PART 1: PROPOSAL REQUIREMENTS

REQUEST FOR PROPOSALS

Proposals will be received at the Altadena Library District, 600 E. Mariposa Street, Altadena, CA 91001 or electronically at https://www.bidnetdirect.com/california/ald until 3:00 pm on October 1, 2025, at which time proposals will be opened for the:

ALTADENA MAIN LIBRARY

RENOVATION PROJECT

The proposed work consists of renovation and additions to the Altadena Main Library at **600 E. MARIPOSA STREET, ALTADENA, CA 91001.** Work includes but is not limited to construction of certain improvements to the existing Library as set forth in the Plans and Specifications for the Project.

Completion of Work: All work shall be completed within:

- Building Renovation and Improvements, 487 Calendar Days from Notice to Proceed. **NOTE: Before actual construction may commence a Conditional Use Permit (CUP) must be issued by Los Angeles County. The Library anticipates issuance of the CUP by January 20, 2026. In the event issuance is delayed beyond that date, the Completion Date will be extended on a day-for-day basis until the CUP is issued.** Prior to issuance of the CUP the selected contractor will be expected to perform pre-construction tasks following issuance of the Notice to Proceed.

Anticipated Solicitation Timeline (subject to change):

August 18, 2025 – RFP Issued

August 27, 2025 – Job Walk

September 17, 2025 – Questions Due

October 1, 2025 – Proposals Due

October 27, 2025 – Board of Trustees Award of Contract

November 10, 2025 – Notice to Proceed, Begin Preconstruction Activities

January 21, 2025 – Begin Site Construction Activities

Obtaining Contract Documents: Contract Documents, including Plans and Specifications for the Project, may be obtained online at https://www.bidnetdirect.com/california/ald.

Questions: Project-specific questions must be made in writing and sent to the District's Capital Projects Manager, Jennifer Pearson, at jennifer.pearson@huckabee-inc.com. If appropriate, the District will post responses to proposer questions received at https://www.bidnetdirect.com/california/ald. The cutoff date for submittal of questions is **5:00 pm on September 17, 2025,** local time.

Job Walk: There will be a job walk on **September 4, 2025 at 11:00 am local time**, at **600 E. MARIPOSA STREET, ALTADENA, CA 91001**. Attendance at the job walk is mandatory.

Submission of Proposals: All proposals must be submitted not later than the date and time prescribed. The proposer is wholly responsible to ensure its proposal is submitted on the date and at the time and place designated for the opening of proposals. Any proposal received after the time and date specified shall not be considered. Any proposal may be withdrawn prior to the scheduled time for opening proposal. Each proposal must conform and be responsive to this notice and shall be made on the official proposal forms furnished with the Contract Documents.

Contractor's License: Proposers must possess a current Class B General Contracting license issued by the State of California, in addition to such other licenses as may be necessary to perform any and all contract work, at the time the proposal is submitted.

Contractor Registration: All Proposers and listed subcontractors must have registered with the California State Department of Industrial Relations pursuant to Labor Code section 1725.5 prior to submitting a proposals. Furthermore, a Contractor and all subcontractors must be registered pursuant to Labor Code section 1725.5 before entering into a contract to work on a public project.

Award: The award shall be made to the most qualified proposer in the best interests of the District, in the sole discretion of the District. The lowest cost proposal shall not necessarily be the most qualified proposal selected. Pursuant to District Purchasing Policy Section 6-1, the District will strive to purchase from the lowest responsible proposer. However, cost shall not be the sole factor in selecting vendors to provide products and services necessary for operations. Value, future costs, and quality of service shall be given equal weight. The award of the Contract will be made by the Altadena Library District Board of Trustees in a noticed meeting, and the Contractor shall execute the Contract within ten (10) days after it has received the signed Contract from the District following award. **A notice of intent to award the Contract is not the formation of a contract, and is not binding on the District in any manner unless and until the Contract is formally awarded by the Board as set forth above.**

Rejection of Proposals: The District reserves the right to reject any and all proposals, or to waive immaterial irregularities in any proposal. Any proposal not conforming to the intent and purpose of the Contract Documents may be rejected. The District reserves the right to make all awards in the best interest of the District. Should all proposals be rejected, the District may re-advertise and seek proposals at a later date, in its sole discretion.

Disqualification of Proposer: If there is a reason to believe that collusion exists among any Proposers, none of the proposals of the participants in such collusion will be considered and the District may likewise elect to reject all proposals received.

Wage Rates: Proposers are hereby notified that the California Department of Industrial Relations has determined the general prevailing rate of wages for each craft, classification, or type of worker needed to execute the work. Copies of the current schedules for prevailing wages applicable to this project are on file in the District's office. It shall be mandatory for the Contractor and any subcontractor under it to pay not less than the said specified rates to laborers and workmen employed by them in the execution of the Contract.

Bonds: The successful Proposer will be required to furnish a payment bond in an amount equal to one hundred percent (100%) of the Contract price, and a faithful performance bond in an amount equal to one hundred percent (100%) of the Contract price.

INSTRUCTIONS TO PROPOSERS

Each Proposal shall be in accordance with the Contract Documents.

1. **Plans**

Additional copies of full scale plans may be obtained as specified in the Request for Proposals

2. **Local Conditions**

(a) The Proposer shall examine carefully the site of the work contemplated and the Contract Documents. The submission of a proposal shall be conclusive evidence that the Proposer has investigated and is satisfied as to the conditions to be encountered, as to the character, quality and quantities of work to be performed and the materials to be furnished, and as to the requirements of the Contract Documents.

(b) Where the Architect and/or Engineer has made investigations of surface and subsurface conditions in areas where work is to be performed under the Contract, or in other areas, some of which may constitute possible local material sources, such investigations were made only for the purpose of study and design. Where such investigations have been made, Proposers and/or the selected Contractor may, upon written request, inspect the records of the Architect/Engineer as to such investigations subject to and upon the conditions hereinafter set forth. Such inspection of records may be made at the office of the Architect/Engineer.

(c) The records of such investigations are not a part of the Contract and are made available for inspection solely for the convenience of the Proposer or selected Contractor. It is expressly understood and agreed by Proposer or the selected Contractor that neither the District nor the Architect or Engineer assumes any responsibility whatsoever with respect to the sufficiency or accuracy of the investigations thus made, the records thereof, or of the interpretation set forth therein or made by the Architect or Engineer in their use thereof, and there is no representation, warranty or guarantee, either express or implied, that the conditions indicated by such investigations or records thereof are correct or representative of those existing throughout such areas or any part thereof, or that unanticipated developments may not occur or that materials other than, or in proportions different from, those indicated may not be encountered.

(d) The availability or use of information described in this section or the special conditions is not to be construed in any way as a waiver of the provisions of this section and a Proposer or selected Contractor is cautioned to make such an investigation and examination as it deems necessary to satisfy itself as to conditions to be encountered in the performance of the work and, with respect to possible local material sources, the quality and quantity of material available from such property and the type and extent of processing that may be required in order to produce material conforming to the requirements of the Specifications.

(e) No information derived from such inspection of records of investigations or compilations thereof made by the Architect, the Engineer or the Engineer's assistants, will in any way relieve the Proposer or Contractor from any risk or from properly fulfilling the terms of the Contract.

(f) Information derived from inspection of topographic maps, or from Plans showing location of utilities and structures will not in any way relieve the Contractor from any risk, or from

properly examining the site and making such additional investigations as it may elect, or from properly fulfilling all the terms of the Contract.

(g) Each Proposer shall inform itself of, and the Proposer awarded a Contract shall comply with, federal, state and local laws, statutes, and ordinances relative to the execution of the work. This requirement includes, but is not limited to, applicable regulations concerning employment of labor, protection of public and employee safety and health, protection, the protection of natural resources, fire protection, burning and non-burning requirements, permits, fees, and similar subjects.

3. **Form of Proposal and Signature**

(a) Proposals shall be submitted only on the forms attached hereto and shall be enclosed in a sealed envelope and marked and addressed as hereinafter directed. The Proposer shall state in figures the unit prices or the specific sums as the case may be, for which it proposes to supply the labor, materials, supplies or machinery, and perform the work required by the Specifications. Proposal prices will be deemed to include all applicable fees and taxes including sales tax. If the Proposal is made by an individual, it shall be signed by the individual and the individual's full name and address shall be given; if it is made by a partnership, it shall be signed with the co-partnership name by a member of the partnership, who shall also sign the member's own name, and the name and address of each member of such partnership shall be given; and, if it is made by a corporation, the name of the corporation shall be given and it shall be signed by its duly authorized officer or officers attested by the corporate seal, the name and titles of all officers of the corporation shall be given, and the address of the corporation and the state in which incorporated shall be stated.

(b) In addition to completing the forms attached hereto, the following information shall be provided in a separate proposal document submitted by each Proposer:

1. Firm Information

   (a) Proposer information, including history/structure;

   (b) All Licenses possessed by Proposer;

   (c) Proposer DIR registration;

   (d) Information regarding financial resources available for performance of the Contract Work;

   (e) Any past or existing claims against the Proposer, including any terminations/failures to complete prior or current contracts;

   (f) Proposer safety record (EMR, OSHA compliance, etc.);

   (g) Proposer bonding capacity;

2. Experience

(a) Proposer Experience with public works projects, including with LA County, SCAQMD, etc.;

(b) Recent similar project information with the following data:

(i) Project description, including project location, type, size and relevant features

(ii) Project Delivery Method

(iii) Initial contract amount and final cost

(iv) Construction start and completion dates

(v) Owner contact information;

3. Project Approach

(a) Proposed Project personnel;

(b) Proposed Project schedule with milestones;

(c) Firm's approach to cost, schedule, and risk management;

4. Proposer References;

5. Any Proposer comments to the form of contract for this Project.

(c) Proposals will be considered only from persons or entities licensed as required under applicable provisions of the Contractor's License Law (Cal. Bus. and Prof. Code section 7000, et seq.) and rules and regulations adopted pursuant thereto; and each Proposer shall insert its type of contractor's license, license number, and other requested information in the place provided in the Proposal. No oral, telephonic or facsimile Proposal or modification of a Proposal will be considered.

(d) If hard copy proposals are submitted, the District will need 5 copies for review, or an electronic copy on USB drive that can be distributed to the review panel. Electronic submittal is preferred.

4. **Submittal of Proposals**

(a) All Proposals must be submitted not later than the time prescribed, at the place and in the manner set forth in the Request for Proposals. Proposals must be made on the prescribed Proposal Forms. A complete Proposal requires submission of all documents identified in subsection (d) below. The Proposer is wholly responsible to see that its Proposal is submitted at the time and place named for the opening of Proposals.

(b) Proposals shall include all addenda or clarifications issued during the Proposal period acknowledged by the Proposer's signature thereon. Failure to so include or acknowledge an addendum or clarification may result in the Proposal being rejected as not responsive.

(c) Proposal documents to be submitted shall include the following:

(1) Completed Proposal

(2) Proposal Signature Sheet

(3) Non-Collusion Declaration

(4) Completed Subcontractor List

(5) Proposer's Checklist

(6) Proposal Documents required by section 3(b).

5. **Preparation of Proposal**

Blank spaces in the Proposal shall be properly completed. The phraseology of the Proposal must not be changed and no additions shall be made to the items mentioned therein. **Unauthorized conditions, limitations or provisions attached to a Proposal may cause its rejection. Similarly, Proposers are expected to carefully review the Contract terms and documents included herewith, as any requested changes to the Contract terms or documents may, in the sole discretion of the District, be further grounds for rejection of a Proposal.** If erasures, interlineations or other changes appear on the form, each erasure, interlineation or change must be initialed by the person signing the Proposal. Alternative Proposals will not be considered unless specifically provided for in the Proposal Schedule. No Proposal received after the time fixed, or received at any place other than the place stated in the Request for Proposals will be considered. Proposers, their representatives and other interested parties are invited to be present at the opening. Where bonds are required, the Proposer shall name in its Proposal the surety or sureties who have agreed to furnish said bonds.

6. **List of Subcontractors**

(a) Each Proposer shall set forth in its Proposal on the form provided the following information in accordance with the provisions of Public Contract Code sections 4100-4113:

(1) The name, contractor's license number, and the location of the place of business of each Subcontractor who will perform work or labor or render service to the prime Contractor in or about the construction of the work or improvement, or a Subcontractor licensed by the State of California who, under subcontract to the prime Contractor, specifically fabricates and installs a portion of the work or improvement according to the Contract Documents, in any amount in excess of one-half of one percent (0.5%) of the prime Contractor's total Proposal, or ten thousand dollars ($10,000), whichever is greater.

(2) The portion of the work which will be done by each such Subcontractor. Only one Subcontractor shall be listed for each such portion of the work as defined in the Proposal.

(b) If the Proposer fails to specify a Subcontractor for any portion of the work to be performed under the Contract, the Proposer agrees to perform that portion of the work itself.

7. **Interpretation of Contract Documents**

Any explanation desired by the Proposers regarding the meaning or interpretation of any of the Contract Documents must be submitted in writing by **3:00 p.m. local time on September 17, 2025**. Requests for clarification received after the above noted deadline may be answered at the discretion of the Architect, Engineer or District Representative as the District deems appropriate. Any such explanations or interpretations will be made in the form of Addenda to the documents and will be furnished to all Proposers who shall submit all addenda with their Proposals. Neither the Architect nor any representative of the District is authorized to give oral explanations or interpretations of Contract Documents, and a submission of a Proposal constitutes agreement by the Proposer that it has placed no reliance on any such oral explanation or interpretation. However, the Architect may, upon inquiry by Proposer, orally direct the Proposer's attention to specific provisions of the Contract Documents which cover the subject of the inquiry.

Requests for Clarifications must be made in writing and sent to the District's Capital Projects Manager. If appropriate, the District will post responses to Proposer questions. The cutoff date for submittal of questions is **3:00 p.m. local time on September 17, 2025.**

8. **Modification of Proposals**

A Proposer may modify its Proposal by written communication provided such communication is received by the District prior to the closing time for receipt of Proposals. The written communication should not reveal the Proposal price but should state the addition or subtraction or other modification so that the final prices or terms will not be known by the District until the sealed Proposal is opened.

9. **Withdrawals of Proposals**

Proposals may be withdrawn without prejudice by written or facsimile requests received from Proposer prior to the time for opening of Proposals, and Proposals so withdrawn will be returned to Proposers unopened when reached in the process of opening Proposals.

10. **Discrepancies**

In the case of discrepancy between unit prices and totals, unit prices will prevail and the District will recalculate the Proposal total based on the unit prices and estimated quantities. In case of discrepancy between words and figures, words will prevail. Discrepancies between drawings and specifications, the more stringent will prevail.

11. **Equipment Types and Brands Disclosures**

Each Proposer must furnish evidence before acceptance of Proposal, names of brands of all major equipment included in the Proposal. These must be approved prior to awarding the contract.

12. **Disqualification of Proposers**

(c) More than one Proposal from an individual, firm, partnership or corporation under the same or different names will not be considered. Reasonable grounds for believing that any individual, firm, partnership or corporation is interested in more than one Proposal for the work contemplated may cause the rejection of all Proposals in which the individual, firm, partnership or corporation is interested. If there is reason for believing that collusion exists among the

Proposers, any or all Proposals may be rejected. Proposals in which the price is obviously unbalanced may be rejected.

13. **Opening & Award of Contract**

Proposals will be opened at the time and date established in the invitation to Proposers.

(a) The District reserves the right to reject any or all Proposals, including, without limitation, the right to reject any non-conforming, non-responsive, unbalanced, or conditional Proposals.

(b) Before a Proposal is considered for award, the District may, in addition to the forms and written proposals included in the Proposal documents, require a Proposer to submit a statement of facts and detail as to its business, technical organization and financial resources and equipment available and to be used in performing the work. Additionally, the District may require evidence that the Proposer has performed other work of comparable magnitude and type. The District expressly reserves the right to reject any Proposal if it determines that the business and technical organization, equipment, financial and other resources or other experience of the Proposer (including the Proposer's Subcontractors) is not sufficiently qualified for the work Proposal upon and, therefore, justifies such rejection. The District may further choose to interview a short list of potentially successful proposers if the District deems it to be necessary.

(c) Scoring Criteria - The District may utilize the following criteria, in addition to any other information the District deems material and relevant in determining which Proposer shall be awarded the Contract:

1. Proposed Price;
2. Firm information;
3. Prior relevant experience;
4. Project approach (schedule management, cost management, risk assessment);
5. Comments to contract;
6. Overall suitability for District project.

14. **Proposal Protests**

The lack of a prompt procedure to resolve disputes regarding the Proposal process would impair the District's ability to carry out its purpose of constructing this project in a timely manner. Therefore, to the maximum extent authorized by law and notwithstanding any other procedures specified in documents referenced herein, all disputes and/or protests regarding the Proposal process shall be subject to the following procedure. In submitting a Proposal to the District for this project, the Proposer agrees to comply with and to be bound by this procedure.

Any Proposal protest must be submitted in writing to Jennifer Pearson, Huckabee at 8640 National Boulevard, Culver City, CA 90232 before 5:00 p.m. on the fifth (5^{th}) working day following Proposal opening.

(a) The initial protest document must contain a complete statement of the basis for the protest, and all supporting documentation.

(1) The party filing the protest must have actually submitted a Proposal for the Work. A subcontractor of a party submitting a Proposal for the Work may not submit a Proposal protest. A party may not rely on the Proposal protest submitted by another Proposer, but must timely pursue its own protest. protest must refer to the specific portion of the Contract Documents which forms the basis for the protest.

(b) The protest must include the name, address and telephone number of the person representing the protesting party.

(c) The party filing the protest must concurrently transmit a copy of the initial protest document and any attached documentation to all other parties with a direct financial interest which may be adversely affected by the outcome of the protest. Such parties shall include all other Proposers who appear to have a reasonable prospect of receiving an award depending upon the outcome of the protest.

(d) The District will give the protested Proposer five (5) working days after the receipt of the protest to submit a written response. The responding Proposer shall transmit the response to the protesting Proposer concurrent with delivery to the District.

(e) The procedure and time limits set forth in this paragraph are mandatory and are the Proposer's sole and exclusive remedy in the event of Proposal protest. The Proposer's failure to comply with these procedures shall constitute a waiver of any right to further pursue the Proposal protest, including filing a Government Code Claim or legal proceedings. A Proposer may not rely on a protest submitted by another Proposer, but must timely pursue its own protest.

(f) If the District determines that a protest is frivolous, that Proposer may be determined to be ineligible for future contract awards.

15. **Contract Bonds**

(a) The successful Proposer shall furnish both a Performance Bond and a Payment Bond in the amount of one hundred percent (100%) of its Total Proposal Price.

(b) These Bonds shall be furnished in the forms enclosed following the Contract and shall be satisfactory to the District and shall be obtained from a responsible corporate surety (or sureties) acceptable to the District, which is admitted by the State of California to act as surety upon bonds and undertakings and which maintains in this State at least one office for the conduct of its business. The surety (or sureties) shall furnish reports as to its financial condition from time to time as requested by the District. The premiums for said Bonds shall be paid by the successful Proposer.

(c) These Bonds shall be furnished by companies who are authorized and licensed by the Insurance Commissioner as an “admitted surety insurer.” The surety shall provide the District with the documentation required by Section 995.660 of the California Code of Civil Procedure.

(d) If any surety becomes unacceptable to the District or fails to furnish reports as to its financial condition as requested by the District, the Contractor shall promptly furnish such

additional security as may be required from time to time to protect the interests of the District and of persons supplying labor or materials in the prosecution of the work contemplated by this Contract.

(e) In the event of any conflict between the terms of the Contract and the terms of the Bonds, the terms of the Contract shall control and the Bonds shall be deemed to be amended thereby. Without limiting the foregoing, the District shall be entitled to exercise all rights granted to it by the Contract in the event of default, without control thereof by the surety, provided that the District gives the surety notice of such default at the time or before the exercise of any such right by the District, and, regardless of the terms of said Bonds, the exercise of any such right by the District shall in no manner affect the liability of the surety under said Bonds.

16. Substitution of Securities for Monies Withheld

Proposers are hereby notified that in accordance with the provisions of Public Contract Code section 22300, securities may be substituted for any monies which the District may withhold pursuant to the terms of the Contract to insure performance.

17. Execution of Contract

The successful Proposer will be notified in writing by the District of the award of the Contract within sixty (60) days, or less, after opening of Proposals. Accompanying the District's Notice of Intent to Award will be the Contract, in triplicate, which the successful Proposer will eventually be required to execute and return, together with the Performance and Payment Bonds, and the required certificates and policies of insurance together with the required endorsements thereto for the Contractor and the workers compensation certificate to the District. Such documents will be returned within ten (10) days following formal award of the Contract by the District. Failure to do so shall be just cause for annulment of the award. The District will promptly determine whether such Contract, Bonds and insurance are as required by the Contract Documents, and upon such determination will forward a fully executed copy of the Contract and a Notice to Proceed with the work to the successful Proposer. Signature by both parties constitutes execution of the Contract.

18. Power of Attorney

The Attorney-in-Fact (resident agent) who executes the Performance Bond and Payment Bond on behalf of the surety company must attach a copy of its Power of Attorney as evidence of its authority. A notary shall acknowledge the power as of the date of the execution of the surety bond which it covers.

19. Time of Completion

The time of completion of the work to be performed under this Contract is the essence of the Contract. Delays and extensions of time may be allowed in accordance with the provisions of the General Conditions. The time allowed for the completion of the work is stated in the Contract.

20. Licensing and Registration Requirements for Contractors

All Proposers, including general contractors and specialty contractors, shall hold such licenses as may be required by the laws of the State of California for the performance of the work specified in the Contract Documents.

(e) All Proposers and listed subcontractors must have registered with the California State Department of Industrial Relations pursuant to Labor Code section 1725.5 prior to submitting a Proposal. Furthermore, all contractors and subcontractors must be registered pursuant to Labor Code section 1725.5 before entering into a contract to work on a public project.

21. **Prevailing Wages**

Copies of the current schedules for prevailing wages are on file in the District's office, and the contents of those schedules are included herein as if set forth in full. Copies of the prevailing rate of per diem wages may also be obtained from the Department of Industrial Relations, P.O. Box 420603, San Francisco, CA 94142-0603, Attn: Chief, Division of Labor Statistics and Research or online at: http://www.dir.ca.gov/oprl/DPreWageDetermination.htm

22. **Preconstruction Conference**

A preconstruction conference will be convened after the Contractor has delivered the necessary bonds, insurance certificates and signed agreement in proper form as required in the Request for Proposals and general conditions of these specifications. Prior to any work, the Contractor shall provide the District Representative/Architect/ Engineer with a list of key personnel assigned to the project and the telephone numbers where they may be reached at any time. The list shall be made available in sufficient copies and presented at the preconstruction conference.

PROPOSER'S CHECKLIST

All items on the Proposer's Checklist must be initialed, dated and submitted for the Proposal to be considered complete. The District reserves the right to award a Contract in a manner and on the basis which will best serve the District, taking into consideration the information in the statement of Proposer's Proposal, qualifications and past work history with the District and in the local area. The Proposer's attention is especially called to the following forms which must be executed in full as required:

1. a) **PROPOSAL**
   The total Proposal price must be shown in the space provided.

   Initial: _____ Date: _____

   b) **PROPOSAL SIGNATURE SHEET**
   To be filled in and signed by the Proposer.

   Initial: _____ Date: _____

3. **NON-COLLUSION DECLARATION**
   A Non-Collusion Declaration must be filled out, signed, and submitted with the Proposal for the Proposal documents to be considered complete.

   Initial: _____ Date: _____

4. **DESIGNATION OF SUBCONTRACTORS**
   A Designation of Subcontractors must be filled out and submitted with the Proposal for the Proposal documents to be considered complete.

   Initial: _____ Date: _____

5. **INSURANCE**
   The insurance requirements for this project have been read and understood.

   Initial: _____ Date: _____

6. **SITE VISIT (optional)**
   The Proposer certifies that it has toured the project site and is familiar with the work involved.

   Initial: _____ Date: _____

PROPOSERS CHECKLIST CONTINUED

7. **PERFORMANCE AND PAYMENT BONDS**
   The Proposer understands that a performance bond issued by an approved surety equaling one hundred percent (100%) of the Contract amount will be required. A payment bond equaling one hundred percent (100%) of the Contract amount will also be required.

Initial: _____ Date: _____

8. **WORK SCHEDULE**

The District makes no guarantee as to the method of work chosen by the Proposer. It is the Proposer's responsibility to plan and schedule the work in order to complete the work in the time specified in the Special Provisions.

Initial: _____ Date: _____

9. **PROPOSAL INFORMATION REQUIRED BY SECTION 3(b)**

The Proposer acknowledges that it must draft and submit a separate document containing all of the information requested under Section 3 (b) of the RFP.

Initial: _____ Date: _____

10. ADDENDA

The Proposer acknowledges that it must sign and attach any applicable addenda to the Proposal.

Initial: _____ Date: _____

11. **WORKERS COMPENSATION**

The Proposer acknowledgment that Worker's Compensation Insurance will be required for this project.

Initial:_____ Date:_____

PROPOSAL

The undersigned Proposer hereby proposes to furnish and deliver all necessary labor, tools, equipment, and other means of construction to perform the work required for the completion of the project entitled "**ALTADENA MAIN LIBRARY RENOVATION PROJECT"** in accordance with the intent of all plans, specifications, and addenda issued by the District in the amount of:

Base Bid:

(Written)_____ dollars

(Number) $_____.00

Additive/Deductive Alternates:
Descriptions of alternates are primarily scope definitions and do not necessarily detail the full range of materials and processes needed to complete the construction.

Alternate #1: North Patio and Sliding Doors.

(Written)_____ dollars

(Number) $_____.00

Alternate #2: Meeting Room Addition.

(Written)_____ dollars

(Number) $_____.00

Alternate #3: Children's Area Ceiling.

(Written)_____ dollars

(Number) $_____.00

Prior to the opening of the Proposal, the Proposer has read the accompanying instructions to Proposers, has carefully examined the location(s) of the proposed work, and has examined all Contract Documents, drawings and addenda issued by the District and will contract with the District to construct the project, complete and in satisfactory condition.

The Proposer further acknowledges that it has adjusted its Proposal price to include all possible items which may influence the proposal during the time period from notice of intent to award through and until formal award by the District. Requests for Proposal price change due to the delay shall not be agreed to by the District.

NOTARIZED NON-COLLUSION DECLARATION

STATE OF CALIFORNIA)
)
COUNTY OF LOS ANGELES)

The undersigned declares:

I am the _____ of _____, the party making the foregoing Proposal.

The Proposal is not made in the interest of, or on behalf of, any undisclosed person, partnership, company, association, organization, or corporation. The Proposal is genuine and not collusive or sham. The Proposer has not directly or indirectly induced or solicited any other Proposer to put in a false or sham Proposal. The Proposer has not directly or indirectly colluded, conspired, connived, or agreed with any Proposer or anyone else to put in a sham Proposal, or to refrain from Proposing. The Proposer has not in any manner, directly or indirectly, sought by agreement, communication, or conference with anyone to fix the Proposal price of the Proposer or any other Proposer, or to fix any overhead, profit, or cost element of the Proposal price, or of that of any other Proposer. All statements contained in the Proposal are true. The Proposer has not, directly or indirectly, submitted its Proposal price or any breakdown thereof, or the contents thereof, or divulged information or data relative thereto, to any corporation, partnership, company, association, organization, Proposal depository, or to any member or agent thereof, to effectuate a collusive or sham Proposal, and has not paid, and will not pay, any person or entity for such purpose.

Any person executing this declaration on behalf of a Proposer that is a corporation, partnership, joint venture, limited liability company, limited liability partnership, or any other entity, hereby represents that it has full power to execute, and does execute, this declaration on behalf of the Proposer.

I declare under penalty of perjury under the laws of the State of California that the foregoing is true and correct and that this declaration is executed on _____[date], at ___[District], ___[state].

DESIGNATION OF SUBCONTRACTORS

Each Proposer shall submit the name, contractor license number, and business location of each subcontractor who will perform work or labor or render service to the Contractor for the construction of the work performed under these specifications in excess of one-half (1/2) of one percent (1%) of the prime Contractor's total Proposal. If the Contractor fails to specify a subcontractor for any portion of the work to be performed under the Contract, it shall be deemed to have agreed to perform such portion itself, and it shall not be permitted to subcontract that portion of the work except under the conditions hereinafter set forth. (Attach additional forms as necessary)

Name Subcontractor	Street Address of Shop, Mill or Office	Types of Work/Category of Contract	$ Value of Work to be Performed	DIR Registration Number	Subcontractor's License Number/ Type/Exp. Date

If no subcontractors will be used, write "None" here:_____

I declare under penalty of perjury that the foregoing is true and correct and this Declaration is executed this _____ day of _____, 20___, in _____, California.

Contractor Company Name: _____

SUBCONTRACTOR FORM MUST BE RETURNED WITH PROPOSAL

PART 2: CONTRACT DOCUMENTS

CONSTRUCTION CONTRACT

THIS CONTRACT made on _____ by and between the Altadena Library District ("District"), and _____, hereinafter "Contractor". The District and Contractor may be collectively referred to as the "parties".

The parties have mutually covenanted and agreed as follows:

1. THE CONTRACT DOCUMENTS:

The complete Contract consists of the following documents ("Contract Documents"):

Request for Proposals
Addenda Nos. _____, as issued
Designation of Subcontractors
Construction Contract
Payment Bond to Accompany Contract
Performance Bond to Accompany Contract
General Conditions
Supplementary and Special Conditions (if any)
Architect's Plans
Architect's Plans and Specifications
Change Orders
Contractor's Certification Regarding Workers' Compensation

2. THE WORK:

The Contractor agrees to furnish all tools, equipment, apparatus, facilities, labor, transportation, and material necessary to perform and complete in a good and workmanlike manner, the **ALTADENA MAIN LIBRARY RENOVATION PROJECT** as called for, and in the manner designated in, and in strict conformity with, the Contract Documents. It is understood and agreed that the tools, equipment, apparatus, facilities, labor, transportation, and material shall be furnished and the work performed and completed as required in the Drawings and Specifications under the sole direction and control of the Contractor, and subject to inspection and approval of the District, or its representatives. The District hereby designates as its representative for the purpose of this Contract the following named person: _____.

3. CONTRACT PRICE:

The District agrees to pay and the Contractor agrees to accept, in full payment for the work above agreed to be done, the sum of [WRITTEN NUMBER] [(NUMBER)] for the Project subject to additions and deductions as provided in the Contract Documents.

4. COMPLETION DATE:

The Project shall be commenced on the date specified in the Notice to Proceed. The total project will be completed within [WRITTEN NUMBER] [(NUMBER)] working days, as defined in the General Conditions, after the date stated in the Notice to Proceed.

5. **NOTICE AND SERVICE THEREOF:**

Any notice from one party to the other under the Contract shall be in writing and shall be dated and signed by the party giving such notice or by a duly authorized representative of such party. Any such notice shall not be effective for any purpose whatsoever unless served in the following manner, namely:

(a) If the notice is given to the District, by personal delivery thereof or by depositing the same in the United States mail, enclosed in a sealed envelope, postage prepaid, and certified; addressed to the District at:

Altadena Library District
600 E. Mariposa Street
Altadena, California 91001
Attn: Nikki Winslow, Director

With a copy to:
Jeff Mitchell, Esq.
Kronick Moskovitz, Tiedemann & Girard
1331 Garden Highway, 2nd Floor
Sacramento, CA 95833

(b) If the notice is given to the Contractor, by personal delivery thereof to said Contractor or to its duly authorized representative at the site of the project, or by depositing the same in the United States mail, enclosed in a sealed envelope, postage prepaid, and certified; addressed to the Contractor at:

Business
Attention:
Street Address
District, State, Zip Code

(c) If the notice is given to the surety or any other person, by personal delivery to such surety or other person, or by depositing the same in the United States mail, enclosed in a sealed envelope, addressed to such surety or other person, as the case may be, at the address of such surety or person last communicated by it to the party giving the notice, postage prepaid and certified.

6. **LIQUIDATED DAMAGES:**

Liquidated damages as provided for in the General Conditions of the Contract shall be in the sum of One Thousand Dollars ($1,000.00) for each and every day as defined therein for each different scope of work as defined by the Base Proposal and each change order except as otherwise specified in the General Conditions.

7. **PREVAILING WAGE:**

Copies of the prevailing rate of per diem wages as determined by the Director of the Department of Industrial Relations in accordance with Labor Code section 1773 are on file at the District, and copies are available for inspection at that office to any interested party on request. Proposers shall be responsible for verifying with the Director of the Department of Industrial Relations that

all such copies of the prevailing rate provided by the District are current and accurate. The requirement to pay the wage rate so specified is further detailed in the General Conditions.

8. **CONTRACTOR REGISTRATION**

By the execution of this Contract, Contractor hereby certifies that it is registered with the California Department of Industrial Relations as required pursuant to Labor Code section 1725.5 (contractor registration).

IN WITNESS WHEREOF, four (4) identical counterparts of this Contract, each of which shall for all purposes be deemed an original, have been duly executed by the above-named parties, on the date noted on the first page of this Contract.

Attorney for the Altadena Library District

PERFORMANCE BOND

The ALTADENA LIBRARY DISTRICT, hereinafter "District," entered into a Contract dated _____, 20___ with _____ hereinafter "Contractor," for the work described as follows: **ALTADENA MAIN LIBRARY RENOVATION PROJECT.** WHEREAS, said Contractor is required under terms of said Contract to furnish a bond for the faithful performance of said Contract; and WHEREAS, the Contract is by reference made a part hereof. NOW, THEREFORE, we, _____, the undersigned Contractor, as Principal, and _____ (corporate surety), a corporation organized and existing under the laws of the State of _____, and duly authorized to transact business under the laws of the State of California, as Surety, are held and firmly bound unto the District in the penal sum of [WRITTEN NUMBER] [(NUMBER)], lawful money of the United States, said sum being not less than one hundred percent (100%) of the total Contract amount, for the payment of which sum be made, we bind ourselves, our heirs, executors, administrators, and successors, jointly and severally, firmly by these presents.
THE CONDITION OF THIS OBLIGATION IS SUCH, THAT, if the above-bounded Contractor, its heirs, executors, administrators, successors or assigns, shall in all things stand to and abide by, and perform the covenants, conditions, and agreements in said Contract and any alterations thereof made as therein provided, on its part, to be kept and performed at the time and in the manner therein specified, and in all respects according to their true intent and meaning, and shall indemnify and save harmless the District, its officers and agents, as therein stipulated, then this obligation shall become null and void; otherwise it shall be and remain in full force and virtue.

As a condition precedent to the satisfactory completion of said Contract, the above obligation in said amount shall hold good for a period of one (1) year after the completion and acceptance of said work, during which time if the above-bounded Contractor, its heirs, executors, administrators, successors or assigns shall fail to make full, complete, and satisfactory repair and replacements or totally protect the District from loss or damage made evident during said period of one (1) year from the date of acceptance of said work, and resulting from or caused by defective materials or faulty workmanship in the prosecution of the work done, the above obligation in said sum shall remain in full force and effect. However, anything in this paragraph to the contrary notwithstanding, the obligation of the Surety hereunder shall continue so long as any obligation of the Contractor remains.

And the Surety, for value received, hereby stipulates and agrees that no change, extension of time, alteration or addition to the terms of the Contract or to the work to be performed thereunder or the specifications accompanying the same shall, in any way, affect its obligations on this bond and it does hereby waive notice of any such change, extension of time, alteration, or addition to the terms of the Contract or to the work or the specifications. Said Surety hereby waives the provisions of Sections 2819 and 2845 of the Civil Code of the State of California. In the event suit is brought upon this bond by the District and judgment is recovered, the Surety shall pay all costs incurred by the District in such suit, including reasonable attorneys' fees to be fixed by the Court.

IN WITNESS WHEREOF, we have hereunto set our hands and seals this _____ day of _____, 20___.

_____
(Contractor as Principal)

(Seal) By _____

(Seal) By _____

NOTE: If Contractor is a Partnership, all parties must execute the Bond. IMPORTANT: Surety companies executing Bonds must appear on the Treasury Department's most current list (Circular 570 as amended) and be authorized to transact business in California.

PAYMENT BOND

The ALTADENA LIBRARY DISTRICT, hereinafter "District," has awarded to _____, hereinafter "Contractor," a Contract for the work described as follows: **ALTADENA MAIN LIBRARY RENOVATION PROJECT.** WHEREAS, the Contractor is required by the Contract and by the provisions of Third Division, Part 4, Title 15, Chapter 7 of the Civil Code to furnish a bond in connection with the Contract, as hereinafter set forth.

NOW, THEREFORE, we, _____, the undersigned Contractor, as Principal, and _____, a corporation organized and existing under the laws of the State of _ duly authorized to transact business under the laws of the State of California, as Surety, are held and firmly bound unto the _____ in the sum of [WRITTEN NUMBER] [(NUMBER)], said sum being not less than one hundred (100) percent of the total Contract amount payable by the District, under the terms of the Contract, for which payment well and truly to be made, we bind ourselves, our heirs, executors and administrators, successors and assigns, jointly and severally, firmly by these presents.

THE CONDITION OF THIS OBLIGATION IS SUCH, THAT, if the Contractor, its heirs, executors, administrators, successors, and assigns or subcontractors shall fail to pay for any materials, provisions, provender or other supplies or teams, implements or machinery used in, upon, for or about the performance of the work contracted to be done, or shall fail to pay for any work or labor thereon of any kind, or shall fail to pay any persons named in Civil Code section 9100, or shall fail to pay for amounts due under the Unemployment Insurance Code with respect to such work or labor thereon of any kind, or shall fail to pay for any amounts required to be deducted, withheld, and paid over to the Employment Development Department from the wages of employees of the Contractor and subcontractors pursuant to Section 13020 of the Unemployment Insurance Code with respect to such work or labor, and provided that the claimant shall have complied with the provisions of that code, the Surety or Sureties hereon will pay for the same in an amount not exceeding the sum specified in the Contract; otherwise, the above obligation shall be void. In case suit is brought upon this bond, the Surety will pay reasonable attorneys' fees to the prevailing party to be fixed by the court.

This bond shall insure to the benefit of any and all persons, companies and corporations entitled to file claims under Section 9100 of the Civil Code, so as to give a right of action to them or to their assigns in any suit brought upon this bond.

It is further stipulated that the Surety of this bond shall not be exonerated or released from the obligation of the bond by any change, extension of time for performance, addition, alteration, or modification in, to, or of any contract, plans, specifications, or agreement pertaining or relating to any scheme or work of improvement described above or pertaining or relating to the furnishing of labor, materials, or equipment therefor, nor by any change or modification of any terms of payment or extension of the time for any payment pertaining or relating to any scheme or work of improvement described above, nor by any rescission or attempted rescission of the Contract, agreement, or bond, nor by any conditions precedent or subsequent in the bond attempting to limit the right of recovery of claimants otherwise entitled to recover under any such contract or agreement or under the bond, nor by any fraud practiced by any person other than the claimant seeking to recover on the bond, and that this bond be construed most strongly against the Surety and in favor of all persons for whose benefit such bond is given, and under no circumstances shall Surety be released from liability to those for whose benefit such bond has been given, by reason of any breach of contract between the District and original contractor or on the party of the obligee named in such bond, but the sole conditions of recovery shall be that claimant is a person described in Sections 8400 and 8402 of the California Civil Code and has not been paid the full amount of its claim and that Surety does hereby waive notice of any such change, extension of time, addition, alteration, or modification.

IN WITNESS WHEREOF, we have hereunto set our hands and seals this _____ day of _____, 20___.

_____
(Contractor as Principal)

(Seal) By _____

(Seal) By _____

NOTE: If Contractor is a Partnership, all partners should execute Bond.

IMPORTANT: Surety companies executing Bonds must appear on the Treasury Department's most current list (Circular 570 as amended) and be authorized to transact business in California.

CONTRACTOR'S CERTIFICATE REGARDING WORKER'S COMPENSATION

TO:

Altadena Library District

600 E. Mariposa Street

Altadena, California 91001

Attn: Nikki Winslow

I am aware of the provisions of Section 3700 of the Labor Code of the State of California which require every employer to be insured against liability for Workers' Compensation or to undertake self-insurance in accordance with the provisions of that code, and I will comply with such provisions before commencing the performance of the work of this Contract.

INSURANCE REQUIREMENTS FOR CONTRACTORS

Contractor shall procure and maintain for the duration of the Contract insurance against claims for injuries to persons or damages to property which may arise from or in connection with the performance of the work hereunder by the Contractor, its agents, representatives, employees or subcontractors.

Minimum Scope of Insurance

Coverage shall be at least as broad as:

1. Insurance Services Office Commercial General Liability coverage (occurrence form CG 0001).
2. Insurance Services Office form number CA 0001 (Ed. 1/87) covering Automobile Liability, code 1 (any auto).
3. Workers' Compensation insurance as required by the State of California and Employer's Liability Insurance.

Minimum Limits of Insurance

Contractor shall maintain limits no less than:

1. General Liability: $2,000,000 per occurrence for bodily injury, personal injury and property damage. If Commercial General Liability Insurance or other form with a general aggregate limit is used, either the general aggregate limit shall apply separately to this project/location or the general aggregate limit shall be twice the required occurrence limit.
2. Automobile Liability: $2,000,000 per accident for bodily injury and property damage.
3. Employer's Liability: $2,000,000 per accident for bodily injury or disease.
4. Excess Liability Insurance: to follow form of General Liability policy. $5,000,000 per occurrence for bodily injury, personal injury and property damage.

Deductibles and Self-Insured Retentions

Any deductibles or self-insured retentions must be declared to and approved by the District. At the option of the Entity, either: the insurer shall reduce or eliminate such deductibles or self-insured retentions as respects the District, its officers, officials, employees and volunteers; or the Contractor shall provide a financial guarantee satisfactory to the District guaranteeing payment of losses and related investigations, claim administration and defense expenses.

Other Insurance Provisions

The automobile liability and general liability policies are to contain, or be endorsed to contain, the following provisions:

1. The District, its officers, officials, employees, and volunteers are to be covered as insureds with respect to liability arising out of automobiles owned, leased, hired or borrowed by or on behalf of the Contractor; and with respect to liability arising out of work or operations performed by or on behalf of the Contractor including materials, parts or equipment furnished in connection with such work or operations. General liability coverage can be provided in the form of an endorsement to the Contractor's insurance, or as a separate owner's policy.
2. For any claims related to this project, the Contractor's insurance coverage shall be primary insurance as respects the District, its officers, officials, employees, and volunteers. Any insurance or self-insurance maintained by the District, its officers, officials, employees or volunteers shall be excess of the Contractor's insurance and shall not contribute with it.
3. Each insurance policy required by the clause shall be endorsed to state that coverage shall not be canceled by either party, except after thirty (30) days prior to written notice by certified mail, return receipt requested, has been given to the District.

Acceptability for Insurers

Insurance is to be placed with insurers with a current A.M. Best's rating of no less than A:VII.

Verification of Coverage

Contractor shall furnish the District with original certificates and amendatory endorsements effecting coverage required by this clause. The endorsements should be on forms provided by the District or on other than the District's forms, provided those forms or policies are approved by the District and amended to conform to the District's requirements. All certificates and endorsements are to be received and approved by the District before work commences. The District reserves the right to require complete, certified copies of all required insurance policies, including endorsements effecting the coverage required by these specifications at any time.

Subcontractors

Contractor shall include all subcontractors as insureds under its policies or shall furnish separate certificates and endorsements for each subcontractor. All coverages for subcontractors shall be subject to all of the requirements stated herein.

