete pavers along its edge with a double-bladed splitter or masonry saw.
- H. Use a low amplitude, high frequency plate vibrator capable of producing 3,000 to 5,000 lbs. centrifugal compaction force to vibrate concrete pavers into sand bedding course.
- I. Vibrate concrete pavers, sweeping dry sand into joints and vibrate until they are fully settled. This will require at least two or three passes with vibrator. Do not vibrate within 3-feet of unrestrained edges of concrete pavers.
- J. Sweep off excess sand when Work is complete.
- K. Do not allow final surface elevations to deviate more than 3/8-inches under a 10-foot long straight edge.
- L. Verify that surface elevations of concrete pavers are at least 1/8 to 1/4-inches above adjacent drainage inlets, paving edge restraints or gutters.

3.03 JOINTING SAND STABILIZER

- A. On completion of the entire pavement installation the surface shall be swept so that the sand level is at the bottom of the chamfers.
- B. The surface shall be made clean and free from oil, laitance, dust and any loose material prior to the application of joint sand stabilizer. The surface and joint sand should be dry for its full depth prior to commencing work.
- C. The joint sand stabilizer sealer shall be applied evenly at the appropriate coverage as follows: Surebond shall be applied from a low pressure regulated backpack sprayer at a coverage rate of 150sqft/gallon. Work the excess material into the joints using a floor squeegee ensuring that all joints are adequately flooded and that no surplus material is left on the surface. This work to be in strict accordance with the manufacturer's recommendations.
- D. The treated area shall be protected from rain or moisture and not be trafficked for 24 hours after completing to the stabilizer. Work shall cease if inclement weather (rain or

strong wind) will affect the stabilizing operation and shall not recommence until the joint sand has dried sufficiently to allow penetration of the sealant.

3.04 INSTALLATION OF CEMENT TREATED BASE

- A. Before other construction operations are begun, the area to be paved shall be graded and shaped as required to receive the Cement Treated Base in conformance with the grades, lines, thicknesses and typical cross-section shown on the plans. Unsuitable subgrade soil or material shall be removed and replaced with suitable soil. The subgrade shall be firm and able to support without displacement of the construction equipment and the compaction hereafter specified. Soft or Yielding subgrade shall be corrected and made stable before construction proceeds.
- B. The aggregate, cement and water shall be mixed in a pug mill. The plant shall be equipped with feeding and metering devices that will add the aggregate, cement and water into the mixer in the specified quantities to produce a mixture that will meet or exceed the mix design criteria as stated above. The aggregate and the cement shall be mixed sufficiently to prevent cement balls from forming when the mix water is added. The mixing time shall be sufficient to assure an intimate, uniform mixture of aggregate, cement and water. The percentage of moisture in the aggregate, at the time of cement application shall be the amount that assures a uniform and intimate mixture of aggregate and cement during mixing operations. It shall not exceed the specified moisture content required for adequate compaction. The mixture shall be hauled to the paving areas in trucks having beds cleaned of deleterious material.
- C. The mixture shall be placed on a moistened subgrade in a uniform layer by any approved method of spreading that will deposit the required quantity per lineal foot, without segregation, to produce a uniformly compacted base conforming to the grade and cross-section. Not more than 30 minutes shall elapse between placement of CTB in adjacent lanes at any location except at longitudinal and transverse construction joints. No CTB mixture shall be placed when the subgrade is frozen or when the air temperature is less than 40°F in the shade. Compaction shall start as soon as possible after spreading. The elapsed time between the addition of water to the CTB mixture and the start of compaction shall not exceed 60 minutes under normal conditions. Laboratory tests may be required to verify changes in compaction time limits. At the start of compaction, the percentage of moisture in the mixture shall not be more than one percentage point below or two percentage points above the specified optimum moisture content, and shall be less than that compaction and finishing. The specified optimum moisture content and density shall be determined in the field by a Moisture-Density Test. AASHTO T 134 or ASTM D 556, on representative samples of Cement Treated Base moisture obtained from the area prior to compaction. Prior to compaction, the mixture shall then be compacted uniformly to the specified density. During compaction operations, initial shaping may be required to obtain uniform compaction and required grade and cross- section.

- D. When initial compaction is completed, the surface of the Cement Treated Base shall be shaped to the required lines, grades and cross-section. The moisture content of the surface material shall be maintained at not less than its specified optimum moisture content during finishing operations. If any reshaping of the surface is necessary, it shall be lightly scarified to remove any compaction planes, scales or smooth surfaces left by equipment. Final compaction shall then be continued until uniform and adequate density is obtained. The CTB shall be uniformly compacted to the minimum of 95% of maximum density. Compaction and finishing shall be done in such a manner as to produce, in not longer than two hours, a smooth, dense surface free of compaction planes, cracks, ridges, or loose material.
- E. Finished portions of Cement Treated Base that are traveled on by equipment used in construction an adjoining section shall be protected in such a manner as to prevent equipment from marring or damaging completed work. Cement Treated Base shall be protected against freezing for seven days after its construction and until it has hardened. Curing shall be performed in accordance with manufacturer's recommendations. Construction Joints: At the end of each day's construction a transverse construction joint shall be formed by cutting back in to the completed work to form a full depth vertical face free of loose or shattered material. The section may be opened to all traffic provided that the Cement Treated Base has hardened sufficiently to prevent marring or distorting of the surface by equipment or traffic.
- F. The contractor shall be required within the limits of his contract to maintain the Cement Treated Base in good condition until all the work has been completed and accepted. Maintenance shall include immediate repairs of any defects that may occur. This work shall be done by the contractor at his own expense and repeated as often as may be necessary to keep the area continuously intact. Faulty work shall be corrected. Any low areas shall be remedied by replacing the material for the full depth of treatment rather than by adding a thin layer of Cement Treated Base to the completed work.

3.05 FIELD QUALITY CONTROL

- A. After removal of excess sand, re-check surface elevations for conformance to Drawings. Make adjustments as necessary.

3.06 CLEAN UP

- A. Upon completion of Work, remove rubbish, waste and debris resulting from operations off-site. Remove equipment and implements of service, and leave entire work area in a neat, clean, and Owner-accepted condition.

END OF SECTION

SECTION 32 16 00

CURBS, GUTTERS, SIDEWALKS AND DRIVES

PART 1 – GENERAL

1.01 SUMMARY

- A. This work includes furnishing materials, labor, transportation, services, and equipment necessary to furnish and install Minor Concrete as indicated on drawings and as specified in these Technical Specifications.
- B. Minor concrete shall include sidewalks, gutters, curbs, combined curbs and gutters, curb ramps, and curb ramp aprons.

1.02 RELATED SECTIONS

- A. Section 31 23 00 – Earthwork
- B. Section 32 11 16 – Aggregate Base
- C. Section 32 12 16 – Asphalt Paving
- D. Section 32 13 13 – Portland Cement Concrete Paving
- E. Section 32 17 26 – Detectable Warning Surfaces
- F. Section 03 20 00 – Concrete Reinforcement

PART 2 – PRODUCTS

2.01 CONCRETE

- A. Concrete for sidewalks, gutters, curbs, combined curbs and gutters, platform slab, utility pads, curb ramps and street rehabilitation shall conform to Section 201-1, "Portland Cement Concrete," of the SSPWC and these Technical Specifications.
- B. Minor concrete shall be 520-C-2500 in accordance with Section 201-1, "Portland Cement Concrete," of the SSPWC. Where Contractor proposes the use of a pumper for concrete placement the concrete shall be 520-C-2500P.
- C. Where cast in place detectable warning tiles are installed in the concrete for curb ramps shall have a slump range of 4 to 7 inches.

2.02 JOINT FILLER

- A. Shall be premolded, nonextruding and resilient filler and comply with Section 201-3, "Expansion Joint filler and Joint Sealants," of the SSPWC.

2.03 JOINT SEALANT

- A. Low modulus silicone or polyurethane joint sealant shall be furnished in a one-part formulation. Acid cure sealants shall not be used. The compound shall be compatible with the surface to which it is applied, match the color of the adjacent paving and shall be installed according to the manufacturer's requirements.
- B. Acceptable products include:
Vulkem 45 Sealant, as manufactured by Tremco, Beachwood, OH (216) 292-5000
Pecora – NR-201 as manufactured by Pecora Corporation, 800-355-8817
- C. The joint sealant shall be formulated to cure rapidly enough to prevent flow after application on grades of up to 15 percent.
- D. Contractor shall submit a Certificate of Compliance for the joint sealant to the Engineer prior to installation. The Certificate shall also be accompanied with a certified test report of the results of the required tests performed on the sealant material within the previous 12 months prior to proposed use. The Certificate and accompanying test report shall be provided for each lot of silicone joint sealant prior to use on the project.

2.04 CURING COMPOUNDS

- A. Curing compound shall be water-based, V.O.C. compliant, clear, non-staining and shall not inhibit the bond or performance of bonding agents, grouts, sealers or other coatings & toppings that will later be applied to the concrete surface.
- B. Acceptable materials include:
Atlas Quantum-Cure, as manufactured by Atlas Tech Products, San Diego, CA
Conspec 21, as manufactured by Conspec, Kansas City, KS

2.05 BONDING AGENT

- A. Bonding agent shall be a 100% solids, two-component, high-modulus, moisture tolerant epoxy bonding agent conforming to ASTM C-881, Type I, II & V, Grade 2, Class B & C.
- B. Acceptable materials include:
Sikadur 32 Hi Mod, as manufactured by Sika Corporation, Lyndhurst, NJ
Atlas LPL Epoxy Bonder, as manufactured by Atlas Tech Products, San Diego, CA

2.06 EPOXY ADHESIVE

- A. Epoxy adhesive shall be a 100% solids, two component, high modulus, moisture tolerant, non-sag, structural epoxy gel adhesive conforming to ASTM C-881, Type I, II, IV & V, Grade 3, Class B & C.

- B. Acceptable materials include:
 - Sikadur 31 Hi-Mod Gel, as manufactured by Sika Corporation, Lyndhurst, NJ
 - Atlas Hi Mod Epoxy Gel, as manufactured by Atlas Tech Products, San Diego, CA

PART 3 – EXECUTION

3.01 GENERAL

- A. All minor concrete elements shall be in accordance with Section 303-5, “Concrete curbs, Walks, Gutters, Cross gutters, Alley Intersections, Access Ramps, and Driveways,” of the SSPWC, these Technical Specifications, and the Plans.

3.02 PREPARATION OF SUBGRADE

- A. After demolition and removal of existing surface and obstructions, the ground shall be leveled and proof-rolled to 95 percent compaction. Where 95 percent compaction is not obtained by proof rolling the top 12 inches of the subgrade material shall be scarified and compacted to 95 percent relative compaction. The subgrade shall be graded to the elevation shown on the Plans. Where the grade is below plan grade, approved available material selected from excavation shall be added until the appropriate grade is met.

3.03 SIDEWALKS

- A. Where indicated sidewalks shall receive scoring in accordance with the dimensions shown on the plans.

3.04 CURB RAMPS

- A. All curb ramps shall be constructed with a slope of no greater than 8.33 percent (1:12) and no less than 5% (1:20), and include the specified detectable warning surfaces as shown on the Plans and concrete aprons where shown on the Plans. Transition from bottom of ramp to gutter or apron shall be smooth with no abrupt change resulting in a flush condition between surfaces. No scoring of concrete shall be applied to top of ramp. Curb ramp slopes shall be checked using a properly calibrated digital level. Curb ramps that do not meet the slope criteria shall be removed and reinstalled at no cost to the Owner. Any deviations from the SSPWC, the City Standards, these Technical Specifications, or the Plans will require approval by the Engineer.
- B. Curb ramps shall be both City standard and modified City standard as indicated on the Plans.
- C. Concrete shall have a broom finish.

3.05 CONSTRUCTION CONTACT JOINTS

- A. A transverse (contact) construction joint shall be constructed at the end of each day's work where concrete work is to continue or where concrete placement is interrupted for more than 30 minutes, to coincide with the next weakened plane joint location.
- B. If sufficient concrete has not been mixed to form a slab to match the next weakened plane joint, when an interruption occurs, the excess concrete shall be removed and disposed of back to the last preceding joint. The cost of removing and disposing of any excess concrete shall be at the Contractor's expense. Any excess material shall become the property of the Contractor and shall be properly disposed of.
- C. A metal or wooden bulkhead (header) shall be used to form the joint. The bulkhead shall be designed to accommodate the installation of dowel bars.

3.06 WEAKENED PLANE AND EXPANSION JOINTS

- A. The joint sealant detail for transverse and longitudinal joints, as shown on the plans, shall apply to all weakened plane joints. All weakened plane joints shall be constructed by the sawing method unless otherwise shown on plans. Should grinding or grooving be required over or adjacent to any joint after sealant has been placed, the joint materials shall be completely removed and replaced at the Contractor's expense. All joints shall have a sealant recessed below the final finished surface as shown on the plans.
- B. Seven days after the concrete pavement placement and not more than 4 hours before placing joint filler, backer rods and joint sealant materials, the joint walls shall be cleaned by means as necessary to completely remove from the joint all objectionable material such as soil, asphalt, curing compound, paint and rust. After cleaning the joint, all traces of sand, dust and loose material shall be removed from and near the joint for a distance along the pavement surfaces of at least 2 inches on each side of the joint by the use of a vacuum device. Surface moisture shall be removed at the joints by means of compressed air or moderate hot compressed air or other means approved by the Engineer. Drying procedures that leave a residue or film on the joint wall shall not be used. Sandblasting equipment shall have a maximum nozzle diameter size of 0.24 in \pm 0.04 in and a minimum pressure of 90 psi.
- C. Joint filler and backer rod shall be installed as shown on the plans. Joint filler and backer rod shall be installed when the temperature of the Portland Concrete Pavement is above the dew point of the air and when the air temperature is 40^oF (4^oC) or above. Joint filler and backer rod shall be installed when the joints to be sealed have been properly patched, cleaned and dried, as determined by the Engineer. Methods of placing joint filler and backer rod that leave a residue or film on the joint walls, shall not be used.
- D. Immediately after placement of joint filler and backer rod, joint sealant shall be placed in the clean, dry, prepared joints as shown on the plans. The joint sealant shall be

applied by a mechanical device with a nozzle shaped to fit inside the joint to introduce the sealant from inside the joint. Adequate pressure shall be applied to the sealant to ensure that the sealant material is extruded evenly and that full continuous contact is made with the joint walls. After application of the sealant the surface of the sealant shall be recessed as shown on the plans.

- E. Any failure of the joint material in either adhesion or cohesion of the material will be cause for rejection of the joint. The finished surface of joint sealant shall conform to the dimensions and allowable tolerances shown on the plans. Rejected joint materials or joint material whose finished surface does not conform to the dimensions shown on the plans, as determined by the Engineer, shall be repaired or replaced, at the Contractor's expense, with joint material that conforms to the requirements.
- F. After each joint is sealed, all surplus joint sealer on the pavement surface shall be removed. Traffic shall not be permitted over the sealed joints until the sealant is tack free and set sufficiently to prevent embedment of debris into the sealant.

3.07 CURING COMPOUNDS

- A. A curing compound shall be applied to all freshly placed and finished concrete surfaces.

3.08 BONDING AGENT

- A. A bonding agent shall be placed following surface preparation in all locations where new concrete, polymer modified concrete overlay, grout or mortar is applied to existing concrete surfaces.

3.09 EPOXY ADHESIVE

- A. An epoxy adhesive shall be utilized to bond new precast concrete units to existing concrete structures and pavements.

PART 4 – MEASUREMENT AND PAYMENT

4.01 MEASUREMENT

Measurement for quantities of minor concrete, by type, shall be as follows:

- A. Curbs, Gutters, and combined Curbs and Gutters shall be measured for payment by the linear foot.
- B. Sidewalk shall be measured for payment by the cubic foot.
- C. Curb Ramps shall be measured for payment by the square foot.

4.02 PAYMENT

Payment for minor concrete, by type, shall be as follows:

GENERAL

All payments for minor concrete shall include subgrade preparation, forming, bonding, concrete, joints, sealant, finishing, curing and any ancillary items unless otherwise indicated and as specified below.

A. CURBS, GUTTERS, AND COMBINED CURBS AND GUTTERS

The contract price paid per linear foot for Concrete Curbs, Gutters, Combined Curbs and Gutters, and Platform Curb and Gutter shall include full compensation for furnishing all labor, materials, tools, equipment, and incidentals, and for doing all the work involved in Curbs, Gutters, and Combined Curbs and Gutters, complete in place, including class 2 base, as specified in the SSPWC, the City Standards, these Technical Specifications, the Plans, and as directed by the Engineer.

B. SIDEWALK

The contract price paid per cubic foot for Sidewalk shall include full compensation for furnishing all labor, materials, tools, equipment, and incidentals, and for doing all the work involved in Sidewalk, complete in place, as specified in the SSPWC, these Technical Specifications, the Plans, and as directed by the Engineer.

C. CURB RAMPS

The contract price paid per square foot for Curb Ramp, shall include full compensation for furnishing all labor, materials, tools, equipment, and incidentals and for doing all the work involved in constructing Curb Ramps, complete in place, as shown on the plans, and as specified in SSPWC, and these Technical Specifications, and as directed by the Engineer.

END OF SECTION

SECTION 32 17 13

PRECAST CONCRETE PARKING BUMPERS

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Precast concrete parking bumpers.
2. Parking bumper anchors.

B. Related Requirements:

1. Division 01 - General Requirements.
2. Section 03 30 00 – Cast-in-Place Concrete.
3. Section 32 12 16 - Asphalt Paving
4. Section 32 13 13 – Site Concrete Work.

1.02 SUBMITTALS

- A. Shop Drawings: Submit plans of the parking areas showing the location of the bumpers and installation details.
- B. Product Data: Submit manufacturers' product data for precast bumpers and bumper anchors.
- C. Material Sample: Submit one concrete bumper and one anchor.

1.03 QUALITY ASSURANCE

- A. Precast parking bumpers shall be manufactured for the intended purpose by a company or firm specializing in the manufacture of precast concrete parking appurtenances.

PART 2 - PRODUCTS

2.01 MATERIALS

- A. Precast Concrete parking Bumper: 28 day minimum compressive strength of 3,500 psi., reinforced with two No. 4 steel reinforcing bars, minimum. Provide chamfered

corners, drainage slots on underside and predrilled holes for dowel-anchoring to substrate.

1. Configuration: Half octagonal.
 2. Size: 7-1/2 inches wide by 5 inches high by 70-inches long, or as indicated on drawings.
- B. Bumper Anchors: # 6 reinforcing bar, 18 inches long, two per bumper.
- C. Adhesive and Sealant: As recommended by bumper manufacturer and approved by the OWNER's Office of Environmental Health and Safety (OEHS).
1. Epoxy adhesive for fastening bumpers to concrete or asphalt pavements.
 2. Adhesive for Bonding Dowel to Wheel Stop.
 3. Sealant for capping off and sealing the rebar at the predrilled holes.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Install bumpers as indicated on the Drawings. On bituminous paving, install anchors through pavement and into the ground a minimum of 12 inches. On concrete pavement, install bumpers in a continuous bed of adhesive.
- B. Fill predrilled anchoring holes with sealant, at both concrete and asphalt pavements.

3.02 CLEAN UP

- A. Remove rubbish, debris, and waste materials and legally dispose of off the Project site.

3.03 PROTECTION

- A. Protect the Work of this section until Substantial Completion.

END OF SECTION

SECTION 32 17 23 PAVEMENT MARKINGS

PART 1 – GENERAL

1.01 SUMMARY

A. The following items are covered in this Section:

1. Surface Preparation
2. Pavement Striping and Markings
 - a. For the purposes of these Specifications, traffic striping shall be defined as longitudinal centerlines and lane lines that separate traffic lanes in the same or opposing direction of travel, and longitudinal edge lines that mark the edge of the traveled way or the edge of the lanes. Curb markings shall be defined as colored markings on the curb that denote parking restrictions. Pavement markings shall be defined as transverse markings which include, but are not limited to, word and symbol markings, limit lines (stop lines), crosswalks, shoulder markings, parking stall markings, and railroad crossing markings.
3. Raised Pavement Markers
4. Removal of Pavement Markings on Roads and Parking Areas

1.02 REFERENCE SPECIFICATIONS, CODES, AND STANDARDS

- A. Standard Specifications for Public Works Construction, The “Greenbook”
Manual on Uniform Traffic Control Devices (MUTCD)
American Association of State Highway and Transportation Officials (AASHTO)
- B. Standards:
1. AASHTO M 247 Standard Specification for Glass Beads Used in Pavement Markings
 2. AASHTO M 248 Standard Specification for Ready-Mixed White and Yellow Traffic Paints
 3. ASTM D471 Standard Test Method for Rubber Property - Effect of Liquids
 4. ASTM D476 Dry Pigmentary Titanium Dioxide Pigments

5. ASTM D522/D522M Mandrel Bend Test of Attached Organic Coatings
6. ASTM D638 Standard Test Method for Tensile Properties of Plastics
7. ASTM D695 Standard Test Method for Compressive Properties of Rigid Plastics
8. ASTM D711 No-Pick-Up Time of Traffic Paint
9. ASTM D823 Standard Practices for Producing Films of Uniform Thickness of Paint, Coatings, and Related Products on Test Panels
10. ASTM D1652 Standard Test Method for Epoxy Content of Epoxy Resins
11. ASTM D2074 Standard Test Methods for Total, Primary, Secondary, and Tertiary Amine Values of Fatty Amines by Alternative Indicator Method
12. ASTM D2240 Standard Test Method for Rubber Property - Durometer Hardness
13. ASTM D2621 Standard Test Method for Infrared Identification of Vehicle Solids from Solvent-Reducible Paints
14. ASTM D2697 Volume Nonvolatile Matter in Clear or Pigmented Coatings
15. ASTM D3335 Low Concentrations of Lead, Cadmium, and Cobalt in Paint by Atomic Absorption Spectroscopy
16. ASTM D3718 Low Concentrations of Chromium in Paint by Atomic Absorption Spectroscopy
17. ASTM D3924 Standard Specification for Environment for Conditioning and Testing Paint, Varnish, Lacquer, and Related Materials
18. ASTM D3960 Determining Volatile Organic Compound (VOC) Content of Paints and Related Coatings
19. ASTM D4060 Abrasion Resistance of Organic Coatings by the Taber Abraser
20. ASTM D4061 Standard Test Method for Retroreflectance of Horizontal Coatings
21. ASTM D4280 Extended Life Type, Nonplowable, Raised, Retroreflective Pavement Markers
22. ASTM D4383 Standard Specification for Plowable, Raised Retroreflective Pavement Markers

23. ASTM D4505 Standard Specification for Preformed Retroreflective Pavement Marking Tape for Extended Service Life
24. ASTM D4541 Standard Test Method for Pull-Off Strength of Coatings Using Portable Adhesion Testers
25. ASTM D6628 Standard Specification for Color of Pavement Marking Materials
26. ASTM D7234 Standard Test Method for Pull-Off Adhesion Strength of Coatings on Concrete Using Portable Pull-Off Adhesion Testers
27. ASTM E1347 Standard Test Method for Color and Color Difference Measurement by Tristimulus (Filter) Colorimetry
28. ASTM E1710 Standard Test Method for Measurement of Retroreflective Pavement Marking Materials with CEN-Prescribed Geometry Using a Portable Retroreflectometer
29. ASTM E2177 Standard Test Method for Measuring the Coefficient of Retroreflected Luminance (RL) of Pavement Markings in a Standard Condition of Wetness
30. ASTM E2302 Standard Test Method for Measurement of the Luminance Coefficient Under Diffuse Illumination of Pavement Marking Materials Using a Portable Reflectometer
31. ASTM G154 Standard Practice for Operating Fluorescent Light Apparatus for UV Exposure of Nonmetallic Materials

1.03 CONTRACTOR SUBMITTALS

- A. CONTRACTOR shall submit to the City, for review, all materials specified herein in accordance with Section 013300 - Contractor Submittals.
- B. Product Data: Submit paint formulation for each type of paint.
- C. Manufacturer Instructions:
 1. Submit instructions for application temperatures, eradication requirements, application rate, line thickness, type of glass beads, and bead embedment and application rate.
 2. Submit detailed instructions on installation requirements, including storage and handling procedures.
- D. Manufacturer's Certificate: Certify that product meet or exceed specified requirements.

1.04 QUALITY ASSURANCE

- A. General
 - 1. Manufacturer's Certificate: Certify that product meet or exceed specified requirements.
 - 2. Test and Evaluation Reports: Indicate source and acceptance test results according to AASHTO M247.

1.05 DELIVERY, STORAGE, AND HANDLING

- A. Section 016000 – Product Requirements: Requirements for transporting, handling, storing, and protecting products.
- B. Inspection: Accept materials on Site in manufacturer's original packaging and inspect for damage.
- C. Storage:
 - 1. According to manufacturer instructions.
 - 2. Paint:
 - a. Invert containers several days prior to use if paint has been stored more than two months.
 - b. Minimize exposure to air when transferring paint.
 - c. Seal drums and tanks when not in use.
- D. Inspection: Accept materials on Site in manufacturer's original packaging and inspect for damage.

1.06 AMBIENT CONDITIONS

- A. Do not apply materials if surface and ambient temperatures are outside temperature ranges required by paint product manufacturer.
- B. Do not apply exterior coatings during rain or snow if relative humidity is outside range required by paint manufacturer, or if moisture content of surfaces exceeds that required by paint manufacturer.
- C. Minimum conditions: Do not apply paint if temperatures are or are expected to fall below 50 deg. F within 24 hours after application.
- D. Thermoplastic Compound: Do not apply unless pavement surface temperature is minimum 40 deg. F and rising.

- E. Maximum VOCs: Do not exceed limit required by State or Environmental Protection Agency.

1.07 TRAFFIC CONTROLS

- A. Place warning signs conforming to MUTCD near the beginning of the worksite and well ahead of the worksite for alerting approaching traffic from both directions. Place small markers along newly painted lines or freshly placed raised markers to control traffic and prevent damage to newly painted surfaces or displacement of raised pavement markers. Mark painting equipment with large warning signs indicating slow-moving painting equipment in operation. When traffic must be rerouted or controlled to accomplish the work, provide necessary warning signs, flag persons, and related equipment for the safe passage of vehicles.

1.08 WARRANTY

- A. Furnish manufacturer's warranty for pavement markings.

PART 2 – PRODUCTS

2.01 PAINTED PAVEMENT MARKINGS

- A. Performance and Design Criteria:
 - 1. Paint Adhesion: Adhere to road surface, forming smooth continuous film one minute after application.
 - 2. Paint Drying: Tack free by touch as not to transfer by vehicle tires within two minutes after application.
- B. Paint:
 - 1. Description: Ready mixed, conventional, fast-dry, waterborne traffic paints.
 - 2. Lead-free and nontoxic.
 - 3. Minimum Retroreflectance: 85 mcd.
 - 4. Durability Rating: 6 or more, after in place for nine months.
 - 5. Properties:
 - a. Pigment Percent by Weight: 60, plus or minus 2.
 - b. Vehicle Percent by Weight: 40, plus or minus 2.
 - c. Nonvolatile Percent by Weight of Paint: 75.0

- d. Viscosity: 80-90 Kneb Units at 77 deg. F.
6. Grind:
 - a. Method: Hegeman Gage
 - b. Minimum Field-Tested, No-Tracking Time under Ambient Conditions: 20 to 90 seconds.
7. Maximum Dry-Through Time:
 - a. 125 minutes
 - b. Wet Film Thickness: 15 mils at 90 percent relative humidity and 72 deg. F.
 - c. Comply with ASTM D1640/D1640M.
8. Maximum VOC Content: 1 lb./gal.
- C. Glass beads:
 1. Comply with AASHTO M247, Type 1.
 2. Coating: Enhance embedment and adherence with paint.
- D. Thermoplastic Compound:
 1. Binder Content: Hydrocarbon resin with pigment, beads, and filler uniformly dispersed.
 2. Asphalt Concrete Primer:
 - a. Description: Thermosetting adhesive with a solids content of pigment reinforced synthetic rubber and synthetic plastic resin dissolved or dispersed in a volatile organic solvent.
 - b. Solids Content: Not less than 10 percent by weight at 70 deg. F and 60 percent relative humidity.
 - c. Wet Film Thickness: 0.005 inch, plus or minus 0.03 inch.
 3. Portland Cement Concrete Primer: Epoxy resin primer, as recommended by manufacturer of thermoplastic compound.

2.02 APPLICATION EQUIPMENT

- A. Paint Application Equipment
 1. Hand-Operated, Push-Type Machines:
 - a. Provide hand-operated push-type applicator machine of a type commonly used for application of water based paint or two-component, chemically curing paint, thermoplastic, or preformed tape, to pavement surfaces for small marking projects,

such as legends and cross-walks, automotive parking areas, or surface painted signs. Provide applicator machine equipped with the necessary tanks and spraying nozzles capable of applying paint uniformly at coverage specified. Hand operated spray guns may be used in areas where push-type machines cannot be used.

2. Road Marking:

- a. Provide equipment used for marking roads capable of placing the prescribed number of lines at a single pass as solid lines, intermittent lines, or a combination of solid and intermittent lines using a maximum of three different colors of paint as specified.

3. Hand Application:

- a. Provide spray guns for hand application of paint in areas where the mobile paint applicator cannot be used.

4. Provide spray guns for hand application of paint in areas where the mobile paint applicator cannot be used:

- a. Provide equipment used for marking roads capable of placing the prescribed number of lines at a single pass as solid lines, intermittent lines, or a combination of solid and intermittent lines using a maximum of three different colors of paint as specified.

B. Thermoplastic Application Equipment

1. Thermoplastic pavement markings shall be applied with equipment and stencils specifically designed and constructed for that purpose.
2. Application equipment shall be approved by the Engineer prior to use. Preheaters with mixers having a 360 degree rotation shall be used to preheat thermoplastic material before it is applied.
3. Application equipment shall be capable of:
 - a. Utilizing either the spray or extrusion methods;
 - b. Applications that dry to “no pick up” in accordance with ASTM D711; and
 - c. Producing smooth, continuous lines having sharp dimensions.

C. Bead Gun:

- b. Description: Automatically dispense glass beads onto painted surface at required application rate.

c. Type: Pressurized

D. Measuring Device

1. Automatically and continuously measure to nearest foot length of each line placed.

E. Paint Heater

1. Capable of heating paint to 125 deg. F for fast-dry applications.

2.03 QUALITY CONTROL

A. Certificate of Compliance:

1. If manufacturer is approved by authorities having jurisdiction, submit certificate of compliance indicating Work performed at manufacturer's facility conforms to Contract Documents.
2. Specified shop tests are not required for Work performed by approved manufacturer.

PART 3 – EXECUTION

3.01 REMOVAL OF TRAFFIC STRIPING AND CURB AND PAVEMENT MARKINGS

- A. The contractor shall remove existing traffic striping and pavement markings by wet or dry sandblasting, high velocity water jet, grinding or other methods as specified. Obliteration with black paint or emulsified asphalt will not be allowed.
- B. Conflicting striping and pavement markings shall be removed before the application of new temporary or permanent striping, and curb and pavement markings.
- C. Removal of existing pavement markers shall be performed in such a manner as to leave the existing pavement undamaged.
 1. Asphalt concrete pavement shall be considered damaged when a depression of more than ¼ inch results. Damaged asphalt concrete pavement shall be patched with E-PG 64-10 asphalt concrete pavement conforming to Sections 203-6 and 302-5 for the SSPWC.

3.02 PREPARATION

- D. Do not apply paint to concrete surfaces until concrete has cured for 28 days.

- E. Mechanical mixers shall be used to mix paint. Prior to application, paint shall be mixed a sufficient length of time to thoroughly mix the pigment and vehicle together, and shall be kept thoroughly agitated during application.
- F. Surface Preparation.
 - 1. Clean and dry paved surfaces prior to painting. Areas which cannot be satisfactorily cleaned shall be scrubbed with a water solution of tri-sodium phosphate (1- percent Na_3PO_4) or other approved cleaning solution. After cleaning, the surface shall be rinsed with water and dried before painting. The cleaning solution and rinse water shall not be allowed to enter any storm drain or natural water course.
 - 2. Blow or sweep surface free of dirt, debris, oil, grease, or gasoline.
 - 3. Spot location of final pavement markings, as specified and as indicated on Drawings, by applying pavement spots.
 - 4. Request inspection by Engineer after placing pavement spots and minimum three days prior to applying traffic lines

3.03 APPLICATION

- A. Application Rate:
 - 1. Reflective Markings:
 - a. Paint: 100 sq. ft./gal.
 - b. Glass Spheres on Wet Paint: 0.5 lb./gal.
 - 2. Nonreflective Markings:
 - a. Paint: 100 sq. ft./gal
 - 3. Thermoplastic Compound:
 - a. After surface preparation has been completed, a primer, of the type recommended by the manufacturer of the thermoplastic material, shall be applied to asphalt concrete surfaces over 6 months old and to all Portland cement concrete surfaces. The primer shall be applied immediately in advance of, but concurrent with, the application of thermoplastic material. The primer shall be applied at the rate recommended by the manufacturer and shall not be thinned.

- b. Thermoplastic material shall be applied at a temperature between 400 deg. F and 425 deg. F, unless a different temperature is recommended by the manufacturer. Thermoplastic material shall be applied in a single layer. The pavement surface to which the thermoplastic material is applied shall be completely coated by the material and the voids in the pavement surface shall be filled.
 - c. Apply reflective glass spheres mechanically at rate of 1 lb./sq/ ft.
 - d. Application Thickness: Not less than 0.125 inch and not more than 0.190 inch.
- B. Paint
1. Apply paint pneumatically, using guidelines and templates as necessary to control application.
 2. Manually paint numbers, letters, and symbols.
 3. Prevent splattering and overspray when applying markings.
 4. Paint Guns: Simultaneously apply paint binder at uniform specified rates.
 5. Dispense at manufacturer recommended temperature, plus or minus 5 deg. F.
 6. Wet-Film Thickness:
 - a. 15 mils.
 - b. Edge Markings: 12 mils
- C. Reflective Media:
1. Immediately follow paint application.
 2. Bead Guns:
 - a. Dispense glass beads simultaneously at specified rate.
 - b. Check guns by dispensing glass beads into gallon container for predetermined fixed period of time.
 - c. Verify weight of glass beads.
- D. Thermoplastic Compound:
1. Place on dry pavement with a surface temperature above 50 deg. F. The wind shall be calm enough that no blowing dirt is deposited on the pavement surface.

2. Apply centerline, skip line, edge line, and other longitudinal type markings with mobile applicator.
 3. Place special markings, crosswalks, stop bars, legends, arrows, and similar patterns with portable applicator.
- E. Raised Pavement Markers:
1. Align prefabricated markers and permanently fix in place by means of epoxy adhesives.
 2. Prior to applying adhesive, thoroughly clean area by water blasting and by compressed air.
- F. Dimensions and Locations: As indicated on Drawings.
- G. Crosswalks, Intersections, Stop Lines, and Legends:
1. Use walk-behind stripers, hand spray, or stencil trucks.
 2. Do not use hand brushers or rollers.
 3. Glass beads may be applied by hand.

3.04 TOLERANCES

- A. Minimum Variation from Wet Film Thickness: 1 mil.
- B. Maximum Variation from Wet Paint Line Width: Plus or minus 1/8 inch.
- C. Automatic Line-Length Gages: Plus or minus 25 ft./mi.
- D. Cycle Length Timer: Plus or minus 6 in./40 ft.
- E. Paint Line-Length Timer: Plus or minus 3 in./10 ft.
- F. Paint Guns: Plus or minus 1 mil.

3.05 FIELD QUALITY CONTROL

- A. Inspect for incorrect location, insufficient thickness, line width, coverage, retention, uncured or discolored material, and insufficient bonding.
- B. Acceptance:
1. Repair lines and markings which after application and curing do not meet following criteria:
 - a. Incorrect location.

- b. Insufficient thickness, width, coverage, or retention.
- c. Uncured or discolored material.
- d. Insufficient bonding.

3.06 CLEANING

- A. Collect and legally dispose of residues from painting operations.

3.07 PROTECTION

- A. Protect painted pavement markings from vehicular and pedestrian traffic until paint is dry and track free.
- B. Unless material is track free at end of paint application convoy, use traffic cones to protect markings from traffic until track free.
- C. If vehicle crosses a marking and tracks it, or if splattering or overspray occurs, eradicate affected marking and resultant tracking and apply new markings.
- D. Follow manufacturer instructions or use minimum of 30 minutes of dry time.
- E. Barrier cones are satisfactory protection for material being dried.

3.08 MAINTENANCE

- A. Provide service and maintenance of traffic paints for three years from date of Substantial Completion.

PART 4 - MEASUREMENT AND PAVEMENT

4.01 MEASUREMENT

- A. All items of work shall be measured in accordance with the SSPWC.

4.02 PAYMENT

- A. Payment for all items of work shall be in accordance with the SSPWC.

END OF SECTION

SECTION 32 17 26 DETECTABLE WARNING SURFACES

PART 1 – GENERAL

1.01 SUMMARY

- A. This work includes furnishing materials, labor, transportation, services, and equipment necessary to furnish and install Detectable Warning Surfaces as indicated on drawings and as specified in these Technical Specifications.
- B. Detectable Warning Surfaces shall include detectable warning tile for curb ramps.

1.02 RELATED SECTIONS

- A. Section 32 13 13 – Portland Cement Concrete Paving
- B. Section 32 16 00 – Curbs, Gutters, Sidewalks, and Drives

1.03 REFERENCES

- A. ASTM International:

 - 10. G155 Practice for Operating Xenon Arc Light Apparatus for Exposure of Non-

Metallic Materials

- B. Americans with Disabilities Act (ADA) Standards issued by U.S. Department of Transportation
- C. California Building Code

1.03 SUBMITTALS

- A. Product Data: Submit manufacturer's literature describing products, installation procedures and routine maintenance.
- B. Samples for Verification Purposes: Submit one (1) full size tile sample.
- C. Shop drawings and manufacturer's product data sheet are required for products specified showing fabrication details, material composition, surface profile, and material to be used for installation.
- D. Material Test Reports: Submit complete test reports from qualified accredited independent testing laboratories to qualify that materials proposed for use are in compliance with requirements and meet or exceed the properties indicated in the specifications. All tests shall be conducted on the tile (or approved equal) as specified herein.
- E. Maintenance Instructions: Submit one copy of manufacturer's specified installation and maintenance practices for each type of detectable warning surface.

1.04 QUALITY ASSURANCE

- A. Provide detectable warning surfaces as produced by a single manufacturer with a minimum of three (3) years' experience in the manufacturing of detectable warning surfaces.
- B. Provide detectable warning surfaces which are in compliance with the following standards:
 - 1. Americans with Disabilities Act (Title III Regulations, 28 CFR Part 36 ADA STANDARDS FOR ACCESSIBLE DESIGN, Appendix A, Section 4.29.2 DETECTABLE WARNINGS ON WALKING SURFACES).
 - 2. California Code of Regulations (CCR): Provide only approved DSAAC detectable warning products as provided in the California Code of Regulations (CCR) Title 24, Part 2, Section 205 definition of "Detectable Warning". Section 1117A.4 and 1127B.5 for "Curb Ramps" and Section 1133B.8.5 for "Detectable Warnings at Hazardous Vehicular Areas".
 - 3. Panels and accessories, including panel adhesive, fasteners, and sealants, shall be from a single source. Products shall have been in successful service for a period of five (5) years.

1.05 DELIVERY, STORAGE AND HANDLING

- A. Detectable warning surfaces shall be suitably packaged or crated to prevent damage in shipment and handling.
- B. Storing detectable warning surfaces at project site shall be on a level, clean surface, protected from other construction activities.

1.06 MANUFACTURER'S WARRANTY

- A. Detectable warning surfaces shall be warranted in writing for a period of five (5) years from date of substantial completion. The guarantee includes factory defects, breakage, and deformation. Warranty shall include furnishing new materials, removal of existing panels, and installation of new panels.

1.07 SITE CONDITIONS

- A. Environmental Conditions and Protection
 - 1. Conduct field operations only when environmental conditions fall within those recommended by manufacturers of the products.

1.08 SPARES

- A. Furnish a minimum of five (5) percent additional panels of the total amount installed of each panel and corresponding fasteners. Deliver spares to location (within 50 mile radius of work site) designated by the Engineer. Furnish spare materials from same manufactured lot as materials installed and enclose in protective packaging with appropriate identification.

PART 2 – PRODUCTS

2.01 DETECTABLE WARNING TILE (CURB RAMPS)

- A. Detectable warning tile shall be designed to be cast into fresh concrete and comply with “Detectable Warning Tiles (DWT)”, of the City Standard Specifications, these Technical Specifications, and the Plans.
- B. Material for tiles shall be stainless steel per the City’s approved materials list
- C. Color: Federal Yellow conforming to Federal Color No. 33538. Color shall be homogeneous throughout the panel.
- D. Dynamic loading in compliance with AASHTO HS20-44.
- E. Able to be cut without losing structural integrity.
- F. Produced by a single manufacturer with a minimum of five (5) years’ experience in the manufacturing of cast in place detectable/tactile warning surface tiles.

- G. Cast in place tiles shall be suitably packaged or crated to prevent damage in shipment or handling. Finished surfaces shall be protected by sturdy plastic wrappings to protect tile from concrete residue during installation and tile type shall be identified by part number.
- H. Subject to conformance with the requirements of this Section, use products fabricated by the following manufacturers or approved equal:
 - 1. Armor-Tile by Engineered Plastics, Inc. of Williamsville, NY
 - 2. ADA Solutions, Inc. of North Billerica, MA
 - 3. Access Products of Buffalo, NY
- I. Panels shall be manufactured from a fiber reinforced polymer composite.
- J. Truncated Dome Geometry
 - 2. Pedestrian Grade Crossings and Curb Ramps:
 - a. Square grid (in-line) pattern of raised truncated domes of 0.2-inch nominal height, base diameter of 0.9-inch and top diameter of 0.45-inch.
 - b. Truncated domes shall have a center-to-center (horizontally and vertically) spacing of 2.35-inch as measured side by side in-line.
- K. Panel Thickness: At a minimum, the thickness of the body of Detectable Warning Panel shall measure 3/16-inch (0.1875-inch) nominal.
- L. Panel Size: Pedestrian Grade Crossings and Curb Ramps (In-Line Pattern): Nominal 36-inch x 48-inch (or longer) with a 7/16-inch thick deep flange along both long sides.
- M. Fastener Holes in Panel
 - 1. Holes for fasteners shall be formed in the factory. Holes for fasteners, whether made in the factory or in the field, shall be located only at the centers of the truncated domes.

2.02 ACCESSORIES

- A. Fasteners for Concrete
 - 1. Color matched nylon expansion sleeves with 1/4 inch diameter by 1-1/2 inches long stainless steel drive pins, or as recommended by panel manufacturer for specific job conditions and accepted by the Engineer.
- B. Adhesive
 - 1. Type approved by panel manufacturer.
- C. Sealant

1. Urethane sealant of type approved by panel manufacturer.
- D. Backer Rod
1. Acceptable to sealant manufacturer. Where required, such as, at platform expansion joints.

PART 3 – EXECUTION

3.01 DETECTABLE WARNING TILE (CURB RAMPS)

- A. Detectable Warning Tile shall be installed in accordance with the Plans. Any damage to detectable warning tiles, due to Contractor activity, shall be repaired or fully replaced at no additional cost to the Owner. Repairs shall comply with Section 218, “Detectable Warning Tiles (DWT)”, of the City Standard Specifications. All repairs will require approval by the Engineer.
- B. Installation procedure shall eliminate all air voids under the tile.
- C. Tiles shall be installed to match slope of ramp as indicated on the Plans and per Section 32 17 26, “Curbs, Gutter, Sidewalk & Drives,” of these Technical Specifications. The field level of tiles, when set, shall be flush with adjacent concrete surface. Immediately after installation slope of tiles shall be checked to ensure it is in compliance. Care shall be taken to ensure no undo force is applied to tile once installed to the proper slope.
- D. Concrete edge around tile shall be finished using a small radius edging tool.
- E. Concrete bleeding onto tiles during installation and finishing activities shall be removed after concrete has set. Cleaning methods shall be in accordance with manufacturer’s recommendations.
- F. Protect and maintain tiles throughout installation and construction period. Prevent wear and damage up to the time of final acceptance.

3.01 CLEANING AND PROTECTING

- A. After the area has been fully paneled and sealant system applied, clean panel surface, following the manufacturer recommended maintenance and cleaning procedures.
- B. Protect sealant and panels against damage during construction period. Comply with panel and sealant manufacturers' recommendations.
- C. Protect panels against damage from rolling loads following installation by covering with plywood or hardwood.

- D. Clean panel by method specified by manufacturer.

PART 4 – MEASUREMENT AND PAYMENT

4.01 MEASUREMENT

- A. Detectable Warning Tile will be measured for payment by the square foot of Detectable Warning Tile, over the actual surfaces placed, within the limits shown on the Plans or as otherwise authorized by the Engineer.

4.02 PAYMENT

- A. The contract price paid per square foot for Detectable Warning Tile includes full compensation for furnishing all labor, materials, tools, equipment and incidentals and for doing all the work involved in installing Detectable Warning Tile, complete in place, including cutting, fitting, slope check, and cleaning as shown on the Plans and as specified in the City Standard Specifications, these Technical Specifications, and as directed by the Engineer.

END OF SECTION

SECTION 32 18 16

PLAYGROUND PROTECTIVE SURFACING

PART 1 – GENERAL

1.01 SUMMARY

- A. Section includes: Resilient playground protective tile surfacing system.
- B. Related Requirements:
 - 1. Division 01 - General Requirements..
 - 2. Section 11 6813 - Playground Equipment and Structures.
 - 3. Section 31 1116 – Aggregate Base.
 - 4. Section 32 1313 - Site Concrete Work.
 - 5. Section 32 1216 - Asphalt Paving.
 - 6. Section 32 3113 - Chain Link Fencing.

1.02 REFERENCES

- A. Reference to standard technical specifications of a society, institute, association, or governmental authority is a reference to the respective organization's standard technical specifications, which are in effect on the date of bid submission.
- B. ASTM International (ASTM) - The publications listed below form a part of this Specification to the extent referenced. The publications are referred to in the text by basic designation only.
 - 1. ASTM C136 – Standard Test Method for Sieve Analysis of Fine and Coarse Aggregates.
 - 2. ASTM D2859 – Standard Test Method for Ignition Characteristics of Finished Textile Floor Covering Materials.
 - 3. ASTM F355 - Standard Test Method for Impact Attenuation of Playing Surface Systems, Other Protective Sports Systems, and Materials Used for Athletics, Recreation and Play.
 - 4. ASTM F1292 – Standard Specification for Impact Attenuation of Surfacing Materials within the Use Zone of Playground Equipment.
 - 5. ASTM F1487 – Standard Consumer Safety Performance Specification for Playground Equipment for Public Use.
 - 6. ASTM F1951 - Standard Specification for Determination of Accessibility of Surface Systems under and Around Playground Equipment.

1.03 DEFINITIONS

- A. Critical Height: Standard measure of shock attenuation. According to CPSC (Consumer Safety Product Commission) No. 325, critical height is defined as “the fall height below which a life-threatening head injury would not be expected to occur.”
- B. Fall Height: According to ASTM F1487, fall height is defined as “the vertical distance between a designated play surface and the protective surfacing beneath it.” The fall height of playground equipment shall not exceed the critical height of the protective surfacing beneath it.
- C. Use Zone: As defined by ASTM F1487 and this Section.
- D. Certified Playground Safety Inspector (CPSI): A Certified Playground Safety Inspector shall possess a current and valid Certified Playground Safety Inspector certificate as recognized by the National Recreation and Parks Association (NRPA).

1.04 SUBMITTALS

- A. Shop and Coordination Drawings: Submit layout plans and elevations drawn to scale for the coordination of playground equipment with playground protective surfacing system. Indicate playground equipment locations, use zones, fall heights, extent of protective surfacing, depths of material, and critical heights, sub-base materials, hardware, penetrations, perimeter edge details, drainage, and surrounding hardscaping, handrail, and guardrails fencing where applicable.
- B. Color Samples: Submit manufacturer’s color charts or 4-inch squares of units (samples) indicating the full range of colors available.
- C. Product Data: Submit manufacturer’s descriptive data and installation instructions.
- D. Manufacturer’s Project References: Submit list of at least five installations where products similar to those specified are installed and have been in successful service for a minimum period of three years. List shall include owner, address of installation, service or maintenance organization, date of installation, contact person, and phone number of the contact person.
- E. Certificate of Compliance: Submit manufacturer’s certificate of compliance indicating materials comply with specified requirements of this Section.
- F. Certified Statement: Submit certified statement indicating that safety tile meets the requirements of ASTM F1292.
- G. Certificate of Insurance: Submit in accordance to Article 1.09 Warranty below.
- H. Maintenance Instructions: Submit maintenance, repair and cleaning instructions.
- I. Installer Certification: Manufacturer shall submit certified statement indicating the following:
 - 1. Installer is trained, approved and/or certified for the installation of the manufacturer’s specified playground protective surfacing.

2. Installer has at least five year experience installing manufacturer's playground protective surfacing of similar type to that specified.

1.05 PERFORMANCE REQUIREMENTS

- A. Safety: Safety surfacing shall meet or exceed the performance requirements of CPSC and ASTM F1292, that a surface yield both, a peak deceleration of no more than 200g, and a Head Injury Criteria (HIC) value of no more than 1,000g. ASTM F1487 specifies designated play surfaces as any elevated surface for standing, walking, sitting, or climbing, or a flat surface larger than 2.0 inches (51mm) wide and 2.0 inches (51mm) long having less than 30° angle from horizontal. The installer is responsible for obtaining a determination from the playground protective surfacing manufacturer of the required product depth to meet the performance requirements for play equipment.
- B. Accessibility: Playground Protective Surfacing intended to serve as accessible paths of travel for persons with disabilities shall be firm, stable and slip resistant and shall meet the requirements of the 2010 Americans with Disabilities Act Standards for Accessible Design (2010 ADAS), ASTM F1487, ASTM F1292, and ASTM F1951.

1.06 QUALITY ASSURANCE

- A. Qualifications:
 1. Manufacturer: Continuously engaged in manufacturing playground protective surfacing of similar type to that specified, with a minimum of five years successful experience.
 2. Installer: Shall be approved by manufacturer and shall have a minimum of five years successful experience installing playground protective surfacing of similar type to that specified.
- B. Regulatory Requirements:
 1. Accessibility: 2010 ADAS and CBC Chapter 11B.
 2. U.S. Consumer Product Safety Commission (CPSC) - Handbook for Public Playground Safety, latest edition, U.S. Consumer Product Safety Commission, Bethesda, MD 20814 Telephone (301) 504-7923.
- C. Certifications: Submit certified statement indicating that protective surfacing meets the requirements of ASTM F1292 for the installed play equipment. The impact attenuating qualities of the protective surfacing system shall not be diminished in the surface areas covering hardware and footings. Testing of products shall include tests conducted over hardware and concrete. The statement shall be dated after the Effective Date of the Contract, shall state CONTRACTOR name and address, and shall name the Project and location. The statement shall also provide the name, address, and telephone number of the testing agency, type of instrument used, instrument model and serial number, instrument recall date, the date of the test, and the test results.

- D. Fall heights shall be determined by the highest designated play surface, to the protective surfacing system below. Fall heights shall also be determined by the highest part of a climber intended for foot support and/or the highest part of upper body equipment, with the exception of support posts. Impact attenuation testing shall be performed at the highest of these values.
- E. Source Limitations: Provide secondary materials including adhesives, anchoring materials, filler/sealant materials, and repair materials of type and from source recommended by manufacturer and approved by the OAR.
- F. Coordination: Coordinate installation of playground protective surfacing with installation of playground equipment, including but not limited to, use zones and fall heights as specified in the CPSC and ASTM F1487.

1.07 DELIVERY, STORAGE, AND HANDLING

- A. Deliver manufactured materials in original package with seals unbroken and bearing manufacturer's labels.
- B. Store manufactured materials in a clean, dry location, protected from the weather and deterioration, and complying with manufacturer's written instructions for minimum and maximum temperature requirements for storage.
- C. Store units on flat surfaces.

1.08 PROJECT CONDITIONS

- A. Environmental Limitations: Do not install playground protective surfacing over wet or excessively damp substrates if prohibited by manufacturer's written instructions.
- B. Weather Limitations: Proceed with installation only when existing and forecasted weather conditions permit playground tile system to be installed according to manufacturer's written instructions.
- C. Adhesives: Install adhesives only when temperatures of surfaces to be adhered to and ambient air temperatures are within range permitted by manufacturer's written instructions. Adhesives shall only be installed under dry conditions.
- D. Do not install products over concrete slabs until slabs have cured and are sufficiently dry and surfaces are within acceptable pH range to bond with adhesive, as recommended by surfacing manufacturer.

1.09 WARRANTY

- A. Product and General Liability: Manufacturer of Playground Protective Surfacing System shall provide OWNER Certificate of Insurance, covering both product and general liability, of not less than \$1,000,000. The issuing underwriter shall be AA rated.
- B. Materials and Fabrication:

1. Manufacturer shall provide OWNER written warranty that guarantees playground protective surfacing system for not less than ten (10) years against defective materials and fabrication.
 - a. Warranty shall include provisions that include, but is not limited to, cracking, shedding and/or abnormal markings.
 - b. Manufacturer shall provide a five (5) year warranty against color fading.
 2. Installer shall provide OWNER a written warranty that guarantees the installation of the playground protective surfacing system for not less than ten (10) years against defective products, faulty installation, adhesive and/or fastener failure, seam and/or perimeter edging separation, slope issues exceeding 1:48 (2.08%) and/or uneven surfaces.
 3. Warranty repairs shall be conducted without cost to OWNER. Prorated warranties are not acceptable.
- C. Performance: Warranty shall guaranty that the playground protective surfacing system will retain its original impact attenuation rating for a period of not less than ten (10) years and meet performance requirements of ASTM F1292. Impact attenuation rating shall be tested per ASTM F1292 after manufacturer makes repairs.

PART 2 – PRODUCTS

2.01 MANUFACTURERS

- A. Manufacturer’s product shall be approved for use by OWNER.

2.02 MATERIALS

- A. Accessories: Made of same material as protective surfacing.
 1. Beauty Rings: Prefabricated finish edging around penetrations in protective surfacing.
- B. Geotextile Fabric: UV stabilized, Terram Product grade 1500, Linq 200, or equal.
- C. Adhesive: Manufacturer recommended and compatible with protective surfacing system.
- D. Hardware: Corrosion resistant metal and/or composite clips, anchors and fasteners.
- E. Concrete: Per Section 32 1313 - Site Concrete Work.
- F. Asphalt: Per Section 32 1216 - Asphalt Paving.
- G. Chain Link Fence: Per Section 32 3113 – Chain Link Fencing.

2.03 AGGREGATE BASE ROCK

- A. Aggregate base rock shall be 3/4 inch minus sharp crushed rock conforming to following grading requirement:

SIEVE SIZE:	PERCENT PASSING:
1 inch	100 percent
3/4 inch	90 – 100 percent
3/8 inch	55-75 percent
1/4 inch or #10	40-60 percent

- B. Where a tolerance range is set forth in above grading requirements, midpoint of tolerance range is target value and product shall conform as closely as realistically possible to this target value. The purpose of tolerance range is only to permit occasional minor variations from target value that are, for practical reasons, unavoidable.
- C. Thickness: The minimum thickness of aggregate base rock shall be 4-inch or as required by manufacturer.
- D. Compaction: Compaction shall be a minimum 95 percent or as recommended in soils report.

PART 3 - EXECUTION

3.01 EXAMINATION

- A. Examine areas and conditions for compliance with requirements for sub-grade substrate conditions and drainage, for compliance with playground protective surfacing manufacturer's requirements and requirements herein, and other installation conditions affecting performance.
- B. Hard-Surface Substrates: Verify that substrates are satisfactory for playground protective surfacing installation and that substrate surfaces are dry, cured, and uniformly sloped to drain within recommended tolerances according to playground protective surfacing manufacturer's written requirements for cross-section profile.
- C. Concrete Substrates: Verify that substrates are dry, free from surface defects, and free of laitance, glaze, efflorescence, curing compounds, form-release agents, hardeners, dust, dirt, loose particles, grease, oil, and other contaminants incompatible with playground protective surfacing or that may interfere with adhesive bond.
- D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION

- A. General: Prepare, fill, patch, clean, remove high spots and ridges, and remove incompatible coatings from substrates to receive surfacing products according to playground protective surfacing manufacturer's written recommendations. Verify that substrates are sound and free from high spots, ridges, holes and depressions.
- B. Concrete Substrates: Provide leveling and patching materials and install according to manufacturer's written instructions. Fill holes and depressions.

3.03 INSTALLATION

A. General:

1. Comply with playground protective surfacing manufacturer's written recommendations.
2. Installation of protective surfacing system must comply with zone requirements of the latest edition of the "Consumer Product Safety Commission – Handbook for Public Playground Safety – Publication No. 325, ASTM F1487 and this Section.
3. The entire area shall be cleaned and made free from foreign and/or loose materials that would cause the protective surfacing to lay in an uneven fashion and expose surfacing. The area to be surfaced shall be void of depressions and/or protrusions edges or leave depressions. Depressions shall be filled with "LevelCrete" or equal type product prior to installation of the playground protective surfacing systems.
4. The playground protective surfacing system shall be installed only after the playground equipment and subsurface have been installed and have passed inspection by a third party or OWNER Certified Playground Safety Inspector, and the OWNER has obtained the completed inspection report stating compliance with ASTM and CPSC.
5. The playground protective surfacing shall cover hardware, footings and/or foundations with the full required thickness. With the exception of the perimeter sloped edging, the playground protective surfacing shall maintain its required thickness throughout. Tapered perimeter edges shall be outside of the Use Zone.
6. Repair work performed to existing protective surfacing shall use the same material components, unless specified otherwise by the manufacturer of the existing surfacing. The playground protective surfacing shall only be installed in straight sections. Radius and/or circles are not acceptable.
7. Border trim sections shall be completely glued down to the protective surfacing and concrete borders. When protective surfacing and/or border trim sections converge with playground equipment components, these sections shall be securely fastened to prevent efforts to displace the system.
8. When playground protective surfacing includes tapered edges, tapered edges shall be designed to fully adhere to subsurface with a combination of adhesive and fasteners. Adhesive shall be continuous. Spacing of fasteners shall not exceed six inches.
9. The maximum slope of tapered border edges shall be 1:3. Sloped border edges shall not exceed twenty-four inches horizontally, or five inches vertically.
10. The maximum cross-slope for the playground protective surfacing shall not exceed 1:48.
11. Playground protective surfacing shall be installed with a continuous reinforced concrete border around the perimeter of the playground. Concrete borders shall

have a maximum slope of one percent. Concrete borders shall be installed a minimum of one inch higher than the surrounding hardscaping's highest adjacent elevation. Existing hardscaping shall be cut back to allow for replacement hardscaping to slope up to concrete border. Slope for the surrounding hardscaping adjacent to the concrete border shall not exceed current ADA requirements. Outside edge of existing hardscaping shall be saw cut as to provide a straight, true line. Due to the raised perimeter concrete border, both above grade and flush with grade protective surfacing systems shall require drainage. Place appropriate forming on the inside and the outside of the curbing as needed. Forming material and installation shall be of sufficient strength to retain wet concrete so as to provide straight surfaces.

12. Provide drainage for Above Grade and Flush with Grade systems installing a minimum of one drywell for every one thousand square feet of protective surfacing. Drywell shall consist of 12 inch diameter PVC, schedule 40, 5 feet deep filled with gravel. Locate drywell at lowest section of the protective surfacing. Perforate lower half with 3/8" diameter holes at 6" on center each way and wrap with filter fabric Marafi 14ON or equal.
- B. Above Grade Installation Procedure: Protective surfacing shall be installed with a 12-inch wide by 5-inch deep concrete curb with two #4 rebars centered, around the entire perimeter to act as an attachment point.
- C. Flush with Grade Installation Procedure: Playground protective surfacing shall be installed with a 12-inch wide by 10-inch deep with three #4 rebars (with keyway) or 6-inch wide by 10-inch deep with two #4 rebars (without keyway) concrete curb around the entire perimeter to act as an attachment point. The type of protective surfacing being used will determine which concrete curbing will need to be utilized.
- D. Provide a base for the playground protective surfacing consisting of a 95 percent compaction of crushed base material. This compaction is to be achieved by the following procedure:
 1. Apply a 2-inch layer of Base Material and compact with a soil compactor.
 2. Apply a 1/8 inch layer of Portland cement over entire area and thoroughly wet down.
 3. Repeat above steps to obtain desired thickness of material.
 4. Finished base material shall be smooth, flat and uniform.
- E. Depressions shall be filled with "Levelcrete" or equal type product prior to installation of the playground protective surfacing. The entire area shall be cleaned and made free from any foreign and/or loose materials.

3.04 SITE TESTS

- A. Upon completion of installation, CONTRACTOR shall have surface system tested by an independent testing laboratory in accordance with ASTM F355 and provide certification that installed surfacing meets requirements of ASTM F1292.

3.05

CLEANING

- A. Prevent pedestrian use of system for at least 48 hours after installation. Riding and/or driving on the protective surfacing system is strictly prohibited. Protect playground surface system until Substantial Completion.
- B. Clean playground surface systems as recommended in writing by playground surface system manufacturer. Provide cleaning materials and procedures recommended in writing by system manufacturer and approved by the OAR.

END OF SECTION

SECTION 32 31 13

CHAIN LINK FENCING

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Chain link fences and fabrications as indicated.

B. Related Requirements:

1. Division 01 - General Requirements.
2. Section 03 30 00_ - Cast-in-Place Concrete.
3. Section 31 10 00 – Site Clearing.
4. Section 31 22 00 - Grading.
5. Section 31 23 00 - Earthwork

1.02 SUBMITTALS

A. Shop Drawings: Submit dimensioned plans and details indicating extent of fences, locations of gates, and details of attachment and footings. Indicate means and methods for surface preparation and finishing.

B. Certifications: Manufacturers material certifications in compliance with the ASTM standards referenced in this Section.

1.03 REFERENCES

A. ASTM International:

1.04 QUALITY ASSURANCE

- A. Manufacturer: Company specialized in manufacturing chain link fence products with at least five years of experience.
- B. Fence Installer: Company with demonstrated successful experience installing similar projects and products in accordance with ASTM F567 and with at least five year experience.

PART 2 – PRODUCTS

2.01 CHAIN LINK FABRIC

- A. Galvanized Chain Link Fabric: Conforming to ASTM A392, Class 2 zinc coating, 2.00 ounces minimum per square foot of uncoated wire surface, hot-dipped galvanized after weaving, and with top and bottom edges knuckled (kk). Tie wires and hog rings shall conform to ASTM F626, and shall be 9 gage and galvanized.
- B. Chain Link Fabric Requirements:
 - 1. Fabric for perimeter fencing and interior fencing shall be 9 gage woven wire with 2 inch mesh, unless otherwise specified.
 - 2. Fences 12 feet high or less shall be furnished with single width fabric.
 - 3.
 - 4. Installed fence fabric shall be free from barbs, icicles, or other projections. Fence fabric with such defects will be deemed defective Work.

2.02 STEEL FENCE FRAMEWORK

- A. Posts, Top Rails, and Brace Rails: Standard weight, schedule 40, hot dip galvanized, welded steel pipe conforming to ASTM F1083, Group IA Heavy Industrial Fence Framework, with a minimum yield strength of 30,000 psi. Minimum 1.8 Oz/ft² hot dipped zinc coating average for interior and exterior.
- B. Miscellaneous Metals:
 - 1. Structural Steel Shapes: ASTM A36.
 - 2. Steel Pipe: ASTM A53 Type E or S, Grade B, standard weight (Schedule 40), unless otherwise noted. Use black finish where hot dip galvanizing after fabrication is indicated.
 - 3. Square and Rectangular HSS: ASTM A500 Grade B or C.
 - 4. Steel Bolts: ASTM A307, Grade A, or F3125 with hex steel nuts per ASTM A563 and washers. Galvanized in accordance with ASTM A153.

- C. Schedule of Posts, Rails, Bracings and Footings: Unless indicated otherwise on the drawings, shall be of sizes indicated on the following schedule.