In consideration of the premium charged and notwithstanding any inconsistent statement in the policy to which this endorsement is attached or any endorsement now or hereafter attached thereto, it is agreed as follows:

1. INSURED. The District, Its elected or appointed officers, agents, volunteers and employees are included as additional insured with regard to liability and defense of suits arising from the operations, products and activities performed by or on behalf of the named insured.
2. CONTRIBUTION NOT REQUIRED. As respects: (a) work performed by the Named Insured for or on behalf of the District; or (b) products sold by the Named Insured to the District; or (c) premises leased by the Named Insured from the District, the insurance afforded by this policy shall be primary insurance as respects the District, its elected or appointed officers, officials, employees or volunteers; or stand in an unbroken chain of coverage excess of the Named Insured's scheduled underlying primary coverage. In either event, any other insurance maintained by the District, its elected or appointed officers, officials, employees or volunteers shall be in excess of this insurance and shall not contribute with it.
3. SEVERABILITY OF INTEREST. This insurance applies separately to each insured against whom claim is made or suit is brought except with respect to the company's limits of liability. The inclusion of any person or organization as an insured shall not affect any right which such person or organization would have as a claimant if not so included.
4. CANCELLATION NOTICE. With respect to the interests of the District, this insurance shall not be canceled, or materially reduced in coverage or limits excepts after thirty (30) days prior written notice by receipted delivery has been given to the District.
5. PROVISIONS REGARDING THE INSURED'S DUTIES. Any failure to comply with reporting provisions of the policy or breaches or violations of warranties shall not affect coverage provided to the District, its elected or appointed officers, officials employees or volunteers.
6. SCOPE OF COVERAGE. This policy, if primary, affords coverage at least as broad as:
   (1) Insurance Services Office Commercial General Liability Coverage, "occurrence" form CG 0001; or
   (2) If excess, affords coverage which is at least as broad as the primary insurance form CG 0001.

Except as stated above nothing herein shall be held to waive, alter or extend any of the limits conditions, agreements or exclusions of the policy to which this endorsement is attached.

PART 3: GENERAL CONDITIONS

PART 3: GENERAL CONDITIONS

SECTION 1

DEFINITIONS AND TERMS

1.01. GENERAL

Wherever the following abbreviations and terms, or pronouns in place of them, are used in these Conditions and other Contract Documents of which these Conditions are a part, the intent and meaning shall be interpreted as provided below.

1.02. ABBREVIATIONS

The following abbreviations may be used in the Contract Documents:

AASHTO	American Association of State Highway/Transportation Officials
ASTM	American Society for Testing and Materials
OSHA	Occupational Safety and Health Act of 1970

1.03. NOT USED

1.04. DEFINITIONS

The intent and meaning of the following, wherever they appear in the Contract Documents, shall be interpreted as follows:

Acceptance - The formal and final acceptance by the Architect/Engineer and the Board of the entire Contract, which has been completed in all respects in accordance with the Specifications and any, approved modifications.

Addenda - Any written change, clarification or supplement to documents issued for the Request for Proposal, issued by the District, its Architect or its Engineer prior to Proposal.

Architect – the person or entity designated by the District as its architectural representative during the course of construction, acting either directly or through properly authorized agents, such agents acting within the scope of the particular duties delegated to them.

As Approved - The words “as approved”, unless otherwise qualified, shall be understood to be followed by the words “by the Engineer” and or “by the Architect.”

As Shown, and As Indicated - The words “as shown” and “as indicated” shall be understood to be followed by the words “on the Plans”.

Award - The decision of the District to accept the proposal of the Proposer for the Work, subject to the execution and approval of a satisfactory contract therefore and bond to secure the performance thereof and to such other conditions as may be specified or required by law.

Proposal - The offer of the Proposer for the Work when made out and submitted on the prescribed Proposal form, properly signed and guaranteed.

Proposer - Any individual, firm, partnership or corporation submitting a Proposal for the Work contemplated, and acting directly or through a duly authorized representative.

Bureau - United States Bureau of Reclamation.

Calendar Day - Each day shown on the calendar.

Change Order - Written order issued by the District to the Contractor covering changes in the Contract and establishing the bases of compensation and time adjustments for work affected by the changes.

Claim - A separate demand by the contractor for (i) a time extension, (ii) payment of money or damages arising from work done by or on behalf of the contractor pursuant to the contract for a public work and payment of which is not otherwise expressly provided for or the claimant is not otherwise entitled to, or (iii) an amount the payment of which is disputed by the District.

Contract - The written agreement covering the performance of the work and the furnishing of labor, materials, tools and equipment in the construction of the Work. The Contract shall include all Contract Documents and supplemental agreements amending or extending the work contemplated which may be required to complete the Work in a substantial and acceptable manner. Supplemental agreements are written agreements covering alterations, amendments, or extensions to the contract and include addenda and change orders.

Contract Documents - Contract Documents is the collective term for all of the following documents and any other document incorporated therein by reference: Request for Proposals, Accepted Proposal, Designation of Subcontractors, Construction Contract, Payment Bond to Accompany Contract, Performance Bond to Accompany Contract, General Conditions, Supplementary and Special Conditions, (if any), Drawings (and Specifications), Addenda, Change Orders, Contractor's Certification Regarding Workers' Compensation.

Contract Provisions – Additions, revisions, special directions, and requirements peculiar to a project and not otherwise thoroughly set forth in General and/or Specifications.

Contractor - The person or persons, firm, partnership or corporation or other entity who has entered into the Contract with the District to perform the Work.

County - County of Los Angeles, California.

Date of Completion - Date of filing of the Notice of Completion with the Los Angeles County Clerk-Recorder's Office.

Date of Execution of the Contract - The date on which the Contract is signed by the District's authorized representative.

Datum - The Figures given in the Specifications or upon the drawings after the word "Elevation" or an abbreviation of it, shall mean U.S.G.S. datum, unless otherwise noted.

Days - Unless otherwise designated, days as used in the Contract Documents shall mean calendar days.

District - The Altadena Library District, also referred to as the Owner.

District Board - The Board of Trustees of the Altadena Library District.

Elevation - The figures given on the Plans or in the other Contract Documents after the word "elevation" or abbreviation of it shall mean the distance in feet above the standard datum used by the District.

Engineer - The District Engineer, or the person designated by the District as its engineering representative during the course of construction, acting either directly or through properly authorized agents, such agents acting within the scope of the particular duties delegated to them.

Extra Work - Work other than that required either expressly or implied by the Contract in its executed form.

Notice of Completion – NOC is the recorded project completion document filed with the Los Angeles County Clerk

Or Equal - The term “or equal” shall be understood to indicate that the “equal” product be the equivalent or better than the product named in function, performance, reliability, quality, and general configuration. Determination of equality in reference to the project design requirements will be made by the Architect.

Plans or Specification Drawings - The term “Plans” or “Specification Drawings” refers to the official plans, profiles, cross sections, elevations, details, and other working drawings and supplementary drawings, or reproductions thereof, signed by the Engineer, which show the location, character, dimensions, and details of the work to be performed. Plans may either be bound in the same book as the balance of the Contract Documents or bound in separate sets. Regardless of the method of binding, Plans shall be part of the Contract Documents.

Plant - All physical, resources, facilities, machinery, equipment, staging, tools, work and storage space other than provided by the Contract, together with subsidiary essentials and necessary maintenance for proper construction and acceptable completion of the project.

Project - The entire Work to be completed under the Contract.

Project Manager - The person designated by the District as its project management representative during the course of construction, acting either directly or through properly authorized agents, such agents acting within the scope of the particular duties delegated to them. The Project Manager will be the District’s Agent unless the District designates a separate Project Manager. When a Project Manager is used for a project, the Project Manager has full authority to act as the District’s Agent unless the designation specifically states otherwise.

Shop Drawings - Drawings prepared by the fabricator or supplier showing the layout and details of components fabricated in a shop for inclusion in the permanent facility (e.g., structural steel, reinforcing steel, railings).

Site - The area upon or in which the Contractor’s operations are carried on and such other areas adjacent thereto as may be designated by the Architect.

Specifications - The term “specifications” refers to the terms, provisions, and requirements contained herein. Where reference specifications, such as those of “ASTM”, “AASHTO”, etc. have been referred to, the applicable portions of such standard specifications shall become a part of these Contract Documents.

State - State of California.

Subcontractor - The term “Subcontractor”, as employed herein, includes only those having a direct contract with the Contractor and it includes one who furnishes material worked to a special design according to the plans or specifications of this work, but does not include one who merely furnishes material not so worked and would be considered a supplier only.

Time Limits - All time limits stated in the Contract Documents are of the essence of the Contract.

Work - All the work specified, indicated, shown or contemplated in the Contract Documents to construct the improvements, including all alterations, amendments or extensions thereto made by Change Order or other written orders of the Engineer.

Working Days – A Working day is defined as any day, except Saturdays, Sundays and legal holidays of the District.

Working Drawings – Drawings furnished by the Contractor showing the layout and details of temporary construction procedures and methods of construction, and data for construction equipment which are to be employed in the construction of the permanent facility (e.g., form drawings, erection drawings, load test pile procedures, pile hammer data, etc.).

Written Notice - "Written Notice" shall be deemed to have been duly served when delivered in person to the individual or to a member of the firm or to an officer of the corporation for whom it is intended, or if delivered at or sent by certified U.S. mail to the last business address known to the party who gives the notice as specified in the Contract.

Whenever in the Specifications or upon the drawings the words "directed", "required", "permitted", "ordered", "designated", "prescribed", or words of like import are used, it shall be understood that the direction, requirement, permission, order, designation or prescription of the Engineer is intended, and similarly the words "approved", "acceptable", "satisfactory", or words of like import, shall mean approved or acceptable to, or satisfactory to the Architect, unless otherwise expressly stated.

SECTION 2

SCOPE OF WORK

2.01. INTENT OF CONTRACT DOCUMENTS

The intent of the Contract Documents is to prescribe the details for the construction and completion of the Work, which the Contractor undertakes to perform in accordance with the terms of the Contract.

Where the Specifications and Plans describe portions of the Work in general terms, but not in complete detail, it is understood that only the best general practice is to prevail and that only materials and workmanship of the first quality are to be used. Unless otherwise specified, the Contractor shall furnish all labor, materials, tools, equipment and incidentals and do all the Work involved in performing the Contract in a satisfactory and workmanlike manner.

The technical provisions are presented in sections for convenience. However, this presentation does not necessarily delineate trades or limits of responsibility. All sections of the Specifications and Plans are interdependent and applicable to the Project as a whole.

The Contract Documents are complementary, and what is called for in any one shall be as binding as if called for in all. Anything shown on the Drawings and not mentioned in the Specifications or mentioned in the Specifications and not shown on the Drawings shall have the same effect as if shown or mentioned respectively in both. Any work shown on one Drawing shall be construed to be shown in all Drawings and the Contractor will coordinate the Work and the Drawings.

If any portion of the Contract Documents shall be in conflict with any other portion, the various documents comprising the Contract Documents shall govern in the following order of precedence: Change Orders; Addenda; Drawings; Supplementary and Special Conditions; Designation of Subcontractors; Construction Contract; General Conditions; Payment Bond to Accompany Contract; Performance Bond to Accompany Contract; and Contractor's Certification Regarding Workers' Compensation.

Detail Drawings take precedence over General Drawings. As between schedules and other information given on Drawings, the Schedules shall govern. If an item is shown on any Drawing and not specifically included in Technical Specifications specific to this project, the Drawing shall govern. Any conflict or inconsistency between or in the drawings shall be submitted to the Architect for clarification as soon as the Contractor becomes aware of such inconsistency.

2.02. CONTRACTOR'S UNDERSTANDING

It is understood and agreed that the Contractor has, by careful examination, satisfied itself as to the nature and location of the Work, the conformation of the ground, the character, quality and quantity of the materials to be encountered, the character of equipment and facilities needed preliminary to and during the prosecution of the Work, the general and local conditions, and all other matters which can in any way affect the Work under this Contract. No verbal agreement or conversation with any officer, agent or employee of the District, either before or after the execution of this Contract, shall affect or modify any of the terms or obligations contained herein.

2.03. CHANGES IN THE WORK

(a) The District may, at any time, by written order, make changes in the Work as deemed necessary by the Architect. Such changes include, but are not limited to:

(1) In the Specifications or Plans;

(2) In the sequence, method or manner of performance of the Work;

(3) In the owner-furnished facilities, equipment, materials, services or site; and

(4) Directing acceleration of the Work.

(b) If such changes cause an increase or decrease in the Contractor's cost of, or time required for, performance of the Contract, an equitable adjustment will be made and the Contract modified in writing accordingly.

(1) Change Orders

A change pursuant to this section will be in the form of a Change Order, which will set forth the work to be done or the method by which the change and cost adjustment, if any, will be determined, and the time of completion of the work.

Upon receipt of a Change Order, the Contractor shall proceed with the ordered work. If ordered in writing by the District, the Contractor shall proceed with the work so ordered prior to actual receipt of a Change Order. A Change Order executed by the Contractor and approved by the District is an executed Change Order as that term is used throughout this section.

(2) Change Order Protests

A Change Order may be issued to the Contractor at any time. Should the Contractor disagree with any terms or conditions set forth in a Change Order, which he has not executed, he shall submit a written protest to the District within fifteen (15) days after the receipt of such Change Order. The protest shall state the points of disagreement and, if possible, the quantities and cost involved.

If a written protest is not submitted, payment will be made as set forth in the Change Order. Such payment shall constitute full compensation for all work included therein or required thereby. Such unprotested Change Orders shall be considered as executed Change Orders.

Where the protest concerning a Change Order relates to compensation, the compensation payable for all work specified or required by said Change Order to which such protest relates will be determined in the same manner as provided in Section 2.04 of this section. The Contractor shall keep full and complete records of the cost of such work and shall permit the District to have such access thereto as may be necessary to assist in the determination of the compensation payable for such work. Where the protest concerning a Change Order relates to the adjustment of time and for completion of the Work, the time to be allowed therefor will be determined as provided in this section.

The consent of the Contractor's sureties shall not be required as to any change or Extra Work, and the liability of the Contractor's Bonds shall be increased or decreased accordingly without notice to the sureties.

2.04. PROCEDURES AND ALLOWABLE COSTS ON CHANGES AND ADDITIONS TO WORK

(a) Forms of Payment

If the change in, or addition to, the Work will result in an increase in the contract sum, the District shall have the right to require the performance thereof. The compensation to be paid for any such work shall, in the District's sole discretion, be determined in one or more of the following ways:

(1) By extension of agreed unit prices, if unit prices are required by the District's Proposal form and provided with contractor's Proposal;

(2) By revision of unit prices;

(3) By proposal and acceptance of an agreed upon lump sum; and

(4) On a force account basis.

Until one of the above methods is agreed on, or if the Work is to be paid for on a time and materials basis, the Contractor shall keep full and complete records of the cost of such work in the form and manner prescribed by the District and shall permit the District to have access to such records as may be necessary to assist in the determination of the compensation payable for such work.

(b) Lump Sum Payment

The District, in its sole and absolute discretion, may request a lump sum proposal by Contractor to perform the change in, or addition to, the Work performed. Such lump sum proposal shall be submitted by the Contractor within ten (10) days of the District's request therefor. Request for a lump sum proposal by District shall not be deemed an election by District to have the Work performed on a lump sum basis. Costs of preparing the proposal shall not be compensable.

(1) Contents of Lump Sum Proposal

(2) The Contractor's proposal shall be itemized and segregated by labor and materials for the various components of the change (no aggregate labor total will be acceptable). The proposal shall be accompanied by signed proposals of any Subcontractors, which will perform any portion of the change, and of any persons who will furnish materials or equipment for incorporation therein. The proposal shall also include the Contractor's estimate of the time required to perform said changes or additional work.

(3) Computation of Labor Costs

The portion of the proposal relating to labor, whether by the Contractor's forces or the forces of any of its Subcontractors, may include the projected wages of the reasonably anticipated Site labor, including foremen, who will be directly involved in the change in the Work. These

projected wages shall not include charges for assistant superintendents, superintendents, office personnel, timekeepers and maintenance mechanics.

Labor costs may also include Contractor's overhead and profit which shall be computed by adding to the labor costs either up to fifteen percent (15%) of the projected wages, but not payroll costs, or the labor surcharge set forth in the California Department of Transportation publication entitled Labor Surcharge And Equipment Rental Rates, which is in effect on the date upon which the Work is accomplished and which is a part of the Contract. The method of computing the overhead and profit shall be solely within the discretion of the District.

The labor surcharge, if used, shall constitute full compensation for all payments imposed by State and Federal laws and for all other payments made to, or on behalf of, the workmen, other than actual wages as defined above. No time or charges will be allowed except when the workers are actually engaged in the proper, efficient and diligent performance or completion of the extra work as authorized. Overtime shall not be worked without prior approval of the Engineer.

(4) Computation of Equipment and Materials Costs

The portion of the proposal relating to materials may include the reasonably anticipated direct costs to the Contractor or to any of its Subcontractors of materials to be purchased for incorporation in the change in the Work. This portion of the proposal may also include transportation and applicable sales or use taxes. Up to fifteen percent (15%) of these direct costs may be included as overhead and profit for the Contractor or any such Subcontractor (such overhead and profit to include all small tools).

This portion of the proposal may further include the Contractor's and any of its Subcontractors' reasonably anticipated costs for the rental and operation of prime construction and automotive equipment furnished and used in connection with the change in the Work. The equipment rental and operation rates used shall be the latest edition of the Department of Transportation, Division of Construction, Equipment Rental Rates. These costs shall not include charges for listed equipment or major tools with a new cost of five hundred dollars ($500) or less. No time charges shall be allowed except for equipment actually used for the proper and efficient performance or completion of the authorized change in the Work.

(5) Subcontractors

The lump sum proposal may include up to five percent (5%) of the amount, which the Contractor will pay to any of its Subcontractors for the change in the Work as allowable overhead and profit to the Contractor.

(6) Failure to Submit Lump Sum Proposal

In the event that the Contractor fails to submit its proposal within the designated period, the District may direct the Contractor to proceed with

the change or addition to the Work and the Contractor shall so proceed. The District shall unilaterally determine the reasonable costs and time to perform the work in question, which determination shall be final and binding upon the Contractor.

(7) Failure to Agree on Lump Sum Amount

In the event that the parties are unable to agree as to the reasonable costs and time to perform the change in or addition to the Work based upon the Contractor's proposal and the District's Representative and District do not elect to have the change in the Work performed on a time and material basis, the District's Representative and District shall make a unilateral determination of the reasonable cost and time to perform the change in the Work, based upon their own estimates, the Contractor's submission or combination thereof. In such instances, a Change Order shall be issued for the amount of costs and time determined by the District's Representative and the District and shall become binding upon the Contractor unless the Contractor submits its protest in writing to the District within thirty (30) days of the issuance of the Change Order. The District has the right to direct the Contractor in writing to perform the change in the Work, which is the subject of the Change Order. Failure of the parties to reach agreement regarding the costs and time of performing the change in the Work and/or any pending protest shall not relieve the Contractor from performing the change in the Work promptly and expeditiously.

(c) Payment by Unit Prices

If any of the items included in the lump sum proposal are covered by unit prices contained in the contract document, the District may, if it requires the change in the Work to be performed on a lump sum basis, elect to use these unit prices in lieu of the similar items included in the lump sum proposal in which event an appropriate deduction will be made in the lump sum amount prior to the application of any allowed overhead and profit percentages. No overhead and profit shall be applied to any unit prices.

(d) Payment on a Force Account Basis

If the District elects to have the change or addition to the Work performed on a force account basis, the Work shall be performed, whether by the Contractor's forces or the forces of any of its Subcontractors or Sub-subcontractors, and payment shall be made subject to the following provision. The Contractor will be paid the direct costs of the labor, equipment and materials used in performing the force account work determined as hereinafter provided.

(1) For labor, the Contractor will be paid the cost of labor for the workers (including foremen when authorized by the District's Representative) used in the actual and direct performance of the work. The cost of labor, whether the employer is the Contractor or any or any subcontractor of any tier, shall be actual wages, including basic hourly wage, health and welfare payments and pension payments incurred in performing the force account work, plus any travel and subsistence payments for the workers performing such work and made necessary thereby. To the actual wages shall be added a labor surcharge as set forth in the State Department of Transportation publication entitled "Labor Surcharge and Equipment

Rental Rates", as in effect on the date the work is performed. The labor surcharge shall be deemed to encompass the District's entire liability to reimburse the Contractor for workers compensation insurance payments, social security payments, Medicare payments, federal unemployment insurance payments, state unemployment insurance payments and state training taxes, made necessary by the force account work.

(2) For equipment, the Contractor will be paid for the use of equipment at the rental rates listed for that equipment in the State Department of Transportation publication entitled "Labor Surcharge and Equipment Rental Rates", which is in effect on the date the work is performed, regardless of ownership or any rental agreement entered into by Contractor for such equipment. The rental rate paid in accord with said publication shall be deemed to include the cost of fuel, oil, lubrication, supplies, small tools, attachments, repairs and maintenance, depreciation, storage and insurance for said equipment. Rental time will not be paid when equipment is inoperable due to breakdowns, repairs or maintenance.

(3) For materials used in the work, the District will pay for materials furnished by the Contractor and necessarily used in the force account work. Prior to markups as set forth below, the amount paid shall be the price paid by the actual purchaser to the actual supplier plus any necessary actual costs of handling the materials.

Contractor may add fifteen percent (15%) to the total labor, equipment and material charges as the total overhead and profit to the entity or entities actually performing the force account work. If the entity or entities actually performing the work are Subcontractors or Sub-subcontractors, the Contractor shall be allowed five percent (5%) of the total charge of the performing entity or entities (including mark- up) as Contractor's mark-up. No other mark-ups shall be allowed hereunder.

The Contractor shall submit to the District daily work and material tickets, to include the identification number assigned to the change in the Work, the location and description of the change in the Work, the classification of labor employed (and names and social security numbers), hours expended, the material used, the equipment rented (not tools) and such other evidence of cost as the District may require. The District may require authentication of all time and material tickets and invoices by persons designated by the District for such purpose. The failure of the Contractor to secure any required authentication shall, if the District elects to treat it as such, constitute a waiver by the Contractor of any claim for the cost of that portion of the Change in the Work covered by a non-authenticated ticket or invoice; provided, however, that the authentication of any such ticket or invoice by the District shall not constitute an acknowledgment by the District that the items thereon were reasonably required for the Change in the Work.

(e) Limitations on Changes

The Contractor shall not be entitled to any amount for indirect costs, damages or expenses of any nature, including, but not limited to, so-called "impact" costs, labor

inefficiency, wage, material or other escalations beyond the prices upon which the proposal is based and to which the parties have agreed pursuant to the provisions of this section, and which the Contractor, its Subcontractors and Sub-subcontractors or any other person may incur as a result of delays, interferences, suspensions, changes in sequence or the like, for whatever cause, whether reasonable or unreasonable, foreseeable or unforeseeable, or avoidable or unavoidable, arising from the performance of any and all changes in the work performed pursuant to this section. It is understood and agreed that the Contractor's sole and exclusive remedy in such event shall be recovery of its direct costs as compensable hereunder and an extension of the time of the Contract, but only in accordance with the provisions of the Contract Documents.

It is expressly agreed that Contractor shall not be entitled to claim damages for anticipated profits on any portion of the Work that may be deleted.

The amount of any adjustment for work deleted shall be estimated at the time deletion of work is ordered and the estimated adjustment will be deducted for the subsequent monthly pay estimates. The District reserves its rights under Section 3.18 to audit Contractor's as-proposed profit in connection with any deductive change, to arrive at a final adjustment. Contractor's as-proposed profit shall be reduced pro rata according to the proportion of the original contract value less as-proposed profit, represented by the work deleted.

The District reserves the right to contract with any person or firm other than the Contractor for any or all Extra Work.

2.05. UNILATERAL CHANGE IN OR ADDITION TO THE WORK

Notwithstanding the above, the District, directly or through the District's Representative, may direct the Contractor in writing to perform changes in or additions to the scope of the Contract. The Contractor shall perform such work and the parties shall proceed pursuant to the provisions of Section 2.04.

2.06. DIFFERING SITE CONDITIONS

The Contractor shall promptly, and before the following conditions are disturbed, notify the District in writing of any:

(a) Material that the Contractor believes may be material that is hazardous waste, as defined in Section 25110.02 of the Health and Safety Code, that is required to be removed to a Class I, Class II, or Class III disposal site in accordance with provisions of existing law; or

(b) Subsurface or latent physical conditions at the Site differing from those indicated in the Contract Documents; or

(c) Unknown conditions at the Site of any unusual nature, different materially from those ordinarily encountered and generally recognized as inherent in work of the character provided for in the Contract.

The Architect/Engineer shall thereupon promptly investigate the conditions. If the Engineer finds that they do involve hazardous waste, or do materially differ and cause an decrease or increase in the Contractor's cost or time of performance, the District will issue a change order as appropriate. Any increase or decrease of cost resulting from such changes shall be adjusted in the manner provided in Section 2.04 for adjustments as to extra and/or additional work and changes. In the event that a dispute arises between the District and the

Contractor, whether the conditions materially differ, or involve hazardous waste, or cause and decrease or increase the Contractor's cost of, or time required for, performance of any part of the Work, the Contractor shall not be excused from any scheduled completion date provided by the Contract, but shall proceed with all work to be performed under the Contract, the procedures applicable to claims for extra costs shall then apply.

2.07. CLAIMS FOR EXTRA COSTS

(a) Notice of Potential Claims

(1) It is hereby mutually agreed that the Contractor shall not be entitled to the payment of any additional compensation for any cause, including any act, or failure to act, by the District, or the happening of any event, thing or occurrence, unless the Contractor provides the District with written notice of the potential claims as hereinafter specified. Compliance with this section, however, shall not be a prerequisite as to matters within the scope of the protest provisions in Section 2.03.

(2) The written notice of potential claims shall set forth the reasons for which the Contractor believes additional compensation will or may be due, the nature of the costs involved, and, insofar as possible, the amount of the potential claim. The notice as above required shall be given to the District prior to the time that the Contractor commences performance of the Work giving rise to the potential claim for additional compensation, if based on an act or failure to act by the District, or in all other cases within ten (10) days after the happening of the event, thing or occurrence giving rise to the potential claim.

(b) Resolution of Claims

(1) Submission of Claims. The Contractor may file a written claim, as defined by Public Contract Code section 9204(c)(1), with the Owner including reasonable documentation to support the claim. Upon receipt of the claim, the Owner shall conduct a reasonable review of the claim, and within a period not to exceed forty-five (45) days, the Owner shall provide the Contractor with a written statement identifying what portion of the claim is disputed and what portion is undisputed. The time in which the Owner must provide a written statement may be extended by mutual agreement of the parties as specified by Public Contract Code section 9204(d)(1)(C). The Owner shall pay any undisputed portion of the claim within sixty (60) days after issuance of its written statement.

(2) Meet And Confer Regarding Unresolved Formal Claim. If the Contractor disputes the Owner's written statement issued pursuant to Section 2(7)(b)(1) or if the Owner fails to issue a timely written response, the Contractor may demand in writing an informal conference to meet and confer for settlement of the issues in dispute. Upon receipt of a demand in writing sent by registered mail or certified mail, return receipt requested, the Owner shall schedule a meet and confer conference within thirty (30) days for settlement of the dispute. The meet and confer conference shall be attended by senior executives of the parties who have authority to settle the controversy. Within ten (10) business days following the conclusion of the meet and confer conference, the Owner

shall provide the Contractor with a written statement identifying the portion of the claim that remains in dispute and the portion that is undisputed. The Owner shall pay any undisputed portion of the claim within sixty (60) days after it issues its written statement.

(3) Mediation. If the Contractor disputes, in writing, any portion of the Owner's written statement as issued under Section 2(7)(b)(2), the disputed items shall be submitted to nonbinding mediation according to the provisions of Public Contract Code section 9204(d)(2), and any costs of mediation shall be allocated as set forth in that section. Upon receipt of a claim, the Owner and the Contractor may agree to waive, in writing, mediation.

(4) Failure to Respond or Pay. If the Owner fails to timely respond to a claim from the Contractor or otherwise fails to meet the time requirements of Public Contract Code section 9204, the claim shall be deemed rejected in its entirety. Additionally, amounts not timely paid in the manner required by Public Contract Code section 9204 shall bear interest at seven (7) percent per annum.

(5) Subcontractor Claims. If a subcontractor or a lower tier subcontractor lacks legal standing to assert a claim against the Owner because privity of contract does not exist, the Contractor may present to the Owner a claim on behalf of the subcontractor or lower tier subcontractor pursuant to Public Contract Code section 9204(d)(5).

(6) Government Claims Act. If, following compliance with the requirements with Section 2(7)(b)(1-5), the claim or any portion thereof remains in dispute, the claimant may file a claim pursuant to Chapter 1 (commencing with Section 900) and Chapter 2 (commencing with Section 910) of Part 3 of Division 3.6 of Title 1 of the Government Code. For purposes of those provisions, the running of the period of time within which a claim must be filed shall be tolled from the time the claimant submits its written claim pursuant to subdivision (a) until the time the claim is denied, including any period of time utilized by the meet and confer conference

2.08. DISPUTES

Except as otherwise specifically provided in the Contract Documents, the District will initially decide all claims of the Contractor and all disputes arising under and by virtue of the Contract. Such claim or dispute will be processed and decided by the District as soon as practicable after its submission and the submission or availability of any additional information necessary to its decision. If the Contractor is dissatisfied with the District's decision, the Contractor may, within fifteen (15) days from the date of the District's decision, follow the procedures set forth in Section 2.07. If the Contractor fails to follow the procedures set forth in Section 2.07 within the fifteen (15)-day period, then the District's decision shall be final, conclusive and binding on the Contractor.

2.09. GUARANTEE

(a) In addition to warranties, representations and guarantees stated elsewhere in the Contract Documents, the Contractor unconditionally guarantees all materials and workmanship furnished hereunder, and agrees to replace the same at

its sole cost and expense, and to the satisfaction of the Engineer, any and all materials which may be defective or improperly installed.

(b) The Contractor shall repair or replace to the satisfaction of the District any or all such work that may prove defective in workmanship or materials, ordinary wear and tear excepted, together with any other work, which may be damaged or displaced in so doing.

(c) In the event of failure to comply with the above stated conditions within a reasonable time, the District is authorized to have the defect repaired and made good at the expense of the Contractor who will pay the costs and charges therefore immediately upon demand, including any reasonable management and administrative costs, and engineering, legal and other consultant fees incurred to enforce this section.

(d) The signing of the Contract by the Contractor shall constitute execution of the above guarantees. Except as otherwise provided in this Contract, the guarantees and warranties shall remain in effect for a period of one (1) year after final acceptance of the Work by the District.

SECTION 3

CONTROL OF WORK

3.01. AUTHORITY OF DISTRICT'S REPRESENTATIVE

(a) The District's Representative is the representative of the District and has full authority to interpret the Contract Documents, to conduct the construction review and inspection of the Contractor's performance, and to decide questions, which arise during the course of the Work and the District's Representative's decisions on these matters, shall be final and conclusive. The District's Representative has the authority to reject all work and materials, which do not conform to the Contract Documents, and has the authority to stop the Work whenever such stoppage may be necessary to insure the proper execution of the Contract. The District's Representative's failure to stop the Work shall not obligate the District to accept defective or otherwise unacceptable work or otherwise affect the District's Representative's or District's authority to reject work for any reason set forth in the Contract Documents.

(b) If at any time the Contractor's work force, tools, plant or equipment appear to the District's Representative to be insufficient or inappropriate to secure the required quality of work or the proper rate of progress, the District's Representative may order the Contractor to increase their efficiency, improve their character, to augment their number or to substitute other personnel, new or additional tools, plant or equipment, as the case may be, and the Contractor shall comply with such order. Neither the failure of the District's Representative to demand such increase of efficiency, number, or improvement, nor the compliance by the Contractor with the demand, shall relieve the Contractor of its obligation to provide quality work at the rate of progress necessary to complete the Work within the specified time.

(c) The District's Representative may authorize minor variations in the work from the requirements of the Contract Documents which do not involve an adjustment in the Contract Price or the Contract Time. These may be accomplished by a Field Order. Contractor shall comply promptly with all Field Orders. If the District's Representative and Contractor are unable to agree on entitlement or on the amount or extent, if any, of any adjustment in the Contract Price or Contract time, or cost, as a result of a Field Order, a claim may be made therefor pursuant to Section 2.07.

(d) Any order given by the District's Representative, not otherwise required by the Contract Documents to be in writing shall, on request of the Contractor, be given or confirmed by the Engineer in writing.

(e) Whenever work, methods of procedure, or any other matters are made subject to direction or approval, such direction or approval will be given by the District's Representative.

(f) If the Contractor, in the course of the Work, finds any discrepancy between the Drawings and the physical condition of the locality, or any errors or omissions in the Drawings, or in the layout as given by points and instructions, it shall be the Contractor's duty to inform the Architect in writing, and the Architect will promptly verify the same.

Any work done after such discovery, until authorized, will be done at the Contractor's risk. All Drawings, Specifications, and copies thereof furnished by the Architect are the property of the Architect and shall not be reused on other work and, with the exception of the signed Contract sets, are to be returned to the Architect, on request, at the completion of the Work. All models are the property of the District.

(g) The Drawings shall be supplemented by such Shop Drawings prepared by the fabricator and/or supplier and Working Drawings prepared by the Contractor as are necessary to adequately control the Work. No changes shall be made by the Contractor in any Shop or Working Drawings after they have been reviewed by the Architect, if the Architect deems that no further submittals are necessary. The Contractor shall not commence the layout, purchase, fabrication, or construction of any work for which Shop or Working Drawings are required until Engineer has reviewed the specifications and drawings and has indicated in writing no further submittals are required for compliance with the Contract Documents.

(h) Shop and Working Drawings for any structure shall include, but not be limited to, detail design calculations, fabrication and installation drawings, lists, graphs, operating instructions, etc., which shall be reviewed and accepted by the Architect before any such work is performed.

(i) Shop and Working Drawings will be required for cribs, cofferdams, falsework, centering and form work and for other temporary work and methods of construction the Contractor proposes to use. Such Drawings shall be subject to the review and acceptance of the Architect insofar as the details affect the character of the finished work, but details of design will be left to the Contractor who shall be responsible for the successful construction of the Work.

(j) Contractor agrees that Shop and/or Working Drawings processed by the Architect are not Change Orders; that the purpose of these Drawings submitted by the Contractor is to demonstrate to the Architect that the Contractor understands the design concept, that the Contractor demonstrates its understanding by indicating which equipment and material the Contractor intends to furnish and by detailing the fabrication methods it intends to use. It is expressly understood, however, that favorable review of the Contractor's Shop and Working Drawings shall not relieve the Contractor of any responsibility for accuracy of dimensions and details, or for mutual agreements of dimensions and details. It is mutually agreed that the Contractor shall be responsible for agreement and conformity of its Drawings with the Specifications. Contractor further agrees that if deviations, discrepancies or conflicts between Shop and/or Working Drawings and Specifications are discovered either prior to or after the Drawings are processed by the Architect, the Specifications shall control and shall be followed.

(k) Unless otherwise stated, the Architect shall have thirty (30) days from the date of receipt of Shop and/or Working Drawings for review.

(l) Full compensation for furnishing all Shop and/or Working Drawings shall be considered as included in the prices paid for the Contract items of work to which such drawings relate and no additional compensation will be allowed therefore. Any cost related to the Architect's review of any particular set of Shop and/or Working Drawings more than twice, due to incompleteness or unacceptability, shall be borne by the Contractor, and the District reserves the right to withhold such costs from payments due the Contractor.

(m) All reasonable effort has been made to locate and delineate all known structures and facilities on the plans. Except as otherwise provided herein, the District shall assume no responsibility for the completeness or accuracy of its delineation of underground utilities nor the existence of other buried objects which may be encountered, or which are not shown on the plans.

(n) The Contractor shall keep and maintain a clean set of plans for the project and shall record in red ink all changes, revisions, etc. made during the course of construction. These plans shall include all changes, revisions, etc. from the original plan complete with the exact sizes, locations, dimensions, elevations, etc. These plans shall be kept and maintained in a neat, clean and legible condition and shall be available for inspection at all times by the Architect. The Contractor shall deliver these completed plans to the Architect and the Architect shall approve these plans prior to final acceptance of the project by the District.

3.02. PERMITS AND REGULATIONS

Permits and licenses, of a temporary or permanent nature, necessary for the prosecution of the Work shall be secured and paid for by the Contractor.

The Contractor shall give all notices and comply with all laws, ordinances, rules and regulations bearing on the conduct of the Work as shown on the plans and described in the Specifications. Contractor shall promptly notify the Architect in writing of any specification at variance therewith. In such instances, any necessary changes shall be adjusted as provided in the Contract for changes in the Work. If the Contractor performs any Work knowing it to be contrary to such laws, ordinances, rules, and regulations and without such notice to the Architect, Contractor shall bear all costs arising therefrom.

3.03. CONFORMITY WITH CONTRACT DOCUMENTS AND ALLOWABLE DEVIATIONS

Work and materials shall conform to the lines, grades, cross sections, dimensions and material requirements, including tolerances, shown on Contract Documents. Although measurement, sampling, and testing may be considered evidence as to such conformity, the Architect shall be the sole judge as to whether the Work or materials deviate from the Contract Documents. The Architect's decision as to any allowable deviations therefrom shall be final and conclusive.

3.04. COORDINATION AND INTERPRETATION OF CONTRACT DOCUMENTS

(a) Should it appear that the Work to be done or any of the matters relative thereto are not sufficiently detailed or explained in the Specifications and Plans, the Contractor shall apply to the Architect for such further explanations as may be necessary and shall conform to them as part of the Contract. In the event of any doubt or question arising respecting the true meaning of the Specifications and Plans, reference shall be made to the Architect, whose decision thereon shall be final and conclusive.

(b) Any reference made in the Specifications and Plans to any specification, standard, method, or publication of any scientific or technical society or other organization shall, in the absence of a specific designation to the contrary, be understood to refer to the specification, standard, method, or publication in effect as of the date that the Work is advertised for Proposals.

3.05. SUBCONTRACTORS

(a) The attention of the Contractor is directed to the provisions of California Public Contract Code sections 4100-4113 regarding subcontracting and said provisions are by this reference incorporated herein and made a part hereof.

(b) Each subcontract shall contain a suitable provision for the suspension or termination thereof should the Work be suspended or terminated or should the Subcontractor neglect or fail to conform to every provision of the Contract Documents insofar as such provisions are relevant. The Contractor shall be fully responsible to the District for the acts or omissions of the Contractor's Subcontractors and of the persons either directly or indirectly employed by the Contractor. Nothing contained in the Contract Documents shall create any contractual relationship between any Subcontractor and the District. If a legal action, including arbitration and litigation, against the District is initiated by a Subcontractor or Supplier, the Contractor shall reimburse the District for the amount of legal, engineering and all other expenses incurred by the District in defending itself in said action.

(c) The District, the District's Representative and the Architect reserve the right to approve all Subcontractors.

Such approval shall be a consideration to the awarding of the Contract and unless notification to the contrary is given to the Contractor prior to the signing of the Contract, the list of Subcontractors which is submitted with the Contractor's proposal will be deemed to be acceptable. Contractor shall not, without the written consent of the District, subcontract the whole of the Work.

3.06. COOPERATION OF CONTRACTORS

(a) Should construction be under way by other forces or by other contractors within or adjacent to the limits of the Work specified or should work of any other nature be under way by other forces within or adjacent to said limits, the Contractor shall cooperate with all such other contractors or other forces to the end that any delay or hindrance to their work will be avoided. The right is reserve d to perform other or additional work at or near the site (including material sources) at any time, by the use of other forces.

(b) When two or more contractors are employed on related or adjacent work, each shall conduct its operation in such a manner as not to cause any unnecessary delay or hindrance to the other. Each contractor shall be responsible to the other for all damage to work, to persons or property caused to the other by its operations, and for loss caused the other due to unnecessary delays or failure to finish the work within the time specified for completion.

3.07. SUPERINTENDENCE

(a) The Contractor shall designate in writing, before starting work, an individual as authorized representative who shall have the authority to represent and act for the Contractor. This authorized representative shall be present at the Site of the Work at all times while work is actually in progress on the Contract. When the Work is not in progress and during periods when the Work is suspended, arrangements acceptable to the District shall be made for any emergency work, which may be required.

(b) The Contractor is solely responsible, at all times, for the superintendence of the Work and for its safety and progress.

(c) Whenever the Contractor or its authorized representative is not present on any particular part of the Work where it may be desired to give direction, orders will be given by the District, which shall be received and obeyed by the superintendent or foreman who may have charge of the particular work in reference to which the orders are given.

(d) Any order given by the District, not otherwise required by the Specifications to be in writing, will on request of the Contractor, be given or confirmed by the District in writing.

3.08. INSPECTION OF WORK

(a) Unless otherwise provided, all equipment, materials, and work shall be subject to inspection and testing by the Architect /Engineer & District's 3rd Party Testing Agency. The Architect /Engineer & District's 3rd Party Testing Agency will observe the progress and quality of the Work and determine, in general, if the Work is proceeding in accordance with the intent of the Contract Documents. The Architect /Engineer & District's 3rd Party Testing Agency shall not be required to make comprehensive or continuous inspections to check the quality of the Work. The Architect /Engineer & District's 3rd Party Testing Agency shall not be responsible for construction means, methods, techniques, sequences, or procedures, or for safety precautions and programs in connection with the Work. Visits and observations made by the Architect /Engineer & District's 3rd Party Testing Agency shall not relieve the Contractor of Contractor's obligation to conduct comprehensive inspections of the Work and to furnish proper materials, labor, equipment and tools, and perform acceptable work, and to provide adequate safety precautions, in conformance with the intent of the Contract.

(b) Whenever the Contractor varies the period during which work is carried on each day, the Contractor shall give due notice to the Architect /Engineer & District's 3rd Party Testing Agency so that proper inspection may be provided. Any work done in the absence of the Architect /Engineer & District's 3rd Party Testing Agency shall be subject to rejection. Proper facilities for safe access for inspection to all parts of the Work shall at all times be maintained for the necessary use of the Architect /Engineer & District's 3rd Party Testing Agency and other agents of the District, and agents of the federal, state, or local governments at all reasonable hours for inspection by such agencies to ascertain compliance with laws and regulations.

(c) One or more inspectors may be assigned to observe the Work by the Architect /Engineer & District's 3rd Party Testing Agency and to act in matters of construction under this Contract. It is understood that inspectors shall have the power to issue instructions and make decisions within the limitations of the authority of the Architect /Engineer & District's 3rd Party Testing Agency. Such inspection shall not relieve the Contractor of the Contractor's obligation to conduct comprehensive inspections of the Work, to furnish proper materials, labor, equipment and tools, and perform acceptable work, and to provide adequate safety precautions in conformance with the intent of the Contract.

(d) The Architect /Engineer & District's 3rd Party Testing Agency and the Architect /Engineer & District's 3rd Party Testing Agency's representatives shall at all

times have access to the Work wherever it is in preparation or progress, and the Contractor shall provide safe and convenient facilities for such access and for inspection. If the Specifications, the Architect /Engineer & District's 3rd Party Testing Agency's instructions, laws, ordinances, or any public authority require any material, equipment or work to be specifically tested or approved, the Contractor shall give the Architect /Engineer & District's 3rd Party Testing Agency timely notice of its readiness for inspection, and if the inspection is by an authority other than the District, of the time fixed for inspection. Inspections by the Architect /Engineer & District's 3rd Party Testing Agency will be made promptly and, where practicable, at the source of supply.

(e) Work performed without inspection may be required to be removed and replaced under proper inspection. In such instances, the entire cost of removal and replacing, including the cost of District-furnished materials used in the Work, shall be borne by the Contractor, regardless of whether or not the Work exposed is found to be defective. Examination of questioned work, other than that installed without inspection, may be ordered by the Architect /Engineer & District's 3rd Party Testing Agency and, if so ordered, the Work must be uncovered by the Contractor. If such work is found to be in accordance with the Contract Documents, the District will pay the cost of re-examination and replacement. If such work is found to be not in accordance with the Contract Documents, the Contractor shall pay such cost, unless the Contractor can show that the defect in the Work was caused by another contractor, and in that event the District will pay such costs.

(f) The inspection of the Work shall not relieve the Contractor of the Contractor's obligation to fulfill the Contract as herein prescribed, or in any way alter the standard of performance provided by the Contractor, and defective work shall be made good and unusable materials may be rejected, notwithstanding that such work and materials have been previously overlooked by the Architect /Engineer & District's 3rd Party Testing Agency and accepted or estimated for payment. If the Work or any part thereof shall be found defective, the Contractor shall, within ten (10) calendar days, make good such defect in a manner satisfactory to the Architect /Engineer & District's 3rd Party Testing Agency. If the Contractor fails to make ordered repairs of defective work or to remove the condemned materials from the Work within ten (10) calendar days after written direction by the Architect /Engineer & District's 3rd Party Testing Agency, the District may make the ordered repairs, or remove the condemned materials, and deduct the cost thereof from any monies due the Contractor.

(g) The Contractor shall furnish promptly, without additional charge, all facilities, labor and materials reasonably needed by the Architect /Engineer & District's 3rd Party Testing Agency for performing all inspection and tests. Contractor shall be charged with any additional cost of inspection when material and workmanship are not ready at the time specified by the Contractor for its inspection.

(h) Where any part of the Work is being done under an encroachment permit or building permit, or is subject to federal, state, county or District codes, laws, ordinances, rules or regulations, representatives of the government agency shall have full access to the Work and shall be allowed to make any inspection or tests in accordance with such permits, codes, laws, ordinances, rules, or regulations. If advance notice of the readiness of the Work for inspection by the governing agency is required, the Contractor shall furnish such notice to the appropriate agency.

(i) The Architect /Engineer & District's 3rd Party Testing Agency may inspect the production of material, or the manufacture of products at the source of

supply. Plant inspection, however, will not be undertaken until the Architect /Engineer & District's 3rd Party Testing Agency is assured of the cooperation and assistance of both the Contractor and the material producer. The Architect /Engineer & District's 3rd Party Testing Agency or the Architect /Engineer & District's 3rd Party Testing Agency's authorized representative shall have free entry at all times to such parts of the plant as concerns the manufacture or production of the materials. Adequate facilities shall be furnished free of charge to make the necessary inspection. The District assumes no obligation to inspect materials at the source of supply.

3.09. TESTS

The District shall perform, at the District's own expense, all tests specified or required by the Specifications. The Engineer may perform such tests as the Engineer deems necessary to determine the quality of work or compliance with Contract Documents. The Contractor shall furnish promptly without additional charge all facilities, labor, and material reasonably required for performing safe and convenient tests as may be required by the Engineer. All tests by the Engineer will be performed in such a manner as will not unnecessarily delay the Work. The Contractor shall not be required to reimburse the District for tests performed by the District or Engineer. If samples of materials are submitted which fail to pass the specified tests, the Contractor shall pay for all subsequent tests. The District is responsible for the 3rd party testing.

3.10. REMOVAL OF REJECTED AND UNAUTHORIZED WORK AND MATERIALS

(a) All work or materials, which have been rejected, shall be remedied, or removed and replaced by the Contractor in an acceptable manner and no compensation shall be allowed the Contractor for such removal, replacement, or remedial work.

(b) Any work done beyond the lines and grades shown on the plans or established by the Architect or any Extra Work done without written authority will be considered as unauthorized work and will not be paid for. Upon order of the Architect or District Representative, unauthorized work shall be remedied, removed, or replaced at the Contractor's expense.

(c) Upon failure of the Contractor to comply with any order of the Architect or District Representative made under this section, the District may cause rejected or unauthorized work to be remedied, removed, or replaced, and may deduct the costs therefore from any monies due or to become due the Contractor.

3.11. DEDUCTIONS FOR UNCORRECTED WORK

If the Architect or District Representative deems it inexpedient to correct work damaged or not done in accordance with the Contract, an equitable deduction from the Contract price shall be made therefore, and such sum may be withheld by the District from Contractor's payment.

3.12. EQUIPMENT AND PLANTS

(a) Only equipment and plants suitable to produce the quality of work and materials required will be permitted to operate on the Project.

(b) Plants will be designed and constructed in accordance with general practice for such equipment and shall be of sufficient capacity to insure the production of sufficient material to carry the Work to completion within the time limit.

(c) The Contractor shall provide adequate and suitable equipment and plants to meet the above requirements, and when ordered by the Architect or District Representative, shall remove unsuitable equipment from the Work and discontinue the operation of unsatisfactory plants. Contractor shall, upon request of the Architect or District Representative, submit one or more lists identifying, by make, model number, contractor's identification number and empty gross weight, each piece of operable equipment used for the Work. Contractor shall, upon request of the Architect or District Representative, submit documentation establishing that any measuring device used for the Work has been tested and properly approved under California Test 109.

(d) In the case of termination of this Contract before its completion for any cause whatsoever, the Contractor, if notified to do so by the District, shall promptly remove any part or all of its equipment and supplies from the property of the District. If the Contractor fails to do so, the District shall have the right to remove such equipment and supplies at the expense of the Contractor.

3.13. CHARACTER OF WORKER

If any Subcontractor, or person employed by the Contractor or any Subcontractor fails or refuses to carry out the directions of the Architect or District Representative or appears to the Architect or District Representative to be incompetent or to act in a disorderly or improper manner, said person shall be removed from the Project immediately on the requisition of the Architect or District Representative. That person shall not again be employed on the Work. Such discharge shall not be the basis for any claim for compensation or damages against the District, or any of its officers or agents.

3.14. SEPARATE CONTRACTS

(a) The District reserves the right to let other contracts in connection with this Work. The Contractor shall afford other contractors reasonable opportunity for the introduction and storage of their materials and the execution of their work, and shall properly connect and coordinate Contractor's work with the other contractor's work.

(b) If any part of the Contractor's work depends on proper execution or results upon the Work of any other contractor, the Contractor shall inspect and promptly report to the District Representative any defects in such work that render it unsuitable for such proper execution and results. The Contractor's failure to inspect and report shall constitute an acceptance of the other contractor's work as fit and proper for the reception of the Contractor's work, except as to defects which may develop in the other contractor's work after the execution of the Contractor's work.

(c) To insure the proper execution of Contractor's subsequent work, the Contractor shall measure work already in place and shall at once report to the District Representative any discrepancy between the executed work and the Drawings.

3.15. ASSIGNMENT

The Contractor shall not assign the Contract or sublet it as a whole or in part without the written consent of the District, nor shall the Contractor assign any monies due, or to become due to the Contractor hereafter without the prior written consent of the District.

3.16. USE OF COMPLETED PORTIONS, RIGHT TO OPERATE UNSATISFACTORY EQUIPMENT OR FACILITIES

(a) The District may, at any time, and from time to time, during the performance of the Work, enter the Work Site for the purpose of installing any necessary work by District labor or other contracts, and for other purpose in connection with the installation of facilities. In doing so, the District shall endeavor not to interfere with the Contractor and the Contractor shall not interfere with other work being done by or on behalf of the District.

(b) If, prior to completion and final acceptance of all the Work, the District takes possession of any structure or facility (whether completed or otherwise) comprising a portion of the Work with the intent to retain possession thereof (as distinguished from temporary possession contemplating the return to the Contractor), then, while the District is in possession of the same, the Contractor shall be relieved of liability for loss or damage to such structure other than that resulting from the Contractor's fault or negligence. Such taking of possession by the District shall not relieve the Contractor from any provisions of this Contract regarding such structure, other than to the extent specified in the preceding sentence, nor shall such taking constitute a final acceptance of such structure or facility.

(c) If, following installation of any equipment or facilities furnished by the Contractor, defects requiring correction by the Contractor are found, the District shall have the right to operate such unsatisfactory equipment or facilities and make reasonable use thereof until the equipment or facilities can be shut down for correction of defects without injury to the District.

3.17. LANDS FOR WORK, RIGHT-OF-WAY CONSTRUCTION ROADS

(a) The District will provide the lands, easements, right-of-way, and/or encroachment permits necessary or other rights to enter and work on lands necessary for the performance of the Work. Other permits and licenses are addressed by Section 3.02. Should the Contractor find it advantageous to use any additional land for any purpose whatever, the Contractor shall provide for the use of such land at its expense. The District or District Representative shall be furnished with a copy of written agreements or otherwise be notified in writing of additional working space which is acquired. Nothing herein contained and nothing marked on the Plans shall be interpreted as giving the Contractor exclusive occupancy of the territory provided by the District. When two or more contracts are being executed at one time on the same or adjacent land in such a manner that work on one contract may interfere with that on another, the District or District Representative shall decide which contractor shall cease work, and which shall continue, or whether the work on both contracts shall progress at the same time and in what manner, and the decision of the District or District Representative shall be final and binding. When the territory of one contract is the necessary or convenient means of access for the performance of another contract, such privilege of access or any other reasonable privilege may be granted by the District or District Representative to the contractor so desiring, to the extent, amount,

in the manner, and at the time permitted. No such decision as to the method or time of conducting the Work or the use of territory shall be the basis of any claim for delay or damage.

(b) Lands, easements or rights-of-way to be furnished by the District for construction operations will be specifically shown on the Plans.

(c) The Contractor shall construct and maintain all roads necessary to reach the various parts of the Work and for the transportation thereto of construction material and personnel. The cost of constructing and maintaining such roads shall be borne by the Contractor.

3.18. DISTRICT'S RIGHT TO AUDIT AND PRESERVATION OF RECORDS

(a) The Contractor shall maintain books, records and accounts of all costs in accordance with generally accepted accounting principles and practices. The District and its authorized representatives shall have the right to audit the books, records and accounts of the Contractor under any of the following conditions:

(1) The Contract is terminated for any reason in accordance with the provisions of the Contract Documents in order to arrive at equitable termination costs;

(2) In the event of a disagreement between the Contractor and the District over the amount due the Contractor under the terms of the Contract;

(3) To check or substantiate any amounts invoiced or paid which are required to reflect the costs of the Contractor, or the Contractor's efficiency or effectiveness under this Contract or in connection with extras, changes, claims, additions, backcharges, or others, as may be provided for in this Contract;

(4) If it becomes necessary to determine the District's rights and the Contractor's obligations under the Contract or to ascertain facts relative to any claim against the Contractor which may result in a charge against the District;

(5) To determine any difference in cost occasioned by a permissible substitution;

(6) And/or for any other reason in the District's sole judgment.

(b) Contractor shall provide the District (or its representatives), unlimited, reasonable access during working hours to the Contractor's books and records. The District's audit rights shall be liberally construed in the District's favor.

(c) The Contractor, from the effective date of final payment or termination hereunder, shall preserve and make available to the District for a period of three (3) years thereafter, at all reasonable times at the office of the Contractor (but without any charge to the District), all its books, records, documents, photographs, micro-

photographs, and other evidence bearing on the costs and expenses of the Contractor under this Contract and relating to the Work hereunder.

(d) The District will make all payments required of it under this Contract subject to audit, under circumstances stated above, which audit may be performed at the District's option, either during the Contract time period or during the record retention time period. Regardless of authorization, approval or acceptance, signatures or letters which are given by the District and are part of the District's control systems or are requested by the Contractor, the payments made under this Contract shall not constitute a waiver or agreement by the District that it accepts as correct the billings, invoices or other charges on which the payments are based. If the District's audit produces a claim against the Contractor, the District may pursue all its legal remedies even though it has made all or part of the payments required by this Contract.

(e) If any audit by the District or its representative discloses an underpayment by the District pursuant to the terms of the Contract Documents, the District shall have the duty to pay any amount found by the audit to be owed to the Contractor. If such audit discloses an overpayment, the Contractor shall have the obligation to reimburse the District for the amount of the overpayment. The District's right to claim reimbursement from the Contractor of any overpayment shall not be terminated or waived until three years after the completion of the District's audit or upon the termination of audit rights under subparagraph 3.18(f), whichever date is later. The obligation of the Contractor to make reimbursements hereunder shall not terminate except as provided by law.

(f) The District's right to audit and the preservation of records shall terminate at the end of three (3) years after the date final payment is made or termination of the Contract. The Contractor shall include this "Right to Audit and Preservation of Records" clause in all subcontracts issued by it and it shall require the same to be inserted by all lower tier Subcontractors in their subcontracts, for any portion of the work. Should Contractor fail to include this clause in any such contract or lower tier contract, or otherwise fail to insure the District's rights hereunder, Contractor shall be liable to the District for all costs, expenses and attorney's fees which the District may have to incur obtaining or attempting to obtain an audit or inspection of or the restoration of records which otherwise would have been available to the District from said persons under this clause. Such audit may be conducted by the District or its authorized representative.

SECTION 4

CONTROL OF MATERIALS

4.01. MATERIALS

(a) Unless otherwise specifically stated in the Specifications, the Contractor shall furnish all materials necessary for the execution and completion of the Work. Unless otherwise specified, all materials shall be new and shall be manufactured, handled, and installed in a workmanlike manner to insure completion of the Work in accordance with the Contract Documents. The Contractor shall, upon request of the Architect or District Representative, furnish satisfactory evidence as to the kind and quality of materials.

(b) Where materials are to be furnished by the District, the type, size, quantity and location at which they are available will be stated in the Contract Documents.

(c) Manufacturers' warranties, guarantees, instruction sheets and parts listed, which are furnished with certain articles or materials incorporated in the Work, shall be delivered to the Engineer before acceptance of the Contract.

4.02. STORAGE OF MATERIALS

Articles or materials to be incorporated in the Work shall be stored in such a manner as to insure the preservation of their quality and fitness for the Work, and to facilitate inspection.

4.03. TRADE NAMES AND ALTERNATIVES

Whenever a material, article, system or sub-system is specified or described by using the name and/or model of a proprietary product or trademark or the name of the manufacturer or vendor, the specified item shall establish the type, function, and quality required. It shall be understood that the words "or approved equivalent" are implied whether or not they follow the proprietary enumeration.

The District reserves the right to determine when proprietary items have no equivalency, and when uniformity of operations, interchangeability of parts, standard parts inventory, etc., are in the District's best interest.

Requests for review of equivalency will be considered upon submission of sufficient information as described herein, to allow complete review. Such requests shall not be accepted from anyone other than the Contractor. Such submission must be made prior to purchase, fabrication, manufacture or use of the equivalent items under consideration.

(a) Contractor's Risk. If the Contractor includes in its Proposal or later proposes any material, product or equipment that the Contractor considers equivalent to that specified, the Contractor assumes all risk of any sort associated with acceptance or rejection of proposed equivalent items. The Contractor shall have no right to make claim based upon Contractor's Proposal that includes a proposed equivalent item(s) of work which resulted in a lower Proposal amount for said item(s) or lower total Proposal.

(b) Submission Requirements. Each submission for equivalency review shall include:

(1) Justification for use of the proposed equivalent item(s), including evidence, as applicable, that Contract specified material, product or equipment is unobtainable or unobtainable within an acceptable time for contract completion;

(2) A description of the difference between specified item(s) and proposed equivalent item(s) and the comparative advantages and disadvantages of each;

(3) All relevant data addressing each specified parameter to show equivalency;

(4) A prediction of any effects the proposed change will have on operation and maintenance costs where applicable.

(5) Equivalency. An item will be considered equivalent to the item specified if it is equal to or better in:

(6) Design and strength in all sub-parts, quality, reliability and durability, operation, maintenance and serviceability, as applicable; and

(7) Specified parameters in performance in all respects for the specific function(s) indicated in the contract.

(c) Supplemental Requirements. Any tests required by the District to establish quality and performance standards shall be promptly conducted by or through the Contractor at no additional cost to the District. In addition, the Contractor shall:

(1) Submit any additional data requested by the District or District Representative for the equivalency review; and

(2) Satisfactorily accomplish all changes, including any Engineering associated with use of equivalent items, at no additional cost to the District.

(d) Equivalency Determinations. The District or District Representative shall be the sole judge as to equivalency determinations. The District or District Representative's decision shall be final. The Contractor shall have no right of appeal to any decision rejecting the equivalency of any item.

(e) Procedure.

(1) Data substantiating a request for a substitution of "an equal" item shall be submitted prior to the Award of the Contract pursuant to Section 3400 of the latest edition of the Public Contract Code.

(2) After the Proposal opening, the Proposers shall have seven (7) calendar days to provide complete substantiating data for all product, material or system substitution requests. After this seven (7)-day period, the District

may award the Contract. In no event will product, material or system substitution requests submitted after the Award of Contract be considered. Failure to submit such substantiating data will result in the automatic rejection of the proposed substitution request. The District will have fifteen (15) days to review the first ten (10) proposed substitution requests. For each additional five (5) product, material or system substitution requests over and above the initial ten (10), the District will have ten (10) additional days to review the proposed substitution requests.

(3) Each substitution request may include one alternate substitution. All alternate substitutions shall be submitted concurrently with substitution requests. Upon review by the District, proposed substitutions shall be returned to the Proposer marked either “accepted” or “rejected”. The District shall only review alternative substitution requests if the primary substitution request is rejected. If a substitution request, and its alternative, is returned “rejected”, no further substitution requests for that product, material or system will be allowed and the Proposer will provide the specified product, material or system.

(4) The District may award the Contract at any time after the time for submitting substitution requests expires pursuant to subpart (2), above. In the event the Contract is awarded prior to acceptance/rejection of substitution requests, all outstanding substitution requests shall be reviewed by the District as provided above. If the successful Proposer elects not to execute the Contract, the Award of Contract shall be rescinded and the Contract awarded to another Proposer in the discretion of the District. All Proposers electing not to execute the Contract expressly agree that the District shall incur no liability for such rescissions.

4.04. CERTIFICATES OF COMPLIANCE

(a) A Certificate of Compliance shall be furnished prior to the use of any materials for which the Technical Specifications require that such a certificate be furnished. In addition, when so authorized in the Specifications, the Architect or District Representative may permit the use of certain materials or assemblies prior to sampling and testing if accompanied by a Certificate of Compliance. The Certificate of Compliance shall be signed by the manufacturer of the material or the manufacturer of assembled materials and shall state that the materials involved comply in all respects with the requirements of the Contract. A Certificate of Compliance shall be furnished with each lot of material delivered to the Work and the lot so certified shall be clearly identified in the Certificate.

(b) All materials used on the basis of a Certificate of Compliance may be sampled and tested at any time. The fact that material is used on the basis of a Certificate of Compliance shall not relieve the Contractor of responsibility for incorporating material in the Work which conforms to the requirements of the Contract Documents and any such material not conforming to such requirements will be subject to rejection whether in place or not.

(c) The District reserves the right to refuse to permit the use of material on the basis of a Certificate of Compliance. The form of the Certificate of Compliance and its disposition shall be as directed by the Architect or District Representative.

SECTION 5

LEGAL RELATIONS AND RESPONSIBILITY

5.01. COMPLIANCE WITH LAWS – PERMITS, REGULATIONS, TAXES

The Contractor is an independent contractor and shall, at the Contractor's sole cost and expense, comply with all laws, rules, ordinances and regulations of all governing bodies having jurisdiction over the Work, obtain all necessary permits and licenses therefore, pay all manufacturers' taxes, sales taxes, use taxes, processing taxes, and all federal and state taxes, insurance and contributions for social security and unemployment which are measured by wages, salaries or any remuneration paid to Contractor's employees, whether levied under existing or subsequently enacted laws, rules or regulations. The Contractor shall also pay all property tax assessments on materials or equipment used until acceptance by the District. If any discrepancy or inconsistency is discovered in the Plans or Specifications, or in this Contract in relation to any such law, rule, ordinance, regulation, order or decree, the Contractor shall forthwith report the same to the District Representative in writing. The Contractor shall also protect, defend and indemnify the District, District Representative the Architect, and all of the District's officers, agents, and servants against any claim or liability arising from or based upon the violation of any such law, rule, ordinance, regulation, order or decree, whether by the Contractor or its employees. Particular attention is called to the following:

(a) Without limitation, materials furnished and performance by Contractor hereunder shall comply with Safety Orders of the Division of Industrial Safety, State of California, Federal Safety regulations of the Bureau of Labor, Department of Labor; and any other applicable Federal regulations.

(b) The Contractor, upon request shall furnish evidence satisfactory to the District and Architect that any or all of the foregoing obligations have been or are being fulfilled. The Contractor warrants to the District that it is licensed by all applicable governmental bodies to perform this Contract and will remain so licensed throughout the progress of the Work, and that Contractor has, and will have, throughout the progress of the Work, the necessary experience, skill and financial resources to enable the Contractor to perform this Contract.

(c) Contractor is required to insure that material safety data sheets (MSDS's) for any material requiring a material safety data sheet pursuant to any federal or state law are available in a readily accessible place on the Project premises. Contractor is also required to insure:

(1) The proper labeling of any substance brought onto the Project premise by Contractor or any subcontractors and

(2) That the person(s) working with the material, or within the general area of the material, are appropriately informed about the hazards of the substance and follow proper handling and protection procedures.

(d) Contractor is required to comply with the provisions of California Health and Safety Code section 25249.5, et seq. (Prop. 65), which requires the posting and giving of notice to persons who may be exposed to any chemical known to the State of California to cause cancer.

(e) On March 4, 2022, Governor Gavin Newsom issued Executive Order N-6-22 (EO) regarding sanctions in response to Russian aggression in Ukraine. The EO is located at https://www.gov.ca.gov/wp-content/uploads/2022/03/3.4.22-Russia-Ukraine-Executive-Order.pdf.

Under the EO, compliance is required with all economic sanctions imposed by the U.S. government in response to Russia's actions in Ukraine, as well as any sanctions imposed under state law. To the fullest extent under the law, the District will engage all measures to comply with the sanctions and the EO, including:

-Refraining from entering into new contracts with prohibited individuals or entities while the sanctions are in effect;

-Desisting from making new investments in, or engaging in financial transactions with, Russian entities, and from transferring technology to Russia or Russian entities; and

-Endeavoring to support the government, people, and businesses of Ukraine where possible.

As a District contractor, compliance with the economic sanctions imposed in response to Russia's actions in Ukraine is required, including with respect to, but not limited to, the federal executive orders identified in the EO and the sanctions identified on the U.S. Department of the Treasury website (https://home.treasury.gov/policy-issues/financial-sanctions/sanctions-programs-and-country-information/ukraine-russia-related-sanctions). Failure to comply may result in the termination of the subject contract or grant, as applicable.

5.02. PREVAILING WAGE

(a) The Contractor shall forfeit as penalty to the District the amount specified by law for each calendar day or portion thereof for each worker (whether employed by the Contractor or any Subcontractor) paid less than the stipulated prevailing rates for any work done under the Contract in violation of the provisions of the Labor Code and in particular, Section 1775 which is incorporated herein by reference.

(b) The District will not recognize any claims for additional compensation because of the payment of the wages set forth in these General Conditions. The possibility of wage increases is one of the elements to be considered by the Contractor in determining its proposal, and will not under any circumstances, other than delays caused by the District, the Architect, or the District's agents, be considered as the basis of a claim against the District.

(c) The Contractor agrees to follow the instructions of the District's labor compliance officer until notified otherwise in writing by the District.

(d) The Director of the Department of Industrial Relations of the State of California has determined the general prevailing rate of wages of per diem wages in the locality in which the work is to be performed for each craft or type of worker needed to execute the Contract. Copies of the applicable prevailing wage rate determinations are made available to the Contractor and Subcontractor at the Pre-Job Conference Meeting. The Contractor shall post a copy of this document at the prevailing wages

at each job site, along with a CMU work place poster (available from the Department of Industrial Relations), printed on 8 1/2" X 11" paper or larger, in accordance with California Code of Regulations, Title 8, section 16451(d).

5.03. PREVAILING WAGE RECORDS

(a) The Work is subject to monitoring and enforcement of prevailing wage requirements by the Department of Industrial Relations ("DIR") and the following provisions will apply:

(1) Contractor and subcontractors shall maintain and furnish to the DIR, a certified copy of each weekly payroll (but no less often than monthly), with a statement of compliance signed under penalty of perjury. Such certified payroll reports in PDF form shall be transmitted electronically to the DIR. The provisions of Labor Code section 1776 are incorporated herein by reference.

(2) The District and the DIR shall review, including by way of job site inspections, and, if appropriate, audit payroll records to verify compliance with the public works requirements of the Labor Code. The DIR will notify the Contractor or Subcontractor(s), as appropriate) of any noncompliance, in order for all such Contractor or Subcontractor(s) to correct the noncompliance.

(3) The District shall withhold payments when payroll records are delinquent or inadequate.

(4) The District shall withhold payments equal to the amount of underpayment and applicable penalties when, after investigation, it is established that underpayment has occurred.

(5) The District shall cooperate with the DIR and DLSE in any investigation of suspected violations of prevailing wage requirements.

(6) As directed by the Labor Commissioner, the District shall withhold Contract payments equal to the payments due or estimated to be due to the Contractor or Subcontractors whose payroll records are delinquent or inadequate, plus any additional amount that the Labor Commissioner has reasonable cause to believe may be needed to cover a back wage and penalty assessment against such Contractor or Subcontractors. The Contractor shall be required to withhold payments to a Subcontractor whose payroll records are delinquent or inadequate until the Labor Commissioner provides notice that the Subcontractor has cured such delinquency or deficiency.

(7) These payroll records shall be made available to the District's representatives. These records shall be maintained during the course of the Work. The Contractor and all subcontractors shall make the certified payroll records available for inspection by District representatives upon request and shall permit such representatives to interview employees during the work hours on the job site.

(8) The Contractor shall be held entirely responsible for the prompt resolution of all non-compliances with the prevailing wage laws, including those pertaining to all subcontractors and any lower tier subcontractors.

(9) The Project will not be accepted as complete by the District nor final payment made until all items of non-compliance are corrected or until appropriate provision is made by depository agreement to assure the ultimate resolution and payment of any back wages that may be found due.

(b) A pre-construction conference shall be conducted before commencement of the Work with the Contractor and subcontractors at which time the prevailing wage requirements will be reviewed and agreed to by all parties.

5.04. LABOR DISCRIMINATION

Attention is directed to Section 1735 of the Labor Code, which reads as follows: “A contractor shall not discriminate in the employment of persons upon public works on any basis listed in subdivision (a) of Section 12940 of the Government Code, as those bases are defined in Sections 12926 and 12926.1 of the Government Code, except as otherwise provided in Section 12940 of the Government Code. Every contractor for public works who violates this section is subject to all the penalties imposed for a violation of this chapter."

5.05. EIGHT-HOUR DAY LIMITATION

(a) In accordance with the provisions of the Labor Code, and in particular, Sections 1810 to 1815 thereof, inclusive, eight hours labor shall constitute a day’s work, and no worker, in the employ of said Contractor, or any Subcontractor, doing or contracting to do any part of the work contemplated by this Contract, shall be required or permitted to work more than eight (8) hours in any one calendar day and forty (40) hours in any one calendar week in violation of those provisions; provided that subject to Labor Code section 1815, a worker may perform work in excess of either eight (8) hours per day or forty (40) hours during any one week upon compensation for all hours worked in excess of eight (8) hours per day or forty (40) hours during any one week at not less than one and one-half times the basic rate of pay.

(b) The Contractor and each Subcontractor shall also keep an accurate record showing the names and actual hours worked of all workers employed by them in connection with the Work. This record shall be open at all reasonable hours to the inspection of the District, State and Federal officers and agents. It is hereby further agreed that, the Contractor shall forfeit as a penalty to the District the sum of twenty-five dollars ($25) for each worker employed in the performance of this Contract by the Contractor or by any of its Subcontractors for each calendar day during which such worker is required or permitted to labor more than eight (8) hours in and one calendar day and forty (40) hours in any one calendar week in violation of Sections 1810 through 1815.

5.06. COMPLIANCE WITH STATE REQUIREMENTS FOR EMPLOYMENT OF APPRENTICES

The Contractor’s attention is directed to Section 1777.5 of the Labor Code. Provisions of said section pertaining to employment of registered apprentices are hereby incorporated by

reference into these Specifications. As applicable, the Contractor or any Subcontractor employed by the Contractor in the performance of the Work shall take such actions as necessary to comply with the provisions of Section 1777.5.

5.07. UNDERGROUND UTILITIES

(a) In accordance with Government Code section 4215, the Contractor shall be compensated for the costs of locating, repairing damage not due to the failure of the Contractor to exercise reasonable care, and removing or relocating existing main or trunkline utility facilities which are not indicated in the Contract Plans and Specifications with reasonable accuracy, and for the equipment on the Project necessarily idled during such work, provided that the Contractor shall first notify the District's Representative before commencing work on locating, repairing damage to, removing or relocating such utilities. Contractor shall not be assessed liquidated damages for delays in completing the Work when such delays are due to the failure of either the District or the owner of the utility to provide for removal or relocation of such utility facilities.

(b) The Contractor shall take all precautions necessary to protect the existing utilities within the project area. Any utilities damaged due to the Contractor's negligence shall be repaired or restored to their original condition at the Contractor's sole expense. Existing utilities shall be kept in service during the life of the Contract unless relocation, reconstruction, abandonment, or outage is specifically authorized by the District's Representative.

(c) The Contractor shall provide and maintain such temporary supports as may be necessary to preserve the functions of the various utility systems. No wires, conduits and/or pipes shall be removed until all services therein have been made inoperable.

(d) The Contractor shall notify the District's Representative and appropriate Regional Notification Center for operators of subsurface installations at least two (2) working days, but not more than fourteen (14) calendar days, prior to performing excavation or other work close to any underground pipeline, conduit, duct, wire and other structures. The Contractor shall provide updated information to the Notification Center as required and on a periodic basis. The Regional Notification Center includes but is not limited to the Underground Service Alert-Southern California (USA) at 1-800-422-4133.

(e) The Contractor is advised that the State of California does not participate in USA. The Contractor is required to notify CalTrans Permits Branch (916) 322-1297 for the location of State facilities.

(f) The Contractor shall not proceed with work until utility facilities involved have been located, disconnected, or otherwise adjusted by utility representatives.

(g) The District Utility Maintenance Division will make repairs to all water service laterals and water mains damaged by the Contractor during the course of construction unless directed otherwise by the Engineer. Except as otherwise provided in this section, the Contractor shall be required to pay all labor, material and equipment costs incurred by the District Utilities Maintenance Division for the repairs made to damaged water service laterals and water mains. The District will bill the Contractor

for the repairs and the bills will be paid by the Contractor prior to either the next monthly progress payment or prior to the final payment, whichever comes first. The Contractor shall provide to the Engineer proof of payment of the repair bills prior to the issuance of either the monthly progress payment or final payment. The current labor and equipment rates for the District Utility Maintenance Division will be made available to the Contractor at the preconstruction conference. The District shall have the right to deduct the total amount of any unpaid District repair bill from the money due or to become due the Contractor.

5.08. WATER POLLUTION

The Contractor shall exercise every reasonable precaution to protect streams, lakes, reservoirs, and canals from pollution with fuels, oils, bitumens, calcium chloride, and other harmful materials and shall conduct and schedule Contractor's operations so as to avoid or minimize muddying and silting of said streams, lakes, reservoirs, and canals. Care shall be exercised to preserve vegetation beyond the limits of construction. The Contractor shall comply with Section 5650 of the California Fish and Game Code and all other applicable statutes and regulations relating to the prevention and abatement of water pollution.

5.09. PAYMENT OF TAXES

The Contract prices paid for the Work shall include full compensation for all taxes, which the Contractor is required to pay, whether imposed by federal, state, or local governments.

5.10. PERMITS AND LICENSES

The Contractor shall procure all permits and licenses, and give all notices necessary and incident to the lawful prosecution of the work. All permits and licenses shall be obtained in sufficient time to prevent delays to the Work. The Contractor shall, at a minimum, possess and maintain the licenses and permits set forth in the Contract Provisions.

5.11. PATENTS

The Contractor shall assume all costs arising from the use of patented materials, equipment, devices, or processes used on or incorporated into the Work, and agrees to indemnify, defend and save harmless the District, the Engineer, and their duly authorized representatives, from all suits at law, or actions of every nature for, or on account of, the use of any patented materials, equipment, devices, or processes.

5.12. PUBLIC CONVENIENCE

This section defines the Contractor’s responsibility with regard to convenience of the public and public traffic in connection with its operations.

(a) The Contractor shall so conduct its operations as to offer the least possible obstruction and inconvenience to the public. The Contractor shall have under construction no greater length or amount of work than can be properly prosecuted with due regard to the rights of the public.

(b) Unless otherwise provided in the Contract Documents, all public traffic shall be permitted to pass through the Work with as little inconvenience and delay as possible. In order to expedite the passage of public traffic through or around the work, the Contractor shall install as appropriate signs, lights, flares, barricades, and other

facilities for the sole convenience and direction of public traffic. Also, where directed by the Engineer, the Contractor shall provide and station competent flagpersons whose sole duties shall consist of directing the movement of public traffic through or around the Work. The cost of furnishing and installing such signs, lights, flares, barricades, and other facilities, and the cost of providing and stationing such flagpersons, all for the convenience and direction of public traffic, will be considered as included in the Contract price and no additional compensation will be allowed.

(c) Spillage resulting from hauling operations along or across any publicly traveled way shall be removed immediately by the Contractor at its expense.

(d) Construction operations shall be conducted in such a manner as to cause as little inconvenience as possible to abutting property owners.

(e) Convenient access to driveways, houses and buildings along the line of the work shall be maintained and temporary approaches to crossings or intersecting highways shall be provided and kept in good condition. When the abutting property owner's access across the right-of-way line is to be eliminated, or to be replaced under the Contract by other access facilities, the existing access shall not be closed until the replacement access facilities are usable.

(f) Contractor shall supply water for the alleviation or prevention of dust nuisance as provided in the Contract Documents.

(g) Flagpersons and guards, while assigned to traffic control, shall perform their duties and shall be provided with the necessary equipment in accordance with the current "Instructions to Flagmen" of the California Department of Transportation. The equipment shall be furnished and kept clean and in good repair by the Contractor at its expense.

(h) All traffic control shall be in accordance with California Manual on Uniform Traffic Control Devices (California MUTCD), Part 6 and this Section 5.12.

(1) Traffic Control Plans

Traffic Control Plans shall be developed for the project to assure that adequate consideration is given to the safety and convenience of motorists, pedestrians, and workers during construction. The Traffic Control Plans shall include, but not be limited to, signing, pavement markings, construction scheduling, permanent barricades, methods and devices for delineation and channelization, placement and maintenance of devices, roadway lighting, traffic regulations, surveillance and inspection. The Traffic Control Plans shall be approved by the Engineer a minimum of two (2) working days prior to start of any work. Non-compliance with any stipulation of this section will be justification for the District to stop work.

(2) Traffic Control Devices and Procedures

Traffic control devices and procedures shall conform to the California Manual on Uniform Traffic Control Devices (California MUTCD), Part 6 and this Section 5.12. Non-compliance with any stipulation of this section will be justification for the District to stop work.

(3) Measurement and Payment

Unless specifically shown as an item of work on the proposal form, all traffic control shall be considered included in other items of work and no additional compensation will be made for labor, materials or equipment needed.

5.13. CONTINUOUS OPERABILITY OF FACILITIES

Absent written permission by the District, the continuous operation of all existing facilities is required and shall in no way be affected by the Work.

5.14. SAFETY

(a) General

(1) The Contractor shall be solely and completely responsible for the conditions of the job Site, including safety of all persons and property during performance of the Work. This requirement shall apply continuously and not be limited to normal working hours. Safety provisions shall conform to all applicable federal, state, and local laws, ordinances, and codes, and to the rules and regulations established by the California Division of Industrial Safety, and to other rules of law applicable to the Work.

(2) The services of the District's Representative or Architect in conducting construction review of the Contractor's performance is not intended to include review of the adequacy of the Contractor's work methods, equipment, bracing or scaffolding or safety measures, in, on, or near the construction site, and shall not be construed as supervision of the actual construction nor make the District's Representative, Architect or the District responsible for providing a safe place for the performance of work by the Contractor, Subcontractors, or suppliers; or for access, visits, use work, travel or occupancy by any person.

(3) The Contractor shall carefully instruct all personnel working in potentially hazardous work areas as to potential dangers and shall provide such necessary safety equipment and instruction as is necessary to prevent injury to personnel and damage to property. Special care shall be exercised relative to electrical work, work involving excavation and in sump pump work.

(4) All work and materials shall be in strict accordance with all applicable State, Federal and local laws, rules, regulations, and codes.

(5) Nothing in this Contract is to be construed to permit work not conforming to governing law. When Contract Documents differ from governing law, the Contractor shall furnish and install the higher standards called for without extra charge. All equipment furnished shall be grounded and provided with guards and protection as required by safety codes. Where vapor-tight or explosion-proof electrical installation is required by law, this shall be provided.

(6) The Contractor shall submit a safety plan and/or narrative description to the District's Representative prior to commencement of the Work. This safety plan and/or narrative description shall describe all first aid, safety clothing, etc. to be used at the Project Site.

(b) Shoring and Trench Safety Plan

(1) Attention is directed to Section 832 of the Civil Code of the State of California relating to lateral and subjacent support, and the Contractor shall comply with this law.

(2) In accordance with Section 6705 of the State Labor Code, the Contractor shall submit to the District specific plans to show details of provisions for worker protection from caving ground. Not less than thirty (30) days before beginning excavation for any trench or trenches five feet or more in depth required under this Contract, the Contractor shall furnish to the District's Representative working drawings of its trench safety plan. The trench safety plan working drawings shall be detailed plans showing the design of shoring, bracing, sloping or other provisions to be made for worker protection from the hazard of caving ground. If such plan varies from the shoring system standards established by the Construction Safety Orders of the California Division of Industrial Safety or the Federal Safety and Health Regulations for Construction of the Occupational Safety and Health Administration, Department of Labor, the plan shall be prepared by a registered civil or structural engineer. In no event shall the Contractor use a shoring, sloping, or protective system less effective than that required by said Construction Safety Orders, or less effective than that required by said Federal Safety Standards. Submission of this plan in no way relieves the Contractor from the requirement to maintain safety in all operations performed by the Contractor or its Subcontractors.

5.15. BLASTING

Except for exceptional circumstances, blasting shall be prohibited. Accordingly, Proposals should be prepared on the basis that no blasting will be permitted. Should blasting be required and expressly approved by the District, the District will issue a Change Order for blasting work.

5.16. INTOXICATING LIQUORS AND NARCOTICS

The Contractor shall not sell, permit or suffer the introduction or use of intoxicating liquors or narcotics upon or about the Site.

5.17. PROTECTION OF PERSONS AND PROPERTY

(a) The Contractor shall take whatever precautions are necessary to prevent damage to all existing improvements, including above ground and underground utilities, trees, shrubbery that is not specifically shown to be removed, fences, signs, mailboxes, survey markers and monuments, buildings, structures, the District's property, adjacent property, and any other improvements or facilities within or adjacent to the work. If such improvements or property are injured or damaged by reason of the Contractor's operations, they shall be replaced or restored, at the

Contractor's expense, to a condition at least as good as the condition they were in prior to the start of the Contractor's operations.

(b) The Contractor shall adopt all practical means to minimize interference to traffic and public inconvenience, discomfort or damage. The Contractor shall protect against injury to any pipes, conduits or other structures crossing the trenching or encountered in the Work and shall be responsible for any injury done to such pipes or structures, or damage to property resulting therefrom. The Contractor shall support or replace any such structures without delay and without any additional compensation to the entire satisfaction of the District. All obstructions to traffic shall be guarded by barriers illuminated at night. The Contractor shall be responsible for all damage to persons and property directly or indirectly caused by its operations and, under all circumstances, Contractor must comply with the laws and regulations of the State of California relative to safety of persons and property and the interruption of traffic and the convenience of the public within the respective jurisdictions.

(c) The Contractor is cautioned that it must replace all improvements in rights-of- way and within the public streets to a condition at least equal to what existed prior to the Contractor's entry onto the job.

(d) Type and time of construction required at any road subject to interference by the work will be determined by those authorities responsible for maintenance of said road. It shall be the responsibility of the Contractor to determine the nature and extent of all such requirements, including provision of temporary detours as required; however, the construction right-of-way obtained by the District at affected roadways will be adequate for provision of all required detours. As required at any road crossing, the Contractor shall provide all necessary flagpersons, guardrails, barricades, signals, warning signs and lighting to provide for the safety of existing roads and detours. Immediately after the need for temporary detours ceases, or when directed, the Contractor shall remove such detours and perform all necessary cleanup work, including replacement of fences, and removal of pavement. Included shall be all necessary replacement of existing roadway appurtenances, grading work, soil stabilization and dust control measures, as required and directed.

(e) The Contractor shall examine all bridges, culverts, and other structures over which it will move its materials and equipment, and before using them, Contractor shall properly strengthen such structures where necessary. The Contractor shall be responsible for any and all injury or damage to such structures caused by reason of its operations.

5.18. RESPONSIBILITY FOR REPAIR OF FACILITIES

All public or private facilities, including but not limited to, gravel surfacing at existing canals, structures, telephone cables, roadways, curbs, gutters, parking lots, private drives, levees and embankments for creeks, ponds and reservoirs disturbed during construction of the work shall be repaired and/or replaced by the Contractor to match facilities existing prior to construction. In addition, the Contractor shall be responsible for any settlement damage to such facilities or adjoining areas for a period of one year after acceptance of such required facilities.

5.19. DISTRICT'S REPAIR

In the event the Contractor refuses or neglects to make good any loss or damage for which it is responsible under this Contract, the District may itself or by the employment of others, make good any such loss or damage, and the cost and expense of doing so, including any reasonable engineering, legal and other consultant fees, and any costs of administrative and managerial services, shall be charged to the Contractor. Such costs and expenses may be deducted by the District from claims for payment made by the Contractor for work completed or remaining to be completed.

5.20. ANTITRUST CLAIM ASSIGNMENT

In entering into a public works contract or a subcontract to supply goods, services, or materials pursuant to this contract, the Contractor and all subcontractors shall offer and agree to assign to the District all rights, title, and interest in and to all causes of action it may have under Section 4 of the Clayton Act (15 U.S.C. Sec. 15) or under the Cartwright Act (Chapter 2 (commencing with Section 16700) of Part 2 of Division 7 of the Business and Professions Code), arising from purchases of goods, services or materials pursuant to the public works contract or subcontract. This assignment shall be made and become effective at the time the District tenders final payment to the Contractor, without further acknowledgement by the parties.

5.21. WAIVER OF RIGHT TO RESCIND FOR MATERIAL BREACH

The Contractor agrees that it can be adequately compensated by money damages for any breach of this Contract which may be committed by the District and hereby agrees that no default, act, or omission of the District or the Engineer, shall constitute a material breach of the Contract entitling the Contractor to cancel or rescind the provisions of this Contract or (unless the District shall so consent or direct in writing) to suspend or abandon performance of all or any part of the Work. The Contractor hereby waives any and all rights and remedies to which it might otherwise be or become entitled, save only its right to money damages.

5.22. CONTRACTOR'S LICENSE NOTICE

CONTRACTORS ARE REQUIRED BY LAW TO BE LICENSED AND REGULATED BY THE CONTRACTORS' STATE LICENSE BOARD. ANY QUESTIONS CONCERNING A CONTRACTOR MAY BE REFERRED TO:

REGISTRAR CONTRACTORS' STATE LICENSE BOARD
9821 BUSINESS PARK DRIVE
SACRAMENTO, CALIFORNIA 95827
MAILING ADDRESS: P.O. BOX 26000
SACRAMENTO, CALIFORNIA 95826

5.23. HISTORICAL, SCIENTIFIC AND ARCHEOLOGICAL DISCOVERIES

All articles of historical or scientific value, including but not limited to coins, fossils, and articles of antiquity which may be uncovered by the Contractor during the progress of work, shall become District property. Such findings shall be reported immediately to the District's Representative who will determine the method of removal, where necessary, and the final disposition thereof.

5.24. INSURANCE

Contractor shall procure and maintain for the duration of the contract insurance against claims for injuries to persons or damages to property, which may arise from or in connection with the performance of the Work hereunder by the Contractor, its agents, representatives, employees or subcontractors. The cost of such insurance shall be included in the Contractor's Proposal.

(a) Neither the Contractor nor any Subcontractors shall commence any work until all required insurance has been obtained at their own expense. Such insurance must have the approval of the District as to limit, form, and amount, and shall be placed with insurers with a current A. M. Best's rating of no less than A-VII.

(b) Any insurance bearing on adequacy of performance shall be maintained after completion of the project for the full guarantee period.

(c) Prior to execution of the Contract, the Contractor shall furnish the District with original endorsements effecting coverage for all policies required by the Contract. The endorsements shall be signed by a person authorized by the insurer to bind coverage on its behalf. The endorsements are to be on forms provided or approved by the District. The District may require the Contractor or any subcontractor to furnish complete certified copies of all insurance policies affecting the coverage required by the Contract.

(d) All of the Contractor's policies shall contain an endorsement providing that written notice shall be given to the District at least sixty (60) calendar days prior to termination, cancellation, or reduction of coverage in the policy.

(e) Any policy or policies of insurance that the Contractor elects to carry as insurance against loss or damage to its construction equipment and tools shall include a provision therein providing a waiver of the insurer's right to subrogation against the District and the Engineer.

(f) The requirements as to the types, limits, and the District's approval of insurance coverage to be maintained by the Contractor are not intended to and shall not in any manner limit or qualify the liabilities and obligations assumed by the Contractor under the Contract.