Item	Height	Nomina l Pipe Size (inches)	Outside Diameter (inches)	Weight (pounds per foot)	Footings	
					Diameter (inches)	Depth (inches)
Top Rail, Brace Rails and Transom Rails	Up to 10'-0"	1-1/4	1.660	2.27	N/A	N/A
	10'-1" to 16'-0"	1-1/2	1.900	2.72	N/A	N/A
Line Posts	6'-1" to 8'-0"	2	2.375	3.65	12	36
	8'-1" to 10'-0"	2-1/2	2.875	5.80	12	36
	10'-0" to 16'-0"	3	3.5	7.58	14	60
Terminal, Corner, Angle & Pull Posts	Up to 8'-0"	2-1/2	2.875	5.79	12	36
	8'-0" to 10'-0"	2-1/2	2.875	5.79	14	42
	10'-1" to 16'-0"	3	3.5	7.58	14	60

2.03 FITTINGS

- A. Fittings shall be malleable iron conforming to ASTM A47 or ASTM F626.
- B. Post Caps: Designed to fit snugly over posts with a minimum projection of 1-1/2 inches below top of posts. Post caps shall be manufactured with a curved top.
- C. Eye Tops: Designed to fit over line posts, and for through passage of top rail.
- D. Expansion Sleeve Couplings for Top Rails: Steel, 6 inches long, designed to fit tightly on inside of rail, fitted with raised center.
- E. Rail Ends for Top Rails and Brace Rails: With holes to receive 3/8 inch bolts for securing to rail end bands.
- F. Tension Bands and Bands for Securing Rail Ends: Mild steel flats, at least 11 gage x one inch, tension bands in gates shall be 11 gage by 1 inch. Bolts for use with tension bands and rail end bands shall be galvanized machined 3/8 inch by 1 1/2-inch.
- G. Tension Bars: Mild steel flats at least 3/16 inch by 3/4 inch.

2.04 TENSION WIRE

- A. 6 gage marcelled steel wire conforming to ASTM A824, Type II Class 5 zinc coated, 2.00 ounces minimum per square foot of uncoated wire surface. Wavy type wire is not acceptable.

- B. ASTM F1664. Color shall match fabric and shall be in compliance with ASTM F934.
- C. Turnbuckles for installation with Tension Wires: Eye and hook type, drop forged steel, right and left hand threads, at least 3/8 inch screw diameter with at least 4 1/2-inches of take-up.

2.05 PAINT FOR GALVANIZING REPAIR

- A. Coatings for Refurbishing Galvanizing: Organic zinc-rich paint conforming to ASTM A780 or Carbomastic 15 by Carboline, or equal. Paints and coatings used on the site shall be approved by OWNER's Office of Environmental Health and Safety (OEHS).

2.07 PRIVACY FENCE SLATS

- A. Flat tubular shape with bottom lock track fabricated of PVC material with UV inhibitors.
- B. Privacy Percentage Factor: [95%]

2.08 CONCRETE AND GROUT

- A. Comply with requirements of Section 03 3000, Cast-in-Place Concrete. Provide normal-weight, air-entrained concrete with a minimum 28-day compressive strength of 3,000 psi, 4-inch slump, and one inch maximum size aggregate.
- B. Nonshrink, Nonmetallic Grout: Factory-packaged, non-staining, noncorrosive, nongaseous grout complying with ASTM C1107. Provide grout specifically recommended by manufacturer for interior and exterior applications "Rapid set Cement".

2.09 FABRICATION

- A. Items to be shop fabricated shall be preassembled to greatest extent possible. Use connections that maintain structural value of joined pieces. Mark units for reassembly and installation.
- B. Cut, drill, and punch metals cleanly and accurately. Remove sharp and rough areas on exposed surfaces. Form exposed work with accurate angles and surfaces and straight edges. Form exposed connections with hairline joints, flush and smooth.
- C. Weld connections unless otherwise indicated. Weld corners and seams continuously and in accordance with requirements of AWS D1.1 Structural Welding Code. Welds shall be inspected. Grind exposed welds smooth and flush to match and blend with adjoining surfaces.
- D. Galvanize fabrications in accordance with ASTM A123 and ASTM A153.

PART 3 - EXECUTION

3.01 EARTHWORK

- A. Refer to the following Sections for earthwork related work:
1. Section 31 2200 - Grading.
 2. Section 31 2300 - Earthwork.

3.02 FRAMEWORK INSTALLATION

- A. Install fences as indicated on Drawings.
- B. Space fence posts at equal intervals between terminal, angle, corner, and gate posts, and not more than 10 feet apart measured from center to center of posts. In curved fence sections having a radius of 50 feet or less, space posts not more than 5 feet - 6 inches apart. Install posts so that top of eye of post caps are level with top of fabric.
- C. Install angle or corner posts at each change in direction of 15 degrees or more, at change of 5 percent or more in grade of fencing, and at the beginning and end of curved fence sections.
- D. Install terminal posts at ends of runs of fencing.
- E. Embed posts into footing 6 inches less than the depth of the footing unless noted otherwise on drawings.
- F. Where a fence is to be installed on a curb, construct footings with top of footing level with the lower finish grade. Align posts, set plumb and true before placing footings. Remove splattered concrete from exposed pipe surfaces while concrete is still soft. In bituminous surfaced areas, install seal coat on top of concrete footings.
- G. Install fences with top rail. Top rail shall pass through eye tops and be secured at ends with rail-end fittings and bands.
- H. Install bottom tension wire a minimum of 3 inches from grade for fencing and secure to fence posts with ties. Provide a turnbuckle for each 150 feet of wire or fractional part thereof. Turnbuckles are not required in runs of 15 feet or less. Install ends of tension wires to posts in a manner to prevent slipping or loss of tension. Wrap should start from fence side of post. Turn end of wire around post tightly twisted at least three times around wire. At turnbuckles, wire through eye and tightly twist end at least three times around wire. Cut tail of bottom wire flush.

3.03 CHAIN LINK FABRIC INSTALLATION

- A. Install fence fabric on outward facing side of posts, except for tennis courts. Install fence fabric with top edge projecting above top rail of fence.
- B. Install bottom of fence fabric to clear finish grades, except on bituminous surface install 3/4 inch above such surface. Locally shape and trench ground surfaces where necessary to provide uniform top and bottom alignment of fence.
- C. Tightly stretch fabric and at terminal, pull corner, angle, and gateposts, secure with tension bars extending full height of fence. Secure tension bars to posts with bolted tension bands spaced not more than 14 inches apart.
- D. Bands and Ties: Install bands and ties in accordance with following schedule:

11 bands on 12 feet fence	12 ties on 12 feet fence
7 bands on 8 feet fence	7 ties on 8 feet fence
6 bands on 6 feet fence	6 ties on 6 feet fence
- E. Fasten fabric to line posts with wire ties spaced not more than 16 inches apart. Where 6 gage aluminum ties are furnished, hook the tie at both ends. Installation of hooked ties with links is not permitted.
- F. Fasten fabric to top rails, mid-rails, brace rails, with wire ties spaced not more than 18 inches apart. Bend back ends of tie wires so as not to be a hazard. At bottom tension wire, install hog rings spaced not more than 18 inches apart. Where 2 fabrics are furnished, lap the fabrics one mesh at mid-rail and tie both fabrics with 9 gage wire or 6 gage aluminum ties to midrails.

3.04 WELD GRINDING

- A. Grind field welds smooth, clean off flux and spatter, damaged galvanizing removed, burrs and projections ground off, properly prepared, then heavily coated with galvanizing repair coating. Install coating in accordance with written recommendations of manufacturer.

3.06 INSTALLATION ON TOP OF CONCRETE WALLS

- A. Posts for fences on top of new concrete or concrete masonry walls shall be installed in 24 gage galvanized iron inserts one inch larger than the outside post diameter. Wall thickness for such installation shall be 8 inches minimum. Depth of embedment of post shall not be less than 15 inches for fence height not exceeding 4 feet. Install post plumb, true, and fill joint space with non-shrink grout, finished flush with top of wall. Remove excess grout and clean posts.
- B. Do not install footings on existing walls without the review of the ARCHITECT.

3.07 HORIZONTAL APPLICATIONS

- A. Spacing of lid joist framing members shall not exceed four feet on center. Joists shall be welded on both ends to supporting chain link framing structure or mechanically fastened to adjacent buildings, as indicated on the drawings.

3.08 ALTERATIONS TO EXISTING FENCING

A. Resetting Fences:

1. Existing fences shall be reset where finish pavement is raised or lowered more than 6 inches from existing grade. Remove and reinstall entire fence assembly as specified in this Section.
 - a. Where the finish grade is raised 6 inches or less, cut and re-knuckle the existing fence fabric. Adjust tension wire and tie to fabric. Bottom of fence fabric shall be installed $\frac{3}{4}$ " above finish grade.
 - b. Where the finish pavement is lowered 6 inches or less, demolish the fence footing flush with the finish grade and adjust the fabric and its attachments. Bottom of fence fabric shall be installed $\frac{3}{4}$ inches above finish grade.
2. Where existing fencing posts are indicated to be removed, reset or relocated, remove posts including their concrete footings
 - a. Fill footing cavity with sand, compact and cap surface matching existing adjacent material.
 - b. Construct new concrete footings, as specified, in their designated location and set posts as indicated above in Framework Installation Article.
3. Bent posts, rails and accessories shall be replaced with new parts as specified to complete reinstallation. New materials shall closely match design of existing installation. Cut bent portion of posts and weld new sections of equal diameter and thickness. Install splice to inside of all welded section prior to welding. Previously repaired or welded posts shall be replaced.
4. Top rail is required in reinstalled fencing which does not have top rail in its existing condition. Install as specified for new installations.
5. Fabric Removal: Do not remove more than what can be replaced during one day unless a barricade, providing equal security, will be installed in its place. If freestanding temporary fence is used, it shall be clamped and wrap tied.

6. Remove and dispose of off-site concrete debris, chain link, hardware and accessories. Use new hardware and accessories.
- B. Painting: Disassemble existing fence and all attachment hardware (bands, pipe, and wire) prior to preparation of posts for painting. Replace attachment hardware with new.
1. Preparation: Prepare exposed steel posts, rails and accessories thoroughly cleaned of rust, oil and foreign materials. Painted galvanized metal shall be stripped to bare metal before applying prime coat.
 2. Priming: Spot prime areas from which the original surface coating had been removed with a metal primer to match adjoining surfaces. Subsequently, install a prime coat to the entire surface to be painted.
 3. First Coat: Install first coat as recommended by the paint manufacturer. Furnish a color that is 10 percent to 15 percent lighter or darker than the finish coat.
 4. Second or Finish Coat: Install finish coat after the first coat has cured.
 5. Install paint in accordance with manufacturer's written recommendations.
 6. Protect adjacent structures, walls, concrete or asphalt from paint.

3.10 COMPLETION

- A. Completed fencing shall form continuous units between points indicated with required parts, accessories, and fittings provided and installed. Clean exposed metal surfaces of cement, grout and other foreign substances.
- B. Fill in holes left by removal of existing fence footings, except in areas where grading Work is indicated or specified, to existing grade with clean earth thoroughly compacted to at least same density as adjoining soil.

3.11 PROTECTION

- A. Protect the Work of this section until Substantial Completion.

3.12 CLEANUP

- A. Remove rubbish, debris and waste materials and legally dispose of off the Project site.

END OF SECTION

SECTION 32 80 00 PLANTING IRRIGATION

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, shall apply to all work in this Section with the same force and effect as though repeated in full herein.

1.02 SUMMARY

- A. Furnish all materials, labor, transportation, services, and equipment necessary to install landscape irrigation as shown on the Drawings and as specified herein. Restore any existing landscaping disturbed during the installation.
1. Work included in this Section:
 - a. Layout.
 - b. Trenching.
 - c. Backfilling.
 - d. Assemblage.
 - e. Wiring.
 - f. System Flushing.
 - g. Sprinkler Head Installation.
 - h. Valve Installation.
 - i. System Testing and Adjustment.
 - j. Maintenance.
- B. Work related in other Sections:
1. Division 1 Section "Sustainable Design Requirements" for additional LEED requirements.
 2. Section 32 84 00 – Planting Irrigation - Drip Systems.
 3. Section 32 90 00 - Planting.
 5. Section 32 01 90 – Operations and Maintenance of Planting.

1.03 REQUIREMENTS OF REGULATORY AGENCIES

- A. All local, municipal and state laws and rules and regulations governing or relating to any portion of this work are hereby incorporated into and made a part of this Specification, and its provisions shall be carried out by the Contractor. Anything contained in this Specification shall not be construed to conflict with any of the above rules and regulations or requirements of the same. However, when the Drawings and Specifications call for or describe materials, workmanship, or construction of a better quality, higher standard, or

larger size than is required by the above rules and regulations, the provisions of the Drawings and Specifications shall take precedence.

1.04 QUALITY CONTROL

A. Manufacturer's Directions

1. The Manufacturer's directions and drawings shall be followed in all cases where the manufacturers of articles used in this Specification, furnish directions covering points not shown in the Drawings and Specifications.

B. Permits, Fees, Bonds and Inspections

1. The Contractor shall pay for any and all permits, fees, bonds and inspections necessary to perform and complete his portion of the Work.

C. Explanation of the Drawings

1. Due to the scale of the Drawings, it is not possible to indicate all offsets, fittings, sleeves, etc. which may be required. The Contractor shall carefully investigate the structural and finished conditions affecting all of his work and plan his work accordingly, furnishing such fittings, etc. as may be required to meet such conditions. The Drawings are diagrammatic only and are indicative of the work to be installed. The Work shall be installed in such a manner as to avoid conflicts between irrigation systems, planting, and architectural features.
2. All work called for on the Drawings by notes or details shall be furnished and installed whether or not specifically mentioned in this Specification.
3. The Contractor shall not willfully install the irrigation system as shown on the Drawings when it is obvious in the field that obstructions, grade differences or discrepancies in area dimensions exist that might not have been considered in engineering. Such obstructions or differences should be brought to the attention of the Owner's Authorized Representative. In the event this notification is not performed, the Contractor shall assume full responsibility for any revisions necessary.

1.05 SUBMITTALS

A. Materials List

1. The Contractor shall furnish the articles, equipment, materials, or processes specified by name in the Drawings and Specifications. No substitution will be allowed without prior written approval by the Owner's Authorized Representative.
2. Complete material list shall be submitted prior to performing any work. Material list shall include the manufacturer, model number and description of all materials and equipment to be used. Although manufacturer and other information may be different, the following is a guide to proper submittal format:

Item No.	Description	Manufacturer	Model No.
1.	Gate Valve	Nibco	T-113
2.	Etc.	Etc.	Etc.

- The irrigation submittal list must be specific and complete. All items must be listed and should include solvent/primer, wire, wire connectors, valve boxes, etc. No copies of manufacturer's literature (catalog cuts) are required as submittal information.
3. The Contractor may submit substitutions for equipment and materials listed on the Drawings by following procedures as outlined in Section 1.8 of this Specification.
 4. Equipment or materials installed or furnished without prior approval of the Owner's Authorized Representative may be rejected and the Contractor required to remove such materials from the site at no cost to the Owner.
 5. Approval of any item, alternate or substitute indicates only that the product or products apparently meet the requirements of the Drawings and Specifications on the basis of the information or samples submitted.
 6. Manufacturer's warranties shall not relieve the Contractor of his liability under the Guarantee. Such warranties shall only supplement the Guarantee.
- B. Record Drawings or "As-Built"
1. The Contractor shall provide and keep up to date at all times, a complete record set "as-builts" of prints which shall be corrected daily and show every change from the original Drawings and Specifications and the exact installed locations, sizes, and kinds of equipment. Prints for these purposes may be obtained from the Owner's Authorized Representative at the Contractor's cost. "As-builts" shall be kept on the site and shall be used only as a record set.
 2. "As-builts" shall also serve as work progress sheets and shall be the basis for measurement and payment for work completed. "As-builts" shall be available at all times for observation and shall be kept in a location easily accessible to the Owner's Authorized Representative. Should the "as-built" progress sheets not be available for review or not current at the time of any site visit by the Owner's Authorized Representative, it will be assumed no work has been completed and the Contractor will be assessed the cost of that site visit at the current billing rate of the Owner's Authorized Representative. No other site observations shall take place without prior payment of this assessment.
 3. The Contractor shall make neat and legible notations on the "as-built" progress sheets daily as the work proceeds, showing the work as actually installed. For example, should a piece of equipment be installed in a location that does not match the Drawings, the Contractor must indicate that equipment has been relocated in a graphic manner so as to match the original symbols as indicated in the irrigation legend. The relocated equipment and dimensions will then be transferred to the original "as-builts" at the proper time.
 4. Record Prints: Record accurately one set of prints of all changes in the Work constituting departures from the original Contract Drawings, including changes in pressure and non-pressure line locations.
 - a. Record the changes and dimensions in legible and manner to the satisfaction of Metro or its designee. Before final inspection of Work, submit record prints to Metro or its designee for review and acceptance.
 - b. As-Built shall be computer generated (AutoCad). Drawings shall be 30-

- inch by 42-inch minimum size.
- c. Dimension from two permanent points of reference (platforms, monuments, sidewalks, curbs, pavements). Record data shown on record prints day-to-day as the Project is being installed.
 - d. Show locations, depths and size, as applicable, of the following items:
 - Point of connection including hydrometer.
 - Routing of sprinkler pressure lines and non-pressure lines (dimension maximum 100 feet along routing).
 - Connection to existing electrical power.
 - Gate valves.
 - Routing of sprinkler pressure lines.
 - Sprinkler control valves.
 - Routing of control wiring.
 - Quick coupling valves.
 - Backflow preventer.
 - Other related equipment.
 - e. Maintain record prints onsite.
 - f. Before the date of the Final Walkthrough, the Contractor shall transfer all information from the "as-built" prints to CAD plans procured from the Owner's Authorized Representative at the Contractor's cost. The original digital PDF and CAD "as-builts" shall be submitted to the Owner's Authorized Representative for approval prior to the making of the irrigation controller charts.
6. On or before the date of the Final Walkthrough, the Contractor shall deliver the corrected and completed sepia mylar "as-builts" to the Owner's Authorized Representative. Delivery of the sepia "as-builts" will not relieve the Contractor of the responsibility of furnishing required information that may be omitted from the "as-builts".
- C. Irrigation Controller Charts
1. "As-built" drawings shall be approved by the Owner's Authorized Representative before irrigation controller charts are prepared.
 2. Provide one irrigation controller chart for each irrigation controller supplied.
 3. Each irrigation controller chart shall show the area controlled by that irrigation controller and shall be the maximum size of which the irrigation controller door will allow.
 4. The irrigation controller chart is to be a reduced drawing of the actual installed irrigation system. In the event that the irrigation controller chart is not legible when the chart is reduced, it may be enlarged to a size that will be readable when reduced.

5. The irrigation controller chart shall be a 11" x 17" Xerox bond reduction with each valve station represented by a different color.
 6. When completed, hermetically seal the irrigation controller chart between two pieces of 3 mil plastic with a 1/8" edge overlap.
 7. Irrigation controller charts shall be completed and approved by the Owner's Authorized Representative prior to the Final Walk-through.
- D. Proof of Backflow Registration:
1. CONTRACTOR to provide proof of registration with the jurisdictional authority.
 2. Backflow test results shall be acceptable to the jurisdictional authority.
- E. Operation and Maintenance Manuals
1. Prepare and deliver to the Owner's Authorized Representative within 10 calendar days prior to completion of irrigation installation, four (4) - 3 ring hard cover binders each containing the following information:
 - a. Index sheets stating the Contractor's address and telephone number and a list of equipment with the name and addresses of local manufacturer's representatives.
 - b. Catalog and part sheets on every material and equipment installed under this Contract.
 - c. Guarantee statement.
 - d. Complete operating and maintenance instruction on all major equipment.
 2. In addition to the above mentioned maintenance manual, provide the Owner with on-site instructions for major equipment and show evidence in writing to the Owner's Authorized Representative at the conclusion of the Project that this service was rendered.
- F. Equipment to be Furnished
1. Supply as a part of this Contract the following tools:
 - a. Two (2) sets of special tools required for removing, disassembling and adjusting each type of sprinkler and valve supplied on the Project.
 - b. Two (2) five-foot valve keys for operation of gate valves.
 - c. Two (2) keys for each automatic controller and irrigation controller enclosure.
 - d. One (1) quick coupler key and matching hose swivel for every five (5), or fraction thereof, of each type of quick coupling valve installed.
 - e. Quantity of units equal to 10 percent of amount of each type of sprinklers installed.
 2. The above mentioned equipment shall be turned over to the Owner at the conclusion of the Project. Before the Final Walk-through shall be performed, evidence that the Owner has received this material must be shown to the Owner's Authorized Representative.

1.06 PRODUCT DELIVERY, STORAGE AND HANDLING

A. Handling of PVC Pipe and Fittings

1. The Contractor is cautioned to exercise care in handling, loading, unloading, and storing of PVC pipe and fittings. All PVC pipe shall be transported in a vehicle which allows the length of pipe to lie flat so as not to subject it to undue bending or concentrated external load at any point. Any section of pipe that has been dented or damaged will be discarded and, if installed, shall be replaced with new piping at no cost to the Owner.

1.07 SUBSTITUTIONS

A. If the Contractor wishes to substitute any equipment or materials for those equipment or materials listed on the Drawings and Specifications, he may do so by providing the following information to the Owner's Authorized Representative for approval:

1. Provide a statement indicating the reason for making the substitution. Use a separate sheet of paper for each item to be substituted.
2. Provide descriptive catalog literature, performance charts and flow charts for each item to be substituted.
3. Provide the amount of cost savings if the substituted item is approved.

B. The Owner's Authorized Representative shall have the sole responsibility in accepting or rejecting any substituted item as an approved equivalent to those equipment and materials listed on the Drawings and Specifications.

1.08 PRIOR TO START OF THE LANDSCAPE MAINTENANCE PERIOD

A. The Contractor shall submit proof of warranty to the Owner's Authorized Representative prior to the start of the landscape maintenance period. All computerized irrigation control system materials except interconnect conductors shall have a five-year warranty. It is the Contractor's responsibility to obtain the necessary warranty inspections from the equipment supplier. No installations will be accepted without proof of warranty.

1.09 GUARANTEE

A. The Guarantee for the irrigation system shall be made in accordance with the Guarantee for Sprinkler Irrigation System form.

B. A copy of the Guarantee form shall be included in the Operations and Maintenance Manual.

C. The Guarantee form shall be re-typed onto the Contractor's letterhead and contain the following information:

1.10 GUARANTEE FOR SPRINKLER IRRIGATION SYSTEM

- A. We hereby guarantee that the sprinkler irrigation system we have furnished and installed is free from defects in materials and workmanship, and the work has been completed in accordance with the Drawings and Specifications, ordinary wear and tear and unusual abuse, or neglect excepted. We agree to repair or replace any defects in material or workmanship which may develop during the period of one year from date of final acceptance and also to repair or replace any damage resulting from the repairing or replacing of such defects at no additional cost to the Owner. We shall make such repairs or replacements within a reasonable time, as determined by the Owner, after receipt of written notice. In the event of our failure to make such repairs or replacements within a reasonable time after receipt of written notice from the Owner, we authorize the Owner to proceed to have said repairs or replacements made at our expense and we will pay the costs and charges therefore upon demand.

PROJECT:

LOCATION:

SIGNED:

ADDRESS:

PHONE:

DATE OF ACCEPTANCE:

1.11 RULES AND REGULATIONS

- A. Work and materials shall be in accordance with the latest edition of the National Electric Code, the Uniform Plumbing Code as published by the Western Plumbing Officials Association, and applicable laws and regulations of the governing authorities.

1.12 PROTECTION OF WORK AND MATERIALS

- A. The Contractor shall protect his work and work of others for the duration of the Contract. He shall protect pipes and fittings from direct sunlight, and avoid undue bending and any concentrated external loading. Pipe or fittings that have been damaged shall not be used.
- B. The Contractor shall exercise extreme care in excavating and working near existing utilities. Damage to utilities which are caused by contractor's operation shall be the Contractor's responsibility.
- C. The Contractor shall take necessary precautions to protect site conditions and plant material that is to remain. Should damage be incurred, Contractor shall repair damage to its original condition or furnish and install equal replacements.

- D. All existing irrigation systems shall be kept in operation at all times. If the existing system is damaged by Contractor, he shall be responsible for immediate repair of such damage. After each repair, all heads of the repaired system shall be removed so that the lines can be cleared of all dirt and foreign matter.

1.13 CORRECTION OF WORK

- A. Unsatisfactory work and discrepancies between installed work and the drawings shall be corrected by the Contractor at no additional expense to the Owner. The correction of work shall be finished with a reasonable period mutually agreed upon between the Owner and Contractor.

PART 2 - PRODUCTS

2.01 GENERAL

- A. Use only new materials of brands and types noted on the Drawings or Specifications or Owner-approved equipment.

2.02 PVC PRESSURE MAIN LINE PIPE AND FITTINGS

- A. Pressure main line piping for sizes 2" and larger, shall be PVC Class 315.
- B. Class 315 pipe shall be made from an NSF approved Type I, Grade I, PVC compound conforming to ASTM compound specification D1784. All pipe must meet requirements as set forth in ASTM D2241 (Solvent-weld Class Pipe), with an appropriate standard dimension (S.D.R.).
- C. Pressure main line piping for sizes 1-1/2" and smaller shall be PVC Schedule 40 with solvent welded joints.
- D. Schedule 40 pipe shall be made from NSF approved Type I, Grade I PVC compound conforming to ASTM compound specification D1784. All pipe must meet requirements as set forth in ASTM D1785 (Solvent-weld Schedule Pipe).
- E. PVC solvent-weld fittings shall be Schedule 40, 1-2, II-I NSF approved conforming to ASTM test procedure D2466.
- F. Solvent cement and primer for PVC solvent-weld pipe and fittings shall be of type and installation methods prescribed by the manufacturer.

- G. All PVC pipe must bear the following markings:
 - 1. Manufacturer's name.
 - 2. Nominal pipe size.
 - 3. Schedule or class.
 - 4. Pressure rating in PSI.
 - 5. NSF (National Sanitation Foundation) approval.
 - 6. Date of extrusion.

- H. All fittings shall bear the manufacturer's name or trademark, material designation, size, applicable IPS schedule and NSF seal of approval.

2.03 PVC NON-PRESSURE LATERAL LINE PIPING

- A. Non-pressure buried lateral line piping shall be PVC class 40 with solvent-welded joints.

- B. Non-pressure lateral line piping installed under paved areas shall be installed in a PVC Schedule 40 sleeve.

- C. Pipe shall be made from NSF approved, Type I, Grade II PVC compound conforming to ASTM compound specification D1784. All pipe must meet requirements set forth in ASTM D2241 (Solvent-weld Class Pipe) with an appropriate standard dimension ratio.

- D. Except as noted in paragraphs A, B, C and D of Section 2.2, all requirements for non-pressure lateral line pipe and fittings shall be the same as for solvent-weld pressure main line pipe and fittings as set forth in this Specification.

2.04 BRASS PIPE AND FITTINGS

- A. Where indicated on the Drawings, use red brass screwed pipe conforming to Federal Specification #WW-P-351.

- B. Fittings shall be red brass conforming to Federal Specification #WW-P-460.

2.05 GALVANIZED PIPE FITTINGS

- A. Where indicated on the Drawings, use galvanized steel pipe ASA Schedule 40 mild steel screwed pipe.

- B. Fittings shall be medium galvanized screwed beaded malleable iron, or Class 150 flanged steel with Corten bolts where required. Galvanized couplings may be merchant coupling.

- C. All galvanized pipe and fittings installed below grade shall be painted with two (2) coats of bitumastic. Or cover pipe with 2 layers of plastic, self-adhesive, pipe wrap, 2 mils thick.

- D. Use non-hardening, nontoxic pipe joint sealant formulated for use on water-carrying pipes on all metal threaded connections.

2.06 GATE VALVES

- A. Gate valves 3" and smaller shall be 125 psi SWP stainless steel ball gate valve with blow-out proof and full port.
- B. Gate valves 3" and smaller shall have threaded ends and shall be equipped with a bronze handle.
- C. All gate valves shall be installed per irrigation installation details.

2.07 QUICK COUPLING VALVES

- A. Quick coupling valves shall have a brass two-piece body designed for a working pressure of 150 PSI, operable with quick coupler. Key size and type shall be as indicated on the Drawings.

2.08 CHECK VALVES

- A. Swing check valves 2" and smaller shall be 200 psi WOG bronze construction with replaceable composition, neoprene or rubber disc and shall meet or exceed Federal Specification WW-V- 51D, Class A, Type IV.
- B. Check valves shall be of heavy duty virgin PVC construction with FIP threaded inlets and outlets. Internal parts shall be stainless steel and neoprene. Check valves shall be field adjustable against draw-out from 5 to 40 feet of head.

2.09 CONTROL WIRE

- A. Connections between the automatic controllers and the electric control valves shall be made with direct burial copper wire AWG-U.F. 600 volt. Pilot wires shall be a different color wire for each automatic controller. Common wires shall be #12 gauge and the color white with a different color stripe for each automatic controller. Install wires in accordance with valve manufacturer's specifications and wire charts. In no case shall wire size be less than #14 gauge. Wire color shall be continuous over its entire length.
- B. Wiring shall occupy the same trench and shall be installed along the same route as pressure supply or lateral lines wherever possible.
- C. Where more than one (1) wire is placed in a trench, the wiring shall be taped together at intervals of 10 feet.
- D. An expansion curl shall be provided within three (3) feet of each wire connection. Expansion curl shall be of sufficient length at each splice connection at each electric control, so that in case of repair, the valve bonnet may be brought to the surface without disconnecting the

control wires. Control wires shall be laid loosely in the trench without stress or stretching of the control wire conductors.

- E. All splices shall be made with either Scotch-Lok #3576 Connector Sealing Packs or Rain Bird Snap-Tite wire connector, or approved equivalent. Use one splice per connector sealing pack.
- F. Field wire splices between the automatic controller and the electrical control valves shall not be allowed without prior approval of the Owner's Authorized Representative.
- G. When control wiring is trenched separately from mainline trenches a continuous warning tape shall be installed with the wiring. Warning tape: Inert plastic film highly resistant to alkalis, acids, or other destructive chemical components likely to be encountered in soils. Three inches wide, colored yellow, and imprinted with "CAUTION: BURIED ELECTRIC LINE BELOW."
- H. Provide a 36-inch excess length of wire in an 8-inch diameter loop at each 90 degree change of direction, at both ends of sleeves, and at 100-foot intervals along continuous runs of wiring. Do not tie wiring loop.
- I. Install common ground wire and one control wire for each remote control valve. Multiple valves on a single control wire are not permitted. Install one common wire for each controller. Multiple controllers with one common wire will not be permitted.

2.10 AUTOMATIC IRRIGATION CONTROLLERS

- A. Existing automatic irrigation controllers shall be utilized for new irrigation systems and to be re-established for existing landscape areas currently irrigated by the controller and proposed to remain.
- B. Final location of automatic irrigation controllers shall be approved by the Owner's Authorized Representative.
- C. Unless otherwise noted on the Drawings, the 120-volt electrical power to the automatic irrigation controller shall be furnished by others. The final electrical hook-up shall be the responsibility of the Contractor.
- D. The automatic irrigation controller shall be included as a part of the Irrigation Controller Enclosure Assembly.

2.11 ELECTRICAL CONTROL VALVES

- A. All electric control valves shall be the same manufacturer as the automatic controllers unless noted otherwise on the Drawings.
- B. All electric control valves shall have a manual flow adjustment.

- C. Provide and install one (1) control valve box for each electric control valve.

2.12 VALVE BOXES

- A. Use a 10" diameter x 10-1/4" round valve box for gate valves, control wire splices and quick coupling valves as manufactured by Carson-Brooks Plastics, model #910-13B with green bolt-down cover (or approved equivalent). Extension sleeves shall be 6" minimum PVC piping material.
- B. Use a 11 3/4" wide x 17" long x 12" deep rectangular valve box for electrical control valves, master valves, and control wire pull boxes, as manufactured by Carson-Brooks Plastics, model #1419-12-3B with a green bolt-down cover (or approved equivalent).
- C. Valve boxes shall be a minimum of one (1) foot apart when arranged in a group or side by side, or unless noted otherwise in the Drawings.

2.13 SPRINKLER HEADS

- A. All sprinkler heads shall be of the same size, type, and deliver the same rate of precipitation with the diameter (or radius) of throw, pressure, and discharge as shown on the Drawings and in this Specification.
- B. Spray heads shall have a screw adjustment.
- C. Riser units shall be fabricated in accordance with the Drawings.
- D. Riser nipples for all sprinkler heads shall be the same size as the riser opening in the sprinkler body.
- E. All sprinkler heads of the same type shall be from the same manufacturer.

2.14 IDENTIFICATION TAGS

- A. Identification tags for electrical control valves, and other equipment assemblies as designated on Drawings, shall be manufactured from Polyurethane Behr Desopan. Use standard tag hot stamped with black letters on yellow background. The tags shall be numbered to match station identification as indicated on Drawings. Provide one (1) tag for each electric control valve. Tags shall be acceptable to the City of Goleta and the Goleta Valley Water District.

2.15 IRRIGATION CONTROLLER ENCLOSURE ASSEMBLY

- A. Located within electrical room.

2.16 SLEEVING

- A. Install separate sleeve beneath paved areas to route each run of irrigation pipe or wiring bundle.
- B. Sleeving material beneath pedestrian pavements - PVC Schedule 40 pipe with solvent welded joints.
- C. Sleeving beneath streets and drives - PVC Schedule 40 pipe with solvent welded joints.
- D. Sleeving diameter - equal to twice that of the pipe or wiring bundle. Minimum sleeving diameter shall be 2 inches.
- E. Marking stakes - 2" x 2" x 24" wood stakes.

2.17 OTHER COMPONENTS

- A. Tools and Spare Parts
 - 1. Provide operating keys, servicing tools, test equipment, other items, and spare parts as indicated in other areas of this Specification.
- B. Other Materials
 - 1. Provide other materials or equipment not indicated on the Drawings or referenced in this Specification, as necessary, to complete the installation of the irrigation system.

2.18 MANUFACTURERS

- A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
- B. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - 1. Cast Iron, Gate Valves for Underground Installation:
 - a. American AVK Co.
 - b. American Cast Iron Pipe Co.; American Flow control Div.
 - c. Griswold.
 - 2. Cast-Iron, Gate Valves for Above-ground and Control-Valve Box Installation:
 - a. American AVK Co.
 - b. Nibco, Inc.
 - c. Or equal.
 - 3. Ball Gate Valves for Underground Installation:
 - a. Hammond
 - b. Fibco
 - c. Or equal.
 - 4. Bronze Valves for Above-Ground and Control-Valve Box Installation: Bronze Ball Valves: MSS SP-110, Class 150, 600 psig (4140-kPa) cold working pressure. Include

- bronze, two-piece construction body with regular port; chrome-plated brass ball; blowout-proof stem; PTFE seats and seals; threaded-end connections; and lever handle.
- a. American Valve, Inc.
 - b. Nibco, Inc.
 - c. Griswold.
5. PVC Valves for Above-ground and Control-Valve Box Installation:
- a. American Valve, Inc.
 - b. Nibco, Inc.
 - c. Rainbird Sprinkler Mfg. Corp.
6. Bronze, Automatic Control Valves:
- a. Rain Bird Sprinkler Mfg. Corp.
 - b. Toro Co. – Irrigation Division
 - c. L. R. Nelson
7. Plastic, Automatic Control Valves: PVC with 150-psig (1035-kPA) minimum pressure rating, ends compatible with piping, and tee handle.
- a. Rain Bird Sprinkler Mfg. Corp.
 - b. Toro Co. – Irrigation Division
 - c. L. R. Nelson.
8. Control Valve Boxes: PE, ABS, fiberglass, polymer concrete, or pre-cast concrete box and cover, with open bottom, openings for piping, and designed for installing flush with grade. Include size as required for valves and service.
- a. American Drainage Products, Inc.
 - b. AMETEK; Plymouth Products Div.
 - c. NDS, Inc.
9. Quick Couplers: Factory fabricated, bronze or brass, two-piece assembly, Include coupler water-seal valve; removable upper body with spring-loaded or weighted, rubber-covered cap; hose swivel with ASME B1.20.7, 3/4-11.5NH threads for garden hose on outlet; and operating key.
- a. Rain Bird Sprinkler Mfg. Corp.
 - b. Toro Co. – Irrigation Division
 - c. L. R. Nelson.
10. Sprinklers:
- a. Rain Bird Sprinkler Mfg. Corp.
 - b. Toro Co. – Irrigation Division
 - c. Hunter.
11. Water Regulators:
- a. Cal-Val Co.
 - b. FLOMATIC Corp.
 - c. Wilkins.
12. Emitter and Drip-Tube Specialties:
- a. Rain Master Sprinkler Mfg. Corp.
13. Miscellaneous Specialties:
- a. Rain Bird Sprinkler Mfg. Corp.
 - b. Toro Co. – Irrigation Division

- c. Hunters.
14. Backflow Preventer: Reduced Pressure Type:
 - a. FEBCO Division of CMB Industries
 - b. WATTS Industries, Inc.
 - c. Zurn Industries, Inc.
 - d. Cla-va Co.
15. Identification Tags:
 - a. Rain Bird Sprinkler Mft. Corp.
 - b. T. Christy Enterprise
 - c. Or equal.

PART 3 - EXECUTION

3.01 GENERAL

- A. All scaled dimensions are approximate. The Contractor shall check and verify all size dimensions and receive the Owner's Authorized Representative's approval prior to proceeding with any work under this Specification. Contractor shall locate with 2" x 2" wood stakes with identifying markings for all proposed locations of electrical control valve boxes, gate valve boxes and quick coupler boxes for approval by the Owner's Authorized Representative. After locating all these items contact the Owner's Authorized Representative for review and approval. Minor adjustments to the stake locations may be requested of the Contractor by the Owner's Authorized Representative at that time.
- B. Exercise extreme care in excavating and working near existing utilities. The Contractor shall be responsible for damages to these utilities which are caused by his operations. Check existing utility drawings for existing utility locations.
- C. Coordinate installation of sprinkler irrigation materials including pipe, so that there shall be no interference with utilities, construction elements, or the planting of trees, shrubs, and ground covers.
- D. The Contractor shall carefully check all finish grades to satisfy himself that he may safely proceed before starting work on the irrigation system.
- E. Report irregularities to Owner's Authorized Representative prior to beginning work. Beginning of work implies acceptance of existing conditions.

3.02 SITE PREPARATION

- A. Physical Layout
 1. Prior to installation, the Contractor shall stake out all pressure and non-pressure supply lines and the location of all sprinkler heads.

2. All layout shall be approved by the Owner's Authorized Representative prior to installation.
- B. Water Supply Point-of-Connections
1. Water supply points of connection are as indicated on the Drawings. The Contractor shall be responsible for minor changes caused by actual site conditions.
 2. The sprinkler irrigation system shall be connected to water supply points of connection as indicated on the Drawings.
- C. Electrical Supply Point-of-Connections
1. Electrical supply point-of-connections for the automatic irrigation controllers are as indicated on the Drawings. The Contractor shall be responsible for minor changes caused by actual site conditions.
 2. Connections shall be made at approximate locations as indicated on the Drawings. The Contractor shall be responsible for minor changes caused by actual site conditions.

3.03 INSTALLATION

- A. Trenching
1. Dig trenches straight and support pipe continuously on bottom of trench. Lay pipe to an even grade. Trenching excavation shall follow the layout as indicated on the Drawings.
 2. Provide a minimum soil cover of 18 inches for all pressure supply lines.
 3. Provide a minimum soil cover of 12 inches for all non- pressure lines.
 4. Provide a minimum soil cover of 18 inches for all control wire.
 5. Where piping is indicated under paved areas, but running parallel and adjacent to planting areas, install the piping in the planted areas. Irrigation head spacing as indicated on the Drawings shall not be exceeded.
- B. Backfilling
1. The trenches shall not be backfilled until all required tests are performed. Trenches shall be carefully backfilled with the excavated materials approved for backfilling, consisting of earth, loam, sandy clay, sand, or other approved materials, free from large clods of earth or stones. Backfill in planting areas shall be 85% compacted in layers. Backfill shall be mechanically compacted landscaped areas to a dry density equal to adjacent undisturbed soil in planting areas. Backfill shall conform to adjacent grades without dips, sunken areas, humps or other surface irregularities.
 2. A fine granular material backfill shall be initially placed over all lines. No foreign matter larger than one-half inch in size will be permitted in the initial backfill.
 3. If settlement occurs and subsequent adjustments in pipe, valves, sprinkler heads, planting, or other construction elements are necessary, the Contractor shall make all required adjustments without cost to the Owner.

C. Trenching and Backfilling Under Paving

1. Trenches located under areas where asphaltic concrete or concrete paving occur, shall be backfilled with sand (a layer six (6) inches below the pipe and three (3) inches above the pipe) and compacted in layers to 95% compaction, using manual or mechanical tamping devices. Trenches for piping shall be compacted to equal the compaction of the existing adjacent undisturbed soil and shall be left in a firm unyielding condition. All trenches shall be left flush with adjoining finish grade. The Contractor shall set in place, cap and pressure test all piping under paving prior to the paving work.
2. Generally piping under existing walks is done by jacking, boring or hydraulic driving, but where any cutting or breaking of concrete is necessary, it shall be done and replaced by the Contractor at no cost to the Owner. Permission to cut or break concrete shall be obtained from the Owner's Authorized Representative. No hydraulic driving will be permitted under concrete paving.
3. Provide a minimum soil cover of 18 inches between the top of the pipe and the bottom of the aggregate base for all pressure and non-pressure piping installed under asphaltic concrete paving.

D. Assemblies

1. Routing of irrigation lines as indicated on the Drawings is diagrammatic only. Install lines and various assemblies in such a manner as to conform with the Drawings.
2. Install no multiple assemblies in plastic lines. Provide each assembly with its own outlet.
3. Install all assemblies specified herein in accordance with their respective details. In absence of Drawings or Specifications pertaining to specific items required to complete this work, perform such work in accordance with best standard practice with prior approval of the Owner's Authorized Representative.
4. PVC pipe and fittings shall be thoroughly cleaned of dirt, dust and moisture before installation. Installation and solvent welding methods shall be as recommended by the pipe and fitting manufacturer.
5. On PVC to metal connections work the metal connections first. Teflon tape or approved equivalent, shall be used on all threaded PVC to PVC and threaded PVC to metal joints. Apply a light wrench pressure only. Where threaded PVC connections are required, use threaded PVC adapters into which the pipe may be solvent welded.

E. Assembling Pipe and Fittings:

1. Inspect all pipe and fittings before installation.
2. Keep pipe free from dirt and pipe scale. Cut pipe ends square and debur. Clean pipe ends of loose pipe shavings.
3. Keep ends of assembled pipe capped. Remove caps only when necessary to continue assembly.
4. Install pipe with all markings up for visual inspection and verification.
5. All lines shall have a minimum clearance of six (6) inches from each other and from lines of other trades. Parallel lines shall not be installed directly over one another.

6. Maintain 10-foot minimum horizontal separation from all potable water piping. Provide a minimum vertical clearance of six (6) inches.
 7. Use only strap-type friction wrenches for threaded plastic pipe.
 8. Snake pipe from side to side within the trench.
- F. Line Clearance
1. All lines shall have a minimum clearance of six (6) inches from each other and from lines of other trades. Parallel lines shall not be installed directly over one another.
- G. Irrigation Controller Installation
1. Install the irrigation controller per the manufacturer's instructions. Remote control valves shall be connected to the irrigation controller in numerical sequence as indicated on the Drawings.
- H. High Voltage Wiring for the Irrigation Controller
1. 120 volt power connection to the irrigation controller shall be provided by the Contractor.
- I. Electric Control Valve Installation
1. Install electric control valves as indicated on the Drawings. When grouped together, allow at least twelve inches between electric control valves. Install each electric control valve in a separate valve box. Each electric control valve number shall be heat-branded on valve box top with 2" tall letters.
 2. The Owner's Authorized Representative shall approve electric control valve and quick coupling valve box locations prior to final installation.
- J. Valve Box Installation
1. Install valve boxes as indicated on the Drawings. When grouped together, allow at least twelve inches between valve boxes.
 2. Heat brand valve box identification. All valve boxes to be clearly identifiable.
- K. System Flushing
1. After all pipe lines and risers are in place and connected and all necessary diversion work has been completed, and prior to installation of sprinkler heads, the control valves shall be opened and a full head of water used to flush out the system. Sprinkler heads shall be installed only after flushing of system has been performed.
- L. Sprinkler Head Installation
1. Install the sprinkler heads as indicated on the Drawings.
 2. Spacing of sprinkler heads shall not exceed the maximum spacing as indicated on the Drawings. In no case shall the spacing exceed the maximum recommended by the manufacturer.
 3. Install check valves on sprinkler heads that drain water after the control valve is turned off. "Low head" drainage will not be allowed on sprinkler heads.

- M. Sleeving
 - 1. Extend sleeve ends a minimum of 12 inches beyond the edge of the paved surface. Cover pipe ends and mark with stakes. Route wire through and tie at each end to stakes.

3.04 TEMPORARY REPAIRS

- A. The Owner reserves the right to make temporary repairs as necessary to keep the irrigation system in operating condition. The exercise of this right by the Owner shall not relieve the Contractor of his responsibilities under the terms of the Guarantee as herein specified.

3.05 INSTALLATION OF OTHER COMPONENTS

- A. Tools and Spare Parts
 - 1. Prior to the Pre-Maintenance Walk-through, supply the Owner operating keys, servicing tools, test equipment, and any other items as indicated on the Drawings.
- B. Other Materials
 - 1. Install other materials or equipment to be part of the irrigation system, as indicated on the Drawings, even though such items may not have been referenced in this Specification.

3.06 EXISTING TREES

- A. Where it is necessary to excavate adjacent to existing trees, the Contractor shall use all possible care to avoid injury to trees and their roots. Excavation in areas where two (2) inch and larger roots occur shall be done by hand. All roots two (2) inches and larger in diameter, except directly in the path of pipe or conduit, shall be tunneled under and shall be heavily wrapped with burlap, to prevent scarring or excessive drying. Where a ditching machine is run close to trees having roots smaller than two (2) inches in diameter, the wall of the trench adjacent to the tree shall be hand trimmed. Roots one (1) inch and larger in diameter shall be painted with two coats of an approved tree seal. Trenches adjacent to existing trees should be closed within 24 hours. Where this is not possible, the side of the trench adjacent to the existing tree shall be kept shaded with burlap or canvas.

3.07 FIELD QUALITY CONTROL

- A. Adjustment of the Irrigation System
 - 1. Flush and adjust all sprinkler heads for optimum performance and to reduce overspray onto walks, roadways, and buildings as much as possible.
 - 2. If it is determined that adjustments to the sprinkler heads will provide proper and more adequate coverage, the Contractor shall make such adjustments prior to any planting. Adjustments may also include changes in nozzle sizes and degrees of arc as required.

3. Lowering raised sprinkler heads by the Contractor shall be accomplished within 10 days after notification by the Owner's Authorized Representative.
4. All sprinkler heads shall be set perpendicular to finish grades unless otherwise indicated on the Drawings.

B. Irrigation System Testing

1. The Contractor shall request the presence of the Owner's Authorized Representative at least 48 hours in advance of irrigation system testing.
2. Test all pressure lines under hydrostatic pressure of 150 PSI for a period of two (2) hours.
Note: Testing of pressure mainline shall occur prior to installation of any electric control valves.
3. All piping (pressure and non-pressure) under paved areas shall be pressure tested under a hydrostatic pressure of 150 PSI for a period of two (2) hours.
4. If during the pressure test, a pressure drop occurs - indicating a leak, replace the faulty joints and repeat the pressure test until the entire system is proven watertight.
5. All hydrostatic tests shall be made only in the presence of the Owner's Authorized Representative. No pipe shall be backfilled until it has been observed, tested and approved in writing. Contractor shall maintain a test log and submit with record documents.
6. The Contractor is to furnish the necessary force pump and all other test equipment for the hydrostatic pressure test.
7. When the irrigation system passes the hydrostatic pressure test and is completed, perform a sprinkler coverage test in the presence of the Owner's Authorized Representative. Determine if the water coverage is complete and adequate. Furnish all materials and perform all work necessary to correct any inadequacies of water coverage due to deviations from the Drawings, or where the irrigation system has been willfully installed as indicated on the Drawings when it is obviously inadequate, without bringing this to the attention of the Owner's Authorized Representative. This test shall be accomplished before any groundcover is planted.
8. Upon completion of each phase of work, the entire system shall be coverage tested and adjusted to meet specific site requirements.

3.08 IRRIGATION SYSTEM MAINTENANCE

- A. The entire irrigation system shall be under full, automatic operation for a period of seven (7) days prior to beginning any planting. The Owner reserves the right to waive or shorten this operation period.

3.09 CLEAN UP

- A. Clean up shall be made as each portion of work progresses. Refuse and excess dirt shall be removed from the site, all walks and paving shall be broom swept or washed down, and any damage sustained to the work of other contractors shall be repaired to original conditions at no cost to the Owner.

- B. Upon completion of the Work, the Contractor shall smooth all ground surfaces. Remove excess materials such as rubbish, debris and sweep adjacent streets, curbs, gutters, walkways and trails. Remove construction equipment from the premises.

3.10 FINAL WALK-THROUGH PRIOR TO ACCEPTANCE

- A. The Contractor shall operate the irrigation system in its entirety for the Owner's Authorized Representative at time of the Final Walk through. Any items deemed not acceptable by the Owner's Authorized Representative shall be reworked to his complete satisfaction.
- B. The Contractor shall show evidence to the Owner's Authorized Representative that the Owner has received all accessories, charts, "As-built drawings", and equipment as required before the Final Walk through will be performed.

3.11 SITE VISIT OBSERVATION SCHEDULE

- A. The Contractor shall be responsible for notifying the Owner's Authorized Representative in advance of the following site visits:
 1. Pre-Job or "Kick-Off" meeting - 7 days.
 2. Pressure supply line installation and testing - 2 days.
 3. Automatic controller installation - 2 days.
 4. Control wire installation - 2 days.
 5. Lateral line and sprinkler head installation - 2 days.
 6. Sprinkler coverage test - 2 days.
 7. Final Walkthrough - 7 days.
- B. When site visits are conducted by other than the Owner's Authorized Representative, show evidence in writing of when and by whom these site visits were made.
- C. No site visits will commence without "As-builts". In the event the Contractor schedules a site visit without "As-builts" or without completing previously noted corrections, or without preparing the system for said visit, the Contractor will be responsible for reimbursing the Owner's Authorized Representative at his current billing rate per hour portal to portal (plus transportation costs) for this inconvenience. No further site visits will be performed by the Owner's Authorized Representative until this charge has been paid and received.

END OF SECTION

SECTION 32 84 01 PLANTING IRRIGATION - DRIP SYSTEMS

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, shall apply to all work in this Section with the same force and effect as though repeated in full herein.

1.02 SUMMARY

- A. Conditions within Irrigation System specification Section 32 80 00 shall apply to this section.
- B. This Section includes the installation of low volume irrigation components including Control Zone Kits, Landscape Dripline, Fittings and Emission Devices.

PART 2 - DRIP IRRIGATION PRODUCTS

2.01 CONTROL ZONE KITS

- A. General
 - 1. Control zone kit assemblies for drip irrigation zones must include a valve, filtration and pressure regulation to meet the flow requirements of the zone. Where necessary a check valve shall also be installed.
 - 2. Components shall be sized according to the hydraulic demands of the system.
- B. Basket Filter
 - 1. Commercial Control Zone Kit for zones with flows from 3.0 to 20.0 GPM
 - a. Control Zone Kit shall be a Commercial Control Zone Kit with 1" valve, Quick Check Basket Filter with 200-mesh (75 micron) screen and 40 psi Pressure Regulator.
 - b. The control zone kit shall have a 1" isolation ball valve.
 - c. The filter shall be a 1" inline Quick Check Basket Filter body constructed of heavy-duty, glass-filled, UV resistant polypropylene capable of withstanding pressures of not less than 150 psi (10,3 bars). The design shall be a basket style body with jar-top cap. The cap shall incorporate an indicator that goes from green to red during operation when the filter element needs cleaning. The dimensions for the filter shall not exceed the following: Height: 6 1/2" (16,5 cm), Length: 6 1/2" (16,5 cm), Width: 3 1/2" (8,9 cm). The filter element shall be constructed of a durable stainless steel mesh attached to a propylene

frame and shall be a standard 200-mesh (75 micron). The screen shall be serviceable for cleaning purposes by unscrewing the cap from the body and removing the filter element.

- d. The control zone kit shall have an inline pressure regulator. The pressure regulator shall be constructed of durable, UV resistant non-corrosive material able to accommodate an inlet pressure rating of not less than 150 psi (10,3 bar). The pressure regulating device is a normally open device that allows full flow with little pressure loss unless the inlet pressure is greater than the preset level. As the inlet pressure increases above the preset level it compresses a spring and begins to reduce the flow and downstream pressure. The inline pressure regulator shall have a preset outlet pressure of approximately 40 psi (2,8 bar).
- e. The control zone kit shall have a 1” series automatic irrigation control valve, or approved equivalent. The valve pressure rating not to be less than 150 psi (10,3 bars). The valve body and bonnet shall be constructed of high-impact, weather-resistant plastic, stainless steel and other chemical/UV resistant materials. The valve shall have a diaphragm constructed of a durable Buna-N rubber material reinforced with nylon.

2.02 LANDSCAPE DRIPLINE

A. Inline Emitter Tubing

1. Pressure-Compensating Landscape Dripline
 - a. The inline emitter shall be welded to the inner circumference of the polyethylene tubing. The inline emitter shall have dual outlet ports, 180° apart, ensuring only one port has contact with the ground when the tubing is installed at grade and mulched over.
 - b. ADI emitter (Advanced Drip Inline) shall pressure compensate by lengthening the emitter’s turbulent flow path. The emitter shall be cylindrical in shape and provide surface area for filtration throughout 360° of its outer circumference. This increased filtration surface area shall assure that the water that enters the inline emitter can always come from the upper half, or cleanest part of the flow path in the polyethylene tubing regardless of how the inline tubing lays on the ground.
 - c. Landscape Dripline tubing shall be brown in color and conform to an outside diameter (O.D.) of 0.630 inches (16 mm) and an inside diameter (I.D.) of 0.540 inches (13,7 mm) and wall thickness of 0.045 inches (1,1 mm).
 - d. Landscape Dripline shall have factory installed, pressure-compensating, inline emitters installed every [12] or [18] or [24] inches on center as indicated on drawings.
 - e. Landscape Dripline shall have factory installed, pressure-compensating, inline emitters with spacing as indicated on drawings.
 - f. The flow rate from each installed inline emitter shall be a consistent [0.6] or [0.9] gallons per hour when inlet pressure is between 8.5 and 60 psi (0,7 to 4,1 bars).

- g. Operating pressure range: 8.5 to 60 psi (0,7 to 4,1 bar).

2.03 FITTINGS

A. Compression Fittings

1. Easy Fit Compression Fittings:
 - a. The Easy Fit Compression Fitting System shall consist of 3 fittings (tee, coupling and elbow) plus 5 adapters and two removable flush caps.
 - b. The Easy Fit Compression Fittings shall accept all polyethylene tubing from .630" to .710" (16mm-18mm) OD and shall provide a leak-free compression fit. They also shall provide connections to threaded components when used with any of the 5 adapters. The fittings shall be molded from UV-resistant ABS material with a Buna-N rubber seal for long-term, leak free connections.
 - c. The adapters shall be made of UV-resistant ABS materials and shall only be used with Easy Fit Compression Fittings. The adapters shall be installed in the Easy Fit Compression Fittings and threaded onto ½" or ¾" Male- or Female-threaded components. Pressure loss for the Easy Fit Adapters is a maximum of .1 PSI for each adapter used.
 - d. The removable [black] or [purple] flush cap shall be used to close off a line. The purple flush cap shall be used to close off a line containing non-potable water.
 - e. The operating pressure range for the Easy Fit Compression Fitting System shall be 0 to 60 psi (0 to 4,1 bars).

END OF SECTION

SECTION 32 90 00

PLANTING

PART 1 – GENERAL

1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, shall apply to all work in this Section with the same force and effect as though repeated in full herein.

1.02 SUMMARY

- A. Furnish all materials, labor, transportation, services, and equipment necessary to install landscape planting as shown on the Drawings and as specified herein.
- B. Work included in this Section:
 - 1. Fine grading.
 - 2. Soil preparation.
 - 3. Pre-plant weed control.
 - 4. Tree, shrub and ground cover planting.
 - 5. Tree staking and guying.
 - 7. Mulching.
 - 9. Concrete mowstrip installation.
 - 10. Hydroseeding
 - 11. Clean-up.
- C. Work related in other Sections:
 - 1. Section 32 80 00 & Section 32 84 00 – Planting Irrigation & Planting Irrigation - Drip Systems.
 - 2. Section 32 01 90 – Operations and Maintenance of Planting

1.03 REQUIREMENTS OF REGULATORY AGENCIES

- A. All Federal, State, and local laws and regulations governing this work are hereby incorporated into and made part of this Section. When this Section calls for certain materials, workmanship or a level of construction that exceeds the level of Federal, State, or local requirements, the provisions of this Section shall take precedence.

1.04 REFERENCE STANDARDS

- A. All plant material shall be true to botanical and common name as indicated in "An Annotated Checklist of Woody Ornamental Plants of California, Oregon and

Washington", (Number 4091)" published by the University of California School of Agriculture - 1979.

- B. "American Standard for Nursery Stock" edition 1985 by The American National Standards Institute for plant materials.
- C. Hortus Third", 1976; Cornell University for plant nomenclature.
- D. All plant material shall conform to the California State Department of Agriculture's regulation for nursery inspections, rules and ratings.

1.05 QUALITY CONTROL

- A. Manufacturer's Directions - manufacturer's directions and drawings shall be followed in all cases where the manufacturers of articles used in this Specification furnish directions covering points not shown in the Drawings and Specifications.
- B. Permits, Fees, Bonds and Inspections - the Contractor shall pay for any and all permits, fees, bonds and inspections necessary to perform and complete his portion of the Work.
- C. Plant Source Quality - submit written documentation to the Owner's Authorized Representative within 25 days of Contract award that the plant material listed on the Drawings is available. Any substitutions required due to unavailability must be requested in writing prior to confirmation of ordering.
- D. Upon execution of the order, the Owner's Authorized Representative has the option of either inspecting the plant material at the source of growth, requesting representative color photos, or inspecting the material as it is being delivered to the site for conformity to the Drawings and Specifications. Such approvals shall not impair the right of additional inspections during further progress of the Work.
- E. Any tagging of plant material by the Owner's Authorized Representative does not constitute his approval of the plant materials' health and vigor. The health and vigor of the plant material is the sole responsibility of the Contractor.
- F. Submit written request to the Owner's Authorized Representative for inspection of the specified plant material, either at the place of growth or by color photographs. Requests for inspection shall state the place of growth and the quantity and variety of plant material.
- G. The Owner's Authorized Representative reserves the right to refuse inspection if in his judgment, a sufficient quantity of plant material at that time is not available for inspection.

H. Topsoil Inspection

1. Within 25 days of contract award, furnish source of topsoil to the Owner's Authorized Representative for purpose of soil inspection.
2. Take representative soil samples from areas identified in the Drawings.
3. Soil samples shall be tested for pH, alkalinity, total soluble salts, porosity, sodium content, organic matter and soil preparation recommendations.
 - i. Soil Fertility: Half-saturation percent, pH, salinity, nitrate, ammonium, phosphate, potassium, calcium, magnesium.
 - ii. Agricultural Suitability: pH, salinity, boron, Sodium Absorption Ratio (SAR) using saturation paste extract.
 - iii. Particle Size/Appraisal: pH, salinity, organic percent, USDA Particle size.
 - iv. Germination (bio-assay) test.
 - v. Tendency towards compaction.

I. Within 25 days of contract award, furnish source of topsoil to the Owner's Authorized Representative for purpose of soil inspection.

J. Take representative soil samples from areas identified in the Drawings.

K. The Soil Analysis Report shall include a statement that the laboratory has reviewed the planting plan and the planting specifications, and that its recommendations respond to the specific needs of the project.

L. Certificates: certify compliance with accepted soil mixes and amendments, including Rates of applications.

1.06 QUALIFICATIONS

A. The applicator of all weed control materials shall be licensed by the State of California as a Pest Control Operator and a Pest Control Advisor in addition to any subcontractor licenses that are required.

B. Landscape Contractor shall have a minimum 5-years experience installing plants for similar project types.

1.07 SUBMITTALS

A. The Contractor shall submit no later than 30 days after the award of Contract (2) bound booklets containing the following landscape information:

1. List of all proposed landscape materials indicated by description, manufacturer and model number. Include catalog cuts of all items.
 2. List of all trees indicated by botanical name, common name, quantity, size, nursery and location and any specific remarks, i.e. "unable to locate", "photo submitted", etc. The tree list is to be accompanied with color photographs of each tree type and size with specifications, i.e. height, spread and caliper. Include a person in each photograph for scale purposes.
 3. List of all shrubs, vines and ground covers indicated by botanical name, common name, size, nursery and location and specific remarks, i.e. "unable to locate", "photo submitted", etc.
 4. Soil amendment receipts containing analytical data and physical samples of all specified amendments.
 5. Receipts from the soil supplier of all soil mixes specified in this section.
- B. The Contractor shall submit no later than 30 days after the award of Contract the following physical samples sent to the Owner's Authorized Representative in plastic bags:
1. Shredded bark mulch.
 2. Certificates
 3. Compliance with State of California and federal quarantine restrictions.
- C. Weed, Insects & Pest Control
1. Prior to the installation of any weed control materials, the Pest Control Advisor shall submit to the Owner's Authorized Representative, a list of the weed control materials and quantities per acre intended for use in controlling the weed types prevalent and expected on the site.
 2. The Pest Control Advisor shall furnish data to demonstrate the compatibility of the weed control materials and methods with the intended planting and seed varieties.
 3. Submit to Owner's Authorized Representative proof of required governmental permits for the use of pesticides, insecticide and herbicides.

1.08 SUBSTITUTIONS

- A. Substitutions shall be in accordance with "General Provisions".
- B. Specific reference to manufacturer's names and products specified in this Specification are used as standards of quality, this implies no right to the Contractor to substitute other materials without prior written approval by the Owner's Authorized Representative.
- C. Any materials installed without written approval by the Owner's Authorized Representative may be rejected.
- D. If an approval is granted for a substitution, adjustment in the Contract amount will be made in accordance with the Contract Conditions.

1.09 SAMPLES, TESTS AND MOCK-UPS

- A. The Owner's Authorized Representative reserves the right to take and analyze selected samples of plant material for conformity to this Specification at any time. Rejected plant material shall be removed from the site and be replaced by the Contractor at no cost to the Owner.

1.10 PROJECT CONDITIONS

- A. Perform planting operations only when weather and soil conditions are suitable in accordance with locally accepted practice.

1.11 PRODUCT DELIVERY, STORAGE AND HANDLING

- A. Delivery
 1. Deliver all plant material with legible and durable identification labels.
 2. Deliver fertilizer to the site in original, unopened containers bearing the manufacturer's name, guaranteed chemical analysis, and its conformance to California State Law.
 3. Notify the Owner's Authorized Representative within seven (7) days of the delivery of plant material to the site. Indicate the quantity and type of plant material in each delivery.
- B. Storage
 1. Store plant materials in the shade and protect from the weather.
 2. Maintain and protect plant material not planted within four (4) hours of delivery.
- C. Protection
 1. Protect plant material during delivery and to the site and after, in order to prevent damage to the root ball or desiccation of leaves.
- D. Handling
 1. Take extreme care in the loading and unloading of plant material. Do not pick up container plants by the stems or trunks.
 2. Any plant material that has been damaged due to mishandling shall be removed and replaced with new material.

1.12 REJECTION OF PLANT MATERIAL

- A. All plant material not conforming to the requirements herein, shall be considered defective. Such plants, whether in place or not, shall be marked as rejected and immediately removed from the site and replaced with new material at the full expense of the Contractor.

Replacement plant material shall be of the same size, specie and condition as that indicated on the Drawings.

1.13 PROTECTION OF THE SITE

- A. Protect previously installed work and materials which may be affected by work of this Section. Provide safeguards and exercise caution against injury or defacement of existing site improvements.
- B. The Contractor shall be responsible for any damage resulting from his landscape planting operations. Repair damage and return the area to the previous condition at no additional cost to the Owner.

1.14 COORDINATION

- A. The Contractor shall notify the General Contractor and all other trades related to the installation of his work, so as to allow sufficient time for those contractors' to perform their portion of the work.
- B. Determine the locations of underground utilities and perform work in a manner which will avoid damage to the utilities.

1.15 GUARANTEE

- A. The manufacturer's warranty shall not relieve the Contractor of his own liability under the guarantee. Such warranties shall only supplement the guarantee.
- B. All plant material installed under this Contract shall be guaranteed against poor, inadequate and inferior quality and installation for a period of 1 year from the date of Final Acceptance. Any plant material not meeting the satisfaction of the Owner's Authorized Representative shall immediately be removed and replaced at no cost to the Owner. Replaced plant material will also be guaranteed for a period of 1 year upon installation.
- C. Replace without cost to the Owner and as soon as weather permits, all dead plants and all plants not found in a vigorous, thriving condition, as determined by the Owner's Authorized Representative during and at the end of the plant warranty period. Replacement of plants shall closely match adjacent specimens of the same specie and shall be subject to all requirements of this section.
- D. Repair damage to adjacent plant material caused by the Contractor's work at no cost to the Owner. All repairs shall be made with materials, varieties, sizes "in kind" with adjacent existing materials.