(g) In addition to any other remedy the District may have, if the Contractor or any of the subcontractors fails to maintain the insurance coverage as required in this section, the District may obtain such insurance coverage as is not being maintained, in form and amount substantially the same as required herein, and the District may deduct the cost of such insurance from any amounts due or which may become due the Contractor under this Contract.

(h) The Contractor and all Subcontractors shall, at their expense, maintain in effect at all times during the performance of work under the Contract not less than the following coverage and limits of insurance, which shall be maintained with insurers and under forms of policy satisfactory to the District. The maintenance by the Contractor and all Subcontractors of the following coverage and limits of insurance is a material element of this Contract. The failure of the Contractor or any Subcontractor

to maintain or renew coverage or to provide evidence of renewal may be treated by the District as a material breach of this contract.

(1) Workers' Compensation and Employer's Liability Insurance

(i) Workers' Compensation

The Contractor and all Subcontractors shall maintain insurance to protect the Contractor or subcontractor from all claims under Workers' Compensation and Employer's Liability Acts, including Longshoremen's and Harbor Workers' Act. Such coverage shall be maintained, in type and amount, in strict compliance with all applicable State and Federal statutes and regulations. The Contractor shall execute a certificate in compliance with Labor Code section 1861, on the form provided in the Contract Documents.

(ii) Claims Against District

If an injury occurs to any employee of the Contractor or any of the Subcontractors for which the employee or its dependents, in the event of its death, may be entitled to compensation from the District under the provisions of the said Acts, or for which compensation is claimed from the District, there will be retained out of the sums due the Contractor under this Contract, an amount sufficient to cover such compensation as fixed by said Acts, until such compensation is paid or it is determined that no compensation is due. If the District is required to pay such compensation, the amount so paid will be deducted and retained from such sums due, or to become due, the Contractor.

(2) Commercial General, Excess and Automobile Liability Insurance

The Contractor shall maintain in effect at all times during the performance of the work hereunder not less than the following coverage's and limits of Commercial General, Excess and Automobile Liability insurance:

(i) Form and Amount

The insurance shall include, but shall not be limited to, protection against claims arising from death, bodily injury, personal injury, or damage to property resulting from actions, failures to act, operations or equipment of the insured, or by its employees, agents or consultants, or by anyone directly or indirectly employed by the insured. The amount of insurance coverage shall not be less than $2,000,000 per occurrence with an aggregate no less than two (2) times the required per occurrence limit applying to bodily injury, personal injury, and property damage, or any combination of the three. The amount of excess insurance coverage shall not be less than $5,000,000 per occurrence. Any deductibles must be declared to and approved by the District. At the option of the District, either: the insurer shall

reduce or eliminate such deductibles as respects the entity, its officers, officials, employees and volunteers; or the Contractor shall procure a bond guaranteeing payment of losses and related investigations, claim administration expenses, and defense expenses.

The commercial general, excess and automobile liability insurance coverage shall also include the following:

(ii) Additional Requirements

Provision or endorsement naming the District, the District's Representative, Architect and its consultants, and each of their officers, employees, and agents, each as additional insured's with respect to any potential liability arising out of the performance of any work under the Contract, and providing that such insurance is primary insurance as respects the interest of the District the District's Representative, Architect, and its consultants, and each of their officers, employees, and agents and that any other insurance, risk pool membership, or other liability protection maintained by the District or maintained by the Architect is excess to the insurance required hereunder, and will not be called upon to contribute to any loss unless and until all limits available under the contractor's and subcontractor's insurance policy/policies have been paid. The additional insured coverage under the Contractor's policy shall be "primary and non-contributory" and will not seek contribution from the District's insurance or self-insurance and shall be at least as broad as CG 20 01 04 13.

(iii) "Cross Liability" or "Severability of Interest" clause.

(iv) Broad Form Property Damage, Personal Injury, Contractual Liability, Protective Liability, and Completed Operations coverage's, and elimination of any exclusion regarding loss or damage to property caused by explosion or resulting from collapse of buildings or structures or damage to property underground, commonly referred to by insurers as the "XCU" hazards.

(v) Provision or endorsement stating that such insurance, subject to all of its other terms and conditions, applies to the liability assumed by the Contractor under the Contract, including, without limitation, that set forth in Section 5.25, Indemnity and Litigation Costs.

(vi) Provision or endorsement stating that any failure to comply with reporting or other provisions of the policies, including breaches of warranties, shall not affect coverage provided to the District, its officers, officials, employees, or volunteers.

(vii) The Contractor's insurance shall apply separately to each insured against whom claim is made or suit is brought, except with respect to the limits of the insurer's liability.

(3) Builder's Risk or Installation Floater "All-Risk" Insurance

Before commencement of the Work, the Contractor shall submit written evidence that it has obtained for the period of the Contract, Builder's Risk "All-Risk" Completed Value Insurance and/or Inland Marine "All-Risk" Installation Floater Insurance, as may be applicable, upon the entire project which is the subject of this Contract, including completed work and work in progress. The policy or policies of insurance shall name the Contractor, District, and Engineer as insured's as their respective interests may appear, and shall include an insurer's waiver of subrogation rights in favor of each. Such insurance may have a deductible clause, but the amount of the deductible shall be subject to the approval of the District, except that the deductible on earthquake coverage may be in accordance with the underwriter's requirements.

5.25. INDEMNITY AND LITIGATION COST

(a) Promptly upon execution of the Contract, the Contractor specifically obligates itself and hereby agrees to protect, hold free and harmless, defend (with counsel selected by the District) and indemnify the District, the District's Representative, Architect and its consultants, and each of their officers, employees and agents, from any and all liability, penalties, costs, losses, damages, expenses, causes of action, claims or judgments, including attorney's fees, which arise out of or are in any way connected with the Contractor's, or its subcontractors' or suppliers', performance of work under this Contract or failure to comply with any of the obligations contained in the Contract. This indemnity shall imply no reciprocal right of the Contractor in any action on the contract pursuant to California Civil Code section 1717 or section 1717.5. To the fullest extent legally permissible, this indemnity, defense and hold harmless agreement by the Contractor shall apply to any and all acts or omissions, whether active or passive, on the part of the Contractor or its agents, employees, representatives, or Subcontractor's agents, employees and representatives, resulting in claim or liability, irrespective of whether or not any acts or omissions of the parties to be indemnified hereunder may also have been a contributing factor to the liability, except such loss or damage which was caused by the active negligence, the sole negligence, or the willful misconduct of the District.

(b) In any and all claims against the District, the District's Representative, Architect and each of their consultants, officers, employees and agents by any employee of the Contractor, any Subcontractor, anyone directly or indirectly employed by any of them, or anyone for whose acts any of them may be liable, the indemnification obligation under this section shall not be limited in way by any limitation on the amount or type of damages, compensation or benefits payable by or for the Contractor or any Subcontractor under Workers' Compensation statutes, disability benefit statutes or other employee benefit statutes.

5.26. PROTECTION OF WORK

(a) The Contractor shall be responsible for the care of all the Work until its completion and final acceptance. The Contractor shall, at its own expense, replace damaged or lost material and repair damaged parts of the Work or the same may be done at the Contractor's expense by the District and the Contractor and its sureties shall be liable therefor. The Contractor shall make its own provisions for properly storing and protecting all material and equipment against theft, injury, or damage from any and all causes. Damaged material and equipment shall not be used in the Work.

The Contractor shall take all risks from floods and casualties except as provided by law, and shall make no charge for the restoration of such portions of the work as may be destroyed or damaged by flood or other casualties or because of danger from flood or other casualties or for delays from such causes. The Contractor may, however, be allowed a reasonable extension of time on account of such delays, subject to the conditions herein before specified. The Contractor shall not be responsible for the cost, in excess of 5% of the contracted amount, of repairing or restoring damage to the Work, if the damage was proximately caused by an earthquake in excess of a magnitude of 3.5 on the Richter Scale or by tidal wave' s; provided that the Work damaged was built in accordance with accepted and applicable building standards, and the plans and specifications of the District.

(b) Contractor shall effectively secure and protect adjacent property and structures, livestock, crops and other vegetation. If applicable, the Contractor shall open fences on or crossing the right-of-way and install temporary gates of sound construction thereon so as to prevent the escape of livestock. Adjacent fence posts shall be adequately braced to prevent the sagging or slackening of the wire. Before such fences are opened, the Contractor shall notify the owner or tenant of the property and, where practicable, the opening of the fence shall be in accordance with the wishes of said owner or tenant. The Contractor shall be responsible that no loss or inconvenience shall accrue to the owner or tenant by virtue of their fences having been opened or the gate not having been either shut or attended at all times. Where special types of fences are encountered, the Contractor shall install temporary gates made of similar materials and of suitable quality to serve the purposes of the original fences. In all cases where the Contractor removes fences to obtain workroom, the Contractor shall provide and install temporary fencing as required, and on completion of construction shall restore the original fence to the satisfaction of the District's Representative. All costs of providing, maintaining and restoring gates and fencing shall be home by the Contractor. The Contractor shall provide and maintain all passageways, guard fences, lights and other facilities for protection required by public authority or local conditions.

(c) The Contractor shall use extreme care during construction to prevent damage from dust to crops and adjacent property. The Contractor, at its own expense, shall provide adequate dust control for the right-of-way and take other preventative measures as directed by the Engineer.

(d) The Contractor shall be responsible for all damage to any property resulting from trespass by the Contractor or its employees in the course of their employment, whether such trespass was committed with or without the consent or knowledge of the Contractor.

(e) The Contractor shall see that the Site is kept drained and free of all ground water and any other water, which may impede the progress or execution of the Work.

(f) The Contractor shall be responsible for any damage caused by drainage or water runoff from construction areas and from construction plant areas.

(g) In an emergency affecting the safety of life, the Work, or adjoining property, the Contractor, without special instruction or authorization from the District is hereby permitted to act at its discretion to prevent such threatened loss or injury,

and the Contractor shall so act without appeal if so instructed or authorized. Any compensation claimed by the Contractor on account of emergency work shall be determined as specified hereinabove. Should the District deem an emergency condition to exist, the Contractor shall immediately do those things and take those steps ordered by the District,. The decision of the District in this respect shall be final and conclusive. Any claims for compensation made by the Contractor on account of emergency work shall be determined as specified hereinabove.

(h) Except as provided by Government Code section 4215, the Contractor shall be responsible for the removal, relocation and protection of all public and private utilities, including irrigation facilities in the nature of utilities, located on the site of the construction project if and to the extent that the same are identified in the Contract Documents, and the Contractor shall not be entitled to any extension of time or claim for damages for extra compensation in connection therewith. If and to the extent that such utilities or facilities are not identified in the Contract Documents, as between the Contractor and the District, the District will be responsible for the cost of their removal, relocation or protection, as the case may be, but the Contractor shall perform any such work in conformance with this Contract, if so directed by the District. In such situations the Contractor shall not be responsible for delay in completion of the project caused by the failure of the District or the owner of the utility to provide for such removal or relocation. If the Contractor, while performing the Contract, discovers utility or irrigation facilities not identified by the District in the Contract Documents, the Contractor shall immediately notify the District in writing.

(i) Subject to the provisions of this section, where the Work to be performed under the Contract crosses or otherwise interferes with existing streams, watercourses, canals, farm ditches, pipelines, drainage channels, or water supplies, the Contractor shall provide for such watercourse or pipelines and shall perform such construction during the progress of the Work so that no damage will result to either public or private interests, and the Contractor shall be liable for all damage that may result from failure to so provide during the progress of the Work.

5.27. ACCIDENTS

(a) The Contractor shall provide and maintain, in accordance with Labor Code section 6708 and OSHA requirements, adequate emergency first-aid treatment for its employees and anyone else who may be injured in connection with the Work.

(b) The Contractor shall promptly report in writing to the District's Representative all accidents whatsoever arising out of or in connection with, the performance of the Work, whether on or adjacent to the site, which caused death, personal injury, or property damage, giving full details and statements of witnesses.

In addition, if death or serious injury or serious damage are caused, the accident shall be reported immediately by telephone or messenger to the District and the Engineer.

(c) If any claim is made by anyone against the Contractor or any Subcontractor on account of any accident, the Contractor shall promptly report the facts in writing to the District's Representative, giving full details of the claim.

5.28. NO PERSONAL LIABILITY

Neither the District, the Architect, nor any of their other officers, agents, or employees shall be personally responsible for any liability arising under the Contract, except such obligations as are specifically set forth herein.

SECTION 6

PROGRESS AND COMPLETION OF WORK

6.01. PROGRESS SCHEDULE

The Contractor shall submit within ten (10) days after execution of the Contract a detailed work schedule(s) which shall detail the actions of the Contractor and Subcontractors working at the Site, and proposed milestones. This schedule(s) shall both show the dates at which the Contractor will start and complete and conform to the completion time specified in the Contract. The controlling operation, defined as the least float path, if any, shall be identified.

The Contractor shall review, revise and resubmit the progress schedule at least once a month to reflect progress. In any event, Contractor shall submit, at any time during the contract period, a current schedule to the District's Representative at the District's Representative's request.

No progress payments will be made for any work performed until a satisfactory schedule has been submitted and approved by the District's Representative. An updated schedule shall be required from the Contractor if the project falls ten (10) working days behind schedule.

If the Work falls behind the accepted schedule, the Contractor shall promptly take whatever actions are necessary to put the project back on schedule. For delays or portions of delays for which the Contractor is responsible, no payment will be made or time extension allowed for increase in work force, equipment, and working hours needed to put the project on schedule.

6.02. COMMENCEMENT AND PROGRESS OF THE WORK AND TIME OF COMPLETION

(a) Commencement

The Contractor shall begin the Work after receiving a Notice to Proceed within the period of time set forth in the Contract Provisions. Thereafter, Contractor shall diligently prosecute the Work to completion as specified in the Contract Documents. The District's Representative shall have the right to specify the locations where Contractor shall start and proceed with the Work.

A preconstruction conference will be convened after the Contractor has delivered the necessary bonds, insurance certificates and signed agreement in proper form as required in the request for proposals and general conditions of these specifications. Prior to any work, the Contractor shall provide the District's Representative with a list of key personnel assigned to the project and the telephone numbers where they may be reached at any time. The list shall be made available in sufficient copies and presented at the preconstruction conference.

Notwithstanding any other provisions of the Contract, the District shall not be obligated to accept or pay for any work furnished by the Contractor prior to the issuance of the Notice to Proceed whether or not the District has knowledge of the furnishing of such work. The Contractor shall not commence with work on this project until its Contract bonds and evidence of insurance comply with all Contract requirements and a Notice to Proceed has been issued.

The Contractor shall notify the District's Representative in writing two (2) working days (48 hours) prior to commencement of work on the Project or scheduling work for a Saturday, Sunday, or District Holiday. Failure to provide said notification will void the District's obligation to provide inspection. Any work done in the absence of the District's Inspector shall be subject to rejection.

(b) Completion

All work under this Contract shall be completed within the period of time set forth in the Contract Provisions. The Contract shall be deemed completed when the District has certified the completion of the Project as provided in Section 9.07 of these General Conditions.

6.03. SUSPENSION OF WORK

(a) The District may at any time, by notice in writing to the Contractor, suspend any part of the Work for such period of time as may be necessary to prevent improper execution of the Work on the project by the Contractor, its Subcontractors or agents, and the Contractor shall have no claim for damages or additional compensation on account of any such suspension.

(b) The District may at any time suspend any part or all of the Work upon ten (10) days written notice to the Contractor, who shall thereupon discontinue all work suspended except for all operations to prevent loss or damage to work already executed as may be directed by the District. Work shall be resumed by the Contractor after such suspension on written notice from the District.

(c) In the event of any suspension of the Work in whole or in part under subsection (B) above, the Contractor shall be entitled to an extension of time wherein to complete the Work to the extent of the delay caused to the Contractor thereby.

(d) In the event the entire work shall be suspended by order of the District, as herein above provided, and shall remain so suspended for a period of sixty (60) consecutive days, through no fault of the Contractor, and notice to resume the Work shall not have been served on the Contractor as herein above provided, Contractor may, at its option, by written notice to the District, terminate the Contract in the same manner as if the termination had been initiated by the District, and the District shall have no claim for damages because of such termination of the Contract.

6.04. DELAY IN THE WORK – TIME EXTENSIONS

The Contractor shall at all times employ such force, plant, materials, and tools as will be sufficient, in the opinion of the District, to prosecute the Work at not less than the rates fixed under the terms of the Contract and to complete the Work thereof within the time limits fixed therein. If the Contractor refuses or fails to prosecute the Work, or any separable part thereof, with such diligence as will ensure the completion within the time specified in the Contract, or any extension thereof, or fails to complete said work within such time, the District may exercise the termination provisions set forth in Section 6.056, below.

(a) Excusable Delays. Excusable delays shall be delays in the controlling operation of the Contractor's work due to strikes, lockouts by others, fire, unusual delay in transportation, unavoidable casualties, adverse weather conditions which could not have been reasonably anticipated, or any other act(s) of God beyond the Contractor's control, or by delay authorized by the District, or by any cause which the

District shall decide to justify the delay. Except as provided in Section 6.04(f), below, in the event of an excusable delay, the time of completion shall be extended for such reasonable time as the District may decide. The Contractor's right to an extension of time for an excusable delay is expressly subject to Contractor's giving written notice of such claim within ten (10) days following the date the Contractor knew or should have known of the delay. Failure to give such notice shall be construed as a waiver of such right. It is understood and agreed that extensions of time shall be the Contractor's sole and exclusive remedy for excusable delays.

(b) Compensable delays. Compensable delays shall be delays in the controlling operating of the Contractor's work due to acts or neglect of the District, its employees or those under it by contract or otherwise, or by changes ordered in the work. In the event of a compensable delay, the time of completion shall be extended for such reasonable time as the District may decide. In addition, the Contractor may recover its direct costs as provided in Section 6.05. The Contractor's remedies for compensable delays are expressly subject to Contractor's giving ten (10) days written notice of such claim from the date the Contractor knew or should have known of the delay. It is understood and agreed that the Contractor's sole and exclusive remedies for compensable delays shall be an extension of the time and recovery of its direct costs as compensable hereunder, but only in accordance with the provisions of the Contract Documents.

(c) Contractor and District understand and agree that the Contract time for the completion of this project is a very important part of the contract. Extensions of time will only be granted as provided above when events actually cause the Contractor to be delayed in the performance of that schedule activity which is the controlling operation as of the time of the delay. When acts or omissions occur which could cause delay, Contractor will take all reasonable means in order to be able to continue to work as scheduled without any delay, or as short a delay as possible. Additionally, if inclement weather causes accumulation of standing water on the work site or other conditions which might cause delay, Contractor shall take all measures reasonably necessary to permit work to continue as quickly as possible.

(d) If adverse weather conditions are the basis for a claim for additional time, such claim shall be documented by date substantiating that weather conditions were abnormal for the period of time and could not have been reasonably anticipated, and that weather conditions had an adverse effect on the scheduled construction. Adverse weather conditions shall be considered only as those conditions that exceed the average annual number of rain days and rain quantities as established by the Annual Local Climatological Summary and NOAA National Technical Memorandum NWS WR-65 (Revised) as published by the United States Government, National Weather Service, National Climate Center, Asheville, North Carolina.

(e) The District shall be responsible for determining when adverse weather conditions result in non-workable days. It shall be the Contractor's duty to stay informed of such determinations by the District. The Contractor may object to such adverse weather determinations by filing with the Engineer a written notice of objection. The notice of objection shall state the basis of the objection and provide supporting documentation, which substantiates that weather conditions were abnormal for the period of time and could not have been reasonably anticipated, and that weather conditions had an adverse effect on the scheduled construction. All such notices of objection shall be filed within three (3) days of the day in dispute. It is hereby

agreed that the Contractor's failure to submit a written notice of objection within three (3) days of the District's adverse weather determination shall constitute a waiver by the Contractor of all its rights to further protest, judicial or otherwise.

(f) The District will, within a reasonable period of time, issue a ruling on the Contractor's notice of objection. All such rulings by the District shall be final, unless the Contractor files a written protest within fifteen (15) days of the Engineer's ruling. This protest shall clearly state the basis of the dispute. Such protest will be forwarded promptly to the District, which will issue a decision on each such protest. The District decision will be final. Pending the District decision, the Contractor shall proceed with its work in accordance with the District's ruling and/or instructions. It is hereby agreed that the Contractor's failure to file a protest within fifteen days (15) of the District's ruling shall constitute a waiver by the Contractor of all its rights to further protest, judicial or otherwise.

(g) The number of days that are anticipated to be non-workable due to adverse weather conditions shall be 15. Days deemed non-workable by the District in excess of such anticipated number shall be considered excusable delays.

(h) Unexcused delays shall be delays in the Contractor's work due to acts or neglect of the Contractor, its employees, subcontractors or those under it by contract or otherwise. In the event of an unexcused delay, the Contractor expressly agrees that it shall not be entitled to either an extension of time or recovery of its costs.

(i) A request for an extension of time, or the granting of an extension of time, shall not constitute a basis for any claim against the District for additional compensation or damages unless caused by the District or another contractor employed by the District.

6.05. DAMAGES FOR DELAY

In the event of compensable delay, the District shall only be liable for idle equipment, idle workers and the necessary costs of transporting equipment. The District shall be liable to the extent that the compensable delay is concurrent with excusable delays or contractor caused delays to the controlling operation. The allowable costs shall be as for force account work under Section 2.04 with the following exceptions:

(a) The Delay Factor in the Labor Surcharge and Equipment Rental Rules applies to each equipment rental rate;

(b) The daily number of payable hours shall equal the normal working hours during the delay, not to exceed eight (8) hours per day; and

(c) No markups will be added.

6.06. TERMINATION FOR CONVENIENCE

If at any time before completion of the Work, the District determines that it is either impossible or against the interests of the District to complete the Work, or if the Work is stopped by an injunction of a court of competent jurisdiction or by order of any competent authority, the District may, upon ten (10) days written notice to the Contractor, discontinue the Work and terminate the Contract. Upon service of such notice of termination, the Contractor shall discontinue the Work in such manner, sequence, and at such times as described below. The

Contractor shall have no claim for damages for such discontinuance or termination, nor any claim for anticipated profits on the Work thus dispensed with, nor any other actually performed up to the time of discontinuance, including any Extra Work ordered by the Engineer to be done, nor for any claim for liquidated damages.

Termination of the Contract for convenience and the total compensation payable to the Contractor in the event of termination shall be governed by the following:

(a) The District will issue the Contractor a written notice signed by the District, specifying that the Contract is to be terminated. Upon receipt of said written notice and, except as otherwise directed in writing by the Engineer, the Contractor shall:

(1) Stop all Work under the Contract except that specifically directed to be completed prior to Acceptance.

(2) Perform Work the District deems necessary to secure the project for termination.

(3) Remove equipment from the site of the Work.

(4) Take such action as is necessary to protect materials from damage.

(5) Notify all Subcontractors and suppliers that the Contract is being terminated and that their contracts or orders are not to be further performed unless otherwise authorized in writing by the District.

(6) Provide the District with an inventory list of all material previously produced, purchased or ordered from suppliers for use in the Work and not yet used in the Work, including its storage location, and such other information as the District may request.

(7) Dispose of material not yet used in the Work as directed by the District.

It shall be the Contractor's responsibility to provide the District with good title to all materials purchased by the District hereunder, including material for which partial payment has been made and with bills of sale or other documents of title for such materials.

(8) Subject to the prior written approval of the District, settle all outstanding liabilities and all claims arising out of subcontracts or orders for material terminated hereunder. To the extent directed by the District, the Contractor shall assign to the District all the right, title and interest of the Contractor under subcontracts or orders for materials terminated hereunder.

(9) Furnish the District with the documentation required to be furnished by the Contractor under the provisions of the Contract including, on projects as to which Federal funds are involved, all documentation required under the Federal requirements included in the Contract.

(10) Take such other actions as the District may direct.

(b) Termination of the Contract shall not relieve the Contractor of responsibility for damage to materials except as follows:

(1) The Contractor's responsibility for damage to materials for which partial payment has been made and for materials furnished by the District for use in the Work and unused shall terminate when the District certifies that such materials have been stored in the manner and at the locations he or she has directed.

(2) The Contractor's responsibility for damage to materials purchased by the District subsequent to the issuance of the notice that the Contract is to be terminated shall terminate when title and delivery of such materials has been taken by the District.

(3) When the District determines that the Contractor has completed the Work under the Contract directed to be completed prior to termination and such other Work as may have been ordered to secure the project for termination, he or she will recommend that the District formally accept the Contract, and immediately upon and after such Acceptance by the District, the Contractor will not be required to perform any further Work thereon and shall be relieved of his or her Contractual responsibilities for injury to persons or damage to property which occurs after the formal Acceptance of the project by the District.

(c) The total compensation to be paid to the Contractor shall be determined by the District on the basis of the following:

(1) The reasonable cost to the Contractor, without profit, for all Work performed under the Contract, including mobilization, demobilization and Work done to secure the project for termination. Reasonable cost will include a reasonable allowance for project Overhead and general administrative Overhead not to exceed a total of seven (7%) percent of Direct Costs of such Work.

(2) A reasonable allowance for profit on the cost of the Work performed as determined under Section 2.04(a), above, provided the Contractor establishes to the satisfaction of the District that it is reasonably probable that he or she would have made a profit had the Contract been completed and provided further, that the profit allowed shall in no event exceed four (4%) percent of said cost.

(3) The reasonable cost to the Contractor of handling material returned to the vendor, delivered to the District or otherwise disposed of as directed by the District.

(4) A reasonable allowance for the Contractor's administrative costs in determining the amount payable due to termination of the Contract.

All records of the Contractor and the Subcontractors, necessary to determine compensation in accordance with this section shall be open to inspection or audit by representatives of the District at all times after issuance of the notice that the Contract is to be terminated and for a period of three (3) years, and such records shall be retained for that period.

After Termination of the Work by the District, the District may make payments on the basis of interim estimates pending issuance of the Final Statement, when in its opinion the amount thus paid, together with all amounts previously paid or allowed, will not result in total compensation in excess of that to which the Contractor will be entitled.

All payments, including payment upon the Final Statement, shall be subject to deduction for prior payments and amounts, if any, to be kept or retained under the provisions of the Contract.

(d) The provisions of this section shall be included in all subcontracts.

6.07. TERMINATION FOR DEFAULT

(a) In the event of any default by the Contractor as described below, the District may, after giving ten (10) days' written notice to the Contractor, terminate the Contractor's right to proceed with the Work or any part of the Work in the District's sole discretion. Events of default include:

(1) Failure or refusal to prosecute the Work, or any separable part thereof, with such diligence as will ensure the completion within the time specified in the Contract, or any extension thereof, or failure to complete said work within such time.

(2) Filing of bankruptcy by the Contractor, or the making of a general assignment for the benefit of its creditors, or appointment of a receiver on account of Contractor's insolvency without discharge of the receiver within ten (10) days after its appointment.

(3) Failure to make prompt payments to Subcontractors or suppliers.

(4) Persistent disregard of laws, ordinances, or the instructions of the Engineer, or other substantial violation of any provision of the Contract.

(b) In the event the right of the Contractor to proceed with the Work, or any portion thereof, has been terminated because of the default of the Contractor and the Contractor has been given ten (10) days' notice to cure such fault and has not done so, the District may take over the Work and prosecute the same to completion by contract or any other method the District deems expedient, and may take possession of and utilize in completing the Work such materials, appliances, equipment and plant as may be on the site of the Work and necessary therefore. In such event, the Contractor and its sureties shall be liable for all damages including costs of managerial and administrative services, engineering, legal and other consultant fees, and liquidated damages sustained or incurred by the District.

(c) Upon termination, the Contractor shall not be entitled to receive any further payment until the Work is finished. If upon completion of the Work the total cost to the District, including engineering, legal and other consultant fees, costs of managerial and administrative services, construction costs, and liquidated damages shall be less than the amount which would have been paid if the Work had been completed by the Contractor in accordance with the terms of the Contract, then the difference shall be paid to the Contractor in the same manner as the final payment under the Contract. If the total cost incurred by the District on account of termination of the Contract and subsequent completion of the Work by the District by whatever

method the District may deem expedient shall exceed said amount which the Contractor would otherwise have been paid, the Contractor and its sureties shall be liable to the District for the full amount of such excess expense.

(d) The rights and remedies of the District provided in this section are in addition to any of the rights and remedies provided by the law or under this Contract.

(e) Liquidated Damages

(1) It is agreed by the parties to this Contract that time is of the essence. In the event all the Work is not completed before or upon the expiration of the time limit as set in the Proposal, Contract and/or Progress Schedule, or within any time extensions that may have been granted, damage will be sustained by the District; and that it may be impracticable to determine the actual amount of damage by reason of such delay. Accordingly, it is agreed that the Contractor shall pay to the District as damages the amount set forth for each and every day's delay in finishing the Work in excess of the number of days specified. Liquidated damages shall be paid at a rate of **one thousand dollars ($1,000) per day** unless otherwise stated in the Contract Documents. The parties expressly agree that the liquidated damage clause found in the Contract Documents is reasonable under the circumstances existing at the time the Contract was made. The District shall have the right to deduct the amount of liquidated damages from any money due or to become due the Contractor.

(2) In addition, the District shall have the right to charge to the Contractor and to deduct from the final or progress payments for the Work the actual cost to the District of legal, engineering, inspection, superintendence, and other expenses, which are directly chargeable to the Contract and which accrue during the period of such delay, except that the cost of final inspection and preparation of the final estimate shall not be included in the charges.

(f) Exclusions

The Contractor shall not be liable for liquidated damages or delays caused by the removal or relocation of utilities when such removal or relocation is the responsibility of the District or the owner of the utility under Government Code section 4215.

6.08. CLEAN-UP

During the progress of the Work, the Contractor shall maintain the Site and related structures and equipment in a clean, orderly condition and free from unsightly accumulation of rubbish. All waste materials shall be removed daily from the Site and disposed of by the Contractor by any proper means at its own expense unless designated otherwise on the plans. No waste materials shall be placed in the public street right-of-way. Unless otherwise specified, all existing piping, materials and/or equipment removed pursuant to this Contract shall become the Contractor's property.

Upon completion of the Work and before the final estimate is submitted, the Contractor shall, at its own cost and expense, remove from the vicinity of the Work all plants, buildings,

rubbish, unused work materials, concrete forms, and temporary bridging and other like materials, belonging to the Contractor or used under the Contractor's direction during the construction, and in the event of the Contractor's failure to do so, the same may be removed by the District after ten (10) calendar days' notice to the Contractor. Such removal shall be at the expense of the Contractor.

The Contractor shall use care in the removal of materials and equipment so as not to cause damage to existing facilities and structures. Contractor shall assume liability for all such damage. Where the construction has crossed yards or driveways, restoration shall be by the Contractor to the complete satisfaction of the Engineer, at the Contractor's expense.

The Contractor shall make its own arrangements for the disposal of waste materials. If the Contractor elects to dispose of such materials on private property, Contractor shall obtain written permission from all property owners involved.

SECTION 7

MEASUREMENT AND PAYMENT

7.01. SCOPE OF PAYMENT

(a) The Contractor shall accept the compensation provided in the Contract as full payment for furnishing all labor, materials, tools, equipment, and incidentals necessary to the completed work and for performing all work contemplated and embraced under the Contract; also for loss or damage arising from the nature of the work, or from the action of the elements, or from any unforeseen difficulties which may be encountered during the prosecution of the Work until the acceptance by the District and for all risks of every description connected with the prosecution of the Work, also for all expenses incurred in consequence of the suspension or discontinuance of the work as provided in the Contract; and for completing the Work according to the Specifications and Plans. Neither the payment of any estimate nor of any retained percentage shall relieve the Contractor of any obligation to make good any defective work or material.

(b) No compensation will be made in any case for loss of anticipated profits. Increased or decreased work involving supplemental agreements will be paid for as provided in such agreements.

(c) The Work includes the preparatory work and operations needed for mobilization and demobilization of the Project. The Work, however, does not include establishing the Engineer's field facility(s) of utility work and connections needed for these facilities.

7.02. PROGRESS PAYMENTS -

(a) The District will pay the Contractor ninety-five percent (95%) of the amount of each progress estimate within thirty (30) days after receipt of an undisputed and properly submitted progress estimate from the Contractor, unless the District has made a finding pre-proposals pursuant to Public Contract Code section 7201(b)(4) justifying a larger retention. If the District fails to pay an undisputed progress estimate within the allotted thirty (30) days, the District shall pay interest to the Contractor equivalent to the legal rate set forth in subdivision (A) of section 685.010 of the Code of Civil Procedure. Five percent (5%) of the amount of each estimate shall be retained by the District until final completion and acceptance of all work under the Contract.

(b) DRAFT APPLICATION FOR PAYMENT

(1) One week prior to submitting the Application for Payment submit a marked-up copy of the previous Application for Payment showing the changes in progress that will be the basis for the new Application for Payment.

(c) BILLING MEETINGS

(1) A billing meeting shall be conducted by District's Representative each month prior to submittal of the Application for Payment.

(2) Location: As designated by District's Representative.

(3) Attending shall be:

(i) District's Representative.

(ii) Contractor's Superintendent or Project Manager

(iii) Subcontractors, as appropriate.

(iv) Others, as appropriate.

(d) SCHEDULE OF VALUES

(1) Coordination. Coordinate preparation of the Schedule of Values with preparation of the Contractor's Contract Schedule and as directed by the District's Representative.

(i) Correlate line items in the Schedule of Values with other required administrative schedules and forms, including:

(1) Contractor's Contract Schedule.

(2) Application for Payment form.

(3) List of Subcontractors

(4) Schedule of Alternates (if any).

(5) List of products (where/if appropriate).

(6) List of principal supplier and fabricators.

(7) Schedule of submittals.

(8) Construction Cost Breakdown Sheet.

(2) Submit the Schedule of Values to the District's Representative at the earliest feasible date, but in no case later than 7 days before the date scheduled for Submittal of the Initial Application for Payment.

(3) Format and Content. Use the [Specification] [Project Manual] Table of Contents as a guide to establish the format for the Schedule of Values.

(i) Include the following Project identification on the Schedule of Values:

(1) Project name, number and location.

(2) Name of the District's Representative.

(3) Project Number.

(4) Contractor's name and address.

(5) Date of Submittal.

(4) Arrange the Schedule of Values in a tabular form with separate columns to indicate the following for each item listed:

(i) Generic name.

(ii) Specification section.

(iii) Name of Subcontractor.

(iv) Name of manufacturer or fabricator.

(v) Name of supplier (if appropriate).

(vi) Change orders (numbers) that have affected value.

(vii) Dollar value. (Percentage of Contract Sum to the nearest one-hundredth percent, adjusted to total 100 percent.)

(5) Provide a breakdown of the Contract Sum in sufficient detail to facilitate continued evaluation of Applications for Payment and progress reports. Break principal subcontract amounts down into several line items.

(6) Round amounts off to the nearest whole dollar; the total shall equal the Contract Sum.

(7) For each part of the Work where an Application for Payment may include materials or equipment, purchased or fabricated and stored, but not yet installed, provide separate line items on the Schedule of Values for initial cost of the materials, for each subsequent stage of completion, and for total installed value of that part of the Work.

(i) Differentiate between items stored on-site and items stored off-site. Include requirements for insurance and bonded warehousing, if required.

(8) Provide separate line items on the Schedule of Values for initial cost of the materials, for each subsequent stage of completion, and for total installed value of that part of the Work. Each item in the Schedule of Values and Application for Payment shall be complete including its total cost and proportionate share of general overhead and profit margin.

(i) General Conditions Work Items, such as temporary facilities and other major cost items that are not direct cost of actual work-in-place may be shown as separate line items in the Schedule of Values.

(9) Allowances (if applicable). Show the line item value of allowances.

(10) Schedule of Values Updating. Update and resubmit the Schedule of Values prior to the next Application for Payment when Change Orders or contract directives result in a change in the Contract Sum.

(i) Each Change Order shall become a new line item.

(e) APPLICATIONS FOR PAYMENT

(1) No portion of an Application for Payment which includes a request for payment of a Change Order not yet fully executed will be approved by District's Representative.

(2) Each Application for Payment shall be consistent with previous applications and payments as certified by the District's Representative and paid for by the District.

(i) The Initial Application for Payment, the Application for Payment at time of Substantial Completion, and the final Application for Payment involve additional requirements.

(ii) Entries shall match data on the Schedule of Values and the Contractor's Contract Schedule.

(iii) Any payment request determined not to be a proper payment request suitable for payment shall be returned to the Contractor as soon as practicable, but not later than seven (7) days, after receipt. A request returned pursuant to this section shall be accompanied by a document setting forth in writing the reasons why the payment request is not proper.

(iv) The number of days available to the District to make a payment without incurring interest pursuant to this section shall be reduced by the number of days by which the District exceeds the seven-day return requirement set forth in

(v) When, in the judgment of the District the Work is not proceeding in accordance with the provisions of the Contract, or when in the District's judgment the total amount of the Work done since the last estimate amounts to less than one thousand dollars ($1,000), no pay estimate will be prepared and no progress payment will be made.

(3) Payment Application Times. Unless otherwise agreed in writing, the date of each progress payment is indicated in the General Conditions. The period of Work covered by each Application for Payment shall be for the Work as indicated in the General Conditions.

(4) Submittal. Submit executed copy of the Application for Payment to the District's Representative by means of ensuring receipt within 24 hours; one copy shall be complete, including waivers of lien and similar attachments, when required.

(i) Transmit copy with a transmittal form listing attachments, and recording appropriate information related to the application in a manner acceptable to the District's Representative.

(ii) With each Application for Payment, submit lien release waivers of from every entity who may lawfully be entitled to file a lien arising out of the Contract, and related to the Work covered by the payment.

(5) Initial Application for Payment for Construction Work. Administrative actions and submittals that must precede or coincide with submittal of the Initial Application for Payment for Construction Work include the following:

(i) List of Subcontractors.

(ii) List of principal suppliers and fabricators.

(iii) Schedule of Values.

(iv) Contractor's updated Contract Schedule.

(v) Schedule of principal products.

(vi) Submittal Schedule (preliminary if not final).

(vii) Certificates of insurance and insurance policies.

(viii) Data needed to acquire District's insurance.

(6) Application for Payment at Substantial Completion. Following issuance of the Certification of Substantial Completion, submit an Application for Payment. This application shall reflect any certificates of Beneficial Occupancy issued previously for District occupancy of designated portions of the Work. Administrative actions and submittals that shall precede or coincide with this application include:

(i) Occupancy permits and similar approvals.

(ii) Warranties (guarantees) and maintenance agreements.

(iii) Test/adjust/balance records.

(iv) Maintenance instructions.

(v) Meter readings.

(vi) Start-up performance reports.

(vii) Change-over information for District's occupancy, use, operation and maintenance.

(viii) Final progress photographs (if any).

(ix) List of incomplete Work, recognized as exceptions to Certificate of Substantial Completion.

(x) Final Cleaning.

(xi) Building Commissioning

(xii) Final list of Contractor installed equipment, including total installed value (Equipment Schedule of Values).

(7) Final Payment Application. Administrative actions and submittals which must precede or coincide with submittal of the final payment Application for Payment include the following:

(i) Completion of Project closeout requirements.

(ii) Completion of items specified for completion after Substantial Completion.

(iii) Assurance that unsettled claims will be settled.

(iv) Assurance work not complete and accepted will be completed without undue delay.

(v) Transmittal of required Project construction records to the District.

(vi) Proof that taxes, fees and similar obligations have been paid.

(vii) Removal of temporary facilities and services.

7.03. PROMPT PROGRESS PAYMENT TO SUBCONTRACTORS

A prime contractor or subcontractor shall pay any subcontractor not later than seven (7) days of receipt of each progress payment in accordance with the provisions in Section 7108.5 of the California Business and Professions Code concerning prompt payment to subcontractors. The seven (7) days is applicable unless a longer period is agreed to in writing. Any delay or postponement of payment over thirty (30) days may take place only for good cause and with the District's prior written approval. Any violation of Section 7108.5 shall subject the violating contractor or subcontractor to the penalties, sanctions and other remedies of that section. This requirement shall not be construed to limit or impair any contractual, administrative, or judicial remedies otherwise available to the contractor or subcontractor in the event of a dispute involving late payment or nonpayment by the prime contractor, deficient subcontract performance, or noncompliance by a subcontractor. This provision applies to both DBE and non-DBE subcontractors.

7.04. LIENS AND STOP NOTICES

The Contractor agrees to keep the Work, the site of the Work and all monies held by the District free and clear of all liens and stop notices related to labor and materials furnished in connection with the Work, if permitted by law. Furthermore, the Contractor waives any right it may have to file any type of lien or stop notice in connection with the Work. Notwithstanding anything to the contrary contained in the Contract Documents, if any such lien or stop notice is filed or there is evidence to believe that lien or stop notice may be filed at any time during the progress of the Work or within the duration of this Contract, the District may refuse to make any payment otherwise due the Contractor or may withhold any payment due the Contractor a sum

sufficient in the opinion of the District to pay all obligations and expenses necessary to satisfy such lien or stop notice. The District may withhold such payment unless or until the Contractor, within ten days after demand therefor by the District, shall furnish satisfactory evidence that the indebtedness and any lien or stop notice in respect thereof has been satisfied, discharged and released of record, or that the Contractor has legally caused such lien or stop notice to be released of record pending the resolution of any dispute between the Contractor and any person or persons filing such lien or stop notice. If the Contractor shall fail to furnish such satisfactory evidence within ten days of the demand therefor, the District may discharge such indebtedness and deduct the amount thereof, together with any and all losses, costs and damages suffered or incurred by the District from any sum payable to the Contractor under the Contract documents, including but not limited to final payment and retained percentage. This section shall be specifically included in all Subcontracts and purchase orders entered into by the Contractor.

7.05. FINAL ACCEPTANCE AND DATE OF COMPLETION

Whenever the Contractor shall deem all Work under this Contract to have been completed in accordance therewith, the Contractor shall so notify the District in writing, and the District shall promptly ascertain whether the Work has been satisfactorily completed and, if not, shall advise the Contractor in detail and in writing of any additional work required. When all the provisions of the Contract have been fully complied with, to the satisfaction of the District , the District shall proceed with all reasonable diligence to determine accurately the total value of all Work performed by the Contractor at the prices set forth in the Contract or fixed by Change Orders, and the total value of all extra work, all in accordance with the Contract. The District will then certify to said final estimate and to the completion of the Work, and will file copies thereof with the District and the Contractor, and shall cause a Notice of Completion to be filed with the Los Angeles County Clerk-Recorder. The date of final completion shall be the date of filing of the Notice of Completion. All guarantees, warranties, and securities securing said guarantees and warranties, shall commence on said date of final completion.

7.06. RIGHT TO WITHHOLD PAYMENTS

(a) In addition to all other rights and remedies of the District hereunder and by virtue of the law, the District may withhold or nullify the whole or any part of any partial or final payment to such extent as may reasonably be necessary to protect the District from loss on account of:

(1) Defective work not remedied, irrespective of when any such work be found to be defective;

(2) Claims or liens filed or reasonable evidence indicating probable filing of claims or liens including, but not limited to claims under Sections 1775, 1776, or 1777.7 of the Labor Code;

(3) Failure of the Contractor to make payments properly for labor, materials, equipment, or other facilities, or to subcontractors and/or suppliers;

(4) A reasonable doubt that the Work can be completed for the balance then unearned;

(5) A reasonable doubt that the Contractor will complete the Work within the agreed time limits;

(6) Costs to the District resulting from failure of the Contractor to complete the Work within the proper time; or

(7) Damage to work or property.

(b) Whenever the District shall, in accordance herewith, withhold any monies otherwise due the Contractor, written notice of the amount withheld and the reasons therefor will be given the Contractor. After the Contractor has corrected the enumerated deficiencies, the District will promptly pay to the Contractor the amount so withheld. When monies are withheld to protect the District against claims or liens of mechanics, material men, Subcontractors, etc., the District may at its discretion permit the Contractor to deliver a surety bond in terms and amount satisfactory to the District, indemnifying the District against any loss or expense, and upon acceptance thereof by the District, the District shall release to the Contractor monies so withheld.

7.07. FINAL PAYMENT

Within ten (10) days after the date of completion, the District will file in the Office of the County Recorder, a Notice of Completion of the Work herein agreed to be done by the Contractor. Within sixty (60) days of completion defined in Public Contract Code section 7107, the difference between said final estimate and all payments theretofore made to the Contractor shall be due and payable to the Contractor, subject to any requirements concerning the furnishings of a maintenance bond, and excepting only such sum or sums as may be withheld or deducted in accordance with the provisions of this Contract. All prior certifications upon which partial Payments may have been made, being merely estimates, shall be subject to correction in the final certificate.

7.08. FINAL RELEASE

Final payment to the Contractor in accordance with the final estimate is contingent upon the Contractor furnishing the District with a signed written release of all claims against the District arising by virtue of the Contract. Disputed Contract claims in stated amounts may be specifically excluded by the Contractor from the operation of the release. The release shall be in substantially the form specified in California Civil Code section 8138.

PART 4: GEOTECHNICAL UPDATE REPORT

Geotechnical
Environmental
Hydrogeology
Material Testing
Construction Inspection

July 19, 2023 Project No. 23-7751

Altadena Library District
Ms. Jennifer Pearson, AIA
Architect, Program Manager
8640 National Boulevard
Culver City, CA 90232

Subject: Geotechnical Update Report, Proposed Renovation, Main Library, Altadena Library District, 626 East Mariposa Street, Altadena, California

Jennifer,

In accordance with your request and authorization, TGR Geotechnical, Inc. (TGR) has prepared this geotechnical update report for the proposed improvements at the Altadena Main Library in Altadena, California. This report presents geotechnical design and grading recommendations for the proposed development. These recommendations were developed based on our review of the previous study performed by Byer Geotechnical, Inc. (2012), our site visit, a review of the current proposed development plan and the 2022 California Building Code. The work was performed in general accordance with our proposal dated June 14, 2023.

Based on our study the proposed development is feasible from a geotechnical viewpoint provided the recommendations presented in this report are implemented during design and construction.

If you have any questions regarding this report, please do not hesitate to contact this office. We appreciate this opportunity to be of service.

Respectfully submitted,

TGR GEOTECHNICAL, INC.

INTRODUCTION

Site Descriptions and Proposed Project Development

The subject site is located on the northeast corner of East Mariposa Street and Santa Rosa Avenue, in Altadena, California (Figure 1). The subject site is a currently occupied by the Altadena Library. It is our understanding that the proposed improvements consist of approximately 4,000 square feet of additions and a full renovation of the existing building. The proposed additions consist of a new community room on the southwest corner of the library, a new entry/lobby and maker space desk on the south side of the library, a new amphitheater on the north side of the library and an elevator in the center of the library.

Scope of Work

The scope of work for this geotechnical investigation included the following:

- Site reconnaissance and review of the referenced report by Byer Geotechnical (2012) for the subject site made available to us.
- Analyses of data, including site seismicity, foundation design, retaining wall recommendations for proposed improvements, and soils engineering/earthwork with respect to the suitability of the proposed additions.
- Preparation of this updated geotechnical report presenting all previous field and laboratory data by Byer Geotechnical (2012) along with geotechnical design recommendations for the currently proposed development.

Previous Study

A previous geotechnical investigation was conducted at the subject site by Byer Geotechnical, Inc. in 2012 for an extensive improvement at the subject site. TGR has reviewed the geotechnical reports prepared by Byer Geotechnical and has developed the geotechnical recommendations provided in this report based on the current improvement plan and the 2022 California Building Code.

The investigation by Byer Geotechnical (2012) consisted of four (4) hollow stem auger borings to approximate depths ranging from 25.5 feet to 30.5 feet below existing grade and two (2) hand dug test pits to an approximate depth of 5.5 feet below existing grade. The boring and test pit logs are included in Appendix A and the associated laboratory test data has been included in Appendix B for this geotechnical update report.

GEOTECHNICAL FINDINGS

Geology

Regional Geologic Setting

The project site is located on the eastern edge of the Pasadena 7.5-minute Quadrangle, Los Angeles County, California. Per the Geologic Map of the San Bernardino and Santa Ana 30' x 60' quadrangles, California (Dibblee, 1989), the subject site is underlain by Quaternary older alluvial fan gravel and sand derived from the San Gabriel Mountains. Figure 2 presents the Regional Geology Map.

Earth Units

Based on subsurface investigations by Byer Geotechnical (2012), the subject area is underlain by approximately 1 to 7 feet of undocumented fill (Afu) overlaying old Quaternary age alluvium (Qof). The undocumented fill generally consists of silty sand with varying amounts of gravel and silt. It is assumed that the undocumented fill was derived from grading operations prior to the construction of the existing library and associated parking lot in 1961. The existing undocumented fill is considered unsuitable for the support of engineered fill and/or structures. The underlying old alluvium consists of silty sand with varying amounts of gravel to approximately 15 to 20 feet below existing grade, where gravelly sand was encountered. Detailed descriptions of the earth units encountered in Byer Geotechnical's borings and test pits are presented in Appendix B.

Groundwater

Subsurface water was not encountered to a depth of 30.5 feet below grade during the subsurface exploration by Byer Geotechnical (2012). Based on our review of available historical groundwater information, the historic high groundwater has not been mapped at the subject site (Figure 3).

The Los Angeles County Department of Public Works groundwater data from wells nearest to the subject site indicate a historic high groundwater of 192.7 feet below existing grade dating back to 1970. Well ID 4081B, State #: 1N12W10H01 is located approximately 0.9 miles east of the subject site

Seasonal and long-term fluctuations in the groundwater may occur as a result of variations in subsurface conditions, rainfall, run-off conditions and other factors. Therefore, variations may occur.

Static groundwater is not anticipated to impact the proposed development.

Expansive Soil

Based on laboratory testing by Byer Geotechnical (2012), onsite soils have a "very low" expansion potential.

Hydro Collapse

Laboratory testing by Byer Geotechnical (2012) indicates near surface soils experience 0% to 2% hydrocollapse when inundated under load, correlating to a "low" potential for hydro collapse.

Seismic Review

Faulting and Seismicity

The subject site, like the rest of Southern California, is located within a seismically active region as a result of being located near the active margin between the North American and Pacific tectonic plates. The principal source of seismic activity is movement along the northwest-trending regional faults such as the San Andreas, San Jacinto and Elsinore fault zones. These fault systems produce approximately 5 to 35 millimeters per year of slip between the plates.

We consider the most significant geologic hazard to be the potential for moderate to strong seismic shaking that is likely to occur at the subject site. The subject site is located in the highly seismic Southern California region within the influence of several faults that are considered to be Holocene-active, pre-Holocene or age-undetermined faults. A Holocene-active fault is defined by the State of California as a fault that has exhibited surface displacement within the Holocene time (about the last 11,700 years). A pre-Holocene fault is defined by the State as a fault whose history of past movement is older than 11,700 years ago and does not meet the criteria for a Holocene-active fault. An age-undetermined fault is defined by the State as a fault where the recency of fault movement has not been determined.

These Holocene-active, pre-Holocene and age-undetermined faults are capable of producing potentially damaging seismic shaking at the site. It is anticipated that the subject site will periodically experience ground acceleration as the result of small to moderate magnitude earthquakes. Other Holocene-active, pre-Holocene and age-undetermined faults without surface expression (blind faults) that are not currently zoned and may be capable of generating an earthquake are known to be present in the region.

The subject site is not included within any Earthquake Fault Zones as created by the Alquist-Priolo Earthquake Fault Zoning Act (CGS, 2018). Our review of geologic literature pertaining to the site area indicates that there are no Holocene-active, pre-Holocene or age-undetermined faults located within or immediately adjacent to the subject property.

The nearest faults to the subject site are the Sierra Madre fault zone mapped approximately 1.0 mile to the northeast of the site, the San Gabriel fault zone mapped approximately 1.2 miles south of the site, the Eagle Rock fault mapped approximately 4.0 miles southwest of the site, the Raymond fault mapped approximately 4.6 miles north of the site, the Verdugo fault mapped approximately 6.4 miles southwest of the site and the Hollywood fault mapped approximately 6.5 miles southwest of the site. The Regional Fault Map, Figure 4, shows the location of the subject site in respect to the regional faults.

Secondary Seismic Hazards

Surface Fault Rupture and Ground Shaking

Since no known faults are located within the site, surface fault rupture is not anticipated. However, due to the close proximity of known active and potentially active faults, severe ground shaking should be expected during the life of the proposed structures.

Liquefaction

Liquefaction is a seismic phenomenon in which loose, saturated, fine-grained granular soils behave similarly to a fluid when subjected to high-intensity ground shaking. Liquefaction occurs when these ground conditions exist: 1) Shallow groundwater; 2) Low density, fine, clean sandy soils; and 3) High-intensity ground motion. Effects of liquefaction can include sand boils, settlement, and bearing capacity failures below foundations.

A review of the Earthquake Zones of Required Investigation, Pasadena Quadrangle (CGS, 1999) indicates that the subject site is not located within an area mapped as having a potential for earthquake induced liquefaction (Figure 5).

Based on the above and depth to groundwater, the potential for liquefaction at the subject site is considered to be very low.

Seismically Induced Settlement

Ground accelerations generated from a seismic event can produce settlements in sands or in granular earth materials both above and below the groundwater table. This phenomenon is often referred to as seismic settlement and is most common in relatively clean sands, although it can also occur in other soil materials. Due to the density of site soils, seismically induced settlement susceptibility is considered to be low.

Landsliding

Landsliding involves downhill motion of earth materials during or subsequent to earth shaking. Historically, landslides triggered by earthquakes have been a significant cause of damage. Areas that are most susceptible to earthquake induced landslides are areas with steep slopes in poorly cemented or highly fractured bedrock, areas underlain by loose, weak soils, and areas on or adjacent to existing landslide deposits.

A review of the Earthquake Zones of Required Investigation, Pasadena Quadrangle (CGS, 1999), this property is not located within a mapped zone of landsliding (Figure 5) and the property and adjacent areas are situated on relatively flat topography. Based on the above, the general landslide susceptibility is considered to be negligible.

Lateral Spreading

Seismically induced lateral spreading involves primarily movement of earth materials due to earth shaking. Lateral spreading is demonstrated by near-vertical cracks with predominantly horizontal movement of the soil mass involved. The topography in the vicinity of the subject site is relatively flat. Therefore, the potential for lateral spreading at the subject site is considered very low.

DISCUSSIONS AND CONCLUSIONS

General

Based on field exploration, laboratory testing and engineering analysis performed Byer Geotechnical (2012), it is our opinion that the proposed structure and proposed grading will be safe against hazard from landslide, settlement, or slippage and the proposed construction will have no adverse effect on the geologic stability of the adjacent properties provided our recommendations presented in this report are incorporated during design and construction.

Conclusions

Based on our findings, the subject site is likely to be subjected to moderate ground shaking due to the proximity of known active and potentially active faults. This may reasonably be expected during the life of the structure and should be designed accordingly.

The primary conditions affecting the proposed project site development are as follows:

- Presence of 1 to 7 feet of undocumented fill.
- Excavations adjacent to existing footings.

The engineering evaluation performed concerning site preparation and the recommendations presented are based on information provided to us and obtained by us during our office and fieldwork. This report is prepared for the additions and renovation to the existing Altadena Library. In the event that any significant changes are made to the proposed development, the conclusions and recommendations contained in this report shall not be considered valid unless the changes are reviewed, and the recommendations of this report are verified or modified in writing by TGR.

RECOMMENDATIONS

Seismic Design Parameters

When reviewing the 2022 CBC the following parameters should be incorporated into the design. The Site Class is based on site soil conditions per Section 11.4.3 of the ASCE 7-16. It is our opinion Site Class D – Stiff Soil is the most appropriate based on site soil conditions.

Parameter	Value
Latitude (degree)	34.1891
Longitude (degree)	-118.1371
Site Class (CBC Section 1613.2.2)	D – Stiff
Site Coefficient, F_a (CBC Table 1613.2.3 (1))	1.0
Site Coefficient, F_v (CBC Table 1613.2.3 (2))	1.7
Mapped Spectral Acceleration at 0.2-sec, S_s (CBC Section 1613.2.1)	1.924 g
Mapped Spectral Acceleration at 1.0-sec, S_1 (CBC Section 1613.2.1)	0.721 g
Spectral Acceleration at 0.2-sec Adjusted for Site Class, S_{MS} (CBC Section 1613.2.3)	1.924 g
Spectral Acceleration at 1.0-sec Adjusted for Site Class, S_{M1} (CBC Section 1613.2.3)	1.226 g
Design Spectral Acceleration at 0.2-sec, S_{DS} (CBC Section 1613.2.4)	1.283 g
Design Spectral Acceleration at 1.0-sec, S_{D1} (CBC Section 1613.2.4)	0.817 g
Seismic Response Coefficient (C_s) ASCE 7-16	Per 12.8-6
Mapped MCE_G, Peak Ground Acceleration, PGA	0.830 g
Site Coefficient for Mapped MCE_G, F_{PGA}	1.1
Site Modified Peak Ground Acceleration, PGA_M	0.913 g

* Based on Equivalent Lateral Force Design Procedure Being Used.

In general, ASCE 7-16 Section 11.4.8 requires site-specific hazard analysis for structures on Site Class D for values of S_1 greater than or equal to 0.2 g. When using Equivalent lateral Force (ELF) and Modal Response Spectrum Analysis (MRSA), the ASCE 7-16 Section 11.4.8 Item 1 exception shall be utilized. Increasing *SM1* by 50% in Eq. (11.4-2) results in an increase in the value of S_{D1} determined by Eq. (11.4-4) by 50%. These increased values of S_{M1} and S_{D1} are to be used for all applications of these parameters throughout the Standard, including for the formulation of the design response spectrum where a design response spectrum is needed per this standard. It should be noted that the 50% increase in S_{D1} also increases *Ts* by 50% resulting in an extension of the acceleration-controlled plateau of the design response spectrum. *Cs* is determined in accordance with Eq. (12.8-6).

The structural consultant should review the above parameters and the 2022 California Building Code to evaluate the seismic design.

Conformance to the criteria presented in the above table for seismic design does not constitute any type of guarantee or assurance that significant structural damage or ground failure will not occur during a large earthquake event. The intent of the code is “life safety” and not to completely prevent damage of the structure, since such design may be economically prohibitive.

Foundation Design Recommendations

The proposed additions may be supported on continuous and/or spread footings. Bearing capacity recommendations for shallow foundations are presented below. These recommendations assume that the footings will be supported on a minimum of three (3) feet of engineered fill. The existing undocumented fill is considered unsuitable for the support for structures and structural fill and shall be removed and replaced with engineered fill compacted to a minimum of ninety (90) percent relative compaction. All footings shall meet the setback requirements presented in 2022 CBC.

For foundations supported on minimum three (3) feet of engineered fill with minimum ninety (90) percent relative compaction at near optimum moisture content, an allowable bearing pressure of 2,000 pounds per square foot may be used in design for a minimum footing depth of 2 feet. The bearing capacity may be increased by 300 psf per additional foot of depth, to a maximum of 3,000 psf. The recommended minimum footing depth is twenty-four (24) inches.

The minimum recommended footing width is eighteen (18) inches for continuous footings and twenty-four (24) inches for pad footings. A minimum reinforcement of two (2) No. 4 steel bar top and two (2) No. 4 steel bar bottom is required for continuous footings from a geotechnical viewpoint. Foundation design details such as concrete strength, reinforcements, etc. should be established by the Structural Engineer.

Resistance to lateral loads including wind and seismic forces may be provided by frictional resistance between the bottom of concrete and the underlying fill soils and by passive pressure against the sides of the foundations. A coefficient of friction of 0.37 may be used between concrete foundation and underlying soil. The recommended passive pressure of the engineered fill may be taken as an equivalent fluid pressure of 260 pounds per cubic foot (2,600 psf max). The above values may be increased by one-third (1/3) for short-term wind or seismic loads.

The total and differential static settlement is anticipated to be 1-inch and 0.5-inch or less over 30 feet.

Footings located near property lines or existing footings where the lateral removal cannot be achieved shall be designed for a reduced bearing capacity of 1,500 pounds per square foot and the passive resistance shall be ignored.

Retaining Wall Recommendations

The following soil parameters may be used for the design of the retaining wall with level backfill and a maximum height of six (6) feet:

Conditions	Parameters
Active (Level)	40 psf/ft
Passive	260 (maximum 2,600 psf)
Friction Coefficient	0.37

- Unrestrained retaining wall, such as a cantilever wall, the active earth pressure shall be used.
- Any import backfill shall be granular non-expansive select fill with a minimum sand equivalent of 30 The import fill should be tested and approved by TGR prior to backfill.
- Passive pressure and frictional resistance could be combined in determining the total lateral resistance. However, one of them shall be reduced by 50 percent.
- The passive pressure in the upper 6 inches of soil not confined by slabs or pavement should be neglected.

In addition to the above lateral forces due to retained earth, surcharge due to improvements, such as an adjacent structure, should be considered in the design of the retaining wall. Loads applied within a 1:1 projection from the surcharging structure on the stem of the wall shall be considered as lateral surcharge. For lateral surcharge conditions, we recommend utilizing a horizontal load equal to 50 percent of the vertical load, as a minimum. This horizontal load should be applied below the 1:1 projection plane. To minimize the surcharge load from an adjacent footing, deepened footings may be considered.

Slab-On-Grade

Slab-on-grade should be a minimum of five (5) inches thick and reinforced with a minimum of No. 4 reinforcing bar on 16-inch centers in two horizontally perpendicular directions. Reinforcing should be properly supported to ensure placement near the vertical midpoint of the slab. "Hooking" of the reinforcement is not considered an acceptable method of positioning the steel.

Control joints may be utilized at the discretion of the Structural engineer to reduce cracking, however the reinforcement recommended above is intended to reduce cracking and its proper placement is critical to the performance of the slab.

The subgrade material should be compacted to a minimum of ninety (90) percent of the maximum laboratory dry density at near optimum moisture content to a minimum depth of two (2) feet. The existing undocumented fill is considered unsuitable for the support for structures and structural fill and shall be removed and replaced with engineered fill compacted to a minimum of ninety (90) percent relative compaction.

The thickness and reinforcement of the slab shall be designed by the structural engineer per the 2022 California Building Code and should include the anticipated loading condition and the anticipated use of the building. For moisture sensitive flooring, the floor slab should be underlain by minimum 15-mil impermeable polyethylene membrane (Stego Wrap, Moistop Plus, or any equivalent meeting the requirements of ASTM E1745, Class A rating) as a capillary break. Sand (2-inches) may be placed above and below the impermeable polyethylene membrane at the discretion of the project structural engineer/concrete contractor for proper curing and finish of the concrete slab-on-grade and protection of the membrane and is considered outside the scope of geotechnical engineering.

Flatwork

Flatwork should be a minimum of 4-inches thick should be reinforced with a minimum of No. 3 reinforcing bar on 18-inch centers in two horizontally perpendicular directions. Reinforcing should be properly supported to ensure placement near the vertical midpoint of the slab. "Hooking" of the reinforcement is not considered an acceptable method of positioning the steel.

The subgrade material should be compacted to a minimum of ninety (90) percent of the maximum laboratory dry density at near optimum moisture content per ASTM D1557 to a minimum depth of one (1) foot. Prior to placement of concrete, the subgrade soils should be moistened at near optimum moisture content and verified by our field representative. The actual thickness and reinforcement of the slab shall be designed by the structural engineer and should include the anticipated loading condition.

Preliminary Pavement Design

The Caltrans method of design was utilized to develop the following asphalt pavement section. The section was developed based on a preliminary "R-Value" for compacted site subgrade soils of 50.

ASPHALT PAVEMENT SECTION			
Traffic Utilization	Asphalt (Inch)	Aggregate Base (Inch)	Total (Inch)
Light Passenger Cars	3.0	4.0	7.0
Moderate Trucks	4.0	4.0	8.0

Aggregate base material for Asphalt Pavement should consist of CAB/CMB complying with the specifications in Section 200-2.2/200-2.4 of the current "Standard Specifications for Public Works Construction" and should be compacted to at least ninety-five (95) percent of the maximum dry density per ASTM D1557. The paving asphalt performance grade (Section 203-1.2) should comply with the historic temperature changes to reduce the impact of thermal cracks. The surface of the base should exhibit a firm and unyielding condition just prior to the placement of asphalt or Portland cement concrete paving. The asphalt concrete shall be compacted to a minimum of ninety-five (95) percent relative compaction.

The pavement subgrade shall be compacted to minimum ninety (90) percent relative compaction to a depth of one (1) foot.

The R-value and the associated pavement section should be confirmed at the completion of site grading.

Cement Type and Corrosion

Based on laboratory testing by Byers Geotechnical (2012) concrete used should be designed in accordance with the provisions of ACI 318-14, Chapter 19 for Exposure Class S0: Concrete with a minimum unconfined compressive strength of 2,500 psi, and for Exposure Class C1 (Moderate) – Concrete exposed to moisture but not a significant source of chlorides, per ACI 318-14 Table 19.3.1.1.

Corrosion tests indicate a moderate corrosion potential for ferrous metals exposed to site soils.

TGR does not practice corrosion engineering. If needed, a qualified specialist should review the site conditions and evaluate the corrosion potential of the site soil to the proposed improvements and to provide the appropriate corrosion mitigations for the project.

Shrinkage/Subsidence

Removal and recompaction of the near surface soils is estimated to result in shrinkage ranging from 0 to 5 percent. Minor ground subsidence is expected to occur in the soils below the zone of removal, due to settlement and machinery working. The subsidence is estimated to be between one and two tenths of a foot, provided the recommendations in this report are incorporated during design and construction.

Site Development Recommendations

General

During earthwork construction, all site preparation and the general procedures of the contractor should be observed, and the fill selectively tested by a representative of TGR. If unusual or unexpected conditions are exposed in the field, they should be reviewed by this office and if warranted, modified and/or additional recommendations will be offered. During construction, voids created from removal of buried elements (footings, pipelines, septic pits etc) shall be backfilled with engineered fill compacted to a minimum of ninety (90) percent relative compaction at near optimum moisture content per ASTM D1557 under the observation of TGR.

Grading

All grading should conform to the guidelines presented in the California Building Code (2022 edition), except where specifically superseded in the text of this report. Prior to grading, TGR's representative should be present at the pre-construction meeting to provide grading guidelines, if needed, and review any earthwork.

The existing undocumented fill (1 to 7 feet deep) is considered unsuitable for the support for structures and structural fill and shall be removed and replaced with engineered fill compacted to a minimum of ninety (90) percent relative compaction.

It is recommended that minimum of three (3) feet of engineered fill be placed under footings, a minimum of two (2) feet of engineered fill under slab-on-grade and a minimum of one (1) foot be placed under flatwork and pavement. Site soils may be reused as engineered fill provided they are free of oversized particles and the recommendations presented in this report are implemented. Exposed bottoms should be scarified a minimum of 6-inches, moisture conditioned at near optimum moisture and compacted to a minimum ninety (90) percent relative compaction. Subsequently, site fill soils should be recompacted to a minimum of ninety (90) percent relative compaction at near optimum moisture content.

Since it is typically not feasible to increase the moisture content of the floor slab and foundation subgrade soil once rough grading has been completed, care should be taken to maintain the moisture content of the building pad subgrade soils throughout the construction process.

The depth of over-excavation should be reviewed by the Geotechnical Consultant during the actual construction. Any subsurface obstruction buried structural elements, and unsuitable material encountered during grading, should be immediately brought to the attention of the Geotechnical Consultant for proper exposure, removal and processing, as recommended.

Fill Placement

Prior to any fill placement TGR should observe the exposed surface soils. The site soils may be re-used as engineered fill provided, they are free of organic content and particle size greater than 4-inches. All particles greater than 4-inches shall be removed and disposed offsite. Fill shall be moisture-conditioned at near optimum moisture and compacted to a minimum relative compaction of ninety (90) percent in accordance with ASTM D1557. Any import soils shall be non-expansive and approved by TGR Geotechnical Inc.

Compaction

Prior to fill placement, the exposed surface should be scarified to a minimum depth of six (6) inches, fill placed in six (6) inch loose lifts moisture conditioned at near optimum moisture and compacted to a minimum relative compaction of ninety (90) percent in accordance with ASTM D 1557.

Temporary Excavations

All excavations to a maximum depth of four (4) feet may be excavated vertically. However, all excavations deeper than 4 feet must either be properly sloped or shored. Where sufficient space is available for sloped excavation, the excavation may be sloped to no steeper than 1:1 (horizontal to vertical). Flattened side slopes may be required where less stable localized deposits are encountered. The exposed slope faces should be kept moist and not allowed to dry out. Where sloped excavation cannot be performed, shoring consisting of soldier pile and lagging may be utilized.

Surcharge loads should not be permitted within a distance equal to the depth of excavation from the top edge of the slopes, unless the cut is properly shored. Excavations that extend below an imaginary plane inclined at 1:1 below adjacent existing facility should be properly shored to maintain support of the adjacent structures. The contractor should be aware that slope height, slope inclination, excavation depths, and shoring design must be in compliance with local, state and federal safety regulations, e.g., OSHA Health and Safety Standards for Excavations. Excavations and shoring must be designed by a qualified registered civil engineer.

Excavations deeper than 4 feet or excavations that extend below an imaginary plane inclined at 45 degrees below the edge of any nearby adjacent existing site facilities should be properly shored to maintain foundation support at the adjacent structures.

Temporary excavations near existing footings shall be in accordance with CBC section 1809.14.

Excavations adjacent to existing footings should have a minimum 5 feet to daylight from the top of the existing footings. As an alternative, shoring or underpinning of existing footings is recommended.

Temporary Shoring

Temporary shoring may be required for those excavations where temporary slope cuts as specified above are not feasible. Temporary cantilever shoring should be designed to resist an active earth pressure of 35 pounds per cubic foot equivalent fluid pressure for level conditions behind shoring. The design of shoring should also include surcharge-loading effects of existing structures and anticipated traffic, including construction equipment, when loading is within a distance from the shoring equal to the depth of excavation. All excavations should conform to CAL-OSHA and local safety codes. The stability of temporary excavation is the responsibility of

the contractor. However, as a minimum the lateral movement at the top of the shoring soldier piles should be monitored. Lateral deflection of 0.5 inches or more shall be brought to the attention of TGR with remedial measures. If lateral deflection exceeds 1.0-inch, work shall stop, and mitigation measures taken prior to continuing work. TGR should be present to observe the excavation to provide additional recommendations as considered necessary depending on the exposed condition.

Soldier piles shall have a minimum diameter of eighteen (18) and shall be spaced at least two diameters on centers, a lateral passive resistance of 300 psf/ft of embedment depth into competent older alluvium with a maximum lateral passive resistance of 3,000 psf should be used in design. The minimum recommended embedment is 10 feet. The point of fixity may be taken as 1 foot below grade. The shoring design engineer may utilize this passive pressure over one to two pile diameters at their discretion/design procedure. The shoring design engineer is however responsible for the performance of the shoring system.

Soldier pile members placed in drilled holes should be properly backfilled with sand/cement slurry or lean concrete in order to develop the required passive resistance.

The lagging between the soldier piles may be designed for a maximum nominal pressure of 400 psf, and should consist of wood members, or solid plywood or steel sheets. All excavations should conform to CAL-OSHA and local safety codes.

A-B-C Slot Cuts

A-B-C slots may be utilized to accomplish the over-excavation adjacent to the existing library building. The slots shall be no more than 6-foot-long/wide and the anticipated maximum depth is 7 feet. The calculations are presented on attached Figure 6. The calculations are based on ultimate shear strength parameters of older alluvium. The slot cut shall be performed under the full-time observation of TGR. Additional recommendations may be provided based on the exposed field condition.

Trenching

All excavations should conform to CAL-OSHA and local safety codes. Trenches near existing footings shall be in accordance with Section 1089.14 of the 2022 California Building Code.

Utility Trench Backfill

All utility trench backfills in structural areas and beneath hardscape features should be brought to near optimum moisture content and compacted to a minimum relative compaction of ninety (90) percent of the laboratory standard. Flooding/jetting is not recommended.

Sand backfill, (unless trench excavation material), should not be allowed in parallel exterior trenches adjacent to and within an area extending below a 1:1 plane projected from the outside bottom edge of the footing. All trench excavations should minimally conform to CAL-OSHA and local safety codes. Soils generated from utility trench excavations may be used provided it is moisture conditioned and compacted to ninety (90) percent minimum relative compaction.

Drainage

Positive site drainage should be maintained at all times. Water should be directed away from foundations and not allowed to pond and/or seep into the ground. Pad drainage should be directed towards street/parking or other approved area.

Geotechnical Review of Plans

All grading and foundation plans should be reviewed and accepted by the geotechnical consultant prior to construction. If significant time elapses since preparation of this report, the geotechnical consultant should verify the current site conditions, and provide any additional recommendations (if necessary) prior to construction.

Geotechnical Observation/Testing During Construction

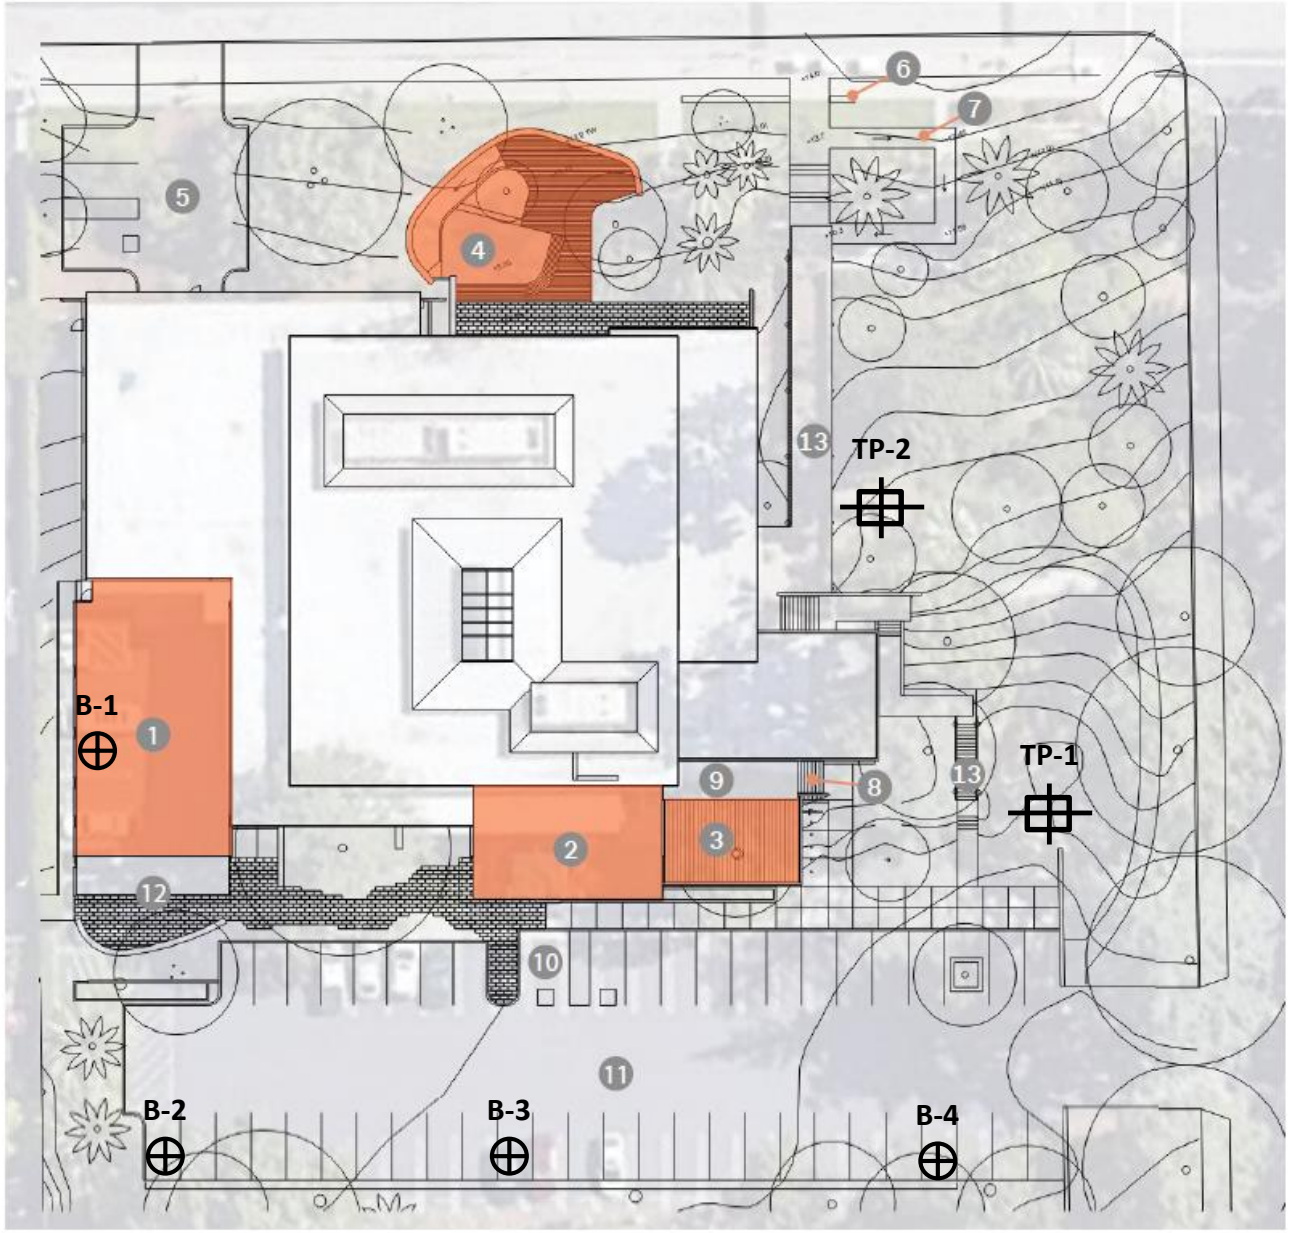
Per sections 1705.6 and table 1705.6 of the 2022 California Building Code, periodic geotechnical inspection shall be performed to:

- Verify materials below shallow foundations are adequate to achieve the design bearing capacity;
- Verify excavations are extended to the proper depth and have reached proper material;
- Verify classification and test compacted materials; and
- Prior to placement of compacted fill, inspect subgrade and verify that the site has been prepared properly.

Per sections 1705.6 and table 1705.6 of the 2022 California Building Code, continuous geotechnical inspection shall be performed to:

- Verify use of proper materials, densities and lift thickness during placement and compaction of compacted fill.

The geotechnical consultant should also perform observation and/or testing at the following stages:



- During any grading and fill placement;
- After foundation excavation and prior to placing concrete;
- Prior to placing slab and flatwork concrete;
- Retaining wall backfill;
- When any unusual soil conditions are encountered during any construction operation subsequent to issuance of this report.

Limitations

This report was prepared for a specific client and a specific project, based on the client's needs, directions and requirements at the time.

This report was necessarily based upon data obtained from a limited number of observances, site visits, soil and/or other samples, tests, analyses, histories of occurrences, spaced subsurface exploration and limited information on historical events and observations. Such information is necessarily incomplete. Variations can be experienced within small distances and under various climatic conditions. Changes in subsurface conditions can and do occur over time.

This report is not authorized for use by and is not to be relied upon by any party except the client with whom TGR contracted for the work. Use or reliance on this report by any other party is that party's sole risk. Unauthorized use of or reliance on this report constitutes an agreement to defend and indemnify TGR from and against any liability which may arise as a result of such use or reliance, regardless of any fault, negligence, or strict liability of TGR.

TGR 20 YEARS ANNIVERSARY

September 18, 2012
BG 21566

LABORATORY TESTING

Undisturbed and bulk samples of the existing fill and older alluvium were obtained from the test pits and borings and transported to the laboratory for testing and analysis. The samples were obtained by driving a ring-lined, barrel sampler conforming to ASTM D 3550-01 with successive drops of the sampler. Experience has shown that sampling causes some disturbance of the sample. However, the test results remain within a reasonable range. The samples were retained in brass rings of 2.50 inches outside diameter and 1.00 inches in height. The samples were stored in close fitting, waterproof containers for transportation to the laboratory.

Moisture-Density

The dry density of the samples was determined using the procedures outlined in ASTM D 2937-10. The moisture content of the samples was determined using the procedures outlined in ASTM D 2216-10. The results are shown on the enclosed Log of Test Pits and Log of Borings.

Maximum Density

The maximum dry density and optimum moisture content of the future compacted fill were determined using the procedures outlined in ASTM D 1557-12, a five-layer standard. Remolded samples were prepared at 90 percent of the maximum dry density. The remolded samples were tested for shear strength.

Boring	Depth (Feet)	Earth Material	Soil Type and Color	Maximum Density (pcf)	Optimum Moisture %	Expansion Index
1	0 - 5	Fill/ Older Alluvium	Silty Sand, Brown	131.0	10.0	13 - Very Low

Expansion Test

To find the expansiveness of the soil, a swell test was performed using the procedures outlined in ASTM D 4829-11. Based upon the testing, soils exposed at finish grade are expected to exhibit a very low expansion potential.

LABORATORY TESTING (Continued)

Shear Tests

Shear tests were performed on samples of future compacted fill and older alluvium using the procedures outlined in ASTM D 3080-11 and a strain controlled, direct-shear machine manufactured by Soil Test, Inc. The rate of deformation was 0.025 inches per minute. The samples were tested in an artificially saturated condition. Following the shear test, the moisture content of the samples was determined to verify saturation. The results are plotted on the enclosed Shear Test Diagrams.

Consolidation

Consolidation tests were performed on *in situ* samples of future compacted fill and older alluvium using the procedures outlined in ASTM D 2435-11. Results are graphed on the enclosed Consolidation Curves.

Corrosion

A representative sample of the near-surface soil was transported to Environmental Geotechnology Laboratory for chemical testing. The testing was performed in accordance with Caltrans Standards 643 (pH), 422 (Chloride Content), 417 (Sulfate Content), and 532 (Resistivity). The results of the testing are reported in the following table:

CHEMICAL TEST RESULTS TABLE

Sample	Depth (Feet)	pH	Chloride (PPM)	Sulfate (%)	Resistivity (Ohm-cm)
B1- Bag1	0 - 5	7.53	75	0.001	7,000

The chloride and sulfate contents of the soil are negligible and not a factor in corrosion. The pH is near neutral and not a factor. The resistivity indicates that the soil is considered moderately corrosive to ferrous metals.

Subject: **Limited Asbestos and Lead Survey Report**
Altadena Main Library
600 East Mariposa Street
Altadena, California 91001

Dear Ms. Pearson:

ATC Group Services LLC dba Atlas Technical (Atlas) is pleased to present this limited asbestos and lead survey report for the site location and buildings listed above and below in summary and introduction.

Atlas appreciates the opportunity to be of service to Altadena Library District on this project and looks forward to working with you on future assignments. In the meantime, if you have questions or comments regarding the information in this report or if we can be of further assistance, please do not hesitate to contact the undersigned.

Respectfully submitted,
Atlas

Site Survey Information Summary	
Date(s) of Survey/Inspection	September 28, 2021
Atlas Project No.	1011602022
Project Name	Altadena Main Library
Site Address	600 East Mariposa Street Altadena, California 91001
Survey Scope	Pre-Renovation Asbestos and Lead
Survey Inspector(s)	Roberto de la Torre / Max Quezada
Inspector ID No.(s)	CSST No. 00-2837 / CAC No. 14-5205
Asbestos Identified (Yes/No)	Yes (See Table 2)
Asbestos Laboratory	LA Testing 520 Mission Street South Pasadena, California 91030 Phone: (800) 303–0047
Asbestos Analytical Method	Polarized-light microscopy (PLM) and dispersion staining [Method Reference: 40 Code of Federal Regulations (CFR) Part 763, Volume 47, No. 103, May 27, 1982 pg. 23376]
Asbestos Laboratory Accreditation	National Voluntary Laboratory Accreditation Program (NVLAP) #200232-0, accredited by the National Institute of Standards and Technology (NIST), and CA ELAP 2283
Lead Inspector(s)	Roberto de la Torre / Max Quezada
Lead Inspector ID No.(s)	LRCIA No. LRC4610 / LRCIA No. LRC5220
Lead-Based Paint Identified (Yes/No)	Yes (See Table 5)
Lead Based Paint Laboratory	LA Testing 5431 Industrial Drive Huntington Beach, CA 92649 Phone: (800) 755-1794
Lead Based Paint Laboratory Accreditation	American Industrial Hygiene Association (AIHA) Environmental Lead LLC-ELLAP #101650, CA ELAP 1406
Lead-Based Paint Analytical Methods	United States Environmental Protection Agency (USEPA) Method SW-846 “Test Methods for Evaluating Solid Waste, Physical/Chemical Methods” using flame atomic absorption (Flame AA) method

INTRODUCTION

ATC Group Services LLC dba Atlas Technical (Atlas) was retained by Altadena Library District c/o Rachlin Partners to conduct an asbestos and lead survey of the library located at 600 East Mariposa Street, Altadena. The purpose of the project was to determine the presence of asbestos and lead in these assessable areas to facilitate the eventual removal of identified hazardous material prior to the building renovation activities. Site diagrams can be found in appendix IV.

The scope of the project was to identify any accessible suspect asbestos-containing materials (ACM), asbestos-containing construction materials (ACCM), or any lead-containing materials.

This asbestos and leads survey was conducted on September 28, 2021 by the following California Division of Occupational Safety and Health (DOSH) Certified Asbestos Consultant (CAC), Certified Site Surveillance Technician (CSST), and California Department of Public Health (CDPH) Certified Lead-Related Construction Inspector/Assessor (LRCIA), and Lead-Related Construction Sampling Technician (LRCST) staff:

Mr. Roberto de la Torre	CSST No. 00-2837 and LRCIA No. LRC4610
Mr. Max Quezada	CAC No. 14-5205 and LRCIA No. LRC5220

Fieldwork and report preparation were performed under the direction and guidance of Mr. Stephen Drengson, DOSH CAC No. 06-3975 and LRCIA No. LRC4394. The asbestos and lead certifications for Atlas personnel are included in Appendix I.

1. ASBESTOS

1.1 Sampling Methodology and Analysis

Atlas typically surveys buildings in teams of two, one person documenting the proceedings of the survey and the other performing bulk sampling and other miscellaneous activities. The team performs a preliminary visual inspection of the building impacted to identify and quantify suspect ACM. A sampling strategy is then developed to provide representative sampling of the suspect ACM in accordance with the methods and procedures identified in the Asbestos Hazard Emergency Response Act (AHERA) and in 40 Code of Federal Regulations (CFR) Part 61, Subpart M, United States Environmental Protection Agency (EPA) National Emissions Standards for Hazardous Air Pollutants (NESHAP).

Atlas field staff utilized semi-destructive sampling methods to collect samples of accessible suspect asbestos-containing building materials. Materials typically known as non-asbestos materials (i.e. unpainted glass, metal or wood) were not sampled during this survey. Some areas of the buildings, e.g. behind walls, pipes chases, voids, etc., may not have been accessible at the time of the inspection.

Each sample is placed in a container; the container is sealed, labeled and placed in a storage bag. Samples are documented by entering the sample data on a bulk log, including a description of the material, sample number, location, condition, accessibility, friability, potential for damage, and quantity. Typically, the sample location is marked on an 8-1/2 x 11 inch not-to-scale floor plan. Throughout the process, special care is taken to prevent cross-contamination of the collected samples. Sampling equipment is cleaned after each sample is obtained. In addition, sample containers are placed directly beneath each sample location, when feasible, to collect any materials which may become dislodged during the sampling process. Any debris generated by the sampling is cleaned by wet-cleaning methods.

Bulk sample analysis is conducted by Polarized Light Microscopy (PLM) with dispersion staining as described in the "*Method for the Determination of Asbestos in Bulk Building Materials*" (EPA-600/R-93/116, July 1993). A suspect material is immersed in a solution of known refractive index and subjected to illumination of polarized light. The color displayed enables mineral identification. Quality control samples at a rate of ten percent (10%) or one per project, whichever is greater, are reanalyzed by a second, independent analyst.

Please note, in California, materials containing greater than one-tenth of one percent (>0.1%) asbestos are defined as asbestos-containing construction material (ACCM) and are regulated by DOSH.