E. Guarantee for Planting

We hereby guarantee that the planting we have furnished and installed is free from defects in materials and workmanship and the work has been completed in accordance with the drawings and specifications, ordinary wear and tear and unusual abuse or neglect excepted. We agree to replace plants 15 gallons and larger for one (1) year after acceptance due to plant's dying or partially dying, thereby damaging shape, size or symmetry. Including damages consequential to defects in materials and workmanship and repair or replacement, which develop during one (1) year after Final Acceptance of the work, at no additional cost to the Owner. We agree to make such repairs and replacements within thirty (30) days after receipt of written notice. In the event of our failure to make such repairs and replacements within thirty (30) days of written notice, we authorize the Owner to proceed to have such repairs and replacements made at our expense and will pay all costs and charges upon demand:

Date of Final Acceptance:

Company Name:

Address:

PART 2 - PRODUCTS

2.01 PRE-EMERGENT WEED CONTROL

- A. Pre-emergent weed control to be EPA registered and recommended by a licensed Pest Control Advisor. Ronstar-G, Treflan, Eptam, Vegitex, or approved equivalent.

2.02 PLANTING SOIL

- A. Reuse of Stockpiled On-Site Soil
Stockpiled on-site soil may be available from the Owner's stockpile for use if it complies with the criteria in 2.02B. Soils for miscellaneous landscape areas are classified as 2-inch minus.
- B. Topsoil shall be obtained from sources within the site of the work, or shall consist of imported topsoil obtained from sources outside the site, or from both such sources. Stripped site soil, if used as topsoil, shall meet the requirements specified herein.
- C. Topsoil shall consist of fertile, friable soil of loamy character, and shall contain organic matter in amounts normal to the region. Imported topsoil shall be obtained from well-drained arable and fertile agricultural land and shall be free from refuse, roots, heavy or stiff clay, stones larger than one inch in size, coarse sand, noxious

seeds, sticks, brush, litter, grasses, weeds, toxic waste, and other deleterious substances detrimental to the health of plants, animals, and humans. Imported topsoil shall be capable of sustaining healthy plant life.

- D. Topsoil shall have no inherent tendency towards compaction due to texture or soil structure or both as indicated in the soils analysis.
- E. Soil Characteristics for Stockpiled Native Soil
1. Composition for 3/8-inch minus topsoil - fertile, friable, well-drained soil of uniform quality, free of materials larger than 3/8" in diameter such as sticks, rocks, concrete, oils, chemicals and other deleterious materials.
 2. Composition for 2-inch minus topsoil - fertile, friable, well-drained soil of uniform quality, free of materials larger than 2" in diameter such as sticks, rocks, concrete, oils, chemicals and other deleterious materials.
 3. Soil Analysis - If soil has not been tested within 30 days of the date of delivery to the project, obtain an agricultural suitability and chemical analysis of the proposed soil from a company as determined by the Owner's Authorized Representative. Cost of the testing will be paid for by the Contractor. The soil report is to include the following information:
 4. Elemental Analysis: Nitrate Nitrogen, Phosphorus, Potassium, Calcium, Magnesium, Sulfur, Sodium Zinc, Iron, Copper, Manganese, Boron and free Lime.
 5. Other: pH factor, % base saturation, electrical conductivity, mechanical analysis, % of organic content, cation exchange capacity (C.E.C.).
 6. Recommendations: Type and quantity of additives required to establish satisfactory pH factor and supply of nutrients to bring topsoil to a satisfactory level for planting.
 7. All stockpiled native soil to be used from 3/8-inch minus topsoil is to be amended at the levels listed in this Section as part of the base bid. Additional amendments, if requested by the Owner's Authorized Representative are not part of the contract and the Contractor will be compensated for this work on a Time and Materials basis. Rates for labor and equipment will be charged according to the Construction Contract.
- C. Imported Top Soil
1. In order to insure conformance with this Specification, soil samples shall be taken by the Contractor and submitted to a qualified soil testing laboratory for analysis prior to planting i.e., Wallace Laboratories, (310) 615-0116 or approved equivalent. The Owner's Authorized Representative shall monitor the Contractor's soil sampling.

2. Use natural friable soil of the local region, free from lumps, toxic substances sticks, debris, vegetation or stones over 1-inch in diameter.
3. Silt plus clay content shall not exceed 20% by weight with a minimum 95% passing the 2.0 millimeter sieve.
4. Sodium absorption ratio (SAR) shall not exceed 6.
5. Electrical conductivity (EC_e) of the saturated extract of this soil shall not exceed 3.0 millimeters per centimeter at 25 centigrade.
6. Boron content shall not exceed (1) part per billion as measured on the saturation extract.
7. Thoroughly blend the planter mix and amendments through a soil blender before placing the soil.

2.03 SOIL AMENDMENTS

- A. Peat Moss - natural product of sphagnum moss, reed, or sedge peat, taken from a fresh water site, free from lumps, woody material, stones and other foreign matter.
- B. Soil Sulfur - agricultural grade sulfur containing a minimum of 99% sulfur (expressed as elemental).
- C. Iron Oxide - 45% iron (expressed as metallic iron), derived from iron oxide with micronutrients.
- D. Calcium Carbonate - 95% lime as derived from oyster shells.
- E. Gypsum - agricultural grade product containing 98% minimum calcium sulfate.
- F. Iron Sulfate - 20% iron (expressed as metallic iron), derived from ferric and ferrous sulfate, 100% sulfur (expressed as elemental).
- G. Ground Limestone - agricultural limestone containing not less than 85% of total carbonates, ground to such fineness that 50% will pass a #1000 sieve and 90% will pass a #20 sieve.
- H. Dolomite Lime - agricultural grade mineral soil conditioner containing 35% minimum magnesium carbonate and 49% minimum carbonate, 100% passing the #65 sieve.
- I. Sulfate of Potash - agricultural grade product containing 50% to 53% of water soluble potash.
- J. Single Superphosphate - commercial grade product containing 20% to 25% available phosphoric acid.

- K. Ammonium Sulfate - commercial grade product containing approximately 21% ammonia.
- L. Ammonium Nitrate - commercial grade product containing approximately 34% ammonia nitrogen.
- M. Urea Formaldehyde - granular commercial product containing 38% nitrogen.
- N. IBDU (Iso Butldiene Diurea) - commercial grade product containing 31% nitrogen.
- O. Iron: Gro-Power Premium Green Iron - 45% Fe, non-staining.

2.04 FERTILIZERS

- A. General Purpose Soil Conditioner Fertilizer (5-3-1)
 - 1. Consisting of the following minimum percents by weight:
 - 5% Nitrogen
 - 3% Phosphoric Acid
 - 1% Potash
 - 50% Humus
 - 15% Humic Acids
 - 1% Soluble Metallic Iron
 - 2. Soil Conditioner Fertilizer shall be "Gro-Power Plus", as manufactured by Gro-Power (909) 393-3744 or approved equivalent.
 - 3. General Purpose Soil Conditioner Fertilizer with Soil Penetrant (5-3-1)
 - 4. Soil conditioning fertilizer for use in areas of clay, adobe soils or soils high in salt, sodium boron or pH consisting of the following minimum percents by weight:
 - 5% Nitrogen
 - 3% Phosphoric Acid
 - 1% Potash
 - 50% Humus
 - 15% Humic Acids
 - 4% Sulfur
 - 1% Soluble Metallic Iron
- B. Pre-Plant Fertilizer (16-20-0)
 - 1. Ammonium phosphate consisting of the following minimum percentages by weight:
 - 16% Nitrogen
 - 20% Phosphoric Acid

- 0% Potash
- 2. Pre-Plant Fertilizer shall be Best "16-20-0", as manufactured by J.R. Simplot Company (800) 992-6066, or approved equivalent.

- C. General Purpose Planting Fertilizer (12-12-12)
 - 1. Pelleted or granular form shall consist of the following minimum percents by weight:
 - 12% Nitrogen
 - 12% Phosphoric Acid
 - 12% Potash
 - 2. General Purpose Planting Fertilizer shall be Best "Triple Twelve", as manufactured by J.R. Simplot Company (800) 992-6066, or approved equivalent.

- D. Controlled Release Fertilizer (12-8-8)
 - 1. Consisting of the following minimum percents by weight:
 - 12% Nitrogen
 - 8% Phosphoric Acid
 - 8% Potash
 - 25% Humus
 - 5% Humic Acids
 - 2. Acceptable product - "Gro-Power Controlled Release", as manufactured by Gro-Power (909) 393-3744, or approved equivalent.

- E. Planting Tablets (20-10-5)
 - 1. Shall be 7 gram, 24-month release, non-burning tablets containing the following percentages of nutrients by weight:
 - 20% Nitrogen
 - 10% Phosphoric Acid
 - 5% Potassium
 - 2.5% Humic acids
 - 2. Acceptable product - "Gro-Power Planting Tablets", as manufactured by Gro-Power (909) 393-3744, or approved equivalent.

2.05 PLANT MATERIAL

- A. General Plant Condition
 - 1. Furnish nursery-grown trees and shrubs conforming to ANSI Z60.1, with healthy root systems developed by transplanting or root pruning. Provide well-shaped, fully-branched, healthy, vigorous stock free of disease, insects, eggs, larvae, and defects such as knots, sun scald, injuries, abrasions, or other objectionable disfigurements.

2. Grade: Provide trees and shrubs of sizes and grades conforming to ANSI Z60.1 for type of trees and shrubs required. Trees and shrubs of a larger size may be used if acceptable to the City of Goleta, with a proportionate increase in size of roots or balls.
3. Plant material shall be grown under climatic conditions similar to those in the locality of the project unless approved otherwise by the Owner's Authorized Representative.
4. Label at least 1 tree and 1 shrub of each variety and caliper with a securely attached, waterproof tag bearing legible designation of botanical and common name.
5. The use of plant material larger than that specified on the Drawings may be used, pending approval from the Owner's Authorized Representative, however, there will be no change in the Contract amount if the larger plant material is approved and used.

B. Trees and Shrubs

1. Tree and shrub trunks shall be sturdy and well hardened with vigorous and fibrous root systems which are not root-bound.
2. In the event of a disagreement as to the condition of the root system, the root conditions of the plants furnished by the Contractor will be determined by the removal of soil around the roots of not less than 10 plants or more than 2% of the total number of plants of each specie.
3. When container grown plants are supplied from several sources, the roots of not less than 10 plants of each species from each source will be inspected. In case the plants sampled are found to be defective, the Owner's Authorized Representative has the right to reject the entire lot represented by the defective sample. Any plant material rendered unsuitable for use because of this inspection will be considered as samples and will be provided at the full expense of the Contractor.

C. Nursery Grown and Collected Stock

1. Nursery grown and collected stock shall be grown under climatic conditions similar to that found in the locality of the site.

D. Container Grown Stock

1. Container grown stock shall be in a vigorous and healthy condition, not root bound or with the root system hardened off.

2.06 AUXILIARY ACCESSORIES

A. Tree Stakes and Guys

1. Wood stakes - 2" diameter by 10 feet Lodgepole Pine stake without splits or bowing. Refer to the Drawings for which trees receive wood stakes.

2. Guy and Tie Wire: ASTM A 641 (ASTM A 641M), Class 1, galvanized-steel wire, 2-strand, twisted, 0.106 inch (2.7 mm) in diameter.
 3. Guy Cable: 5-strand, 3/16-inch (4.8-mm) diameter, galvanized-steel cable, with zinc-coated turn buckles, 3-inch- (75-mm-) long minimum, with two 3/8-inch (10- mm-) galvanized eyebolts.
 4. Hose Chafing Guard: Reinforced rubber or plastic hose at least 1/2 inch (13 mm) in diameter, black, cut to lengths required to protect tree trunks from damage.
 5. Flags: Standard surveyor's plastic flagging tape, white, 6 inches (150 mm) long.
 6. Turnbuckles - 6" long, galvanized eye/hook type.
 7. Wire Clamps - 3/4" galvanized "U" clamps.
- B. Top Dressings
1. Organic Mulch: Organic mulch, free from deleterious materials and suitable as a top dressing of trees and shrubs, consisting of one of the following:
 - a. Type: Ground or shredded bark.
 - b. Type: Wood and bark chips.
 2. Fiber Mulch: Biodegradable dyed-wood cellulose-fiber mulch, nontoxic, free of plant growth- or germination-inhibitors, with maximum moisture content of 15 percent and a pH range of 4.5 to 6.5.
- C. Erosion Control Materials
1. Blankets: Biodegradable wood excelsior, straw, or coconut-fiber mat enclosed in a photodegradable plastic mesh. Include manufacturer's recommended steel wire staples, 6 inches (150 mm) long.
 2. Staples - 11-gauge, 6" x 1" looped wire.
 3. Fiber Mesh: Biodegradable twisted jute or spun-coir mesh, 0.92 lb per sq. yd. (0.5 kg per sq. m) minimum, with 50 to 65 percent open area. Include manufacturer's recommended steel wire staples, 6 inches (150 mm) long.
- D. Weed Barrier Fabric
1. Permeable weed barrier fabric "Tyvar" as manufactured by Reemay approved equivalent.
- E. Tree Root Barriers
1. Tree root barriers as supplied by Deep Root Corporation (Catalog #UB 24-2) or Root Solutions Root Guide Barrier by Root Solutions, Inc. (415)434-3072, or approved equivalent. Provide commercially available manufactured root barriers, consisting of polyvinyl chloride or polypropylene sheeting having ultraviolet inhibitors and a minimum thickness of 0.085 inch. Barriers shall be either factory preformed into the circular shape shown, or have an integrated

joining system for instant assembly into the final shape. Glued joints will not be acceptable.

Root barrier sheeting shall have horizontal tabs to prevent root growth from lifting the barrier. These tabs shall be spaced vertically not less than 8 inches on centers, and horizontally not less than 8 inches on centers. Depth of these tabs shall be not less than 3/8 inch at its widest point.

Root barrier sheeting shall have vertical fins running the full length on the inside face of the barrier at 90 degrees to the inside face, to direct root growth downwards. These fins shall be not less than 6 inches on centers, and its width shall be not less than 1/2 inch.

F. DECOMPOSED GRANITE

1. Decomposed granite shall be crushed granite rock screenings, graded from 1/4-inch particles to dust, with uniform tan or buff color. Decomposed granite shall conform with the following aggregate gradation:

<u>Sieve Size</u>	<u>% Passing</u>
No. 4	95-100
No. 30	30-50
No. 200	5-15

2. Binder/Stabilizer shall be a polymer based, water resistant (once cured), non-toxic, and clear in color. Compressive strength of the decomposed granite mixed with the binder/stabilizer shall result in a minimum 5,000 pounds stability per ASGTMD 1559, per manufacturer's data.

G. Concrete Header

1. Refer to construction details as specified on the drawings.

G. Wood Header

1. 2" x 4" Pressure – treated redwood.
2. Nails shall be hot dipped galvanized common nails.

PART 3 - EXECUTION

3.01 RENOVATION AND PREPARATION OF EXISTING SOIL

- A. Contractor shall prepare Horticultural soil samples taken in (6) selected locations for initial horticultural analysis and soil amendment recommendations. See drawings for locations.
- B. The contractor's Soil Scientist shall examine the site prior to preparing recommendations.
- C. Contractor shall perform soil renovation procedures to the soil as required by soils report.

3.02 CULTIVATION OF EXISTING SOIL

- A. In areas where topsoil will not be applied, rip or cultivate the existing soil that will be receiving planting to a depth of at least 10-inches immediately prior to applying soil amendments.
- B. In areas where topsoil will be applied the following procedures are to be followed:
- C. Verify that subgrades for installation of topsoil have been established under rough grading, subgrade depth plus specified depth of topsoil should equal finished grade. Do not spread topsoil prior to the Owner's Authorized Representative acceptance of all subgrade work.
- D. Rip or cultivate subgrade in all planting areas to a minimum depth of 10-inches immediately prior to spreading topsoil.
- E. Remove all rocks, stones, sticks and debris larger than 1-inch in diameter from the surface of the subgrade prior to applying topsoil.

3.03 SOIL SCARIFICATION

- A. Planting areas which become compacted in excess of 85% relative compaction due to construction activities, shall be thoroughly cross-ripped to a minimum depth of 9-inches to alleviate the condition, taking care to avoid existing subsurface utility lines, if present.

3.04 VERIFICATION OF EXISTING CONDITIONS

- A. Prior to the work in this Section, examine previously installed work from other trades and verify that such work is complete and as required, to the point where this installation may commence properly.

3.05 ROUGH GRADING CERTIFICATION

- A. Obtain the Owner's Authorized Representative's written certification that indicates that final rough grade has been set by previous contractors to plus or minus 0.10-foot prior to commencing fine grading operations.

3.06 FINE GRADING OPERATIONS

- A. Ensure that the top 2-inches of soil is free of stones, roots, stumps, wire, or other deleterious matter 1-inch in diameter and larger. Dispose of debris offsite.
- B. All planting areas to be fine graded to within 1-1/2-inches of paved areas, irrigation valve boxes, concrete mowstrips.
- C. Upon acceptance of rough grade by the Owner's Authorized Representative and prior to beginning planting operations, finish grade all planting areas, fill as needed and remove surplus soil and float areas to a smooth, uniform grade to elevations as indicated on the Drawings. Obtain the Owner's Authorized Representative approval of the fine grading prior to commencing planting operations.

3.07 SURFACE DRAINAGE OF PLANTING AREAS

- A. The Contractor shall bear final responsibility for properly draining all planting areas. Any discrepancy in the Drawings or Specifications, obstructions on the site, or prior work done by another contractor, which the Contractor feels precludes establishing proper drainage, shall be brought to the immediate attention of the Owner's Authorized Representative for correction or relief of said responsibility. The Contractor is to insure proper drainage of all planting areas at a minimum of 2% slope.

3.08 SOIL PREPARATION

- A. After finish grades for all landscaped areas have been established and approved by the Owner's Authorized Representative perform the following operations:
- B. Cross-rip all area to a depth of 9-inches.
- C. Spread organic amendments uniformly on the surface of the soil and cultivate thoroughly into the top 4-6 inches in a minimum of two directions with a mechanical rototiller.
- D. The following soil amendments and fertilizers are to be used for bid purposes only. Specific amendment recommendations will be made after horticultural soil samples are taken and paid for by the Contractor and analyzed. Application rates per 1,000 square feet shall be as follows:
 - Nitrolized Fir bark - 6 cu. yds.
 - Planting fertilizer - 200 lbs. of Gro-Power Plus.
 - Agricultural gypsum - 100 lbs.
 - Soil sulfur - 20 lbs.
- E. After applying soil amendments and prior to planting, irrigate with overhead irrigation so that a minimum of 1-3 inches of good quality water passes through the soil profile.
- F. For acid loving plant materials, surface treat planting areas with 2-inches of peat moss for base bid. This may change after soils recommendations are prepared based upon the required soils testing by the selected contractor.

3.09 BACKFILL MIX FOR SHRUBS AND TREES

- A. The following backfill mix is for bid price basis only. Final backfill recommendations will be made only after rough and fine grading operations are completed and horticultural soil testing has been performed and paid for by the Contractor and approved by the Owner's Authorized Representative.
 - 7 parts by volume on-site soil.
 - 3 parts by volume nitrolized stabilized Fir bark.
 - 2 lbs. iron sulfate per cubic yard of mix.
 - 18 lbs. of Gro-Power Plus per cubic yard of mix (or approved equivalent).
 - Planting tablets - quantity based on size of plant.
- B. Thoroughly blend the backfill mix prior to placement.
- C. Do not apply iron sulfate over paved materials since severe staining is likely to occur.

3.10 PRE-PLANT WEED CONTROL

- A. Clear and remove existing weeds by mowing or grubbing to at least 1/4-inch below the soil surface.
- B. Fertilize areas to receive planting with urea 46-0-0 commercial fertilizer at the rate of 1/2-pound per 1,000 square feet.
- C. Water area thoroughly and continuously for a period of 3 consecutive weeks. Employ a specific watering duration and frequency program designed to germinate all residual weeds.
- D. After sufficient weed germination is present, apply a post-emergent contact weed killer according to the directions of the manufacturer.
- E. Allow for a sufficient period of time to ensure that the weeds are dead and the weed killer has dissipated before applying a second weed kill.
- F. Water planting areas thoroughly and continuously for a period of 3 weeks. Discontinue the watering process for 1 day prior to the second application of the herbicide. Reapply the spraying operation with a straight contact weed killer according to the pest control adviser's recommendations. Avoid any irrigation for a minimum of 4 days for effective weed kill.
- G. After the second weed kill, water planting areas thoroughly and continuously for 3 consecutive days to saturate upper layers of soil prior to commencing planting operations.

3.11 TREE PIT PERCOLATION TESTING

- A. Due to the potential of standing water in the tree pits, Contractor is to perform a tree pit percolation test (for trees larger than 15 gallon only) in each tree pit prior to planting the tree. Fill the tree pit to the top with water. If the water has not drained by more than 95% within 24 hours, do not plant the tree and bring this to the immediate attention of the Owner's Authorized Representative. The Contractor may be required to install a drainage sump in the existing plant pit. Substitute plant pits are the responsibility of the Contractor under the Base Bid. Drainage sumps are not part of the Base Bid and compensation will be awarded to the Contractor based on an itemized amount to be provided by the contractor in the Construction Agreement.
- B. Submit written results of each plant pit percolation test with locations, date and time of test to the Owner's Authorized Representative.

3.12 CONCRETE MOWSTRIP LAYOUT

- A. Concrete mowstrips shall be laid true to line and grade. Protect adjacent improvements and existing landscape from damage.
- B. Refer to construction details as specified on the drawings.

3.13 PLANTING OPERATIONS

- A. Planting Layout
 - 1. It is the Contractor's responsibility to verify with the Owner's Authorized Representative's site superintendent and local governing agencies the location and depth of all underground utilities. If any underground construction or utility lines are encountered in the excavation of planting holes, alternative planting locations may be selected by the Owner's Authorized Representative.
 - 2. Locations for all shrubs and trees shall be marked on the ground either by flagged grade stakes indicating plant type and size or the actual plants themselves for the Owner's Authorized Representative's review and approval prior to planting.
- B. General Planting Guidelines
 - 1. Plant only as many plants that can be planted and watered on that same day in a given planting area.
 - 2. Protect the planting area from excessive vehicle compaction.
 - 3. Face plant material with fullest growth into the prevailing wind and/or the primary direction of view.
 - 4. Center plant material in the planting hole.
 - 5. Set plant material plumb and hold rigidly in place until soil has been tamped firmly around the rootball.
 - 6. Planting pits shall have vertical sides and roughened surfaces. The size of the plant pit shall be twice the diameter and only as deep as the rootball itself.
- C. Container Removal

1. Plant containers shall be opened and removed in such a manner that the soil surrounding the rootball shall not be broken.
 2. Do not injure the root ball while removing the container. After removing plant, superficially cut edge roots with a knife on three (3) sides.
- D. Tree Box Removal
1. Remove the bottom of the box before planting.
 2. Remove the sides of the box without damaging the rootball after positioning the tree and partially backfilling the plant pit.
- E. Shrub and Tree Installation
1. Apply backfill mix to the plant pit up to 1/2 the height of the rootball. Add water to the top of the remaining plant pit and let soak in before completing the remainder of backfilling.
- F. Placement of Plant Tablets
1. Prior to planting, place the required amount of planting tablets per plant size on top of each root ball while the plants are still in their containers so that the Owner's Authorized Representative can easily verify their existence and quantity.
 2. After obtaining approval by the Owner's Authorized Representative on plant tablet quantity and after water has completely drained from the plant pit, add plant tablets to the planting pits in the following quantities:
 - 1 gallon - 3 tablets
 - 5 gallon - 8 tablets
 - 15 gallon - 14 tablets
 - 24" box - 15 tablets
 - 36" box - 19 tablets
 - 48" box - 24 tablets
 3. Dig planting pit to the recommended depth.
 4. Backfill the plant pit to attain the proper level for the plant.
 5. Place the specified amount of plant tablets between the bottom of the rootball but not higher than 1/3 of the way up the rootball. Space the plant tablets equally around the perimeter of the rootball approximately 2" from the rootball.
 6. Finish backfilling of the planting pit by tamping the soil firmly around the rootball and watering thoroughly.
- G. Final Backfilling
1. Once the water has soaked in thoroughly, place the remaining backfill and tamp firmly.
 2. After final backfilling, construct an earthen basin around the base of each plant with backfill mix sufficient to hold water for the following plant sizes:
 - 1 gallon - 2-inches of water.
 - 5 gallon through 24" box - 3-inches of water.
 - 36" box and larger - 4-inches of water.
- H. Plant Settling

1. Any plant material that has settled deeper than the surrounding grade shall be raised to the correct level.

I. Ground Cover Planting

1. Ground cover flats shall contain sufficient moisture to reduce soil separation when lifting out the plants.
2. Plant ground covers in straight rows, evenly, triangular spaced, and at an on-center spacing as indicated on the Drawings.
3. Each rooted ground cover plant shall be planted with its proportional amount of soil.
4. Apply a 2-inch layer of wood mulch at the completion of planting.

3.14 WATERING

- A. All planting shall be watered immediately after planting. After the first watering, water shall be applied to all plants as conditions may require keeping the plants in a healthy and vigorous growing condition until the completion of the Contract.

3.15 TREE STAKING

- A. Staking of trees shall be completed immediately after planting trees. Trees shall stand plumb before stakes are applied.
- B. All stakes shall be installed plumb when tied to the tree. Stakes may be located in a specific location to the trunk - refer to the Drawings.
- C. When locating a single stake, locate it on the windward side of the tree and as close to the main trunk as possible without damaging the trunk.
- D. Stakes shall be driven at least 3' into the ground or as specified on the plans.
- E. Tie the tree trunk to the stake with the specified tree guy. Cut off stake after installation 4-inches above the upper tie.

3.16 TREE GUYING

- A. Guying of trees shall be completed immediately after planting trees. Trees shall stand plumb before guys are applied.
- B. Trees shall stand plumb once guys are installed.
- C. Guy trees at points of branching with guys spaced 120 degrees apart.
- D. Guys shall be covered with black rubber hose at points of contact with bark positioned at crotches and fastened to a deadman. One turnbuckle shall be provided for each guy wire. Use (2) cable clamps at each cable terminus.

- E. Install a warning guy wire tube on each guy wire.

3.17 PRUNING

- A. At no time shall plant material be pruned, trimmed or topped prior to delivery. Any alteration to their shape shall be conducted only on-site and in the presence of the Owner's Authorized Representative.
- B. All planted material requiring pruning shall be done under the observation of the Owner's Authorized Representative. Prune planted material only when necessary and under standard horticultural practices to preserve the natural character of the plant.

3.18 WOOD MULCH INSTALLATION

- A. Spread a 3" deep layer of shredded bark mulch in all landscaped areas.

3.19 JUTE MESH INSTALLATION

- A. Install Jute Mesh on slopes greater than 3 to 1.
- B. Clear away trash, large stones and other debris. Fine grade area to receive jute mesh, eliminating footprints, tracks and ruts.
- C. Install jute mesh completely in contact with the ground. Confirm that there is not tension on the mesh to minimize soil contact.
- D. Overlap jute mesh a minimum of 4-inches on the sides and 18-inches on the ends. Staples shall be inserted at intervals no greater than 3-feet on-center along overlaps and down the center of each roll length.
- E. Joining (2) jute mesh rolls shall be installed at the down channel end of installed roll which should overlap up-channel end of roll being installed. Overlap should be a minimum of 18-inches. Use (5) staples on a 12-inch on-center spacing.
- F. Anchor slot at top of slope shall be installed by burying up-channel end in trench a minimum of 6-inch deep. Use (5) staples at a 12-inch on-center spacing.
- G. On slopes less than (6) feet in height, jute mesh may be installed with roll perpendicular to the contours.

- H. The terminal fold shall be installed by bringing the jute mesh down to the level area before terminating. Turn the end under a minimum of 6-inches. Use (5) staples across the fold at a 12-inch on-center spacing.

3.20 CLEANUP

- A. Contractor shall remove all trash caused from his Work on a weekly basis throughout the duration of the Project.
- B. Upon completion of his Work under this Section, the Contractor shall remove all rubbish, waste and debris resulting from his operations offsite or as directed by the Owner's Authorized Representative.
- C. All scars, ruts or other marks in the ground caused by the Contractors work shall be repaired.
- D. Remove all equipment and implements of service, and leave the entire work area in a neat, clean, and Owner's Authorized Representative-accepted condition. All sidewalks and other paving areas shall receive a broom-clean treatment.

3.21 SITE VISIT SCHEDULE

- A. The Contractor shall be responsible for notifying the Owner's Authorized Representative in advance to schedule the following site visits:
 - 1. Pre-construction "Kick-Off" meeting - 7 days.
 - 2. At completion of fine grading - 2 days.
 - 3. At completion of soil preparation - 2 days.
 - 4. Delivery of plant material - 2 days.
 - 5. Plant layout prior to plant pit excavation - 2 days.
 - 6. At start of tree planting, staking and guying - 2 days.
 - 7. Final walkthrough prior to going on contracted maintenance period - 7 days.
 - 8. Final walkthrough for project acceptance - 7 days.
- B. The Owner's Authorized Representative may or may not attend all of the above mentioned site visits. He may also elect to attend more than is listed above, and without notice to the Contractor.
- C. When site visits are made by other than the Owner's Authorized Representative, the Contractor shall show evidence in writing of when and by whom the site visit was made.
- D. No site visit will commence without all previous punch list items being completed, unless compliance has been waived by the Owner's Authorized Representative. Failure to accomplish the timely execution of previous field report punch list items and preparing adequately for the next site visit shall make the Contractor potentially liable for reimbursing the Owner's Authorized Representative's for his labor and reimbursable expenses. No

Department of Neighborhood Services and Public Safety
GOLETA TRAIN DEPOT PROJECT

further site visits will be made until outstanding charges have been paid to the Owner by the Contractor.

END OF SECTION

SECTION 32 91 13 SOIL PREPARATION

PART 1 – GENERAL

1.01 SUMMARY

- A. This section includes soil and soil amendments products for on-structure plantings. Execute all labor to achieve soil preparation, complete, as shown and as specified.

1.02 DEFINITIONS

- A On-Structure: Planted areas to be installed on top of concrete structure built under another section.

1.03 SUBMITTALS

- A. Product Data: Manufacturer's current catalog cuts and specifications of the following:
 - 1. Fertilizer
 - 2. Organic Amendments
 - 3. Soil Conditioner
 - 4. Herbicide
- B. Quality Control Submittals:
 - 1. Testing Agency: Wallace Laboratories, El Segundo, CA 90245, (310) 615-0116.

1.04 SEQUENCING AND SCHEDULING

- A. Do not install on-structure drainage materials and soil mix prior to acceptance of waterproofing in another section.

PART 2 – PRODUCTS

2.01 ORGANIC COMPONENTS

- A. Peat Moss:
 - 1. Type: Finely shredded, brown in color, suitable for horticultural purposes and frequently referred to in the trade as "greenhouse" or "coarse grind".
 - 2. Measurement: Measure peat in air dry condition, containing not more than 35% moisture by weight on an "as-received" basis. Ash content shall not exceed 10%.

3. Physical Properties:

<u>Percent Passing</u>	<u>Sieve Size</u>
95 - 100	9.51 mm (3/8 in.)
0 - 40	500 micron (#35, 32 mesh)
4. Organic Content (dry weight basis): 90-100%
5. Chemical Properties:

Nitrogen (dry weight basis): 0.6-3.0%
Salinity/Soluble Salts: Saturation extract conductivity 0.0-3.0 millimhos/cm @ 25 degrees C.
pH: 3.0-4.5
6. Acceptable Substitute: Ground redwood bark, per specifications for peat moss.

2.02 SOIL CONDITIONER

- A. Humus based fertilizer and soil conditioner 'Gro-Power Plus' with 1.00% soil penetrant and consisting of the following percent by weight: 5-3-1 (N-P-K), 70 humus, and 15 humus acids. Gro-Power, Inc. (800) 473-1307 or equivalent.

2.03 ACCESSORIES

- A. Fine Sand:
 1. Physical Properties (by dry weight basis):

<u>Percent Passing</u>	<u>Sieve Size</u>
100	4.76 mm (#4, 4 mesh)
95 - 100	1.00 mm (#18, 16 mesh)
65 - 100	500 micron (#35, 32 mesh)
0 - 50	250 micron (#60, 60 mesh)
0 - 20	105 micron (#140, 150 mesh)
0 - 5	53 micron (#270, 270 mesh)
 2. Chemical Properties: (by Saturation Extract Method):
 - a. Soluble Salts/Salinity: Maximum conductivity of 3.0 millimhos/cm at 25 degrees C.
 - b. Boron: Maximum concentration of 1.0 ppm.
 - c. Sodium Absorption Ratio (SAR): Maximum 6.0.
- B. Pre-emergence Weed Control: "Rout" by Scotts (800) 492 8255 "Treflan 5G", by Dow Elanco, (800) 352-6776, or equal.
- C. Water: Clean, fresh and potable, as available from Owner. Transport as required.

2.04 COMMERCIAL FERTILIZERS

- A. Pre-Plant Fertilizer:

1. Type: Mixed by a commercial fertilizer supplier and consisting of the following percent by weight: 6-20-20 (N-P-K).
2. Manufacturer: J.R Simplot Company - (800) 992-6066.

2.05 CHEMICAL COMPONENTS

The following additives may or may not be used depending on the outcome of the soil report.

- A. Ground Limestone: Agricultural limestone containing not less than 85% of total carbonates, ground to such fineness that 50% will pass #100 sieve and 90% will pass #20 sieve.
- B. Dolomite Lime: Agricultural grade mineral soil conditioner containing 35% minimum magnesium carbonate and 49% minimum calcium carbonate, 100% passing #65 sieve.
- C. Gypsum: Agricultural grade product containing 80% minimum calcium sulphate.
- D. Iron Sulfate (Ferric or Ferrous): Supplied by a commercial fertilizer supplier, containing 20% to 30% iron and 35% to 40% sulphur.
- E. Sulphate of Potash: Agricultural grade containing 50% to 53% of water-soluble potash.
- F. Single Superphosphate: Commercial product containing 20% to 25% available phosphoric acid.
- G. Ammonium Sulphate: Commercial product containing approximately 21% ammonia.
- H. Ammonium Nitrate: Commercial product containing approximately 34% ammonia.
- I. Calcium Nitrate: Agricultural grade containing 15-1/2% nitrogen.
- J. Urea Formaldehyde: Granular commercial product containing 38% nitrogen.
- K. I.B.D.U. (Iso Butyldiene Diurea): Commercial product containing 31% nitrogen.
- L. Soil Sulfur: Agricultural grade sulfur containing a minimum of 96% sulfur.
- M. Calcium Carbonate: 95% lime as derived from oyster shells.
- N. Triple Superphosphate: Commercial product containing 50% available phosphoric acid

2.06 POTTING MIX

- A. Pot Planting Soil Mix: Commercial Potting Soil. Submit analysis and sample bag for approval.

2.07 BIO-RETENTION SOIL MIX

- A. Bioretention Soil Landscape Mix: In accordance with, "Stormwater Technical Guide for Low Impact Development" of the latest edition of the "*County of Santa Barbara Water Resource Division*".

1. General Requirements: Bioretention soil shall achieve a long-term, in-place infiltration rate of at least 5 inches per hour. Bioretention soil shall also support vigorous plant growth.
2. Soil Mix: Bioretention Soil shall be a mixture of topsoil or fine sand, and compost measured on a volume basis. (Amount per Cubic Yard)

a. Mix B – Fine Sand Blend

1. 70% Fine Sand (Number 16 gives better growth. Number 20 gives a firmer soil but it will have a reduced growth rate.)
2. 30% Compost (by volume medium size peat moss)

- b. Sand for Bioretention Soil shall be free of wood, waste, coating such as clay, stone dust, carbonate, etc., or any other deleterious material. All aggregate passing the No. 200 sieve size shall be non-plastic. Sand for Bioretention Soils shall be analyzed by an accredited lab using #200, #100, #40, #30, #16, #8, #4, and 3/8 inch sieves (ASTM D 422 or as approved by municipality), and meet the following gradation:

<u>Sieve Size</u>	<u>Percent Passing (by weight)</u>	
	<u>Min</u>	<u>Max</u>
3/8 inch	100	100
No. 4	90	100
No. 8	70	100
No. 16	40	95
No. 30	15	70
No. 40	5	55
No. 100	0	15
No. 200	0	5

- c. Topsoil for Bioretention Soil shall be free of wood, waste, or any other deleterious material. The overall topsoil texture shall be loamy sand as analyzed by an accredited laboratory. The overall dry weight percentages shall be 60-90% sand, with less than 20% passing than the #200 sieve and less than 5% clay of the total weight with no gravel.
- d. Composted Material shall be a well decomposed, stable, weed free organic matter source meeting the standards developed by the US Composting Council (USCC). The product shall be certified through the USCC Seal of Testing Assurance (STA) Program (a compost testing and information disclosure program). Before delivery of the soil, the supplier shall submit a copy of lab analysis performed by a laboratory that is enrolled in the US Composting Council's Compost Analysis Proficiency (CAP) program and using approved Test Methods for the Evaluation of Composting and Compost (TMECC).

PART 3 – EXECUTION

3.01 SOIL MOISTURE CONTENT

- A. General: Do not work soil when moisture content is so great that excessive compaction will occur, nor when it is so dry that dust will form in air. Apply water, if necessary, to bring soil to an optimum moisture content for planting.
- B. Range: Maintain within 2 percent above or below optimum moisture content at all times during the work.

3.02 CLEARING AND CULTIVATION

- A. Clearing: Clear all planting areas of weeds, debris and other extraneous materials prior to soil preparation work.

3.03 BLENDING OF SOIL MIXES

- A. Acid-Loving Planting Soil Mix: Thoroughly bulk blend all components in stockpiles on site. Do not blend in individual planters or plant pits.
- B. On-structure Planting Soil Mix: Thoroughly bulk blend all components in stockpiles on site. Do not blend in individual planters. Required chemical components that could potentially stain completed improvements can be applied in individual planters after placement of soil mix.

3.04 FIELD QUALITY CONTROL

- A. Tests: Right is reserved to take samples of prepared soil for testing for conformity to Specifications.
- B. Rejected Materials: Remove off site at Contractor's cost. Pay cost of testing of materials, not meeting Specifications.

END OF SECTION

SECTION 33 01 10

WATERLINE DISINFECTION AND TESTING

PART 1 – GENERAL

1.01 REQUIREMENTS

- A. The Contractor shall perform flushing, disinfection, and testing of all waterlines, services, and appurtenances, complete, in accordance with the Contract Documents.

1.02 RELATED WORK SPECIFIED ELSEWHERE

Section 33 05 09 – Piping, General

Section 33 05 31 – PVC Pressure Pipe (AWWA C900, Modified)

1.03 REFERENCE SPECIFICATIONS, CODES, AND STANDARDS

- A. The Contractor shall perform flushing, disinfection, and testing of all waterlines, services, and appurtenances, complete, in accordance with the Contract Documents.

ANSI/AWWA B300 Hypochlorites

ANSI/AWWA B301 Liquid Chlorine

ANSI/AWWA C651 Disinfecting Water Mains

1.04 CONTRACTOR SUBMITTALS

- A. A proposed plan and schedule for water conveyance, cleaning, disinfection, flushing and water disposal, and pressure testing shall be submitted in writing for approval a minimum of two weeks before testing is to start. The plan shall demonstrate that personnel are experienced and prepared to resolve problems which may arise.

PART 2 – PRODUCTS

2.01 MATERIALS REQUIREMENTS

- A. All test equipment, chemicals for chlorination, temporary valves, bulkheads, or other water control equipment and materials shall be selected and furnished by the Contractor

subject to the Goleta Water District's review. No materials shall be used which would be injurious to the construction or its future function.

- B. Chlorine for disinfection may be in the form of liquid chlorine or sodium hypochlorite solution.
- C. Liquid chlorine shall be in accordance with the requirements of ANSI/AWWA B301. Liquid chlorine shall be used only:
 - 1. In combination with appropriate gas flow chlorinators and ejectors;
 - 2. Under the direct supervision of an experienced technician;
 - 3. When appropriate safety practices are observed.
- D. Sodium hypochlorite and calcium hypochlorite shall be in accordance with the requirements of ANSI/AWWA B300.

PART 3 – EXECUTION

3.01 GENERAL

- A. All waterlines, services, and appurtenances shall be disinfected prior to pressure and leakage testing. Unless otherwise indicated, water for disinfecting and testing waterlines shall be furnished by the Contractor on private contracts and by Goleta Water District on District contracts. In both cases the Contractor shall make all necessary provisions for conveying the water from the District-designated source to the points of use. The Contractor shall furnish all equipment and materials for disinfection and testing of waterlines.
- B. Disinfection shall be accomplished by chlorination. All disinfection and testing operations shall be performed in the presence of the Goleta Water District. All pressure waterlines, services, and appurtenances shall be disinfected and tested.
- C. Disinfection operations shall be scheduled by the Contractor as late as possible during the contract time period so as to assure the maximum degree of sterility of the facilities at the time the work is accepted by the District.

3.02 DISINFECTING PIPELINES

- A. General: All potable waterlines, services, and appurtenances shall be disinfected in accordance with the requirements of ANSI/AWWA C651. Prior to disinfecting, waterlines shall be flushed or blown out as appropriate.

- B. Chlorine-water solution method: A chlorine-water solution shall be uniformly introduced into the waterline by means of a solution-feed chlorinating device. The chlorine solution shall be introduced at one end of the pipeline through a tap such that the concentration of free chlorine in the water entering the pipe is a minimum of 25 mg/l. Care shall be taken to prevent the strong chlorine solution in the waterline being disinfected from flowing back into the line supplying the water. The table below provides the quantity of chlorine required to produce 25 mg/L concentration in 100 feet of pipe – by diameter.

Pipe Diameter (inches)	12.5 % Chlorine Solution (ounces)
4	0.16
6	0.36
8	0.65
10	1.02
12	1.44
16	2.60

- C. Tablet Method: The tablet method may be used only when all foreign materials have been kept out of the waterline during construction. If groundwater has entered the pipe during installation and tablets have been installed, Contractor shall flush main and use chlorine-water solution method. Do not use this method if the temperature is below 41 degrees Fahrenheit. Tablets shall be secured with non-toxic adhesive in each pipe length in top of pipe. The table below provides the number of 5-g hypochlorite tablets required for a minimum dose of 25 mg/L, based on 3.25g available chlorine per tablet.

Pipe Diameter	Length of pipe section				
	13 ft	18 ft	20 ft	30 ft	40 ft
6	1	1	1	2	2

8	1	2	2	3	4
10	2	3	3	4	5
12	3	4	4	6	7
16	4	6	7	10	13

- D. Disinfection: Assure valves are closed on existing system to prevent chlorine solution flowing into water supply system. Chlorinated water shall be retained in the waterline long enough to destroy all non-sporeforming bacteria. This period shall be at least 24 hours. After the chlorine-treated water has been retained for the required time, the free chlorine residual at the waterline extremities and at other representative points shall be at least 10 mg/l. Should the chlorine level drop below 10 mg/l at the end of 24 hours, the waterline shall be flushed and the disinfection procedure repeated until 10 mg/l residual is achieved.
- E. Chlorinating Valves: During the disinfection process of chlorinating the waterline, all valves, hydrants, and other appurtenances shall be operated while the pipeline is filled with the heavily-chlorinated water.
- F. Sampling Ports: The Contractor shall provide sampling ports along the waterline as defined in AWWA C651.
- G. Preliminary Flushing: Prior to chlorinating, waterlines shall be filled to eliminate air pockets and flushed to remove particulates.
- H. Final Flushing: After disinfection is successfully completed, the heavily chlorinated water shall be flushed from the pipeline using fresh potable water until chlorine measurements show that the concentration in the water leaving the pipeline is no higher than 2 mg/l. The Contractor shall notify the Goleta Water District that final flushing will be required. The District will then send personnel to operate District valves and assist the Contractor with the final flushing. If there is any question that the chlorinated discharge will cause damage to the environment, a reducing agent shall be applied to the water to neutralize thoroughly the chlorine residual remaining in the water.
- I. Bacteriological Testing: After final flushing and before the waterline is placed in service, two consecutive sets of samples, taken at least 24 hours apart shall be collected from the ends and intermediate points of the line. Samples shall be tested for bacteriological quality in accordance with the requirements of the State Department of Health Services. For this purpose, for the first set of samples, the pipe shall be re-filled with fresh potable

water and left for a period of 24 hours before any sample is collected, for the second set of samples, wait at least 24 hours after the first set of samples were collected and tested before any sample is collected. Contractor shall contact the Goleta Water District a minimum of 3 working days prior to requested date of sampling. The District will collect samples and perform bacteriological tests. Should the initial disinfection treatment fail to produce satisfactory bacteriological test results, the disinfection procedure shall be repeated until acceptable results are obtained.

3.03 PRESSURE AND LEAKAGE TESTING OF WATERLINES

- A. Prior to pressure and leakage testing, waterlines shall be flushed or blown out as appropriate. The Contractor shall test all waterlines either in sections or as a unit. Test sections shall not exceed 1000 feet in length. No section of waterline shall be tested until all field-placed concrete or mortar has attained an age of 14 days, or the waterline has been fully restrained against thrust forces. The test shall be made by closing valves when available, or by placing temporary bulkheads in the pipe and filling the line slowly with water. The Contractor shall be responsible for ascertaining that all test bulkheads are suitably restrained to resist the thrust of the test pressure without damage to, or movement of, the adjacent pipe. Any unharnessed sleeve-type couplings, expansion joints, or other sliding joints shall be restrained or suitably anchored prior to the test, to avoid movement and damage to piping and equipment. The Contractor shall utilize waterline appurtenances or provide sufficient temporary air tappings in the waterline to allow for evacuation of all entrapped air in each pipe segment to be tested. After completion of the tests, such taps shall be permanently plugged. Care shall be taken to see that all air vents are open during filling.
- B. The waterline shall be filled at a rate which will not cause any surges or exceed the rate at which the air can be released through the air valves at a reasonable velocity and all the air within the pipeline shall be properly purged. For steel and ductile iron pipe, after the waterline has been filled, it shall be allowed to stand under a slight pressure for at least 24 hours to allow the mortar lining to absorb what water it will and to allow air to escape from any air pockets. During this period, bulkheads, valves, and connections shall be examined for leaks. If leaks are found, corrective measures shall be taken.
- C. Pressure Test: The hydrostatic test shall consist of holding the test pressure (+/- 5 psi) on the waterline for a period of 2 hours. The test pressure at the low point of the section being tested shall be 1.5 times the working pressure or 100 psi, whichever is greater. At the end of the pressure test period, the amount of water used to maintain the test pressure shall be determined.
- D. Leakage Test: The leakage test shall be conducted concurrently with the pressure test. Leakage is defined as the quantity of water that must be supplied to a section of pipe to

maintain the pressure within 5 psi of the specified test pressure after the pressure test has begun. The maximum allowable leakage shall be according to the following formula:

$$L = S \times D \times P^{1/2} / 133,200$$

where:

L = leakage (gallons per hour)

S = length (feet), the lessor of the actual length being tested or the maximum length for determining leakage. Maximum length for determining leakage is [2000 feet].

D = pipe diameter (inches) P = test pressure (psi)

Pipe with welded joints shall have no leakage.

- E. Waterlines, services, and appurtenances that fail to pass the prescribed pressure and leakage test shall be considered defective work. The Contractor shall determine the cause of the failure/leakage, repair the leaks, and shall retest the waterline.

3.04 CONNECTIONS TO EXISTING SYSTEM

- A. Where connections are to be made to an existing potable water system, the interior surfaces of all pipe and fittings used in making the connections shall be swabbed or sprayed with a one percent hypochlorite solution before they are installed. Thorough flushing shall be started as soon as the connection is completed and shall be continued until discolored water is eliminated.

END OF SECTION

33 05 09

PIPING, GENERAL

PART 1 – GENERAL

1.01 REQUIREMENTS

- A. The Contractor shall provide all piping systems indicated, complete and operable, including pipe supports, hangers, guides, anchors, and connection to and abandonment of existing water facilities in accordance with the GWD Standards & Specifications and Contract Documents.
- B. The provisions of this Section shall apply to all piping sections in Divisions 2 and 33.
- C. The drawings define the general layout, configuration, routing, method of support, pipe size, and pipe type. The drawings are not pipe construction or fabrication drawings. It is the Contractor's responsibility to develop the details necessary to construct all piping systems, to accommodate the specific equipment provided, and to provide all spools, spacers, adapters, and connectors for a complete and functional system

1.02 RELATED WORK SPECIFIED ELSEWHERE

Section 02 82 00 – Asbestos Cement Pipe Removal and Disposal

Section 31 23 16 – Trenching, Backfill, and Compaction

Section 33 01 10 – Waterline Disinfection and Testing

Section 05 50 00 – Miscellaneous Metalwork

Section 09 90 00 – Protective Coatings

1.03 CONTRACTOR SUBMITTALS

- A. General: Submittals shall be furnished in accordance with Section 013300 - Contractor Submittals.
- B. Shop Drawings: Shop Drawings shall contain the following information:
 - 1. Drawings: Layout drawings including all necessary dimensions, details, pipe joints, fittings, specials, bolts and nuts, gaskets, valves, appurtenances, anchors, guides, and material lists. Fabrication drawings shall indicate all spool pieces, spacers, adapters,

connectors, fittings, and supports to accommodate the equipment and valves in a complete and functional system.

2. Drawings of pipe supports, hangers, anchors, and guide rails.
 3. Calculations for special supports and anchors.
- C. Samples: Performing and paying for sampling and testing as necessary for certifications are the Contractor's responsibility.
- D. Certifications
1. Location: As the Contractor's first order of work, the various connection points to the existing waterlines shall be potholed to identify depth, diameter, and pipe material. Pothole information shall be immediately provided to the DISTRICT for review. The DISTRICT will not review any other Contractor Submittals until after the pothole data is received.
 2. Leak-By: The Contractor shall note that existing DISTRICT valves do not close drip tight. Existing valves in many areas are known to allow significant leak-by when fully closed. The Contractor shall expect leak-by conditions and provide the necessary labor, materials, and equipment to address this condition such that the connection can be made under safe conditions for personnel and contaminated water is prevented from entering the open ends of the existing and new mains. The Contractor shall not operate any DISTRICT valves. Only DISTRICT personnel shall operate existing system valves to facilitate the Contractors connection work. Also, only DISTRICT personnel shall operate valves connecting new mains to the existing in-service mains.

PART 2 – PRODUCTS

2.01 GENERAL

- A. Extent of Work: Pipes, fittings, and appurtenances shall be provided in accordance with the requirements of the applicable Sections of Divisions 2 and 33 and as indicated.
- B. Pipe Supports: Pipes shall be adequately supported, restrained, and anchored in accordance with this Section and as indicated.
- C. Coating: Pipes above ground or in structures shall be field-coated in accordance with Section 099000 - Protective Coatings.
- D. Pressure Rating: Piping systems shall be designed for the maximum expected pressure as defined in Section 330110 - Water Pipeline Testing and Disinfection, or as indicated on

the Piping Schedule. Minimum pressure rating shall be 200 psi, which corresponds to a working pressure of 133 psi when pressure tested at 1.5 times the working pressure. Where there is a working pressure greater the 133 psi, the minimum pressure rating shall be 305 psi.

- E. Inspection: Pipe shall be subject to inspection at the place of manufacture. During the manufacture of the pipe, the City shall be given access to all areas where manufacturing is in progress and shall be permitted to make all inspections necessary to confirm compliance with requirements.
- F. Tests: Except where otherwise indicated, materials used in the manufacture of the pipe shall be tested in accordance with the applicable specifications and standards. The Contractor shall be responsible for performing material tests.
- G. Welder Qualifications: Welding shall be done by skilled welders and welding operators who have adequate experience in the methods and materials to be used. Welders shall be qualified under the provisions of ANSI/AWS D1.1 by an independent local, approved testing agency not more than 6 months prior to commencing work on the pipeline. Machines and electrodes similar to those used in the work shall be used in qualification tests. Qualification testing of welders and materials used during testing are part of the work.

2.02 PIPE FLANGES

- A. General: Flanges shall have flat faces and shall be attached with bolt holes straddling the vertical axis of the pipe (2-holed) unless otherwise indicated. Attachment of the flanges to the pipe shall conform to the applicable requirements of ANSI/AWWA C207. Flange faces shall be perpendicular to the axis of the adjoining pipe. Flanges for miscellaneous small pipes shall be in accordance with the standards indicated for these pipes.
- B. Pressure Ratings
 - 1. 150 psi or less: Flanges shall conform to either ANSI/AWWA C207 - Steel Pipe Flanges for Waterworks Service--Sizes 4 In. Through 144 In., Class D, or ANSI/ASME B16.5 - Pipe Flanges and Flanged Fittings, 150-lb class.
 - 2. 150 psi to 275 psi: Flanges shall conform to ANSI/ASME B16.5, 300-lb class.
 - 3. 275 psi to 700 psi: Flanges shall conform to ANSI/ASME B16.5, 300-lb class.
 - 4. Selection based on test pressure: AWWA flanges shall not be exposed to test pressures grater than 125 percent of rated capacity. For higher test pressures, the next higher rated AWWA flange or an ANSI-rated flange shall be selected.

- C. Blind Flanges: Blind flanges shall be in accordance with ANSI/AWWA C207, or as indicated for miscellaneous small pipes. Blind flanges for pipe sizes 12 inches and greater shall be provided with lifting eyes in form of welded or screwed eye bolts.
- D. Flange Coating: Machined faces of metal blind flanges and pipe flanges shall be coated with a temporary rust-inhibitive coating to protect the metal until the installation is completed.
- E. Flange Bolts: Bolts and nuts shall conform to Section 055000 - Miscellaneous Metalwork. Studs and bolts shall extend through the nuts a minimum of 1/4-inch. All-thread studs shall be used on all valve flange connections, where space restrictions preclude the use of regular bolts.
- F. Insulating Flanges: Insulated flanges shall have bolt holes 1/4-inch diameter greater than the bolt diameter.
- G. Insulating Flange Sets: Insulating flange sets shall be provided where indicated. Each insulating flange set shall consist of an insulating gasket, insulating sleeves and washers and a steel washer. Insulating sleeves and washers shall be one piece when flange bolt diameter is 1-1/2-inch or smaller and shall be made of acetal resin. For bolt diameters larger than 1-1/2-inch, insulating sleeves and washers shall be 2-piece and shall be made of polyethylene or phenolic material. Steel washers shall be in accordance with ASTM A 325 - Structural Bolts, Steel, Heat Treated, 120/105 ksi Minimum Tensile Strength. Insulating gaskets shall be fullface.
- H. Insulating Flange Manufacturers, or equal

JM Red Devil, Type E
Maloney Pipeline Products Co., Houston
PSI Products, Inc.
- I. Flange Gaskets: Gaskets for flanged joints shall be ring type, with material and thickness in accordance with ANSI/AWWA C207, suitable for temperatures to 700 degrees F, a pH of one to eleven, and pressures to 1000 psig. Blind flanges shall have gaskets covering the entire inside face of the blind flange and shall be cemented to the blind flange.
- J. Flange Gasket Manufacturers, or equal

John Crane, Style 2160
Garlock, Style 3000

2.03 THREADED INSULATING CONNECTIONS

- A. General: Threaded insulating bushings, unions, or couplings, as appropriate, shall be used for joining threaded pipes of dissimilar metals and for piping systems where corrosion control and cathodic protection are involved.
- B. Materials: Threaded insulating connections shall be of nylon, Teflon, polycarbonate, polyethylene, or other non-conductive materials, and shall have ratings and properties to suit the service and loading conditions.

2.04 MECHANICAL-TYPE COUPLINGS & MECHANICAL JOINT ADAPTERS

- A. Mechanical-type Couplings: Cast mechanical-type couplings (grooved or banded pipe) shall be provided where indicated. The couplings shall conform to the requirements of ANSI/AWWA C606 - Grooved and Shouldered Joints. Bolts and nuts shall conform to the requirements of Section 055000 - Miscellaneous Metalwork. Gaskets for mechanical-type couplings shall be compatible with the piping service and fluid utilized, in accordance with the coupling manufacturer's recommendations. The wall thickness of grooved piping shall conform with the coupling manufacturer's recommendations to suit the highest expected pressure. To avoid stress on equipment, equipment connections with mechanical-type couplings shall have rigid-grooved couplings or flexible type coupling with harness in sizes where rigid couplings are not available, unless thrust restraint is provided by other means. Mechanical-type couplings shall be bonded. Have the coupling manufacturer's service representative verify the correct choice and application of couplings and gaskets, and the workmanship, to assure a correct installation. To assure uniform and compatible piping components, all grooved fittings, couplings, and valves shall be from the same manufacturer.

- B. Manufacturers of Couplings for Steel Pipe, or equal

- Aeroquip Corp. (banded or grooved)
 - Victaulic Style 41 or 44 (banded, flexible)
 - Victaulic Style 77 (grooved, flexible)
 - Victaulic Style 07 or HP-70 (grooved, rigid)

- C. Manufacturers of Ductile Iron Pipe Couplings, or equal

- Aeroquip Corp.
 - Victaulic Style 31 (flexible or rigid grooving)

Note: Ductile iron pipe couplings shall be furnished with flush seal gaskets.

- D. Manufacturers of Couplings for PVC Pipe, or equal

- Aeroquip Corp
 - Victaulic Style 77

Note: Couplings for PVC pipe shall be furnished with radius cut or standard roll grooved pipe ends.

- E. Mechanical Joint Adapters: The direct connection of mechanical joint (MJ) fittings shall be made using MJ restraint adapters where indicated on the Construction Drawings. The MJ restraint adapters shall be constructed of ductile iron and comply with applicable AWWA Standards. Bolts and nuts shall conform to the requirements of Section 055000 - Miscellaneous Metalwork. The MJ restraint adapters shall be designed for a working pressure of 200 psi and to withstand a test pressure of 250 psi. MJ restraint adapters shall be lined and coated in accordance with AWWA C104 and C110. Manufacturer shall be Infact Corporation, Foster Adaptor, or approved equal

2.05 SLEEVE-TYPE COUPLINGS

- A. Construction: Sleeve-type couplings shall be provided where indicated, in accordance with ANSI/AWWA C219 - Standard for Bolted Sleeve-Type Couplings for Plain-End Pipe. Couplings shall be steel with steel bolts, without pipe stop. Couplings shall be of sizes to fit the pipe and fittings indicated. The middle ring shall be not less than 1/4-inch in thickness and shall be either 5 or 7 inches long for sizes up to and including 30 inches and 10 inches long for sizes greater than 30 inches, for standard steel couplings, and 16 inches long for long-sleeve couplings. The followers shall be single-piece contoured mill sections welded and coldexpanded as required for the middle rings, and of sufficient strength to accommodate the number of bolts necessary to obtain adequate gasket pressures without excessive rolling. The shape of the follower shall be of such design as to provide positive confinement of the gasket. Bolts and nuts shall conform to the requirements of Section 055000 – Miscellaneous Metal Work. Buried sleeve-type couplings shall be epoxy-coated at the factory as indicated.
- B. Pipe Preparation: Where indicated, the ends of the pipe shall be prepared for flexible steel couplings. Plain ends for use with couplings shall be smooth and round for a distance of 12 inches from the ends of the pipe, with outside diameter not more than 1/64-inch smaller than the nominal outside diameter of the pipe. The middle ring shall be tested by cold-expanding a minimum of one percent beyond the yield point, to proof-test the weld to the strength of the parent metal. The weld of the middle ring shall be subjected to air test for porosity.
- C. Gaskets
 - 1. Gaskets for sleeve-type couplings shall be rubber-compound material that will not deteriorate from age or exposure to air under normal storage or use conditions. Gaskets for wastewater and sewerage applications shall be Buna "N," Grade 60, or equivalent suitable elastomer. The rubber in the gasket shall meet the following specifications:
 - a. Color - Jet Black

- b. Surface - Non-blooming
 - c. Durometer Hardness - 74 plus or minus 5
 - d. Tensile Strength - 1000 psi Minimum
 - e. Elongation - 175 percent Minimum
2. The gaskets shall be immune to attack by impurities normally found in water or wastewater. All gaskets shall meet the requirements of ASTM D 2000 - Classification System for Rubber Products in Automotive Applications, AA709Z, meeting Suffix B13 Grade 3, except as noted above. Gaskets shall be compatible with the piping service and fluid utilized.
- D. Insulating Couplings: Where insulating couplings are required, both ends of the coupling shall have a wedge-shaped gasket which assembles over a rubber sleeve of an insulating compound in order to obtain insulation of all coupling metal parts from the pipe.
- E. Restrained Joints: Sleeve-type couplings on pressure lines shall be harnessed unless thrust restraint is provided by other means. Harnesses shall be designed by the pipe manufacturer in accordance with Manual M11, or as indicated. Harness sets shall be designed for the maximum test pressure of the pipe in which they are installed.
- F. Manufacturers, or equal
- Dresser
 - Ford Meter Box Co.
 - Smith-Blair
 - Romac

2.06 FLANGED COUPLING ADAPTERS

- A. Construction: Flanged coupling adapters (FCA's) shall be provided where indicated, in accordance with the applicable provisions of ANSI/AWWA C219 - Standard for Bolted Sleeve-Type Couplings for Plain End Pipe. FCA's shall be steel with steel bolts, and sized to fit the pipe and fittings indicated. The middle ring shall be not less than 1/4-inch in thickness and shall be a minimum of 5 inches long for sizes up to and including 30 inches. The followers shall be single-piece contoured mill sections welded and cold-expanded as required for the middle ring, and of sufficient strength to accommodate the number of bolts necessary to obtain adequate gasket pressures without excessive rolling. The shape of the follower shall be of such design as to provide positive confinement of the gasket. Bolts and nuts shall be stainless steel. FCA's shall be epoxy-coated at the factory as indicated.
- B. Pipe Preparation: Where indicated, the end of the pipe shall be prepared for use with the FCA and shall be smooth and round for a distance of 12 inches from the ends of the pipe,

with outside diameter not more than 1/64-inch smaller than the nominal outside diameter of the pipe.

C. Gaskets:

1. Gaskets for FCA's shall be rubber-compound material that will not deteriorate from age or exposure to air under normal storage or use conditions. The rubber in the gasket shall meet the following specifications:

Color - Jet Black
Surface - Non-blooming
Durometer Hardness - 74 plus or minus 5
Tensile Strength - 1000 psi Minimum
Elongation - 175 percent Minimum

2. The gaskets shall be immune to attack by impurities normally found in water or wastewater. All gaskets shall meet the requirements of ASTM D 2000 - Classification System for Rubber Products in Automotive Applications, AA709Z, meeting Suffix B13 Grade 3, except as noted above. Gaskets shall be compatible with the piping service and fluid utilized

- D. Restrained Joints: FCA's shall be restrained by the use of thrust blocks, harnesses, or other means. Harness sets shall be designed for the maximum test pressure of the pipe in which they are installed. For PVC and ductile iron pipe, EBAA Iron Sales, Mega-Flange may be substituted for restrained FCA's.

E. Manufacturers, or equal

Dresser, Style 127 & 128W
Smith-Blair, Style 911
Romac, Style FC400 & FCA501
EBAA Iron Sales, Mega-Flange

2.07 EXPANSION JOINTS

- A. Piping subject to expansion and contraction shall be provided with sufficient means to compensate for such movement without exertion of undue forces to equipment or structures. This may be accomplished with expansion loops, bellow-type expansion joints, or sliding-type expansion joints. Expansion joints shall be of stainless steel, monel, rubber, or other materials best suited for each individual service. Submit detailed calculations and manufacturer's Shop Drawings of all proposed expansion joints, piping layouts, and anchors and guides, including information on materials, temperature, and pressure ratings.

2.08 PIPE THREADS

- A. Pipe threads shall be in accordance with ANSI/ASME B1.20.1 - Pipe Threads, General Purpose (inch), and be made up with Teflon tape unless otherwise indicated.

2.09 RESTRAINING GLANDS AND JOINT HARNESSSES

- A. Restraining glands shall be of a model and type designed for the intended pipe material and service conditions, and shall be EBAA Iron Sales, Romac, or approved equal. Joint harnesses shall be of a model and type designed for the intended pipe material and service conditions, and shall be EBAA Iron Sales, Romac, Star, Sigma, or approved equal.

2.10 RESTRAINING GLANDS AND JOINT HARNESSSES

- A. Thrust blocks and anchor blocks shall be constructed of Portland Cement Concrete with a minimum compressive strength of 2500 psi. Anchor rods for anchor blocks shall be #5 rebar or 5/8 inch diameter steel rods, and shall be epoxy coated.

2.11 TAPE WRAPPING AND CATHODIC PROTECTION

- A. All nuts and bolts on all pipe fittings shall be primered and single tape wrapped with Trenton Wax Tape #1 to fully encapsulate the nuts and bolts without any air voids. The nuts and bolts should broadcast through the wax tape . Manufacturer shall be Polyken or approved equal.
- B. Existing buried steel piping shall be cathodically protected by welding a sacrificial anode to the pipe and flat strap jumpers across couplers whenever uncovered for work

2.12 TRACER WIRE

- A. For non-metallic pipelines, 12 gauge continuous location wire shall be placed on all water mains and brought up in valve can per Goleta Water District direction. Underground detectable warning tape shall also be used.

2.13 PIPE HANGERS AND SUPPORTS

- A. Code Compliance: All piping systems and pipe connections to equipment shall be properly anchored and supported to prevent undue deflection, vibration, dislocation due to seismic events and line pressures, and stresses on piping, equipment, and structures. All supports and parts thereof shall conform to the requirements of ANSI/ASME B31.1 - Power Piping, except as supplemented or modified below. Supports for plumbing piping shall be in accordance with the latest edition of the applicable plumbing code or local administration requirement.

- B. **Structural Members:** Wherever possible, pipes shall be supported from structural members. Where it is necessary to frame structural members between existing members, such supplementary members shall be provided. All supplementary members shall be in accordance with the requirements of the building code and the American Institute of Steel Construction and shall be acceptable to the City.
- C. **Pipe Hangers:** Pipe hangers shall be capable of supporting the pipe in all conditions of operation, allowing free expansion and contraction of the piping, and preventing excessive stress on equipment. All hangers shall have a means of vertical adjustment after erection. Hangers shall be designed to prevent becoming disengaged by any movement of the supported pipe. Hangers subject to shock, seismic disturbances, or thrust imposed by the actuation of safety valves, shall include hydraulic shock suppressors. All hanger rods shall be subject to tensile loading only.
- D. **Hangers Subject to Horizontal Movements:** At hanger locations where lateral or axial movement is anticipated, suitable linkage shall be provided to permit such movement. Where horizontal pipe movement is greater than 1/2-inch, or where the hanger rod deflection from the vertical is greater than 4 degrees from the cold to the hot position of the pipe, the hanger rod and structural attachment shall be offset in such a manner that the rod is vertical in the hot position.
- E. **Spring-Type Hangers:** Spring-type pipe hangers shall be provided for piping subject to vibration or vertical expansion and contraction, such as engine exhausts and similar piping. All spring-type hangers shall be sized to the manufacturer's printed recommendations and the loading conditions encountered. Variable spring supports shall be provided with means to limit misalignment, buckling, eccentric loading, or to prevent overstressing of the spring, and with means to indicate at all times the compression of the spring. Supports shall be capable of accommodating at least 4 times the maximum travel due to thermal expansion.
- F. **Thermal Expansion:** Wherever expansion and contraction of piping is expected, a sufficient number of expansion loops or joints shall be provided, together with the necessary rolling or sliding supports, anchors, guides, pivots, and restraints permitting the piping to expand and contract freely in directions away from the anchored points. All components shall be structurally suitable to withstand all loads imposed.
- G. **Heat Transmission:** Supports, hangers, anchors, and guides shall be so designed and insulated, that excessive heat will not be transmitted to the structure or to other equipment.
- H. **Riser Supports:** Where practical, risers shall be supported on each floor with riser clamps and lugs, independent of the connected horizontal piping.

- I. Freestanding Piping: Free-standing pipe connections to equipment such as chemical feeders and pumps shall be firmly attached to steel frames fabricated from angles, channels, or I-beams anchored to the structure. Exterior, free-standing overhead piping shall be supported on fabricated pipe stands consisting of pipe columns anchored to concrete footings, with horizontal, welded steel angles and U-bolts or clamps securing the pipes.
- J. Materials of Construction:
 - 1. General: All pipe support assemblies, including framing, hardware, and anchors, shall be steel construction, galvanized after fabrication, unless otherwise indicated.
 - 2. Submerged Supports: All submerged piping, as well as piping, conduits, and equipment in hydraulic structures within 24 inches of the water level, shall be supported with support assemblies, including framing, hardware, and anchors, constructed of Type 316 stainless steel, unless otherwise indicated.
- K. Point Loads: Any meters, valves, heavy equipment, and other point loads on PVC, FRP, and other plastic pipes, shall be supported on both sides, according to manufacturer's recommendations to avoid undue pipe stresses and failures. To avoid point loads, all supports on PVC, FRP, and other plastic piping shall be equipped with extra wide pipe saddles or galvanized steel shields.
- L. Noise Reduction: To reduce transmission of noise in piping systems, all copper tubes in buildings and structures shall be wrapped with a 2-inch wide strip of rubber fabric or similar, suitable material at each pipe support, bracket, clip, or hanger.

2.14 SUPPORT SPACING

- A. Supports for piping with the longitudinal axis in approximately a horizontal position shall be spaced to prevent excessive sag, bending, and shear stresses in the piping, with special consideration given where components such as flanges and valves impose concentrated loads. Pipe support spacing shall not exceed the maximum spans in the tables below. For temperatures other than ambient temperatures, or those listed, and for other piping materials or wall thicknesses, the pipe support spacings shall be modified in accordance with the pipe manufacturer's recommendations. Vertical supports shall be provided to prevent the pipe from being overstressed from the combination of all loading effects.
 - 1. Support Spacing for Schedule 40 and Schedule 80 Steel Pipe:

Nominal Pipe Diameter (inches)	Maximum Span (feet)

1/2	6
3/4 and 1	8
1-1/4 to 2	10
3	12
4	14
6	17
8 and 10	19
12 and 14	23
16 and 18	25
20 and greater	30

2. Support Spacing for Welded Fabricated Steel Pipe:

Maximum Spans for Pipe Supported in Minimum
 120 degree Contact Saddles (feet)

Nominal Pipe Diameter (inches)	Wall Thickness (inches)							
	3/16	1/4	5/16	3/8	7/16	1/2	5/8	3/4
24	33	37	41	43	45	47		
26	34	38	41	44	46	48		
28	34	38	41	44	47	49		
30	34	38	42	45	48	49		
32	34	39	42	45	48	50		
34	35	39	43	46	48	50		
36	35	39	43	46	49	51	55	
38	35	39	43	46	49	51	55	
40	35	40	43	47	49	52	56	
42	35	40	44	47	50	52	56	
45	--	40	44	47	50	53	57	
48	--	40	44	47	50	53	58	61

For steel pipe sizes not presented in this table, the support spacing shall be designed so that the stress on the pipe does not exceed 5,000 psi. Maximum deflection of pipe shall be limited to 1/360th of the span and shall be calculated by using the formula:

$$L = (7500tD/(32t+D))^{1/2}$$

where: t = Thickness (inches)
 D = Diameter (inches)

$$L = \text{Maximum span (feet)}$$

3. Support Spacing for Ductile-Iron Pipe:

Nominal Pipe Diameter (inches)	Maximum Span (feet)
All Diameters	Two supports per pipe length or 10 feet (one of the 2 supports located at joint)

4. Support Spacing for Copper Tubing:

Nominal Pipe Diameter (inches)	Maximum Span (feet)
1/2 to 1-1/2	4
2 to 4	6
6 and greater	8

5. Support Spacing for Schedule 80 PVC Pipe:

Nominal Pipe Diameter (inches)	Maximum Span (at 100 degrees F) (feet)
1/2	4
3/4	4.5
1	5
1-1/4	5.5
1-1/2	5.75
2	6.25
3	7.5
4	8.25
6	10
8	11
10	12.25
12	13.25

2.15 MANUFACTURED SUPPORTS

- A. Stock Parts: Where not specifically indicated, designs which are generally accepted as exemplifying good engineering practice and use stock or production parts, shall be

utilized wherever possible. Such parts shall be locally available, new, of best commercial quality, designed and rated for the intended purpose.

B. Manufacturers, or Equal:

Basic-PSA, Johnstown, PA
Bergen-Paterson Pipesupport Corp., Woburn, MA
Power Piping Company, Pittsburgh, PA
Standon, Model S89 &S92
Pipeline Products

2.16 COATING

- A. Galvanizing: Unless otherwise indicated, all fabricated pipe supports other than stainless steel or nonferrous supports shall be blast-cleaned after fabrication and hot-dip galvanized in accordance with ASTM A 123 - Specifications for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products.
- B. Other Coatings: Other than stainless steel or non-ferrous supports, all supports shall receive Protective Coatings in accordance with the requirements of Section 099000 - Protective Coatings.

2.17 CONNECTIONS TO EXISTING FACILITIES

- A. All materials used in making the connection or removing the facility from service shall conform to the applicable sections of the City's Standards & Specifications and the Construction Drawings.

PART 3 – EXECUTION

3.01 MATERIAL DELIVERY, STORAGE, AND PROTECTION

- A. Pipe and pipe appurtenances such as fittings, valves, etc. shall be delivered in a clean and undamaged condition. The Contractor shall be responsible for unloading and loading of pipe and pipe appurtenances at the job site in accordance with the manufacturer's printed instructions and recommendations. All pipe shall be unloaded at the site with care using a double padded sling or as specified in the applicable Sections. Pipe appurtenances shall be unloaded at the site with care using hoists or skids to avoid damage to materials. Under no circumstances shall materials be dropped. When unloading pipe, trucks shall be parked on level ground. All pipe and pipe appurtenances shall be kept in a safe storage area where they can be protected from heat, dirt, weather, or other detrimental factors. Cement mortar lined pipe shall be stored with proper stulling per the manufacturer's recommendations. Pipe shall be stored in such a way as not to inflict loading which may cause bending, cracking, or other damage. Pipe appurtenances shall be stored off the

ground for protection against oxidation caused by ground contact. Defective or damaged materials shall be replaced with new materials at the Contractor's expense.

3.02 GENERAL

- A. Pipes, fittings, and appurtenances shall be installed in accordance with the requirements of the applicable Sections of Divisions 2 and 33.
- B. Corrosion Protection: All nuts and bolts on flanges, fittings, couplings, joint harnesses, etc. for buried service shall be tape wrapped, after installation is completed, using heavy duty joint wrap, in accordance with Section 099000 – Protective Coatings. Entire length of bolts and all hardware shall be fully encapsulated with tape wrapping.
- C. Core Drilling: Where core drilling is required for pipes passing through existing concrete, core drilling locations shall be determined by radiograph of concrete construction to avoid damage to embedded raceways and rebar.
- D. Cleanup: After completion of the work, cuttings, joining and wrapping materials, and other scattered debris shall be removed from the Site. The entire piping system shall be handed over in a clean and functional condition.

3.03 THRUST RESTRAINT

- A. General: Thrust restraint shall be provided at all vertical and horizontal bends, tees, crosses, dead ends, hydrants, reducers, valves, and fittings. Thrust restraint shall be accomplished by the use of restraining glands and joint harnesses, or thrust blocks. Restraining Glands shall be used where specified on mechanical joint fittings for PVC and ductile iron pipe.
- B. Restraining Glands and Joint Harnesses: Restraining glands and joint harnesses shall be installed in accordance with manufacturer recommendations. After installation, all nuts and bolts shall be primed and wrapped with 2 layers of 35 mil adhesive pipe wrap. Joint harnesses shall be used in conjunction with retainer glands wherever retainer glands are to be used to provide thrust restraint.
- C. Thrust Blocks: Thrust and anchor blocks shall be formed out of concrete meeting requirements of Section 033000 – Cast-in-Place Concrete. Blocks shall be sized and configured in accordance with Section 2.04 C and Standard Detail 2-08 of these Standards & Specifications. Concrete shall be poured against undisturbed ground.
- D. Epoxy coated number 5 reinforcement bar shall be embedded and wrapped around appurtenance as shown in Standard Detail 2-08. Care shall be taken not to cover fittings, valves, bolts, nuts, or other appurtenances with concrete. Blocks shall be cured 24 hours

prior to backfill, and shall be cured a minimum of 7 days or have 75% of the 28-day strength before the water line can be filled and pressurized.

3.04 TRACER WIRE

- A. Continuous tracer wire shall be placed directly on the top surface of all water mains. Where detectable warning tape is also used, place it no less than 1 foot above the top of the water main.

3.05 INSTALLATION OF PIPE SUPPORTS

- A. General: All pipe supports, hangers, brackets, anchors, guides, and inserts shall be fabricated and installed in accordance with the manufacturer's printed instructions and ANSI/ASME B31.1 - Power Piping. All concrete inserts for pipe hangers and supports shall be coordinated with the formwork.
- B. Appearance: Pipe supports and hangers shall be positioned to produce an orderly, neat piping system. All hanger rods shall be vertical, without offsets. Hangers shall be adjusted to line up groups of pipes at the proper grade for drainage and venting, as close to ceilings or roofs as possible, without interference with other work.

3.06 FABRICATION

- A. Quality Control: Pipe hangers and supports shall be fabricated and installed by experienced welders and fitters, using the best welding procedures available. Fabricated supports shall be neat in appearance without sharp corners, burrs, and edges.

3.07 CONNECTION TO EXISTING WATER LINES

- A. Shutdown Request: The Contractor shall submit a written request to the Goleta Water District a minimum of ten (10) working days before the time of any desired shutdown of existing waterlines or services. The written request shall include the date of the proposed shutdown and the estimated number of hours required to complete the work. The District will review the request and determine the actual time and date of the shutdown based on the availability of District staff.
- B. Authorization: Connections shall be made only by the Goleta Water District. No connection work shall be performed prior to authorization by the District.
- C. Time Schedule: Work which will require disruption of service in water mains shall be planned and executed so that it will not disrupt service before 8:30 A.M. and ensure restoration of service before 4:00 P.M. each day, unless an exception in writing is obtained from the District prior to the shutdown. To comply with this schedule the Contractor must consider the time required to:

1. Turn off customer services and isolation valves;
2. Drain and dispose the water from the isolated section of the water line to be cut;
3. Perform cut-in operations; and
4. Flush the water line prior to service restoration.

Note: If the District determines that the disruption of service may exceed the time limitations, the Contractor shall re-plan the work for more than one day of operation to ensure service is restored by 4:00 P.M. each day.

- D. **Material:** The Contractor shall provide the Goleta Water District with verification that all materials are on hand a minimum of five working days in advance of the proposed shutdown date. The Contractor shall furnish all pipe and materials as may be required for connections the day before of the shutdown date the Contractor shall be fully prepared for the planned work with all required materials, tools, equipment, dewatering equipment, lights, barricades, permits, skilled personnel, and supervision. If adequate preparations have not been made by the Contractor, the District will cancel the shutdown and the Contractor shall be responsible for all costs associated with the cancelled shutdown.
- E. **Inadequate Progress:** If progress is inadequate during the connection operations to complete the connection in the time specified, the Goleta Water District shall order necessary corrective measures. All costs for corrective measures shall be paid by the Contractor.
- F. **Connections:** New mains shall be connected to existing in-service mains against a closed valve prior to disinfection, flushing and pressure testing of the new mains. The Contractor shall not operate the closed valve. Only Goleta Water District field personnel shall operate and/or open existing system valves and valves connecting new mains to the existing in-service mains. Connections shall be made with as little change as possible in the grade of new main. If the grade of the existing pipe is below that of the new pipeline, a sufficient length of the new line shall be deepened so as to prevent the creation of any high spot or abrupt changes in grade of the new line. Where the grade of the existing pipe is above that of the new pipeline, the new line shall be laid at specified depth, except for the first joint adjacent to the connection, which shall be deflected as necessary to meet the grade of the existing pipe. If sufficient change in direction cannot be obtained by the limited deflection of the first joint, a fitting of the proper angle shall be installed. Where the connection creates a high or low spot in the line, a combination air valve or blowoff assembly shall be installed as directed by the District.
- G. **Testing:** The new pipeline shall be disinfected and pressure tested in accordance with Section 02643 – Waterline Disinfection & Testing.

3.08 REMOVAL OF EXISTING MAINS AND APPURTENANCES FROM SERVICE

- A. General: Existing waterlines, conduits, or structures shall be abandoned and removed from service at the locations shown on the Construction Drawings or as directed by the Goleta Water District, in accordance with the District 's Standards & Specifications. At all locations where new waterlines are to be connected to existing waterlines and where portions of the existing waterlines are to be abandoned, the existing waterlines to be abandoned shall be removed for a minimum distance of five feet clear from any waterlines to remain in service. Conduits to be abandoned in place shall be plugged with concrete to form a 2 foot long plug at all openings. Existing valves removed from service due to the abandonment of a waterline shall be closed, the valve can removed, and the hole backfilled with concrete slurry and patched with asphalt.
- B. Removed Material: Removed pipe and appurtenances may be temporarily stockpiled on the job in a location that will not disrupt traffic or be a safety hazard per restrictions and requirements of the County of Santa Barbara. Materials from abandoned facilities shall be salvaged as shown on the Construction Drawings or as indicated in the District's Standards & Specifications. Removed appurtenances to be salvaged shall be delivered to the District's storage yard as directed by the District. Removed pipe shall be disposed of by the Contractor in accordance with State and local regulations.
- C. Maintenance of Service: Before excavating for laying mains that are to replace existing pipes and/or services, the Contractor shall make provisions for maintaining continuous service as directed by the City or Goleta Water District.

END OF SECTION

SECTION 33 05 31.16

PVC GRAVITY PIPE (AWWA C900, MODIFIED)

PART 1 – GENERAL

1.01 REQUIREMENTS

- A. The Contractor shall provide 305 psi or Class 235 polyvinyl chloride (PVC) pressure pipe, complete in place, in accordance with the Contract Documents.

1.02 RELATED WORK SPECIFIED ELSEWHERE

Section 31 23 16 – Trenching, Backfill and Compaction

AWWA Manual M23 PVC Pipe - Design and Installation

1.04 CONTRACTOR SUBMITTALS

- A. Furnish submittals in accordance with Section 013300 - Contractor Submittals.
- B. Shop Drawings: Design calculations to demonstrate compliance of pipe and fittings with this Section. Manufacturer's literature for metallic locating tape.
- C. Certifications: A certified affidavit of compliance for pipe and other products or materials under this Section and the following supplemental requirements:
 - 1. Hydrostatic proof test reports.
 - 2. Sustained pressure test reports.
 - 3. Burst strength test reports.
- D. The Contractor shall be responsible for performing and paying for sampling and testing as necessary for the certifications.

PART 2 – PRODUCTS

2.01 GENERAL

- A. All PVC pressure pipe (4-inch through 12-inch) shall be Class 200, and shall conform to the applicable requirements of ANSI/AWWA C900 subject to additional requirements herein. All large diameter PVC pressure pipe (14-inch through 36-inch) shall be Class 235, and shall conform to the applicable requirements of AWWA C900 and the additional requirements herein. Materials used in manufacture of the pipe shall be tested in accordance with the requirements of this Section and the referenced standards, as applicable.

2.02 PIPE DESIGN CRITERIA

- A. General: PVC pressure pipe shall be designed in accordance with the requirements of Appendix A of ANSI/AWWA C900, Large PVC pressure pipe shall be designed in accordance with the requirements of Manual M23, as applicable, and the supplemental requirements in this Section.

- B. Pipe Wall Thickness for Internal Pressure: The pipe shall be designed with a minimum thickness (t) or dimension ratio (DR) in accordance with paragraph A.3 of the above referenced Appendix A.
- C. Determination of External Loads: Instead of the equations in paragraph A.4 of the above referenced Appendix A, the dead (earth) loads shall be computed using the following 2 equations for trench or embankment conditions as applicable:
- D. In lieu of the equations in the Manual, the dead (earth) loads shall be computed using the following 2 equations for trench or embankment conditions as applicable:

1. Trench Condition:

$$W_d = C_d w B_d^2$$

Where: W_d = Earth load in pounds per linear foot
 C_d = Calculation coefficient
 Ku' = [0.13]
 w = [130] lb/ft³
 B_d = Trench width at top of pipe, feet

2. Positive Projecting Embankment Condition:

$$W_c = C_c w B_c^2$$

Where: W_c = Earth load in pounds per linear foot
 C_c = Calculation coefficient (based on r_{sdP} of 0.75)
 C_c = Calculation coeff. for lg dia. (based on $r_{sdP} = 0.25$)
 Ku = [0.19]
 w = [130] lb/ft³
 B_c = Outside diameter of pipe, feet

- E. Instead of the equations in paragraph A.4, the truck live loads shall be determined using the method recommended by AASHTO in "Standard Specifications for Highway Bridges." For depths of cover less than 10 feet HS-20 live loads shall be added to the earth loads to determine the total load. For depths of cover 3 feet or less, HS-20 live load plus impact shall be included.
- F. Pipe Deflection: With reference to paragraph A.5, the deflection of the pipe after installation shall not exceed 0.03 times the outside diameter.

2.03 PIPE

- A. The pipe shall be Class 200 or 235 (diameter 14 inch and greater) and of the diameter specified or shown, shall be furnished complete with rubber gaskets, and all specials and fittings shall be provided as required in the Contract Documents. The dimensions and

pressure classes for PVC pressure pipe with CastIron Pipe Equivalent O.D.'s shall conform to the requirements of AWWA C900.

- B. Additives and Fillers: Unless otherwise allowed in alternate qualification procedures of PPI-TR3, compounds which have a Hydrostatic Design Basis (HDB) of 4000 psi at 73.4 degrees F and for water shall not contain additives and fillers that exceed the recommended values in Table 1, Part Y of PPI-TR3 (e.g., allowable content range for calcium carbonate is 0.0-5.0 parts per hundred of resin). If requested by the Goleta Water District, the additive and filler content shall be determined using the pyrolysis method as specified in ASTM D 2584.
- C. Joints and Deflection: Joints for the buried PVC pipe shall be integral bell and spigot push-on joints employing a rubber gasket. The bell and coupling shall be the same thickness as of the pipe barrel, or greater thickness. Deflection at the joint shall not exceed 1.5 degrees or the maximum deflection recommended by the manufacturer. No deflection of the joint shall be allowed for joints which are over-belled or not belled to the stop mark.

2.04 FITTINGS

- A. Fittings shall be ductile iron and shall conform to the requirements of ANSI/AWWA C153/A21.53 or ANSI/AWWA C110/A21.10 for diameters 3-inch through 48-inch and shall have a minimum pressure rating of 250 psi. PVC pipe fittings shall be mechanical joint or flanged as indicated on the plans. Each fitting shall be clearly labeled to identify its size and pressure class.
- B. All fittings shall be lined and coated in accordance with AWWA Standards and the requirements of Section 099000 - Protective Coatings.
- C. All mechanical joint fittings shall be supplied with restraining glands for thrust restraint unless otherwise specified on the Construction Drawings.
- D. Couplings shall be Romac 501 straight, Romac XR501, or Smith-Blair.

PART 3 – EXECUTION

3.01 GENERAL

- A. Installation shall conform to the requirements of AWWA M23, instructions furnished by the pipe manufacturer, and to the supplementary requirements herein. Wherever the provisions of this Section and the aforementioned requirements are in conflict, the more stringent provision shall apply.

- B. Laying, jointing, testing for defects and for leakage shall be performed in the presence of the Goleta Water District, and shall be subject to approval before acceptance. Material found to have defects will be rejected and the Contractor shall promptly remove such defective materials from the Site.
- C. The Contractor shall determine the location of existing underground utility structures in the vicinity of proposed pipe installation prior to excavation. All existing above and below ground structures within the work area shall be protected in place unless indicated otherwise on the Construction Drawings.
- D. Whenever the work is not actively in progress, the open ends of all installed pipe shall be plugged or capped with bulkhead mechanical joint end cap to prevent the entry of animals, water, or other undesirable substances.

3.02 HANDLING AND STORAGE

- A. Handling: Pipe, fittings and accessories shall be carefully inspected before and after installation and those found defective will be rejected. Pipe and fittings shall be free from fins and burrs. Before being placed in position, pipe, fittings, and accessories shall be cleaned, and shall be maintained in a clean condition. Proper facilities shall be provided for lowering sections of pipe into trenches. Under no circumstances shall pipe, fittings or any other material be dropped or dumped into trenches.
- B. Storage: Pipe should be stored, if possible, at the Site in unit packages provided by the manufacturer. Caution should be exercised to avoid compression damage or deformation to bell ends of the pipe. Pipe should be stored in such a way as to prevent sagging or bending and be protected from exposure to direct sunlight by covering with an opaque material while permitting adequate air circulation above and around the pipe. Gaskets should be stored in a cool, dark place out of the direct rays of the sun, preferably in original cartons.

3.03 TRENCHING AND BACKFILL

- A. Trench excavation and backfill shall conform to the requirements of Section 312316 – Trenching, Backfill and Compaction.

3.04 INSTALLATION

- A. Bell-and-spigot pipe shall be laid with the bell end pointing in the direction work is progressing. Pipe shall be graded in straight lines, taking care to avoid the formation of any dips or low points. Pipe shall not be laid when the conditions of trench or weather are unsuitable. Pipe shall be laid uphill on grades 10% or greater.

- B. Pipe shall be supported at its proper elevation and grade, care being taken to secure firm and uniform support. Wood support blocking will not be permitted. The full length of each section of pipe and fittings shall rest solidly on the pipe bed, with recessed excavation to accommodate bells, joints, and couplings. Anchors and supports shall be provided where indicated and where necessary for fastening work into place. Fittings shall be independently supported.
- C. Short lengths of pipe shall be used in and out of each rigid joint or rigid structure. Piping that does not allow sufficient space for proper installation of jointing material shall be replaced by one of proper dimensions. Blocking or wedging between bells and spigots will not be permitted. Pipe alignment shall be checked after each length of pipe is installed to insure the downstream pipe did not deflect. Pipe shall not deflect at the joints more than 75% of manufacturer's printed recommendations. Trench shall not be backfilled prior to pipeline inspection by the Goleta Water District. Any pipeline buried prior to inspection shall be uncovered by the Contractor, at his own expense, for the District to inspect.
- D. Joints shall be installed according to manufacturer's recommendations. The surfaces of the pipe spigot end, bell and gasket shall be cleaned just prior to joining pipes. The spigot end of the pipe shall be beveled and checked for proper fit in the bell end without causing damage to the gasket. A lubricant, approved by the pipe manufacturer, shall be applied to the spigot end prior to joining pipes. The spigot shall penetrate bell completely as indicated by penetration line. Trenches shall be kept free of water until joints have been properly made. The maximum combined deflection at any coupling shall be in accordance with the manufacturer's recommendations.
- E. Pipe shall be cut by means of saws, power driven abrasive wheels, or pipe cutters, which will produce a square cut. No wedge-type roller cutters will be permitted. After cutting, the end of the pipe shall be beveled using a beveling tool, portable type sander, or abrasive disc. The pipe shall be remarked with a penetration line at the required penetration depth.
- F. Work Stoppage: At the end of each working day, Contractor shall plug or cap the open ends of all unfinished pipelines with securely bolted mechanical joint plugs, mechanical joint end caps, or blind flanges. If pipe is subject to flooding, pipe shall be anchored as precaution against flotation. Trenches shall be backfilled in accordance with the City Standards and Specifications.

3.05 SERVICE CONNECTIONS

- A. Service Connections: Direct tapping will not be permitted. Bronze service clamps shall be used for all service connections. Service clamps shall have a bearing area of sufficient width along the axis of the pipe, so that the pipe will not be distorted when the saddle is made tight. An internal shell cutter shall be used to drill through the corporation stop to

minimize PVC shavings, retain the coupon, and reduce stress. Single fluted shell cutters or twist drills are not acceptable. Lubricate the cutting and tapping edges of the tool with cutting lubricant. Make the cuts slowly and use the follower very lightly - do not force cutter through pipe wall. Shell cutter shall have sufficient throat depth to handle the heavy wall PVC pipe. Maximum outlet size permitted with service clamps or saddle is 2 inches.

- B. Tapping sleeves and valves shall be used for all outlet sizes greater than 2 inches in diameter. Tapping sleeves shall be assembled and installed in accordance with the manufacturer's recommendations.

3.06 CONNECTIONS TO EXISTING PIPELINES

- A. The Contractor shall locate all underground improvements and install the pipelines to the depths indicated. Where the new work is to be connected to existing pipelines, the Contractor shall make its arrangements with the Goleta Water District well in advance of the connections, to allow adequate time for dewatering of the existing line, if necessary, and shall expedite the work to minimize water outages to the users. Where sections of existing distribution mains are taken permanently out of service and abandoned in place, the cut ends shall be plugged solid with concrete to a depth of not less than two pipe diameters.

3.07 FIELD TESTING AND DISINFECTION

- A. Field testing and disinfection and water mains shall conform to the requirements of Section 330110 - Waterline Disinfection & Testing.

END OF SECTION

SECTION 33 05 31.11

PVC GRAVITY PIPE

PART 1 – GENERAL

1.01 GENERAL

- A. This section applies to the requirements for unplasticized PVC plastic pipe for sanitary sewers, storm drains, and house connection sewers.

1.02 TEST REQUIREMENTS

- A. Pipe, fittings, and couplings shall meet the requirements of the section titled “Requirements” of ASTM D3034, or F679 (“T-1” wall only). During production of the pipe, the manufacturer shall perform the specified tests for each pipe marking. A Certificate of Compliance by the manufacturer indicating compliance with specification requirement shall be delivered with the pipe. This Certificate of Compliance shall include the test result data.
- B. The basis for acceptance will be the inspection of pipes, fittings, and couplings, and compliance with the Specifications. When the pipe is delivered to the work site, the Engineer may require additional testing to determine conformance with the requirements of pipe flattening, impact resistance, pipe stiffness, and extrusion quality.
- C. When testing is required by the Engineer, one test pipe shall be selected at random by the Engineer from each 1,200 ft or fraction thereof of one test pipe per lot. A lot shall be defined as pipe having the same identification marking. The length of specimen for each selected pipe shall be a minimum of 8 feet.
- D. Chemical Resistance and Physical Testing: PVC shall conform to table below:

Property	ASTM Test Method	Values (Initial and After 112-Day Exposure)		
		Cell Classification		
		12454	13343	13364
Tensile stress at yield, psi, min.	D638	7000	6000	6000
Impact Strength ft-lbs /inch of notch, min,	D256 Method A Size ½ x 1/8 x 2-1/2”	0.65	1.5	1.5

Weight Change Unconditioned Conditioned	D543			+/- 1.5% max
		+/- 1.5% max +/- 1.0 % max	+/- 1.5% max +/- 1.0 % max	+/- 1.0 % max

PART 2 – PRODUCTS

2.01 MANUFACTURING REQUIREMENTS

- A. Pipe shall be made of PVC plastic having a cell classification of 12454 or 13364 as defined in ASTM D1784. The fittings shall be made of PVC Plastic having a cell classification of 12454 or 13343. Additives and fillers, including but not limited to stabilizers, antioxidants, lubricants, colorants, etc. shall not exceed 10 parts by weight per 100 of PVC resin in the compound.
- B. Joints for sanitary sewers, except house connection sewers, shall be gasketed joints.
- C. Pipe fittings, couplings, and joints for solid wall pipe shall conform to the requirements shown below:

Nominal Size (in)	ASTM	Wall Thickness Min.
4 – 15	D3034	SDR 35
18- 30	F679	“T-1” only

2.02 IDENTIFICATION MARKS

- A. All pipes, fitting, and couplings shall be clearly marked at intervals not to exceed 5 feet as follows:
 1. Nominal pipe diameter
 2. PVC cell classification
 3. Company, plant, shift, ASTM, SDR, and date designation
 4. Service designation or legend

For fittings and couplings, the SDR designation is not required.

2.03 JOINING SYSTEMS

- A. General:
 1. All pipe shall have a home mark on the spigot end to indicate proper penetration when the joint is made. The socket and spigot configurations for the fittings and couplings shall be compatible to those used for the pipe.

B. Elastomeric Gasket Joints

1. Pipe with gasketed joints shall be manufactured with a socket configuration which will prevent improper installation of the gasket and will ensure that the gasket remains in place during the joint operation. The gasket shall be manufactured from a synthetic elastomer.

C. Solvent Cement Joints

1. Pipe with solvent cement joints shall be joined with PVC cement conforming to ASTM D2564.

D. Injection Sealed Joints

1. Pipe with injection sealed joints shall be sealed with a PVC adhesive compound. The compound shall conform to the requirements of ASTM D2564 and shall have a minimum viscosity of 50,000 centipoises. The internal diameter of the socket shall be uniform with a locking taper at the base and an outer seal ring attached to the end. The socket shall have an injection port to inject the adhesive and an exhaust port on the opposite site to allow air to escape from the annular space.

PART 3 – EXECUTION

3.01 GENERAL

- A. Installation shall conform to the instructions furnished by the pipe manufacturer, and to the supplementary requirements herein. Wherever the provisions of this Section and the aforementioned requirements are in conflict, the more stringent provision shall apply.
- B. The CONTRACTOR shall determine the location of existing underground utility structures in the vicinity of proposed pipe installation prior to excavation. All existing above and below ground structures within the work area shall be protected in place unless indicated otherwise on the Construction Drawings.

3.02 TRENCHING AND BACKFILL

- A. Trench excavation and backfill shall conform to the requirements of Section 31 23 16 –Trenching, Backfill and Compaction.

END OF SECTION

SECTION 33 05 33.13

HDPE GRAVITY PIPE

PART 1 – GENERAL

1.01 GENERAL

- A. These specifications apply to high density polyethylene, annular corrugated pipe and applicable fittings and coupling systems intended for use in the construction of gravity flow storm drains, culverts, and subsurface drains. The size, type, and material properties of the pipe to be furnished shall be shown on the Plans.

1.02 TEST REQUIREMENTS

- A. For testing purposes, a production lot size shall consist of all pipe having the same lot marking number, but shall not exceed a total of 50 lengths per day.
- B. A minimum of 3 pipe specimens per production run shall be tested for pipe stiffness and pipe flattening in accordance with ASTM D2412 modified as follows:
1. The test specimens shall be a minimum of one diameter length.
 2. Position the first specimen in the loading machine with an imaginary line connecting the two seams formed by the corrugation mold (end view) parallel to the loading planes, when applicable. The specimen shall lie flat on the plate within 1/8 inch. The specimen may be straightened by hand bending at room temperature to accomplish this. The first location shall be used as a reference point for rotation and testing of the other two specimens. Rotate the other specimens 45 and 90 degrees, respectively, from the reference point. Each specimen shall be tested in one position only.
 3. The deflection indicator shall be readable and accurate to plus or minus 7.9×10^{-4} inches.
 4. The beginning point for deflection measurement shall be at a load of 4.5 plus or minus 1.1 pounds. This point shall be considered as the origin of the load deflection curve.
 5. The specimens shall be flattened until the vertical inside diameter is reduced by 20 percent. The loading shall conform to the same rate as above. The specimens shall not exhibit any cracking, splitting or delamination. Wall buckling is indicated by reverse curvature in the pipe wall accompanied by a decrease in the load carrying ability of the pipe. And decrease or downward deviation in the pipe stiffness test curve shall be considered a wall buckling point.

C. Brittleness

1. Test pipe specimens shall be tested in accordance with ASTM D2444, except 6 specimens shall be tested, or 6 impacts shall be made on one specimen. In the latter case, successive impacts shall be separated by 120 plus or minus 10 degrees for impacts made on one circle, or at least 12 inches longitudinally for impacts made on one element. Impact points shall be at least 6 inches from the end of the specimen. A tup (type B) shall be used, with a mass of 10 pounds. The height of drop shall be 10 feet. A flat plate specimen holder shall be used. Specimens shall be conditioned for 24 hours at a temperature of 24.8 plus or minus 1.8 deg F, and all tests shall be conducted within 60 seconds of removal from this atmosphere. The center of the falling tup shall strike on a corrugation crown for all impacts.

D. Environmental Stress Cracking of Finished Pipe

1. Pipe shall be tested for environmental stress cracking in accordance with ASTM D1693 as follows:
 - a. Three specimens shall be tested.
 - b. Each specimen shall consist of a 90-degree arc length of pipe.
 - c. Bend the specimens to shorten the inside chord length 20 plus or minus 1 percent and retain in this position using a suitable holding device. Determine the arc chord measurement (B) of the specimen under test as follows:
 - i. Place the bent specimen in a container of suitable size and cover completely with a preheated wetting agent at 122 plus or minus 1.8 deg F. Maintain this temperature for 24 hours, and then remove the sample and inspect immediately. The wetting agent used in this test shall be 100 percent nonylphenoxy poly (ethyleneoxy) ethanol.

E. Slow Crack Growth Resistance

1. Basic resin compounds shall be tested for stress crack resistance in accordance with ASTM F2136 modified as follows:
 - a. The applied stress for the NCLS test shall be 600 pounds per square inch.
 - b. The notched depth shall be 20 percent of the nominal thickness of the specimen.
 - c. The average failure time of the 5 test specimens shall not be less than 24 hours with no single test specimen's failure time less than 17 hours.

1.03 PIPE ACCEPTANCE OR REJECTION

- A. Pipe shall be free of cracks, holes, delaminations, foreign inclusions, blisters, or other defects that would, due to their nature, degree or extent, have a deleterious effect on pipe performance as determined by the Engineer. Prior to installation, damaged pipe shall either be repaired or field cut to remove the damaged portion as approved by the Engineer and in accordance with the manufacturer’s recommendations.

PART 2 – PRODUCTS

2.01 MARKINGS

- A. Pipes and fittings shall be clearly marked at intervals of 11.5 feet or less. Markings shall display the manufacturer’s name and/or trademark, nominal size, plant design code and date of manufacture.

2.02 MATERIALS

- B. Pipes and fittings shall be made of HDPE that conforms to the requirements of AASHTO M294. The residue for ignition shall not exceed 30 percent as determined by ASTM 2584 except that the furnace temperature shall be 840 degrees F plus or minus 40 degrees F.
- C. Nominal Diameter, Wall Thickness and Pipe stiffness

- 1. The inside diameter, minimum wall thickness, and minimum pipe stiffness shall be as specified in the table below:

Diameter (in)	Minimum Wall thickness (in)	Minimum Pipe Stiffness (psi)
12	0.035	50
15	0.039	42
18	0.050	40
24	0.059	34
30	0.059	28
36	0.069	22
42	0.070	20
48	0.070	18
60	0.080	14

- 2. The nominal diameter for each pipe shall be determined in accordance with ASTM D2122. The diameter shall not vary from a true circle by more than 2 percent of the nominal diameter. The wall thickness and inside diameter for each production pipe shall be determined in accordance with AASHTO M294. Wall thickness of Type S corrugated polyethylene pipe shall be the thickness of the inner liner measured between corrugated valleys.

2.03 JOINTS, FITTINGS, AND CONNECTIONS

A. Water-Tight Joints

1. Pipes shall be joined with bell and spigot joints and unless otherwise shown on the Plan. Pipe shall incorporate a gasket. Water-tight joints shall be tested at a pressure of at least 11 psi in conformance with ASTM D3212. The manufacturer shall clearly identify watertight joints on the pipe delivered to the work site.

B. Silt-Tight Joints

1. Pipe shall be joined with bell and spigot joints and shall at a minimum be silt tight and leak resistant. Silt-tight joints shall conform to ASTM D3212, modified to a test pressure of at least 2 pounds per square inch.

C. Fittings

1. Corrugated fittings include in-line joint fittings, such as couplings and reducers, and branch or complimentary assembly fittings such as tees, whyes, and end caps. Fittings shall be installed in accordance with the Plans.
 - a. Fittings shall not reduce or impair the overall integrity or function of the pipe.
 - b. Fittings shall not reduce the inside diameter of the pipe being joined by more than ½ inch. Reducer fittings shall not reduce the cross-sectional area of the smaller size.
 - c. Fabricated fittings shall be welded on the interior and exterior of all junctions.
 - d. Fittings shall be silt tight and leak resistant, and shall conform to ASTM D3212, modified to a test pressure of at least 2 pounds per square inch.

D. Joint integrity shall be tested in accordance with the following:

1. Each fitting or coupling shall be assembled in accordance with the manufacturer's recommendations. Use pipe samples at least 12 inches in length. Assemble a specimen at least 21 inches in length with the connection at the center.
2. Load the connected pipe and fitting between parallel plates at the rate of ½ inch per minute until the vertical inside diameter is reduced by at least 20 percent of the nominal diameter of the pipe.
3. Inspect for damage while at the specified deflection and after removal of the load.
4. Measure the maximum radial distance between pipe and fittings or between bell and spigot, during the test and after the load is removed.

5. Pipe connections shall not separate to create a gap exceeding 2/16 inch when measure in the radial direction between pipe and coupling or between bell and spigot portions of the pipe. The gap measurement shall be taken at the gasket or hinge point. The test shall be conducted on a fully assembled joint, including the gasket. Fittings shall not crack or delaminate.

PART 3 – EXECUTION

3.01 GENERAL

- A. Installation shall conform to the instructions furnished by the pipe manufacturer, and to the supplementary requirements herein. Wherever the provisions of this Section and the aforementioned requirements are in conflict, the more stringent provision shall apply.
- B. The CONTRACTOR shall determine the location of existing underground utility structures in the vicinity of proposed pipe installation prior to excavation. All existing above and below ground structures within the work area shall be protected in place unless indicated otherwise on the Construction Drawings.

3.02 TRENCHING AND BACKFILL

- A. Trench excavation and backfill shall conform to the requirements of Section 312316 – Trenching, Backfill and Compaction.

END OF SECTION

SECTION 33 12 13

BACKFLOW PREVENTION DEVICES

PART 1 – GENERAL

1.01 REQUIREMENTS

- A. The Contractor shall furnish and install all lead-free backflow prevention devices with associated valves, piping, instrumentation, and controls as shown on the Construction Drawings and specified herein, complete and operable, for backflow prevention. For fire lines, a double check detector assembly shall be used unless there is secondary source of pressurized water or recycled water on site, in which case a Reduced Pressure (RP) Zone Backflow device shall be used.

1.02 RELATED WORK SPECIFIED ELSEWHERE

Section 33 05 09 – Piping, General

Section 33 14 23 – Manholes, Vaults, & Meter Boxes

Section 33 14 17 – Service Connections

1.03 REFERENCE SPECIFICATIONS, CODES, AND STANDARDS

- A. Codes: All codes, as referenced herein, are specified in Section 014200 - Reference Standards.
- B. Commercial Standards:

ISA - S 5.1 Instrumentation Symbols and Identification

ANSI - B16.1 Cast Iron Pipe Flanges and Flanged Fittings, Class 25, 125, 250, and 800

ANSI/AWWA C207 Steel Pipe Flanges for Waterworks Service - Sizes 4 In through 144 In

ANSI/AWWA C510 Double Check Valve Backflow Prevention Assembly

ANSI/AWWA C511 Reduced Pressure Principle Backflow Prevention Assembly

1.04 CONTRACTOR SUBMITTALS

- A. The Contractor shall submit complete shop drawings of backflow prevention devices for review in accordance with Section 013300 - Contractor Submittals. With the shop drawings, the Contractor shall also furnish certified curves indicating flow versus differential pressure.

PART 2 – PRODUCTS

2.01 BACKFLOW PREVENTION DEVICES

- A. Approved devices shall be lead-free and shall be as outlined in Part III of these Standards & Specifications. Devices shall conform to the requirements of the Goleta Water District, the County of Santa Barbara Environmental Health Services Division, the State of California Department of Drinking Water, and AWWA Standards C510 and C511.

PART 3 – EXECUTION

3.01 INSTALLATION

- A. The Contractor shall assemble and install all equipment specified herein, in strict accordance with the manufacturer's published instructions, under the supervision of the manufacturer's representative, under the general review of the Goleta Water District. All installations shall be accomplished by competent craftsmen in a workmanlike manner. At a minimum testing and certifications shall be completed after meter installation and before it is unlocked for permanent use. Ongoing testing shall be performed on an annual basis.

3.02 BACKFLOW PREVENTION DEVICES

- A. Backflow Prevention devices shall be installed as required by the signed Plans, the Goleta Water District's Standards & Specifications and the County of Santa Barbara Environmental Health Services Division.

3.03 TESTING

- A. Equipment shall be prepared for operational use in accordance with manufacturer's instructions, including bench test and calibration, where required. Each item shall be subjected to an operating test over the total range of capability of the equipment. Where applicable, tests shall be conducted in accordance with the Test Code of the Standards of the Hydraulic Institute.

3.04 ACCEPTANCE BY AGENCY

- A. Final acceptance of the equipment is contingent on satisfactory operation after installation and certification of backflow prevention device.

END OF SECTION

SECTION 33 12 16

VALVES AND APPURTENANCES

PART 1 – GENERAL

1.01 DESCRIPTION

- A. This section describes the materials and installation procedures gate valves, butterfly valves, ball valves, combination air valves (CAV), pressure reducing valves, pressure relief valves, check valves, stainless steel tapping sleeves, pressure gauges, and appurtenances (valve cans, extensions, CAV enclosures).

1.02 REQUIREMENTS

- A. The Contractor shall provide all valves, actuators, valve cans, and appurtenances, complete and operable, in accordance with the Contract Documents.
- B. The provisions of this Section shall apply to all valves and valve actuators except where otherwise indicated. Valves and actuators in particular locations may require a combination of units, sensors, limit switches, and controls indicated in other Sections of the Specifications.
- C. Where a valve is to be supported by means other than the piping to which it is attached, the Contractor shall obtain from the valve manufacturer a design for support and foundation. The design, including drawings and calculations sealed by the Project Engineer, shall be submitted with the Shop Drawings. When the design is approved, the support shall be provided.
- D. Unit Responsibility: A single manufacturer shall be made responsible for coordination of design, assembly, testing, and furnishing of each valve, sleeve, and actuator; however, the Contractor shall be responsible to the District for compliance with the requirements of each valve section or sleeve. Unless indicated otherwise, the responsible manufacturer shall be the manufacturer of the valve or sleeve.
- E. Single Manufacturer: Where two or more valves of the same type and size are required, the valves and actuators shall be furnished by the same manufacturer. Where indicated, valves may be provided with actuators manufactured by the valve manufacturer. Where actuators are furnished by different manufacturers, the Contractor shall coordinate selection to have the fewest number of manufacturers possible. Where two or more tapping sleeves of the same type or size are required, the sleeves shall be produced by the same Manufacturer.

1.03 RELATED WORK SPECIFIED ELSEWHERE

- Section 03 3 000 – Cast-in-Place Concrete
- Section 31 23 16 – Trenching, Backfill and Compaction
- Section 33 01 10 – Waterline Disinfection & Testing
- Section 33 05 09 – Piping, General
- Section 09 90 00 – Protective Coatings

1.04 CONTRACTOR SUBMITTALS

- A. General: Submittals shall be furnished in accordance with Section 013300 – Contractor Submittals.
- B. Submit shop drawings. Submit manufacturer's catalog data. Show dimensions, materials of construction by ASTM reference and grade, and coatings. A cavitation study shall be submitted for pressure reducing valves.
- C. Shop Drawings of all tapping sleeves and service saddles shall be submitted as a completed package. Shop Drawings shall contain the following information:
 - 1. Valve name, size, Manufacturer, model number, pressure rating, identification number (if any), and specification section number.
 - 2. Assembly drawings with part nomenclature, materials, dimensions, and weights.
 - 3. Tapping Sleeve Labeling: A schedule of sleeves to be labeled, indicating in each case the sleeve location and the proposed wording for the label.
- D. Shop Drawings. The Contractor shall submit complete Shop Drawings of butterfly valves and actuators, with drawings showing valve port diameter complete with dimensions, part numbers and materials of construction. Certification of proof-of-design test from the valve manufacturer shall also be provided.
- E. Manufacturer's Certification that the valve complies with all applicable provisions of AWWA C504 – Rubber-Seated Butterfly Valves.
- F. Technical Manual: The Technical Manual shall contain the required information for each valve.

1.05 QUALITY ASSURANCE

- A. Valves shall be subjected to performance, leakage, and hydrostatic tests in accordance with procedures and acceptance criteria established by AWWA C504.

PART 2 – PRODUCTS

2.01 GENERAL

- A. General: Valves and actuators shall be new and of current manufacture. Shut-off valves 6-inches and larger within vaults and above ground shall have actuators with position indicators. Buried valves shall be provided with valve cans and lids, and valve stem extensions.
- B. Protective Coatings: The exterior surfaces of all valves and the wet interior surfaces of ferrous valves of sizes 4 inches and larger shall be coated in accordance with Section 099000- Protective Coatings. The valve Manufacturer shall certify in writing that the required coating has been applied and tested in the manufacturing plant prior to shipment, in accordance with these Specifications.
- C. Valve Labeling: Except when such requirement is waived by the Goleta Water District in writing, a label shall be provided on all shut-off valves and control valves except for hose bibs. The label shall be of 1/16-inch plastic or stainless steel, minimum 2 inches by 4 inches in size, and shall be permanently attached to the valve or on the wall adjacent to the valve as directed by the Goleta Water District.
- D. Valve Testing: As a minimum, unless otherwise indicated or recommended by the reference Standards, valves 3 inches in diameter and smaller shall be tested in accordance with manufacturer's standard and 4 inches in diameter and larger shall be factory tested as follows:
 - 1. Hydrostatic Testing: Valve bodies shall be subjected to internal hydrostatic pressure equivalent to twice the water rated pressure of the valve. Metallic valves rating pressures shall be at 100 degrees F and plastic valves shall be 73 degrees, or at higher temperature according to type of material. During the hydrostatic test, there shall be no leakage through the valve body, end joints, or shaft seals, nor shall any part of the valve be permanently deformed. The duration shall be sufficient time to allow visual examination for leakage. Test duration shall be at least 10 minutes.
 - 2. Seat Testing: Valves shall be tested for leaks in the closed position with the pressure differential across the seat equal to the water rated pressure of the valve. The duration of test shall be sufficient time to allow visual examination for leakage. Test duration shall be at least 10 minutes. Leakage past the closed valve shall not exceed 1 fluid ounce per hour per inch diameter for metal seated valves and drop-tight for resilient seated valves.

3. Performance Testing: All valves shall be shop operated from fully closed to fully open position and reverse under no-flow conditions in order to demonstrate the valve assembly operates properly.
- E. Certification: Prior to shipment, the Contractor shall submit for valves over 12 inches in size, certified, notarized copies of the hydrostatic factory tests, showing compliance with the applicable standards of AWWA, ANSI, or ASTM.
- F. Valve Marking: Valve bodies shall be permanently marked in accordance with MSS SP25 - Standard Marking Systems for Valves, Fittings, Flanges, and Unions.

2.02 MATERIALS

- A. General: Materials shall be suitable for the intended application. Materials not indicated shall be high-grade standard commercial quality, free from defects and imperfections that might affect the serviceability of the product for the purpose for which it is intended. Actuators shall be current models of the best commercial quality materials and liberally-sized for the required torque. Unless otherwise indicated, valve and actuator bodies shall conform to the following requirements:
 1. Cast Iron: Close-grained gray cast iron, conforming to ASTM A 48 - Gray Iron Castings, Class 30, or to ASTM A 126 - Gray Iron Castings for Valves, Flanges, and Pipe Fittings.
 2. Ductile Iron: ASTM A 536 - Ductile Iron Castings, or to ASTM A 395 - Ferritic Ductile Iron Pressure-Retaining Castings for Use at Elevated Temperatures.
 3. Bronze: ASTM B 62 - Composition Bronze or Ounce Metal Castings, and valve stems not subject to dezincification shall conform to ASTM B 584 - Copper Alloy Sand Castings for General Applications.
 4. Stainless Steel: Stainless steel valve and operator bodies and trim shall conform to ASTM A 351 - Steel Castings, Austenitic, for High-Temperature Service Pressure-Containing Parts, Grade CF8M, or shall be Type 316 stainless steel.
 5. NSF Standard 61: All materials shall be listed for use in contact with potable water.

2.03 VALVE CONSTRUCTION

- A. Bodies: Valve bodies shall be cast, molded (in the case of plastic valves), forged, or welded of the materials indicated, with smooth interior passages. Wall thicknesses shall be uniform in agreement with the applicable standards for each type of valve, without casting defects, pinholes, or other defects that could weaken the body. Welds on welded bodies shall be done by certified welders and shall be ground smooth. Valve ends shall be

as indicated, and be rated for the maximum temperature and pressure to which the valve will be subjected.

- B. Bonnets: Valve bonnets shall be clamped, screwed, or flanged to the body and shall be of the same material, temperature, and pressure rating as the body. The bonnets shall have provision for the stem seal with the necessary glands, packing nuts, or yokes.
- C. Stems: Valve stems shall be of the materials indicated, or, if not indicated, of the best commercial material for the specific service, with adjustable stem packing, O-rings, Chevron V-type packing, or other suitable seal. Where subject to dezincification, bronze valve stems shall conform to ASTM B 62, containing not more than 5 percent of zinc or more than 2 percent of aluminum, with a minimum tensile strength of 30,000 psi, a minimum yield strength of 14,000 psi, and an elongation of at least 10 percent in 2 inches. Where dezincification is not a problem, bronze conforming to ASTM B 584 may be used, except that zinc content shall not exceed 16 percent.
- D. Internal Parts: Internal parts and valve trim shall be as indicated for each individual valve. Where not indicated, valve trim shall be of Type 316 stainless steel or other best suited material.
- E. Operating Nuts: Buried operating nuts shall comply with AWWA C500 - Metal-Seated Gate Valves for Water Supply Service.
- F. Nuts and Bolts: Nuts and bolts on valve flanges and supports shall be in accordance with Section 05500 - Miscellaneous Metalwork.

2.04 ACTUATORS

- A. General: Unless otherwise indicated, valves and gates shall be furnished with manual actuators. Valves in sizes up to and including 4 inches shall have direct acting lever or handwheel actuators of the Manufacturer's best standard design. Larger valves and gates shall have gear- assisted manual actuators, with an operating pull of maximum 60 pounds on the rim of the handwheel. Buried and submerged gear-assisted valves, valves 30 inches in diameter and larger, and where so indicated, shall have worm-gear actuators, hermetically-sealed and grease-packed, where buried or submerged. All other valves 6 inches to 24 inches in diameter may have traveling-nut actuators, worm-gear actuators, spur- or bevel-gear actuators, as appropriate for each valve. The Contractor shall furnish actuators complete and operable with mounting hardware, handwheels, levers, and extensions, as applicable. Actuators shall have the torque ratings equal to or greater than required for valve seating and dynamic torques, whichever is greater and shall be capable of holding the valve in any intermediate position between fully-open and fully-closed without creeping or fluttering.

- B. Mounting: Actuators shall be securely mounted by means of brackets or hardware specially designed and sized for this purpose and of ample strength. The word "open" shall be cast on each valve or actuator with an arrow indicating the direction to open in the counter-clockwise direction. Non-buried gear and power actuators shall be equipped with position indicators.
- C. Manual Worm-Gear Actuator: The actuator shall consist of a single or double reduction gear unit contained in a weather-proof cast-iron or steel body with cover and minimum 12-inch diameter handwheel. The actuator shall be capable of 90-degree rotation and shall be equipped with travel stops capable of limiting the valve opening and closing. The actuator shall consist of spur or helical gears and worm-gearing. The spur or helical gears shall be of hardened alloy steel and the worm-gear shall be alloy bronze. The worm-gear shaft and the handwheel shaft shall be of 17-4 PH or similar stainless steel. All gearing shall be accurately cut with hobbing machines. Ball or roller bearings shall be used throughout. Actuator output gear changes shall be mechanically possible by simply changing the exposed or helical gearset ratio without further disassembly of the actuator. All gearing shall be designed for a 100 percent overload.
- D. Traveling-Nut Actuator: The actuator shall consist of a traveling-nut with screw (Scotch yoke) contained in a weather-proof cast-iron or steel housing with spur gear and minimum 12-inch diameter handwheel. The screw shall run in 2 end bearings, and the actuator shall be self-locking to maintain the valve position under any flow condition. The screw and gear shall be of hardened alloy steel or stainless steel, and the nut and bushings shall be of alloy bronze. The bearings and gear shall be grease-lubricated by means of grease nipples. All gearing shall be designed for a 100 percent overload.

2.05 VALVE CANS AND LIDS

- A. Unless otherwise indicated, buried valves shall be in cast iron valve cans with lids permanently labeled "WATER" for potable waterlines and "RW" for recycled waterlines. Valves shall have extension stems with square nuts or floor stands, position indicators, and PVC pipe extensions for valve cans. Size and type of valve cans and lids shall match existing valve cans and lids so as to be interchangeable. Valve cans shall be the 3-piece adjustable type. All materials used in manufacturing shall conform to ASTM 48-30. Frame and Cover shall exceed H-20 wheel loading. Castings shall be dipped in black bituminous coating. Valve cans shall be Parkson "Buffalo" style, South Bay Foundry, Sigma, or approved equal.

2.06 VALVE STEM EXTENSIONS AND ACCESSORIES

- A. Extensions: Unless otherwise indicated, buried valves shall be furnished complete with valve stem extensions and other accessories required to provide a functional system. Buried valves shall have valve stem extensions extending to 12 inches below finished grade. Valve stem extensions shall be fabricated steel or fiberglass as indicated in GWD

Standard Detail 3-08. The maximum length of fiberglass valve stem extensions shall be 8 feet. Fiberglass valve stem extensions shall be manufactured by Pipeline Products, San Marcos, CA, or approved equal.

- B. Stem Guides: Stem guides shall be provided, spaced 10-feet on centers unless the manufacturer can demonstrate by calculation that a different spacing is acceptable. Submerged stem guides shall be 304 stainless steel.

2.07 SPARE PARTS

- A. The Contractor shall furnish the required spare parts suitably packaged and labeled with the valve name, location, and identification number. The Contractor shall also furnish the name, address, and telephone number of the nearest distributor for the spare parts of each valve. Spare parts are intended for use by the Goleta Water District, after expiration of the warranty period.

2.08 SPARE PARTS

- A. CAV's 3-inches and smaller shall have ½-inch threaded outlets with bronze plugs in the top cover and near the bottom of the valve body. Valves larger than 3-inches shall have a 1-inch threaded drain outlet with bronze plug near the bottom of the valve body and a 1-inch threaded outlet with bronze plug on the side of the valve body above the minimum water level in the valve which forces the float against the valve seat. Valves shall be designed for an operating pressure of 250 psi.
- B. Valves smaller than 3-inches shall have threaded ends. Valves 3-inches and larger shall have flanged ends. Flanges for Class 250 valves shall comply with AWWA Class E250. Threaded ends shall comply with ANSI B1.20.1. The minimum CAV size shall be 1-inch.

Valves manufacturer shall be:

APCO, Model 143C or 145C
Valmatic, Model 201C or 202C
Crispin, Model UL10 or UL20
Cla-Val, Model 361CAV or 362CAV, or equal.

- C. CAV's shall be equipped with schedule 40 PVC venting system and insect screen as shown in GWD Standard Detail 3-03. Insect screen shall be Northtown Company, Hytech Air Vac Screen, McMaster-Carr, Suction Screen with Nylon Base, or approved equal.

2.09 TAPPING SLEEVES

- A. Stainless steel tapping sleeves shall be new and of current manufacture. Where a sleeve is to be supported by means other than the piping to which it is attached, obtain from the sleeve manufacturer a design for support and foundation. Tapping sleeves shall be of full sleeve type capable of containing pressure within the full volume of the sleeve. Weld-on “nozzle” type steel tapping sleeves and mechanical joint tapping sleeves shall only be allowed when approved by the Goleta Water District. Tapping procedures shall be in accordance with the Manufacturer’s published recommendations for tapping of pipes 4 inches or larger. Furnish tapping valve that is coordinated with tapping sleeve and conforming in every respect with this Section.
- B. Protective Coatings: The exterior surfaces of the tapping sleeve shall be double wrapped with 35 mil Polyken tape wrap.
- C. Tapping Sleeve Testing: As a minimum, unless otherwise indicated, each sleeve body 4 inches and larger shall be tested hydrostatically to 1.5 times its rated design water-working pressure, for a period of 5 minutes, without showing any leaks or loss of pressure. In addition, each valve 4 inches and larger shall undergo a functional test to demonstrate satisfactory operation throughout its operating cycle, and a closure test at rated water-working pressure for a period of 5 minutes to demonstrate tight seal during shut-off.
- D. Certification: Prior to shipment, the Contractor shall submit for all tapping sleeves over 12 inches in size; certified, notarized copies of the hydrostatic factory tests showing compliance with the applicable standards of AWWA, ANSI and ASTM.

2.10 MATERIALS FOR TAPPING SLEEVES

- A. General: Materials shall be suitable for the intended application. Materials not indicated shall be high-grade standard commercial quality, free from defects and imperfections that might affect the serviceability of the product for the purpose for which it is intended. Unless otherwise indicated, tapping sleeves and gaskets shall conform to the following requirements:
 - 1. Stainless Steel: 316 stainless steel, outlet flange conforming to AWWA C207 Class D, ANSI 150 lb. Drilling shall be recessed for tapping valve.
 - 2. Gasket: Red rubber SBR grade 30 or equal. Gaskets should conform with section AWWA C111 Rubber Gasket Joints for Ductile Iron Pressure Pipe and Fittings and contain only 100 percent new rubber suitable for mild acids, water, and salt media.
 - 3. Tapping Sleeve: Outlet flange conforming to AWWA C207 with an ANSI 150 lb. flange bolt pattern for the tapping valve. Tapping sleeve shall fit AWWA standards; Class AB-CD cast iron pipe.

2.11 TAPPING SLEEVE CONSTRUCTION

- A. Bodies: Sleeve bodies shall be cast, forged, or welded of the materials indicated with smooth interior passages. Wall thicknesses shall be uniform in agreement with the applicable standards for each type of sleeve, without casting defects, pinholes, or other defects that could weaken the body. Welds on welded bodies shall be done by certified welders and shall be ground smooth. Sleeve ends shall be as indicated, and be rated for the maximum pressure to which the sleeve will be subjected.
- B. Nuts and Bolts: Nuts and bolts on sleeve flanges and supports shall have stainless steel bolts, nuts, and washers of Type 316 stainless steel, class 2, conforming to ASTM A 193 for bolts and ASTM A 194 for sleeves with stainless nuts.
- C. Branches: The inside diameter of each branch shall be oversized to permit entry and exit of tapping machine cutters. Each shall have a recess to center a tapping valve. Flange dimensions and drilling shall meet the requirements of ANSI B16.1. Sleeve length shall be a minimum of twice the diameter of the pipe being tapped such that the sleeves will not leak when installed on cast iron, ductile iron, or polyvinyl chloride pipe (PVC) with outside diameters shown in AWWA Standards.

2.12 MANUFACTURERS OF TAPPING SLEEVES

- A. Manufacturer's Qualifications: Sleeve manufacturers shall have a successful record of not less than 5 years in the manufacture of the sleeves indicated.
- B. Manufacturers, or Equal: Ford; Dresser Industries; Romac; KOPPL; Powerseal; and SmithBlair.

2.13 RUBBER SEATED BUTTERFLY VALVES 25 TO 150 PSI (AWWA)

- A. General: Butterfly valves for steady-state water working pressures and steady-state differential pressure up to 150 psi and for fresh water service having a pH range from 6 to 10 and temperature range from 33 to 125 degrees F shall conform to AWWA C504 and be as indicated.
- B. Valves shall be of the body type, pressure class, end joint, and actuator indicated. The valve actuators shall be equipped with counter-clockwise opening stems. Valves shall be marked with manufacturers name, size, pressure rating, and year manufactured.
- C. Construction: Unless otherwise indicated, all materials of construction shall be in accordance with AWWA C504, suitable for the service. The seats shall be positively clamped or bonded into the disc or body of the valve, but cartridge-type seats which rely on a high coefficient of friction for retention shall not be acceptable.

Description	Material Standards
Valve Bodies	[ASTM A 48, Class 40] or [Cast iron, ASTM A 126, Class B], or [Ductile iron, ASTM A 536, grade 65-45-12 or 70-50-05] [Alloy cast iron, ASTM A 436, Type 1 or 2], or [ASTM A 439, Type D2, with minimum lead content of 0.003 percent]
End flanges	The same material as the valve bodies
Valve shafts	Stainless steel ASTM A 276, Type 316
Valve discs	The same material as for the valve bodies.
Rubber sets	New natural or synthetic rubber
Seat mating surfaces	Stainless steel, ASTM A 276, Type 316
Clamps and retaining rings	Type 316 retaining rings and cap screws.
Valve bearings	Self-lubricating materials per AWWA C504
Shaft seals	Resilient non-metallic materials suitable for service
Painting and coating	Refer to Section 09800 – Protective Coatings

D. Manufacturers, or Equal

De Zurik Corporation
 Clow Valve Company
 M & H Valve Company
 Mueller Company
 Henry Pratt Company
 Rodney Hunt Company (24 inches and larger)

2.14 RUBBER SEATED BUTTERFLY VALVES, 250 PSI (AWWA)

- A. General: Butterfly valves for steady-state water working pressures and steady-state differential pressure up to 250 psi and for fresh water service having a pH range from 6 to 10 and temperature range from 33 to 125 degrees F shall conform to AWWA C504. Valves shall be designed and manufactured in accordance with the intent of AWWA C504 except valves shall be suitable for 250 psi service and as indicated herein.
- B. Valves shall be of the body type, pressure class, end joint, and actuator indicated.
- C. One prototype valve for each size of valve required by the project shall be subjected to proof of design test in accordance with the procedures established by AWWA C504. Certificate of proof-of-design test shall be submitted to the DISTRICT prior to delivery of the valves.