The amended NESHAP, November 20, 1990, included a requirement that when the asbestos content of a bulk sample material is determined using procedures outlined and the asbestos content is estimated to be less than ten percent (<10%) by a method other than point counting, the parties legally responsible for a building (owner/operator) may (1) elect to assume the amount to be greater than one percent (>1%) and treat the material as a regulated asbestos-containing material, or (2) require verification of the amount by the Point Counting method. The purpose of this procedure is to minimize false negative analysis (reporting the samples as containing less than one percent (<1%) asbestos for asbestos-containing samples actually containing greater than one percent (>1%) and false positives [reporting the sample as containing greater than one percent (>1%) asbestos for samples containing less than one percent (<1%) asbestos]. Point Counting was included in NESHAP in response to a United States EPA study that found an unacceptable amount of false negative and false positive analyses by methods outlined in the interim method.

The samples were analyzed by LA Testing located in South Pasadena, California. LA Testing is certified by the State of California Water Resources Control Board Environmental Laboratory Accreditation Program (ELAP) and accredited by the United States Department of Commerce National Institutes of Standards and Technology's (NIST) National Voluntary Laboratory Accreditation Program (NVLAP) for asbestos bulk fiber analysis.

1.2 Results

A total of one hundred and fifty-six (156) bulk asbestos samples were collected and one hundred sixty-eight (168) layers were analyzed by PLM with dispersion staining.

The following table (Table 1 – Asbestos Survey Results) summarizes the results of the survey. Materials identified as ACM or ACCM are denoted in **bold**. The asbestos laboratory analytical report and asbestos sampling logs of the materials sampled during the field survey are included in Appendix II. Site sampling diagrams are included in Appendix IV.

ND = None Detected

SF = Square Feet

R001 = Refer to quantity of sample 001.

1000 PC = 1000 Point Count Analysis

ACCM = Asbestos-containing Construction Material

N* = Sample was initially analyzed by using PLM methods, was re-analyzed using the 1000 PC and found to be <0.1% asbestos.

1.3 Conclusions and Recommendations

Based on the survey results, asbestos was identified in the materials listed in the following table (Table 2 – ACM or ACCM Materials and Quantities). It should be assumed that any of the materials listed below when encountered within the building should be treated as ACM or ACCM.

Table 2 – ACM / ACCM Materials and Quantities				
Homogenous Material	Location	Approximate Quantity	Condition	Asbestos Content
9” x 9” Off White with Brown Smudges Vinyl Floor Tile and Associated Mastic	Main Floor, Circulation Room and Janitorial Room	400 SF	Intact	3-10% Chrysotile
Interior Stucco	Main Floor, Ceiling, South Column, and West Column. Mid-Level, Foyer	4,700 SF	Intact	0.1-1% Chrysotile by 1,000 PC (ACCM)
9” x 9” Beige Vinyl Floor Tile and Associated Mastic	Mid-Level, Electrical Room and Storage Closet	1,000 SF	Intact	3-10% Chrysotile
9” x 9” White with Red Smudges Vinyl Floor Tile and Associated Mastic	Lower Level, Hallway	500 SF	Intact	5% Chrysotile
Plaster	Lower Level, Library Storage	2,000 SF	Intact	0.9-1% Chrysotile by 1,000 PC (ACCM)

SF = Square Feet

ACCM = Asbestos-containing Construction Material

If additional suspect materials are observed by the contractor during abatement/renovation, the consultant should be notified and the presence of these materials should be verified. All materials listed above should be removed and disposed of as ACM prior to any renovation activities. Certain materials may not have been visible during the initial survey such as barrier paper under wood, materials behind walls, materials in pipe chases, and materials under the building structure.

Asbestos is a hazardous substance. Its condition, handling and disposal are regulated by Federal, State, and local agencies. ACMs and ACCMs generally do not pose a health threat unless the asbestos fibers are disturbed by renovation, construction or demolition and may become airborne and inhaled.

A building material is considered to be ACM if at least one sample collected from the homogeneous material shows asbestos present in an amount greater than one percent (>1%). Materials with less than one percent (<1%) asbestos are not regulated by the EPA or Federal Occupational Safety and Health Administration (OSHA). However, the DOSH does regulate materials with greater than one-tenth of one percent (>0.1%) under California Code of Regulations (CCR) Title 8, Section 1529. These materials are considered ACCMs.

Atlas recommends removal of the noted ACMs and ACCMs above that will be disturbed during the planned renovation prior to any renovation activities. Contractors must use asbestos safe work practices when disturbing the material listed above.

Building occupants and contractors working in an area where asbestos is present must be informed of the type and location of ACM or ACCM. Since these materials are going to be impacted during the planned building renovation, Atlas recommends abatement of all identified ACM and ACCM by a California licensed, certified and registered asbestos abatement contractor. Asbestos abatement must be performed in accordance with Federal OSHA, DOSH, and the South Coast Air Quality Management District (SCAQMD).

The DOSH also requires employers to implement specific work practices, which protect workers from airborne asbestos exposure. Building materials, which contain even low levels of asbestos (trace amounts), can potentially generate significant concentrations of airborne asbestos fibers when disturbed. Therefore, control measures should be instituted which adequately addresses worker health and safety during the planned renovation activities involving these materials.

2. LEAD-CONTANING MATERIALS

2.1 Sampling Methodology and Analysis

Atlas' field technician(s) conducted a visual inspection of the building and observed most interior paint to be intact. Atlas' field staff utilized an X-Ray Fluorescence (XRF) Analyzer device as well as collected representative samples of suspect lead-based paint that was observed to be loose and flakey.

The lead testing was performed on-site using an XRF Analyzer on various surfaces, according to the procedures identified in Chapter 7 of the *Housing and Urban Development (HUD) Guidelines for the Evaluation and Control of Lead-Based Paint (LBP) in Housing,* and the XRF-specific *Performance Characteristic Sheet* (PCS) methodology for the Heuresis Pb200i Lead Paint Analyzer.

The Heuresis Pb200i Lead Paint Analyzer is a complete lead paint analysis system, which quickly, accurately, and non-destructively measures the concentration of LBP on surfaces. The Heuresis Pb200i relies on the measurement of the K-shell X-rays simultaneously to determine the amount of lead present in the painted surface. These X-rays can penetrate many layers of paint and allow a good measurement of the lead content of paint to be made without being significantly affected by the thickness or number of layers of paint on the surface of the sample.

The Heuresis Pb200i has the ability to analyze and compute corrections for the differences in the energy spectrums relating to different substrates. This analysis of the energy spectrum means that the lead paint reading displayed on the instrument already accounts for any substrate effects and no correction is required by the operator. The Heuresis Pb200i's field of view is deep enough to handle virtually all painted surfaces, but not prone to detect lead objects located behind the surface.

Upon arrival at the job site, a "calibration test" was performed to assure that the instrument was operating properly. A series of three calibrated readings and one “zero standard” reading were taken at the start of each shift, and three more calibration check readings and one “zero standard” reading were taken near the end of each sampling sequence. Test measurements consisting of approximately 30 seconds per measurement were taken of three of the test block and/or NIST Paint Film Standards (SRM No. 2570-2575) as required by the instrument’s PCS. The individual readings and an average of the calibration readings were recorded and compared to standards.

In all cases the instrument was functioning within the standard deviation as defined by the manufacturer and the PCS. All validation readings were recorded in a logbook, which accompanies the instrument. If for any reason the XRF does not pass the calibration procedures, it is Atlas’ policy to replace that instrument with an XRF that passes the above criteria for calibration. HUD developed the PCS for use with the specific instrument used for testing.

Paint chip samples were collected of loose, flakey paint, in accordance with DOSH standards, and of surfaces that were measured by XRF as undetermined. One paint chip sample was collected from each identified surface meeting this criteria. Pursuant to American Society for Testing and Materials (ASTM) E 1729-05 sub-section 7.4.2: Using the appropriate cutting tool, paint was scraped down to the substrate within the marked area and collected for analysis. For brick or concrete substrates, the minimum amount needed to completely remove the paint from the substrate was collected. On wood substrates, scraping in the direction of the wood grain was conducted in order to minimize inclusion of the substrate in the collected sample.

Pursuant to ASTM E 1729-05 sub-section 9.2.4: Field data was collected to include a unique sample identifier, the sample location (including sample location description), sample component (e.g. wallboard, window sill, wallboard above ceiling grid, door, decorative brick, paint applied to concrete curb, exterior wood siding, canopy support, and ballard post), condition of the paint, color, and estimated square footage of paint coverage.

The paint chip samples were analyzed by LA Testing located in Huntington Beach, California. LA Testing is certified by the State of California Water Resources Control Board Environmental Laboratory Accreditation Program (ELAP) and is accredited by the American Industrial Hygiene Association's (AIHA) Laboratory Quality Assurance Program for industrial hygiene and lead analysis.

2.2 XRF Survey Results

A total of one hundred and four (104) readings were taken. Ninety (90) readings were taken throughout the interior/exterior of the building areas and fourteen (14) readings were calibration checks.

The following table (Table 3 – Positive XRF Survey Results) represents the positive results of the XRF survey. The LACDHS definition of lead-based paint/materials is lead equal to or greater than 0.7 mg/ cm^2. The lead-based paint/materials XRF sampling logs of the materials sampled during the field survey are included in Appendix III. Site sampling diagrams are included in Appendix IV.

Positive: An XRF reading is classified as positive if it is greater than or equal to 0.7 mg/cm^2.

Negative: An XRF reading is classified as negative if it is less than 0.7 mg/cm^2.

Table 3 – Positive XRF Survey Results

Sample No.	XRF Results (mg/cm^2)	Condition of Paint	Approx Qty	Building/ Floor/ Room/ Area	Location	Surface	Substrate	Color
13	16.9	Intact	250 SF	Main Floor	Women's Restroom	Wall Tile	Ceramic	White
21	16.9	Intact	250 SF	Main Floor	Men's Restroom	Wall Tile	Ceramic	White
46	16.9	Intact	240 SF	Second Floor	Women's Restroom	Wall Tile	Ceramic	White
51	16.8	Intact	240 SF	Second Floor	Men's Restroom	Wall Tile	Ceramic	White

Table 3 – Positive XRF Survey Results								
Sample No.	XRF Results (mg/cm^2)	Condition of Paint	Approx Qty	Building/ Floor/ Room/ Area	Location	Surface	Substrate	Color
61	15.1	Intact	200 SF	Lower Level	Men's Restroom	Wall Tile	Ceramic	White
65	16.3	Intact	200 SF	Lower Level	Women's Restroom	Wall Tile	Ceramic	White

2.3 Laboratory Analyses Results

Atlas also collected a total of two (2) paint-chip samples for analysis of lead content. The sample(s) were submitted to LA Testing for analysis by Flame Atomic Absorption Spectrophotometry (Flame AAS) in accordance with EPA Method 7420 analytical protocol.

The following table (Table 4 – Lead-Based Paint Bulk Sample Survey Results) represents the results of the paint chip analysis via Flame AAS. The CDPH Title 17 CCR, HUD define LBP as paints containing greater than or equal to five tenths percent (≥0.5%) lead by weight or 5,000 milligrams per kilogram (mg/kg) or parts per million (ppm) total lead. Samples found to contain lead-based paint are denoted in **bold**. Samples that contain detectable levels of lead are denoted with an asterisk. The lead laboratory analytical report of the materials sampled during the field survey is included in Appendix III. Site sampling diagrams are included in Appendix IV.

When determining the condition of paint, the inspector will use their professional judgement to determine if the condition is intact, fair, or poor. Intact condition suggests the entire surface is intact and adhering to the substrate. Fair condition suggests some damage such as cracking, blistering, and some areas of loose and flakey (<10%). Poor suggests significant loose and flakey paint (>10%).

Table 4 - Lead-Based Paint Bulk Sample Survey Results						
Sample No.	Building/ Floor	Location	Surface	Substrate	Color	Results (ppm)
P01	Library	Roof	Slats	Metal	White	1,200*
P02	Library	Roof	Fascia	Metal	Red	1,300*

ppm = Parts per Million

Bold = Lead-Based Paint: concentration greater than or equal to 0.5% lead by weight or 5,000 milligrams per kilogram (mg/kg) or parts per million (ppm) total lead.
* = Lead-containing coating: concentration above detection limit

2.4 Recommendations and Conclusions

Based on the survey results, the lead-containing materials listed below in the table (Table V – Lead-Based Paint/Materials and Quantities) meet the definition of lead-based paint. The CDPH (as defined in Title 17 California Code of Regulations) and HUD define LBP as paints containing greater than 1.0 mg/cm^2, as well as, paints containing greater than or equal to 0.5% lead by weight or 5,000 mg/kg or ppm total lead. Paint containing less than these amounts but greater than the limit of detection is generally termed "lead-containing paint" (LCP).

Table 5 – Lead-Based Paint / Materials and Quantities

Material Description	Location	Condition	Approx Quantity	Results (ppm)	Results (mg/ cm^2)
White Ceramic Wall Tile	Men's and Women's Restrooms – all 3 levels	Intact	1,380 SF	-----	15.1-16.9

SF = Square Feet

Lead is a hazardous substance. Its condition, handling and disposal are regulated by Federal, State, and local agencies. Lead-containing materials, LBP and LCP, generally do not pose a health risk unless the material is disturbed or sufficiently deteriorated to produce dust, which may become airborne and inhaled or ingested.

DOSH regulations (8 CCR 1532.1 - Lead Construction Standard) do not provide a definition for "lead-based paint," but rather provide a Permissible Exposure Limit (PEL) for worker exposure to airborne lead particles of 50 micrograms per cubic meter of air (50 µg/m^3 for an 8-hour time-weighted average). The OSHA Lead Construction Standard also lists an Action Level of 30 µg/m^3 for an 8-hour time-weighted average. All employees (workers) and supervisors who are engaged in lead related construction and shown to be exposed to lead at or above the PEL, shall be trained by state-accredited training providers and certified by the CDPH.

If lead-containing material, LBP or LCP, will be impacted (activities such as demolition, sanding, sand /shot blasting, chipping or any other method of surface preparation which may cause potential airborne lead concentrations to exceed the DOSH action level) during the building renovation, Atlas recommends removal and/or stabilization of those building materials denoted above that will be disturbed during the upcoming renovation**,** as well as, other surfaces of similar substrate, color and condition. Contractor must use lead safe work practices when disturbing any of the materials listed above.

Work activities impacting the lead-containing materials pose a potential exposure risk for workers. Workers trained in proper safety and respiratory techniques should perform work activities that may impact the LBP. All construction work where an employee may be occupationally exposed to lead must comply with DOSH requirements. This regulation requires initial employee exposure monitoring to evaluate worker exposure during work that disturbs lead-containing materials (lead present in detectable levels). Any disturbance to LBP surfaces or materials, such as demolition, sanding, sand /shot blasting, chipping or any other method of surface preparation which may cause potential airborne lead concentrations above current regulatory levels are prohibited by state law.

3. CONCLUSIONS AND RECOMMENDATIONS

Based on information collected from the hazardous material portion of this survey, Atlas recommends the following:

- If impacted, remove all asbestos listed in Table 2 and remove and/or paint-film stabilize the lead listed in Table 5 as part of the pre-renovation activities in accordance with applicable Federal, State and local regulations.
- Perform a follow-up inspection of the building prior to renovation to confirm the hazardous items have been removed before commencing with renovation activities.

4. LIMITATIONS

Our professional services have been performed, our findings obtained, and our recommendations prepared in accordance with principles and practices in the fields of environmental science and engineering. The results, findings, conclusions, and recommendations expressed in the report are based only on conditions that were noted during the noted dates of fieldwork. This warranty is in lieu of all other warranties either expressed or implied. This company is not responsible for the independent conclusions, opinions, or recommendations made by others based on the results and designs presented in this report.

The passage of time may result in a change in the environmental characteristics at this site and surrounding properties. This report does not warrant against future operations or conditions, nor does it warrant operations or conditions present of a type or at a location not investigated.

Reasonable effort is made by Atlas personnel to locate and sample materials representative of the site structures. However, for any facility, the existence of unique or concealed materials or debris not observed by Atlas is a possibility. Atlas does not warrant, guarantee or profess to have the ability to locate or identify all concealed hazardous materials at the facility. This report is intended for the sole use of Altadena Library District c/o Rachlin Partners. This report is not intended to be utilized as a construction and/or bidding document, nor is this document designed to be used as a remediation or abatement specification. The scope of services performed in execution of this evaluation may not be appropriate to satisfy the needs of other users, and use or re-use of this document or the findings, conclusions, or recommendations is at the risk of said user.

This inventory does not represent an exhaustive listing of types of materials that may be required to be removed from a building prior to renovation. Any conditions or materials that could not be visually identified on the surface were not inspected and may differ from those conditions or materials noted.

LA Testing maintains liability limited to cost of analysis. Interpretation and use of test results are the responsibility of the client. This report relates only to the samples reported above, and may not be reproduced, except in full, without written approval by LA Testing. LA Testing bears no responsibility for sample collection activities or analytical method limitations. The report reflects the samples as received. Results are generated from the field sampling data (sampling volumes and areas, locations, etc.) provided by the client on the Chain of Custody. Samples are within quality control criteria and met method specifications unless otherwise noted. The above analyses were performed in general compliance with Appendix E to Subpart E of 40 CFR (previously EPA 600/M4-82-020 "Interim Method") but augmented with procedures outlined in the 1993 ("final") version of the method. This report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST or any agency of the federal government. Non-friable organically bound materials present a problem matrix and therefore LA Testing recommends gravimetric reduction prior to analysis. Unless requested by the client, building materials manufactured with multiple layers (i.e. linoleum, wallboard, etc.) are reported as a single sample. Estimation of uncertainty is available on request.

Samples analyzed by LA Testing South Pasadena, CA NVLAP Lab Code 200232-0, CA ELAP 2283

LA Testing maintains liability limited to cost of analysis. Interpretation and use of test results are the responsibility of the client. This report relates only to the samples reported above, and may not be reproduced, except in full, without written approval by LA Testing. LA Testing bears no responsibility for sample collection activities or analytical method limitations. The report reflects the samples as received. Results are generated from the field sampling data (sampling volumes and areas, locations, etc.) provided by the client on the Chain of Custody. Samples are within quality control criteria and met method specifications unless otherwise noted.
Analysis following Lead in Paint by LA Testing SOP/Determination of Environmental Lead by FLAA. Reporting limit is 0.008% wt based on the minimum sample weight per our SOP. "<" (less than) result signifies the analyte was not detected at or above the reporting limit. Measurement of uncertainty is available upon request. Definitions of modifications are available upon request.
Samples analyzed by LA Testing Huntington Beach, CA AIHA-LAP, LLC--ELLAP Accredited #101650, CA ELAP 1406

LEAD HAZARD EVALUATION REPORT

Section 1 — Date of Lead Hazard Evaluation 9/28/21

Section 2 — Type of Lead Hazard Evaluation (Check one box only)

☑ Lead Inspection ☐ Risk assessment ☐ Clearance Inspection ☐ Other (specify) _____

Section 3 — Structure Where Lead Hazard Evaluation Was Conducted

Address [number, street, apartment (if applicable)]	City	County	Zip Code
600 East Mariposa Street	Altadena	Los Angeles	91001

Construction date (year) of structure	Type of structure	Children living in structure?
1967	☐ Multi-unit building ☐ School or daycare ☐ Single family dwelling ☑ Other Library	☐ Yes ☑ No ☐ Don't Know

Section 4 — Owner of Structure (if business/agency, list contact person)

Name	Telephone number
Altadena Library District c/o Rachlin Partners / Jennifer Pearson	310-204-3400

Address [number, street, apartment (if applicable)]	City	State	Zip Code
8640 National Boulevard	Culver City	California	90232

Section 5 — Results of Lead Hazard Evaluation (check all that apply)

☑ No lead-based paint detected ☐ Intact lead-based paint detected ☐ Deteriorated lead-based paint detected

☐ No lead hazards detected ☐ Lead-contaminated dust found ☐ Lead-contaminated soil found ☑ Other Ceramic Tile

Section 6 — Individual Conducting Lead Hazard Evaluation

Name	Telephone number
Atlas Technical / Steve Drengson	323-517-9780

Address [number, street, apartment (if applicable)]	City	State	Zip Code
1180 Durfee Avenue, Suite 125	South El Monte	California	91733

LA Testing maintains liability limited to cost of analysis. Interpretation and use of test results are the responsibility of the client. This report relates only to the samples reported above, and may not be reproduced, except in full, without written approval by LA Testing. LA Testing bears no responsibility for sample collection activities or analytical method limitations. The report reflects the samples as received. Results are generated from the field sampling data (sampling volumes and areas, locations, etc.) provided by the client on the Chain of Custody. Samples are within quality control criteria and met method specifications unless otherwise noted. The above analyses were performed in general compliance with Appendix E to Subpart E of 40 CFR (previously EPA 600/M4-82-020 "Interim Method") but augmented with procedures outlined in the 1993 ("final") version of the method. This report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST or any agency of the federal government. Non-friable organically bound materials present a problem matrix and therefore LA Testing recommends gravimetric reduction prior to analysis. Unless requested by the client, building materials manufactured with multiple layers (i.e. linoleum, wallboard, etc.) are reported as a single sample. Estimation of uncertainty is available on request.

Samples analyzed by LA Testing South Pasadena, CA NVLAP Lab Code 200232-0, CA ELAP 2283

SECTION 1. ASBESTOS BIDDING REQUIREMENTS

Part 1.1 - Site Investigations

By submitting a bid for asbestos related work, the asbestos abatement contractor acknowledges that they have investigated and satisfied themselves as to:

1. The conditions affecting the work, including but not limited to, physical conditions of the site which may bear upon site access, handling, and storage of tools and materials, access to water, electric, or other utilities, or otherwise affect performance of required activities;

2. The character and quality of all surface and subsurface materials or obstacles to be encountered, in so far as, this information is reasonably ascertainable from an inspection of the site, including exploratory work done by the Owner or a designated consultant, as well as, information presented in drawings and specifications included with this contract. Any failure by the asbestos abatement contractor to acquaint themselves with available information will not relieve them from the responsibility for estimating properly the difficulty or cost of successfully performing the work. The Owner is not responsible for any conclusions or interpretations made by the asbestos abatement contractor on the basis of the information made available by the Owner.

Part 1.2 - Insurance Requirements

The successful asbestos abatement contractor shall purchase and maintain insurance that will protect them from claims that may arise out of or result from the activities under this Contract. Whether those activities are performed by the asbestos abatement contractor, by any Subcontractor, or by anyone directly or indirectly employed by any of them or by anyone for whose acts any of them may be liable.

Successful asbestos abatement contractor shall submit proof of coverage, as well as, Subcontractors under the Worker's Compensation insurance system of the State of California or other similar benefit acts.

Successful asbestos abatement contractor shall submit a certificate of general liability insurance protecting against liability for bodily injury and property damage arising from asbestos abatement contractor’s activities under this contract.

Such certificate of insurance must contain the following provisions:

1. The limit of liability shall not be less than $1,000,000.00 per occurrence for bodily injury and property damage liability combined.

2. The Owner, Owner’s Agents, and Consultant must be named as additional insured, but only in respect to liability arising or resulting from activities under this contract.

3. In the event of cancellation of the insurance policy, the Owner shall be given thirty days advance written notice.

4. The insurance certificate must state that the insurance includes liability coverage for asbestos abatement work.

Successful asbestos abatement contractor’s Subcontractors shall submit a certificate of general liability insurance protecting against liability for bodily injury and property damage arising from Contractor's activities under this contract.

Such certificates of insurance must contain the following provisions:

1. The limit of liability shall not be less than $1,000,000.00 per occurrence for bodily injury and property damage liability combined.

2. The Owner, Owner's Agents, and Consultant must be named as an additional insured, but only in respect to liability arising or resulting from activities under this contract.

3. In the event of cancellation of the insurance policy, the Owner shall be given thirty days advance written notice.

Part 1.3 - Licenses and Qualifications Requirements

The asbestos abatement contractor shall be duly licensed in the State of California with the Contractors State License Board (CSLB) in accordance with the provisions of Chapter 9 of Division 3 of the Business and Professions Code, as amended. This includes certification for asbestos-related work, and all other trades or work required under this contract and within these specifications.

The asbestos abatement contractor shall submit a statement, signed by an officer of the company, containing the following information:

1. A record of any citations issued by Federal, State, or Local regulatory agencies within the last 3 years, relating to asbestos abatement activity. Include projects, dates, and resolutions.
2. A list of penalties incurred through non-compliance with asbestos abatement project specifications, including liquidated damages, overruns in scheduled time limitations, and resolutions.
3. Situations in which an asbestos-related contract has been terminated including projects, dates, and reasons for terminations.
4. A list of any asbestos-related legal proceedings/claims in which the Contractor (or employees scheduled to participate in this project) has participated or is currently involved. Include descriptions or role, issue, and resolution to date.

The asbestos abatement contractor is fully and totally responsible at all times for compliance with payment of prevailing wage rates pursuant to provisions of the California Labor Code, for compliance with Division 2, Part 7, Chapter 1, California Labor Code, including but not limited to Section 1776; and for compliance with California Labor Code, Section 1777.5 for all apprentice able occupations.

SECTION 2. ASBESTOS GENERAL REQUIREMENTS - DEFINITIONS

Abatement - Procedures beyond a special operations and maintenance program to control fiber release from asbestos-containing materials. Includes removal, encapsulation, enclosure, and repair.

ACGIH - American Conference of Governmental Industrial Hygienists, 6500 Glenway Avenue, Building D-5, Cincinnati, Ohio 45211

AHERA - Asbestos Hazard Emergency Response Act

AIHA - American Industrial Hygiene Association, 475 Wolf Ledges Parkway, Akron, Ohio 44311

Air Filtration Device - See "Pressure Differential Unit"

Airlock - A system for permitting ingress and egress with minimum air movement between a contaminated area and an uncontaminated area, typically consisting of two curtained doorways separated by a distance of at least three (3) feet such that one passes through one doorway into the airlock, allowing the doorway sheeting to overlap and close off the opening before proceeding through the second doorway, thereby preventing flow-through contamination.

Air Monitoring - The process of measuring the fiber content of a known volume of air collected during a specific period of time. The procedure normally utilized for asbestos follows the NIOSH Standard Analytical Method for Asbestos in Air Phase Contrast Microscopy Method 7400. For clearance air monitoring, electron microscopy methods may be utilized for lower detection and specific fiber identification.

Altadena Library

Air Sampling Professional - The professional contracted or employed by the Owner to supervise and/or conduct air monitoring and analysis schemes. This individual may also function as the Asbestos Project Manager, if qualified. Supervision of air sampling and evaluation of results should be performed by a Certified Asbestos Consultant (CAC) and have specialized experience in air sampling for asbestos. Other acceptable Air Sampling Professionals include Environmental Engineers, Architects, Chemists and Environmental Scientists or others with equivalent experience in asbestos air monitoring. This individual shall not be affiliated in any way other than through this contract with the contractor performing the abatement work.

Ambient Air - The air outside the buildings and structures or the air as it normally exists in a space prior to abatement.

Amended Water - Water to which a surfactant has been added.

ANSI - American National Standards Institute, 1430 Broadway, New York, New York, 10018

Asbestos - Means the asbestiform varieties of serpentine (chrysotile), riebeckite (crocidolite), cummingtonite grunerite (amosite), anthophyllite, actinolite, and tremolite.

Asbestos Containing Hazardous Waste - Materials defined by the State of California to be packaged, labeled, transported, and disposed of as an asbestos hazardous waste. This includes all friable asbestos-containing material over one-percent (1%) asbestos. This also includes all asbestos-containing material containing less than one-percent asbestos for which one or more bulk samples have not been point counted and found to contain less than one-percent (1%) asbestos.

Asbestos Containing Material (ACM) - Cal/OSHA - Material composed of asbestos of any type and in an amount greater than one percent (1%) either alone or mixed with fibrous or non-fibrous materials.

Asbestos Containing Construction Material (ACM) - a manufactured construction material containing greater than 0.1% asbestos by weight by the PLM method.

Asbestos Containing Waste - Asbestos-containing material or asbestos-contaminated objects requiring disposal.

Asbestos Project Manager (APM) - (Competent Person) - An individual qualified by virtue of experience and education, designated as the Owner's representative and responsible for overseeing the asbestos abatement project.

ASTM - American Society for Testing and Materials, 916 Race Street, Philadelphia, PA 19103.

Authorized Visitor - The Owner (and any designated representative) and any representative of a regulatory or other agency having jurisdiction over the project.

Bidder - A duly licensed and accredited asbestos contractor who was present at the bid-walk and has submitted a bid.

Cal/OSHA - California Division of Occupational Safety and Health.

Certified Industrial Hygienist (CIH) - An industrial hygienist certified in Comprehensive Practice by the American Board of Industrial Hygiene.

Clean Room - An uncontaminated area or room, which is a part of the worker decontamination enclosure system with provisions for storage of workers' street clothes and clean protective equipment.

Competent Person - A person who is an accredited EPA Asbestos Contractor/Supervisor and whose accreditation is current.

Containment - Isolation of the work area from the rest of the building to prevent escape of asbestos fibers.

Contract Documents - Written contractual agreements between the Owner and the Contractor that pertain to the work on this project.

Altadena Library

Contractor - The individual and/or legal entity and its subcontractors and employees of the contractor and subcontractor awarded the contract.

Contractor/Supervisor - A person who successfully completed an initial U.S. EPA and/or state-approved five-day AHERA accreditation course and who has maintained that training through approved annual refresher training, and possesses current and valid AHERA accreditation documentation as a AHERA accredited Contractor/Supervisor.

Class I, II, III, or IV Work - Work classes described in 8 CCR 1529 that describe different levels of asbestos work.

Critical Barrier - Critical Barriers used to restrict water and air flow. Critical Barriers are the barriers placed over openings in the walls and ceilings of a work area in order to ensure that airborne fibers cannot escape the work area via these openings. The Contractor will construct impermeable barriers at all exits or openings, including doorways, duct chases, mechanical shafts, elevator shafts, floor openings, drains, and the like, so that all possible exit or entrance routes are effectively barricaded and sealed. Unless otherwise specified in the Contract documents, critical barriers shall be constructed of at least one layer of 6-mil thick poly.

Critical Barrier Negative Pressure Test - Required test for negative pressure with only critical barriers and air filtration units installed. This test must be conducted prior to the installation of cleaning barriers, but may be conducted with or without the decontamination unit in place.

Decontamination Enclosure System - (Also known as Decon or Waste Transfer Decon) A series of connected rooms designed for the decontamination of workers and equipment that is separated from the work area and from each other by z-flapped curtained doorways. This unit shall be constructed with at least six-mil poly for the floors, walls, and ceiling. All decontamination enclosure systems used for worker entry and exit shall be equipped with a shower.

Demolition - The wrecking or taking out of any load-supporting structural member of a facility together with any related handling operations.

DOP - Dispersed Oil Particulate, which are normally used as an agent for testing the efficiency of HEPA filters.

Dust or Debris - Any visible dust or debris remaining in an abatement area will be considered asbestos-containing residue.

Encapsulant - A liquid material which can be applied to asbestos-containing material which controls the possible release of asbestos fibers from the material either by creating a membrane over the surface (bridging encapsulant) or by penetrating into the material and binding its components together (penetrating encapsulant).

EPA - U.S. Environmental Protection Agency

Equipment Room - A contaminated area or room that is part of the worker decontamination enclosure system with provisions for storage of contaminated clothing and equipment.

Exterior of Containment HEPA Filtered Pressure Differential Unit - An air-purifying unit positioned outside, rather than inside the regulated work area. The face, or filter portion of the unit is integrated within the work area, and the remainder of the unit (housing, wheels, rivets, control panel, etc.) is located outside of the work area. This allows filters on the air intake to be changed from within the regulated area but access to the machine itself is available to those outside the area. Pressure differential units which pass DOP testing across the HEPA filter, but fail at rivets, control panels, wheels, etc. may be used in this fashion as long as the failure point of the unit can remain on the exterior of containment while the face of the unit and filters are inside containment.

Facility - Any institutional, commercial or industrial structure, installation, or building.

Facility component - Any pipe, duct, boiler, tank, reactor, turbine, or furnace at or in a facility or any structural member or a facility.

Fed OSHA or OSHA - Federal Occupational Safety and Health Administration.

Altadena Library

Fixed object - A piece of equipment or furniture in the work area, which cannot be removed from the work area.

Friable asbestos - Asbestos-containing material, which can be crumbled to dust when dry, under hand pressure or by mechanical means.

Glove Bag Technique - A method with limited applications for removing small amounts of friable asbestos-containing materials from ducts, short piping runs, valves, joints, elbows, and other non-planar surfaces. The glove bag is constructed of 6 mil transparent polyethylene with two inward projecting long sleeves, an internal tool pouch, and an attached, labeled receptacle for asbestos waste.

HVAC - Heating, ventilation and air conditioning system.

HEPA Filter - A high efficiency particulate air filter capable of removing particles 0.3 microns in diameter from an air stream with 99.97% efficiency.

HEPA Vacuum - A vacuum system equipped with HEPA filtration.

Lock-down - To mist the air and to wet surfaces with an agent designed to bind asbestos fibers together.

Manometer - Instrument for measuring the static air-pressure differential across a barrier.

Mini-Enclosure - Mini-enclosures shall be constructed of 6 mil polyethylene (attached with tape and/or glue to walls and floors) and shall be small enough for 1-2 workers who can enter the enclosure, complete the abatement exercise, pass out the containerized debris and exit.

Monitoring - May include:

1. Visual inspection for the presence of visible emissions; or
2. Air monitoring performed in accordance with accepted methods;
3. Core samples of encapsulated or bridged materials.
4. Bulk sampling of soil during and following abatement.
5. Sampling substrata following abatement.

Movable Object - An unattached piece of equipment or furniture in the work area, which can be removed from the work area.

NVLAP - National Voluntary Laboratory Accreditation Program.

NESHAP - The National Emissions Standards for Hazardous Air Pollutants (40 CFR Part 61, Nov. 20, 1990)

NIOSH - The National Institute for Occupational Safety and Health CDC-NIOSH, Building J N.E. Room 3007, Atlanta, GA 30033

Outside Air - The air outside buildings and structures.

Owner - The Owner or Owners authorized Representative.

PCM - Phase contrast microscopy according to NIOSH Method 7400.

Plasticize - See "Poly".

Poly - Polyethylene sheeting. Used to cover floors, walls, ceilings, create critical barriers, and seal open vents on mechanical systems, etc. Note: All poly must be flame-retardant.

Pressure Differential Unit (PDU) - A portable exhaust system equipped with HEPA filtration and capable of maintaining a constant low velocity airflow into contaminated areas from adjacent uncontaminated areas. Air intake must have a filter on it, which can be changed within a containment.

Regulated Area - means an area established by a Contractor to demarcate areas where airborne concentrations of asbestos exceed, or there is a reasonable possibility they may exceed, the permissible exposure limit. Additionally “Regulated Area” means any measure used to restrict access to an area where

personnel impacting asbestos-containing materials are required to wear respiratory protection and/or protective clothing by the project specifications regardless of airborne asbestos concentration levels.

Regulations - shall include but not be limited to:

1. U.S. Environmental Protection Agency Regulations for Asbestos (Title 40, Code of Federal Regulations, Part 61, Subparts A & B)

2. U.S. Environmental Protection Agency, Office of Toxic Substances, Asbestos-Containing Materials in School Buildings, A Guidance Document, Parts 1 & 2.

3. Title 8, Chapter 4, Subchapters 1 through 21, California Administrative Code, General Industry Safety orders, Section 5208 "Asbestos" or the applicable sections of the Federal Asbestos Regulations. Cal/OSHA Construction Safety Orders, Section 1529.

4. "Asbestos Hazard Emergency Response Act", U. S. Environmental Protection Agency, 40 CFR, Part 763. Final Rule and Notice.

5. Applicable Local County Air Pollution Control Owners and Air Quality Management Districts.

Removal - The stripping of any asbestos-containing materials from surface or components of a facility.

Renovation - Altering in any way one or more facility components. Operations in which load-supporting structural members are wrecked or taken out are excluded.

Shower Room - A room between the clean room and the equipment room in the decontamination enclosure with hot and cold or warm running water controllable at the tap and suitably arranged for complete showering during decontamination. The shower room must be equipped with an overflow pan to contain water splashed, leaked or spilled out of the shower unit.

Staging Area - Either the holding area or some area near the waste transfer airlock where containerized asbestos waste has been placed prior to removal from the work area.

Structural Member - Any load-supporting member of a facility, such as beams and load-supporting walls or any non-load-supporting member, such as ceilings and non-load supporting walls.

Submittals - Pre, interim, and post job documents submitted by the contractor to Owner/Owner's Representative as indicated in General Requirements and Bidding Requirements.

Surfactant - A chemical agent added to water to improve wetting and penetration into asbestos materials.

TEM - Transmission Electron Microscopy according to AHERA specifications for Level II analysis.

Visible emissions - Any emissions containing particulate asbestos material that are visually detectable without the aid of instruments. This does not include condensed uncombined water vapor.

Waste Load-out/Transfer System - A decontamination system utilized for transferring containerized waste from inside to outside of the work area. A series of three connected rooms used for the load-out of asbestos-containing materials that have been properly containerized. The waste load out chamber system shall normally consist of three connected chambers adjacent to the work area. Each chamber shall be constructed with six- mil thick poly for the floors, walls, and ceiling

Wet Cleaning - The process of eliminating asbestos contamination from building surfaces and objects by using cloths, mops, or other utensils, which have been dampened with water and afterwards thoroughly decontaminated or disposed of as asbestos contaminated waste.

Altadena Library

Work Area - Designated rooms, spaces, or areas of the project in which asbestos abatement actions are to be undertaken or which may become contaminated as a result of such abatement actions. A contained work area is a work area, which has been sealed, plasticized, and equipped with a decontamination enclosure system. A non-contained work area is an isolated or controlled-access work area which has not been plasticized nor equipped with a decontamination enclosure system.

Worker - Contractor employee who has completed course work and passed the exam for an EPA accredited, AHERA asbestos abatement worker. Certificate must be current.

SECTION 3. NOTIFICATIONS, SUBMISSIONS, POSTINGS

Part 3.1 - Notification

Prior to commencement of work the Contractor shall send notices of work to be completed to the agencies listed below with a copy of each to be provided to the Owner or its representative at the pre-construction meeting.

For compliance with 40 CFR part 61.146 of Subpart M, send notice at least 10 working days prior to start of work to the following appropriate agencies if trigger quantities of are met or for a demolition:

- South Coast Air Quality Management District (SCAQMD)
  Address: 21865 Copley Drive - Diamond Bar, California 91765
  Phone Number: (909) 396-2336

- U.S. EPA - Region IX Southern California Field Office
  Address: 600 Wilshire Blvd. Suite 940 Los Angeles, CA 90017
  Phone Number: (213) 244-1800

For compliance with Title 8, California Administrative Code, Construction Safety Order 1529, Asbestos Regulations send written notice at least one day prior to start of work to: Department of Occupational Safety and Health (Cal/OSHA)

These notices shall include, at a minimum:

1. The name and address of the Contractor,
2. The name and address of the work site,
3. The type of work to be done including the percent asbestos content of the material, the methods used to prevent migration of the fibers, personal protective measures, the number of workers involved, any union representation of the workers and the methods of disposal including the names and EPA numbers of both the certified hauler and the waste disposal site.
4. The start and finish dates and changes in start and completion dates shall be reported immediately to the proper agency. Use forms provided by agency whenever possible.

Part 3.2 - Pre-Construction Submittals

Submit copies of documents required to be included in the Bidding Requirements. At a minimum, these documents will include:

1. Copy of State of California Contractor License Issued by CSLB
2. Copy of State of California CSLB Active License
3. Copy of State of California CSLB Asbestos Certification
4. Copy of Department of Industrial Relations; Division of Occupational Safety and Health; Certificate of Registration for Asbestos-related Work
5. Copy of signed statement from company officer listing citations and pending proceedings against the Contractor, or if there have been no citations, a copy of the statement that no actions by regulatory agencies have occurred in the last three years signed by an officer of the company.

Altadena Library

Submit copies of insurance certificates, which meet requirements as, outlined in Section 1, Part 1.2, of this Specification.

Submit copies of notifications to government agencies.

Submit proof satisfactory to the Owner that required permits have been acquired applicable to the project being performed and specific to the project site and location. If no city, county, or other permits for parking, waste container location, or variances for scheduled work hours are required this should be stated in writing and submitted to the Owner.

Submit Sub-contractors information or statement that Sub-contractors will not be required or used during this project. This statement should also include that if it becomes necessary to use a Sub-contractor during this project that Sub-contractor will not be allowed to perform work until all required documentation has been submitted for review by the Owner or Owner's agent/site representative, and the Contractor receives written approval for use of the Sub-contractor on this project.

Submit a complete list of all rented equipment, or equipment expected to be rented from an outside contractor for use in "Regulated Areas", "Work Areas", or "Containments", where the equipment may be exposed to elevated levels of airborne asbestos. If no equipment is to be rented a statement should be submitted stating no equipment will be used on the project. The statement should also include that if it becomes necessary to use rented equipment that written statements from each rental company will be provided to the Owner prior to its use, indicating the rental companies acknowledgment that the equipment is provided for and may be used in areas where airborne levels of asbestos may be present.

Submit non-emergency telephone numbers, other then 911, for the appropriate Police, Sheriff, and Fire Departments. This list of numbers shall also include the Name, pager or cell phone numbers of the on-site supervisor and his immediate company supervisor.

Submit detailed written directions from the project site to the medical facility to be used in case of an emergency. Also include a map which sufficiently shows the route to be taken from the site to the designated medical facility.

Submit written emergency procedures pertinent to the work to be performed and which can be implemented by site personnel if the need arises.

Submit detailed information on preparation of work area, personal protective equipment, employee experience, training and assigned responsibilities during the project. List decontamination procedures for personnel, work area and equipment, abatement methods and procedures, required air monitoring program, procedures for handling and disposing of waste materials and procedures for final decontamination and cleanup.

Submit a detailed work schedule. The schedule shall have, as a minimum, the work area and the day/month for beginning and terminating work in each work area. During progress of work, it shall be the Contractor's responsibility to keep the schedule current and up to date.

Submit documentation satisfactory to the Owner that the Contractor's employees, including foremen, supervisor, and any other company personnel or agents who may be exposed to airborne asbestos fibers or who may be responsible for any aspects of abatement activities, have received required US EPA AHERA training.

Submit documentation from physician that all employees or agents who may be exposed to airborne asbestos in excess of background levels have been provided with an opportunity to be medically monitored to determine whether they are physically capable of working while wearing the respirator required without suffering adverse health effects. In addition, document that personnel have received medical monitoring as required by Cal/OSHA regulations. The Contractor must be aware of and provide information to the examining physician about unusual conditions in the workplace environment (e.g., high temperatures, humidity, chemical

contaminants) that may impact the employee's ability to perform work activities.

Submit documentation of respirator fit testing for all Contractor employees and agents who must enter any work area where asbestos-containing materials may or will be impacted. This fit testing shall be in accordance with qualitative procedures as required by OSHA regulations or be quantitative in nature. Documentation pertaining to NIOSH approvals for all respiratory protective devices utilized on site shall also be included.

Submit copy of waste transporters Department of Toxic Substances Control, Hazardous Waste Transporter Registration if hazardous asbestos-containing waste is to be removed during the project. If hazardous asbestos-containing waste will not be generated, submit the name, address, and registration information for the waste hauler to be used for transporting the waste.

Submit documentation listing the name and site address of the waste facility designated to receive asbestos-containing waste generated during this project. This documentation shall also include the EPA Identification number, and a copy of the current permit authorizing the waste facility to accept and dispose of asbestos-containing waste.

Submit Safety data sheets (SDS) for any and all applicable, materials, supplies, etc. These documents must be legible and completely reveal information required to be communicated to the Contractor’s employees, visitors, and Owner Representatives.

Submit manufacturers' certifications that high efficiency particulate air (HEPA) vacuums, pressure differential units and other local exhaust ventilation equipment conform to ANSI Z9.2-79.

Submit name of laboratory/person to be used for Phase Contrast Microscopy (PCM) analysis and copy of current NVLAP Certificate of Accreditation (if applicable), and most recent NIOSH Proficiency Analytical Testing Program results.

Submit a written statement that OSHA monitoring will be performed for all asbestos-related activities performed during this project. This statement must be on company letterhead, dated, include name of the site or project being worked on, and signed by an authorized agent of the company performing the asbestos-related work.

Submit manufactures documentation pertaining to the capability of wastewater filters to filter particles of 1.0 micron in size.