- D. Construction: Unless otherwise indicated, all materials of construction shall be in accordance with AWWA C504, suitable for the service. The seats shall be positively clamped or bonded into the disc or body of the valve, but cartridge-type seats, which rely on a high coefficient of friction for retention, shall not be acceptable.

Description	Materials Standards
Valve Bodies	[ASTM A 48, Class 40] or [Cast iron, ASTM A 126, Class B], [Ductile iron, ASTM A 536, grade 65-45-12 or 70-50-05] [Alloy cast iron, ASTM A 436, Type 1 or 2], or [ASTM A 439, Type D2, with minimum lead content of 0.003 percent]
End flanges	The same material as the valve bodies
Valve shafts	Stainless steel ASTM A 276, Type 316
Valve discs	The same material as for the valve bodies.
Rubber sets	New natural or synthetic rubber
Seat mating surfaces	Stainless steel, ASTM A 276, Type 316
Clamps and retaining rings	Type 316 retaining rings and cap screws.
Valve bearings	Self lubricating materials per AWWA C504
Shaft seals	Resilient non-metallic materials suitable for service
Painting and coating	Refer to Section 09800 – Protective Coatings

- E. Manual Actuators: Unless otherwise indicated, all manually-actuated butterfly valves shall be equipped with a handwheel and 2-inch square actuating nut and position indicator. Screw-type (traveling nut) actuators will not be permitted for valves 30 inches in diameter and larger.
- F. Worm Gear Actuators: Valves, 30 inch and larger, as well as all submerged and buried valves, shall be equipped with worm-gear actuators, lubricated and sealed to prevent entry of dirt or water into the housing.
- G. Manufacturers, or Equal

De Zurik Corporation
Henry Pratt Company
Rodney Hunt Company (24 inches and larger)

2.15 PRESSURE AND VACUUM GAUGES

- A. General: Pressure gauges shall be provided on suction and discharge connections to pumps as indicated in the pump specifications; on discharge connections from blowers and compressors; each side of pressure reducing valves; and wherever indicated. Vacuum gauges shall be provided for vacuum pumps and wherever indicated. In all locations (such as certain pump suction connections) where pressures may vary from below to above atmospheric head, compound gauges shall be installed.
- B. Gauge Construction: Gauges shall be industrial quality type with Type 316 stainless steel movement and stainless steel or alloy case. Unless otherwise indicated, gauges shall have a 3-1/2inch dial, 1/4-inch threaded connection, a Type 316 stainless steel snubber adapter, and a shut-off valve. Gauges shall be calibrated to read in applicable units, with an accuracy of plus and minus 1 percent, to 150 percent of the working pressure or vacuum of the pipe or vessel to which they are connected. All gauges shall be vibration and shock resistant.
- C. Diaphragm Seal: Gauges attached to systems involving chemical solutions, corrosive fluids, sludge, sewage, or other liquids containing solids at less than 1 percent dry solids shall be equipped with diaphragm seals, or equal protective pressure or vacuum sensing devices.
- D. Gauge Manufacturers, or Equal: Marsh Instrument Company; Ashcroft Industrial Instruments (Dresser); Foxboro; Marshalltown Instruments, Inc.; and U.S. Gauge Div. of Ametek.
- E. Snubber Manufacturers, or Equal: Weksler Instruments, Corp.

2.16 SWING CHECK VALVES (3-INCH AND LARGER)

- A. General: Swing check valves for water, sewage, sludge, and general service shall be of the outside lever and spring or weight type, in accordance with ANSI/AWWA C508 - Swing-Check Valves for Waterworks Service, 2 in. through 24 in. NPS, unless otherwise indicated, with full-opening passages, designed for a water-working pressure of 150 psi. They shall have flanged ends and a flanged cover piece to provide access to the disc.
- B. Body: The valve body and cover shall be of cast iron conforming to ASTM A 126 - Gray Iron Castings for Valves, Flanges, and Pipe Fittings, with flanged ends conforming to ANSI/ASME B 16.1 - Cast Iron Pipe Flanges and Flanged Fittings, Class 25, 125, 250, and 800, or mechanical joint ends, as indicated.
- C. Disc: The valve disc shall be of cast iron, ductile iron, or bronze conforming to ASTM B 62 - Composition Bronze or Ounce Metal Castings.
- D. Seat and Rings: The valve seat and rings shall be of bronze to conforming ASTM B 62 or B 148 - Aluminum-Bronze Castings, or of Buna-N.
- E. Hinge Pin: The hinge pin shall be of bronze or stainless steel.

F. Manufacturers, or Equal

American Flow Control (Darling)
APCO (Valve and Primer Corporation)
Kennedy Valve
Mueller Company (Grinnell Corporation)
Stockham Valves and Fittings

2.17 SWING CHECK VALVES (2-1/2-INCH AND SMALLER)

- A. General: Swing 2check valves for steam, water, oil, or gas in sizes 2-1/2-inch and smaller shall be suitable for a steam pressure of 150 psi and a cold water pressure of 300 psi. They shall have screwed ends, unless otherwise indicated, and screwed caps.
- B. Body: The valve body and cap shall be of bronze conforming to ASTM B 61 - Steam or Valve Bronze Castings, or ASTM B 62 with threaded ends conforming to ANSI/ASME B1.20.1 - Pipe Threads, General Purpose (inch).
- C. Disc: Valves for steam service shall have bronze or brass discs conforming to ASTM B 16 - Free-Cutting Brass Rod, Bar, and Shapes for Use in Screw Machines, and for cold water, oil, and gas service replaceable composition discs.
- D. Hinge Pin: The hinge pins shall be of bronze or stainless steel.

E. Manufacturers, or Equal

Crane Company
Milwaukee Valve Company
Stockham Valves and Fittings
Wm. Powell Company

2.18 INTERNAL SPRING-LOADED CHECK VALVES (GLOBE STYLE)

- A. General: Internal spring-loaded check valves for water pumps, compressors, gas, air, and steam shall be of the full-flow internal spring-loaded poppet type. The valves shall be designed for a water-working pressure of not less than 150 psi unless otherwise indicated.
- B. Body: The bodies of all valves in sizes 3-inch and larger shall be of cast iron conforming to ASTM A 126 with 125-lb flanged ends conforming to ANSI/ASME B 16.1 unless otherwise indicated. Where necessary, there shall be a positive, watertight seal between the removable seat and the valve body. The stem guide shall be integrally cast with the body or screwed into the body.

- C. Valves smaller than 3 inches shall have bronze bodies with screwed ends conforming to ANSI/ASME B 1.201, suitable for a minimum working pressure of 200 psi, and a temperature of 250 degrees F, unless otherwise indicated. The type of bronze shall be suitable for the intended service.
- D. Disc and Stem: The disc and stem of all valves in sizes 3-inch and larger shall be of bronze conforming to ASTM B 584 - Copper Alloy Sand Castings for General Applications or stainless steel. The stem shall have two-point bearings. The downstream bearing shall have a bronze or other suitable bushing, to provide a smooth operation.
- E. Valves smaller than 3 inches shall have discs and retaining rings of Teflon, nylon, or other suitable material, and stems of bronze, brass, or stainless steel, suitable for the intended service.
- F. Stem Guide: The stem guide shall be either firmly fixed in the valve body to prevent it from sliding into the adjacent pipe and damaging the pipe lining, or the valve manufacturer shall furnish each valve with one matching flange compatible with the adjacent pipe and its lining to prevent damage to the lining. The compatible flange shall be part of the Shop Drawing submittal.
- G. Seat: Valves for general service at temperatures up to 250 degrees F shall have bubble-tight shut-off with resilient seats of Buna-N, Teflon, or other suitable material. Valves for steam service and temperatures over 250 degrees F shall have metal-to-metal seating of bronze or stainless steel, as recommended by the manufacturer for the specific service condition. Resilient seats shall be firmly attached to the seating ring by compression-molding or other acceptable method.
- H. Spring: Valves in sizes 3-inch and larger shall have Type 316 stainless steel springs, and valves smaller than 3-inch shall have stainless steel or beryllium copper springs, as suitable for the service. The spring tension of the valves shall be designed for the individual pressure condition of each valve.
- I. Manufacturers, or Equal

APCO (Valve and Primer Corp.)
CPV (Combination Pump Valve Company)
Miller Valve Co., Inc.
VAL-MATIC (Valve and Manufacturing Corporation)

2.19 METAL BALL VALVES (4-INCH AND SMALLER)

- A. General: Unless otherwise indicated, general purpose metal ball valves in sizes up to 4-inch shall have direct acting lever actuators in accordance with this Specification.
- B. Body: Ball valves up to 1-1/2-inch (incl.) in size shall have bronze or carbon steel 2-or 3piece bodies with screwed ends for a pressure rating of not less than 600 psi WOG. Valves 2-inch to 4-

inch in size shall have bronze or carbon steel 2-or 3-piece bodies with flanged ends for a pressure rating of ANSI 125 psi or 150 psi unless otherwise indicated.

- C. Balls: The balls shall be solid chrome plated brass or bronze, or stainless steel, with standard port (single reduction) or full port openings.
- D. Stems: The valve stems shall be of the blow-out proof design, of bronze, stainless steel, or other acceptable construction, with reinforced Teflon seal.
- E. Seats: The valve seats shall be of Teflon or Buna-N, for bi-directional service and easy replacement.
- F. Manufacturers, or Equal

Conbraco Industries, Inc. (Apollo)
ITT engineered Valves
Neles-Jamesbury, Inc.
NIBCO, Inc.
Watts Regulator
Worcester Controls

2.20 RESILIENT-SEATED GATE VALVES – GENERAL

- A. Buried valves shall be of the inside screw, non-rising stem type. The valve actuators shall be as indicated, with counter-clockwise opening stems, shall be marked with manufacturers name, size, pressure rating, and year manufactured.

2.21 RESILIENT-SEATED GATE VALVES (4 to 6-inch)

- A. General: All gate valves shall be resilient-wedge gate valves unless directed otherwise by the DISTRICT.
- B. Construction: Resilient-wedge gate valves shall conform to ANSI/AWWA C509 – Resilient- Seated Gate Valves for Water and Sewerage Systems. The valves shall be suitable for a design working water pressure of 200 psig, with flanged, bell and spigot, or mechanical joint ends. The valve body, bonnet, and disc shall be of cast iron or ductile iron and the disc or body shall be rubber-coated. Body and bonnet wall thickness shall be equal to or greater than the minimum wall thickness as listed in Table 2 of ANSI/AWWA C509. The stem, stem nuts, glands, and bushings shall be of bronze, with the stem seal per ANSI/AWWA C 509. Valves shall be internally coated in accordance with AWWA C550.
- C. Actuators: Unless otherwise indicated, resilient-wedge gate valves shall have manual actuators in accordance with this Section.

D. Manufacturers, or Equal

American Flow Control
American AVK Company
Clow Valve Co.
M & H Valve Company
Mueller Company (Grinnell Corp.)
Stockham Valves and Fittings

2.22 HIGH-PRESSURE GATE VALVES (2- TO 12-INCH)

- A. Construction: High-pressure gate valves, except for buried valves, shall have cast iron bodies and flanged bonnets conforming to ASTM A 126 - Gray Iron Castings for Valves, Flanges, and Pipe Fittings, with 250 psi flanged ends. The valves shall have outside screw & yoke rising stems, or non-rising stems as indicated on the Construction Drawings. The valves shall be rated for 250 psig steam and 500 psig cold water working pressure. The solid wedges shall be of bronze or cast iron, bronze fitted and the stem shall be of bronze with non-asbestos fiber packing.
- B. Actuators: Unless otherwise indicated, high-pressure gate valves shall have cast iron or ductile iron handwheels with 2-inch square operating nuts, in accordance with Section 15201 - Valve & Gate Actuators.
- C. Manufacturers, or Equal

American AVK Company
Crane Company
Milwaukee Valve Company
Wm. Powell Company
Stockham Valves and Fittings
Walworth Company

2.23 TAPPING VALVES (4- TO 24-INCH)

- A. Construction: Tapping valves shall meet the requirements of ANSI/AWWA C500 or C509 and shall have flanged ends. Double disc gate valve gates, gate rings, and body-seat rings shall be oversized to permit entry and exit of tapping machine cutters.
- B. Valve end connecting to tapping sleeve shall have a flange for bolting to the sleeve. The flange shall have a tongue, which fits a recess in the sleeve. The flanged and bolt pattern of the tapping valve shall match the flange and bolt pattern of the tapping sleeve. Resilient-wedge gate valves having a port diameter equal to or exceeding $\frac{1}{4}$ inch over nominal diameter shall not require a tongue. Flange dimensions and drilling shall meet

the requirements of ANSI B16.1. Nuts, bolts, and gaskets for flange joints shall meet the requirements of ANSI/AWWA C110. Nuts and bolts shall be 316 stainless steel. A full nominal diameter cutter shall be used for tapping.

- C. Tapping valve coating and lining shall be applied per Section 099000 – Protective Coatings and shall be System 103 Fusion Bonded Epoxy, unless otherwise directed by the DISTRICT.

2.24 PRESSURE REDUCING VALVES, GENERAL

- A. Function: Pressure reducing valves shall reduce a higher upstream pressure to a pre-set, lower, constant pressure, regardless of fluctuations in the upstream pressure.
- B. Operation: The valves shall be hydraulically operated, with diaphragm direct action, pilot controlled, per paragraph 2.2, and shall be of the globe or angle pattern as indicated. All necessary repairs shall be possible without removing the valves from the pipeline. The smaller direct-acting valves with threaded ends per paragraph 2.3, shall be suitable for water or air service and shall be of the globe patterns.

2.25 FLANGED PRESSURE REDUCING VALVES, SIZES 1 ½ INCHES THROUGH 24 INCHES

- A. Valve Body: The valve body shall be of cast iron to ASTM A 48 - Gray Iron Castings, or ASTM A 126 - Gray Iron Castings for Valves, Flanges, and Pipe Fittings, with [125 lb] [250 lb] flanged ends to ANSI/ASME B 16.1 - Cast Iron Pipe Flanges and Flanged Fittings, Class 25, 125, 250, and 800, or the body shall be of ductile iron to ASTM A 536 - Ductile Iron Castings, with [150 lb] [300 lb] flanged ends to ANSI/ASME B 16.42 - Ductile Iron Pipe Flanges and Flanged Fittings. The valve cover shall be flanged and be the same material as the body.
- B. Valve Trim: The valve stems with position indication, springs, body seat rings, and all bolts, nuts, and washers shall be of Type 302, 303, or 316 stainless steel. The valve stems shall have top and bottom guides. All rubber parts shall be of Buna-N. The diaphragms shall be of Nylon-reinforced BunaN, supported firmly between body and valve cover.
- C. Valve Controls: The valve shall be provided with a complete, externally mounted control system, including speed control needle valves, strainers, check valve, isolation valves, and all necessary copper or stainless steel connecting tubing and fittings. The controls shall be capable of achieving all the flow and speed adjustment indicated.
- D. Factory Tests and Warranty: All valves shall be factory tested with a hydrostatic test and a functional test and a test certificate shall be submitted to the DISTRICT prior to delivery of the valve. The valve shall be warranted for a period of 3 years from the date of shipment to be free of defects in materials and workmanship.

E. Operating Conditions: The valve shall be designed to operate under the following conditions, or as stated on the construction drawings:

- 1. Maximum inlet pressure (psi) - []
- 2. Minimum inlet pressure (psi) - []
- 3. Minimum outlet pressure (psi) - []
- 4. Maximum flow (gpm) - []
- 5. Minimum flow (gpm) - []
- 6. Valve size (inches) - []
- 7. Size of pipeline (inches diameter) - []

F. Spare Parts: The following spare parts shall be furnished in accordance with Section 15200 - Valves, General:

- 1. One set of all resilient seals and discs
- 2. One diaphragm

G. Manufacturer shall be Cla-Val Company, or equal.

2.26 FLANGED PRESSURE RELIEF VALVES, SIZES 1-1/2 INCHES THROUGH 24 INCHES

A. Valve Characteristics: The pressure relief valve shall open when the inlet pressure exceeds a set maximum level. It shall maintain that level and gradually close as the inlet pressure drops below the maximum pressure. The valve shall be a hydraulically operated, adjustable, pilot controlled, diaphragm or piston type globe or angle valve as indicated. All necessary repairs shall be possible without removing the valve from the pipeline.

B. Valve Body: The valve body shall be of cast iron, ASTM A 48 - Gray Iron Castings, or ASTM A 126 - Gray Iron Castings for Valves, Flanges, and Pipe Fittings, with [125 lb] [250 lb] flanged ends to ANSI/ASME B 16.1 - Cast Iron Pipe Flanges and Flanged Fittings, Class 25, 125, 250, and 800, or the body shall be of ductile iron to ASTM A 536 - Ductile Iron Castings, with [150 lb] [300 lb] flanged ends to ANSI/ASME B 16.42 - Ductile Iron Pipe Flanges and Flanged Fittings. The valve cover shall be flanged and be of the same material as the body.

C. Valve Trim: The valve stems, springs, body seat rings, and all bolts, nuts, and washers shall be of Type 302, 303, or 316 stainless steel. The valve stems shall have top and bottom guides. All rubber parts shall be of Buna-N. The diaphragms shall be of Nylon-reinforced Buna-N, supported firmly between body and valve cover.

D. Valve Controls: The valve shall be furnished with a complete, externally mounted control system, including adjustable speed control needle valves, strainer, and all necessary copper or stainless steel connecting tubing and fittings. The controls shall be capable of achieving all the flow and speed adjustment indicated.

- E. **Factory Tests and Warranty:** Valves shall be factory tested with a hydrostatic test and a functional test and a test certificate shall be submitted to the Goleta Water District prior to delivery of the valve. The valve shall be warranted for a period of 3 years from the date of shipment to be free of defects in materials and workmanship.
- F. **Operating Conditions:** The valve shall be designed to operate under the following conditions, or as stated on the construction drawings:
 - 1. Total flow from pump station [gpm] - []
 - 2. Maximum inlet pressure (psi) - []
 - 3. Maximum flow through valve (gpm) - []
 - 4. Valve size (inches) - []
 - 5. Size of pipeline (inches diameter) - []
- G. **Spare Parts:** The following spare parts shall be furnished in accordance with Section 15200:
 - 1. 1 set of all resilient seals, and discs
 - 2. 1 diaphragm
- H. **Manufacturer shall be Cla-Val Company, or equal.**

2.27 **HARDWARE AND MISCELLANEOUS MATERIALS**

- A. **Indoor Use:** Bolts and nuts for flanged valves located indoors shall be carbon steel, ASTM A 307, Grade B.
- B. **Exposed Use:** Bolts and nuts for flanged valves located outdoors above ground and flanges located in underground vaults and structures shall be Type 316 stainless steel conforming to ASTM A 193, Grade B8M, for bolts and ASTM A 194, Grade 8M, for nuts.
- C. **Washers:** Washers shall be provided for each nut. Washers shall be of the same material as the nuts.
- D. **Gaskets for flanged end valves shall be as specified in Section 330509 – Piping, General.**

2.28 **COATING AND LINING OF CAV**

- A. **Combination Air Valves shall be coated in accordance with Section 099000 – Protective Coatings.** Prime coat shall be applied at the place of manufacture. The interior surfaces of CAV’s shall be epoxy coated. Seating areas and plastic, bronze, stainless steel, or other high alloy parts shall not be coated.

2.29 STEEL ENCLOSURE FOR CAV

- A. The vented steel pipe vertical enclosure shall be manufactured and constructed as detailed on the DISTRICT's Standard Detail 3-03 and shall be hot dip galvanized after fabrication. The door on the cover shall be equipped with a handle and have the ability to be locked using a standard pad lock. Manufacturer shall be Groeniger & Co or approved equal.

2.30 PRESSURE AND VACUUM GAUGES

- A. General: Pressure gauges shall be provided on suction and discharge connections to pumps as indicated in the pump specifications; on discharge connections from blowers and compressors; each side of pressure reducing valves; and wherever indicated. Vacuum gauges shall be provided for vacuum pumps and wherever indicated. In all locations (such as certain pump suction connections) where pressures may vary from below to above atmospheric head, compound gauges shall be installed.
- B. Gauge Construction: Gauges shall be industrial quality type with Type 316 stainless steel movement and stainless steel or alloy case. Unless otherwise indicated, gauges shall have a 3-1/2-inch dial, 1/4-inch threaded connection, a Type 316 stainless steel snubber adapter, and a shut-off valve. Gauges shall be calibrated to read in applicable units, with an accuracy of plus and minus 1 percent, to 150 percent of the working pressure or vacuum of the pipe or vessel to which they are connected. All gauges shall be vibration and shock resistant.
- C. Diaphragm Seal: Gauges attached to systems involving chemical solutions, corrosive fluids, sludge, sewage, or other liquids containing solids at less than 1 percent dry solids shall be equipped with diaphragm seals, or equal protective pressure or vacuum sensing devices.
- D. Gauge Manufacturers, or Equal: Marsh Instrument Company; Ashcroft Industrial Instruments (Dresser); Foxboro; Marshalltown Instruments, Inc.; and U.S. Gauge Div. of Ametek.
- E. Snubber Manufacturers, or Equal: Weksler Instruments, Corp.

PART 3 – EXECUTION

3.01 VALVE INSTALLATION

- A. General: Valves, actuating units, stem extensions, valve cans, and accessories shall be installed in accordance with the Manufacturer's written instructions and as indicated. Contractor shall carefully inspect valves and operate valves before installation to verify

- all parts are in proper working order. If a valve is found to be defective no attempt shall be made to repair it. The defective valve shall be returned to the manufacturer and replaced with a new properly working valve.
- B. Access: Valves shall be installed with easy access for actuation, removal, and maintenance and to avoid interference between valve actuators and structural members, handrails, or other equipment. Valves shall be firmly supported to avoid undue stresses on the pipe. Mainline valves shall be set plumb and securely braced into place using concrete anchor blocks as shown in Std. Detail 2-08. Non-buried actuators shall be located to be readily accessible for operation and maintenance, and shall not be mounted where shock or vibrations will impair their operation, nor shall the support systems be attached to handrails, process piping, or mechanical equipment.
 - C. Valve Accessories: All buried valves shall be provided with valve cans as indicated in GWD Standard Detail 2-06. Valve cans shall be installed centered and plumb over the operating nut. Valve cans shall be supported on bonnet of valve. In areas where road construction is not completed, set PVC sleeve to pavement subgrade level to prevent damage during construction of road base and AC pavement. After road construction is complete, Contractor is to return and set cans to grade.
 - D. Corrosion Protection: All nuts and bolts on valves for buried service shall be tape wrapped, after valve installation is completed Trenton Wax Tape #1, in accordance with Section 330509 – Piping General.

3.02 SERVICES OF MANUFACTURER

- A. Field representatives of manufacturers of valves with pneumatic, hydraulic, or electric actuators shall adjust actuator controls and limit-switches in the field for the required function.

3.03 INSTALLATION OF GATE VALVES

- A. Care shall be taken when installing valves on plastic pipe. Valve shall be supported at each end of the valve.

3.04 INSTALLATION OF BUTTERFLY VALVES

- A. All exposed butterfly valves shall be installed with a means of removing the complete valve assembly without dismantling the valve or operator. The installation shall be in accordance with Section 331216 – Valves, General.

3.05 INSTALLATION OF CAV

- A. Combination Air Valves shall be installed as shown on the plans and the District's Standard Detail 3-03. The tap for the air valves shall be made in a level section of pipe no closer than 24-inches to a bell, coupling, joint, or fitting. CAV's shall be located a minimum of five feet clear of any obstruction such as trees and fences.
- B. Flanged Connections: Flanges shall be cleaned by wire brushing before installing flanged valves. Flange bolts and nuts shall be cleaned by wire brushing, and threads lubricated with oil and graphite. Nuts shall be tightened uniformly and progressively. If flanges leak under pressure testing, nuts and bolts shall be loosened or removed, the gasket reseated or replaced, the bolts and nuts reinstalled or re-tightened, and joints re-tested. Joints shall be watertight.
- C. Threaded Connections: Threaded joints shall be cleaned by wire brushing or swabbing. Teflon joint compound or Teflon tape shall be applied to pipe threads before installing threaded valves. Joints shall be watertight.

3.06 VALVE PRESSURE TESTING OF CAV

- A. CAV's shall be tested at the same time that the connecting pipelines are pressure tested.

3.07 APPLICATION

- A. Install tapping sleeves and valves at locations and of sizes shown on Drawings. Size-on-size taps shall not be performed without the prior approval of the Goleta Water District.
- B. Clean tapping sleeve, tapping valve, and pipe prior to installing and in accordance with Manufacturer's instruction.
- C. Inspect sleeve for leaks, and remedy leaks prior to tapping operation.

3.08 INSTALLATION

- A. Hot tap connections to existing waterlines shall be made only after proper blocking has been installed under the pipe, the sleeve of the tapping tee, and the tapping equipment to prevent cracking of the existing pipe. At no time before, during, or after completion of the hot tap shall the tapping tee bear the weight of the pipe or tapping equipment.
- B. There should be a minimum of two feet from the end of the sleeve to any joint. When multiple taps occur on the same length of pipe there should be a minimum of five feet of space between the sleeves and should be located in slightly different planes unless otherwise approved by the Goleta Water District.
- C. Tighten bolts in proper sequence so that undue stress is not placed on pipe.

- D. Align and mount tapping valve tapping sleeve to achieve a good watertight connection. Make tap with sharp, shell cutter:
 - 1. For 12-inch and smaller tap, use minimum cutter diameter one-half inch less than nominal tap size.
 - 2. For 16-inch and larger tap, use Manufacturer's recommended cutter diameter.
- E. Withdraw coupon and flush cuttings from newly made tap.
- F. Wrap completed tapping sleeves and valves in accordance with Section 099000 – Protective Coatings, except for stainless steel sleeves and valves.
- G. Place concrete thrust block behind tapping sleeve (not over tapping sleeve and valve) or encase existing pipe or appropriate restraint system as directed by the Goleta Water District.
- H. Goleta Water District's construction supervisor shall inspect installation of tapping sleeve and valve prior to backfilling.
- I. Backfill in accordance with Section 312316 –Trenching, Backfill and Compaction.

3.09 INSTALLATION OF GAUGES

- A. Gauges shall be installed with the face in the vertical position, at the locations indicated and in strict accordance with the manufacturer's printed instructions. Gauges shall be attached to a thread-olet. Tapping the wall of the pipe for a threaded connection is not acceptable unless approved by the District. Care shall be taken to minimize the effect of water hammer or vibrations on the gauges.

3.10 SERVICES OF MANUFACTURERS FOR PRESSURE REDUCING OR RELIEF VALVES

- A. Inspection, Startup, and Field Adjustment: The service representative of the valve manufacturer shall be present at the Site for one work day, to assist the Contractor in the installation and adjustment of the valve(s). For the purpose of this paragraph, a work day is defined as an eight hour period, excluding travel time.

END OF SECTION

SECTION 33 12 19

FIRE HYDRANTS & END DRAINS

PART 1 – GENERAL

1.01 REQUIREMENTS

- A. The Contractor shall provide fire hydrants and end drains, complete and operable, including all appurtenances and accessories, in accordance with the Contract Documents.

1.02 RELATED WORK SPECIFIED ELSEWHERE

Section 03 30 00 – Cast-in-Place Concrete

Section 33 05 09 – Piping, General

Section 33 13 16 – Valves and Appurtenances

Section 09 90 00 – Protective Coatings

PART 2 – PRODUCTS

2.01 WET-BARREL FIRE HYDRANTS

- A. Unless shown otherwise, all fire hydrants shall be of the wet-barrel type, in accordance with ANSI/AWWA C503.
- B. Where a hydrant is installed it shall have the number, size and type of pumper connections required by the County of Santa Barbara Fire Department. The hydrant head shall have a minimum of one 4-inch pumper connection and one 2-1/2-inch hose connection. Operating nuts and caps shall be 1-1/8 inch pentagonal nuts measured “point to flat”. Caps shall be bronze and shall be attached to hydrant with chains. Cap shall have 1/8-inch diameter weep hole drilled through its center adjacent to operating nut. The hydrant inlet shall be 6-inch in diameter. Hydrant shall be isolated by a buried gate valve. Hydrant bury shall be 6inch diameter ductile iron conforming to the requirements of AWWA C502 with a 6-inch diameter flanged break-away spool connected to the hydrant head. Breakaway spool shall be 12-inch minimum length, 125pound class, cast iron, 6 bolt-breakaway spool with breakaway (hallow) bolts on top flange. All bolts, nuts, and washers shall be 307A zinc plated steel with standard HEX head and machined per ASTM A325.
- C. The hydrants shall be tested to 300 psig and they shall be suitable for a working pressure of 150 psig. All interior and exterior surfaces shall be coated in accordance with AWWA C550 and Section 099000 - Protective Coatings. Color of finish coat shall be Goleta

Water District approved “Safety Yellow” on fire hydrants in the public right of way while fire hydrants not in the public right of way (e.g., on private property) shall be factory painted red in accordance with Santa Barbara County requirements. Prior to final inspection of the water system improvements, the Contractor shall conduct fire flow tests at all new hydrants in accordance with section 3.02.03, Fire Hydrant Flow Tests.

D. Unless otherwise specified, hydrant bury shall be 6-inch diameter, 6-hole wet barrel fire hydrant bury with mechanical joint.

E. Fire Hydrant Manufacturers, or Equal:

MANUFACTURER	SINGLE FAMILY RESIDENCE		MULTI-FAMILY RESIDENCE, COMMERCIAL & INDUSTRIAL	
	Size	Model	Size	Model
Jones	6”x4”x2 ½ “	J-3700	6”x4”x2 ½”x2 ½”	J-3765R

American AVK Co	6”x4”x2 ½ “	2442	6”x4”x2 ½”x2 ½”	2452
	6”x4”x2 ½”x2 ½”	2452		

F. Bury Manufacturers, or Equal:

Clow Valve Company
 US Pipe and Foundry
 Star
 Sigma/Napco
 South Bay Foundry

2.02 END DRAINS

A. End drains shall have a 2-1/2-inch hose connection. Operating nuts and caps shall be 1-1/8 inch pentagonal nuts measured “point to flat”. Caps shall be bronze and shall be

attached to end drain with chains. The end drains shall be tested to 250 psig and they shall be suitable for a working pressure of 150 psig.

- B. Manufacturers, or Equal: James Jones, J-342.

PART 3 – EXECUTION

3.01 INSTALLATION

- A. All fire hydrants shall be installed in strict accordance with the manufacturer's published recommendations, applicable sections of AWWA Standard C600, AWWA Manual M17, and GWD Standard Detail 3-01. Hydrants shall be installed plumb and shall be installed before the construction of curb and gutter, and sidewalk where possible. All installations shall be to the satisfaction of the Goleta Water District and the County of Santa Barbara Fire Department.
- B. Hydrants located on roads where no sidewalk exists or where sidewalk and curb are separated by a parkway, shall be located 18 inches from the back of the curb to the fire hydrant centerline. Hydrants located on roads with sidewalk at the back of curb shall be located 18 inches from the back of sidewalk to the fire hydrant centerline and shall comply with the requirements of the Americans with Disabilities Act. Hydrants located where no curb exists shall be located a minimum of 36 inches from the edge of pavement and shall be protected by guard posts as shown in GWD Standard Detail 4-03.
- C. A minimum of 18 inches and a maximum of 24 inches clearance shall be maintained between finished grade and the lowest operating nut on the hydrant. The center of the breakaway spool shall be at grade with the top of curb unless the hydrant is set in concrete in which case a 3-inch minimum clearance shall be maintained between the finished sidewalk surface and the top flange of the breakaway spool. Breakaway bolts shall be installed with tips pointing up and filled with silicone caulking. Hydrant isolation valve shall be connected to the hydrant piping by means of a retainer gland. Hydrant shall be installed with a concrete thrust block, calculated for the maximum expected water pressure.
- D. All end drains shall be installed in accordance with GWD Standard Detail 2-12 and applicable sections of AWWA Standards. End drains shall be installed before the construction of curb and gutter, and sidewalk where possible. End drains located on roads where no sidewalk exists or where sidewalk and curb are separated by a parkway, shall be located 18 inches from the back of the curb. End drains located on roads with sidewalk at the back of curb shall be located per the Santa Barbara County Department of Public Works requirements. End drains located where no curb exists shall be located a minimum of 36 inches from the edge of pavement.

Department of Neighborhood Services and Public Safety
GOLETA TRAIN DEPOT PROJECT

END OF SECTION

SECTION 33 12 33

METERS LARGE AND SMALL

PART 1 – GENERAL

1.01 REQUIREMENTS

- A. Contractors shall furnish and install DCDA fire meters. Goleta Water District shall furnish and install all domestic, irrigation, and associated, service laterals, valves, piping, and boxes as shown on the Construction Drawings and specified herein, complete and operable, for flow measurement of water.

1.02 RELATED WORK SPECIFIED ELSEWHERE

Section 33 0 509 – Piping, General

Section 33 14 23 – Manholes, Vaults, & Meter Boxes

Section 33 14 17 – Service Connections

1.03 REFERENCE SPECIFICATIONS, CODES, AND STANDARDS

- A. Codes: All codes, as referenced herein, are specified in Section 014200 - Reference Standards.
- B. Commercial Standards:

ISA - S 5.1 Instrumentation Symbols and Identification

ANSI - B16.1 Cast Iron Pipe Flanges and Flanged Fittings, Class 25, 125, 250, and 800

ANSI/AWWA C207 Steel Pipe Flanges for Waterworks Service - Sizes 4 In through 144 In

ANSI/AWWA C510 Double Check Valve Backflow Prevention Assembly

ANSI/AWWA C703 Cold-Water Meters – Fire Service Type

AWWA C704 Cold-Water Meters - Propeller Type for Main Line Applications

ASME REPORT Fluid Meters, Sixth Edition, 1971

1.04 CONTRACTOR SUBMITTALS

- A. The Contractor on applicant projects isolated from the distribution during construction shall submit complete shop drawings of meters for review in accordance with Section 013300 -

Contractor Submittals. Each meter shall be identified with its equipment number and property number, as shown or specified.

PART 2 – PRODUCTS

2.01 METERS

- A. Meters 1-inch and smaller shall be Mach 10 Ultrasonic Meters manufactured by Neptune Technology Group. Meters 1-inch and 1-1/2"-inch shall be E-Series Ultrasonic Meters manufactured by Badger Meter. Meters 3-inch and larger shall be Octave Ultra Sonic Meters manufactured by Master Meter. Meters shall measure in units of one hundred cubic feet. The lay length of solid spacer shall match the lay length of the meter.

PART 3 – EXECUTION

3.01 INSTALLATION

- A. Goleta Water District shall assemble and install all service laterals and meters specified herein.
- B. For private projects isolated from the District distribution system during construction, the Contractor shall assemble and install all service laterals excluding the meters in strict accordance with Goleta Water District standard details, under the general review and observation of the District. All installations shall be accomplished by competent craftsmen in a workmanlike manner.

3.02 METERS

- A. All meters shall be installed by the Goleta Water District. When the Contractor installs the service, the Contractor shall install a temporary solid PVC spacer in conjunction with installation of the service.
- B. Per Senate Bill No. 7, approved September 25, 2016, Section 1954.203, all multi-unit rental property constructed after January 1, 2018 must provide residents with info on volume and cost of their water use through their own individual submeters. The submeter shall be capable of being accessed and read by the tenant of the dwelling unit and read by the landlord without entering the dwelling unit. A submeter installed before January 1, 2018 may be read by the landlord after entry into the unit, in accordance with this chapter and Section 1954. Per this section, the Goleta Water District is not required to assume responsibility for ensuring compliance with any law or regulation governing installation, certification, maintenance, and testing of submeters and associated onsite plumbing

3.03 ACCEPTANCE BY THE DISTRICT

- A. Final acceptance and unlocking the meter stop to use the meter is contingent on satisfactory operation after installation, certification of backflow prevention device, receipt and Goleta Water District approval of record drawings, and the project dedication process.

END OF SECTION

SECTION 33 14 17

SERVICE CONNECTIONS

PART 1 – GENERAL

1.01 REQUIREMENTS

- A. The Contractor shall provide water service connections, complete and in place, in accordance with the Contract Documents. The requirements of Section 330509 - Piping, General apply to the work of this Section.

1.02 RELATED WORK SPECIFIED ELSEWHERE

Section 01 55 26 – Traffic Control & Access

Section 31 23 16 – Trenching, Backfill and Compaction

Section 33 01 10 – Waterline Disinfection & Testing

Section 33 05 09 – Piping, General

Section 33 14 23 – Manholes, Vaults, & Meter Boxes

PART 2 – PRODUCTS

2.01 COPPER WATER TUBE

- A. Copper water tube shall conform to the requirements of ASTM B 88 - Seamless Copper Water Tube. All 1” copper water tube for buried locations shall be soft temper tube in rolls. All above ground installations, and 2” copper water tube for buried locations shall be hard drawn lengths. Unless otherwise indicated, all copper water tube shall be of Type K wall thickness. The minimum copper service size shall be 1 inch. Copper service size for service run-outs of 50 feet or greater, for ¾-inch and 1-inch meters, shall be increased to 2 inches. Service connections 4 inches in diameter and larger shall be constructed of C900 PVC DR-18 pressure rated to 235 psi in accordance with AWWA C900.
- B. Joints: Copper water tube shall have either brazed joints, or flared ends and fittings. Brazed joints shall be made with silver brazing alloy metal filler. Brazing alloy metal filler shall contain a minimum of 15% silver and no lead. Brazing alloy metal filler shall be STAY SILV 15 Brazing Metal Filler manufactured by The Harris Products Group, SIL-CAN 15 manufactured by Canfield Technologies, or approved equal.

- C. Fittings: Brazed fittings shall conform to ANSI/ASME B 16.18 - Cast Copper Alloy Solder Joint Pressure Fittings, or to ANSI/ASME B 16.22 - Wrought Copper and Copper Alloy Solder - Joint Pressure Fittings. The brazing flux shall be the Manufacturer's approved type for the fitting and brazing used. Compression fittings shall conform to ANSI/ASME B 16.26 - Cast Copper Alloy Fittings for Copper Tubes. Cast copper alloy flanges and flanged fittings shall be in accordance with ANSI/ASME B 16.24 - Cast Copper Alloy Pipe Flanges and Flanged Fittings, and ASTM B 62 - Standard Specification for Composition Bronze or Ounce Metal Castings, with 150 lb ratings, or as indicated.

2.02 SERVICE FITTINGS

- A. Saddles and Tapping Sleeves: Saddles shall be bronze with female iron pipe threads. On PVC pipe, saddles shall be secured by single flat strap. On steel and ductile iron pipe, service saddles shall be with two flat straps up to 2-inches. On all service connections 4-inch and larger, tapping sleeves shall be used. Manufacturer shall be as indicated on Goleta Water District Approved Materials List.
- B. Corporation Stops: Corp stops shall be bronze with male iron pipe threads to match saddle threads. Connection to service line shall be compression fitting (pack joint) outlet connection. Manufacturer shall be as indicated on Goleta Water District Approved Materials List.
- C. Angle Ball Meter Stops: Angle ball meter valves shall be bronze, equipped with padlock wings, and provide for 360 degree rotation of the tee head. Padlock wings for dedicated firelines shall have the ability be locked off in the open position Angle ball meter valves for ¾-inch and 1-inch meters shall have 1-inch compression fitting (pack joint) copper inlet and meter swivel nut outlet to match meter size. Angle ball meter valves for 1-1/2-inch and 2-inch meters shall have compression fitting (pack joint) copper inlets and flanged meter connection outlets. Angle ball meter valve manufacturers and model numbers shall be as indicated on Goleta Water District Approved Materials List.
- D. Curb Stops: Ball valve curb stops shall be bronze. Size, connection type and manufacturer shall be as indicated on Goleta Water District Approved Materials List.
- E. Couplings and Adapters: Manufacturers of couplings and adapters shall be as indicated on Goleta Water District Approved Materials List.
- F. Other Brass Fitting: Manufacturers of couplings and adapters shall be as indicated on Goleta Water District Approved Materials List.

PART 3 – EXECUTION

3.01 INSTALLATION

- A. General: Service runouts shall be installed perpendicular to the waterline. The configuration of the services shall be as shown on the applicable Goleta Water District standard details. Meters shall be installed in accordance with Goleta Water District Standards & Specifications. All copper tubes shall be installed in a neat and workmanlike manner, properly aligned, and cut from measurements taken at the site, to avoid interferences with structures or equipment. Exposed tubing shall afford maximum access to equipment, and where necessary all tubing shall be installed with sufficient slopes for venting or drainage of liquids. For 1-inch copper tubing, tubing may be curved around a minimum radius of 12 inches. For 1-1/2-inch and 2-inch copper tubing, copper fittings shall be silver brazed where bends are required. All installations shall be acceptable to the District. There shall be a minimum of two feet in spacing between service saddles.
- B. Valves and Unions: Unless otherwise indicated, tubing to fixtures, groups of fixtures, and equipment shall be provided with a shutoff valve and union, unless the valve has flanged ends. Low points in water systems shall have drainage valves. Unions shall be provided at threaded valves, equipment, and other devices requiring occasional removal or disconnection.

3.02 PREPARATION

- A. Prior to installation, each tube length shall be carefully inspected, flushed clean of any debris or dust, and be straightened, if not true. Ends of tubes shall be reamed and filed smooth. All fittings shall be equally cleaned before assembly.

3.03 JOINTS

- A. Brazed and Soldered Joints: Brazed and soldered joints shall conform to the Manufacturer's recommendations and to the specifications and recommendations of ANSI/ASME B 31.1 - Power Piping. All brazing shall be done by skilled and qualified welders per Section 330509 - Piping, General. Prior to the application of flux, the end of all tubes shall be thoroughly dried and cleaned.

3.04 INSPECTION AND FIELD TESTING

- A. Inspection: All finished installations shall be carefully inspected for proper joints and supports, anchoring, interferences, and damage to tubing, fittings, and coating. Damage shall be repaired to the satisfaction of the Goleta Water District.
- B. Field Testing: When constructed independent of the District distribution system, all copper service connections shall be pressure tested in conjunction with new water mains for a period of not less than two hours, without exceeding the following tolerance: pipes shall show zero leakage for unburied pipe, and not more than 0.02 gallons per hour per

inch diameter per 100 feet of buried pipe. Copper pipe shall be subject to 100 psi or 1-1/2 times the maximum working pressure, whichever is greater. The Contractor shall furnish all test equipment, labor, materials, and devices at no extra cost to the Goleta Water District. For additional testing requirements refer to Section 330110 – Waterline Disinfection & Testing.

- C. Leakage is determined by the change in incremental volume markings on the site reservoir on the test pressure pump. All fixtures, devices, or other accessories which are to be connected to the lines and which would be damaged if subjected to the test pressure shall be disconnected and ends of the branch lines be plugged or capped as required during the testing procedures.
- D. Leaks shall be repaired to the satisfaction of the District, and the system shall be re-tested until no leaks are found.

END OF SECTION

SECTION 33 14 23

MANHOLES, VAULTS & METER BOXES

PART 1 – GENERAL

1.01 REQUIREMENTS

- A. The Contractor shall provide precast concrete manholes, vaults, meter boxes, complete and in place, in accordance with the Contract Documents.

1.02 RELATED WORK SPECIFIED ELSEWHERE

Section 31 23 16 – Trenching, Backfill and Compaction.

Section 33 05 09 – Piping, General.

1.03 SPECIFICATIONS, CODES AND STANDARDS

- A. Commercial Standards

ASTM A 48 Gray Iron Castings

ASTM C 150 Portland Cement

ASTM C 478 Circular Precast Reinforced Concrete Manhole Sections

ASTM C 923 Resilient Connectors Between Reinforced Concrete Manhole Structures, Pipes, and Laterals

1.04 CONSTRUCTOR SUBMITTALS

- A. General: Furnish submittals for manholes and vaults in accordance with Section 013300 - Contractor Submittals

- B. Shop Drawings

1. Show dimensions, locations, lifting inserts, reinforcement, and joints.

1.05 QUALITY ASSURANCE

- A. Inspection: After installation, the Contractor shall demonstrate that manholes and vaults have been properly installed, level, with tight joints, at the correct elevations and orientations, and that the backfilling has been carried out in accordance with the Contract Documents.

PART 2 – PRODUCTS

2.01 MANHOLES

- A. The Contractor shall provide precast manhole sections and conical sections conforming to ASTM C 478 and the requirements of this Section. Adjusting rings shall be standard items from the manufacturer of the manhole sections. Minimum wall thickness of rings shall be 4 inches if steel reinforced and 6 inches if not reinforced.
- B. Axial length of sections shall be selected to provide the correct total height with the fewest joints.
- C. Conical sections shall be designed to support cast iron frames and covers under an H-20 loading, unless indicated otherwise.
- D. Where the manhole barrel diameter is greater than 48 inches, an eccentric flat slab transition shall be used to transition to 48-inch diameter riser sections. Underside of the transition shall be at least 7 feet above the top of the bench.
- E. Design Criteria: Manhole walls, transitions, conical sections, and base shall be designed per ASTM C 478 for the depths indicated and the following:
 - 1. AASHTO H-20 loading applied to the cover.
 - 2. Unit weight of soil of 120 pcf located above all portions of the manhole.
 - 3. Lateral soil pressure based on saturated soil producing 100 pcf acting on an empty manhole.
 - 4. Internal fluid pressure based on unit weight of 63 pcf with manhole filled from invert to cover with no balancing external soil pressure.
 - 5. Dead load of manhole sections fully supported by the base and transition.
 - 6. Additional reinforcing steel in walls to transfer stresses at openings.
 - 7. The minimum clear distance between the edges of any 2 wall penetrations shall be 12 inches or one-half of the diameter of the smaller penetration, whichever is greater.

- F. Joints shall be sealed with o-ring gaskets conforming to ASTM C 443.
- G. Concrete for base and channel formation shall be 4000 psi concrete conforming to Section 033000 - Cast-In-Place Concrete.
- H. Barrel section to sewer pipe connections shall be sealed with resilient connectors complying with ASTM C 923. Mechanical devices shall be stainless steel.
- I. Manhole steps shall be comprised of 1/2-inch grade 60 steel reinforcement rod encased in polypropylene copolymer plastic. Steps shall have tread width of 14-inches. Furnish test results demonstrating step capability to resist a pull out force of 2200 pounds. Provide PS2-PF Manhole Step by M.A. Industries, or equal.
- J. Manhole Manufacturers, or Equal

2.02 FRAMES AND COVERS

- A. Castings: Castings for manhole frames and covers shall be non-rocking and shall conform to the requirements of ASTM A 48, Class 30. Unless otherwise indicated, cast iron covers and frames shall be heavy traffic type, 30 inches in diameter, with embossed lettering saying "Goleta Water District". Frame and cover shall be designed for H-20 traffic loading.
- B. Castings Manufacturers, or Equal

Alhambra Foundry Co., Ltd.
Neenah Foundry Co.
East Jordan Iron Works

2.03 VAULTS

- A. The Contractor shall provide precast vaults designed for the indicated applications and of the sizes indicated.
- B. The minimum structural member thickness for vaults shall be 5-inches. Cement shall be Type V Portland cement as specified in ASTM C 150. The minimum 28-day concrete compressive strength shall be 4,000 psi. All reinforcing steel shall be embedded in the concrete with a minimum clear cover as recommended by ACI 318.
- C. Design Loading: Vaults in areas subject to vehicular traffic shall be designed for H-20 traffic loading. Vaults in other areas shall be designed for a vertical live load of 300 psf. Lateral loads on vaults in all areas shall be calculated from:

$L = 90 h$ (+ surcharge of 240 psf in areas of vehicular traffic),

where L = loading in psf, and h = depth of fill in feet.

- D. Where joints are designed in pre-cast concrete vaults, such joints shall be interlocking to secure proper alignment between members and prevent migration of soil through the joint. Structural sections at joints shall be sized sufficiently to reinforce the section against localized distress during transportation and handling and against excess contact bearing pressures through the joint.
- E. Where openings for access to the vault are required, the full clear space opening indicated shall be provided, without obstructions from brackets or supports. For large openings where brackets or supports are designed to protrude into the opening for support of required covers, such brackets or supports shall be designed to be easily removed and replaced with a minimum of effort and without cutting or welding.
- F. Covers for access openings shall be provided. Frames for lids shall be fabricated from steel (galvanized after fabrication) or aluminum, and shall be integrally cast into the vault concrete sections. Vault lids shall be fabricated from plate aluminum with stainless steel hardware. Aluminum plate (vault lids) shall incorporate an anti-slip aluminum surface permanently bonded to the plate with a minimum coefficient of friction of 0.6, and shall be UL listed as slip resistant. The anti-slip aluminum surface shall be "SlipNOT" Grade 2 Medium as manufactured by W.S. Molnar Company or approved equal. All lids shall be tight fitting to prevent the entrance of dirt and debris. Where edge seams are permitted, no gaps greater than 1/16-inch between edges will be accepted.
- G. All covers, except round, heavy-weight, cast iron manhole covers, shall have securing mechanisms to hold the covers firmly in place against the effects of repetitious live loads such as pedestrian or vehicle traffic. All vaults shall have spring assisted or torsional lids. Hinges for lid sections shall run parallel to centerline of meter. Reading lids shall be fabricated in the field to align with meter register as approved by the GWD Inspector. All vault covers for vaults containing meters shall be provided with appropriate hole for Touch-Read device.
- H. Where penetration of the pre-cast concrete vault are required for piping, conduit, or ducts, such penetrations shall be accommodated through pre-cast openings or thin-wall knock-out sections. All openings for penetrations shall be smooth and free of surface irregularities and without exposed steel reinforcing. Vaults need not be designed to resist thrust from piping passing through the vault.
- I. All hardware, nuts, and bolts used inside vaults shall be stainless steel unless otherwise specified.

2.04 BLOW-OFF VAULTS

- A. The Contractor shall provide precast or prefabricated circular vaults designed for the indicated application and of the size indicated. Blow-off vaults shall be reinforced concrete or fiber reinforced polymer.
- B. Design Loading: Vaults in areas subject to vehicular traffic shall be designed for H-20 traffic loading. Vaults in other areas shall be designed for a vertical live load of 300 psf.
- C. The full clear space opening indicated shall be provided, without obstructions from brackets or supports, and covers for access openings shall be provided. Covers shall be cast iron or reinforced polymer. All lids shall be tight fitting to prevent the entrance of dirt and debris. All covers, except round, heavy-weight, cast iron manhole covers, shall have securing mechanisms to hold the covers firmly in place against the effects of repetitious live loads such as pedestrian or vehicle traffic.

2.05 WARNING SIGNS

- A. The entrance to every manhole and vault shall be fitted with a permanently affixed, plastic warning sign, located above and centered on the top step. The size and wording of each sign shall be as directed by the Goleta Water District.
- B. Sign Manufacturer, or Equal

W. H. Brady Company
Seton Nameplate Corporation

2.06 METER BOXES

- A. The Contractor shall provide meter boxes for the indicated applications and of the sizes indicated. Meter boxes and vaults shall be sized in accordance with the table below. All replacement and retrofit meters shall be located in the appropriate meter box or vault as shown. Any exceptions shall be approved in advance by the District. Meter box and vault manufacturers and product numbers shall be as indicated on District approved materials list.
- B. Where specified by the District, meter boxes shall be provided with single piece polymer concrete cover with appropriate hole for an Invensys (Sensus) Touch-Read device.

PART 3 – EXECUTION

3.01 GENERAL

- A. Pre-cast concrete sections shall be transported and handled with care in accordance with the manufacturer's written recommendations. Where lifting devices are provided in pre-cast sections, such lifting devices shall be used as intended. Where no lifting devices are provided, the Contractor shall follow the manufacturer's recommendations for lifting procedures to provide proper support during lifting.
- B. Meter Boxes shall be assembled and placed in excavations on properly compacted soil foundations as indicated. Meter boxes shall be set to grade and oriented to provide the required dimensions and clearances from pipes and other structures.
- C. Prior to backfilling, all cracks and voids in meter boxes shall be filled with non-shrink grout. Around pipe and conduit penetrations, openings shall be sealed with non-shrink grout.

END OF SECTION

SECTION 33 40 00 STORM DRAINAGE UTILITIES

PART 1 - GENERAL

1.01 SUMMARY

- A. This Section includes storm drainage piping; sub-surface drains; metal covers, grates and frames; catch basins; box culverts; manholes, and BMPs.
 - 1. Best Management Practices (BMPs):
 - a. Proprietary Detention BMPs - Precast Concrete.
 - b. Cartridge Media Filters.
 - c. Hydrodynamic Separation Devices.
 - d. Catch Basin Inserts.
 - e. Downspout Filters.
 - f. Stormwater Interceptors.
 - g. Proprietary Retention/Infiltration BMPs – Polypropylene or Polyethylene.
 - h. Proprietary Retention/Infiltration BMPs – Precast Concrete.
 - i. Proprietary Biotreatment Devices.
 - 2. Closed-circuit television inspection of storm drain lines.

1.02 RELATED REQUIREMENTS

- A. Division 01 - General Requirements.
- B. Section 01 3593 - Off-site Improvement Procedures.
- C. Section 01 7416 - Storm Water Pollution Prevention Plan.
- D. Section 01 7417 – BMP Implementation Plan.
- E. Section 01 7418 – Water Pollution Control.
- F. Section 22 1000 - Plumbing.
- G. Section 31 2300 - Earthwork.

- H. Section 31 2316 – Trenching Backfill and Compaction.
- I. Section 32 0117 – Asphalt Pavement Repair.
- J. Section 32 1313 – Portland Cement Concrete Paving (Pedestrian).

1.03 DEFINITIONS

- A. AASHTO: American Association of State Highway and Transportation Officials.
- B. ASME: American Society of Mechanical Engineers.
- C. ASTM: American Society for Testing and Materials.
- D. BMP: Stormwater Best Management Practice.
- E. CBC: California Building Code.
- F. CCTV: Closed-Circuit Television.
- G. DET: Detention BMP.
- H. DWV: Drain, Waste, and Vent.
- I. FILT: Filter BMP.
- J. GS: Gravity Separator.
- K. HDPE: High Density Polyethylene.
- L. IAPMO: International Association of Plumbing and Mechanical Officials.
- M. IOR: Inspector of Record.
- N. NPS: Nominal Pipe Size.
- O. OAR: OWNER's Authorized Representative.
- P. PE: Polyethylene.
- Q. Post Construction BMP: Devices installed by the CONTRACTOR for storm water management to be left on site after construction completion.
- R. PP: Polypropylene.
- S. PVC: Poly Vinyl Chloride.
- T. RET: Retention.
- U. SDR: Standard Dimensions Ratio.

- V. VEG: Vegetative.
- W. OWNER: City of Goleta.
- X. SWPPP: Storm Water Pollution Prevention Plan.

1.05 SUBMITTALS

- A. Shop Drawings: Submit site plan denoting locations of lines, valves, and appurtenances.
- B. Product Data: Manufacturer's catalog data for all required materials. Include technical data for accessories, information concerning gaskets, joints and couplings.
- C. Certificates: Certificates attesting that tests set forth in referenced publication have been performed and the results required by design have been met.
- D. Closeout Documents: At Substantial Completion submit to the OAR two CD's and one hard copy of the documents indicated in paragraphs 1 through 5 below:
 1. Maintenance Log: Provide Microsoft Excel Spreadsheet including the following information:
 - a. Maintenance log and upkeep records of the installed Post Construction BMPs. Include the following headers as a minimum: "Date of Service", "Location of BMP", "Type of Maintenance or Service", "Notes", "Next Scheduled Preventive Maintenance Due", and "Inspector Signature".
 - b. Maintenance Requirements: Include the following headers as a minimum: "BMP Description", "Location of BMP and Map Grid Location" and "Type of Maintenance or Service Needed", i.e.; weekly, monthly, quarterly, etcetera. "Stock No.", "Manufacturer Contact

- Information”, along with “Frequency” namely: weekly, monthly, quarterly, etcetera and “Special Instructions”.
2. Maintenance Manuals: Provide Maintenance Manual for storm drainage BMP components installed along with requirements, replacement or maintenance schedule and plans with the location of each BMP component. This manual shall include product information cut sheet, shop drawings, vendor information for each component and warranty.
 3. Record drawings: ‘As-Built’ site plan(s) showing Post Construction BMP. Provide a copy of marked record set with red pencil identifying any variations from design documents.
 4. Training Documentation:
 - a. OWNER attendees sign off training sheet.
 - b. Two DVD’s of materials covered in the training and components installed.
 5. Post-Construction BMP Maintenance Plan: Submit complete Plan per Attachment “A”, edit per As-Built conditions and provide missing information.
 6. Records of Closed-Circuit Television Inspection: At Substantial Completion submit to the OAR three DVD’s of Closed-circuit television inspections performed. Include the following information:
 - a. Electronic Media Recordings: Visual and audio record of the entire length of pipe. For existing laterals identify problem areas, such as roots, cracks, fractures, broken pipe, and other unusual conditions found.
 - b. Digital Photographs of the pipe condition, connections, points of interest and defects found. Indicate distance of defects to a point of reference such as face of building or mainline. Provide the Digital Photographs after fixing the defective pipes.
 - c. Inspection Log: Provide written report including:
 - 1) Date and time of inspection.
 - 2) Name of School, Project, CONTRACTOR, and operator name.
 - 3) Location, material and size of pipe.
 - 4) Description of defects found and attempts to fix them.

1.06 QUALITY ASSURANCE

- A. Comply with the following as a minimum requirement: Standard Specifications for Public Works Construction, current edition.

1.07 DELIVERY, STORAGE, AND HANDLING

- A. Do not store plastic products, pipes, and fittings in direct sunlight.
- B. Protect pipe, pipe fittings, and seals from dirt and damage.
- C. Handle all products according to manufacturer's written rigging instructions.

1.08 TRAINING OF OWNER PERSONNEL

- A. At Substantial Completion and when the storm drainage system is fully operational, knowledgeable representatives from the CONTRACTOR and manufacturer(s) of the components specified and installed at the site shall provide up to 8 hours of training. Date, time and location for the training shall be coordinated through the project OAR. Have OWNER attendees sign off training sheet and provide a copy to the OAR.
- B. Training period shall cover but not be limited to the following:
 - 1. Explain the operation of storm drainage system and its design intent.
 - 2. Explain the maintenance requirements of every component of the system.
 - 3. Provide recommendations of practices to minimize or eliminate negative impact on the system.
 - 4. Provide maintenance schedule as recommended by the manufacturers for every component and review it with OWNER's Maintenance and Operations staff.
 - 5. Conduct a site walk, identify every component of the system and demonstrate its operation.
 - 6. Training shall be conducted with the use of Maintenance log and Maintenance manual.

1.09 SURPLUS MATERIALS

- A. Provide enough additional materials for each component of BMP that requires replacement or service during the first year.

1.10 ATTACHMENTS

- A. The following attachments are included at the end of Section 33 4000:
 - 1. Attachment "A" - Post-Construction BMP Maintenance Plan.
 - 2. Attachment "B" – Post-Construction Water Balance Calculator.

PART 2 – MATERIALS AND PRODUCTS

2.01 PIPING MATERIALS

- A. General: Minimum 5 feet away from building boundaries. For piping within 5 feet from building boundaries, and interior piping refer to Division 22 plumbing sections. Provide piping system in conformance with Section 207 - Pipe and Section 208 - Pipe Joint Types and Materials of the Standard Specifications for Public Works Construction. All Soil-tight pipes shall be provided with joints that are function of opening size, channel length, and backfill particle size. A backfill material containing a high percentage of fine-graded soils requires investigation for the specific type of joint to be used to guard against soil infiltration, including the requirement for fabric-wrapped joints.
- B. Nonreinforced Concrete Pipe (CP): ASTM C14, with bell-and-spigot ends and gasketed joints with ASTM C443 rubber gaskets.
- C. Reinforced Concrete Pipe (RCP): ASTM C76, with bell-and-spigot ends and gasketed joints with ASTM C443 rubber gaskets.
 - 1. Approved manufacturers: Thompson Pipe Group, or equal.
- D. Cast Iron Soil Pipe (CIP):
 - 1. Hubless, service weight, ASTM A888, CISPI 301, conforming to CISPI 310 and installed in accordance to IAPMO IS 6.
 - 2. Cast iron soil coupling: Hubless, heavy-duty with neoprene gaskets, stainless steel corrugated shields, and 4 bands of stainless-steel clamps. IAPMO, ASTM C564 and CISPI 310.
 - 3. Approved manufacturers: American Foundry, Mission Rubber Company, Tyler, or equal.
- E. Corrugated, Dual Wall, High Density Polyethylene Drainage Pipe (HDPE):
 - 1. Corrugated PE Drainage Pipe and Fittings NPS 4 to NPS 10: AASHTO M 252, Type S (double-wall) with smooth waterway for coupling joints.
 - 2. Corrugated PE Pipe and Fittings NPS 12 to NPS 60: AASHTO M 294 or ASTM F2306, Type S (double-wall) with smooth waterway for coupling joints.
 - 3. Approved manufacturer: ADS, Hancor, JM Eagle, or equal.
- F. Corrugated, Dual or Triple Wall, Polypropylene Pipe (PP):
 - 1. Corrugated PP Drainage Pipe and Fittings NPS 12 to NPS 60: ASTM F2764, ASTM F2881, or AASHTO M 330, Type S (double-wall) or Type D (triple-wall), for respective diameters. Provide coupling joints with smooth waterway.

2. Approved manufacturers: ADS, Prinsco, or equal.
- G. PVC (Poly Vinyl Chloride) Schedule 40 DWV Pipe:
1. Conform to ASTM D2665, ASTM F794, and ASTM F1866.
 2. Installer of PVC Schedule 40 DWV piping system shall carry ASTM D2855 and ASME B31.3 qualification. Installer shall provide proof of these qualifications to IOR prior to commencing work.
 3. Containers for solvent and primer shall be clearly marked with manufacturer's data. Solvent and primer shall not be more than one year old. The safety placards must be visible.
 4. Blue or red-hot glue shall not be used.
 5. Approved manufacturers and products:
 - a. Pipe: Charlotte pipe and foundry, Harvel Plastics Inc., JM Eagle, Spears Manufacturing Company, or equal.
 - b. Primer: Weld-On P-70 by IPS, Conforming to ASTM F656.
 - c. Cement: Weld-On 711 (gray) by IPS, Conforming to ASTM D2564.
- H. PVC (Poly Vinyl Chloride) SDR-35 Pipe, 6" through 15":
1. Conform to ASTM D3034.
 2. Gasketed Joints: Elastomeric gasket joints conforming to ASTM D3212.
 3. Gaskets: Chloroprene conforming to ASTM F477.
 4. Approved manufacturers: Charlotte pipe and foundry, Harvel Plastics Inc., JM Eagle, Spears Manufacturing Company, or equal.
- 2.02 BEDDING MATERIAL FOR PIPE
- A. General: Conform to the requirements of Section 31 2313 - Excavation and Fill or Section 31 2323 - Excavation and Fill for Utilities, as required.
- B. Approved manufacturers and products:
1. Propex Fabrics, Inc.: Geotex 451.
 2. TenCate Geosynthetics Americas: Mirafi 140N.
 3. US Fabrics, Inc.: 120NW.
 4. Equal products.

2.03 PERFORATED SUBSURFACE DRAIN PIPE

- A. Perforations shall be symmetrically located within a maximum arc of 160 degrees. Perforations shall provide a total open area of at least 0.3 square inches per linear foot of pipe, with a minimum of one perforation per linear foot, except for joint areas. Perforation shall be either holes or slots. Hole diameters of ¼-inch minimum to ½-inch maximum. Width of slots of 1/8-inch minimum to 5/16-inch maximum with slot length not exceeding 5 inches.
- B. Aggregate Around Perforated Pipe shall be 6 inches of gravel containing no particles finer than a 1/2-inch to 3/4-inch sieve opening size.