Part 3.3 - Submittals During the Work Process

Submit weekly - copies of work site entry/exit logs as well as information on worker and visitor access.

Submit weekly - copies of results of air sampling data collected during the course of the abatement including OSHA compliance air monitoring results.

Submit weekly - copies of air-differential manometer graphs and HEPA filter change logs. (see Section 13)

Submit weekly - copies of all transport manifests, trip tickets, weights and disposal receipts as applicable for all asbestos waste materials removed from the site during the abatement process.

Submit as applicable - copies of current insurance certificates, notifications, worker documentation, etc. if these items expire during the course of the project.

During abatement, the Owner will upon request submit to the Contractor results of bulk material analyses and air sampling data collected during the course of the abatement. These serve only to monitor Contractor performance during the project.

Submit upon request during or after completion of the project, documentation deemed by the Owner to be pertinent to the project.

Altadena Library

Part 3.4 - On-Site/Clean-Room Area Postings and Documentation

The following items shall be posted at the entrance to “Regulated Areas”, “Work Areas”, and “Containments”, or in the possession of the Contractor’s on-site supervisor where respiratory protection or protective clothing is required by this Specification.

A Cal/OSHA Information poster and a Cal/OSHA Construction Site poster.

A copy of the CAL-OSHA and the local AQMD/APCD or EPA NESHAP Notification (if applicable).

Non-emergency telephone numbers, other then 911, for the appropriate Police, Sheriff, and Fire Departments. This list of numbers shall also include the Name, pager or cell phone numbers of the on-site supervisor and his immediate company supervisor. Detailed written directions from the project site to the medical facility to be used in case of an emergency. Also a map, which sufficiently shows the route to be taken from the site to the designated medical facility.

Written emergency procedures pertinent to the work to be performed and which can be implemented by site personnel if the need arises.

Written entry/exit procedures shall be posted in the clean room and equipment room. (See Section 12)

List of persons authorized to be in restricted area. The list shall include, among others, the following names with addresses and phone numbers:

1. Contractor
2. Testing Laboratory
3. Air-sampling Professional
4. Owner's representatives
5. Asbestos Project Manager
6. Any other designated by the Owner

Entry/exit log for work performed in all “Regulated Areas”, “Work Areas”, and “Containments” where respiratory protection or protective clothing is required by this Specification. Contractor shall maintain copies of all entry/exit logs on the site during the performance of asbestos-related work.

All of the Contractor's personnel and area air sampling results shall be posted in the clean room area or in the possession of the Contractor’s site supervisor if no decontamination unit is required for the work being performed within 72 hours of collection, and submitted to Owner’s agent/site representative weekly unless otherwise noted.

Copies of Safety data sheets (SDS) for all materials on-site.

Part 3.5 - Job Site Documents

The following shall be in the possession of the Contractor’s supervisor at each job site:

1. All contract specifications to include change orders, etc. Contractor competent person must sign a document stating he has full knowledge of all Sections included in this specification.
2. Written Injury and Illness Prevention Program.
3. Written Respiratory Protection Program
4. An updated list of all contractor employees who have worked on this job.
5. List of all US EPA AHERA competent employees (supervisors).
6. Training records
7. Medical records
8. Respiratory fit test records

Part 3.6 - Project Close-out Documents

Contractor shall submit post-construction submittals to Owner/Owner's Representative within thirty (30) days of the completion of asbestos-related work. This documentation shall include at a minimum any and all applicable documents as outlined in Part 3.2 and Part 3.3 of this Section. In addition the Contractor should consult and submit as applicable documents identified in Section 24, Part 24.3 - Post Construction Submittal List

SECTION 4. SITE SECURITY

The work area is to be restricted to authorized, trained and protected personnel. A list of authorized personnel shall be established prior to job start and posted in the clean room of the work decontamination facility, or in the possession of the on-site supervisor for the Contractor.

Contractor shall report to the Owner immediately entry into the work area by unauthorized individuals.

A logbook shall be maintained during the project. Anyone who enters the work areas must record name, affiliation, time in, and time out for each entry.

Access to all "Regulated Areas", "Work Areas", and "Containments" shall be through a designated entry point.

All other means of access (doors, windows, hallways, etc.) shall be blocked or locked to prevent entry to or exit from these areas. The only exceptions for this rule are the waste pass out air-lock, and emergency exits in case of fire or accident.

Emergency exits shall NOT be locked; however, they shall be sealed with polyethylene sheeting and tape until needed. All emergency exits shall be clearly designated. They shall also have a razor knife permanently in place to facilitate emergency exit.

Contractor should have control of site security during abatement operations whenever possible, in order to protect work efforts and equipment. During off-hours, access to the abatement area shall be restricted by a lockable entry.

Contractor will have Owner's assistance in the enforcement of restricted access by Owner's employees.

Storage of debris will be such that access to it is limited to the Contractor. Lockable bins shall be utilized and they shall be locked at all times except when loading occurs. No soft covers will be allowed for any storage containers. When a container with rolling tops is being used, all access points to the interior of the container must be secured by the Contractor with locks of sufficient strength to require special effort to gain access to the interior of the waste container.

SECTION 5. EMERGENCY PLANNING

Emergency planning and procedures shall be developed by the Contractor and shall include considerations of fire, explosion, toxic atmospheres, electrical hazards, slips, trips and falls, and heat related injury and agreed to by Contractor and Owner prior to abatement initiation. These emergency procedures shall be established and presented to all employees and the Owner prior to the beginning of any work. A written emergency plan shall be posted or in the possession of the on-site supervisor for the Contractor regardless of the work being performed.

A copy of the Contractor's written Injury and Illness Prevention Program shall be posted or in the possession of the on-site supervisor for the Contractor regardless of the work being performed.

Employees shall be trained in evacuation procedures in the event of workplace emergencies. Telephone numbers of all emergency response personnel shall either be in the possession of the on-site supervisor, or

be prominently posted in the clean change area and equipment room, along with the locations of the nearest telephone indicated on a map or diagram.

At least two fire extinguishers shall be present on site and in close proximity to the work being performed regardless of the type of work being conducted. At least one fire extinguisher shall be present outside of any containment. Additional extinguishers shall be distributed according to Cal/OSHA requirements or as identified in this Specification.

When open abatement is being performed, an emergency blast horn (canned air horn) shall be placed inside of containment for emergency evacuation in the event of a fire or other emergency.

If noted in any other section of this Specification, a means of radio communication shall be established between inside and outside of containment whenever a decontamination setup is required, particularly for all open abatement projects. This requirement may be met through walkie-talkies or by wired communication systems.

During hot working conditions, such as in an attic space during summer, or in containments where live steam or hot water lines are exposed, special attention must be given to the possibility of heat stress and burns. The Owner's site representative may make recommendations for work breaks for employees, but the supervisor is ultimately responsible for his workers.

SECTION 6. PRE-CONSTRUCTION MEETING

A pre-construction meeting will be held at a time and location to be determined by the Owner. The successful Bidder, his on-site supervisory personnel, and Air Sampling Professional (if applicable), representatives of the Owner, Owner's Representative, and other individuals as necessary shall be present at this meeting.

Prior to this meeting, the Contractor shall provide all required submittals, as indicated above in Section 3, Part 3.2. The Contractor should use the Pre-Construction Submittal List provided in Section 24, Part 24.1 to assure all required submittals are included in his submittal package.

SECTION 7. MATERIALS AND EQUIPMENT

Part 7.1 - Contractor Equipment and Supplies

Deliver all consumable materials in the original packages, containers or bundles bearing the name of the manufacturer and brand name (where applicable). These must be approved by the Owner. Polyethylene (Poly) sheeting, of appropriate thicknesses for walls, floors, and ceilings, (4 mil's thick for walls, 10 mil's thick for lining of waste containers, 6 mil's thick for floors and all other uses), shall be provided in widths selected to minimize the frequency of joints.

All poly shall be flame-retardant regardless of its designated use inside or outside any building.

Poly sheeting utilized for worker decontamination enclosure shall be opaque white or black in color and each layer shall be a minimum of 6 mil thick. At least two layers shall be required. Modesty barriers are to be erected whenever and wherever the Owner's agent/site representative determines one is needed.

Disposal bags shall be constructed of 6 mil poly with labels required by OSHA, CDPH, Toxic Substance Control regulations. Disposal drums shall be metal or fiber board with locking ring tops to be used only if required and/or allowed by selected waste facility.

Stick-on labels as per CDPH and OSHA requirements for disposal drums shall be provided. Warning signs as required by OSHA shall be provided and posted per regulations.

Surfactant (wetting agent) shall be a 50/50 mixture of polyoxyethylene ether and polyoxyethylene ester, or

equivalent, mixed in a proportion of one (1) fluid ounce to five (5) gallons of water or as specified by manufacturer. If amosite asbestos in present in the materials being removed, the Contractor shall use a surfactant that is designed to wet amosite. This information shall be submitted to the Owner's agent/site representative before the start of the project.

A sufficient quantity of pressure differential units equipped with HEPA filtration and operated in accordance with ANSI Z9.2-79 and EPA guidance document EPA 560/5-83-002 Guidance for Controlling Friable Asbestos-Containing Materials in Buildings, Appendix F: Recommended Specifications and Operating Procedures for the Use of Negative Pressure Systems for Asbestos Abatement, shall be utilized so as to meet the requirements of Section 12. All HEPA filtration equipment must be tested with DOP or an equivalent testing agent (see Section 12).

An adequate number of respirators for the work force shall be on hand. These respirators will include, when specified:

1. Type "C" air-supplied respirators in positive pressure or pressure demand mode with full face pieces and HEPA-filtered disconnects.

2. Powered-air respirators with HEPA-filters, full face piece.

3. Half mask or full face respirators with HEPA filters.

All respirators shall be NIOSH-approved and be equipped with supplies for immediate replacement of defective parts.

Full body disposable protective clothing, including head, body, and foot coverings consisting of material impenetrable by asbestos fibers (Tyvek or equivalent) shall be provided to all workers and authorized visitors in sizes adequate to accommodate movement without tearing.

Additional safety equipment (e.g., hard hats, eye protection, safety shoes, disposable PVC gloves), as necessary shall be provided to all workers and authorized visitors.

Non-skid footwear shall be provided to all abatement workers.

If launderable clothing is to be worn underneath disposable protective clothing, it shall be provided by the Contractor to all abatement workers. Laundering must occur in accordance with applicable OSHA requirements.

A sufficient supply of scaffolds, ladders, lifts and hand tools (e.g., scrapers, wire cutters, brushes, utility knives, wire saws, etc.) shall be provided as needed.

Rubber dustpans and rubber squeegees shall be provided for cleanup. A sufficient supply of HEPA-filtered vacuum systems shall be available.
The Owner's agent/site representative may require the use of additional equipment if he feels the number or amount of certain items or materials is not sufficient.

Vacuums and pressure differential units shall arrive on site sealed and free of debris. Pre-filters of all pressure differential units must be new and unused.

No product or material will be used on the project unless the product data sheets and all SDS's have been submitted, reviewed, and approved by the Owner for use. Any product or material found on the project which has a product data sheet and/or SDS available and has not been approved will be removed from the site by the Contractor until review and approval has been completed by the Owner.

Part 7.2 - Rental Equipment and Supplies

Any equipment rented and delivered to the site for the purpose of conducts asbestos abatement work must be accompanied with documentation verifying that the rental agency has been notified, and acknowledges receipt of notification that the equipment being rented will be used for asbestos abatement work. This documentation must be submitted to the Owner's agent/site representative prior to the equipment being delivered to the job site. Rental equipment, including scaffolding, will be held to the same standard of cleanliness as all other equipment on this project.

All rented equipment must be inspected and accepted by Owner's agent/site representative as it arrives onsite. Any equipment covered with dust (no matter the source of dust), plaster debris, multiple layers of encapsulant and/or spray glue, or any other debris will not be accepted. Delays caused by a lack of clean equipment will not extend Contractor's schedule. Equipment rejected due to a lack of cleanliness must be removed from Owner's grounds in order to be cleaned. Dirty equipment wrapped in plastic will not be acceptable.

The Owners' agent/site representative must be informed 24 hours prior to the delivery of any rental equipment. The decision of the Owner or its representative on all rental equipment and supplies shall be final.

SECTION 8. WORK SITE FACILITIES

- The Owner shall provide sanitary facilities for abatement personnel outside of the enclosed work area. To use these facilities all workers shall wear normal street clothes, not bathing suits or Tyveks.
- The Owner shall provide water for construction purposes. Contractor shall connect to existing Owner system. The Owner or its representative shall specify the wastewater discharge location and location of waste containers.
- The Owner shall provide the electrical source.
- The Owner shall specify on-site parking areas, if available, and access to the site.

SECTION 9. RESPIRATORY PROTECTION

All respiratory protection shall be provided to workers in accordance with the submitted written respiratory protection program, which includes all items as required by OSHA. This program shall be posted in the clean room of the worker decontamination enclosure system or adjacent to the clean room.

The Contractor shall ensure that all workers entering the regulated area wear appropriate respiratory protection. Respiratory protection provided workers shall be in accordance with 8 CCR 1529, and 8 CCR 5144 and the respiratory protection program submitted by the Contractor. This program shall be available at the project site.

The Owner or their representative may deny access to a regulated area to anyone who, in the final judgement of the Owner or their representative, is not properly wearing adequate respiratory protection for the project conditions. This includes but is not limited to those wearing unidentified respirators, those with improperly sealed respirators, those wearing respirators in an improper manner such as over their protective suit hood, or in any other fashion judged by the Owner or their representative to be improper or inadequate to protect the individual from the airborne asbestos at the project site.

The Contractor shall provide each worker needing respiratory protection with his or her own, individually identified, NIOSH-approved respirator. At a minimum, these respirators will be equipped with a P-100 series HEPA filter. The Contractor shall provide additional filter types if that becomes necessary for specific hazards discovered on the job site or if required in the contract documents.

The Contractor shall ensure that all workers use the respirator in compliance with the manufacturer's instructions for proper use and care of that product.

Workers must perform positive and negative respirator seal checks each time a respirator is put on, provided the respirator design so permits.

The Contractor shall ensure that those workers wearing powered air purifying respirators test the air flow rate according to the frequency and methods specified by the manufacturer.

Workers shall be given, at least, a qualitative fit test in accordance with procedures detailed in the Cal/OSHA requirements for all respirators to be used on this abatement project. An appropriately administered quantitative fit test may be substituted for the qualitative fit test.

The Contractor shall ensure and provide written records to the Owner's agent/site representative that all workers wearing tight-fitting respirators have been appropriately fit tested in accordance with the requirements of 8 CCR 5144.

The Contractor shall ensure that nothing interferes with the seal of the respirator to the face of the worker. This includes but is not limited to facial hair, clothing, protective clothing, equipment or anything else that comes between the respirator and the face of the worker.

Use of any respirator must comply with the manufacturer's instructions for proper use and care of that product.

The Contractor shall ensure that workers wear respirators underneath protective clothing.

Workers conducts any work that may create an airborne release of asbestos must wear appropriate respiratory protection. This includes, but is not limited to the pre-cleaning of asbestos contamination of furniture, equipment and floors, and the set-up of contaminated work areas.

The judgement of the Owner's agent/site representative shall be final if there is a disagreement between the Owner and the Contractor regarding the need for wearing or the type of personal protection required.

In no event will a negative exposure assessment be allowed to lower respiratory protection, from that listed in the Scope of Work or required by regulation in the absence of an NEA, prior to the start of a project. Air samples used for negative exposure assessments created after the project has started must be from work conducted under this contract.

Minimum Respiratory Protection for OSHA Class I Work

Unless specified differently in the contract documents, the Contractor's employees conducts Class I work will wear tight-fitting, full-face powered-air purifying respirators for all Class I work that will take more than one hour to complete. They must wear a minimum of a half-face negative air–purifying respirator for Class I work lasting less than one hour. Contract documents may require additional respiratory protection, such as the use of supplied air respirator systems if, in the opinion of the Owner's agent/site representative, the airborne asbestos levels are expected to exceed one fiber per cubic centimeter of air (1 f/cc)as an 8 hour TWA.

After work has begun, if the Contractor wishes to lower respiratory protection requirements, such as for glove bag or other work, he or she must demonstrate to the Owner's agent/site representative that personal air sampling results from that project prove that airborne fibers levels are below the Cal/OSHA Permissible Exposure Limit. The Owner's agent/site representative will normally require sampling results used for this purpose to include several days of sampling taken during the work expected to generate the highest airborne levels. The Owner's agent/site representative will have final authority regarding whether or not the respiratory protection may be reduced below the need for powered-air purifying respirators.

Altadena Library

Unless stated otherwise in the contract documents, for the purposes of respiratory protection, Class I work will include the removal of materials such as gypsum board surfaces that are covered with a texturing or skim coat material that contains over one percent asbestos.

Minimum Respiratory Protection for Class II and III Work Practices

Unless specified differently in the contract documents, the Contractor's employees conducts Class II or III work will wear a minimum of half-face, air-purifying respirators. Contract documents may require additional respiratory protection, such as the use of full-face air-purifying respirators or powered-air-purifying respirators.

After work has begun, if a Contractor wishes to lower respiratory protection requirements, he or she must demonstrate to the Owner's agent/site representative that personal air sampling results from that project prove that airborne fibers levels are below the limit of quantification for the phase contrast microscopy method. The Owner's agent/site representative will normally require sampling results used for this purpose to include several days of sampling taken during the work expected to generate the highest expected airborne levels. The Owner's agent/site representative will have final authority regarding whether or not the respiratory protection may be reduced or eliminated. For example, the Owner's agent/site representative may require personal samples be analyzed by TEM before determining that asbestos does not pose an airborne health risk.

Respiratory Protection for All Work Classes and Unclassified Work

Respiratory protection will always be required if thermal system or surfacing materials are disturbed or if any asbestos-containing materials will not be removed substantially intact.

The Owner's agent/site representative has full authority to raise the level of respiratory protection required for access to the regulated area if in his or her judgement additional respiratory protection is required. For example, if personal air sample results collected by either the Contractor or Owner's agent/site representative indicate higher than expected levels, the Owner's agent/site representative is authorized to increase the level of required respiratory protection. The Owner's agent/site representative will determine if the increased respiratory protection is due to new, unexpected developments such as the discovery of new materials, or if the increase is due to the Contractor failing to follow good work practices. The judgement on this matter by the Owner's agent/site representative will be final.

The Owner is not responsible for increased costs or delays resulting from the need to increase respiratory protection should the reason for the increased respiratory protection be due to the Contractor's failure to adequately utilize wet work methods and/or the prompt cleanup of debris.

The Contractor may only implement respiratory protection changes after receiving written approval for the change from the Owner's agent/site representative.

Waste transport and disposal personnel must wear at least half-face, air-purifying respirators when handling intact sealed bags. Powered-air purifying respirators must be worn if waste containers spill, break, or in any other fashion require a Class I work cleanup be performed.

The Contractor shall comply with the respiratory protection requirements listed in 8 CCR 1529 until that date that 8 CCR 5144 includes assigned protection factors for all respirators. The following list of respirators and their assigned "protection factors" shall be the criteria for the selection of respiratory protection.

Respirator Selection	Protection Factor
Half-face or full-face air purifying respirator equipped with HEPA filter.	10
Full-face air purifying respirator equipped with HEPA filter with quantitative fit test.	50
Full-face Type C continuous flow supplied air.	1000

Altadena Library

Full-face, powered air purifying respirator equipped with HEPA filter.	1000
Full-face supplied air respirator operated in pressure demand mode.	1000
Full-face supplied air respirator operated in pressure demand mode, equipped with an auxiliary positive pressure self-contained breathing apparatus.	1000

Workers shall be provided, as a minimum, with personally issued and marked respirators equipped with HEPA filters approved by NIOSH to be worn in the designated work area and/or whenever a potential exposure to asbestos exists. Owner or its representative may refuse entry to the work area to a worker with an unidentified respirator.

Sufficient filters shall be provided for replacement as required by the workers or applicable regulations. Disposable respirators shall not be used.

No worker shall be exposed to levels greater than 0.01 f/cc as determined by the protection factor of the respirator worn and the work area fiber levels.

Whenever type C respirator protection is used, compressed air systems shall be designed to provide air volumes and pressures to accommodate respirator manufacturer specifications. The compressed air system shall have a reservoir of adequate capacity to allow the escape of all respirator wearers from contaminated areas in the event of compressor failure. Compressors must meet the requirements of 29 CFR 1910.134(d).

Location of compressors must be approved by Owner for exhaust and noise considerations.

Compressors must have an in-line carbon monoxide monitor and periodic inspection of carbon monoxide monitors must be documented. Documentation of adequacy of compressed air systems/respiratory protection systems must be retained on site. This documentation will include a list of compatible components with the maximum number and type of respirators that may be used with the system. Periodic testing of compressed air shall insure that systems provide air of sufficient quality (Grade D breathing air). Documentation of this testing, including a description of the process used to perform the test and results of each test must be submitted to the Owner’s agent/site representative weekly.

Location of compressors must be approved by Owner for exhaust and noise considerations.

Whenever powered air-purifying respirator protection is used, a sufficient supply of replacement batteries and HEPA filter cartridges shall be provided to the workers. At least one spare fully charged battery must be available on-site for each PAPR in use. The flow rate delivered to the face piece shall be checked and recorded by the Contractor on the sheet provided by the Owner’s agent/site representative each time a worker dons the respirator. Written respiratory protection program must detail how this testing is to be performed by each employee or the onsite supervisor. The Contractor shall ensure that the flow rate for PAPRs meets the requirements listed in 8 CCR 1544 regarding tight and loose fitting respirators as appropriate. The Contractors shall also ensure that PAPRs are worn, checked and maintained according to the directions of the manufacturer.

During encapsulation operations or usage of other organic base aerosols (e.g. spray glue, expanding foam, etc.) workers shall be provided with combination organic vapor/HEPA filter respirator cartridges.

The Contractor shall comply with OSHA CFR 1926.110(h) (Respiratory Protection) and Cal/OSHA Title 8 5144. The following list of respirators and their associated "protection factors" shall be the criteria for the selection of respiratory protection.

Sufficient filters shall be provided for replacement as required by the workers or applicable regulations. Disposable respirators shall not be used.

No worker shall be exposed to levels greater than 0.01 f/cc as determined by the protection factor of the respirator worn and the work area fiber levels.

Whenever powered-air-purifying respirator protection is used, a sufficient supply of replacement batteries and P-100 HEPA filter cartridges shall be provided to the workers. At least one spare fully charged battery must be available on-site for each PAPR in use. The flow rate delivered to the face piece shall be checked and recorded by the Contractor on the sheet provided by the Owner's agent/site representative each time a worker dons the respirator. Written respiratory protection program must detail how this testing is to be performed, and whether it will be performed by each employee or the onsite supervisor.

During encapsulation operations or usage of other organic base aerosols (e.g. spray glue, expanding foam, etc.) workers shall be provided with combination organic vapor/HEPA filter respirator cartridges.

During application of spray-poly, appropriate NIOSH approved respirators shall be worn.

SECTION 10. PERSONNEL PROTECTION REQUIREMENT AND TRAINING

Prior to commencement of abatement activities all personnel who will be required to enter the work area or handle containerized asbestos containing materials must have received adequate training in accordance with the OSHA, EPA AHERA and NESHAP regulations.

Special on-site training on equipment and procedures unique to this job site shall be performed by the Contractor as required by law or recommended by the equipment manufacturer.

The Contractor shall provide training in emergency response and evacuation procedures. See Section 8 for respiratory protection requirements.

Disposable clothing, including head, foot and full body protection, shall be provided in sufficient quantities and adequate sizes for all workers and authorized visitors. Damaged coveralls shall be immediately repaired or replaced.

Hard hats, protective eyewear, proper protective gloves, rubber boots and/or other footwear shall be provided by the Contractor as required for workers and authorized visitors. Safety shoes may be required for some activities.

Contractor personnel shall not wear street clothes or clothes of any type underneath the protective disposable clothing. Upon exiting the work area, no items worn in the work area, such as clothing, personal protective gear, footwear, or hair coverings will be allowed to be worn past the shower of the decontamination unit.

Contractor worker(s) have the option of wearing disposable undergarments underneath protective clothing, or they may be nude underneath the protective disposable clothing.

Each time the worker(s) enter the work area they will don new disposable clothing and undergarments. Street clothes (including underwear and shoes) shall not be allowed inside the work area, except during visual clearance activities.

The Owner's agent/site representative may use personal judgement to allow authorized personal to wear street clothes under protective clothing during the construction of final visual or other short-duration visits into the regulated area during times which asbestos is not being disturbed and gross debris is not present. In these situations, approved by the Owner's agent/site representative, the authorized person shall deposit the protective clothing on the dirty side of the decontamination system and may proceed through the shower and clean room wearing the clothes they wore under their protective clothing.

SECTION 11. WORKER DECONTAMINATION ENCLOSURE SYSTEMS

Worker decontamination enclosure systems shall be provided at all locations where workers will enter or exit the work area. One system at a single location for each contained work area is preferred. Enclosure systems may be constructed out of metal, wood or plastic support as appropriate. Plans for construction, including materials and layout, shall be submitted as shop drawings and approved, in writing, by the Owner or its representative prior to work initiation. Detailed descriptions of portable, prefabricated units, if used, must be submitted for the Owner's approval. The worker decontamination enclosure system shall consist of at least a clean room, a shower room, and an equipment room, separated from the work area by air lock. The air lock shall be, at least, three feet square. All fabricated units shall have, at least, two layers of 6 mil poly sheeting.

All decontamination units and pressure differential units outside the building shall be covered with a 2"x 4" wood studs and ½" plywood enclosure for security. Pressure differential units shall be secured as necessary to the building or ground. Exhaust openings shall have metal grates to prevent objects from being put into the exhaust openings. Pressure differential exhaust shall be exhausted to an area acceptable to the Owner or Owner’s agent/site representative.

Entry and exit from all air locks and decontamination enclosure system chambers shall be through doorways designed to restrict air movement between chambers when not in use. The dirty side shall have an extra layer of 6 mil poly sheeting on the floor as a "boat layer" and it shall be replaced at least daily.

The clean room shall be sized and equipped to adequately accommodate the work crew. Lighting, heat and electricity shall be provided as necessary for comfort. This space shall not be used for storage of tools, equipment or materials (except as specifically designated), or as office space.

Shower room shall contain one or more showers as necessary to adequately accommodate workers. The shower enclosure shall be constructed to ensure against leakage of any kind. In addition, the shower shall be a separate unit from the decontamination unit walls. The shower unit cannot be made from poly. Metal or hard plastic is acceptable. An adequate supply of soap, shampoo and towels shall be supplied by the Contractor and available at all times. Shower water shall be drained, collected and filtered through a system with at least 5.0 micron particle size collection capability.

The shower pan in the shower chamber shall be, at least, 3' x 3' in size. The shower chamber shall be constructed so that no water from the shower can spray out of the chamber, nor any water run down the sides of the poly and miss the pan. The shower chamber dimensions shall be determined by the size of the shower pan but are not to be smaller than 3' wide by 3' long by 6' tall. At least one shower shall be provided for each 10 workers. A minimum of two showers will be required for more than 10 workers.

Each decontamination chamber shall have, at least, a 4" lip of poly from the floor up the wall to prevent possible transfer of water and debris between chambers. Excess poly at the corners of this floor is to be fitted to the sides of the chamber by folding poly and taping, as opposed to cutting away excess poly and taping seams. In addition to this 4" lip of poly the shower chamber shall have an overflow pan, in which the shower unit sits, that is capable of holding 2" of water. The filter system and any hose connections transferring contaminated water shall be located in a secondary containment, such as a metal pan. Any leakage shall be double-bagged or re-filtered.

Unless otherwise specified in the scope of work, the minimum size of the decontamination chambers shall be the following:

Clean Room	5' x 6'
Shower	3' x 3'
Dirty Room	5' x 6'
Air Locks	3' x 6' (If five chambers are specified)

Abatement work will be stopped if decontamination unit is not kept in acceptable condition.

Storage or consumption of food and/or beverages shall not be permitted inside the containment or within any of the decontamination chambers. Food or drink consumption within containment will result in the abatement worker(s) dismissal from the site for the duration of the project.

SECTION 12. WORKPLACE ENTRY AND EXIT PROCEDURES

All workers and authorized personnel shall enter the work area through the worker decontamination enclosure system.

All personnel who enter the work area must sign the entry log, located in the clean room. This log shall have space for the workers name, social security number, time in, time out, and be identified with the project name, date, and containment location.

All personnel, before entering the work area, shall read and be familiar with all posted regulations, personal protection requirements (including workplace entry and exit procedures) and emergency procedures. A sign-off sheet shall be used to acknowledge that these have been reviewed and understood by all personnel prior to entry.

All personnel shall proceed first to the clean room (or area), remove all street clothes and don appropriate respiratory protection and disposable coveralls, head covering and foot covering. Hard hats, eye protection and gloves shall also be worn, as appropriate. Clean respirators and protective clothing shall be provided and utilized by each person for each separate entry into the work area.

Personnel wearing designated personal protective equipment shall proceed from the clean room through the shower room and equipment room to the main work area.

Before leaving the work area all personnel shall remove gross contamination from the outside of respirators and protective clothing by brushing and/or wet-wiping procedures. (Small HEPA vacuums with brush attachments may be utilized for this purpose.) Each person shall clean bottoms of protective footwear in the walk-off pan just prior to entering the equipment room.

Personnel shall proceed to equipment room where they remove all protective equipment except respirators. Deposit disposable clothing into appropriately labeled containers for disposal.

Reusable, contaminated footwear shall be stored in the equipment room when not in use in the work area. This footwear shall be cleaned prior to being removed from the work area. Placing footwear in two 6 mil poly bags is sufficient for moving from one containment to another, but not for moving from one site to another.

Still wearing respirators, personnel shall proceed to the shower area, clean the outside of the respirators and the exposed face area under running water prior to removal of respirator, then shower and shampoo to remove residual asbestos contamination. Various types of respirators will require slight modification of these procedures.

After showering and drying off, proceed to the clean room and don clean disposable clothing if there will be later re-entry into the work area, or street clothes if it is the end of the work shift.

These procedures shall be posted in the clean room and equipment room.

SECTION 13. DIFFERENTIAL AIR PRESSURE SYSTEMS

Part 13.1 - Negative Pressure Requirements

Negative pressure shall be maintained at 0.025" water differential at all times during abatement activities, including entry/exit and bag out procedures. Contractor shall assign crewmembers to determine cause of loss

of pressure any time containment's negative pressure drops below 0.025" water differential. All work will be stopped in any containment for which the negative pressure drops below 0.025" water differential, until problem is resolved and pressure returns to 0.025" water differential or better.

In the event that containment cannot be brought up to 0.025" water differential, abatement contractor must increase number of negative pressure differential units until 10 air changes per hour is taking place. If this fails to raise negative pressure to acceptable levels, Contractor may request in writing a reduction in negative pressure requirements. If Owner's agent/site representative agrees that Contractor has tried all possible remedies, Owner's agent/site representative may grant reduction in negative pressure requirement. Owner's agent/site representative is under no obligation to grant this request.

All negative pressure units installed, but not operating, must be sealed at both the exhaust location and the intake of the machine. This will prevent back draft, which could allow asbestos fiber contamination from the HEPA filter.

Part 13.2 - DOP Testing

Contractor shall provide differential air pressure systems for each work area in accordance with Appendix J of EPA "Guidance for Controlling Asbestos-Containing Materials in Buildings," EPA 560/5-85-024.

All HEPA filtered systems used on this project shall be tested and certified by an independent company, approved in advance by Owner's agent/site representative, on-site and prior to use. All vacuums and pressure differential units shall meet ANSI Z9.2, using an appropriate testing agent. Documentation of these tests shall be provided to the Owner's agent/site representative prior to the use of any HEPA system.

DOP, or equivalent, testing must be conducted on-site, unless stated otherwise in the Scope of Work. All HEPA filtered units, including but not limited to, vacuums, air pressure differential units, and make-up air filters must be tested onsite. Testing of air pressure differential units must include testing of the wheel attachments, control panel, and seam and rivets of the housing, as well as the HEPA filter itself. A unit which passes DOP testing across the filter, but which fails testing for any component of the housing may be certified as an "Exterior of Containment HEPA Filtered Unit" only.

All HEPA equipped equipment to be used on the project must be delivered to the site empty of all debris, clean and free of dust, and in full operating condition. Covering dirty units with poly, other than the HEPA filter surface, will not be acceptable.

DOP or equivalent testing must be conducted by an independent testing company approved in advance by Owner's agent/site representative Contractors may not test their own equipment.

DOP or equivalent testing is required when any HEPA filters are changed.

All HEPA filtered machines, including but not limited to vacuums and negative pressure differential machines, shall be utilized in the manner in which they were DOP tested.

Any negative pressure unit turned upside down, or on its side, must be returned to an upright position and re-DOP tested. Negative pressure units shall not be used on this project while laid on their side or upside down.

In case of a power outage, Contractor must seal exhaust ducts against back draft into containment.

All negative air units will have the filter sealed with poly and tape before being shutdown to prevent back drafting.

Part 13.3 - Differential Pressure Recording Requirements

Differential air pressure shall be continuously monitored by Contractor using a recording instrument, Dwyer Instrument Co., "Photohelic Gauge" or equivalent, connected to an appropriate circular chart recorder or a

comparable recorder that maintains a record of dates, times and pressure differentials. The location of the pressure measurement tap shall be approved in advance by the Owner's agent/site representative. During the operation of the unit, circular charts shall be collected on a daily basis, dated, and signed by an OSHA Competent Person present on site. Pressure differential shall be checked a minimum of every hour during the work shift by a person familiar with the operation of the pressure-differential-filtration units, as well as the recording device. Each check shall be documented with a time and date notation on the circular chart and

"Manometer Readings" form along with the initials of the person performing the check. A copy of the circular chart record shall be submitted to the Owner's agent/site representative on a daily basis. The circular chart shall record time, date, pressure differential, coordinates, and location.

In the event the manometer recording mechanism fails, the Contractor shall be responsible for manually recording the pressure differential at fifteen (15) minute intervals. The log shall be kept until the recording device is operational. The log shall be provided to the Owner's agent/site representative on a daily basis.

The "Manometer Readings" form shall be a record of dates and times of pressure readings and instrument stability.

Connect recording instrument to an audible alarm which will activate at pressure differential of-0.025 inches water gauge air pressure. Defective or non-operating instrumentation may require temporary stoppage of work until instrumentation is replaced.

For larger projects, at least one manometer station shall be in place for each 25,000 square feet of containment space.

Part 13.4 - Differential Pressure System

Selection of pressure differential unit (PDU) air exhaust locations and avenues shall require careful consideration with regard to the work being performed and needs of the owner. Unless there is no viable alternative all air exhaust from PDU's shall be directed out of the building. This is expected to be accomplished through use of a temporary duct system (flexible or rigid) provided by the Contractor, or permanent, dedicated exhaust duct systems present within the building. The first choice should always be to direct PDU air exhaust out of the building through Contractor supplied ducts. The first alternative would be to use an existing dedicated exhaust duct system located within the building. The second alternative would be to direct exhaust air into an above ceiling space with no applied fireproofing, loose insulations or un- jacketed fiberglass insulation on building systems. The third and most undesirable alternative would be to allow exhaust from pressure differential air systems to remain within the buildings occupied spaces. The three alternatives may only be utilized with approval of the owner.

When directing exhaust to a building's exterior through the use of temporary supplied duct, the Contractor shall select a path of travel (if applicable) for these ducts which does not impede building occupants or other trades, result in creation of a hazard to building occupants, or restrict the closing of entry and exit doors to the building. The exhaust opening must not be within 10' of any air intake vents, open windows or open doors, and must not be directed at paths of travel into or out of the building.

When utilizing a dedicated exhaust duct system present within the building the system must be investigated to determine its capability of handling the volume of exhaust air expected to be produced by the pressure differential system. Sufficient air volume of the existing dedicated exhaust duct system should have a minimum of 5X but preferably up to about 10X the total volume capacity of the exhaust of the pressure differential air system. For example, if a single 2,000 cfm PDU is to be used, the dedicated exhaust fan system which will exhaust the air produced by the PDU should be capable of handling about 10,000 cfm of total exhaust air capacity. Use of permanent dedicated exhaust duct systems may also require sealing of adjacent registers in the same exhaust system to allow the PDU exhaust to make up the difference in exhaust volume.

The owner shall provide approval prior to the contractor utilizing any permanent dedicated exhaust systems, which might be considered, since the dedicated exhaust systems will be required to operate at all times the pressure differential air system is operable, and sealing any adjacent registers may not be acceptable. It is critical to note that a dedicated exhaust system is not the same as a return air duct system, which re-circulates air from a given building space back to the HVAC fan unit and ultimately is supplied back to the workspace. Return air duct systems will not be allowed for exhaust from PDU's.

Directing PDU air exhaust into an attic or above ceiling space may only be utilized in specific conditions and is limited to attic spaces with only exposed wood, metal or concrete undersides of roof or flooring systems. The space may not under any circumstances have any existing known or assumed asbestos containing materials present regardless of their condition. The attic or above ceiling space may also not contain any applied fireproofing, loose insulations or un-jacketed fiberglass insulation materials which could be dislodged from the force generated by any exhaust air.

Regardless of the exhaust system utilized, the system and its components shall be inspected daily by the Contractor to ensure compliance with the requirements of this specification, remains in good repair and is otherwise not compromised in any way which could negate its designed purpose. Any deficiencies found in the system being used shall be repaired immediately and if necessary all work will cease until those repairs can be accomplished.

The work area shall have a differential air pressure of -0.030 inches water whenever the work is being performed including removal, gross clean-up, encapsulation of surfaces, bag-out operations and worker entry and exit procedures. If pressure differential ever drops below 0.025 inches water differential, all work, other than cleanup of waste on the floor of containment, must be halted until reason for pressure differential drop has been determined and corrected.

Only unused pre-manufactured, reinforced flexible ducts shall be used within the containment area for exhausting of filtered air. Contractor may not construct ducts using poly or other materials.

All interior of containment PDU's and flexible ducts must be wrapped in poly during all abatement activities. This poly wrap is to be removed after "finish detail" work has been completed, but prior to clearance visual.

Flexible ducts must be supported by solid surface at point of exit from containment. This may require Contractor to install plywood, or similar, structure for exhaust point.

SECTION 14. EXECUTION, WORK SCHEDULE

Part 14.1 – Execution

Contractor and Owner's agent/site representative shall investigate the work area and agree (in writing, if necessary) on the pre-abatement condition of the work area.

Contractor shall post danger signs meeting the OSHA specifications at locations and approaches to locations where airborne concentrations of asbestos may exceed ambient background levels.

When electrical supply within area of abatement poses a hazard, Contractor, in conjunction with the Owner, shall shut down and lock out electric power to all work areas. Contractor shall provide temporary power and lighting sources, ensure safe installation (including ground faulting) of temporary power sources and equipment by complying with all applicable electrical code requirements and OSHA requirements for temporary electrical systems. Contractor shall have a licensed electrician shut down and lock out electric power, and setup temporary power and lighting sources. All cost of electricity shall be paid for by the Owner unless specified differently in the Scope of Work. Cost for set-up of temporary power is the responsibility of the abatement contractor unless specified differently in the Scope of Work.

Altadena Library

When plumbing is required to be altered or becomes damaged, Contractor shall have a licensed plumber disconnect and cap all water as necessary within the work area. Water shall be provided by the Owner from a location near the work area, but not necessarily within the work area.

Shut down and lock out all heating, ventilating and air-conditioning-system (HVAC) components that are in, supply, or pass through the work area. Seal all intake and exhaust vents in the work area with tape and 6-mil polyethylene within the work area (interior) and on the exterior of the building. Also, seal any seams in system components that pass through the work area.

Pre-clean all fixed objects in all work areas using HEPA-filtered vacuums and/or wet-cleaning techniques as appropriate and deemed necessary by the Owner's agent/site representative. Careful attention must be paid to machinery behind grills or gratings where access may be difficult but contamination significant. After pre-cleaning, enclose fixed objects in 6-mil polyethylene sheeting and seal securely in place with tape.

Pre-clean all surfaces in all work areas using HEPA filtered vacuums and/or wet cleaning methods as appropriate. Do not disturb asbestos-containing materials during the pre-cleaning phase.

Unless otherwise stated in the Scope of Work or by agreement with the Owner's agent/site representative Project Manager all non-asbestos-containing materials left in the work area shall be covered by two layers of 6-mil polyethylene sheeting. If any non-asbestos containing materials become contaminated with asbestos during removal, activities these materials shall be disposed of as asbestos-containing materials by the Contractor. The Owner's agent/site representative shall determine the friability of these materials prior to disposal. These materials shall be manifested appropriately.

Contractor shall seal all windows, doorways, elevator openings, corridor entrances, drains, ducts, grills, grates, diffusers, skylights and other openings between the work area and uncontaminated areas outside of the work area. These openings must be sealed with 6-mil polyethylene sheeting and tape. These protective layers shall be in addition to the two polyethylene layers on floors, ceilings and walls. These openings are referred to as critical barriers. Seal all cracks in critical barrier areas with tape, caulk, or foam prior to sealing critical barriers.

A critical barrier only, negative pressure check shall be required prior to the set-up of interior containment. Prior to the Contractor covering critical barriers with additional layers of wall, floor, or ceiling poly, the installation and integrity of critical barrier seals must be approved by the Owner's agent/site representative. Wall, floor and ceiling poly installed prior to the critical barrier negative pressure check shall be removed by the Contractor if deemed required by the Owner's agent/site representative in order to properly test critical barriers.

All items attached to asbestos-containing materials and items which cannot be removed without disturbing asbestos-containing materials shall be removed by the Contractor after establishment of containment and negative pressure. If these items are to be "saved and returned" or "reused" by the Owner, the Contractor must remove and clean them without damage. These items must be cataloged using the attached "Return Item Inventory Sheet" provided by Owner's agent/site representative

Contractor shall cover floors in the work area with polyethylene sheeting. Floor shall be covered with a minimum of two layers of 6-mil polyethylene sheeting. Plastic shall be sized to minimize seams. A distance of at least six (6) feet between seams is sufficient. DO NOT locate any seams at wall/floor joints. Floor sheeting shall extend at least twelve inches (12") up the sidewalls of the work area. Sheeting shall be installed in a fashion so as to prevent slippage between successive layers of material. A layer of 10-mil polyethylene sheeting and/or plywood may be required by the Owner's agent/site representative to protect certain flooring materials -- carpets, hardwood floors, tiles, etc. At no time will wall or ceiling materials be permitted to be dropped onto unprotected floors. This includes areas where the floor surfaces contain asbestos.

Contractor shall cover walls in the work area with polyethylene sheeting. Walls shall be covered with a minimum of two layers of 4-mil polyethylene sheeting. Plastic shall be sized to minimize seams. Seams shall be staggered and separated by a distance of at least six feet (6'). DO NOT locate any seams at wall/floor

joints. Wall sheeting shall overlap floor sheeting by at least twelve inches (12") beyond the wall/floor joint to provide a better seal against water damage and for pressure differential maintenance. Wall sheeting shall be secured adequately to prevent it from falling away from the walls. This may require additional support/attachment when pressure differential systems are utilized.

Contractor shall cover ceilings in the work area with polyethylene sheeting. Ceilings shall be covered with a minimum of two layers of 4 mil polyethylene sheeting. Plastic shall be sized to minimize seams. Seams shall be staggered and separated by a distance of at least six feet (6'). DO NOT locate seams at wall/ceiling joints. Ceiling sheeting shall overlap wall sheeting by at least twelve inches (12") beyond the ceiling/wall joint to provide a better seal against water damage and for pressure differential maintenance. Ceiling sheeting shall be secured adequately to prevent it from falling away from the walls. This may require additional support/attachment when pressure differential systems are utilized.

The Contractor shall add clear sight windows in the containment walls at least 1' x 2' in size. The Owner's agent/site representative will approve quantity and placement of these inspection windows. Owner's agent/site representative has the right to require more clear sight windows or require placement of windows to be altered.

The equipment room shall be used for storage of equipment and tools at the end of a shift after they have been decontaminated using a HEPA-filtered vacuum and/or wet-cleaning techniques as appropriate. A walk-off pan shall be located in the work area just outside the equipment room. A six-mil. disposal bag or a drum lined with a labeled 6-mil polyethylene bag for collection of disposable clothing shall be located in this room.