2.04 STORMWATER TREATMENT SYSTEMS /BMPS

- A. DET-1: Proprietary Detention BMPs – Reinforced Precast Concrete, approved manufacturers and products:
 - 1. Jensen Precast: Precast-Concrete-Detention-Reservoir.
 - 2. Oldcastle Precast Inc.: Storm Capture-Detention.
 - 3. Storm Trap: Single-Trap-Detention.
 - 4. Equal products.
- B. FILT-2: Cartridge Media Filters, approved manufacturers and products:
 - 1. Baysaver Technologies Inc.: Bayfilter.
 - 2. Contech: Storm Filter.
 - 3. OldCastle Precast Inc.: Perk Filter.
 - 4. Equal products.
- C. GS-1: Hydrodynamic Separation Devices, approved manufacturers and products:
 - 1. ADS-Baysaver Technologies Inc.: Barracuda S Series.
 - 2. Contech: CDS.
 - 3. Hydro International: First Defense HC (High Capacity).
 - 4. Jensen Precast: JDS.
 - 5. Oldcastle Precast Inc.: DVS.
 - 6. Equal products.
- D. GS-2: Catch Basin Inserts, approved manufacturers and products:

Department of Neighborhood Services and Public Safety
GOLETA TRAIN DEPOT PROJECT

1. AbTech Industries: UUF DI-DO.
 2. ADS-FlexStorm: FlexStorm Pure or Catch-it.
 3. Aquashield Inc.: Aqua-Guardian.
 4. Ecosense International: EcoSense International's Catch Basin Insert.
 5. EnviroPod Inc.: LittaTrap.
 6. Oldcastle Precast Inc.: FLoGard, or GISB.
 7. UltraTech International Inc.: Ultra-Drain Guard.
 8. Equal products.
- E. GS-3: Downspout Filters, approved manufacturers and products:
1. Oldcastle Precast Inc.: FLoGard +Plus.
 2. Equal products.
- F. GS-5: Stormwater Interceptors, approved manufacturers and products:
1. Jensen Precast: JPHV-stormwater-interceptors-with-bypass.
 2. Oldcastle Precast Inc.: Storm Capture Detention.
 3. Oldcastle Precast Inc.: NSBB, Nutrient Separating Baffle Box.
 4. Storm Trap: Single-Trap-Detention.
 5. Equal products.
- G. RET-4: Drywells
1. Pre-Cast Liner: Reinforced 4000 PSI concrete. 48" I.D., 54" O.D.
 2. Overflow/Riser Pipe: Minimum 6" I.D. Schedule 40 Poly Vinyl Chloride (PVC) solid wall with debris shield.
 3. Drainage Screen: Minimum 6" I.D., Schedule 40 PVC slotted screen with 0.120-inch slots continuous, with a minimum of 160 slots per foot.
 4. Rock: Clean washed rock uniformly graded between 3/8" and 1-1/2".
 5. Absorbent: Hydrophobic petrochemical sponge with minimum four (4) quart capacity used in all chambers.
 6. Approved manufacturers and products:

- a. Torrent Resources: MaxWell.
 - b. Equal products.
- H. RET-7a: Proprietary Retention/Infiltration BMPs – Polypropylene or Polyethylene
1. Molded PP or PE with open bottom. Thermoplastic Corrugated Wall Chambers (Chambers): Provide in conformance with ASTM F 2418 “Standard Specification for Polypropylene Corrugated Wall Stormwater Collection Chambers”, ASTM F 2922 “Standard Specification for Polyethylene Corrugated Wall Stormwater Collection Chambers”, and ASTM F 2787 “Standard Practice for Structural Design of Thermoplastic Corrugated Wall Stormwater Collection Chambers”.
 2. Filtering Material: ASTM.D448, washed, crushed stone or ¾” to 2” gravel. For more information refer to plans, and manufacturer installation manual.
 3. Filter Mat, applicable to isolator/main row: Geotextile woven or spun filter fabric, in one or more layers. For more information refer to plans, and manufacturer installation manual.
 4. Provide non-woven geotextile fabric around the entire system to prevent migration of fines into the rock voids. For more information refer to plans, and manufacturer installation manual.
 5. Pipe Systems: Perforated manifold, header, and lateral piping complying with AASHTO M 252 for NPS 10 and smaller, AASHTO M 294 for NPS 12 to NPS 60. Include proprietary fittings, couplings, seals, and filter fabric.
 6. Approved manufacturers and products:
 - a. ADS - Storm Tech: MC3500, MC4500, SC740 or DC780.
 - b. Contech: ChamberMaxx.
 - c. NDS: StormChambers SC34 or SC44.
 - d. Prinsco: HydroStor HS180 or HS75.
 - e. Triton: S22 or S29.
 - f. Equal products.
- I. RET-7b: Proprietary Retention/Infiltration BMPs – Reinforced Precast Concrete, approved manufacturers and products:
1. Jensen Precast: Precast-Concrete-Arches.
 2. Oldcastle Precast Inc.: Storm Capture Infiltration.

3. StormTrap: Single-Trap-Infiltration.
 4. Equal products
- J. VEG-6: Proprietary Biotreatment Devices, approved manufacturers and products:
1. BioClean: Modular Wetlands System.
 - a. Infiltration media shall be ARCOSA.
 2. Contech: Filterra Bioretention Systems.
 - a. Infiltration media shall be Filterra Media consist of a combination of natural sand, gravel, and organic materials.
 3. DeepRoot Urban Landscape: Silva Cell 2.
 4. Oldcastle: BioPod Underground.
 - a. Infiltration media shall be StormMix.
 5. StormTree: Tree Filter System.
 - a. Grates shall be Hot-dip galvanize steel.
 - b. Infiltration media shall be CocoGro Coir Fiber.
 6. Equal products.

2.05 MANHOLES

- A. Provide round reinforced concrete manhole with an H-20 traffic rated hatch & solid cover of minimum 30-inch in diameter with holes of maximum ½-inch in diameter.

2.06 MISCELLANEOUS MATERIALS

- A. Metal Covers, Grates, Frames and Accessories:
1. Conform to Section 206 - Miscellaneous Metal Items of the Standard Specifications for Public Works Construction.
 2. Hot-dip galvanize steel parts after fabrication in accordance with Section 210 - Paint and Protective Coatings of the Standard Specifications for Public Works Construction.
 3. Grates and Frames:
 - a. Vandal-proof design and construction.
 - b. ADA compliant, in conformance to CBC 11B-302.3.

- c. Rated for vehicular traffic on areas intended for use by motor vehicles.
- d. Hot-dip galvanized.
- B. Concrete, Mortar and Related Materials: Conform to Section 32 1313 - Site Concrete Work.
- C. Manhole Brick Mortar, Grout, and Plaster: Conform to Standard Specifications for Public Works Construction, Section 202 - Masonry Materials.
- D. Underground Concrete Structures: Shall be precast and rated for H-20 traffic loading and applicable soil loads. The materials and structural design of the devices shall be per ASTM C857 and ASTM C858.

2.07 NAMEPLATES

- A. Stainless steel or aluminium nameplate permanently fastened to BMP showing the following information:
 - 1. BMP ID number and BMP type.
 - 2. Next service day followed by a 1-inch by 4-inch long blank space.
 - 3. Manufacturer name, model number, telephone number and stock ID number.
 - 4. Installation or production date.
 - 5. 1-inch by 4-inch blank space for OWNER's use.

PART 3 – EXECUTION

3.01 GENERAL INSTALLATION REQUIREMENTS

- A. CONTRACTOR shall arrange for a preconstruction meeting with the manufacturer's representative to review the basic principles for proper installation of Underground BMP type products prior to any installation.
- B. Underground Concrete modules shall be installed in accordance with manufacturer's instructions and the current ASTM C891 procedures.

3.02 EXCAVATION, BACKFILLING AND COMPACTING

- A. Conform to the requirements of Section 31 2313 - Excavation and Fill or Section 31 2323 - Excavation and Fill for Utilities, as required.

3.03 INSTALLATION OF PIPE

- A. Conform to Section 306 - Underground Conduit Construction of the Standard Specifications for Public Works Construction.
- B. Non-ferrous drainpipe installed with less than 12 inches of cover to finish grade shall be provided with a 4-inch thick concrete pipe encasement.

3.04 DRAINAGE APPURTENANCES

- A. Catch basins, junction chambers, manholes, box culverts, outlet chambers and other drainage structures: Construct as indicated on Drawings and as specified in Section 32 1313 - Site Concrete Work, and in compliance with the Standard Specifications for Public Works Construction, Section 303 - Concrete and Masonry Construction.
- B. Ensure that Post Construction BMP have a visible identifying manufacturer tag with product identification, manufacturer contact information, date of last service and date of next service due.
- C. Provide storm drain stencil per City or County requirements as applicable.

3.05 STORMWATER TREATMENT SYSTEMS/BMPs

- A. (Shall be completed by design team.)

3.06 ABANDONED DRAINAGE LINES AND STRUCTURES

- A. Cap or plug existing drain lines that are cut and abandoned and remove existing drainage structures that are abandoned.

3.07 CLEANUP

- A. Remove rubbish, debris, and waste materials and legally dispose of off the Project site.
- B. Maintain Post Construction BMP after installation and keep a maintenance log to be turned over to OAR at Substantial Completion.

3.08 PROTECTION

- A. Protect the Work of this section until Substantial Completion.

I. INTRODUCTION

A. Project Description

The proposed train depot will be constructed on an approximately 2.2 acre site. The majority of this new school site is in a flat area and initially covered with _____.

B. Site Conditions

Groundwater

Per the geotechnical evaluation prepared by _____, groundwater [*was/ was not*] encountered [*at _____ft.*] The borings were drilled to a maximum depth of _____ ft.

Soils

Slopes

The proposed project site is at approximately _____ feet above mean sea level and has a general slope of approximately ____%. There is a difference in elevation of about _____ feet across the site.

Drainage Patterns (onsite/offsite)

The drainage generally flows in a _____ direction towards _____ [*street/avenue*]. The [*north/south/east/west*] adjacent property has drainage patterns directed towards the school site.

II. STORMWATER TREATMENT STRATEGY

A. Description of Proposed Site Drainage

B. Site Drainage Areas, Land Uses and Proposed BMP Table

Drainage Area	Land Use	BMP Selected	Treatment Type
A	Buildings/Roofs and Associated Landscaped Areas; Playfield	GS-1 Hydrodynamic Separator; GS-2 Catch Basin Inserts	Pre-Treatment
		RET-7a Retention/Infiltration BMPs-Thermoplastic or RET-7b Retention/Infiltration BMPs-Precast Concrete	Highly Recommended Structural Treatment BMP
B	Buildings/Roofs and Associated Landscaped Areas	VEG-6 Modular Wetland Systems	Recommended Structural Treatment BMP
D	Roadway, Driveways and Parking Lot	Permeable Interlocking Concrete Pavement – Refer to guide specification section 32 1415	Highly Recommended Structural Treatment BMP

IV. MONITORING AND MAINTENANCE

See Appendix 3 for additional BMP monitoring and maintenance information. At a minimum:

- The drainage system and the associated structures and BMP shall be maintained according to manufacturer's specification and to ensure maximum pollutant removal efficiencies as needed.
- Debris and other water pollutants removed from BMP during cleanout shall be contained and disposed of in a proper manner as needed.

V. NON-STRUCTURAL BMP

Source Control BMP used at this site include:

- SC-1 Landscaping Maintenance and Integrated Pest Management (IPM)
- SC-3 Parking Area Maintenance
- SC-4 Sidewalk and Plaza Maintenance
- SC-5 Leaking Vehicles
- SC-6 Vehicle and Equipment Cleanup
- SC-7 Outdoor Storage of Equipment and Materials
- SC-9 Storm Drainage Signage/ Stenciling
- SC-8 Fire Sprinkler Test Water
- SC-9 Miscellaneous Drain or Wash Water
- SC-10 Safer Alternative Products
- SC-11 Spill Prevention Control and Cleanup
-

SECTION 26 05 00

COMMON WORK RESULTS FOR ELECTRICAL

PART 1 - GENERAL

1.01 SUMMARY

- A. This Section specifies the basic requirements for electrical installations and includes requirements common to more than one section of Division 26. It expands and supplements the requirements specified in sections of Division 01.
- B. Related Requirements:
1. Division 01 – General Requirements.
 2. Section 03 30 00 – Cast-in-Place Concrete (Train Depot Package).
 3. Section 09 90 00 – Painting and Coating (Train Depot Package).
 4. Division 26 – Electrical.
 5. Division 31 – Earthwork.
 6. Division 32 – Exterior Improvements.
 7. Division 33 – Site Improvements.
- C. Related Industry Standards: The most current version of the following industry standards.
1. ASTM D 709 – Laminated Thermosetting materials.
 2. ANSI/NEMA FB-1 – Fittings, Cast Metal Boxes, and Conduit Bodies for Conduit, Electrical Metallic Tubing, and Cable.
 3. ANSI/NEMA 250 – Enclosures for Electrical Equipment (1000 Volts Maximum).
 4. California Electrical Code (CEC).
 5. IEEE C57.12.28 – Standard for Pad-Mounted equipment Enclosure Integrity.
 6. IEEE 1584 – Performing Arc-Flash Hazard Calculations.
 7. UL/ANSI 1 – Standard for Flexible Metal Conduit.
 8. UL/ANSI 1242 – Standard for Electrical Intermediate Metal Conduit.

9. UL/ANSI 506 – Standard for Specialty Transformers.
10. UL/ANSI 6 – Electrical Rigid Metal Conduit-Steel.
11. UL/ANSI 6A – Electrical Rigid Metal Conduit-Aluminum, Red Brass, and Stainless Steel.
12. UL 797 – Electrical Metallic Tubing-Steel.
13. UL/ANSI 870 – Standard for Wireways, Auxiliary Gutters, and Associated Fittings.
14. UL/ANSI 891 – Standard for Safety Switchboards.

1.02 BASIC ELECTRICAL REQUIREMENTS

A. Quality Assurance:

1. Work shall be performed by CONTRACTOR'S personnel possessing the skills and experience obtained in performing work of similar scope and complexity.
2. Refer to related division(s) specifications for other requirements.

B. Drawings and Specifications Coordination:

1. For purposes of clearness and legibility, Drawings are essentially diagrammatic, and the size and location of equipment is indicated to scale whenever possible. Verify conditions, dimensions, indicated equipment sizes, and manufacturer's data and information as necessary to install the Work of this Division. Coordinate location and layout with other Work.
2. Verify final locations for rough ins with field measurements and with the requirements of the equipment to be connected.
3. Drawings indicate required size and points of termination of conduits, number and size of conductors, and diagrammatic routing of conduits. Install conduits with minimum number of bends to conform to structure, avoid obstructions, preserve headroom, keep openings and passageways clear, and comply with applicable code requirements.
4. Routing of conduits may be changed provided that the length of any conduit run is not increased more than 10 percent of length indicated on the Drawings.
5. Outlet locations shall be coordinated with architectural elements prior to start of construction. Locations indicated on the Drawings may be distorted for clarity; CONTRACTOR shall coordinate in the field prior to rough-in work.

6. Coordinate electrical equipment and materials installation with building components and the Work of other trades.
 7. Equipment disconnects shall be readily accessible and free of obstructions.
 8. When extending or intercepting existing electrical facilities, CONTRACTOR shall Coordinate and verify existing conditions.
- C. Terminology:
1. Signal Systems: Applies to clock, bell, fire alarm, annunciator, sound, public address, buzzer, telephone, television, inter-communication, elevator access controls, lighting control systems and security systems.
 2. Low Voltage: Applies to signal systems operating at 120 volts and less, and power systems operating at less than 600 volts. Medium voltage: Applies to power systems operating at more than 600 volts.
 3. UL: Underwriter's Laboratories Inc, Nationally Recognized Testing Laboratory (NRTL), or equal.
- D. Regulations: Work shall comply with the requirements of authorities having jurisdiction and the California Electrical and Building Codes. Material shall conform to regulations of the National Board of Fire Underwriters for electrical wiring and apparatus. Materials shall be new and listed by UL, or another NRTL.
- E. Structural Considerations for Conduit Routing:
1. CONTRACTOR shall provide calculations and drawings as necessary for any construction and/or alterations requiring conduits to pass through or interfere with any structural members, or where notching, boring or cutting of the structure is necessary, or where special openings through walls, floors, footings, or other buildings elements, or where notches and bored holes in wood or steel are required. All work shall conform to CBC, Part 2, Title 24 requirements.
 2. Concrete encasement for underground conduits that abuts a foundation wall or underground structure shall rest on a haunch integral with wall or structure, or shall extend down to footing projection, or shall be doweled into structure unless otherwise indicated. Underground structures shall include maintenance holes; pull boxes, vaults, and buildings.

- F. Power Distribution System Reports: For fault current, coordinatization and Arc-Flash system report requirements refer to applicable electrical distribution equipment sections. for specific requirements.
- G. Protection of Materials:
 - 1. Protect materials and equipment from damage and provide adequate and proper storage facilities during progress of the Work. Damaged materials and/or equipment shall be replaced.
- H. Cleaning:
 - 1. Exposed parts of Work shall be left in a neat, clean, usable condition. Finished painted surfaces shall be unblemished and metal surfaces shall be polished.
 - 2. Thoroughly clean parts of apparatus and equipment. Exposed parts to be painted shall be thoroughly cleaned of cement, plaster, and other materials. Remove grease and oil spots with solvent. Such surfaces shall be wiped, and corners and cracks scraped out. Exposed rough metal shall be smooth, free of sharp edges, carefully steel brushed to remove rust and other spots, and left in proper condition to receive finish painting.
 - 3. Remove rubbish, debris, and waste materials and legally dispose of off the Project site.
- I. WARRANTIES
 - 1. Provide one-year warranty on all material and labor performed, unless noted otherwise in specific sections.

PART 2 - PRODUCTS - NOT USED

PART 3 - EXECUTION

3.01 GENERAL REQUIREMENTS

- A. Advise the Inspector before starting the Work of this Division.
- B. Exposed conduits shall be painted to match the surfaces adjacent to installation.
- C. Salvaged materials removed from buildings shall be removed from the Project site as required by the OAR.

- D. Trenches outside of barricade limits shall be backfilled and paved within 24 hours after being inspected by the Inspector. Provide traffic plates during the time that trenches are open in traffic areas and in areas accessible to the public.
- E. Electrical equipment shall be braced and anchored for CBC Seismic Design requirements, or as otherwise indicated on the Drawings.

3.02 DELIVERY STORAGE AND HANDLING

- A. Deliver products to project site with proper identification, which shall include names, model numbers, types, grades, compliance labels, and similar information needed for District identification; all products and materials shall be adequately packaged and protected to prevent damage during shipment, storage, and handling.
- B. Coordinate deliveries of electrical materials and equipment to minimize construction site congestion.

3.03 CUTTING AND PATCHING

- A. Cutting and patching of electrical equipment, components, and materials shall include the removal and legal disposal of selected materials, components, and equipment.
- B. Do not endanger or damage installed Work through procedures and processes of cutting and patching.
- C. Repair or restore other work or surfaces damaged as a result of the work performed under this contract.

3.04 CLEANUP

- A. Remove rubbish, debris and waste materials and legally dispose off the Project site.
- B. Remove equipment and implements of service, and leave entire work area neat and clean, to the satisfaction of the OWNER Authorized Representative.

3.05 PROTECTION

- A. Protect the Work of this section until Substantial Completion.

END OF SECTION – 26 0500

SECTION 26 05 13

BASIC ELECTRICAL MATERIALS AND METHODS

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Boxes, enclosures, keys and locks.
2. Identifications and signs.

B. Related Requirements:

1. Division 01 - General Requirements.
2. Division 26 – Electrical.

PART 2 - PRODUCTS

2.01 BOXES, ENCLOSURES, KEYS AND LOCKS

A. Junction and Pull boxes:

1. Junction and pull boxes, in addition to those indicated, shall only be used in compliance with codes, recognized standards, and Contract Documents.
2. Interior and non-weatherproof boxes shall be constructed of blue or galvanized steel with ample laps, spot welded, and shall be rigid under torsion and deflecting forces. Boxes shall be furnished with auxiliary angle iron framing where necessary to ensure rigidity.
3. Covers shall be fastened to box with enough machine screws to ensure continuous contact all around. Flush type boxes shall be drilled and tapped for cover screws if boxes are not installed plumb. Surfaces of pull and junction boxes and covers shall be labeled in black marker ink designating system, panelboard and circuit designation contained in box. In exposed Work, designation shall be installed on inside of pullbox or junction box cover.
4. Weatherproof NEMA 3R pull and junction boxes shall conform to foregoing for interior boxes with following modifications:
 - a. Cover of flush mounting boxes shall be furnished with a weather-tight gasket cemented to, and trimmed even with, cover all around.

- b. Surface or semi-flush mounting pull and junction boxes shall be UL, or another Nationally Recognized Testing Laboratory (NRTL) listed as rain-tight and shall be furnished complete with threaded conduit hubs.
 - c. Exposed portions of boxes shall be galvanized and finished with one prime coat and one coat of baked-on gray enamel, unless already furnished with factory baked-on finish.
5. Junction and pull boxes shall be rigidly fastened to structure and shall not depend on conduits for support.
6. Underground Concrete Pull Boxes:
- a. Pre-cast concrete pull boxes. Concrete pull boxes shall be traffic type, reinforced for H-20 wheel loading, pre-cast concrete. Pull boxes with inside dimensions of 2 feet by 3 feet by 3 feet deep shall consist of a base section, top ring, and cover. Base section shall be furnished with 2 knockouts measuring 10 inches by 10 inches in each 3 feet side, and one 20 inches by 20 inches knockout in each 2-foot side. Pull boxes with inside dimension 4 feet by 4 feet by 4 feet deep shall consist of a base section, midsection, topping, and cover. Base section shall be furnished with 2 knockouts measuring 8-inch by 16-inch on each of two opposite sides, and one 20-inch by 20-inch knockout on each of other two opposite sides. Pull boxes shall be furnished with a minimum of 6-inch diameter sump knockout and one-inch diameter ground rod knockout. In pull boxes, furnish and install cable racks on walls. Racks shall be furnished with 3 porcelain cable holders on vertical steel mounting bars. Pull boxes shall be furnished with 3/4-inch diameter pull irons. Covers shall be traffic-type consisting of steel safety plate bolted to frame. Covers shall be marked as electrical, power, or signal as required.
 - b. Provide end bells in duct entrances. Terminate each metal conduit with insulated bushing provided with a grounding terminal.
 - c. Provide 6-inch deep sand base under pull boxes.
 - d. Identify power and signal cables by tagging in manholes and pull boxes. Tie securely to cables with nylon cord.
 - e. Top of steel plate shall provide a minimum coefficient of static friction of 0.5 for either wet or dry locations, when tested for any shoe sole material. Test shall comply with ASTM D 1047 or F 489 or F 609 standards. Submit manufacturer's test results for Architect's review as part of materials and equipment submittals.
 - f. The use of underground extension boxes shall be limited to not more than 1 times the original depth of pull box.

1. Install identification markings to surface-mounted starters, switches, disconnect switches, contactors, and other devices controlling motors and appliances. Provide abbreviations required along with an identifying number. Markings to be provided with locking type stencils using paint of a contrasting color. Figures shall be 3/8 inch high unless otherwise indicated. Dymo Industries Inc., self-sticking plastic labels, with embossed characters made with a typewriter may be installed instead of stencils and paint; p-touch self adhesive plastic, or Brother P-Touch self sticking laminated plastic labels may be installed.
2. High Voltage: High voltage switchboards, cabinets, boxes, and conduits exposed in accessible locations, including under buildings and in attics, are required to be marked "WARNING-HIGH VOLTAGE – ABOVE 600 VOLTS". Markings for switchboards shall consist of 18 gage steel, porcelain enamel sign of standard manufacture. Markings for boxes, cabinets, and conduits shall be by means of stenciling or printed self-adhesive markers, Westline Tel-A-Pipe, or equal. Provide letters of black on orange background and not less than 1-7/8 inches high. On conduit runs, install markings at intervals not exceeding 10 feet in any individual area. Markings shall be installed after other painting Work is complete.

C. Warning Signs:

1. Provide a warning sign on outside of each door or gate to rooms or enclosures containing high voltage equipment. Signs required reading, "WARNING - HIGH VOLTAGE - KEEP OUT". Provide 2-inch high lettering.
2. Provide a warning sign on each high-voltage non-load break disconnect and fused cutout (not oil filled). Signs required reading, "DO NOT OPEN UNDER LOAD". Provide 2-inch-high lettering.
3. Provide signs of standard manufacture, 18 gage steel, with porcelain enamel finish. Provide red lettering on a white background.

PART 3 - EXECUTION

3.01 INSTALLATION AND SUPPORT OF BOXES

- A. Install outlet boxes flush with finished surface of wall or ceiling. Install plumb and securely fastened to structure, independent of conduit. Except where otherwise indicated, provide factory-fabricated adjustable attachment bar hangers between studs to support outlet boxes. When installation is performed in fire rated walls, maintain the wall's rating integrity by means of approved fire stop methods.

3.02 IDENTIFICATION OF CIRCUITS AND EQUIPMENT

- A. Provide descriptive nameplates or tags permanently attached to switchboards, motor control centers, transformers, panelboards, circuit breakers, disconnect switches, starters, pushbutton control stations and other apparatus installed for operation or control

of circuits, appliances, fire alarm control panel(s), fire alarm annunciator(s), power supplies, terminal cabinets, energy management control units, and Information technology system backbone and distribution equipment points.

- B. Provide nameplates of engraved laminated plastic, or etched metal. Submit Shop Drawings denoting dimensions and format to Architect before installation. Fasten to equipment with escutcheon pins, rivets, self-tapping screws, or machine screws. Self-adhering or adhesive backed nameplates are not permitted.
- C. Fasten tags to feeder wiring in conduits at every point where runs are broken or terminated, including pull wires in empty conduits. Indicate circuit, phase, and function. Tag branch circuits in panel boards and motor control centers. Tags may be manufactured of pressure-sensitive plastic or embossed self-attached stainless steel or brass ribbon.
- D. Provide circuit identification cards and cardholders in all panel boards. Cardholders shall consist of metal frame retaining a clear plastic cover permanently attached to inside of panel door. List of circuits shall be typewritten on a card. Circuit description shall include name or number of circuit's area and connected load.
- E. Junction and pull boxes shall have covers stenciled with box number when indicated on Drawings, or circuit numbers according to panel schedules. Data shall be lettered in a conspicuous manner with a color contrasting with finish.
- F. Name shall be correctly engraved, with a legend indicating function or areas, when required by codes or indicated on Drawings.

3.03 PROTECTION

- A. Protect Work of this section until Substantial Completion.

3.04 CLEANUP

- A. Remove rubbish, debris, and waste materials and legally dispose of off Project site.

END OF SECTION – 26 0513

SECTION 26 05 26

GROUNDING AND BONDING

PART 1 - GENERAL

1.01 SUMMARY

- A. Provide and install an effective grounding and bonding system.
- B. Related Requirements:
 - 1. Refer to related sections for their system grounding requirements.
 - 2. Division 01 - General Requirements.
 - 3. Division 26 – Electrical.

1.02 QUALITY ASSURANCE

- A. Reference Standards:
 - 1. IEEE 142 Green Book.
 - 2. Underwriter's Laboratories (UL).
 - 3. California Electrical Code.
 - 4. Building Industry Consultant Services International (BICSI).
 - 5. EIA/TIA (Signal and power).
 - 6. Nationally Recognized Testing Laboratory (NRTL).

1.03 SYSTEM DESCRIPTION

- A. Equipment, components, or materials that enclose electrical conductors, or are likely to be energized by electrical currents shall be effectively grounded.
- B. Metal equipment parts such as switchboards, panelboards, metal enclosures, raceways, equipment grounding conductors, and earth grounding electrodes shall be effectively bonded into a continuous grounding path.
- C. Metallic systems or electrically conductive materials shall be effectively bonded to the building's grounding electrode system.

- D. A separately derived AC system shall be grounded to the equipment grounding conductor and to a separate “made” electrode of building grounding electrode system.
- E. Provide effective electrical equipment bond continuity to all metal raceways and enclosures. Grounding shall be achieved through a code sized green insulated grounding conductor provided within each raceway.
 - 1. Each flexible conduit over six feet in length shall be provided with a green insulated grounding conductor of required size.
 - 2. Provide code sized equipment grounding conductor in all flexible conduits as required by CEC.
 - 3. The length of flexible conduit installations shall not be less than six feet.
 - 4. Effectively ground metal raceways and enclosures at each end.
- F. Cold water, or other utility piping systems, shall not be utilized as grounding electrodes. In addition to bonding to cold water pipe provide at least one of the following made grounding electrodes:
 - 1. A dedicated “made” electrode, fabricated of at least 20 feet of uncoated galvanized 1/2 inch diameter rebar encased by at least two inches of concrete, and placed next to the bottom of a concrete foundation, or footing in direct contact with earth A welded extended portion shall surface at the location of the common grounding electrode bus bar and be extended by a 3/0 exothermic welded bare copper cable, or be welded directly to the bus. The exothermic weld shall be at least four inches above finished floor in a dry location. The main grounding electrode and associated grounding conductors shall be in an enclosure and in conduit.
 - 2. Concrete enclosed electrode, fabricated of at least 20 feet of No. 2 AWG, minimum size, bare copper conductor, encased by at least two inches of concrete, located within or near bottom of a concrete foundation, or footing, which is in direct contact with earth. Footing rebar shall be connected to copper wire with approved connectors.
 - 3. An external grounding electrode, as specified hereafter or as required by the CEC shall be installed and connected to foundation or footing rebar.
 - 4. Extend the ground connections to the reinforcing steel of the concrete pads. Connect ground connections to 20 feet minimum of one or more of concrete pad reinforcing steel bars not less than 1/2 inch diameter. Provide a concrete encased electrode consisting of 20 feet of bare copper conductor not smaller than No. 4 AWG.

5. Ground metal sheathing and any exposed metal, vertical structural elements of buildings. Ground metal fences enclosing electrical equipment. Bond any metal equipment platforms which support electrical equipment to that equipment. Provide good electrical contact between metal frames and railings supporting push button stations, receptacles, instrument cabinets, etc., and raceways carrying circuits to those devices.

- G. Non-current carrying metal parts of high-voltage (1000 Volts or more) equipment enclosures, signal and power conduits, switchboard and panelboard enclosures, motor frames, equipment cabinets, and metal frames of buildings shall be permanently and effectively bonded to the grounding system. Provide a CEC sized equipment grounding conductor in every raceway.

- H. Metallic or semi-conducting shields and lead sheaths of cables operating above 1000 Volts shall be permanently and effectively grounded at each splice and termination.

- I. Neutral of service conductors shall be grounded as follows:
 1. Neutral shall be solidly grounded at only one point within the Project site for that particular service. Preferable location of grounding point shall be at the service switchboard, or main switch.
 2. Equipment and conduit grounding conductors shall be bonded to that grounding point.
 3. If other buildings or structures on the Project site are served from a switchboard or panelboard in another building, power supply is classified as a feeder and not as a service.
 4. Equipment grounding conductor shall be installed from switchboard to each individual building. At building, grounding conductor shall be bonded with power equipment enclosures, metal frames of building, etc., to “made” electrode for that building.
 5. Feeder neutrals shall be bonded at service entrance point only; neutrals of separately derived systems shall be bonded at the source only.

- J. If there is a distribution transformer at a building the secondary neutral conductor shall be grounded to “made” electrode serving the building.

1.04 SUBMITTALS

- A. Provide in accordance with Division 01.

PART 2 - PRODUCTS

2.01 MATERIALS

- A. Furnished yard boxes shall be precast concrete and shall be approximately 14 inches wide by 19 inches long by 12 inches deep or larger.
 - a. Boxes shall be furnished with bolt-down, checkered, cast iron covers and cast-iron frames cast into the yard boxes.
 - b. Provide yard boxes with hinged Frame Locking Cover.
 - c. Approved products include Brooks No. 36 HFL, Jensen Precast, Oldcastle Precast, Western Precast, Kistner, or equal.
- B. External ground electrodes shall be copper-clad steel ground rods, minimum 3/4-inch diameter by ten feet long.
- C. Clamps and fittings used in ground boxes below grade shall be listed for direct burial.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Grounding electrodes shall be installed in the nearest suitable planting area, where not otherwise indicated on Drawings, and each electrode shall terminate within a concrete yard box installed flush with finish grade. In planting areas, finish elevation of concrete yard boxes shall be two inches above planting surfaces.
- B. If concrete enclosed electrode is provided, grounding wire shall be terminated to a suitable copper plate with grounding lugs and must be enclosed in a raceway or box.
- C. Grounding rods shall be driven to a depth of not less than eight feet. Permanent ground enhancement material, (GEM) as manufactured by Erico Electrical Products, Loresco Powerset, Tessco Ultrafil or equal, shall be installed at each ground rod to improve grounding effectiveness. Install in accordance with manufacture's installation instructions.
- D. Grounding electrodes shall provide a resistance to ground of not more than 25 ohms.
- E. When installing grounding rods, if resistance to ground exceeds 25 ohms, two or more rods connected in parallel, or coupled together shall be provided to meet CEC grounding resistance requirements.
- F. Ground rods shall be separated from one another by not less than ten feet.

- G. Parallel grounding rods shall be bonded together with listed fittings and grounding conductors in galvanized rigid steel conduit, buried not less than 12 inches below finish grade.

3.02 TESTING

- A. Provide the services of an approved independent testing laboratory to test grounding resistance of “made” electrodes, ground rods, bonding of building steel, water pipes, gas pipes and other utility piping. Tests shall be performed as follows:
 - 1. Visually and mechanically examine ground system connections for completeness and adequacy.
 - 2. Perform fall of potential tests on each ground rod or ground electrode where suitable locations are available per IEEE Standard No. 81, Section 8.2.1.2. Where suitable locations are not available, measurements will be referenced to a known dead earth or reference ground.
 - 3. Perform the two-point method test per IEEE No. 81, Section 8.2.1.1 to determine ground resistance between ground rod and building steel, and utility piping - such as water, gas and panelboard grounds. Metal hand railings at building entrances and at handicapped ramps shall also be tested.
 - 4. Test shall be performed in the presence of the Inspector.
- B. Submit 3 copies of test results to the Architect. Test results shall be submitted on an official form from the independent testing laboratory recording Project location, test engineer, test conditions, test equipment data, ground system layout or diagram, and final test results.

3.03 PROTECTION

- A. Protect the Work of this section until Substantial Completion.

3.04 CLEANUP

- A. Remove rubbish, debris, and waste materials and legally dispose of off the Project site.

END OF SECTION – 26 0526

SECTION 26 05 33

RACEWAYS, BOXES, FITTINGS, AND SUPPORTS

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Raceways and wire ways.
2. Conduit installation.
3. Underground requirements.

B. Related Requirements:

1. Section 26 05 00: Common Work Results for Electrical.
2. Section 26 05 13: Basic Electrical Materials and Methods.

C. Applicable Standards and Codes.

1. EIA/TIA 569 Standards.
2. National American Standards Institute (ANSI).
3. National Electrical Manufacturer's Association (NEMA).
4. Nationally Recognized Testing Laboratory (NRTL).
5. California Electrical Code (CEC).
6. Uniform Building Code (UBC).
7. Underwriters Laboratory (UL).

1.02 SUBMITTALS

- ###### **A. Materials List: Provide in accordance with Division 01.**

PART 2 - PRODUCTS

2.01 RACEWAYS

A. Conduit Materials:

1. Metallic conduit, and tubing shall be manufactured under the supervision of an UL, or another NRTL factory inspection and label service program. Each ten-foot length of conduit and tubing shall bear the UL or another NRTL label and manufacturer's name.

2. Rigid metallic conduit shall be rigid steel, heavy wall, mild steel, zinc-coated, with an inside and outside protective coating manufactured in accordance with ANSI C 80.1. Couplings, elbows, bends, conduits, bushings and other fittings shall be the same materials and finish as the rigid metallic conduit. Fittings, connectors, and couplings shall be threaded type, manufactured in accordance with ANSI C 80.1 and UL 6.
 3. Electrical metallic tubing shall be steel tubing, zinc-coated with a protective enamel coating inside, manufactured in accordance with NEMA C 80.3. Fittings, couplings, and connectors shall be gland compression type, set screw couplings and connectors not permitted. All parts shall be manufactured in accordance with NEMA C80.3 and UL 6A Electrical metallic tubing is designated hereinafter as EMT. Steel and rain tight fittings shall be approved and listed for the intended application.
 4. Flexible steel conduit shall be of flexible interlocking strip construction with continuous zinc coating on strips, manufactured in accordance with UL 1.
 - a. Connectors and couplings shall be required fittings of the type, which threads into convolutions of flexible conduit.
 5. Liquid-tight flexible metal conduit shall be galvanized heavy wall, flexible locked steel strip construction, UV rated, with smooth moisture and oil-proof, abrasion-resistant, extruded plastic jacket. Connectors shall be as required for installation with liquid-tight flexible conduit and shall be installed to provide a liquid-tight connection.
 6. Non-metallic conduit shall be rigid PVC electrical conduit extruded to schedule 40 dimensions of Type II. Grade 1 high impact, polyvinyl chloride, sweeps, couplings, reducers and terminating fittings shall be listed under the UL, or another NRTL, and shall bear the manufacturer's listed marking.
 7. Multi-cell raceway shall be four inch PVC, Type 40, UL or another NRTL listed for underground use with optical fiber and signal system cables. Raceway shall be furnished with 3-1/2 inch factory installed inner ducts with required internal spacers, and required couplers, sweeps, and end bells. Multicell raceway shall be Carlon Multigard, or District approved equal.
 8. Metal Clad (MC) cable system is not allowed.
- B. Sleeves for Conduits: Sleeves shall be adjustable type by Carlon, U.S. Plastic, PEP Plastic or equal.

C. Conduit Seal Fittings:

1. Provide conduit seal fittings where indicated on the Drawings. Conduit seals shall be of rigid galvanized steel. Seals in horizontal conduit installations shall be Thomas & Betts EYS, Appleton Type ESU, Crouse Hinds Type EYS, or equal. Seals in vertical conduit installations shall be Thomas & Betts EYD, Appleton Type SF, Crouse Hinds Type EYD, or equal, with continuous drain. When installing conduit seals make provision for percent fill space reduction in accordance with CEC.
2. Install sealing compound after wire has been installed. Ensure drain is not blocked in vertical seals when installing compound. Where conduit seals are installed in hazardous area applications, there shall be no conduit coupling, fitting, etc., between seal and boundary of hazardous area.

D. Factory Pre-Wired Surface Metal Raceway:.

1. Standard non-OEM wiring devices shall be used as specified.

PART 3 - EXECUTION

3.01 CONDUIT INSTALLATION

A. General Requirements:

1. Provide complete and continuous systems of rigid metallic conduit, outlet boxes, junction boxes, fittings and cabinets for systems of electrical wiring including lighting, power, and signal systems, except as otherwise specified.
2. EMT may be installed in interior concealed applications and in areas approved by owner. EMT shall not be installed in concrete, directly buried underground, outdoors, in boiler rooms, elevator pits, or where subject to damage.
3. Flexible Steel conduit shall not exceed 1-1/2 inches in size.
4. Liquid-tight flexible steel conduit shall only be installed, except where otherwise specified, for final connection of motor terminal boxes, shop equipment, cafeteria equipment, HVAC equipment and other equipment, or for frequent interchange, and shall be of sufficient length, not exceeding 36 inches, to permit full travel or adjustment of motor on its base. Liquid-tight flexible conduit shall not be used for equipment not requiring adjustment or frequent interchange.
5. Connectors for flexible metal conduit shall be made of steel, and of the types which threads into convolutions of conduit. Connectors for watertight flexible metal conduit shall be as required for installation and shall be installed to provide a watertight connection.
6. Exposed conduit shall be installed vertically and horizontally following the general configuration of the equipment, using cast threaded hub conduit fittings

where required and shall be clamped to equipment with suitable iron brackets and one hole pipe strap.

7. If connection is from a flush wall-mounted junction box, install an approved extension box.
8. Underground feeder distribution conduits for systems may be non-metallic conduit instead of rigid conduit except where otherwise specified or indicated.
9. Conduit shall be concealed unless otherwise indicated.
10. Bends or offsets will not be permitted unless absolutely necessary. Radius of each conduit bend or offset shall be as required by ordinance. Bends and offsets shall be performed with standard industry tools and equipment or may be factory fabricated bends or elbows complying with requirements for radius of bend specified. Heating of metallic conduit to facilitate bending is not permitted. Public telephone conduit bends and offsets shall be provided with a radius which is not less than ten times trade size of conduit unless otherwise permitted. Refer to underground installation, specified in this section, for radius of bends and offsets required for underground installations.

B. Underground Requirements:

1. Conduits and multicell raceways installed underground shall be entirely encased in three inch thick concrete on all sides , except where otherwise specified. Provide required spacers to prevent any deflection when concrete is placed and to preserve position and alignment. Conduits and raceways shall be tied to spacers. Anchors shall be installed to prevent floating of conduits and raceways during placing of concrete. Provide red colored concrete to encase conduits of systems operating above 600 volts.
2. Underground conduits and raceways shall be buried to a depth of not less than 24 inches below finished grade to top of the concrete envelope, unless otherwise specified.
3. Assemble sections of conduit with required fittings. Cut ends of conduit shall be reamed to remove rough edges. Joints in conduits shall be provided liquid-tight. Bends at risers shall be completely below surface where possible.
4. Conduits and raceways in a common trench shall be separated by at least three inches of concrete. Electrical power and/or lighting conduit runs installed in a common trench with conduits containing signal system wiring such as public address, telephone, intrusion detection, fire alarm, television, computer networking, and clock systems shall maintain a separation of a minimum of six inches from these types of signal system conduits and raceways. Electrical power, lighting and signal conduits and raceways installed in a common trench with other utility lines such as gas, water, sewer and storm lines shall maintain 12 inches separation from these types of utility lines.

5. Non-metallic conduit installations shall comply with following additional requirements. Joints in PVC conduit shall be sealed by means of required solvent-weld cement supplied by conduit manufacturer. Non-metallic conduit bends and deflections shall comply with requirements of applicable electrical code, except that minimum radius of any bend or offset for conduits sized from 1/2 inch to 1 1/2-inch inclusive shall not be less than 24 inches. Bends at risers and risers shall be PVC-coated rigid steel conduit. Radius of curve of bends or offsets in non-metallic conduit for public telephone system shall be not less than ten times trade size of conduit, unless otherwise specifically permitted.
6. Underground conduit systems provided for utility companies shall be furnished to meet the requirements of the utility companies requiring service.
7. Protect inside of conduit and raceway from dirt and rubbish during construction by capping openings.
8. Add bell-end bushings for conduit stub-up including underground entries to pull boxes, and manholes. Under floor standing switchboards and motor control centers provide a four-inch galvanized nipple with ground bushing.

3.02 STUBS

B. Underground:

1. Underground conduit stubs shall be terminated at locations indicated, and shall extend five feet beyond building foundations, steps, arcades, concrete walks and paving. Rigid metallic conduit stubs and non-metallic conduit stubs shall be capped by installing a coupling flush in end wall of concrete encasement and plugging with a permitted plug. Project record drawings shall indicate location of ends of underground conduit stubs fully dimensioned and triangulated with reference to buildings or permanent landmarks. These dimensions, including depth below finished grade, shall be marked on project record drawings in presence of the Inspector before backfilling trench. Where extending existing concrete encased stubs, clean, chip and wire brush end of existing concrete and brush on a heavy coat of neat cement paste or epoxy bonding agent.
2. Over ends of individual underground conduit stubs or groups of conduit stubs, install four-inch by 18-inch deep PVC filled with concrete, flush with finished grade in concrete, and two inches above finished grade in planting areas. Cast a three-inch by three-inch brass plate engraved "ELECT" flush in top of concrete. Secure plate to concrete with brass dowels or as indicated on drawings.

3.03 PROTECTION

- A. Protect the Work of this section until Substantial Completion.

3.04 CLEANUP

- A. Remove rubbish, debris and waste materials and legally dispose of off the Project site.

Department of Neighborhood Services and Public Safety
GOLETA TRAIN DEPOT PROJECT – SOUTH LA PATERA LANE

END OF SECTION - 26 0533

SECTION 26 24 16

PANELBOARDS

PART 1 - GENERAL

1.01 SUMMARY

- A. Section Includes: Lighting and power distribution facilities, including panelboards.
- B. Related Requirements:
 - 1. Division 01 - General Requirements.
 - 2. Section 26 05 00: Common Work Results for Electrical.
 - 3. Section 26 05 13: Basic Electrical Materials and Methods.
 - 4. Section 26 50 00: Lighting.

1.02 SUBMITTALS

- A. Provide in accordance with Division 01.
- B. Shop Drawings: Include a front elevation indicating cabinet dimensions, make, location and capacity of equipment, size of gutters, type of mounting, finish, and catalog number of locks. General layout of internal devices, wiring drawings with wire numbers and device connections, vendor cut sheets of devices in enclosure and bill of materials listing description, manufacturer, part number, and quantity of items shall be included.
- C. Installation Instructions: Submit manufacturer's written installation instructions.

1.03 DESIGN REQUIREMENTS

- A. Panelboards:
 - 1. Panelboards shall be enclosure-mounted, enclosed safety type with 120/240 volt, three-wire solid neutral 277/480 volt, four-wire or 120/208 volt, four-wire solid neutral mains as indicated on Drawings or specified. First panelboard of each building shall be provided with main or sub-feeder circuit breakers where so indicated.
 - 2. Single pole branches shall be molded case, thermal magnetic circuit breakers with inverse time delay, trip free, quick-make, quick-break mechanism and silver alloy contacts. Circuit breakers shall be fully rated, with ampere rating marked on handle and shall indicate on/off and tripped positions. Ground fault

interrupters shall be incorporated into circuit breakers where indicated. They shall be listed by UL, or other NRTL as ground fault devices. Provide appropriate lug kit of sufficient size to accommodate the feeders.

3. Two- and three-pole branches shall be enclosed, and shall be thermal magnetic circuit breakers with inverse time delay, tamper-proof, ambient compensated, single handle, internal common trip, and quick-make, quick-break mechanism with silver alloy contacts. Circuit breakers shall be fully rated or as otherwise indicated on the Drawings.
4. Main and subfeeder circuit breakers shall be enclosed, thermal magnetic type with inverse time delay, single handle common trip, quick-make, quick-break mechanism, corrosion-resistant bearings and silver alloy contacts. Ampere frame size and trip rating shall be as indicated on Drawings. Breakers over 225 amperes shall be furnished with interchangeable trip units. Handles of main and subfeeder circuit breakers shall be provided cabinet door. Voltage rating shall be as indicated on Drawings.
5. Circuit breakers shall be fully rated and of one-piece, bolt-on type and shall meet short-circuit interrupting capacity requirements indicated on Drawings. Series rated circuit breaker combinations are not acceptable.
6. Internal connections shall be fabricated with plated copper bus bars and the busses shall extend for full length of space available for branch circuit breakers. Feeder cable connectors shall be installed at point of feeder entrance. Terminals shall be furnished with copper conductors. Panelboards fed by conductors having over-current protection greater than 200 amperes shall be protected on supply side by over-current devices having a rating not greater than that of panelboards. Copper bussing shall be fully rated. Heat rated bussing is not acceptable.
7. Except where otherwise indicated, circuit breakers shall be in two vertical rows connected to bus bars in a distributed phase arrangement. Two-pole branches shall be balanced on busses. Single pole branches shall be numbered adjacent to its circuit breaker, with odd numbers on left and even numbers on right.
8. Specified circuit breaker spaces shall be furnished with hardware required for future installation of circuit breakers.
9. Provide locking devices for individual circuit breakers. Padlocking devices shall be secured to circuit breakers and by panel dead front plates.

B. Panelboard Cabinets:

1. Panelboard cabinets shall be code gage galvanized steel or blue steel; fronts, doors, and trims shall be code gage furniture steel. Cabinets shall be furnished

- with at least six-inch high gutters at top and bottom where feeder cable size exceeds four gage or where feeder cable passes through cabinet vertically. Cabinets shall be furnished with top and bottom gutters sized as required by inspection department having jurisdiction, but never less than six inches where more than one feeder enters top or bottom of cabinets. Side gutters shall not be less than four inches wide. Width of cabinets shall be 20 inches, unless otherwise indicated on Drawings.
2. Doors shall be cut true, shall accurately fit opening and finish smooth across joints. Rabbets shall be inside. Hinges shall be entirely concealed except for barrels and pins. Hinge flanges shall be welded to door and trim. Doors shall be equipped with flush type, spring-latching, Corbin locks for metal doors, keyed to Corbin No. 60 keys.
 3. Where contactors, time switches, and control devices are specified or indicated to be installed within panelboard cabinets, a separate compartment and door shall be provided at top of cabinet for such devices. Door shall be sized as required to permit removal of contactor and other devices intact. Gutters shall be provided at sides and top of compartment. Doors shall be equipped with flush type, spring-latching, Corbin locks for metal doors keyed to Corbin No. 60 keys.
 4. Provide and install panelboard manufacturer's permanent circuit number kit option.
 5. Panelboards with control devices in compartment shall arrive at the Project site completely assembled with control devices installed and wired.
- C. Panelboard Schedule: Provide a neatly typewritten schedule with number or name of room or area, or load served by each panelboard circuit. Room numbers or names shall be determined at the Project site and shall not necessarily be those indicated on the Drawings. Schedule shall also indicate panel designation, voltage and phase, building and distribution panel or switchboard from which it is fed. Schedule shall be installed in a frame under transparent plastic 1/32 inch thick on inside of each panelboard cabinet door.
- D. Panelboard nameplate: Provide a nameplate identifying panelboard. Plates shall be black and white plastic nameplate stock, with character cut through black exposing white and shall bare designation of service. Name plate shall be mechanically fastened to switchboard.
- E. Provide additional labeling on dead-front of panelboard. Label shall be a P-Touch or equal with a minimum width of 3/8 inch with black letters on white background. Label shall re-identify panelboard and also identify name and location of power source feeding this panel. Location information shall include building name if located in different

building and name or room location. If power source is installed in same room, label should indicate source name and “In this Room”

- F. Panelboard Standards: Panelboards shall be UL, or other NRTL listed and labeled. Panelboards shall meet latest revisions of following standards:
1. California Electric Code, Article 384.
 2. UL 67, Panelboards.
 3. UL 50, Cabinets and Boxes.
 4. UL 943, GFCI.
 5. UL 489, Molded Case Circuit Breakers.
 6. NEMA PB1.
 7. Federal Specifications W-P- 115C and WC-375B.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

- A. Panelboards shall be manufactured by Siemens, W.A. Benjamin, General Electric, Cutler Hammer, Square D or equal.

PART 3 - EXECUTION

3.01 INSTALLATION

- A. Panelboards shall be located so they are readily accessible and not exposed to physical damage.
- B. Panelboard locations shall provide sufficient working space around panels to comply with the California Electrical Code.
- C. Panelboards shall be securely fastened to structure and mounted on surface by at least four points.
- D. Unused openings in cabinets shall be effectively closed as required by the manufacturer.
- E. Cabinets shall be grounded as specified in Article 250 of the California Electrical Code.

- F. Conduits shall be installed so as to prevent moisture or water from entering and accumulating within the enclosure.
- G. Lugs shall be suitable and listed for installation with the conductor being connected.
- H. Conductor lengths shall be maintained to a minimum within the wiring gutter space. Conductors shall be long enough to reach the terminal location in a manner that avoids strain on the connecting lugs.
- I. Maintain the required bending radius of conductors inside the cabinet.
- J. Clean the cabinet of foreign material such as cement, plaster, and paint.
- K. Distribute and arrange conductors neatly in the wiring gutters.
- L. Use the manufacturer's torque values to tighten lugs.
- M. Before energizing panelboards, the following steps shall be taken:
 - 1. Retighten connections to the manufacturer's torque specifications. Verify that required connections have been provided.
 - 2. Remove shipping blocks from component devices and panelboard interiors.
 - 3. Manually exercise circuit breakers to verify they operate freely.
 - 4. Remove debris from panelboard interior.
- O. Follow manufacturer's instructions for installation.
- P. Do not install in highly corrosive environments, unless rated for the application.

3.02 PROTECTION

- A. Protect the Work of this section until Substantial Completion.

3.03 CLEANUP

- A. Remove rubbish, debris, and waste materials and legally dispose of off the Project site.

END OF SECTION – 26 0800

SECTION 26 50 00

LIGHTING

PART 1 – GENERAL

1.01 SECTION INCLUDES

- A. Lighting fixtures.
- B. Fixture mounting hardware.
- C. Lamps.
- D. Lighting control equipment.
- E. Source quality control.
- F. Standard fixtures.

1.02 RELATED SECTIONS

- A. Lighting control panel boards (addressable panels) are specified in Section 26 09 26, Lighting Control Systems.
- B. Refer to Section 26 05 00, Common Work Results for Electrical.

B. California Code of Regulations (CCR):

1. Title 8 Industrial Relations
2. Title 22 Social Security
3. Title 24, Part 2 California Building Code
4. Title 24, Part 3 California Electrical Code
5. Title 24, Part 6 California Energy Code
6. Title 24, Part 11 California Green Buildings Standards Code

1.05 SUBMITTALS

A. Refer to Section 01 33 00, Submittal Procedures, and Section 01 33 23, Shop Drawings, Product Data, and Samples, for submittal requirements and procedures.

B. Submit product data including the following:

1. Catalog sheets and specifications
2. Ratings, configurations, wiring diagrams, dimensions, service conditions, options

and features

3. Table matrix showing the specification requirement and the product data showing specifications are met
- C. Submit Shop Drawings including the following:
1. Single line, schematic, block, and wiring diagrams
 2. Equipment layout of lighting system components
 3. Plan view details and component topologies
 4. Photometric drawings and network riser diagrams
 5. Luminaire marking and labeling
- D. Installation procedures: Include tools and materials list, mounting templates, and dimensions.
- E. Calculations:
1. Lighting photometric analysis shall reference the IES recommended calculations using a lighting software tool. Report shall include the following:
 - a. Calculations at L70 and another at initial lumens.
 - b. Lighting fixture schedule shall include symbol, quantity, arrangement, lighting loss factor (LLF), manufacturer and luminaire name, luminaire type, wattage, color correlated temperature (CCT), house shield if any, distribution type, color rendering index (CRI).
 - c. Calculation areas shall include visible lighting luminaire pattern, area dimensions, and calculation points.
 - d. Calculation and statistical summary shall be separate for each area as indicated. Each statistical area shall be highlighted differently.
 - e. Rendering view of calculated areas.
 - f. Contract number and title, Contractor name, revision, date.
 - g. Surface reflectance.
 2. Submit details of lighting pole, foundation, and anchorage with supporting loads and structural design calculations.
 3. Submit details of luminaire mounting and bracket with supporting loads and structural design calculations.
- F. Submit test reports including the following:

1. Certified test reports of factory and field tests performed.
 2. Title 24 Acceptance Testing Documentation in accordance to Title 24, Part 6, as indicated.
 3. Seismic analysis report.
 4. LM-79, LM-80, and TM-21.
 5. Testing and Commissioning Testing Results.
- G. Manufacturer's certificates: Include certificate ensuring products meet or exceed specified requirements.
- H. Submit the operation and maintenance manual, in accordance with Section 01 78 23, Operation and Maintenance Data, including the submittal items mentioned above and the following:
1. Sequence of operation
 2. Preventive maintenance procedure
 3. Spare parts list and ordering form
 4. Troubleshooting guide for common issues

1.06 *LABELING*

- A. Lighting fixtures, light poles, lighting control equipment shall be labeled. Labelling shall be approved by the Engineer.
- B. Luminaire labeling information shall include panel and circuit number, and contract number.

1.07 *NAMEPLATE*

- A. Mark fixtures clearly with manufacturer's name, voltage, wattage, UL listings.

1.08 *DELIVERY HANDLING AND STORAGE*

- A. Deliver luminaires and lighting equipment to the Jobsite complete with related items, completely wired and assembled.

PART 2 – PRODUCTS

2.01 LIGHT EMITTING DIODE (LED) LIGHTING

A. LED Luminaire

1. LED fixture requirements are as described below:

- a. The LED fixture shall consist of LED lamps, driver, assembly, and mounting hardware.
- b. Each fixture shall have its own LED driver. LED drivers shall be placed within LED fixture, unless otherwise specified.
- c. Input voltage and frequency: 120 VAC to 277 VAC plus or minus 10 percent, 60Hz.
- d. Efficacy: as indicated.
- e. NEMA Rating: as indicated.
- f. Brightness and glare: Lighting systems shall be free from distracting and uncomfortable glare.
- g. Warranty: minimum 5 years.
- h. Cooling System: Cooling system shall not have fans, pumps, or liquids and shall be resistant to debris and dust buildup.
- i. LED fixtures shall be rated for Class I Division II Hazardous Locations, as indicated.
- j. Lens: as indicated.
- k. Shields: as indicated.
- l. LM-80 and TM-21 shall be used to determine lifespan outside L70 controlled lab settings.
- m. Outdoor LED Luminaires shall comply with Title 24 Part 6 – 130.2(b) for luminaire cutoff requirements.
- n. Fixture shall be UL Listed.

B. LED lamp

1. LED lamp requirements are as described below:

- a. Definition: LED lamp Assembly is the LED assembly without LED driver.
- b. Correlated Color Temperature (CCT): 3000K to 3500K indoor, 4000K to 4500K outdoor and tunnels.
- c. Color Rendering Index (CRI): greater than or equal to 80, except for parking lots where it shall be greater than or equal to 70.
- d. Operating hours shall be determined by LM-80 and TM-21. Reported L70 hours shall be minimum 50,000 hours.
- e. Difficult access areas such as on top of escalators and stairs shall have reported L70 of 60,000 hours, minimum.

C. LED Driver General Requirements:

1. LED driver general requirements as described below:
 - a. Input voltage: 120 VAC to 277 VAC (plus or minus 10 percent).
 - b. Frequency: 60Hz.
 - c. Operating temperature: minus 20 degrees Celsius to plus 50 degrees Celsius.
 - d. Minimum efficiency: 85 percent.
 - e. Driver shall be dimmable.
 - f. LED dimmable driver requirements are as described below:
 - 1) There shall be no visible change in light output with a variation of plus or minus 10 percent line voltage input.
 - 2) Driver shall provide step-free, continuous dimming from 100 percent to 10 percent; and shall respond similarly when rising from 10 percent to 100 percent.
 - 3) LED dimming driver shall provide continuous step-free, flicker free dimming over the operating range, with “Fail-Safe” 0 to 10 V dimming standard.
 - g. Driver shall be self-protected, including surge protection and short circuit protection and shall comply with ANSI or IEEE standards.
 - h. Comply to FCC CFR, Title 47, Section 15.
 - i. LED driver shall have a minimum of 50,000 operating hours under warranty.
 - j. Power Factor (PF) greater than or equal to 0.90.
 - k. Each fixture shall have its own LED driver. LED drivers shall be placed within LED fixture, unless otherwise specified.

2.02 FIXTURE MOUNTING HARDWARE

A. Requirements:

1. Luminaire mounting hardware shall be in accordance to the luminaire manufacturer’s recommended requirements.
2. When exposed to public view, fabricate and finish hardware in material matching the fixture body.

B. Light poles:

1. Provide the type, configuration, and dimensions indicated. Light pole shall resist wind loads in accordance with the California Building Code,. Maximum deflection of pole shall be five percent when fully loaded. Furnish poles as indicated with handhole and flush cover with tamper proof screw and grounding stud, luminaire mounting tenon/bracket, base cover and mounting hardware including anchor bolts, nuts, washers, and baseplate to permit accurate alignment and installation of pole and luminaire as indicated. Light pole anchor bolt covers shall have tamper

proof screw.

2. Light pole ladder and safety cable shall conform to CCR Title 8, Industrial Relations, Division 1, Chapter 4, Subchapter 7, Group 1, Article 4, Section 3277(m), Ladder Safety Systems, and CAL/OSHA.

2.03 SOURCE QUALITY CONTROL

- A. The lighting fixture to be tested shall be typical of the unit it represents, clean and free from mechanical defects, equipped with the proper fittings, and with the lamp of the size and type in the position recommended for service operation.
- B. Test UL-listed material, equipment, and components in accordance with UL standards. Test material, equipment, and components not covered by UL standards in accordance with nationally recognized standards. Provide material, equipment, and components bearing a label tag or certification of such inspection.
- C. Perform and report tests for photometric performance in accordance with the approved methods outlined by the IES Lighting Handbook for photometric testing, and include data on candlepower, distribution, zonal lumens, maximum luminance values, and luminaire efficiency, including complete coefficients of utilization tables to indicate compliance with performance requirements.
- D. Test data shall be reported on 8-1/2 inch by 11-inch sheets and shall be certified by a nationally recognized independent testing laboratory.

2.04 SPARE PARTS

- A. General: Refer to Section 01 78 44, Spare Parts and Maintenance Materials, for spare part requirements.
- B. Luminaire: Furnish 2 percent of each style of lighting luminaire, or a minimum of 5 each, whichever is greater.
- C. Light Poles: Furnish 1 percent of each style of light pole assembly, or a minimum of 2 each, whichever is greater.

PART 3 – EXECUTION

3.01 INSTALLATION OF LIGHTING FIXTURES

- A. Install lighting fixtures as indicated and in accordance with the manufacturer's installation instructions and recommendations, complete with lamps, hangers, brackets, poles, fittings, and accessories, ready for operation.

B. Align, mount, and level lighting fixtures uniformly.

Avoid interference with, and provide clearance for, the equipment. Where the indicated locations for the lighting fixtures conflict with the locations for other equipment, change the locations for the lighting fixtures by the minimum distances necessary and as approved by the Engineer.

C. Where aluminum is placed in contact with dissimilar materials, except galvanized steel, zinc, and stainless steel, treat contact surfaces as follows:

1. Dissimilar metals: Apply a prime coat of zinc chromate primer followed by two coats of aluminum and masonry paint.
2. Concrete, masonry, and plaster: Apply zinc chromate primer, bituminous paint, aluminum and masonry paint, or pressure-sensitive tape to aluminum contact surfaces.

D. Provisions for coating and electrically isolating aluminum and stainless steel, or any other dissimilar metals in contact, when exposed to salt water, water immersion, or burial shall be provided.

E. Welding:

1. Locate welds in assemblies to be anodized so as to conceal visible discoloration in the heat-affected zone.
2. Where weld metal will be exposed after anodizing, select filler alloys to closely match composition of base metal. Follow manufacturer's recommendations for such filler alloys.

F. Install fixtures to be pole-mounted in accordance with the manufacturer's installation instructions.

3.02 INSTALLATION OF DRIVERS

A. Install drivers, other than those mounted integrally within luminaries, in such a manner that the driver is protected from weather, moisture, and other atmospheric conditions, and in ambient temperatures that will not cause the temperature of the driver housing hot-spot to exceed UL requirements.

B. Voltage drop to lamp, due to remote driver mounting, shall not exceed one percent of the nominal lamp voltage. Provide secondary driver conductors with 600 V insulation. When more than one driver is mounted at one location, the minimum spacing between driver shall be 6 inches in a horizontal direction and 12 inches in a vertical direction. Mount driver components securely in such a manner as to obtain

the necessary heat dissipation.

3.03 INSTALLATION OF LIGHT POLES

- A. Determine surface and structure load ratings prior to installation of equipment.
- B. Install light poles as indicated and in accordance with the manufacturer's installation instructions and recommendations. Light poles shall be grounded as indicated on the Contract Drawings.

3.04 CONCRETE BASES

- A. Provide necessary templates and anchor kits before starting work, and coordinate installation of anchors in concrete with the work specified under Division 3 – Concrete (Train Depot Package).

3.05 FIELD QUALITY CONTROL

- A. Inspect luminaries, lamps, and associated hardware before and after installation to ensure that they are of the quality and type specified and indicated, and are free of defects and damage.
- B. Whenever practicable, test lighting systems at the same time that the distribution panelboard or switchboard is tested.
- C. Replace lamps that fail within 90 Days after final acceptance without additional cost to the District.
- D. Test light poles for continuity to the grounding system.
- E. Inspect lighting fixtures, light poles, and lighting control equipment for labelling.

3.06 TESTING AND COMMISSIONING

- A. Contractor shall test and commission installed system per testing and commissioning procedures.
 - 1. Provide checklist of individual lighting fixtures with verification that lighting fixtures are functioning.
 - 2. Provide lighting level measurements per IES or as indicated in Contract Drawings.

END OF SECTION – 26 5000

SECTION 31 1000

SITE CLEARING

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Removal of vegetation, grass, grass roots, shrubs, tree stumps, trees, upturned stumps, weed growth, tree roots, brush, masonry, concrete, rubbish, debris and other materials.
2. Removal of concrete and bituminous surfaces.
3. Removal of existing fences and gates.

B. Related Requirements:

1. Division 01 - General Requirements.
2. Section 31 2200 - Grading.
3. Section 31 2300 - Earthwork.
10. Caltrans Standard Specification Division III - Earthwork and Landscape, Section 17 – General
11. Caltrans Standard Specification Division III - Earthwork and Landscape, Section 18 – Dust Palliatives
12. Caltrans Standard Specification Division III - Earthwork and Landscape, Section 19 – Earthwork
13. Caltrans Standard Specification Division IV – Subbases and Bases, Section 23 – General
14. Caltrans Standard Specification Division IV – Subbases and Bases, Section 26 – Aggregate Bases

1.02 SUBMITTALS

- ###### A. Shop Drawings: Submit site plan indicating extent of site clearing.

1.03 QUALITY ASSURANCE

- ###### A. Comply with Caltrans Standard Specifications, current edition, as a minimum requirement.

PART 2 - CALTRANS STANDARD SPECIAL PROVISIONS (SSPs)

- A. Replace the 4th paragraph in section 17-2.03A with:
Clear and grub vegetation only within the excavation and embankment slope lines.

PART 3 – PROJEC SPECIFIC PROVISIONS

3.01 TREE AND STUMP REMOVAL

- A. Remove trees and stumps indicated or required to be removed. Remove trees, together with bulk of roots, to a minimum depth of 4 feet below required grade, and within a radius of approximately 7 feet beyond perimeter of trunk at grade.
- B. Fill and compact excavation from tree and stump removal. Fill in 6 inch layers, each compacted to 90 percent of maximum density in accordance with ASTM D1557.
1. Back filling shall not commence until the excavation is inspected and tested.

3.02 CONCRETE AND BITUMINOUS SURFACING REMOVAL

- A. Break up and completely remove existing concrete surfacing, curbs, gutters, walks and bituminous surfacing to indicated limits. Cutting shall be performed to a neat and even line with proper tools or a concrete cutting saw. Minimum depth of cut shall be 1 1/2-inch, unless otherwise indicated. Remove concrete broken beyond the indicated limits to the nearest joint or score line and replace with new concrete to match existing.

3.04 CLEANUP

- A. Remove rubbish, debris and waste materials and legally dispose of off the Project site.

PART 4 – MEASUREMENT AND PAYMENT

- A. Measurement and payment must conform to Caltrans Standard Specifications.

END OF SECTION – 31 1000

SECTION 31 2200

GRADING

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. General exterior grading, cutting and filling, including grading for concrete and paving improvements.

B. Related Requirements:

1. Division 01 - General Requirements.
2. Section 31 1000 - Site Clearing.
3. Section 31 2300 - Earthwork.
4. Section 31 2316 – Trenching Backfill and Compaction
5. Section 32 1116 – Aggregate Base.
6. Section 32 9000 - Planting.
7. Caltrans Standard Specification Division III - Earthwork and Landscape, Section 18 – Dust Palliatives
8. Caltrans Standard Specification Division III - Earthwork and Landscape, Section 19 – Earthwork
9. Caltrans Standard Specification Division IV – Subbases and Bases, Section 23 – General
10. Caltrans Standard Specification Division IV – Subbases and Bases, Section 26 – Aggregate Bases

1.02 PROJECT REQUIREMENTS

A. General:

1. Fees: Pay as required by authorities having jurisdiction over the area.
2. Bonds: Post as required by authorities having jurisdiction over the area.
3. Haul Routes and Restrictions: Comply with requirements of authorities having jurisdiction over the area.

4. Before grading, contact Underground Service Alert of Southern California (USASC) for information on public buried utilities and pipelines. Retain the services of an underground utility locator for on-site utilities.

PART 2 - CALTRANS STANDARD SPECIAL PROVISIONS (SSPs)

- A. Replace the 2nd, 3rd, and 4th paragraphs of section 19-2.03B with:

Dispose of surplus material. Ensure enough material is available to complete the embankments before disposing of it.

PART 3 – PROJECT SPECIFIC PROVISIONS

3.01 PREPARATION

- A. Protect and maintain installed stakes until their removal is required for the Work. Provide replacement grade or location stakes lost or disturbed.
- B. Install grade stakes and compare to indicated grades. If discrepancies are found between existing grades and grades indicated on Drawings, do not proceed until discrepancies are resolved.

3.02 ROUGH AND FINE GRADING

- A. Rough grade area sufficiently high to require cutting by fine grading:
 1. Grade area for bituminous surfacing and other paving to the indicated grades, equal to the section of the indicated base and pavement.
 2. Slope banks to required finish grades as cut progresses or leave cuts full and finish grade by mechanical equipment to provide grades and soil densities indicated on the Drawings.
 3. Rough grade, fill and compact banks beyond indicated finish grades. Finish grade banks and slopes to indicated grades and specified soil densities.
 4. Grade Only Areas: In areas not indicated to receive pavement, rough grade to approximate finish grades and then scarify, moisten and roll to obtain required density and indicated finish grades.

3.03 SHORING

- A. Provide shoring as necessary to properly and safely support earth sides of excavations, and existing curbs, sidewalks, gutter, drives and stairs, against movement and collapse.
- B. Design and Calculations: Provide in accordance with requirement of CalOHSA.

- C. Remove shoring upon completion of the Work of this section or when no longer needed unless required otherwise by authorities having jurisdiction.

3.04 EXCESS MATERIAL DISPOSAL

- A. Remove rubbish, debris, and waste materials and legally dispose of off the Project site.

3.05 PROTECTION

- A. Protect the Work of this section until Substantial Completion.

PART 4 – MEASUREMENT AND PAYMENT

- A. Measurement and payment must conform to Caltrans Standard Specifications.

END OF SECTION – 31 2200

SECTION 31 23 00

EARTHWORK

PART 1 – GENERAL

1.01 DESCRIPTION OF WORK

- A. Earthwork shall conform to the provisions in Section 19, “Earthwork,” of the Caltrans Standards and the Technical Specifications.
- B. Valve boxes, manhole covers, and drainage structures within the limits of any grading operation shall be adjusted to proposed finish grade.
- C. Embankment materials shall be free from organic and otherwise deleterious materials and as provided in Section 19, “Earthwork,” of the Caltrans Standards.
- D. Surplus excavated material shall become the property of the Contractor and shall be disposed of outside the right-of-way in conformance with Federal, State, and local regulations.

PART 2 – PRODUCT

2.01 IMPORTED SOIL

- A. Import materials shall have a liquid limit of 25 or less, a plasticity index of 12 or less, and be well graded with no greater than 30 percent of the particles passing the No. 200 sieve and no particles greater than 6 inches in maximum dimension. Import materials shall be non-corrosive in accordance with the following corrosive limits as provided in Section 8.1 of the Caltrans Corrosion Guidelines, Version 2.0, 2012:
 - Minimum resistivity must be greater than 2000 ohm-cm, CT 643
 - Chloride concentration must be less than 250 ppm, CT 422
 - Sulfate concentration must be less than 500 ppm, CT 417
 - pH must be between 5.5 and 10.0, CT 643

PART 3 – EXECUTION

3.01 HAZARDOUS WASTE IN EXCAVATION

- A. If the Contractor encounters hazardous waste in excavation, as defined by Section 25117 of the Health and Safety Code, the Contractor shall immediately notify the Engineer in writing. Excavation in and around the suspected hazardous material shall be suspended until the Engineer authorizes it to be resumed. The limits of excavation shall be as directed

by the Engineer. If such suspension delays the current controlling operation, the Contractor will be granted an extension of time as provided the Special Provisions.

- B. If such suspension delays the current controlling operation more than 2 working days, the delay will be considered a right-of-way delay and the Contractor will be compensated for each such delay as provided in the Special Provisions.
- C. The City of Goleta reserves the right to use other forces for exploratory work to identify and determine the extent of such material and for removing hazardous material from such area.
- D. If hazardous material is encountered the contractor shall mobilize employees with the herein designated safety and remediation training within 24 hours of the Contractor, the City or third party determining a hazardous or contaminated soils condition exists in an excavation. The contractor shall have the trained employees available prior to the start of any hazardous material excavation and at the direction of the Engineer, the Contractor shall include a hazmat training as a scheduled task in the Contract Schedule. No additional working days shall be granted for the contractor's inability to provide and mobilize trained workers within the 24 hour time limit.
- E. The employees shall be trained through an OSHA approved Hazardous Waste Operations and Emergency Response Standard (Hazwoper) 40 Hour Training class or have a Hazwoper refresher course within one year prior to the date the work is to be performed; and possess a certificate showing successful completion of the Hazwoper training. OSHA accepted Hazwoper training shall conform to all Federal, State, and Local requirements (including those specified in 29 CFR 1910.120. In addition, workers shall have additional hands-on training in use of the Personal Protective Equipment (PPE) required for their jobsite(s) in accordance with 29 CFR 1910.120.
- F. Voids resulting from excavation of hazardous material shall be backfilled in accordance with Section 19-3, "Structure Excavation and Backfill," of the Caltrans Standards and as specified in the Technical Specifications. Backfill material shall comply with Section 2.01, "Imported Soil," above.
- G. Measurement and payment for removal of hazardous waste in excavation, including training, obtaining any necessary permits, testing and analysis, disposal, and relevant disposal fees will be made in accordance with the Special Provisions.

3.02 STRUCTURE EXCAVATION AND BACKFILL

- A. Structure excavation and backfill shall conform to the provisions in Section 19-3, "Structure Excavation and Backfill," of the Caltrans Standards and as specified in the Technical Specifications.
- B. All structural backfill shall be of the type indicated and placed to the limits shown on the plans. For all subgrade of structural backfill a relative compaction of not less than 95 percent shall be obtained for a minimum depth of 6 inches below the bottom of excavation.

- C. Placement of structural backfill shall comply with Section 19-3.02C, “Structure Backfill,” of the Caltrans Standards except that compaction shall not be performed by ponding or jetting.
- D. Excavating by blasting will not be allowed.
- E. Shoring, lagging, or other bracing shall be designed, furnished, and placed by the contractor to adequately support the excavation.
- F. Steel shoring, steel and timber lagging, and other steel bracing may remain in place, subject to the following requirements:
 - 1. The amount of bracing remaining in place shall not exceed the practical minimum that is necessary to safely support the sides of the excavation.
 - 2. Bracing shall be placed in an open type arrangement with ample clearance between adjacent braces to permit the ready flow of concrete around the bracing and provide proper clearance to the reinforcement.

3.03 TRENCH EXCAVATION AND BACKFILL

- A. Excavating and backfilling for trenches shall conform to the provisions in Section 87-1.03B(3), "Conduit Installation Underground," of the Caltrans Standards.
- B. Open trenches and excavations shall be covered or barricaded to protect pedestrians and vehicles in accordance with Section 01 55 26, “Traffic Control and Access,” of the Technical Specifications. Following excavation Contractor shall minimize exposure of public to open trenches.
- C. All surplus excavation, from whatever source, shall be disposed of outside the right of way in conformance with Federal, State, and local regulations.

3.04 TESTING EXCAVATED MATERIAL

- A. Excavated soil may be tested for potential use as fill material in compliance with Section 2.01, “Imported Soil,” above. Contractor shall submit test results prior to placement. Where excavated soil is compliant Contractor shall stockpile or place excavated soil as required. Stockpiling of compliant excavated soil shall remain within limits of work or designated offsite area.

3.05 IMPORTED SOIL AS BACKFILL

- A. Where excavated soil is insufficient or does not meet soil requirements for backfill Contractor shall import suitable backfill material complying with Section 2.01, “Imported Soil,” above.

PART 4 – MEASUREMENT AND PAYMENT

4.01 MEASUREMENT

- A. No separate measurement will be made for the requirements of this section, unless otherwise stated.

4.02 PAYMENT

- A. Unless otherwise stated full compensation for complying with the requirements of this section shall be considered as included in the contract prices paid for the various items of work involved, unless otherwise stated, and no additional compensation will be allowed therefore.

END OF SECTION – 31 2300

SECTION 31 23 16

TRENCHING, BACKFILL AND COMPACTION

PART 1 – GENERAL

1.01 REQUIREMENTS

- A. The Contractor shall perform all earthwork and trenching operations indicated and required for construction of the work, provide advance notification of the affected residents, perform preparation work. The Contractor shall secure all necessary permits to complete the requirements of this Section of the Specifications.

1.02 RELATED WORK SPECIFIED ELSEWHERE

Section 01 55 26 – Traffic Control & Access

1.03 CONTRACTOR SUBMITTALS

- A. Where shoring is required the Contractor's attention is directed to the provisions for "Shoring and Bracing Drawings" in Section 6705 of the California Labor Code. The Contractor, prior to beginning any trench or structure excavation 5 feet deep or over shall submit to the City and shall be in receipt of the City's written acceptance of the Contractor's detailed plan showing design of all shoring, bracing, sloping of the sides of excavation, or other provisions for worker protection against the hazard of caving ground during the excavation of such trenches or structure excavation. If such plan varies from the shoring system standards established in the Construction Safety Orders of the State of California, such alternative systems plans shall be prepared by a civil or structural engineer licensed in the State of California.
- B. The Contractor shall submit a copy of the excavation permit issued by the California Department of Industrial Safety.
- C. The Contractor shall submit samples of all materials to be used in the work in accordance with the requirements in Section 01 33 00.
- D. Submit CLSM mix designs which show the proportions and gradations of all materials proposed for each type of CLSM indicated. Each mix design shall be accompanied by independent laboratory test results of the indicated properties.

1.04 CONTRACTOR SUBMITTALS

- A. It shall be the sole responsibility of the Contractor to control the rate and effect of the dewatering in such a manner as to avoid all objectionable settlement and subsidence.

All dewatering operations shall be adequate to assure the integrity of the finished project and shall be the responsibility of the Contractor.

- B. Where critical structures or facilities exist immediately adjacent to areas of proposed dewatering, reference points shall be established and observed at frequent intervals to detect any settlement which may develop. The responsibility for conducting the dewatering operation in a manner that will protect adjacent structures and facilities rests solely with the Contractor. The cost of repairing any damage to adjacent structures and restoration of facilities shall be the responsibility of the Contractor.
- C. At the option of the City inspector, asphalt mix, subgrade, aggregate base course, and asphalt pavement may be tested by the City's testing laboratory and paid for by the City in accordance with Section 014200 – Reference Standards. Sample sizes shall be as determined by the testing laboratory.

PART 2 – PRODUCTS

2.01 SUITABLE FILL AND BACKFILL MATERIAL REQUIREMENTS

- A. **General:** Fill, backfill, and embankment materials shall be suitable selected or processed clean, fine earth, rock, or sand, free from grass, roots, brush, or other vegetation.
- B. Fill and backfill materials to be placed within 6 inches of any structure or pipe shall be free of rocks or unbroken masses of earth materials having a maximum dimension larger than 3 inches.
- C. **Suitable Materials:** Materials not defined as unsuitable in Section 2.3 shall be reviewed by the City and may be used in fills, backfilling, and embankment construction subject to the indicated limitations and at the City's discretion. In addition, when acceptable to the City, some of the material listed as unsuitable may be used when thoroughly mixed with suitable material to form a stable composite.
- D. Suitable materials may be obtained from on-site excavations (if applicable), may be processed on-site materials, or may be imported. If imported materials are required by this Section or to meet the quantity requirements of the project, the Contractor shall provide the imported materials at no additional expense to the City, unless a unit price item is included for imported materials in the bidding schedule.
- E. The following types of suitable materials are defined:
 - 1. **Type A (three-quarters inch minus granular backfill):** Crushed rock or gravel, and sand with the gradation requirements below. The material shall have a minimum sand equivalent value of 28 and a minimum R-value of 78. If the sand equivalent value exceeds 35 the R-value requirement is waived.

Sieve Size	Percentage Passing
3/4-inch	100
No. 4	30 - 50
No. 200	0 - 5

2. **Type B (Class I crushed stone):** Manufactured angular, crushed stone, crushed rock, or crushed slag with the following gradation requirements. The material shall have a minimum sand equivalent value of 75.

Sieve Size	Percentage Passing
3/4-inch	100
No. 4	30 - 50
No. 200	0 - 5

3. **Type C (sand backfill):** Sand with the following gradation requirements, and with a sand equivalent value not less than 30.

Sieve Size	Percentage Passing
1/2-inch	100
No. 4	85 - 100
No. 8	70 - 95
No. 200	0 - 10

4. **Type F (coarse drainrock):** Crushed rock or gravel with the size gradation for Size Number 4 in ASTM C 33.

5. **Type G (aggregate base):** See also Section 32 11 16 for Aggregate Base Specifications.

Crushed rock aggregate base material of such nature that it can be compacted readily by watering and rolling to form a firm, stable base for pavements. At the option of the Contractor, the grading for either the 1-1/2-inch maximum size or 3/4-inch maximum size gradation shall be used. The sand equivalent value shall be not less than 22, and the material shall meet the following gradation requirements:

Sieve Size	Percentage Passing	
	1-1/2-inch Max	3/4-inch Max.
2-inch	100	-
1-1/2-inch	90 - 100	-

1-inch	-	100
3/4-inch	50 - 85	90 - 100
No. 4	25 - 45	35 - 55
No. 30	10 - 25	10 - 30
No. 200	2 - 9	2 - 9

6. **Type H (graded drainrock):** Drainrock shall be crushed rock or gravel, durable and free from slaking or decomposition under the action of alternate wetting or drying. The material shall be uniformly graded and shall meet the gradation requirements for Size Number 57 in ASTM C 33. The drainrock shall have a sand equivalent value not less than 75. The finish graded surface of the drainrock immediately beneath hydraulic structures shall be stabilized to provide a firm, smooth surface upon which to construct reinforced concrete floor slabs.
7. **Type I:** Not Used.
8. **Type K (topsoil):** Stockpiled topsoil material which has been obtained at the site by removing soil to a depth not exceeding 1 foot. Removal of the topsoil shall be done after the area has been stripped of vegetation and debris.

2.02 UNSUITABLE FILL MATERIAL

A. Unsuitable materials include the materials listed below.

1. Soils which, when classified under ASTM D 2487 - Standard Classification of Soils for engineering Purposes (Unified Soil Classification System), fall in the classifications of Pt, OH, CH, MH, or OL.
2. Soils which cannot be compacted sufficiently to achieve the density specified for the intended use.
3. Materials that contain hazardous or designated waste materials including petroleum hydrocarbons, pesticides, heavy metals, and any material which may be classified as hazardous or toxic according to applicable regulations.
4. Soils that contain greater concentrations of chloride or sulfate ions, or have a soil resistivity or pH less than the existing on-site soils.
5. Topsoil, except as allowed by Section 2.4.

2.03 USE OF FILL, BACKFILL, AND EMBANKMENT MATERIAL TYPES

- A. The Contractor shall use the types of materials as designated herein for all required fill, backfill, and embankment construction hereunder.
- B. Where these Specifications conflict with the requirements of any local agency having jurisdiction or with the requirements of a pipe material manufacturer, the City shall be immediately notified. In case of conflict between types of pipe zone bedding, the Contractor shall use the agency-specified bedding material if that material provides a greater degree of structural support to the pipe, as determined by the City. In case of conflict between types of trench or final backfill types, the Contractor shall use the agency-specified backfill material if that material provides the greater in-place density after compaction.
- C. Fill and backfill types shall be used in accordance with the following provisions:
 - 1. Embankment fills shall be constructed of Type I material, as defined herein, or any mixture of Type I and Type A through Type H materials.
 - 2. Pipe zone bedding for mortar coated steel pipe, ductile iron pipe, and PVC pipe shall be Type C backfill (pipe bedding) material. Pipe zone bedding for PVC pipe, coal tar enamel coated or tape wrapped steel pipe, and polyethylene encased ductile iron pipe shall be Type C backfill (pipe bedding) material.
 - 3. Trench zone and final backfill for pipelines under paved areas, as defined under "Pipe and Utility Trench Backfill," shall be Type L backfill material unless otherwise shown or specified. Trench zone and final backfill under areas not paved shall be select native material free of rocks larger than 3 inches and free of deleterious material, or Types A, C or G, backfill materials or any mixture thereof. In agricultural or landscaped areas Type K material shall be used for final backfill unless otherwise indicated.
 - 4. Trench backfill and final backfill for pipelines under structures shall be the same material as used in the pipe zone, except where concrete encasement is required by the Contract Documents.
 - 5. Backfill around structures shall be Type A through Type H materials, or any mixture thereof, except as shown.
 - 6. Backfill materials beneath structures shall be as follows:
 - a. Drain rock materials under hydraulic structures or other water retaining structures with underdrain systems shall be Type H material.

- b. Under concrete hydraulic structures or other water retaining structures without underdrain systems, Types G or H materials shall be used.
 - c. Under structures where groundwater must be removed to allow placement of concrete, Type F material shall be used. Before the Type F material is placed, filter fabric shall be placed over the exposed foundation.
 - d. Under all other structures, Type G or H material shall be used.
7. Backfill used to replace pipeline trench over-excavation shall be a layer of Type F material with a top layer of filter fabric to prevent migration of fines for wet trench conditions or the same material as used for the pipe zone bedding if the trench conditions are not wet.
 8. The top 6 inches of embankment fills around hydraulic structures, and all other embankment fills shall consist of Type K material, topsoil.
 9. Filter fabric shall be per City or agency direction.

2.04 SOIL MATERIALS TESTING

- A. All soils testing of samples submitted by the Contractor will be done by a testing laboratory of the City's choice and at the City's expense. At its discretion, the City may request that the Contractor supply samples for testing of any material used in the work.
- B. Particle size analysis of soils and aggregates will be performed using ASTM D 422 - Standard Test Method for Particle-Size Analysis of Soils.
- C. Determination of sand equivalent value will be performed using ASTM D 2419 - Standard Test Method for Sand Equivalent Value of Soils and Fine Aggregate.
- D. **Unified Soil Classification System:** References in this Section to soil classification types and standards shall have the meanings and definitions indicated in ASTM D 2487. The Contractor shall be bound by all applicable provisions of said ASTM D 2487 in the interpretation of soil classifications.
- E. The testing for chloride, sulfate, resistivity, and pH will be done in accordance with California Test Methods 417, 422 and 643 of the California Department of Transportation.

2.05 ASPHALT CONCRETE PAVING MATERIALS

- A. See Section 32 12 16 for Asphalt Paving Specifications.

- B. All materials required for asphalt concrete pavement construction as specified herein shall conform to the Caltrans Standard Specifications:
- C. Asphalt concrete for roadway pavement shall be Type B, Grade AR-4000 as specified in Section 39 with ½” mix, unless specified otherwise. Asphalt concrete for construction of sidewalks, berms, dikes, or curbs shall be Type B, Grade AR-4000 as specified in Section 39 with 3/8” mix, unless specified otherwise. Paint binder shall be SS-1h emulsified asphalt conforming requirements of Section 94. Base course shall be treated Class 2 aggregate base material. Paint for traffic stripes and pavement markings shall conform to Section 84.

PART 3 – EXECUTION

3.01 EXCAVATION - GENERAL

- A. **General:** Except when specifically provided to the contrary, excavation shall include the removal of all materials of whatever nature encountered, including all obstructions of any nature that would interfere with the proper execution and completion of the work. The removal of said materials shall conform to the lines and grades indicated or ordered.
- B. **Sheeting, Shoring and Bracing:** The Contractor shall furnish, place, and maintain all supports and shoring that may be required for the sides of the excavations and trenches. Excavations and trenches shall be sloped or otherwise supported in a safe manner in accordance with applicable CAL/OSHA requirements and the requirements of OSHA Safety and Health Standards for Construction (29CFR1926). As a minimum, lateral pressures for design of trench sheeting, shoring, and bracing shall be based on type of soil exposed in the trench, groundwater conditions, surcharge loads adjacent to the trench, and type of shoring that will be used in the trench.

3.02 PROTECTION OF EXISTING UTILITIES AND FACILITIES

- A. **General:** The Contractor shall be responsible for the care and protection of all existing sewer pipelines, water pipelines, gas mains, electrical and communications conduits, cables, storm drains, culverts, or other facilities and structures that may be encountered in or near the area of work.
- B. **Notification:** It shall be the duty of the Contractor to notify each agency having jurisdiction and make arrangements for locating each agency's facilities prior to beginning construction.
- C. **Damage:** In the event of damage to any existing facilities during the progress of the work due to the failure of the Contractor to exercise the proper precautions, the Contractor shall be responsible for the cost of all repairs and protection to said facilities. The Contractor's work may be stopped until repair operations are complete.

- D. **Storage and Disposal of Excavated Material:** During trench excavation, store excavated material only within the work area. Do not obstruct roadways, streets, bike paths, or sidewalks. Contractor shall remove and dispose of excess excavated soil material off the Project site at no additional cost to the City, in accordance with local regulations.

3.03 ROADWAY, AND EMBANKMENT EXCAVATION

- A. **Excavation Beneath Paved Areas:** Excavation under areas to be paved shall extend to the bottom of the aggregate base or subbase, if such base is called for; otherwise it shall extend to 1 inch below the existing paving thickness. After the required excavation has been completed, the top 6 inches of exposed surface shall be scarified, brought to optimum moisture content, and rolled with heavy compaction equipment to obtain 95 percent of maximum density. The finished subgrade shall be even, self-draining, and in conformance with the slope of the finished pavement. Areas that could accumulate standing water shall be regraded to provide a self-draining subgrade.
- B. **Notification of City:** The Contractor shall notify the City at least 3 days in advance of completion of any structure excavation and shall allow the City a review period of at least one day before the exposed foundation is scarified and compacted or is covered with backfill or with any construction materials

3.04 PIPELINE AND UTILITY TRENCH EXCAVATION

- A. **General:** Unless otherwise indicated or ordered, excavation for pipelines and utilities shall be opencut trenches with widths as indicated. Trenches shall be excavated to line and grade as shown on the Plans (Construction Drawings). Excavation for water lines shall be made only after pipe and other necessary materials are delivered to the project site and inspected by the Goleta Water District's inspector. Where trenching occurs in paved areas, the pavement shall be saw cut ahead of the trenching operations. The proper tools and equipment shall be used in marking and breaking so that the pavement will be cut accurately and on neat lines parallel to the trench. Material excavated from trenches shall be placed in such a way as not to endanger the health of the workers or the public. Excavated material shall not be stockpiled within the public right-of-way, or placed in areas where it could be hazardous to traffic, or block access to roads or driveways. Excavation within the public right-of-way shall be performed in compliance with the requirements of the County of Santa Barbara Department of Public Works.
- B. **Trench Geometry:** Trenches shall be constructed to allow for safe installation of pipe and structures. Trench width shall be in accordance with GWD Standard Details except when stated otherwise on the Plans and Specifications. The bottom of the trench shall be excavated uniformly to the grade of the bottom of the pipe bedding. Trench bottom shall consist of firm native soil or imported compacted soil able to

evenly support pipe bedding for the full length of the pipe. Excavations for pipe bells and welding shall be made as required.

- C. **Abrasive Materials:** When rocks, concrete, or other hard and abrasive materials are encountered during excavation, it may be required that all or a portion of the material be removed to provide a minimum clearance of 12 inches below and on each side of pipe, valves and fittings. If in the opinion of the Goleta Water District damage to other systems or structures will occur by the removal of material, Contractor shall not proceed until receiving further instructions from the District.
- D. **Unsuitable Foundation:** If soft, spongy, unstable, or other similar material is encountered upon which the pipe bedding material is to be placed, an additional 12 inches in depth of this unsuitable material shall be removed and replaced with bedding material placed in the manner specified for pipe bedding material. Tree roots are to be removed.
- E. **Protection of Property:** Tree, shrubs, fences and all other property and surface structures shall be protected during construction unless the Plans and Specifications call for their removal.
- F. **Temporary Supports:** When other structures, pipes, conduits, cables, wires or any underground improvements are encountered during excavation they shall be temporarily supported as necessary to prevent damage to or disturbance of said improvements.
- G. Exploratory Excavation
1. The Contractor shall excavate and expose buried points of connection to existing utilities where indicated on the Drawings. Excavation shall be performed prior to preparation of Shop Drawings for connections and before fabrication of pipe, and the data obtained shall be used in preparing Shop Drawings.
 2. Data, including dates, locations excavated, and sketches, shall be submitted to the City within one week of excavation.
 3. Damage to utilities from excavation activities shall be repaired by the Contractor.
- H. **Open Trench:** The maximum amount of open trench permitted in any one location shall be 300 feet, or a length equivalent to the amount of pipe able to be installed in a single day, whichever is less. Trenches shall not remain open overnight. All trenches shall be fully backfilled at the end of each workday, or shall be properly shored and covered by heavy steel plates adequately braced and capable of supporting vehicular traffic in those locations where it is impractical to backfill at the end of each day. The above requirements for backfilling or use of steel plates may be waived at the discretion of the INSPECTOR in cases where the trench is located further than 100

feet from any traveled roadway or occupied structure. In such cases, however, barricades and warning lights meeting safety requirements shall be provided and maintained.

- I. **Over Excavation:** Any over-excavation carried below the grade ordered or indicated, shall be backfilled and compacted to the required grade with the indicated material

3.06 EXCAVATION IN LAWN AND LANDSCAPED AREAS

- A. Where excavation occurs in landscaped areas, Contractor shall protect all trees, shrubs, sidewalk, walls, fences, and other landscape items adjacent to or within the work area unless directed otherwise by the Contract Documents. In the event of damage to landscape items, Contractor shall replace the damaged items in a manner satisfactory to the City at no cost to the City.
- B. Where excavation occurs in lawn areas, the sod shall be carefully removed, dampened, and stockpiled to preserve it for replacement. Excavated material may be placed on the lawn; provided, that a drop cloth or other suitable method is employed to protect the lawn from damage. The lawn shall not remain covered for more than 72 hours. Immediately after completion of backfilling [and testing of the pipeline], the sod shall be replaced and lightly rolled in a manner so as to restore the lawn as near as possible to its original condition. Contractor shall provide new sod if stockpiled sod has not been replaced within 72 hours.
- C. Except where trees are indicated to be removed, trees shall be protected from injury during construction operations. No tree roots over 2 inches in diameter shall be cut without express permission of the City. Trees shall be supported during excavation by any means previously reviewed by the City.

3.07 BACKFILL - GENERAL

- A. Backfill shall not be dropped directly upon any structure or pipe. Backfill shall not be placed around or upon any structure until the concrete has attained sufficient strength to withstand the loads imposed. Backfill around water retaining structures shall not be placed until the structures have been tested, and the structures shall be full of water while backfill is being placed.
- B. Except for drain rock materials being placed in over-excavated areas or trenches, backfill shall be placed after all water is removed from the excavation, and the trench sidewalls and bottom have been dried to a moisture content suitable for compaction.
- C. Immediately prior to placement of backfill materials, the bottoms and sidewalls of trenches and structure excavations shall have all loose sloughing, or caving soil and rock materials removed. Trench sidewalls shall consist of excavated surfaces that are in a relatively undisturbed condition before placement of backfill materials.

3.08 PLACING AND SPREADING OF BACKFILL MATERIALS

- A. Backfill materials shall be placed and spread evenly in layers. When compaction is achieved using mechanical equipment, the layers shall be evenly spread so that when compacted each layer shall not exceed 6 inches in thickness.
- B. During spreading, each layer shall be thoroughly mixed as necessary to promote uniformity of material in each layer. Pipe zone bedding materials shall be manually spread around the pipe so that when compacted the pipe bedding will provide uniform bearing and side support.
- C. Where the backfill material moisture content is below the optimum moisture content, water shall be added before or during spreading until the proper moisture content is achieved. Where the backfill material moisture content is too high to permit the specified degree of compaction the material shall be dried until the moisture content is satisfactory.

3.09 PLACING AND SPREADING OF BACKFILL MATERIALS

- A. Each layer of Types A, B, C, G, H, I, and K backfill materials as defined herein, where the material is graded such that 10 percent or more passes a No. 4 sieve, shall be mechanically compacted to the indicated percentage of density. Equipment that is consistently capable of achieving the required degree of compaction shall be used and each layer shall be compacted over its entire area while the material is at the required moisture content.
- B. Each layer of Type F backfill materials shall be compacted by means of at least 2 passes from a flat plate vibratory compactor. When such materials are used for pipe zone backfill, vibratory compaction shall be used at the top of the pipe zone or at vertical intervals of 24 inches, whichever is the least distance from the subgrade.
- C. Flooding, ponding, or jetting shall not be used for backfill around structures, for final backfill materials, or aggregate base materials.
- D. Equipment weighing more than 10,000 pounds shall not be used closer to walls than a horizontal distance equal to the depth of the fill at that time. Hand operated power compaction equipment shall be used where use of heavier equipment is impractical or restricted due to weight limitations.
- E. Backfill around and over pipelines that is mechanically compacted shall be compacted using light, hand operated, vibratory compactors and rollers. After completion of at least two feet of compacted backfill over the top of pipeline, compaction equipment weighing no more than 8,000 pounds may be used to complete the trench backfill.

3.10 PLACING AND SPREADING OF BACKFILL MATERIALS

- A. **Methods:** Classification of pipe bedding and trench backfill materials shall be determined in accordance with ASTM D 2487. The density of soil in place shall be determined by the sand cone method, ASTM D 1556, or by the nuclear method, ASTM D 2922 or D 3017. When ASTM D 2922 is used and a one-sack slurry is not used to backfill the trench, the calibration curves shall be checked and adjusted using the sand cone method. ASTM D 2922 results in a wet unit weight of soil and when using this method, ASTM D 3017 (Nuclear Gauge Method for Water Content) shall be used to determine the moisture content of the soil. The calibration curves furnished with the moisture gauges shall be checked along with density calibration checks, as described in ASTM D 3017. The calibration checks of both the density and moisture curves shall be made at the beginning of the job and on each different type of material used. Copies of calibration curves, results of calibration tests, and results of laboratory tests shall be furnished to the City prior to performing any field tests. Field test results shall be furnished to the City within 48 hours of the testing. Trenches improperly compacted shall be reopened to the depth directed by the City, then filled and compacted to the density specified at no additional cost to the City.
- B. **Soil Moisture-Density Relationship:** Laboratory moisture-density relations of soils shall be determined per ASTM D 1557.
- C. **Cohesionless Materials:** Relative density of cohesionless materials by ASTM D 4253 and D 4254.
- D. **Sampling:** Sample backfill materials per ASTM D 75.
- E. **Relative Compaction:** "Relative compaction" shall be defined as the ratio, expressed as a percentage, of the in place dry density to the laboratory maximum dry density.
- F. **Compaction Compliance:** Compaction shall be deemed to comply with the specifications when none of the tests falls below the specified relative compaction. Notify the City 24-hours in advance of when backfill lifts are ready for testing to allow inspection by the City. The Contractor shall pay the costs of any re-testing of work not conforming to the Specifications.
- G. **Testing Frequency:** Testing shall be performed by a certified soils testing service. All tests shall be performed at locations specified by the City. A minimum of one soil classification and one moisture-density relation test shall be performed for each different type of soil material used for pipe bedding and trench backfill. These tests shall also be performed for every 1500 cubic yards of material placed. A minimum of one field density test shall be performed for each soil type, and at least one test for each 24" compacted thickness. These test requirements shall be repeated for every 300 feet of trench length.

H. **Compaction Requirements:** The following compaction test requirements shall be in accordance with ASTM D 1557 - Test Method for Laboratory Compaction Characteristics of Soils Using Modified Effort (56,000 ft - lbf/ft³) (2,700 kN-m/m³) for Type A, B, C, G, H, I, K, M, and N materials and in accordance with ASTM D 4253 - Standard Test Method for Maximum Index Density and Unit Weight of Soils Using a Vibratory Table, and D 4254 - Standard Test Method for Minimum Index Density and Unit Weight of Soils and Calculation of Relative Density, for Type B, E, F, and J materials. Where agency or utility company requirements govern, the highest compaction standards shall apply.

<u>Location or Use of Fill</u>	<u>Percentage of Maximum Density</u>	<u>Percentage of Relative Density</u>
Pipe bedding and over-excavated zones under bedding for flexible pipe, including trench plugs.	95	70
Pipe bedding and over-excavated zones under bedding for rigid pipe.	90	55

structures.	95	70
Topsoil (Type K material)	80	N.A.
Aggregate base or sub-base (Type G or M material)	95	N.A.

3.11 PIPE AND UTILITY TRENCH BACKFILL

A. Pipe Zone Bedding

1. The pipe zone is defined as that portion of the vertical trench cross-section lying between the trench bottom and a plane 12-inches above the top surface of the pipe as indicated. The pipe bedding is defined as backfill material within the pipe zone. Bedding shall be placed across the entire trench extending from a minimum of four inches below the bottom of the pipe to 12 inches above the top of pipe. Bedding shall be placed in layers not exceeding six inches loose thickness for compaction by hydraulic or hand operated mechanical compactors, and eight inches loose thickness when compacted by other mechanical compactors. Bedding shall be compacted to at least 90% of its maximum dry density as determined by ASTM D 1557. Bell holes in bedding shall be provided for each joint, but shall be no larger than necessary to allow joint assembly and to ensure that pipe will lie flat on the bedding. Contractor shall ensure that pipe is not being supported by the bell portion of the pipe at any joint and shall ensure that no less than 2 inches of bedding is provided for yokes, restraints, bells and all other extensions of fittings and joints.
2. The pipe zone shall be backfilled with the indicated backfill material. The Contractor shall exercise care to prevent damage to the pipeline coating, cathodic bonds, and the pipe itself during the installation and backfill operations

- B. Trench Zone Backfill: After the pipe zone backfill has been placed, backfilling of the trench zone may proceed. The trench zone is defined as that portion of the vertical trench cross-section from 12 inches above the top of the pipe to the bottom of the pavement zone if the trench is under pavement, or to within 12 inches of finished grade if the trench is in an unpaved area. Where slurry backfill is not used, material shall be compacted to at least 95% of maximum dry density as determined by ASTM D 1557. Trench shall be backfilled in lifts not exceeding eight inches, uncompacted depth, and then compacted by mechanical means prior to placement of succeeding lifts. Where the pipeline is located within an existing paved street within the public right of way, trench shall be backfilled with Type L backfill material as described above.

- C. **Pavement Zone Backfill and Final Backfill:** The pavement zone includes the asphalt concrete and aggregate base pavement section. Final backfill applies to trenches not beneath paved areas and is all backfill in the trench cross-sectional area within 12 inches of finished grade.
- D. **Identification Tape:** Install identification tape as indicated.

3.12 FILL AND EMBANKMENT CONSTRUCTION

- A. The area where a fill or embankment is to be constructed shall be cleared of all vegetation, roots, and foreign material. Following this, the surface shall be moistened, scarified to a depth of six inches, and rolled or otherwise mechanically compacted. Embankment and fill material shall be placed and spread evenly in approximately horizontal layers. Each layer shall be moistened or aerated, as necessary. Unless otherwise approved by the City, each layer shall not exceed 6 inches of compacted thickness. The embankment, fill, and the scarified layer of underlying ground shall be compacted to 95 percent of maximum density under structures and paved areas, and 90 percent of maximum density elsewhere.
- B. When an embankment or fill is to be made and compacted against hillsides or fill slopes steeper than 4:1, the slopes of hillsides or fills shall be horizontally benched to key the embankment or fill to the underlying ground. A minimum of 12 inches normal to the slope of the hillside or fill shall be removed and re-compacted as the embankment or fill is brought up in layers. Material thus cut shall be re-compacted along with the new material. Hillside or fill slopes 4:1 or flatter shall be prepared in accordance with Paragraph A, above.
- C. Where embankment or structure fills are constructed over pipelines, the first 4 feet of fill over the pipe shall be constructed using light placement and compaction equipment that does not damage the pipe. Heavy construction equipment shall maintain a minimum distance from the edge of the trench equal to the depth of the trench until at least 4 feet of fill over the pipe has been completed.

3.13 FIELD TESTING

- A. **General:** All field soils testing will be done by a testing laboratory of the City's choice at the City's expense except as indicated below.
- B. Where soil material is required to be compacted to a percentage of maximum density, the maximum density at optimum moisture content will be determined in accordance with Method C of ASTM D 1557. Where cohesionless, free draining soil material is required to be compacted to a percentage of relative density, the calculation of relative density will be determined in accordance with ASTM D 4253 and D 4254. Field density in-place tests will be performed in accordance with ASTM D 1556 - Standard Test Method for Density and Unit Weight of Soil in Place by the Sand-Cone Method,

ASTM D 2922 - Standard Test Methods for Density of Soil and Soil-Aggregate in Place By Nuclear Methods (Shallow Depth), or by such other means acceptable to the City.

- C. In case the test of the fill or backfill show non-compliance with the required density, the Contractor shall accomplish such remedy as may be required to ensure compliance. Subsequent testing to show compliance shall be by a testing laboratory selected by the City and paid by the Contractor.
- D. The Contractor shall provide test trenches and excavations including excavation, and trench support for the City's field soils testing operations. The trenches and excavations shall be provided at the locations and to the depths required by the City.

3.14 ASPHALT CONCRETE

- A. General: Furnishing, placing, shaping, rolling, and finishing asphalt concrete for resurfacing of pavement after trenching shall be performed in accordance with local jurisdiction's Standards and Section 39 of the Caltrans Standard Specifications.
- B. Wherever required by the governing agency, the Contractor shall place temporary surfacing promptly after backfilling and shall maintain such surfacing for the period of time fixed by said agency before proceeding with the final restoration of improvements.
- C. All paved areas, including curbs and berms, cut or damaged during construction shall be replaced with similar materials and of equal thickness to match the existing adjacent undisturbed areas, except where specific resurfacing requirements have been called for in the Contract Documents or in the permit of the governing agency. All temporary and permanent pavement shall conform to the requirements of the governing agency.
- D. In order to obtain a satisfactory junction with adjacent surfaces, the Contractor shall saw cut back and trim the edge so as to provide a clean, sound, vertical joint before permanent resurfacing of an excavated or damaged portion of pavement. Damaged edges of pavement along excavations and elsewhere shall be trimmed back by saw cutting in straight lines.
- E. Pavement and base shall be constructed to the line, grade and thickness shown on the Construction Drawings. All pavement restoration and other facilities restoration shall be constructed to finish grades compatible with adjacent undisturbed pavement.

3.15 BASE AND SUBGRADE BELOW ASPHALT CONCRETE

- A. The preparation of the subgrade to receive aggregate base course, and preparation and construction of aggregate base for construction of asphalt concrete paving shall

conform to the requirements of the applicable sections of the Caltrans Standard Specifications.

- B. Spreading and compacting of base material shall conform to the requirements of Section 26 of the Caltrans Standard Specifications.
- C. Base course shall be maintained until asphalt pavement is placed. Areas of base course which are damaged or do not conform to the requirements herein shall be conditioned, reshaped, and recompact in accordance with the requirements herein.
- D. Compaction tests will be performed by the City, in accordance with the requirements of the applicable sections of the Caltrans Standard Specifications

3.16 TACK COAT

- A. An asphalt tack coat shall be applied to all existing asphalt concrete or concrete surfaces upon or against which asphalt concrete is to be placed. Application of tack coat shall conform to the requirements of Section 39 of the Caltrans Standard Specifications.

3.17 ASPHALT CONCRETE PAVING

- A. Asphalt concrete paving shall be constructed in accordance with the requirements of Section 39 of the Caltrans Standard Specifications.

3.18 ASPHALT CONCRETE PAVEMENT MARKING AND STRIPING

- A. Asphalt concrete pavement shall be marked and striped to replace all markings and striping disturbed by the paving operation in accordance with Section 84 of the Caltrans Standard Specifications.

END OF SECTION – 31 2316

SECTION 32 01 90

OPERATIONS AND MAINTENANCE OF PLANTING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, shall apply to all work in this Section with the same force and effect as though repeated in full herein.

1.2 SUMMARY

- A. After landscape planting work have been completed, reviewed and accepted by OAR, furnish materials, labor, transportation, services and equipment necessary to provide landscape maintenance as indicated on Drawings and as specified herein.
- B. Work included in this Section:
 - 1. Continuous maintenance of plant material during specified landscape maintenance period.
- C. Work related in other Sections:
 - 1. Section 32 90 00 - Planting.

1.3 LANDSCAPE MAINTENANCE PERIOD

- A. Landscape Maintenance Period: 90 days from Final Acceptance by OAR. Contractor may, at discretion of OAR, be allowed to proceed into landscape maintenance period if planting is deemed "substantially complete" by OAR.
- B. Continuously maintain areas involved in this Contract during progress of Work and during landscape maintenance period until Final Acceptance by OAR has been granted.
- C. Improper landscape maintenance or possible poor condition of planting at termination of the scheduled landscape maintenance period may cause landscape maintenance period to be continued at no cost to Owner.
- D. In order to carry out plant establishment work, furnish sufficient labor and adequate equipment to perform Work during landscape maintenance period.

- E. Request an observation of Work by OAR to begin landscape maintenance period after planting and related work has been completed in accordance with Contract Documents. A prime requirement is that groundcover areas be planted and show a consistent and healthy appearance. If such criteria are met to satisfaction of OAR, a field report may be issued to OAR recommending a start date to begin landscape maintenance period.
- F. Any day that Contractor fails to adequately perform landscape maintenance, as determined necessary by OAR, that day will not be credited as one of landscape maintenance working days.
- G. Prior to being placed on landscape maintenance, submit a schedule of activities planned during landscape maintenance period. This schedule needs to be accepted by OAR prior to start of landscape maintenance. Document scheduled changes and obtain acceptance by OAR.

PART 2 - PRODUCTS

2.1 GENERAL

- A. Provide materials used during landscape maintenance work in accordance with requirements of Section 32 90 00 - Planting. Provide fertilizer per soil's test recommendation and following:
 - 1. Shrub and Groundcover Planting Fertilizer:
 - a. Consisting of following minimum percents by weight:
 - 14% Nitrogen
 - 4% Phosphoric Acid
 - 9% Potash
 - 30% Humus
 - 6% Humic Acid
 - 3% Sulfur
 - b. Acceptable Manufacturers:
Gro-Power Hi Nitrogen; Gro-Power (909) 393-3744 or approved equivalent.
- B. Submit a list of materials that are to be used during landscape maintenance that are not specified in Section 32 90 00 in written form to OAR for review and approval.

PART 3 - EXECUTION

3.1 LANDSCAPE MAINTENANCE

- A. Keep landscape areas free of debris.
- B. Keep planted areas weed-free. Cultivate at intervals of not more than 10 days.

- C. Maintain adequate protection of Work area. Repair damaged areas.
- D. Sweep clean paved areas on once a week intervals or less, if deemed necessary.

3.2 TREE AND SHRUB CARE

A. Watering:

- 1. Maintain a large enough water basin around trees and shrubs so that enough water can be applied to establish moisture through major root zone.
- 2. When hand watering, use a water wand to break water force.
- 3. Replenish wood mulches to reduce evaporation and frequency of watering.
- 4. Regulate watering times to minimize erosion and gullyng.

B. Pruning:

- 1. Trees:
 - a. Prune Trees To:
 - 1) Select and develop permanent scaffold branches that are smaller in diameter than trunk or branch to which they are attached which have vertical spacing of from 18-inches to 48-inches and radial orientation so as not to overlay one another.
 - 2) To eliminate diseased or damaged growth.
 - 3) To eliminate narrow V-shaped branch forks that lack strength.
 - 4) To reduce toppling and wind damage by thinning out crowns.
 - 5) To maintain growth within space limitations.
 - 6) To maintain a natural appearance and to balance crown with root mass.
 - b. Under no circumstances, will stripping of lower branches "raising-up" of young trees be permitted.
 - c. Retain lower branches in a "tipped-back" or pinched condition with as much foliage as possible to promote caliper trunk growth.
 - d. Cut lower branches flush with trunk only after tree is able to stand erect without staking or other support.
 - e. Remove sucker growth.
 - f. Thin evergreen trees and shape when necessary to prevent wind and storm damage.
- 2. Shrubs:
 - a. Overall objective of shrub pruning is same as for trees.
 - b. Do not clip shrubs into balled or boxed forms unless approved initially by OAR.
 - c. Make pruning cuts on lateral branches or buds flush with trunk.
 - d. Do not "stub" branches.

C. Tree Staking and Guying:

1. Restake, tighten and repair damaged ties and guys.
 2. Reset to proper grades or upright position, trees that are not in their proper growing position.
 3. Inspect stakes and guys to prevent girdling of trunks or branches and to prevent rubbing that may cause bark wounds.
- D. Weed Control:
1. Keep planted and aggregate areas free of weeds.
 2. Use recommended legally approved herbicides.
 3. Avoid frequent soil cultivation that destroy shallow surface roots.
 4. Replenish lost wood mulch to reduce weed growth.
- E. Insect and Disease Control:
1. Maintain insect and disease control during landscape maintenance period.
- F. Fertilization:
1. Fertilize planting areas with application of Gro-Power Hi-Nitrogen 14-4-9, or approved equivalent. Commercial fertilizer at the rate of 7 1/2 pounds per 1,000 square feet 30 days after planting.
 2. Repeat fertilizer application at 30-day intervals until end of the landscape maintenance period.
- G. Replacement of Plants:
1. Replace dead, dying and missing plants of a like size and condition as to those that were originally installed at no cost to Owner.
- H. Replacement of Soil
1. Replacement of soil to maintain height of 2” below top of planter.
- 3.3 GROUND COVER CARE
- A. Weed Control:
1. Control weeds with chemical systemic spray or by hand so as to cause minimal damage to planted materials.
- B. Watering:
1. Water enough so that moisture penetrates throughout root zone and only as frequently as necessary to maintain healthy growth.
- C. Fertilizing:
1. Fertilize as specified under Tree and Shrub care of this Specification.
- D. Edge groundcover to keep in bounds and trim top growth as necessary to achieve an overall even appearance.

- E. Replace dead, dying and missing plants of a like size and condition as to those that were originally installed.

3.4 WATERING DURING ESTABLISHMENT PERIOD

- A. Provide periodic watering and other activities required during landscape maintenance period to keep plants thriving.

3.5 FINAL WALKTHROUGH

- A. At completion of landscape maintenance period, schedule a Final Walkthrough with OAR.
- B. OAR, General Contractor and others deemed necessary by OAR may be present at Final Walkthrough.
- C. If, during Final Walkthrough OAR is of opinion that landscape maintenance has been substantially completed in accordance with this Section, written notice of recommendation to allow Contractor to be released from Project will be submitted to OAR for approval. This report will note any incomplete punch list items from Final Walkthrough and a date on which these items must be completed. Complete remaining punch list items within 5 working days after Final Walkthrough was performed by OAR.

3.6 CLEAN UP

- A. Upon completion of landscape maintenance, remove rubbish, waste and debris resulting from Contractor's operations.
- B. Repair scars, ruts or other marks in landscaped areas caused by Contractor.
- C. Remove equipment, implements of service, and leave Work area in a neat and clean condition. Sweep clean paved areas.

END OF SECTION – 32 01 90

AGGREGATE BASE

32 11 16

PART 1 – GENERAL

1.01 SUMMARY

- A. This Section specifies the material and work requirements for aggregate base to be furnished and place to the lines, grades, and dimensions in accordance with the Plans, Specifications and as directed by the Engineer.
- B. Class 2 Aggregate Base must conform to Caltrans Standard Specification Division IV – Subbases and Bases, Section 26 – Aggregate Bases,

1.02 RELATED SECTIONS

- A. 31 23 16 – Trenching Backfill and Compaction
- B. 32 12 16 – Asphalt Paving
- C. Caltrans Standard Specification Division IV – Subbases and Bases, Section 23 – General
- D. Caltrans Standard Specification Division IV – Subbases and Bases, Section 26 – Aggregate Bases

1.4 SUBMITTALS

- A. Section 01 3300 – Submittal Procedures: Procedures for submittals.
- B. Samples: Submit, in air-tight containers, 10 l. sample of each type of fill material to testing laboratory for evaluation.
- C. Materials Source: Submit name of imported materials suppliers and location of material source.

1.5 QUALITY ASSURANCE

- A. Perform Work in accordance with this Section and referenced standards. Maintain one copy of test results on-site.

PART 2 – CALTRANS STANDARD SPECIAL PROVISIONS (SSPs)

- A. None.

PART 3 – MEASUREMENT AND PAYMENT

- A. Measurement and payment must conform to Caltrans Standard Specification Section 26 – Aggregate Bases.

END SECTION - 32 11 16

ASPHALT PAVING

32 12 16

PART 1 – GENERAL

1.01 SUMMARY

- A. This Section specifies the material and work requirements for asphalt paving to be furnished and place to the lines, grades, and dimensions in accordance with the Plans, Specifications and as directed by the Engineer.

Asphalt paving shall include all street paving, and street rehab paving in the public right of way along Hollister Avenue, South La Patera Lane and Lindmar Drive must conform to Caltrans Standard Specification Division V – Surfacing and Pavements, Section 39 – Asphalt Concrete.

1.02 RELATED SECTIONS

- A. 31 23 00 – EARTHWORK
- B. 32 11 16 – AGGREGATE BASE
- C. Caltrans Standard Specification Division III - Earthwork and Landscape, Section 19 – Earthwork
- D. Caltrans Standard Specification Division IV – Subbases and Bases, Section 23 – General
- E. Caltrans Standard Specification Division IV – Subbases and Bases, Section 26 – Aggregate Bases
- F. Caltrans Standard Specification Division V – Surfacing and Pavements, Section 36 – General
- G. Caltrans Standard Specification Division V – Surfacing and Pavements, Section 39 – Asphalt Concrete
- H. Caltrans Standard Specification Division IX – Traffic Control Devices, Section 84 – Markings

1.1 REFERENCES

- A. Work shall comply with the rules and regulations of the City of Goleta, Santa Barbara County and the State of California.
- B. Reference to the "Caltrans Standard Specifications" shall mean 2023 Caltrans Standard Specifications.

- C. ASTM Standards.

1.2 PROJECT CONDITIONS

- A. The Contractor shall keep his work area clean, and in a safe and workmanlike condition so that rubbish, waste and debris do not interfere with the work of other trades.
- B. Apply prime and tack coats when ambient temperature is above 50 degrees F and when temperature has not been below 35 degrees F for 12 hours immediately prior to application. Do not apply when base is wet or contains an excess of moisture.
- C. Construct asphalt concrete surface course only when atmospheric temperature is above 40 degrees F and when base is dry. Base course may be placed when air temperature is above 30 degrees F.

1.3 COORDINATION

- A. The Contractor shall notify the General Contractor and all other contractors related to the installation of his Work in ample time, so as to allow sufficient time for those contractors to perform their portion of the Work.

PART 2 – CALTRANS STANDARD SPECIAL PROVISIONS (SSPs)

- A. Minor HMA in the public right of way including Hollister Avenue, South La Patera Lane and Lindmar Drive must conform to Caltrans Standard Specification Section 39 – Asphalt Concrete. This includes coatings (tack coat, etc.).
- B. All HMA is Minor Type A.
- C. Replace section 39-2.01B(2)(b) with:

39-2.01B(2)(b) Hot Mix Asphalt Treatments

Determine the plasticity index of the aggregate blend under California Test 204. Use only the aggregate blend with plasticity index equal to or less than 10.

- D. Replace section 39-2.01C(3)(c) with:

39-2.01C(3)(c) Prime Coat

Apply a slow-setting asphaltic emulsion as a prime coat to AB areas designated by the Engineer and at a spread rate from 0.15 to 0.40 gal/sq yd. Do not apply more prime coat than can be absorbed completely by the AB in 24 hours.

You may modify the prime coat application rates if authorized.

Close areas receiving prime coat to traffic. Do not allow tracking the prime coat onto pavement surfaces beyond the job site.

- E. Replace Reserved in section 39-2.02B(3) with:

The grade of asphalt binder for Type A HMA must be PG 64-10.

For Type A HMA using RAP substitution of greater than 15 percent of the aggregate blend, the virgin binder grade must comply with the PG binder grade specified above with 6 degrees C reduction in the upper and lower temperature classification.

For Type A HMA using RAP substitution of 15 percent or less of the aggregate blend, the grade of the virgin binder must comply with the PG binder grade specified above.

- F. Replace section 39-2.07B(3) with:

39-2.07B(3) Asphalt Binder

The grade of asphalt binder for minor HMA must be PG 64-10.

For minor HMA using RAP substitution of greater than 15 percent of the aggregate blend, the grade of the virgin binder must comply with the binder grade specified above with a 6-degree reduction in the upper and lower temperature classification.

For minor HMA using RAP substitution of 15 percent or less of the aggregate blend, the grade of the virgin binder must comply with the binder grade specified above.

- G. Cold Plane Asphalt Concrete Pavement

- a. Caltrans Standard Specification Section 39-3.04 includes specifications for cold planing asphalt concrete pavement.
- b. Replace the 3rd paragraph of section 39-3.04A with:
- c. Schedule cold planing activities such that not more than 7 days has elapsed between the time the pavement is cold planed and the HMA is placed. Items 2 and

PART 3 – MEASUREMENT AND PAYMENT

- A. Measurement and payment must conform to Caltrans Standard Specification Section 39 – Asphalt Concrete.

END SECTION - 32 12 16

SECTION 32 13 13

PORTLAND CEMENT CONCRETE PAVING

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, shall apply to all work in this Section with the same force and effect as though repeated in full herein.

1.02 DESCRIPTION OF WORK

- A. Furnish materials, labor, transportation, services, and equipment necessary to install portland cement concrete paving as indicated on Drawings and as specified herein.
- B. Work included in this Section:
 - 1. Natural colored concrete paving.
 - 2. Materials and accessories.
 - 3. Preparation of subgrade, subbase, or base.
 - 4. Formwork.
 - 5. Placing concrete reinforcement.
 - 6. Placing concrete.
 - 7. Joints.
 - 8. Finishing.
 - 9. Curing and protection.
 - 10. Installation of joint seals.
 - 11. Field quality control.
- C. Work related in other Sections:
 - 1. Section 32 11 16 – Aggregate Base

1.03 DEFINITIONS

- A. The Owner in this Section will refer to the City of Goleta.
- B. The Owner's Authorized Representative (OAR) in this Section will refer to CM as the Point of Contact, retained by the Owner.

1.02 REFERENCES

- A. ACI 117 - Standard Tolerances for Concrete Construction and Materials.
- B. ACI 318 - Building Code Requirements for Reinforced Concrete.

- C. ACI 211.1 - Standard Practice for Selecting Proportions for Normal, Heavyweight, and Mass Concrete.
- B. ACI 304R - Recommended Practice for Measuring, Mixing, Transporting and Placing Concrete.
- C. ACI 305R - Hot Weather Concreting.
- D. ACI 309R - Guide for Consolidation of Concrete.
- E. ASTM A 615 - Deformed and Plain Billet-Steel for Concrete Reinforcement.
- F. ASTM C 31 - Standard Specification for Making and Curing Concrete Test Specimens in the Field.
- G. ASTM C 33 - Standard Specification for Concrete Aggregates.
- H. ASTM C 39 - Standard Test Method for Compressive Strength of Cylindrical Concrete Specimens.
- I. ASTM C 94 - Standard Specification for Ready Mix Concrete.
- J. ASTM C 143 - Standard Specification for Hydraulic Hydrated Cement Concrete.
- K. ASTM C 150 - Standard Specification for Portland Cement.
- L. ASTM C 172 - Standard Practice for Sampling Freshly Mixed Concrete.
- M. ASTM C 231 - Standard Test Method for Air Content of Freshly Mixed Concrete by the Pressure Method.
- N. ASTM C 260 - Standard Specification for Air-Entraining Admixtures for Concrete.
- O. ASTM C 309 - Standard Specification for Liquid Membrane-Forming Compounds for Curing Concrete.
- P. ASTM C 494 - Standard Specification for Chemical Admixtures for Concrete.
- Q. ASTM C 1064 - Standard Test Method for Temperature of Freshly Mixed Portland Cement Concrete.

1.03 SUBMITTALS

- A. In accordance with Section 01340 - Shop Drawings, Samples and Product Data: Procedures for submittals.
- B. Provide Shop Drawings for the Following:
 - 1. Paving Jointing and Pour Sequence Plan - submit six blueprints indicating the following:
 - a. Proposed layout of contraction, construction and isolation joints. Clearly delineate the three different joint types.

- b. Layout of paving types as indicated on Drawing Paving Schedule. Give overall dimensions of each paving type.
 - c. Concrete pour sequence. Indicated sequence of paving pour installation.
- C. Paving Mix Designs: Provide documentation for each paving type specified on Drawings that will enable Owner to better match replaced concrete:
- 1. Laboratory and Cement Test Reports: Submit six (6) copies of laboratory test reports for concrete materials and a certificate with each concrete mixer truck, stating mix design, PSI rating, slump, water and cement quantity, cement/water ratio, fine and coarse aggregates.
 - 2. Cement:
 - a. Manufacturer and plant location.
 - b. Cement type, i.e. Type I, II or V.
 - 3. Admixtures:
 - a. Manufacturer and plant location.
 - 4. Sand:
 - a. Source and type.
 - 5. Aggregates:
 - a. Source and type.
 - 6. Signed certification from a licensed structural engineer.
- D. Submit specification data “Cut Sheets” for release agent, plastic dowel sleeve.

1.04 QUALITY ASSURANCE

- A. Pre-Bid Conference: Prior to submitting bid, attend pre-bid conference with Owner and to review requirements and artistic effect desired.
- B. Mock-Ups:
- 1. Install a 4-foot wide x 4-foot long mock-up of sample paving indicating all joint types and finishes at location as directed by The OAR.
 - 2. This mock-up will be the standard from which future work will be judged.
 - 3. Remove Mock-up completely prior to Final Payment.
- C. Concrete Manufacturer Qualifications: Manufacturer of ready-mixed concrete products complying with ASTM C 94 requirements for production facilities and equipment.
- D. Installer: Provide evidence to indicate successful experience in providing patterned concrete work similar to that specified herein and can demonstrate successful experience through past project documentation and references.
- 1. Experience: Minimum 5 years experience in the installation of seeded concrete paving.
 - 2. Demonstration of Experience: 10 projects which have been completed within the past 36 months utilizing similar products, scope, and complexity.

3. Supervision: Perform placement and finishing of concrete work under supervision of a person having a minimum of 5 years of experience in placement and finishing of products specified herein.
 4. Submit qualifications to Owner for information purposes. Submit a resume of Project Manager and Superintendent who will be overseeing the Work.
- E. Slip Resistance: Provide a finish surface slip resistance coefficient of friction equal or greater than 0.6 for flat surfaces and 0.8 for ramps, when tested in accordance with ASTM F 489.

1.05 DELIVERY, STORAGE, AND HANDLING

- A. In accordance with Section 01 6000 – “Products, Materials, Equipment & Substitutes” - Product Handling and Protection: Transport, handle, store, and protect.
- B. Store materials in dry and protected locations and protect from damage.
- C. Do not change brand of cement nor source of aggregate during course of Work.

1.06 SITE CONDITIONS

- A. Do not place concrete when subbase surface temperature is less than 40 degrees F, nor when surface is wet.

1.07 COORDINATION

- A. In accordance with Section 01 3113 - Project Coordination.
- B. Ensure that irrigation sleeves, electrical conduit, outlets and other utility elements are accommodated and as-built located prior to pouring concrete.

1.08 INSPECTION OF SITE

- A. Verify conditions at site that affect Work of this Section, and take field measurements as required. Report major discrepancies between Drawings and field dimensions to Owner prior to commencing work.

PART 2 - PRODUCTS

2.01 FORMS

- A. Form Materials: Plywood, metal, metal-framed plywood, or other acceptable panel-type materials to provide full-depth, continuous, straight, smooth exposed surfaces.

- B. Provide metal forms, weighing not less than 18 pounds per linear foot for pavement 8 inches thick, not less than 20 pounds per linear foot for pavement 9 inches thick, and not less than 22 pounds per linear foot for pavement 10 inches thick, and in no case less than 7/32 inch thick.
- C. Provide side forms having a depth equal to the prescribed edge thickness of the pavement, without horizontal joints.
- D. Provide forms having a base not less than 8 inches wide and a flanged tread or top surface not less than 2 inches wide. For multiple lanes, provide base width at least equal to height.
- E. Use flexible or curved forms for curves of 200-foot or less radius.
- F. Provide forms not less than 10 feet long except where shorter forms are necessary for curves. Use metal keyway forms for the full length of roadway form to which attached. Provide wood bulkheads for the full width of pavement lane equipped with keyway form.
- G. Provide holes for bars and dowel assemblies where required.
- H. Provide at least three stake pockets to accommodate a 1-inch diameter stake in each section of form 10 feet or more in length, and at least two such pockets in each section of form less than 10 feet long.
- I. Provide each section of form with a positive locking device that will secure it tightly to the adjoining section.
- J. Provide forms free from warp and of sufficient strength to resist, without visible springing or settlement, all loads applied in the paving process.

2.02 REINFORCING MATERIAL

- A. Synthetic Fiber Reinforcement: 100% pure synthetic polypropylene fibers, engineered and designed for secondary reinforcement of concrete slabs, complying with ASTM C 1116 - Type III. Maximum length of fibers to be 3/4-inch.
 - 1. Acceptable Manufacturers:
 - a. Fibermesh: Stealth (800)348-9348.
 - b. Forta Fiber: Microfiber (800)245-0306.
 - c. W.R. Grace: Monofiliment (800)433-0020.
 - d. Bomanite; Monofiliment (800)854-2094.
- B. Reinforcing Bars and Tie Bars: ASTM A 615 - Grade 60, deformed.
- C. Plain, Cold-Drawn Steel Wire: ASTM A 82.

- D. Fabricated Bar Mats: Welded or clip-assembled steel bar mats, ASTM A 184. Use ASTM A 615, Grade 60 steel bars.
- E. Construction Joint Dowel Bars: Plain steel bars, ASTM A 615, Grade 60. Cut bars true to length with ends square and free of burrs.
- F. Epoxy-Coated Construction Joint Dowel Bars: ASTM A 775 over ASTM A 615, Grade 60 plain steel bars.
- G. Joint Dowel Alignment Sleeves: Polypropylene plastic sleeve dowel to ensure proper alignment of steel dowels.
- H. Hook Bolts: ASTM A 307, Grade A bolts, internally and externally threaded. Design hook bolt joint assembly to hold coupling against pavement form and in position during concrete operations, and to permit removal without damage to concrete or hook bolt.
- I. Supports for Reinforcement: Chairs, spacers, dowel bar supports and other devices for spacing, supporting, and fastening reinforcing bars in place. Use wire bar-type supports.
 - 1. Benches and Chairs: ACI 318
 - 2. Use supports with sand plates or horizontal runners where base material will not support chair legs.

2.03 CONCRETE MATERIALS

- A. Portland Cement: ASTM C 150 - Type I.
- B. Concrete Aggregate: ASTM C 33 - Class 4, and as follows. Provide aggregates from a single source:
- C. Water: Clean and free from injurious amounts of oils, acids, alkalis, salts, organic materials, or other substances that may be deleterious to concrete or reinforcement.

2.04 ADMIXTURES

- A. Provide concrete admixtures that contain not more than 1 percent chloride ions and no calcium chloride.
- B. Water-Reducing Admixture: ASTM 4 94, Type A.
- C. High-Range Water-Reducing Admixture: ASTM C 494, Type F or Type G.
- D. Water-Reducing and Retarding Admixture: ASTM C 494, Type D or E.

- E. Acceptable Manufacturers:
1. Water-Reducing Admixtures:
 - a. ChemMasters Corp; Chemtard.
 - b. Cormix Construction Chemicals; Type A Series.
 - c. Euclid Chemical Company; Eucon WR-75.
 2. High-Range Water-Reducing Admixtures:
 - a. Anti-Hydro Co. Inc.; Super P.
 - b. Cormix Construction Chemicals; Cormix 2000, PSI Super.
 - c. Euclid Chemical Company; Eucon 37.
 3. Water-Reducing and Acceleration Admixtures:
 - a. Conspec Marketing & Manufacturing Company; Q-Set.
 - b. Cormix Construction Chemicals; Gilco Accelerator or Lub NCR.
 - c. Euclid Chemical Company; Accelguard 80.
 4. Water-Reducing and Retarding Admixtures:
 - a. Cormix Construction Chemicals; Type D Series.
 - b. Euclid Chemical Company; Eucon Retarder 75.
 - c. W.R. Grace Company; Daratard-17.

2.05 CURING MATERIALS

- A. Absorptive Cover: Burlap cloth made from jute or kenaf, weighing approximately 9 oz. per sq. yd., complying with AASHTO M 182, Class 2.
- B. Moisture-Retaining Cover: One of the following complying with ASTM C 171:
1. Waterproof paper.
 2. Polyethylene film.
 3. White burlap-polyethylene sheeting.
- C. Clear, Waterborne Membrane-Forming Curing Compounds:
1. Provide curing materials that have a maximum volatile organic compound (VOC) rating of 350 g/l.
- D. Evaporation Control: Monomolecular film-forming compound applied to exposed concrete slab surfaces for temporary protection from rapid moisture loss.
1. Clear, Waterborne Membrane-Forming Curing Compounds Acceptable Manufacturers:
 - a. Anti-Hydro Company; Clear Cure Water Base.
 - b. The Burke Company; Spartan Cote WB.
 - c. Cormix Construction Chemicals; Sealco VOC.
 2. Acceptable Evaporation Control Manufacturers:
 - a. Conspec Marketing and MFG. Company; Aquafilm.
 - b. Euclid Chemical Company; Eucobar.
 - c. L&M Construction Chemicals; E-Con.

2.06 RELATED MATERIALS

- A. Bonding Agent: Acrylic or styrene butadiene.
- B. Epoxy Adhesive: ASTM C 881, two-component material suitable for dry or damp surfaces. Provide material type, grade, and class to suit requirements.
- C. Miscellaneous Materials: Miscellaneous specialty materials, acids, or other materials required to achieve the specialized effects indicated on the mock-up or as required by Owner.
- D. Concrete Finish Retarder: Spray applied, film forming, water based top surface retarder, calibrated for specific sized aggregate and finish requirements.
 - 1. Acceptable Materials: “Top Cast” by Grace Construction Products. Customer Service Center - 888-336-9303, www.graceconstructionproducts.com or Owner approved equivalent.

2.07 CONCRETE

- A. Prepare design mixes for each type and strength of normal-weight concrete by either laboratory trial batch or field experience methods as specified under ACI 301.
- B. Proportion mixes according to ACI 211.1 and ACI 301 to provide normal-weight concrete with the following properties:
 - 1. Compressive Strength at 28 days: 3,000 psi.
 - 2. Maximum Water-Cement Ratio at Point of Placement: 0.55.
 - 3. Slump Limit at Point of Placement: 3-inches. Slump limit for concrete containing high-range water-reducing admixture: Not more than 8-inches after adding admixture to site-verified 2 to 3-inch slump concrete.
 - 4. Air Content: 2 1/2 to 4 1/2 percent.
- C. Synthetic Fiber Reinforcement: 1 lb. per cu. yd of mix added only at batch plant.
- D. Adjustment to Concrete Mixes: Mix design adjustments may be requested by Contractor when characteristics of materials, project conditions, weather, test results, or other circumstances warrant.

2.08 CONCRETE MIXING

- A. Ready-Mixed Concrete: Comply with requirements of ASTM C 94.
 - 1. Reduce mixing and delivery time when air temperature is between 85 degrees F and 90 degrees F and reduce mixing and delivery time from 1-1/2 hours to 75 minutes.
 - 2. Reduce mixing and delivery time to 60 minutes when air temperature is above 90 degrees F.

PART 3 - EXECUTION

3.01 SURFACE PREPARATION

- A. Prepare subgrade per geotechnical report.
- B. Verify that paving subgrade extends 1-foot beyond the outside edge of paving or curbing and has a positive outfall for trapped water.
- C. Proof-roll prepared subbase surface to check for unstable areas and verify need for additional compaction. Do not begin paving work until such conditions have been corrected and are ready to receive paving.
- D. Remove loose material from compacted subbase surface immediately before placing concrete.
- E. Provide necessary chairs or supports, and maintain position of reinforcing bars.
- F. Wet a minimum of 2 inches of sand subgrade prior to placing concrete.
- G. Place 1” minimum of washed concrete sand over prepared subgrade.

3.02 EDGE FORMS AND SCREED CONSTRUCTION

- A. Set, brace, and secure edge forms, bulkheads, and intermediate screed guides for paving to required lines, grades, and elevations.
- B. Install forms to allow continuous progress of Work and so that forms can remain in place at least 24 hours after placing concrete.
- C. Check completed formwork and screeds for grade and alignment to following tolerances:
 - 1. Top of Forms: Not more than 1/8-inch in 10-feet.
 - 2. Vertical Face on Longitudinal Axis: Not more than 1/4-inch in 10-feet.
- D. Clean forms after each use and coat with form release agent to ensure separation from concrete.

3.03 PLACING REINFORCEMENT

- A. Comply with Concrete Reinforcing Steel Institute’s recommended practice for “Placing Reinforcing Bars” for placing and supporting reinforcement.

- B. Clean reinforcement of loose rust and mill scale, earth, ice, and other bond-reducing materials.
- C. Arrange, space, and securely tie bars and bar supports to hold reinforcement in position during concrete placement. Maintain minimum cover over reinforcement.
- D. Install fabricated bar mats in lengths as long as practicable. Handle units to keep them flat and free of distortions. Straighten bends, kinks, and other irregularities or replace units as required before placement. Set mats for a minimum 2-inch overlap to adjacent mats.

3.04 CONCRETE PLACEMENT

- A. Inspection: Before placing concrete, inspect and complete formwork installation, reinforcing steel, and items to be embedded or cast in. Notify other trades to facilitate installation of their work.
- B. Moisten subbase to provide a uniform dampened condition at the time concrete is placed. Do not place concrete around manholes and other utility structures until they are at the required finish elevation and alignment.
- C. Comply with requirements and with ACI 304R for measuring, mixing, transporting, and placing concrete.
- D. Deposit and spread concrete in a continuous operation between construction joints. Do not push, drag, or use vibrators to move concrete into place.
- E. Consolidate concrete by mechanical vibrating equipment supplemented by hand-spading, rodding, or tamping. Use equipment and procedures to consolidate concrete complying with ACI 309 R.
 - 1. Consolidate concrete along face of forms with an internal vibrator. Keep vibrator away from joint assemblies, reinforcement, or side forms. Use only square-faced shovels for hand-spreading and consolidation. Prevent dislocating reinforcing and dowels.
- F. Screed paved surfaces with a straightedge and strike off. Use bull floats or darbies to form a smooth surface plane before excess moisture or bleed water appears on surface. Do not further disturb concrete surfaces prior to beginning finishing operations.
- G. Hot-Weather Placement: Place concrete complying with ACI 305R when hot weather conditions exist.
 - 1. Cool ingredients before mixing to maintain concrete temperature at time of placement 90 degrees F and below. Mixing water may be chilled or chopped ice may be used to control temperature, provided water equivalent of ice is calculated to total amount of mixing water.

2. Cover reinforcing steel with water-soaked burlap if it becomes too hot, so that steel temperature will not exceed the ambient air temperature immediately before embedding in concrete.
 3. Fog-spray forms, reinforcing steel, and subgrade just before placing concrete. Keep subgrade moisture uniform without standing water, or soft or dry areas.
- H. Cold Weather Placement: Adhere to ACI 306R - Cold Weather Concreting for installing concrete paving during cold weather.

3.05 CONCRETE FINISHING

- A. General: Wetting of concrete surfaces during screeding, initial floating, or finishing operations is prohibited.
- B. Float Finish: Begin the second floating operation when bleed-water sheen has disappeared and the concrete surface has stiffened sufficiently to permit operations. Float surface with power-driven floats, or by hand floating if area is small or inaccessible to power units. Finish surfaces to true planes. Cut down high spots, and fill low spots. Refloat surface immediately to uniform granular texture.
1. Medium-to-Fine-Textured Broom Finish: Draw a soft bristle broom across float-finished concrete surface perpendicular to line of traffic to provide a uniform, fine-line texture.
 2. Medium-to-Coarse-Textured Broom Finish: Provide a coarse finish by striating float-finished concrete surface 1/16 to 1/8 inch (1.6 to 3 mm) deep with a stiff-bristled broom, perpendicular to line of traffic.
- C. Concrete Retarder Application:
1. Grace Construction Products (888) 336-9303.
 2. Provide for containment of retarder during finishing procedures so as to protect adjacent improvements. Repair damage to adjacent improvements at no cost to Owner.
 3. Perform retardant finish in two separate stages:
 - a. First Stage: Primary wash to take place within 3 days after concrete pour. Apply retarder with a low-pressure sprayer at a rate of 250-350 sq.ft./ gal. per manufacturers' requirements.
 - b. Second stage: Wash with water rinse/light broom or pressure wash with power equipment within 6 – 24 hours after the retarder is applied. Retarder removal intervals depend on strength of mix, exposed aggregate size and desired washing techniques. Earlier washing for light etch finishes may be necessary.
- D. Exposed Aggregate Finish:
1. Water-wash;
 - a. Surface layer of mortar is removed with a light, controlled spray of water and scrubbed with a stiff brush to expose aggregate fines.

2. Retardant;
 - b. Surface layer of mortar is removed by applying an approved retardant to the finished concrete, to effect the setting of the top mortar paste, and then removing it by water-wash and/or brushing to expose aggregate to the desired finish.
- E. Sand Blast Finish:
1. Blasting Operations and Requirements:
 - a. Apply sandblasted finish to exposed surfaces where indicated.
 - b. Perform sand blasting at least 72 hours after placement of concrete.
 2. Coordinate with formwork construction, concrete placement schedule, and formwork removal to ensure that surfaces to be blast finished are blasted at the same age for uniform results.
 3. Determine type of nozzle, nozzle pressure, and blasting techniques required to match the SCRRA's control samples.
 4. Abrasive-blast corners and edges of patterns carefully, using back-up boards, to maintain uniform corner or edge line.
 5. Depths of Cut: Use an abrasive grit of the proper type and gradation to expose aggregate and surrounding matrix surface, to match the SCRRA's control samples as follows:
 - a. Brush Sand Blast Finish: Remove cement matrix to expose face of fine aggregate, no reveal (slab accents - must maintain non-slip coefficient for walking surfaces).
 - b. Light Sand Blast Finish: Expose fine aggregate with occasional exposure of coarse aggregate; max 1/16-inch reveal (wall accents).
 - c. Medium Sand Blast Finish: Generally expose coarse aggregate; 3/16-inch to 1/4-inch reveal.
 6. Surface Continuity: Perform sand blast finishing in as continuous an operation as possible, utilizing the same work crew to maintain continuity of finish on each surface or area of work. Maintain patterns of variances in depths of cuts as indicated.
 7. Construction Joints: Use technique acceptable to the SCRRA to achieve uniform treatment of construction joints.
 8. Protection and Repair:
 - a. Protect adjacent materials and finishes from dust, dirt, and other surface or physical damage during abrasive-blast finishing operations. Provide protection as required and remove from site at completion of the work.
 - b. Repair or replace other work damaged by finishing operations.
 9. Clean-Up: Maintain control of concrete chips, dust, and debris in each work area. Clean up and remove such material at the completion of each day of operation. Prevent migration of airborne materials by use of tarpaulins, wind breaks, and similar containing devices.
- G. Finish surface texture to match texture and pattern as indicated in Owner mock-up.

3.06 JOINTING

- A. Construct contraction, construction, and isolation joints to match irregular edge pattern of stamping tools with faces perpendicular to surface plane of concrete.

- B. Contraction Joints: Provide contraction joints as indicated on Drawings (or to not exceed 10-feet in either direction), to minimize random surface cracking and as indicated on approved Paving Jointing and Pour Sequence Plan provided by Contractor. Match irregular pattern of stamping tools, sectioning concrete into areas as indicated on Drawings. Construct contraction joints for a depth equal to at least one fourth of concrete thickness, as follows:
 - 1. Hand-tooled Joints: Form contraction joints in fresh concrete by grooving and finishing each joint edge with a radiused jointer tool.
 - 2. Machine-Sawn Joints: Machine-sawn joints are not permitted unless otherwise indicated on Drawings. Provide saw cut joints as soon as concrete has sufficient strength to support sawing equipment.
 - 3. Do not exceed 1/4-inch in joint width.

- C. Doweled Construction Joints: Construct doweled construction joints at end termination's of paving where paving operations are stopped for more than 1/2 hour, unless paving terminates at an isolation joint and at all edges of different paving types. Locations of doweled construction joints to adhere as closely as possible to Contractor's Paving Jointing and Pour Sequence Plan.
 - 1. Steel Dowels:
 - a. Provide smooth steel dowels across construction joints to reduce differential movement across the joint. Utilize smooth steel dowels based upon the following:
 - 1) 6-inch Thick Pavement:
 - (i) Diameter: 3/4-inch.
 - (ii) Length: 24-inches.
 - (iii) On-center Spacing: 18-inches.
 - 2) 4-inch Thick Pavement:
 - (i) Diameter: 1/2-inch.
 - (ii) Length: 24-inches.
 - (iii) On-center Spacing: 18-inches.
 - b. To assist in correct alignment of steel dowels along construction joints use plastic dowel sleeves:
 - 1) Insure that wood edge forms are true to line and grade prior to installing plastic dowel sleeves.
 - 2) Install plastic dowel sleeves on wood forms at the specified on-center dowel spacing, centered between top and bottom of wood form.
 - 3) Contact plastic dowel sleeve manufacturer for complete installation requirement.
 - 2. Do not continue tie-reinforcement through sides of strip paving.

3. Use a bond breaking agent on cured concrete edges that will be joined with fresh concrete.
 4. Immediately before new concrete is placed, wet construction joint and remove standing water.
 5. Tool edges of construction joints to match decorative field jointing.
- D. Isolation Joints: Provide isolation joints to permit horizontal and vertical movement between slab and fixed vertical edges such as building walls, steps, columns, and other vertical restraints. Locations of isolation joints to adhere as closely as possible to Contractor's Paving Jointing and Pour Sequence Plan.
1. Provide 1/4-inch thick pre-molded asphalt impregnated fiber board, backup, and caulking along edges of isolation joints.
 2. Extend pre-molded asphalt impregnated fiber board to full-width and depth of joint, not less than 1/4-inch or more than 1-inch below finished surface of slab.
 3. Furnish pre-molded asphalt impregnated fiber board in one-piece lengths for full width being placed. Where more than one length is required, lace or clip pre-molded asphalt impregnated fiber board sections together.
 4. Protect top edge of pre-molded asphalt impregnated fiber board during concrete placement with a metal, plastic, or other temporary cap. Remove protective cap after concrete has been placed on both sides of joint to facilitate installation of caulking backup.
 5. Joints for Non-Stamped Special Flooring: Tool to profile and dimensions detailed; fill with specified grout, tool grout to a concave profile.

3.07 CONCRETE PROTECTION AND CURING

- A. Protect freshly placed concrete from premature drying and excessive cold or hot temperatures. Comply with the recommendations of ACI 305R for hot weather and ACI 306R for cold weather protection during curing.
- B. Evaporation Control: In hot, dry, and windy weather, protect concrete from rapid moisture loss before and during finishing operations with an evaporation-control material. Apply according to manufacturer's instructions after screeding and bull floating, but before floating.
- C. Begin curing after finishing concrete but not before free water has disappeared from concrete surface.
- D. Curing Methods: Cure concrete by moisture curing, moisture retaining cover curing, curing compound, or a combination of following:
1. Moisture Curing: Keep surfaces continuously moist for not less than 7 days with following materials:
 - a. Water.
 - b. Continuous water fog spray.
 - c. Absorptive cover, water saturated, kept continuously wet.

2. Cover concrete surfaces and edges with a 12-inch lap over adjacent absorptive covers.
3. Curing Compound:
 - a. Apply uniformly in continuous operation by power spray or roller according to manufacturer's directions.
 - b. Recoat areas subjected to heavy rainfall within 3 hours after initial application.
 - c. Maintain continuity of coating and repair damage during curing period.

3.08 REPAIRS AND PROTECTION

- A. Remove and replace concrete paving that is broken, damaged, defective, or does not meet the requirements of this Section.
- B. Protect concrete from damage until Final Payment. Exclude traffic from paving for at least 14 days after placement. When construction traffic is permitted, maintain paving as clean as possible by removing surface stains and spillage of materials as they occur.
- C. Maintain concrete paving free of stains, discoloration, dirt, and other foreign material until Final Payment.

3.09 CLEANUP

- A. At completion of Work, remove concrete stains from adjacent work, including but not limited to dissimilar paving types, walls, columns, railing posts, light fixtures, plant materials, to satisfaction of Owner.

3.10 PAVING FINISH SCHEDULE

- A. Provide paving finishes, as indicated on Paving Schedule on Drawings.

PART 4 MEASUREMENT AND PAYMENT

- 1.01 General: Measurement and payment for portland cement concrete paving will be either by the lump-sum method or by the unit-price method as determined by the listing of the bid item for portland cement concrete paving indicated in the Bid Schedule of the Bid Form.
- 1.02 Lump sum: If the Bid Schedule indicates a lump sum for portland cement concrete paving, the lump-sum method of measurement and payment will be in accordance with Section 01 29 73.
- 1.03 Unit Price: If the Bid Schedule indicates a unit price for portland cement concrete paving, the unit-price method of measurement and payment will be as follows:

- A. Measurement:
1. Portland cement concrete pavement will be measured for payment by the square yard for each specified class of concrete and thickness.
 2. Reinforcing steel, dowels, and tie bars will be measured separately for payment as specified in Section 03 20 00 - Concrete Reinforcing.
 3. Subgrade paper, transverse expansion joints, weakened-plane joints, and joints sawed within 5 feet of volunteer cracks, longitudinal and transverse construction joints, and longitudinal weakened-plane joints will not be measured separately for payment, and all costs in connection therewith will be considered included in the measurement of portland cement concrete pavement.
- B. Payment: Portland cement concrete paving will be paid for at the indicated Contract unit prices for the computed quantities as determined by the measurement Method specified in Article 1.03.C.1.

**END OF SECTION – 32 1313
SOUTH LA PATERA LN.**

CURBS, GUTTERS, SIDEWALKS AND DRIVES

32 16 00

PART 1 – GENERAL

1.01 SUMMARY

- A. This work includes furnishing materials, labor, transportation, services, and equipment necessary to furnish and install Minor Concrete as indicated on drawings and as specified in these Technical Specifications.
- B. Minor concrete shall include sidewalks, driveways, gutters, curbs, cross-gutters, spandrels, and curb ramps and must conform to Caltrans Standard Specification Section 73 – Concrete Curbs and Sidewalks.

1.02 RELATED SECTIONS

- A. 32 13 13 - Portland Cement Concrete Paving (Pedestrian)
- B. 31 23 00 – Earthwork
- C. 32 11 16 – Aggregate Base
- D. 32 12 16 – Asphalt Paving
- C. Caltrans Standard Specification Division VIII – Miscellaneous Construction, Section 73 – Concrete Curbs and Sidewalks

PART 2 – CALTRANS STANDARD SPECIAL PROVISIONS (SSPs)

- A. None.

PART 3 – PROJECT SPECIFIC PROVISIONS

3.02 SIDEWALKS

- A. Where indicated sidewalks shall receive scoring in accordance with the dimensions shown on the plans.

3.03 CURB RAMPS

- A. All curb ramps shall be constructed with a slope of no greater than 8.33 percent (1:12) and no less than 5% (1:20), and include the specified detectable warning surfaces as shown on the Plans and concrete aprons where shown on the Plans. Transition from bottom of ramp to gutter or apron shall be smooth with no abrupt change resulting in a flush condition between surfaces. No scoring of concrete shall be applied to top of ramp. Curb ramp slopes shall be checked using a properly calibrated digital level.

Curb ramps that do not meet the slope criteria shall be removed and reinstalled at no cost to the Owner. Any deviations from the Caltrans Standard Plans, the City Standards, these Technical Specifications, or the Plans will require approval by the Engineer.

- B. Curb ramps shall be both Caltrans Standard, City standard and modified City standard as indicated on the Plans.
- C. Concrete shall have a broom finish.

3.04 CONSTRUCTION CONTACT JOINTS

- A. A transverse (contact) construction joint shall be constructed at the end of each day's work where concrete work is to continue or where concrete placement is interrupted for more than 30 minutes, to coincide with the next weakened plane joint location.
- B. If sufficient concrete has not been mixed to form a slab to match the next weakened plane joint, when an interruption occurs, the excess concrete shall be removed and disposed of back to the last preceding joint. The cost of removing and disposing of any excess concrete shall be at the Contractor's expense. Any excess material shall become the property of the Contractor and shall be properly disposed of.
- C. A metal or wooden bulkhead (header) shall be used to form the joint. The bulkhead shall be designed to accommodate the installation of dowel bars.

PART 4 – MEASUREMENT AND PAYMENT

- A. Measurement and payment must conform to Caltrans Standard Specification Section 73 – Concrete Curbs and Sidewalks.

END SECTION - 32 16 00

PAVEMENT MARKINGS

32 17 23

PART 1 – GENERAL

1.1 SUMMARY

- A. The following items are covered in this Section:
1. For the purposes of these Specifications, traffic striping shall be defined as longitudinal centerlines and lane lines that separate traffic lanes in the same or opposing direction of travel, and longitudinal edge lines that mark the edge of the traveled way or the edge of the lanes. Curb markings shall be defined as colored markings on the curb that denote parking restrictions. Pavement markings shall be defined as transverse markings which include, but are not limited to, word and symbol markings, limit lines (stop lines), crosswalks, shoulder markings, parking stall markings, and railroad crossing markings.
 2. Pavement delineation (striping), markings and markers in the public right of way along Hollister Avenue, South La Patera Lane and Lindmar Drive must conform to Caltrans Standard Specification Division IX – Traffic Control Devices, Section 84 – Markings.

1.2 REFERENCE SPECIFICATIONS, CODES, AND STANDARDS

- A. California Manual on Uniform Traffic Control Devices (CA-MUTCD)
- B. Caltrans Standard Specification Division IX – Traffic Control Devices, Section 84 – Markings

1.3 CONTRACTOR SUBMITTALS

- A. CONTRACTOR shall submit to the City, for review, all materials specified herein in accordance with Section 013300 - Contractor Submittals and Caltrans Standard Specification Division IX – Traffic Control Devices, Section 84 – Markings.
- B. Product Data: Submit paint formulation for each type of paint or thermoplastic.

PART 2 – CALTRANS STANDARD SPECIAL PROVISIONS (SSPs)

Pavement striping including pavement delineation, marking and markers in the public right of way including Hollister Avenue, South La Patera Lane and Lindmar Drive must conform to Caltrans Standard Specification Section 84 – Markings.

All pavement delineation and marking must be thermoplastic, except the green pavement marking may be painted (2 coats).

Add to section 84-2.01C:

Submit surface frictional properties test results for each lot or batch of preformed thermoplastic.

Submit the manufacturer’s material data for the surface preparation adhesive before it is applied to precondition the pavement surface.

Add to section 84-2.01D(2):

Within 30 days of application, test the skid resistance of the preformed thermoplastic pavement markings under ASTM E303.

Replace section 84-2.02H:

4-2.02H Preformed Thermoplastic Pavement Markings

Preformed thermoplastic pavement markings must:

1. Conform to AASHTO designation M249, except it must be supplied in a preform state and may be a color other than white or yellow
2. Be on the Authorized Material List for signing and delineation materials
3. Be free from lead, chromium, arsenic, cadmium, barium, and other toxic metals
4. Have glass beads embedded to depth of 60 percent of their diameters
5. Have resealing characteristics and be capable of fusing with itself
6. Be resistant to sunlight, water, salt, or adverse weather conditions and must be impervious to motor fuels, lubricants, hydraulic fluids, oil, and gasoline

The application of preformed thermoplastic pavement markings must not damage the underlying pavement.

Preformed thermoplastic pavement markings must be sufficiently flexible and cohesive at temperatures above 50 degree F and must not fracture prior to application.

Preformed thermoplastic pavement markings must have a minimum thickness of 90 mils.

Preformed thermoplastic pavement markings must affix to all types of pavements and must not lift, shift, smear, spread, flow, or tear by traffic.

Add to section 84-2.03B(1):

The retroreflectivity of applied preformed thermoplastic pavement markings must comply with the requirements shown in the following table:

Preformed Thermoplastic Retroreflectivity Requirements

Traffic stripe material	White (min, mcd ^{m-2} lx ⁻¹)	Yellow (min, mcd ^{m-2} lx ⁻¹)	Other colors (min, mcd ^{m-2} lx ⁻¹)
Preformed thermoplastic	250	125	125

The applied preformed thermoplastic pavement marking must have a skid resistance value of 60.

Add to section 84-2.03B(2):

84-2.03B(2)(e) Preformed Thermoplastic Pavement Markings

After cleaning the surfaces, apply sealer or primer as recommended by the manufacturer.

Apply the preformed thermoplastic under the manufacturer's instructions. You may use a surface preparation adhesive to precondition the pavement surface.

Preformed thermoplastic pavement markings must be ready for traffic immediately after application.

Add to section 84-2.03B(7):

Contrast for preformed thermoplastic pavement markings consists of a black border with a width from 2 to 4 inches. The borders must be nonreflective film bonded to the outer edge of the marking.

Replace the 2nd paragraph of section 84-2.03B(2)(b) with:

Apply extruded thermoplastic for traffic stripes in a single pass at a rate of at least 0.405 lb/ft of 6-inch-wide solid stripe. The applied thermoplastic must be at least 0.080 inch thick.

PART 3 – MEASUREMENT AND PAYMENT

- A. Measurement and payment must conform to Caltrans Standard Specification Section 84 – Markings.

END OF SECTION - 32 17 23

SECTION 32 90 00

PLANTING

PART 1 – GENERAL

1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, shall apply to all work in this Section with the same force and effect as though repeated in full herein.

1.02 SUMMARY

- A. Furnish all materials, labor, transportation, services, and equipment necessary to install landscape planting as shown on the Drawings and as specified herein.
- B. Work included in this Section:
 - 1. Fine grading.
 - 2. Soil preparation.
 - 3. Pre-plant weed control.
 - 4. Tree, shrub and ground cover planting.
 - 5. Tree staking and guying.
 - 7. Mulching.
 - 9. Concrete mowstrip installation.
 - 10. Hydroseeding
 - 11. Clean-up.
- C. Work related in other Sections:
 - 1. Section 32 01 90 – Operations and Maintenance of Planting

1.03 REQUIREMENTS OF REGULATORY AGENCIES

- A. All Federal, State, and local laws and regulations governing this work are hereby incorporated into and made part of this Section. When this Section calls for certain materials, workmanship or a level of construction that exceeds the level of Federal, State, or local requirements, the provisions of this Section shall take precedence.

1.04 REFERENCE STANDARDS

- A. All plant material shall be true to botanical and common name as indicated in "An Annotated Checklist of Woody Ornamental Plants of California, Oregon and Washington", (Number 4091)" published by the University of California School of Agriculture - 1979.

- B. "American Standard for Nursery Stock" edition 1985 by The American National Standards Institute for plant materials.
- C. Hortus Third", 1976; Cornell University for plant nomenclature.
- D. All plant material shall conform to the California State Department of Agriculture's regulation for nursery inspections, rules and ratings.

1.05 QUALITY CONTROL

- A. Manufacturer's Directions - manufacturer's directions and drawings shall be followed in all cases where the manufacturers of articles used in this Specification furnish directions covering points not shown in the Drawings and Specifications.
- B. Permits, Fees, Bonds and Inspections - the Contractor shall pay for any and all permits, fees, bonds and inspections necessary to perform and complete his portion of the Work.
- C. Plant Source Quality - submit written documentation to the Owner's Authorized Representative within 25 days of Contract award that the plant material listed on the Drawings is available. Any substitutions required due to unavailability must be requested in writing prior to confirmation of ordering.
- D. Upon execution of the order, the Owner's Authorized Representative has the option of either inspecting the plant material at the source of growth, requesting representative color photos, or inspecting the material as it is being delivered to the site for conformity to the Drawings and Specifications. Such approvals shall not impair the right of additional inspections during further progress of the Work.
- E. Any tagging of plant material by the Owner's Authorized Representative does not constitute his approval of the plant materials' health and vigor. The health and vigor of the plant material is the sole responsibility of the Contractor.
- F. Submit written request to the Owner's Authorized Representative for inspection of the specified plant material, either at the place of growth or by color photographs. Requests for inspection shall state the place of growth and the quantity and variety of plant material.
- G. The Owner's Authorized Representative reserves the right to refuse inspection if in his judgment, a sufficient quantity of plant material at that time is not available for inspection.

H. Topsoil Inspection

1. Within 25 days of contract award, furnish source of topsoil to the Owner's Authorized Representative for purpose of soil inspection.
2. Take representative soil samples from areas identified in the Drawings.
3. Soil samples shall be tested for pH, alkalinity, total soluble salts, porosity, sodium content, organic matter and soil preparation recommendations.
 - i. Soil Fertility: Half-saturation percent, pH, salinity, nitrate, ammonium, phosphate, potassium, calcium, magnesium.
 - ii. Agricultural Suitability: pH, salinity, boron, Sodium Absorption Ratio (SAR) using saturation paste extract.
 - iii. Particle Size/Appraisal: pH, salinity, organic percent, USDA Particle size.
 - iv. Germination (bio-assay) test.
 - v. Tendency towards compaction.

I. Within 25 days of contract award, furnish source of topsoil to the Owner's Authorized Representative for purpose of soil inspection.

J. Take representative soil samples from areas identified in the Drawings.

K. The Soil Analysis Report shall include a statement that the laboratory has reviewed the planting plan and the planting specifications, and that its recommendations respond to the specific needs of the project.

L. Certificates: certify compliance with accepted soil mixes and amendments, including Rates of applications.

1.06 QUALIFICATIONS

A. The applicator of all weed control materials shall be licensed by the State of California as a Pest Control Operator and a Pest Control Advisor in addition to any subcontractor licenses that are required.

B. Landscape Contractor shall have a minimum 5-years experience installing plants for similar project types.

1.07 SUBMITTALS

A. The Contractor shall submit no later than 30 days after the award of Contract (2) bound booklets containing the following landscape information:

1. List of all proposed landscape materials indicated by description, manufacturer and model number. Include catalog cuts of all items.
 2. List of all trees indicated by botanical name, common name, quantity, size, nursery and location and any specific remarks, i.e. "unable to locate", "photo submitted", etc. The tree list is to be accompanied with color photographs of each tree type and size with specifications, i.e. height, spread and caliper. Include a person in each photograph for scale purposes.
 3. List of all shrubs and ground covers indicated by botanical name, common name, size, nursery and location and specific remarks, i.e. "unable to locate", "photo submitted", etc.
 4. Soil amendment receipts containing analytical data and physical samples of all specified amendments.
 5. Receipts from the soil supplier of all soil mixes specified in this section.
- B. The Contractor shall submit no later than 30 days after the award of Contract the following physical samples sent to the Owner's Authorized Representative in plastic bags:
1. Shredded bark mulch.
 2. Certificates
 3. Compliance with State of California and federal quarantine restrictions.
- C. Weed, Insects & Pest Control
1. Prior to the installation of any weed control materials, the Pest Control Advisor shall submit to the Owner's Authorized Representative, a list of the weed control materials and quantities per acre intended for use in controlling the weed types prevalent and expected on the site.
 2. The Pest Control Advisor shall furnish data to demonstrate the compatibility of the weed control materials and methods with the intended planting and seed varieties.
 3. Submit to Owner's Authorized Representative proof of required governmental permits for the use of pesticides, insecticide and herbicides.

1.08 SUBSTITUTIONS

- A. Substitutions shall be in accordance with "General Provisions".
- B. Specific reference to manufacturer's names and products specified in this Specification are used as standards of quality, this implies no right to the Contractor to substitute other materials without prior written approval by the Owner's Authorized Representative.
- C. Any materials installed without written approval by the Owner's Authorized Representative may be rejected.
- D. If an approval is granted for a substitution, adjustment in the Contract amount will be made in accordance with the Contract Conditions.

1.09 SAMPLES, TESTS AND MOCK-UPS

- A. The Owner’s Authorized Representative reserves the right to take and analyze selected samples of plant material for conformity to this Specification at any time. Rejected plant material shall be removed from the site and be replaced by the Contractor at no cost to the Owner.

1.10 PROJECT CONDITIONS

- A. Perform planting operations only when weather and soil conditions are suitable in accordance with locally accepted practice.

1.11 PRODUCT DELIVERY, STORAGE AND HANDLING

- A. Delivery
 1. Deliver all plant material with legible and durable identification labels.
 2. Deliver fertilizer to the site in original, unopened containers bearing the manufacturer's name, guaranteed chemical analysis, and its conformance to California State Law.
 3. Notify the Owner’s Authorized Representative within seven (7) days of the delivery of plant material to the site. Indicate the quantity and type of plant material in each delivery.
- B. Storage
 1. Store plant materials in the shade and protect from the weather.
 2. Maintain and protect plant material not planted within four (4) hours of delivery.
- C. Protection
 1. Protect plant material during delivery and to the site and after, in order to prevent damage to the root ball or desiccation of leaves.
- D. Handling
 1. Take extreme care in the loading and unloading of plant material. Do not pick up container plants by the stems or trunks.
 2. Any plant material that has been damaged due to mishandling shall be removed and replaced with new material.

1.12 REJECTION OF PLANT MATERIAL

- A. All plant material not conforming to the requirements herein, shall be considered defective. Such plants, whether in place or not, shall be marked as rejected and immediately removed from the site and replaced with new material at the full expense of the Contractor.

Replacement plant material shall be of the same size, specie and condition as that indicated on the Drawings.

1.13 PROTECTION OF THE SITE

- A. Protect previously installed work and materials which may be affected by work of this Section. Provide safeguards and exercise caution against injury or defacement of existing site improvements.
- B. The Contractor shall be responsible for any damage resulting from his landscape planting operations. Repair damage and return the area to the previous condition at no additional cost to the Owner.

1.14 COORDINATION

- A. The Contractor shall notify the General Contractor and all other trades related to the installation of his work, so as to allow sufficient time for those contractors' to perform their portion of the work.
- B. Determine the locations of underground utilities and perform work in a manner which will avoid damage to the utilities.

1.15 GUARANTEE

- A. The manufacturer's warranty shall not relieve the Contractor of his own liability under the guarantee. Such warranties shall only supplement the guarantee.
- B. All plant material installed under this Contract shall be guaranteed against poor, inadequate and inferior quality and installation for a period of 1 year from the date of Final Acceptance. Any plant material not meeting the satisfaction of the Owner's Authorized Representative shall immediately be removed and replaced at no cost to the Owner. Replaced plant material will also be guaranteed for a period of 1 year upon installation.
- C. Replace without cost to the Owner and as soon as weather permits, all dead plants and all plants not found in a vigorous, thriving condition, as determined by the Owner's Authorized Representative during and at the end of the plant warranty period. Replacement of plants shall closely match adjacent specimens of the same specie and shall be subject to all requirements of this section.
- D. Repair damage to adjacent plant material caused by the Contractor's work at no cost to the Owner. All repairs shall be made with materials, varieties, sizes "in kind" with adjacent existing materials.

E. **Guarantee for Planting**

We hereby guarantee that the planting we have furnished and installed is free from defects in materials and workmanship and the work has been completed in accordance with the drawings and specifications, ordinary wear and tear and unusual abuse or neglect excepted. We agree to replace plants 15 gallons and larger for one (1) year after acceptance due to plant's dying or partially dying, thereby damaging shape, size or symmetry. Including damages consequential to defects in materials and workmanship and repair or replacement, which develop during one (1) year after Final Acceptance of the work, at no additional cost to the Owner. We agree to make such repairs and replacements within thirty (30) days after receipt of written notice. In the event of our failure to make such repairs and replacements within thirty (30) days of written notice, we authorize the Owner to proceed to have such repairs and replacements made at our expense and will pay all costs and charges upon demand:

Date of Final Acceptance:

Signed:

Company Name:

Address:

PART 2 - PRODUCTS

2.01 PRE-EMERGENT WEED CONTROL

- A. Pre-emergent weed control to be EPA registered and recommended by a licensed Pest Control Advisor. Ronstar-G, Treflan, Eptam, Vegitex, or approved equivalent.

2.02 PLANTING SOIL

- A. Reuse of Stockpiled On-Site Soil
Stockpiled on-site soil may be available from the Owner's stockpile for use if it complies with the criteria in 2.02B. Soils for miscellaneous landscape areas are classified as 2-inch minus.
- B. Topsoil shall be obtained from sources within the site of the work, or shall consist of imported topsoil obtained from sources outside the site, or from both such sources. Stripped site soil, if used as topsoil, shall meet the requirements specified herein.
- C. Topsoil shall consist of fertile, friable soil of loamy character, and shall contain organic matter in amounts normal to the region. Imported topsoil shall be obtained from well-drained arable and fertile agricultural land and shall be free from refuse, roots, heavy or stiff clay, stones larger than one inch in size, coarse sand, noxious seeds, sticks, brush, litter, grasses, weeds, toxic waste, and other deleterious substances detrimental to the health of plants, animals, and humans. Imported topsoil

shall be capable of sustaining healthy plant life.

- D. Topsoil shall have no inherent tendency towards compaction due to texture or soil structure or both as indicated in the soils analysis.
- E. Soil Characteristics for Stockpiled Native Soil
1. Composition for 3/8-inch minus topsoil - fertile, friable, well-drained soil of uniform quality, free of materials larger than 3/8" in diameter such as sticks, rocks, concrete, oils, chemicals and other deleterious materials.
 2. Composition for 2-inch minus topsoil - fertile, friable, well-drained soil of uniform quality, free of materials larger than 2" in diameter such as sticks, rocks, concrete, oils, chemicals and other deleterious materials.
 3. Soil Analysis - If soil has not been tested within 30 days of the date of delivery to the project, obtain an agricultural suitability and chemical analysis of the proposed soil from a company as determined by the Owner's Authorized Representative. Cost of the testing will be paid for by the Contractor. The soil report is to include the following information:
 4. Elemental Analysis: Nitrate Nitrogen, Phosphorus, Potassium, Calcium, Magnesium, Sulfur, Sodium Zinc, Iron, Copper, Manganese, Boron and free Lime.
 5. Other: pH factor, % base saturation, electrical conductivity, mechanical analysis, % of organic content, cation exchange capacity (C.E.C.).
 6. Recommendations: Type and quantity of additives required to establish satisfactory pH factor and supply of nutrients to bring topsoil to a satisfactory level for planting.
 7. All stockpiled native soil to be used from 3/8-inch minus topsoil is to be amended at the levels listed in this Section as part of the base bid. Additional amendments, if requested by the Owner's Authorized Representative are not part of the contract and the Contractor will be compensated for this work on a Time and Materials basis. Rates for labor and equipment will be charged according to the Construction Contract.
- C. Imported Top Soil
1. In order to insure conformance with this Specification, soil samples shall be taken by the Contractor and submitted to a qualified soil testing laboratory for analysis prior to planting i.e., Wallace Laboratories, (310) 615-0116 or approved equivalent. The Owner's Authorized Representative shall monitor the Contractor's soil sampling.
 2. Use natural friable soil of the local region, free from lumps, toxic substances sticks, debris, vegetation or stones over 1-inch in diameter.
 3. Silt plus clay content shall not exceed 20% by weight with a minimum 95% passing the 2.0 millimeter sieve.
 4. Sodium absorption ratio (SAR) shall not exceed 6.

5. Electrical conductivity (ECe) of the saturated extract of this soil shall not exceed 3.0 millimeters per centimeter at 25 centigrade.
6. Boron content shall not exceed (1) part per billion as measured on the saturation extract.
7. Thoroughly blend the planter mix and amendments through a soil blender before placing the soil.

2.03 SOIL AMENDMENTS

- A. Peat Moss - natural product of sphagnum moss, reed, or sedge peat, taken from a fresh water site, free from lumps, woody material, stones and other foreign matter.
- B. Soil Sulfur - agricultural grade sulfur containing a minimum of 99% sulfur (expressed as elemental).
- C. Iron Oxide - 45% iron (expressed as metallic iron), derived from iron oxide with micronutrients.
- D. Calcium Carbonate - 95% lime as derived from oyster shells.
- E. Gypsum - agricultural grade product containing 98% minimum calcium sulfate.
- F. Iron Sulfate - 20% iron (expressed as metallic iron), derived from ferric and ferrous sulfate, 100% sulfur (expressed as elemental).
- G. Ground Limestone - agricultural limestone containing not less than 85% of total carbonates, ground to such fineness that 50% will pass a #1000 sieve and 90% will pass a #20 sieve.
- H. Dolomite Lime - agricultural grade mineral soil conditioner containing 35% minimum magnesium carbonate and 49% minimum carbonate, 100% passing the #65 sieve.
- I. Sulfate of Potash - agricultural grade product containing 50% to 53% of water soluble potash.
- J. Single Superphosphate - commercial grade product containing 20% to 25% available phosphoric acid.
- K. Ammonium Sulfate - commercial grade product containing approximately 21% ammonia.
- L. Ammonium Nitrate - commercial grade product containing approximately 34% ammonia nitrogen.

- M. Urea Formaldehyde - granular commercial product containing 38% nitrogen.
- N. IBDU (Iso Butldiene Diurea) - commercial grade product containing 31% nitrogen.
- O. Iron: Gro-Power Premium Green Iron - 45% Fe, non-staining.

2.04 FERTILIZERS

- A. General Purpose Soil Conditioner Fertilizer (5-3-1)
 - 1. Consisting of the following minimum percents by weight:
 - 5% Nitrogen
 - 3% Phosphoric Acid
 - 1% Potash
 - 50% Humus
 - 15% Humic Acids
 - 1% Soluble Metallic Iron
 - 2. Soil Conditioner Fertilizer shall be "Gro-Power Plus", as manufactured by Gro-Power (909) 393-3744 or approved equivalent.
 - 3. General Purpose Soil Conditioner Fertilizer with Soil Penetrant (5-3-1)
 - 4. Soil conditioning fertilizer for use in areas of clay, adobe soils or soils high in salt, sodium boron or pH consisting of the following minimum percents by weight:
 - 5% Nitrogen
 - 3% Phosphoric Acid
 - 1% Potash
 - 50% Humus
 - 15% Humic Acids
 - 4% Sulfur
 - 1% Soluble Metallic Iron
- B. Pre-Plant Fertilizer (16-20-0)
 - 1. Ammonium phosphate consisting of the following minimum percentages by weight:
 - 16% Nitrogen
 - 20% Phosphoric Acid
 - 0% Potash
 - 2. Pre-Plant Fertilizer shall be Best "16-20-0", as manufactured by J.R. Simplot Company (800) 992-6066, or approved equivalent.
- C. General Purpose Planting Fertilizer (12-12-12)
 - 1. Pelleted or granular form shall consist of the following minimum percents by weight:

- 12% Nitrogen
 - 12% Phosphoric Acid
 - 12% Potash
 - 2. General Purpose Planting Fertilizer shall be Best "Triple Twelve", as manufactured by J.R. Simplot Company (800) 992-6066, or approved equivalent.
- D. Controlled Release Fertilizer (12-8-8)
- 1. Consisting of the following minimum percents by weight:
 - 12% Nitrogen
 - 8% Phosphoric Acid
 - 8% Potash
 - 25% Humus
 - 5% Humic Acids
 - 2. Acceptable product - "Gro-Power Controlled Release", as manufactured by Gro-Power (909) 393-3744, or approved equivalent.
- E. Planting Tablets (20-10-5)
- 1. Shall be 7 gram, 24-month release, non-burning tablets containing the following percentages of nutrients by weight:
 - 20% Nitrogen
 - 10% Phosphoric Acid
 - 5% Potassium
 - 2.5% Humic acids
 - 2. Acceptable product - "Gro-Power Planting Tablets", as manufactured by Gro-Power (909) 393-3744, or approved equivalent.

2.05 PLANT MATERIAL

- A. General Plant Condition
- 1. Furnish nursery-grown trees and shrubs conforming to ANSI Z60.1, with healthy root systems developed by transplanting or root pruning. Provide well-shaped, fully-branched, healthy, vigorous stock free of disease, insects, eggs, larvae, and defects such as knots, sun scald, injuries, abrasions, or other objectionable disfigurements.
 - 2. Grade: Provide trees and shrubs of sizes and grades conforming to ANSI Z60.1 for type of trees and shrubs required. Trees and shrubs of a larger size may be used if acceptable to the City of Goleta, with a proportionate increase in size of roots or balls.
 - 3. Plant material shall be grown under climatic conditions similar to those in the locality of the project unless approved otherwise by the Owner's Authorized Representative.

4. Label at least 1 tree and 1 shrub of each variety and caliper with a securely attached, waterproof tag bearing legible designation of botanical and common name.
5. The use of plant material larger than that specified on the Drawings may be used, pending approval from the Owner's Authorized Representative, however, there will be no change in the Contract amount if the larger plant material is approved and used.

B. Trees and Shrubs

1. Tree and shrub trunks shall be sturdy and well hardened with vigorous and fibrous root systems which are not root-bound.
2. In the event of a disagreement as to the condition of the root system, the root conditions of the plants furnished by the Contractor will be determined by the removal of soil around the roots of not less than 10 plants or more than 2% of the total number of plants of each specie.
3. When container grown plants are supplied from several sources, the roots of not less than 10 plants of each species from each source will be inspected. In case the plants sampled are found to be defective, the Owner's Authorized Representative has the right to reject the entire lot represented by the defective sample. Any plant material rendered unsuitable for use because of this inspection will be considered as samples and will be provided at the full expense of the Contractor.

C. Nursery Grown and Collected Stock

1. Nursery grown and collected stock shall be grown under climatic conditions similar to that found in the locality of the site.

D. Container Grown Stock

1. Container grown stock shall be in a vigorous and healthy condition, not root bound or with the root system hardened off.

2.06 AUXILIARY ACCESSORIES

A. Tree Stakes and Guys

1. Wood stakes - 2" diameter by 10 feet Lodgepole Pine stake without splits or bowing. Refer to the Drawings for which trees receive wood stakes.
2. Guy and Tie Wire: ASTM A 641 (ASTM A 641M), Class 1, galvanized-steel wire, 2-strand, twisted, 0.106 inch (2.7 mm) in diameter.
3. Guy Cable: 5-strand, 3/16-inch (4.8-mm) diameter, galvanized-steel cable, with zinc-coated turn buckles, 3-inch- (75-mm-) long minimum, with two 3/8-inch (10- mm-) galvanized eyebolts.

4. Hose Chafing Guard: Reinforced rubber or plastic hose at least 1/2 inch (13 mm) in diameter, black, cut to lengths required to protect tree trunks from damage.
 5. Flags: Standard surveyor's plastic flagging tape, white, 6 inches (150 mm) long.
 6. Turnbuckles - 6" long, galvanized eye/hook type.
 7. Wire Clamps - 3/4" galvanized "U" clamps.
- B. Top Dressings
1. Organic Mulch: Organic mulch, free from deleterious materials and suitable as a top dressing of trees and shrubs, consisting of one of the following:
 - a. Type: Ground or shredded bark.
 - b. Type: Wood and bark chips.
 2. Fiber Mulch: Biodegradable dyed-wood cellulose-fiber mulch, nontoxic, free of plant growth- or germination-inhibitors, with maximum moisture content of 15 percent and a pH range of 4.5 to 6.5.
- C. Erosion Control Materials
1. Blankets: Biodegradable wood excelsior, straw, or coconut-fiber mat enclosed in a photodegradable plastic mesh. Include manufacturer's recommended steel wire staples, 6 inches (150 mm) long.
 2. Staples - 11-gauge, 6" x 1" looped wire.
 3. Fiber Mesh: Biodegradable twisted jute or spun-coir mesh, 0.92 lb per sq. yd. (0.5 kg per sq. m) minimum, with 50 to 65 percent open area. Include manufacturer's recommended steel wire staples, 6 inches (150 mm) long.
- D. Weed Barrier Fabric
1. Permeable weed barrier fabric "Typar" as manufactured by Reemay approved equivalent.
- E. Tree Root Barriers
1. Tree root barriers as supplied by Deep Root Corporation (Catalog #UB 24-2) or Root Solutions Root Guide Barrier by Root Solutions, Inc. (415)434-3072, or approved equivalent. Provide commercially available manufactured root barriers, consisting of polyvinyl chloride or polypropylene sheeting having ultraviolet inhibitors and a minimum thickness of 0.085 inch. Barriers shall be either factory preformed into the circular shape shown, or have an integrated joining system for instant assembly into the final shape. Glued joints will not be acceptable.

Root barrier sheeting shall have horizontal tabs to prevent root growth from lifting the barrier. These tabs shall be spaced vertically not less than 8 inches

on centers, and horizontally not less than 8 inches on centers. Depth of these tabs shall be not less than 3/8 inch at its widest point.

Root barrier sheeting shall have vertical fins running the full length on the inside face of the barrier at 90 degrees to the inside face, to direct root growth downwards. These fins shall be not less than 6 inches on centers, and its width shall be not less than 1/2 inch.

F. DECOMPOSED GRANITE

1. Decomposed granite shall be crushed granite rock screenings, graded from 1/4-inch particles to dust, with uniform tan or buff color. Decomposed granite shall conform with the following aggregate gradation:

<u>Sieve Size</u>	<u>% Passing</u>
No. 4	95-100
No. 30	30-50
No. 200	5-15

2. Binder/Stabilizer shall be a polymer based, water resistant (once cured), non-toxic, and clear in color. Compressive strength of the decomposed granite mixed with the binder/stabilizer shall result in a minimum 5,000 pounds stability per ASGTMD 1559, per manufacturer's data.

G. Concrete Header

1. Refer to construction details as specified on the drawings.

G. Wood Header

1. 2" x 4" Pressure – treated redwood.
2. Nails shall be hot dipped galvanized common nails.

PART 3 - EXECUTION

3.01 RENOVATION AND PREPARATION OF EXISTING SOIL

- A. Contractor shall prepare Horticultural soil samples taken in (6) selected locations for initial horticultural analysis and soil amendment recommendations. See drawings for locations.
- B. The contractor's Soil Scientist shall examine the site prior to preparing recommendations.
- C. Contractor shall perform soil renovation procedures to the soil as required by soils report.

3.02 CULTIVATION OF EXISTING SOIL

- A. In areas where topsoil will not be applied, rip or cultivate the existing soil that will be receiving planting to a depth of at least 10-inches immediately prior to applying soil amendments.
- B. In areas where topsoil will be applied the following procedures are to be followed:
- C. Verify that subgrades for installation of topsoil have been established under rough grading, subgrade depth plus specified depth of topsoil should equal finished grade. Do not spread topsoil prior to the Owner's Authorized Representative acceptance of all subgrade work.
- D. Rip or cultivate subgrade in all planting areas to a minimum depth of 10-inches immediately prior to spreading topsoil.
- E. Remove all rocks, stones, sticks and debris larger than 1-inch in diameter from the surface of the subgrade prior to applying topsoil.

3.03 SOIL SCARIFICATION

- A. Planting areas which become compacted in excess of 85% relative compaction due to construction activities, shall be thoroughly cross-ripped to a minimum depth of 9-inches to alleviate the condition, taking care to avoid existing subsurface utility lines, if present.

3.04 VERIFICATION OF EXISTING CONDITIONS

- A. Prior to the work in this Section, examine previously installed work from other trades and verify that such work is complete and as required, to the point where this installation may commence properly.

3.05 ROUGH GRADING CERTIFICATION

- A. Obtain the Owner's Authorized Representative's written certification that indicates that final rough grade has been set by previous contractors to plus or minus 0.10-foot prior to commencing fine grading operations.

3.06 FINE GRADING OPERATIONS

- A. Ensure that the top 2-inches of soil is free of stones, roots, stumps, wire, or other deleterious matter 1-inch in diameter and larger. Dispose of debris offsite.
- B. All planting areas to be fine graded to within 1-1/2-inches of paved areas and concrete mowstrips.
- C. Upon acceptance of rough grade by the Owner's Authorized Representative and prior to beginning planting operations, finish grade all planting areas, fill as needed and remove

surplus soil and float areas to a smooth, uniform grade to elevations as indicated on the Drawings. Obtain the Owner's Authorized Representative approval of the fine grading prior to commencing planting operations.

3.07 SURFACE DRAINAGE OF PLANTING AREAS

- A. The Contractor shall bear final responsibility for properly draining all planting areas. Any discrepancy in the Drawings or Specifications, obstructions on the site, or prior work done by another contractor, which the Contractor feels precludes establishing proper drainage, shall be brought to the immediate attention of the Owner's Authorized Representative for correction or relief of said responsibility. The Contractor is to insure proper drainage of all planting areas at a minimum of 2% slope.

3.08 SOIL PREPARATION

- A. After finish grades for all landscaped areas have been established and approved by the Owner's Authorized Representative perform the following operations:
- B. Cross-rip all area to a depth of 9-inches.
- C. Spread organic amendments uniformly on the surface of the soil and cultivate thoroughly into the top 4-6 inches in a minimum of two directions with a mechanical rototiller.
- D. The following soil amendments and fertilizers are to be used for bid purposes only. Specific amendment recommendations will be made after horticultural soil samples are taken and paid for by the Contractor and analyzed. Application rates per 1,000 square feet shall be as follows:
 - Nitrolized Fir bark - 6 cu. yds.
 - Planting fertilizer - 200 lbs. of Gro-Power Plus.
 - Agricultural gypsum - 100 lbs.
 - Soil sulfur - 20 lbs.
- E. After applying soil amendments and prior to planting, water with overhead spray so that a minimum of 1-3 inches of good quality water passes through the soil profile.

3.09 BACKFILL MIX FOR SHRUBS AND TREES

- A. The following backfill mix is for bid price basis only. Final backfill recommendations will be made only after rough and fine grading operations are completed and horticultural soil testing has been performed and paid for by the Contractor and approved by the Owner's Authorized Representative.
 - 7 parts by volume on-site soil.
 - 3 parts by volume nitrolized stabilized Fir bark.
 - 2 lbs. iron sulfate per cubic yard of mix.
 - 18 lbs. of Gro-Power Plus per cubic yard of mix (or approved equivalent).
 - Planting tablets - quantity based on size of plant.

- B. Thoroughly blend the backfill mix prior to placement.
- C. Do not apply iron sulfate over paved materials since severe staining is likely to occur.

3.10 PRE-PLANT WEED CONTROL

- A. Clear and remove existing weeds by mowing or grubbing to at least 1/4-inch below the soil surface.
- B. Fertilize areas to receive planting with urea 46-0-0 commercial fertilizer at the rate of 1/2-pound per 1,000 square feet.
- C. Water area thoroughly and continuously for a period of 3 consecutive weeks. Employ a specific watering duration and frequency program designed to germinate all residual weeds.
- D. After sufficient weed germination is present, apply a post-emergent contact weed killer according to the directions of the manufacturer.
- E. Allow for a sufficient period of time to ensure that the weeds are dead and the weed killer has dissipated before applying a second weed kill.
- F. Water planting areas thoroughly and continuously for a period of 3 weeks. Discontinue the watering process for 1 day prior to the second application of the herbicide. Reapply the spraying operation with a straight contact weed killer according to the pest control adviser's recommendations. Avoid any watering for a minimum of 4 days for effective weed kill.
- G. After the second weed kill, water planting areas thoroughly and continuously for 3 consecutive days to saturate upper layers of soil prior to commencing planting operations.

3.11 TREE PIT PERCOLATION TESTING

- A. Due to the potential of standing water in the tree pits, Contractor is to perform a tree pit percolation test (for trees larger than 15 gallon only) in each tree pit prior to planting the tree. Fill the tree pit to the top with water. If the water has not drained by more than 95% within 24 hours, do not plant the tree and bring this to the immediate attention of the Owner's Authorized Representative. The Contractor may be required to install a drainage sump in the existing plant pit. Substitute plant pits are the responsibility of the Contractor under the Base Bid. Drainage sumps are not part of the Base Bid and compensation will be awarded to the Contractor based on an itemized amount to be provided by the contractor in the Construction Agreement.
- B. Submit written results of each plant pit percolation test with locations, date and time of test to the Owner's Authorized Representative.

3.12 CONCRETE MOWSTRIP LAYOUT

- A. Concrete mowstrips shall be laid true to line and grade. Protect adjacent improvements and existing landscape from damage.
- B. Refer to construction details as specified on the drawings.

3.13 PLANTING OPERATIONS

- A. Planting Layout
 - 1. It is the Contractor's responsibility to verify with the Owner's Authorized Representative's site superintendent and local governing agencies the location and depth of all underground utilities. If any underground construction or utility lines are encountered in the excavation of planting holes, alternative planting locations may be selected by the Owner's Authorized Representative.
 - 2. Locations for all shrubs and trees shall be marked on the ground either by flagged grade stakes indicating plant type and size or the actual plants themselves for the Owner's Authorized Representative's review and approval prior to planting.
- B. General Planting Guidelines
 - 1. Plant only as many plants that can be planted and watered on that same day in a given planting area.
 - 2. Protect the planting area from excessive vehicle compaction.
 - 3. Face plant material with fullest growth into the prevailing wind and/or the primary direction of view.
 - 4. Center plant material in the planting hole.
 - 5. Set plant material plumb and hold rigidly in place until soil has been tamped firmly around the rootball.
 - 6. Planting pits shall have vertical sides and roughened surfaces. The size of the plant pit shall be twice the diameter and only as deep as the rootball itself.
- C. Container Removal
 - 1. Plant containers shall be opened and removed in such a manner that the soil surrounding the rootball shall not be broken.
 - 2. Do not injure the root ball while removing the container. After removing plant, superficially cut edge roots with a knife on three (3) sides.
- D. Tree Box Removal
 - 1. Remove the bottom of the box before planting.
 - 2. Remove the sides of the box without damaging the rootball after positioning the tree and partially backfilling the plant pit.
- E. Shrub and Tree Installation
 - 1. Apply backfill mix to the plant pit up to 1/2 the height of the rootball. Add water to the top of the remaining plant pit and let soak in before completing the remainder of backfilling.
- F. Placement of Plant Tablets

1. Prior to planting, place the required amount of planting tablets per plant size on top of each root ball while the plants are still in their containers so that the Owner's Authorized Representative can easily verify their existence and quantity.
 2. After obtaining approval by the Owner's Authorized Representative on plant tablet quantity and after water has completely drained from the plant pit, add plant tablets to the planting pits in the following quantities:
 - 1 gallon - 3 tablets
 - 5 gallon - 8 tablets
 - 15 gallon - 14 tablets
 - 24" box - 15 tablets
 - 36" box - 19 tablets
 - 48" box – 24 tablets
 3. Dig planting pit to the recommended depth.
 4. Backfill the plant pit to attain the proper level for the plant.
 5. Place the specified amount of plant tablets between the bottom of the rootball but not higher than 1/3 of the way up the rootball. Space the plant tablets equally around the perimeter of the rootball approximately 2" from the rootball.
 6. Finish backfilling of the planting pit by tamping the soil firmly around the rootball and watering thoroughly.
- G. Final Backfilling
1. Once the water has soaked in thoroughly, place the remaining backfill and tamp firmly.
 2. After final backfilling, construct an earthen basin around the base of each plant with backfill mix sufficient to hold water for the following plant sizes:
 - 1 gallon - 2-inches of water.
 - 5 gallon through 24" box - 3-inches of water.
 - 36" box and larger - 4-inches of water.
- H. Plant Settling
1. Any plant material that has settled deeper than the surrounding grade shall be raised to the correct level.
- I. Ground Cover Planting
1. Ground cover flats shall contain sufficient moisture to reduce soil separation when lifting out the plants.
 2. Plant ground covers in straight rows, evenly, triangular spaced, and at an on-center spacing as indicated on the Drawings.
 3. Each rooted ground cover plant shall be planted with its proportional amount of soil.
 4. Apply a 2-inch layer of wood mulch at the completion of planting.

3.14 WATERING

- A. All planting shall be watered immediately after planting. After the first watering, water shall be applied to all plants as conditions may require keeping the plants in a healthy and vigorous growing condition until the completion of the Contract.

3.15 TREE STAKING

- A. Staking of trees shall be completed immediately after planting trees. Trees shall stand plumb before stakes are applied.
- B. All stakes shall be installed plumb when tied to the tree. Stakes may be located in a specific location to the trunk - refer to the Drawings.
- C. When locating a single stake, locate it on the windward side of the tree and as close to the main trunk as possible without damaging the trunk.
- D. Stakes shall be driven at least 3' into the ground or as specified on the plans.
- E. Tie the tree trunk to the stake with the specified tree guy. Cut off stake after installation 4-inches above the upper tie.

3.16 TREE GUYING

- A. Guying of trees shall be completed immediately after planting trees. Trees shall stand plumb before guys are applied.
- B. Trees shall stand plumb once guys are installed.
- C. Guy trees at points of branching with guys spaced 120 degrees apart.
- D. Guys shall be covered with black rubber hose at points of contact with bark positioned at crotches and fastened to a deadman. One turnbuckle shall be provided for each guy wire. Use (2) cable clamps at each cable terminus.
- E. Install a warning guy wire tube on each guy wire.

3.17 PRUNING

- A. At no time shall plant material be pruned, trimmed or topped prior to delivery. Any alteration to their shape shall be conducted only on-site and in the presence of the Owner's Authorized Representative.
- B. All planted material requiring pruning shall be done under the observation of the Owner's Authorized Representative. Prune planted material only when necessary and under standard horticultural practices to preserve the natural character of the plant.

3.18 WOOD MULCH INSTALLATION

- A. Spread a 3" deep layer of shredded bark mulch in all landscaped areas.

3.19 CLEANUP

- A. Contractor shall remove all trash caused from his Work on a weekly basis throughout the duration of the Project.
- B. Upon completion of his Work under this Section, the Contractor shall remove all rubbish, waste and debris resulting from his operations offsite or as directed by the Owner's Authorized Representative.
- C. All scars, ruts or other marks in the ground caused by the Contractors work shall be repaired.
- D. Remove all equipment and implements of service, and leave the entire work area in a neat, clean, and Owner's Authorized Representative-accepted condition. All sidewalks and other paving areas shall receive a broom-clean treatment.

3.20 SITE VISIT SCHEDULE

- A. The Contractor shall be responsible for notifying the Owner's Authorized Representative in advance to schedule the following site visits:
 - 1. Pre-construction "Kick-Off" meeting - 7 days.
 - 2. At completion of fine grading - 2 days.
 - 3. At completion of soil preparation - 2 days.
 - 4. Delivery of plant material - 2 days.
 - 5. Plant layout prior to plant pit excavation - 2 days.
 - 6. At start of tree planting, staking and guying - 2 days.
 - 7. Final walkthrough prior to going on contracted maintenance period - 7 days.
 - 8. Final walkthrough for project acceptance - 7 days.
- B. The Owner's Authorized Representative may or may not attend all of the above mentioned site visits. He may also elect to attend more than is listed above, and without notice to the Contractor.
- C. When site visits are made by other than the Owner's Authorized Representative, the Contractor shall show evidence in writing of when and by whom the site visit was made.
- D. No site visit will commence without all previous punch list items being completed, unless compliance has been waived by the Owner's Authorized Representative. Failure to accomplish the timely execution of previous field report punch list items and preparing adequately for the next site visit shall make the Contractor potentially liable for reimbursing the Owner's Authorized Representative's for his labor and reimbursable expenses. No further site visits will be made until outstanding charges have been paid to the Owner by the Contractor.

END OF SECTION – 32 90 00