Contractor shall obtain written containment visual clearance from Owner's agent/site representative prior to the start of abatement in any and all containments.

Contractor is not responsible for normal tape damage due to tape requirements for containment set-up, unless specifically mentioned in the Scope of Work. Contractor is responsible for excessive tape damage and damage from spray glue application, staples, nails, hooks, etc. installed to support containment.

Install and initiate operation of pressure differential equipment as needed to maintain differential-air pressure of -0.030 inches of water. There shall be a sufficient number of differential air pressure units to maintain a minimum of four air changer per hour. All pressure differential units shall have pre-filters at the intake of the system which must be changeable from inside the containment area. Openings made in the enclosure system to accommodate these units shall be made airtight with tape and/or caulking as needed. They shall NOT be exhausted into occupied areas of the building. Twelve inch (12") extension ducts shall be used to reach from the work area to the outside when required. Careful installation, air monitoring and daily inspections shall be done to ensure that the ducts does not release fibers into uncontaminated building areas.

All flexible ducts, protected by poly during abatement or not, pre-filters and intermediate filters shall be manifested and discarded as friable, hazardous asbestos-containing materials. A flexible tube may be used for multiple containments on the same job as long as it is moved from one containment to another in two 6 mil poly bags.

Once the containment has been constructed and reinforced as necessary with pressure differential units in operation as required, the Contractor shall test the enclosure for leakage utilizing smoke tubes. The containment shall be repaired or reconstructed as needed.

All HEPA systems used on this project shall be tested and certified onsite by an independent company prior to use. (See section 12)

Contractor shall submit logs documenting filter changes for each pressure differential unit. Contractor shall clearly identify and maintain emergency and fire exits from the work area. Work shall not begin each day until:

1. Enclosure systems, or modifications thereof, have been designed and built by the Contractor and each step approved by the APM. If design of containment is to be altered in any way, after it is approved by

the Owner's agent/site representative, a written explanation of how and why the containment is to be altered must be submitted to the Owner's agent/site representative for approval.
2. Pressure-differential systems are functioning according to an acceptable design.
3. All pre-abatement submissions, notifications, postings and permits have been provided and are satisfactory to the Owner or its representative.
4. All equipment for abatement, clean-up and disposal is on hand.
5. All worker training (and AHERA certification) is completed and documented.
6. The Contractor has installed all required clear transparent view ports made of plastic or equivalent, in the polyethylene wall so that activities can be visually monitored by the Owner's agent/site representative from outside the containment. This window shall measure approximately 1' wide by 2' high. It shall be installed at a location approved by the Owner's agent/site representative. It is recognized that viewing ports are not possible in all locations.
7. All pressure-differential units and vacuums have received and passed onsite DOP testing.
8. Contractor has at least one competent person at each site in which work is taking place.
9. All necessary documents and information have been posted or are on the work site. See Section 2.

Part 14.2 - Power Outage Procedures

The following procedures shall be followed in the event of a power outage (no matter the source of the outage):

1. Immediately stop abatement activities.
2. Wet all debris and/or friable materials within the containment.
3. Depart containment area as soon as reasonable. Shower out or use Hudson sprayers to decontaminate worker if shower is inoperable due to power outage.
4. Seal containment area including:

    A. Decontamination units
    B. Makeup air ports
    C. Bag out chambers
    D. Negative pressure air exhausts or inlets (must be sealed in a fashion that will allow for exhaust of air to occur when power is restored)
    E. Re-establish APD before starting abatement

5. Contractors will be given credit against liquidated damages for all actual down time plus two hours for shut down procedures, decontamination procedures and start up, (total of 6 hours) unless power outage is attributable to abatement contractor actions.

If a generator is required in the specifications, made necessary due to extended power outages, or chosen to be used by the abatement contractor the following issues must be addressed:

1. Generator must not violate any local noise ordinances nor disturb adjacent building occupants.
2. Generator exhaust must not be allowed to contaminate the makeup air being pulled into the containment. It must, also, not be allowed to mix with HVAC air supplied to adjacent occupied buildings.

Part 14.3 - Work Schedule

Contractor shall schedule work as required to meet the needs of the project. During progress of work, it shall be the Contractor's responsibility to inform the Owner's agent/site representative 48 hours or earlier of any and all work shifts to be performed. If at least 48 hours notice is not given, the proposed work shift may be canceled by the Owner's agent/site representative.

Contractor shall be responsible for informing the Owner's agent/site representative in writing at least 48 hours or earlier prior to the proposed addition of any off hours work, work expected to include more than one shift per day, or extend beyond 10 hours in a shift. If 48 hours notice is not given, work shift may be canceled by

the Owner's agent/site representative. The Owner's agent/site representative reserves the right to deny any changes in the work schedule.

If the Contractor wishes to work on a Federal or State holiday, more than five days a week, or more than 9 hours a day, Contractor becomes responsible for cost of project management fees to cover extended hours.

If Contractor fails to appear on-site without notifying Owner's agent/site representative at least 24 hours in advance of a scheduled work shift, the Contractor becomes responsible for all Owner's agent/site representative travel fees, on-site time fees, and other associated project management fees for that day.

At no time shall a work shift extend beyond 12 hours in a day.

SECTION 15. REMOVAL PROCEDURES

Wet all asbestos-containing material with an amended water solution using equipment capable of providing a fine spray mist, in order to reduce airborne-fiber concentrations when the material is disturbed. Saturate the material to the substrate; however, do not allow excessive water to accumulate in the work area. Keep all removed material wet enough to prevent fiber release until it can be containerized for disposal. Maintain high humidity in the work area by misting or spraying to assist in fiber settling and reduce airborne concentrations. Wetting procedures are not equally effective on all types of asbestos-containing materials but shall none-the-less be used in all cases.

Saturated asbestos-containing material (ACM) shall be removed in manageable sections. Removed material should be containerized immediately. Surrounding areas shall be periodically sprayed and maintained in a wet condition until visible material is cleaned up. Gross debris shall be cleaned up and bagged prior to end of each shift.

Material removed from building structures or components shall not be dropped or thrown to the floor. Material should be removed as intact sections or components whenever possible and carefully lowered to the floor.

Containers (6 mil poly bags or drums) shall be sealed when full. Double bagging of waste material is necessary. Bags shall not be overfilled. They should be securely sealed to prevent accidental opening and leakage by tying tops of bags in an overhand knot or by taping in gooseneck fashion. Do not seal bags with wire or cord.

Asbestos-containing waste with sharp-edged components (e.g., nails, screws, metal lath, tin sheeting) will tear the polyethylene bags and sheeting and shall be placed into drums or burlap bags and then poly bags (at least 6 mil's thick) for disposal.

After completion of all stripping work, surfaces from which asbestos-containing materials have been removed shall be wet-brushed and sponged or cleaned by some equivalent method to remove all visible residue.

After the work area has been rendered free of visible residues (and verified clean by the APM), a thin coat of a satisfactory encapsulating agent shall be applied to lock-down non-visible fibers on all surfaces in the work area including structural members, building components and plastic sheeting on walls, floors and covering non-removable items, to seal in non-visible residue.

SECTION 16. WASTE CONTAINER PASS-OUT PROCEDURES

Asbestos-contaminated waste that has been containerized shall be transported out of the work area through the waste transfer airlock or through an approved pass-out arrangement.

Waste pass-out procedures shall utilize two teams of workers, an "inside" team and an "outside" team. The inside team, wearing appropriate protective clothing and respirators for inside the work area, shall clean the outside, including bottoms, of properly labeled containers (bags, drums, or wrapped components) using

HEPA vacuums and wet-wiping techniques and transport them into the waste container pass-out airlock. Provisions for spray cleaning exterior of bags, equipment, and removable items shall be present in the waste pass-out. Waste water from this operation shall be collected and filtered as required through a 1.0 micron filter. No worker from the inside team shall further exit the work area through this airlock.

The three-chamber system is utilized in the following manner. Workers inside the work area place the waste in the initial waste container, which is usually a bag. They then rinse the bag and seal it. They hand it to a worker in the dirty chamber room who inspects the bag and, if it is clean, places it in the secondary waste container. The secondary container is either another bag or a lined rigid-wall container such as a barrel or box. The worker then seals the secondary container and may attach the proper labeling. The worker places the container in the middle chamber. The worker in the clean chamber then reaches in and lifts the container into the clean chamber. The worker inspects it and if not already labeled, attaches the proper labels. The worker then passes the container to the outside worker who transports the container either to the waste transport vehicle or to a holding area. At no time shall z-flaps of transfer system chambers be taped, held or otherwise blocked open. The Contractor must not allow more than one poly airlock doorway to be open at any one time. This prevents a tunnel system and a breakdown in the isolation of the work area. Negative pressure must be maintained during all waste load-out activities.

The contract documents or the Owner's agent/site representative may in allow a one or two chamber system to be used for some projects, as long as the liability to the client, in the judgment of the Owner's agent/site representative is not increased. As with a three-chamber system, in a one or two chamber system, the Contractor may never allow more than one poly air flap doorway to be open at any one time. For example, a one chamber system would function in the following manner. Workers in the work area rinse and seal the initial waste container. They hand the initial container to a worker in the load-out chamber. That worker verifies that the container is clean and then places it into the secondary container which will be either another bag or lined ridged-wall container depending on the specifications. The load-out worker then seals the container and applies the appropriate labels. The sealed, labeled container is then passed to the outside workers who transport it to the waste transport container or holding area.

The exit from this airlock shall be secured to prevent unauthorized entry.

SECTION 17. CLEAN-UP PROCEDURE

Part 17.1 - Clean-up Procedure

Remove and containerize all visible accumulations of asbestos-containing material and asbestos-contaminated debris utilizing rubber dust pans and rubber squeegees to move material around. DO NOT use metal shovels to pick up or move accumulated waste. Special care shall be taken to minimize damage to floor sheeting.

Wet-clean all surfaces in the work area using rags, mops and sponges as appropriate. (Note: Some HEPA vacuums might not be wet-dry vacuums.) To pick up excess water and gross wet debris, a wet-dry shop vacuum with HEPA filter may be used.

Airless sprayers and water hoses shall not be used in a "power washing" fashion on any surfaces.

Contractor shall remove each cleaned layer of polyethylene sheeting from walls and floors. Windows, doors, HVAC system vents and all other critical barriers shall remain sealed. The pressure differential units shall remain in continuous operation. Decontamination enclosure systems shall remain in place and be utilized.

Remove all containerized waste from the work area.

Decontaminate all tools and equipment and remove at the appropriate time in the cleaning sequence.

Contractor shall clean work area and conduct pre-clearance visual. Once pre-visual has been passed by Contractor, Contractor shall allow dust to settle within containment for 24 hours, then return and re-clean by

HEPA-vacuuming and/or wet-cleaning all objects and surfaces in the work area again. At this point Owner's agent/site representative will conduct the final visual. If final visual fails, Contractor must re-clean area until final visual passes. Once final visual is passed, Contractor will be instructed to encapsulate the containment area, unless encapsulation of containment has been disallowed in the Scope of Work or material specific specification.

Contractor may request a reduction in the 24-hour waiting period; if personal samples collected during the abatement, work and detail clean-up work have shown fiber levels below the PEL. Reduction of waiting period must be made in writing, accompanied by personal sample results from this project. Contractor must acknowledge that reduction in waiting period may result in failed clearance air samples and that retaking and re-analyzing these air samples will be at the Contractor's expense. Reduction in waiting time will be at the discretion of the Owner's agent/site representative and client.

Part 17.2 - Visual Clearance Criteria

The Contractor shall perform a pre-final visual of the removal area and adjacent surfaces prior to requesting that the Owner's representative conduct a final visual inspection. The pre-final visual performed by the Contractor shall verify that all materials have been completely removed from the work area, and that the work area meets the requirements specified in Section 17.

In addition, the level of cleanliness in all work areas where asbestos has been removed shall meet the final clearance criteria established in the ASTM E1368-90 Standard Practice for Visual Inspection of Asbestos Abatement Projects.

Upon completion of the pre-final visual inspection by the Contractor a final visual of the containment area will be performed by the Owner's representative. The Owner's agent/site representative will determine the clearance criteria for the project. At a minimum, no three dimensional debris shall be left within the work area; all poly shall be wet wiped so that no visible dust or debris is left; the decontamination chambers shall be clean of all debris; the waste transfer area shall be clean of all debris; all equipment and supplies shall be clean of all debris. The Contractor shall not be released to encapsulate the containment until receiving written acceptance by the Owner's representative stating the removal area and the containment have met the criteria of the Owner's representative for completeness of removal and cleanliness of the containment barriers and surfaces.

The Owner's agent/site representative will conduct the final visual inspection of the work area for visible residue. If any accumulation of residue is observed, it will be assumed to be asbestos and the 24 hour settling period/cleaning cycle will be repeated.

Additional cleaning cycles shall be provided by the Contractor, as necessary, at no cost to the Owner until the specified clean criteria have been met.

Owner's agent/site representative has final say on whether or not an area meets these requirements.

Following the satisfactory completion of clearance-air monitoring, remaining barriers may be removed and properly discarded as non-asbestos containing waste. If contamination exists behind these critical barriers, additional cleaning and air monitoring may be required.

Final visual will be conducted by at least one Owner's agent/site representative. Owner's agent/site representative may supply additional personnel for inspection in order both to speed the inspection and to more thoroughly inspected the containment areas.

Owner, Contractor and Owner's agent/site representative shall jointly review the work area and make a damage assessment, after clearance air samples have passed and containment has been torn down.

Altadena Library

SECTION 18. CLEARANCE AIR MONITORING

Following the completion of clean-up operations, the Contractor shall notify the Owner's agent/site representative in writing that work areas are ready for final visual inspection. This notification is to be made only after Contractor foreman has made a visual inspection of his own.

After the Owner's agent/site representative has given a final written approval of the clean-up operations, the Contractor shall proceed to "lock-down" the containment area with an encapsulant. Exception to this is for containments that are not to be encapsulated prior to clearance air testing according to the Scope of Work (i.e. floor tile only projects).

When required, clearance air sampling shall be performed following the requirements specified in Section 18 after encapsulation of the containment has taken place and a sufficient amount of time has passed to allow the encapsulant to dry. The Owner shall determine the method of analysis to be used based on the amount and type of material removed within a containment. If at a K through 12 site and the quantity of Asbestos-Containing Material (ACM) exceeds 160 square feet or 260 linear feet, analysis of air samples must be by transmission electron microscopy (TEM) per US EPA AHERA regulations.

Owner shall then arrange for an Air Monitoring Professional to sample the air in the work area for airborne fiber concentrations. Clearance-air monitoring shall proceed 24 hours after lock-down or when the area is dry, whichever is later.

Contractor may request a reduction in the 24-hour waiting period, if personal samples collected during the abatement work and detail clean-up work have shown fiber levels below the PEL. Reduction of waiting period must be made in writing, accompanied by personal sample results from this project. Contractor must acknowledge that reduction in waiting period may result in failed, or overloaded (with encapsulant) clearance air samples and that retaking and re-analyzing these air samples will be at the Contractor's expense. Reduction in waiting time will be at the discretion of the Owner's agent/site representative and the Owner.
Air samples will be taken using the "aggressive" air sampling techniques described in the AHERA regulations unless noted differently in the Scope of Work for non-AHERA sites. In the case aggressive samples cannot be collected (e.g. in a dirt floor area) this will be noted in the Owner's agent/site representative's notes.

If PCM analysis is used for clearance air samples, all clearance samples at all locations shall indicate a fiber concentration of less than or equal to 0.01 f/cc for release of the work area.

If TEM analysis is to be used for clearance air samples, then the clearance criteria shall be the same as AHERA, unless otherwise specified in the Scope of Work.

Areas exceeding these levels shall be re-cleaned and, if appropriate, re-encapsulated at no additional cost to the owner. All areas where clearance air samples fail will be re-tested.

The Contractor shall be responsible for all subsequent air-sampling costs if air samples fail to meet clearance criteria levels. This cost includes four hours of time for Owner's agent/site representative personnel to collect the air samples and the cost of laboratory analysis.

SECTION 19. MONITORING

Owner reserves the right to perform air and performance monitoring at any time.

Contractor shall provide personal air monitoring in accord with OSHA regulations. Results shall be made available to the Owner's agent/site representative within 72 hours of collection. Hard copies of these results shall be supplied to the Owner's agent/site representative within 7 days of collection. Failure to supply these sample results in specified time may cause work to be stopped until all delinquent results have been submitted. Loss of Contractor work time because of non-compliance with the provisions of this paragraph will not extend the date for work completion.

Owner's agent/site representative may take air samples prior to, during, and after the project. Work shall not be considered complete until all air sampling has been completed and satisfactory levels have been obtained. "Satisfactory levels" shall be those established by AHERA, unless more stringent requirements have been identified in any other section of this Specification.

In areas where soil contamination may be present, soil samples must meet specified criteria in any other section of this Specification prior to clearance air samples collection.

Owner, or Owner's agent/site representative, shall be authorized to issue a STOP WORK order whenever Contractor's work or protective measures are not in accord with published regulations or contract specifications.

SECTION 20. DISPOSAL PROCEDURES

Part 20.1 - Disposal Procedures

Waste transport and disposal personnel must wear at least half mask HEPA-cartridge type respirators when handling intact sealed bags. If any bags are broken or if visual debris is observed, powered air respirators (HEPA-filtered) must be worn.

Disposal bags shall be of 6 mil poly, pre-printed with labels as required by CDPH, Toxic Substance Control regulations.

Disposal drums shall be metal or fiberboard with locking ring tops to be used only if required and/or allowed by selected dumpsite.

Stick-on labels as per OSHA and Cal/EPA requirements for disposal containers shall be provided. All containers shall be labeled in accordance with Cal/EPA regulations that require a "Caution" label and a "Hazardous Waste" label with the generator's name, address, and Manifest Document number.

As the work progresses, to prevent exceeding available storage capacity on site, sealed and labeled containers of asbestos-containing waste shall be removed and transported to the prearranged disposal location.

Disposal must occur at an authorized site in accordance with regulatory requirements of NESHAP and applicable State and Local guidelines and regulations, including the California State Department of Health Services, Toxic Substances Control Division.

Transport vehicles shall be marked with the sign prescribed by OSHA during loading and unloading to warn people of the presence of asbestos.

All dump receipts, trip tickets, waste manifests, NESHAP Waste Shipment Record (WSR) and other documentation of disposal shall be delivered to the Owner, for its records. The WSR is not required if the cubic yards of asbestos-containing waste is indicated on the Waste Manifest. The manifest should be signed by the Owner, the hauler, and the Disposal Site Operator as the responsibility for the material changes hands. If a second hauler is employed, his name, address, telephone number and signature should also appear on the form.

The WSR, if used, shall be signed by the Owner or its agent and the disposal site operator.

All manifests shall have asbestos waste identified as: "RQ, Asbestos, 9 NA2212, III". This requirement may be changed as new regulations are issued. See "Waste Disposal" requirements at end of "General Requirements".

All manifests shall be accompanied by a "Notice and Certification". A signed copy of this must be provided to the Owner or its agent.

Altadena Library

Part 20.2 - Transportation to the Landfill

Once drums, bags and wrapped components have been removed from the work area, they shall be loaded into an enclosed (solid walls, ceiling and floor) truck or waste container, which has been lined with 6 mil poly sheeting (walls and floor).

When moving containers, utilize hand trucks, carts and proper lifting techniques to avoid back injuries. Trucks with lift gates are helpful for raising drums during truck loading.

Personnel loading asbestos-containing waste shall be protected by disposable clothing including head, body and foot protection and, at a minimum, half-face, air-purifying, dual cartridge respirators equipped with high-efficiency filters. Any debris or residue observed on containers or surfaces outside of the work area resulting from clean up or disposal activities shall be immediately cleaned up using HEPA filtered vacuum equipment and/or wet methods as appropriate.

No waste containers shall be on site, which contain other hazardous waste, or hazardous waste from any other source or job site. Waste from multiple sites of the Owner within the same waste container is acceptable; however, it must be manifested separately.

If Contractor is storing waste from various sites of one owner, all transportation vehicles shall be covered by the same regulations as the waste container or truck being used to haul the waste to the dump. If equipment or supplies are to be left in vehicles during hauling of waste to waste container or truck, waste and equipment/supplies must be separated by a solid (wood or metal) barrier which has been sealed as a critical barrier. A poly wall barrier is not sufficient.

Waste container, truck, or storage bin must be locked at all times except when being filled.

It is the Contractor's responsibility to see that all waste containers, trucks, and storage bins arrive on site completely free from debris.

The contractor shall provide a weight receipt that identifies the net weight of the material being discarded.

Part 20.3 - Disposal at the Landfill

Upon reaching the landfill, trucks are to approach the dump location as closely as possible for unloading of the asbestos-containing waste.

Bags, drums and components shall be inspected as they are off-loaded at the disposal site. Material in damaged containers shall be re-packed in empty drums or bags as necessary. (Local requirements may not allow the disposal of asbestos waste in drums. Check with appropriate agency and institute appropriate alternative procedures.)

Waste containers shall be placed on the ground at the disposal site, not pushed or thrown out of the trucks (weight of wet material could rupture containers).

Personnel off-loading containers at the disposal site shall wear protective equipment consisting of disposable head, body and foot protection and, at a minimum, half-face, air-purifying, dual cartridge respirators equipped with high-efficiency filters.

Following the removal of all containerized waste, the truck cargo area shall be decontaminated using HEPA vacuums and/or wet methods to meet the no visible residue criteria. Poly sheeting shall be removed and discarded, along with contaminated cleaning materials and protective clothing, in bags or drums at the disposal site.

Altadena Library

SECTION 21. PATENTS AND PREVAILING WAGES

Part 21.1 - Patents

Contractor shall pay all royalties and license fees required for the performance of the work. Contractor shall defend suits or claims resulting from Contractor's or any Sub-contractor's infringement of patent rights and shall indemnify Owner and Owner's representative from losses on account thereof.

Part 21.2 - Prevailing Wage Requirements

The asbestos abatement contractor is fully and totally responsible at all times for compliance with payment of prevailing wage rates pursuant to provisions of the California Labor Code, for compliance with Division 2, Part 7, Chapter 1, California Labor Code, including but not limited to Section 1776; and for compliance with California Labor Code, Section 1777.5 for all apprentice able occupations.

SECTION 22. PERMITS AND FEES

If any permits are required to be issued for any of the Work to be performed by Contractor, Sub-contractor(s) or Sub-subcontractor(s) as part of the Project, it shall be the sole responsibility of the Contractor to expeditiously obtain all such permits and any costs incurred by the Contractor in obtaining such Permits shall be included within the Contract Price.

SECTION 23. SPECIFIC PROCEDURES AND REQUIREMENTS

NOTE: All Specific Procedures and Requirements listed in Section 20 shall be reviewed by the Contractor along with the Scope of Work issued for the project. If any perceived conflicts are present between the Scope of Work and these specifications or within the General Requirements specification itself, the Contractor shall ask for a written interpretation from the Owner's agent/site representative prior to submission of his bid. If conflicts in the "Scope of Work" and this specification or with the General Requirements specification itself are discovered after the start of abatement, the more stringent specification and/or requirements will be enforced. The Owner's agent/site representative shall make the determination as to what which requirements and/or specifications are more stringent.

Part 23.1 - General Repair of Damaged Thermal System Insulation (TSI)

Where TSI has been damaged, and it is feasible to repair the small nicks, cuts, and exposed ends, the following procedures shall be performed:

1. Piece of 4-6 mil poly sheeting shall be placed directly under the area to be worked to collect any fallen debris or repair compound.

2. Half-masks and disposable suits (at a minimum) shall be used during this work.

3. The area shall be restricted to those personnel involved in the work, so posting of the accesses is required. In some cases, poly shall be used to cover the access points.

4. A HEPA vacuum must be in the immediate area to pre-clean any debris observed surrounding the damaged section, or in the event of a mishap.

5. If work is performed indoors, the ventilation system shall be off in the areas worked in to prevent fiber distribution. Ventilation supply and exhaust ducts shall be covered with poly sheeting.

6. It will be necessary to remove small sections of other insulation material, such as fiberglass, if debris from the damaged pipe covering has contaminated it.

7. In some cases HEPA vacuuming the damaged section will collect all loose, hanging, friable insulation material prior to any further repair work.

8. Very small cracks, holes, nicks, and cuts can be repaired with only a joint compound or with a single layer of wettable cloth and appropriate bridging encapsulant. Larger sections of damaged pipe covering, particularly where pipe hangers or metal channel have damaged the insulation, will require at least two layers of wettable cloth such as HardCast by Carlisle Industries.

9. Where the pipe covering cannot be removed completely from penetrations in the walls, floors, or ceilings, the pipe covering shall be removed at least 1" into the opening and sealed with a bridging encapsulant to grade. The Contractor may choose to fill large gaps with fiberglass insulation, prior to sealing with the encapsulant.

10. All of the Contractor's materials, including poly sheeting, tape, joint compound, etc. shall be removed at the completion of the work performed.

Part 23.2 - Glove Bag Technique Requirements

Where glove bag technique is specified for removal of Thermal System Insulation (TSI), or in those areas where the Contractor opts to use glove bags, all of the following conditions must be met:

1. The Contractor shall follow the procedures recommended by the manufacturer of the glove bags, and the specifications required by Federal OSHA and Cal/OSHA regulations.

2. All critical openings shall be sealed prior to set up of the containment.

3. At least one layer of 6 mil poly must be used to fully enclose/contain the abatement area.

4. Stationary objects in the immediate area of the room which cannot be removed from the work area must be covered with at least one layer of 4 mil poly sheeting after being pre-cleaned.

5. A minimum three stage decontamination unit with a shower shall be contiguous with the containment for areas requiring removal of more than 6 linear feet of TSI, or 10 square feet of surfacing material.

6. Negative pressure shall be established and a circular graph recording manometer shall be attached to the containment per Section 13.

7. A HEPA filtered vacuum shall be in the immediate area for use in conjunction with the bags or in case of a spill.

8. Glove bags may not be used on surfaces where temperatures exceed 150 degrees Fahrenheit.

9. Glove bags may be used only once, and may not be moved or slid for removal of a second section of TSI.

10. At least two persons shall perform Class I glove bag removal as defined by Federal and Cal/OSHA.

11. Before beginning the operation, loose and friable material adjacent to the glove bag operation shall be wrapped and sealed in two layers of 6 mil poly sheeting or otherwise rendered intact.

12. Where the system uses an attached waste bag, such bag shall be connected to a collection bag using a hose or other materials which shall withstand pressure of ACM waste and water without losing its integrity.

13. The Contractor shall apply a sufficient volume of amended water to all pipe covering scheduled for removal while it is enclosed in the glove bag.

14. A sliding valve or other device shall separate the waste bag from the hose to ensure no exposure when the waste bag is disconnected.

15. Prior to placement in the disposal bag, glove bags shall be collapsed by removing air within them using a HEPA filtered vacuum.

16. Upon detachment, the glove bag must be immediately placed into at least two 6 mil thick disposal bags. The disposal bags must be sealed using the "gooseneck" sealing technique.

17. Where pipes enter walls, floors, or ceilings which are not within the scope of the project, the pipe covering shall be removed at least 1" into the structure and the pipe covering end must be sealed with bridging encapsulant and/or wettable cloth.

18. If the Contractor chooses to use a Negative Pressure Glove Bag System, Negative Pressure Glove Box System, or Water Spray Process System in lieu of the traditional Glove bag System, the Contractor shall submit to Owner's agent/site representative detailed written procedures on those systems which will be used. In addition, air sampling data, generated by the Contractor, must be provided to Owner's agent/site representative. Owner's agent/site representative must provide prior approval to alternate techniques and approaches to those specifications detailed here.

19. The Contractor is responsible for salvage and decontamination of all pipe system supports, hangers, brackets, saddles, etc. These items shall be inventoried by the Contractor, and verified by the Owner's agent/site representative before and after abatement. The Contractor will be responsible for replacement of any items lost or damaged.

20. The Contractor shall be responsible for ensuring the piping system remains adequately supported at all times. This may be achieved by readjusting existing hanger brackets as insulation is removed, or by other approved methods, such as inserting wood blocks to replace the thickness of the removed insulation.

Part 23.3 - Mini-Cube Enclosure Requirements

1. For the purposes of these specifications, "mini-cube enclosure", enclosure", "mini-enclosure", and "mini-cube" are all used interchangeably and mean the same. The mini-cube enclosure is required to be constructed whenever small sections of walls, ceilings, or pipe insulation are to be removed for electrical, plumbing, mechanical, etc., work. The purpose is to create an enclosed and controlled work environment while removing asbestos or accessing an attic space which is contaminated.

2. Enclosure walls and floors must be constructed of at least two layers of fire-rated 6 mil poly sheeting. No visible holes, cracks, penetrations, etc. shall be within this enclosure. The upright frame shall be adjustable in order to butt the top of the enclosure to the wall or ceiling area. A single drop layer of 6 mil poly sheeting shall be put down and removed daily at the end of the work shift. For work involving removal of TSI by glove bag technique, only one layer of 6 mil poly sheeting is required for construction of the mini-enclosure.

3. Since the top of the enclosure must be open in the chamber where ceiling access will take place, special care must be taken prior to moving the enclosure. If the mini-enclosure is designed to be portable, the enclosure must be sealed at the top prior to being moved to the next location. This may be achieved by temporarily sealing the top with poly and tape from the inside.

4. For access to an attic space, position the enclosure at the location to be worked. The enclosure must be butted up to the ceiling surface to form a semi-seal between the top of the enclosure and the ceiling. The enclosure can then be completely sealed to the ceiling, using tape. After a seal has been established, access into the ceiling can then proceed.

5. A HEPA vacuum shall be used to establish "negative pressure" or airflow into the enclosure. This

shall be verified by using ventilation smoke tubes.

6. The following equipment and materials, at a minimum, must be present inside the mini-enclosure "dirty" chamber:

- 6 mil poly bag for waste.
- Flashlights or drop light as appropriate.
- Daily change of 6 mil poly sheeting drop layer. Other tools needed to perform task.
- Clean potable water in a Hudson-like sprayer, which is labeled "Clean Potable Water Only".
- HEPA Filtered Vacuum

7. The outside of the poly-flapped entry to the mini-cube must be posted with OSHA required warning signs.

8. Clean disposable coveralls must be worn entering the mini-enclosure, and must be removed prior to leaving the mini-enclosure. Depending upon the work being performed, the Contractor may choose to "double suit" in disposable coveralls. All workers shall use the Clean Room and its supplies for personal hygiene prior to exiting the enclosure.

9. For work involving removal of more than 6 linear feet of TSI, or greater than 10 square feet of surfacing material (regardless of method to be used), a shower must be attached to the mini-cube enclosure and be contiguous with the work environment, and comply with all other requirements in related sections of this Specification.

10. If there is removal of greater than 3 linear feet of TSI, or greater than 3 square feet of surfacing material (regardless of the method used), the enclosure must remain in place until a final visual is passed, and clearance air samples are collected by Owner's agent/site representative. Where work involves less than these quantities, only a final visual inspection by Owner's agent/site representative will be required prior to removal of the mini-enclosure.

Part 23.4 - Roofing Abatement Requirements General Requirements

1. Except as amended here and in Section 24, Asbestos Specification/ Procedures, all other Sections of this Specification shall be followed.

2. The work shall be coordinated and scheduled when there are favorable weather conditions, such as, performing the abatement work when the forecast is for "clear skies" and no rain for three or more consecutive days. The Contractor shall remove only that amount of roofing material, which can be re-roofed or covered, and secured from the weather.

3. Work may be halted at the discretion of the Owner's agent/site representative if wind conditions occur which can or does cause removed roofing materials to be blown off the roof area, or beyond the designated removal area perimeter. All roofing work shall be coordinated to allow other trades to work at the same time as long as their work is located in areas where contamination cannot occur. No cutting, sanding, grinding, or removal of any type will take place until all preparations for removal have been completed and inspected by the Owner's agent/site representative. This section may be amended in other sections of this Specification for this project.

4. The words "clear skies" are used as a means of indicating favorable weather conditions. These two words do not mean, nor are they intended to require skies be clear and free of clouds, fog, or other

5. meteorological conditions which are not expected or forecast to produce measurable rain. The follow up requirement of no rain for three or more consecutive days is to help clarify the favorable weather condition requirement. The last sentence concerning the amount of roofing to be removed is to further instruct and direct the Contractor not to be over optimistic and create more open roof areas than can be re-roofed, secured, or properly protected from weather in case the forecast changes unexpectedly or without warning.

6. All work hours at the site shall be determined by the Owner or as defined in other sections of this Specification. Unless otherwise stated, the buildings will be reoccupied each morning Monday through Friday.

7. All work shall be coordinated with the other trades involved on this project, with central coordination being primary between the abatement Contractor and the General Contractor for the project. However, Owner's agent/site representative must be notified of projects in advance as stated in other sections of this Specification.

8. The Contractor shall provide all necessary equipment, tools, materials, lighting, labor, etc. to perform the work. Sufficient lighting shall be provided to illuminate the entire removal and transit areas for removal of roofing material, and for the final visual inspection by the Owner's agent/site representative if the work is to be performed at night.

9. All HEPA equipment to be used on the project must be delivered to the site empty of all debris, clean, free of dust, and in full operating condition. HEPA equipment to be used inside any building must have been DOP tested within the last 90 days. This DOP certification must be verified by Owner's agent/site representative prior to its use.

10. The Contractor shall provide worker safety according to all OSHA regulations (Title 8), including use of tie-offs, harnesses, and lanyards. Particular attention shall be given to the placement and securing of accesses (ladders, etc.) to the roof.

11. All ladders used shall conform to Cal/OSHA requirements. The ladders shall extend at least three feet above the roof line, and shall be tied off to the building to prevent them from sliding.

Contractor Responsibilities

1. The Contractor shall be responsible for securing all exposed roof surfaces, including any roof penetrations against weather after roofing materials have been removed. Protection of the roof must be made with an impermeable barrier to prevent water from entering the building structure.

2. The Contractor will be responsible for all clean-up and costs associated with the decontamination of occupied spaces in the event of contamination of an occupied space.

3. The Contractor is responsible for any contamination of the attic space above the existing ceilings inside the buildings caused by their work, except as noted specifically in Section 24, Asbestos Specification/Procedures.

4. The Contractor is responsible for damage to the roofing substrate, and will be responsible for repair or replacement if damaged.

5. The Contractor is responsible for removal of all roofing layers and associated materials such as roofing nails, insulation, fiberboard, etc. down to the wood or metal substrate regardless of asbestos content, unless otherwise noted in Section 24, Asbestos Specification/ Procedures. Where it is unknown how many layers of roofing materials exist, it must be assumed that there are multiple roofing layers present. The Contractor may, upon request and approval by the Owner, collect core samples of any roof to be removed for the purpose of determining its depth and structure. If coring is conducted, it is the responsibility of the Contractor to repair to industry standards using non-asbestos materials the areas affected.

6. The Contractor is responsible for removing all roofing nails, and driving in all nails used for securing the roofing substrate after roof material has been removed. The Contractor will not be required to remove silver painted or tar coating on conduit, roof jacks, heating, ventilation, and air conditioning (HVAC) equipment, flashing, etc. which will be reused by the Owner. Where flashing is to be reused, the Contractor shall carefully remove and save the flashing in an undamaged condition, unless otherwise required by the Owner. This section may be amended in Section 24, Asbestos Specification/Procedures for this project.

7. The Contractor is responsible for removal and replacement of wood block or metal supports which may be present under conduit, gas lines, piping, HVAC units, ducts, etc. in order to perform the work. The Contractor is also responsible for temporarily installing wood blocks for any existing roof structures during the roofing removal, when it is necessary to remove existing support members to accomplish the work.

8. The Contractor is responsible for damage to all equipment and existing cables which are present on the roof. The Contractor is responsible for damage to electrical wiring, telephone lines, antenna wires, and other conduits which are present. An inspection for pre-existing conditions is the responsibility of the Contractor, but may also be conducted by Owner's agent/site representative.

9. The Contractor is responsible for obtaining all necessary permits to perform this work, including any local permits for work in the evening/night hours.

10. Standards of cleanliness for fluted metal decks located underneath asbestos-containing roofing materials. It is possible for the abatement crew to remove the asbestos-containing roofing materials without breaking through or removing the light grey insulation material beneath it. If removal of asbestos roofing materials is performed as described above, and the insulation material remains intact, Owner's agent/site representative can conduct a final visual for asbestos-containing debris. Once this inspection has been completed, and the requirement for no remaining asbestos-containing debris on the roof is met, the insulation layer is removed.

    At this point, asbestos is no longer an issue, and Owner's agent/site representative will allow minor amounts of the non-asbestos debris to remain in the fluted areas of the deck. General cleaning of the flutes is conducted to a point where the amount of debris remaining is reduced to a minimal amount without having to completely clean or vacuum the flute channel.

    The Owner is unaware of any potential hazard which could be caused by leaving some non-asbestos debris, and does not consider it necessary to have the flute channels detailed beyond generally clean conditions. However, if the fiberboard layer is extensively damaged during removal of the asbestos-containing materials, and asbestos-containing roofing debris cannot be distinguished from non-asbestos containing roofing materials, all flutes shall be vacuumed and cleaned as set forth in the project specifications.

Owner Responsibilities

1. The Owner is responsible for closing all windows in the building where the asbestos roofing material will be removed. This must be done prior to the asbestos abatement contractor arriving onsite for the work shift, in order to prevent delays.

2. The Owner shall also be responsible for cutting or trimming back all trees and limbs which may impact the removal of the existing roofing materials.

3. It is assumed that the buildings associated with this project have roof decking which may include any number of construction methods which allow for roofing debris to sift into joist spaces, or attics located beneath areas where roofing may have previously been removed. Therefore, it must be assumed that all inaccessible and accessible attic spaces, joist spaces, and even flutes of metal decks involved with this project will become, or have already been contaminated with asbestos, and

shall be noted in the Management Plan.

4. The Owner acknowledges that the removal of any roofing materials during this project will result in contamination of the attic spaces, and assumes any associated responsibilities.

General Roof Removal Instructions and Requirements

1. Removal of non-friable asbestos-containing roofing is designated as Class II work. Half-face respirators and disposable coveralls shall be used at a minimum by all workers, at all times, when within the regulated area.

2. No personnel will be allowed into the regulated area during actual removal work without proper respiratory and personal protective equipment. Work boots with hard soles are required to be worn by all abatement personnel. No athletic, street, or dress shoes are to be worn during work activities.

3. All roofing material shall be removed in an intact state to the extent feasible.

4. All roofing is to be removed wet by an amended water solution or encapsulant as necessary.

5. The abated roof area shall be HEPA vacuumed after roofing materials have been removed. Particular attention shall be directed at the flute channels of metal decks.

Additional Requirements for Removal of Nicolite (Nicolet) Roofing Felts

1. Set up of perimeter barriers shall be extended to 30 feet from roof edge at ground level. Contractor shall be required to use barrier tape stamped with, “DANGER ASBESTOS HAZARD” in black letters on a solid red background.

2. Pre-wetting of materials utilizing amended water must attain complete and thorough penetration of the felts prior to their removal, and additional application of amended water shall be performed as necessary throughout the removal and bagging process.

Pre-Abatement Preparation Requirements

1. The Contractor shall seal all air intakes associated with the HVAC units which are on or near the roof under abatement, and at adjacent HVAC units, particularly downwind from roofing removal activity. In addition, all louvers, window mounted fan systems, attic openings, etc., shall be sealed as critical barriers. The Contractor is responsible for sealing all HVAC openings as critical barriers using one layer of 6 mil poly. These critical barriers shall be installed at the beginning of each shift, and removed at the end of each shift prior to reuse by the Owner. If the building will not be reoccupied daily, the barriers may stay in place.

   The perimeter of the roof where removal is to be conducted, shall be posted with barrier tape at a distance of at least 20 feet from the edge of the removal area. This barrier tape will provide a buffer zone, and assist in the restriction of non-abatement personnel.

   Poly sheeting shall be placed on the ground directly below the work area or on the adjacent roof surfaces at least 10 feet. The Contractor shall secure the poly to the ground using tape, weights, or other means to secure the poly from being picked up by wind or becoming a trip hazard. The Contractor shall secure the poly to the adjacent roof surfaces with tape, etc.

Waste containers and Waste container Preparations

1. The Contractor is responsible for inspecting all waste containers delivered to the job site for load worthiness. The Owner’s agent/site representative reserves the right to refuse any waste container without any additional cost to the client, which upon examination, and in the opinion of the site

representative, has a high probability of failure of doors, skids, walls, floors, or which contains other debris.

2. The Contractor shall be required to place footing materials of sufficient thickness, strength, and size under the casters, footings, and/or runners of waste container(s) to prevent damage of property surfaces. The Contractor is responsible for all damages to Owner's property caused by the delivery, placement, or removal of a waste container. Damaged property shall be repaired to equal or better condition than was present prior to the activity causing the damage. This section may be amended in Section 24, Asbestos Specification/Procedures for this project.

3. Unless the roofing material is carried or passed to the ground by hand, it shall be lowered to the ground via covered, dust-tight chute, crane, or hoist. All waste shall be sufficiently wetted with amended water to prevent fiber release. If fiber release cannot be prevented, then the chute and bin must be within a negative pressure enclosure. In no case shall roofing materials be dropped or thrown into bins or waste containers from the roof.

Posting and Label Requirements for:

Regulated Area Entry Points and Waste container Perimeters

Access to regulated areas shall be posted as outlined by Cal/OSHA Title 8, 1529 (k)(7)(B) 1 and 2 with warning signs. Perimeters of waste container(s) shall also be posted as outlined by Cal/OSHA Title 8, 1529 (k)(7)(B) 1 and 2 with barrier tape bearing the following information:

DANGER
ASBESTOS
MAY CAUSE CANCER
CAUSES DAMAGE TO LUNGS
AUTHORIZED PERSONNEL ONLY
WEAR RESPIRATORY PROTECTION AND PROTECTIVE CLOTHING IN THIS AREA

These postings are required to warn non-abatement personnel of the restricted access, and potential hazard which exists in the vicinity of the regulated areas and waste container(s).

Building Perimeter at Ground Level

Building perimeters shall be posted with barrier tape bearing one of the following descriptions:

CAUTION in black letters on a solid yellow background.
DANGER in black letters on a solid red background.
DANGER ASBESTOS HAZARD in black letters on a solid red background.

Waste Material Containers

Waste material containers, including the "burrito wrapped" material, shall have warning labels affixed in accordance with Cal/OSHA Title 8, 1529 (k)(8)(A-D).

DANGER
CONTAINS ASBESTOS FIBERS
MAY CAUSE CANCER
CAUSES DAMAGE TO LUNGS
DO NOT BREATHE DUST
AVOID CREATING DUST

Altadena Library

Waste Disposal and Documentation Requirements

1. Roofing waste may be disposed as non-hazardous asbestos waste, in a landfill permitted to accept non-friable, non-hazardous asbestos roofing material. If the asbestos roofing material is currently friable, or becomes friable during its removal, it shall be disposed of in a landfill permitted to accept friable asbestos waste.

   It is acceptable to dispose of bagged or sealed roofing waste into open topped waste containers lined with a single layer of 10 mil poly sheeting. The Contractor shall completely enclose all roofing waste material commonly known as "burrito wrap" in the waste container using 10 mil poly sheeting. Upon being lowered, unwrapped material shall be transferred to a closed receptacle in such a manner as to preclude the dispersion of dust. In addition to the 10 mil poly sheeting, the top of the waste container shall be completely enclosed with a tarp which is secured to the vehicle for transport or storage on-site if left overnight. The type of material for the tarp shall meet all requirements for transport of hazardous materials.

2. The Contractor is required to provide to Owner's agent/site representative a copy of the "trip tickets" indicating the actual weight of waste material.

Visual Inspection Forms-Interior and Exterior (Roof Removal Shifts Only)

The Owner's agent/site representative shall conduct visual inspections inside each building space prior to each work shift to determine existing conditions, including loose or dislodged acoustical ceiling tiles.

In addition, all interior spaces directly below the area of work shall be visually inspected by the Owner's agent/site representative, at the end of the work shift, to inspect for roofing debris and for loose or dislodged ceiling tiles, etc.

The Contractor is responsible for all costs associated with clean-up of any debris which falls in the occupied spaces of the building.

The Contractor is responsible for providing adequate lighting during all phases of work. This includes final visual inspection by the Owner's agent/site representative, of the removal area and adjacent surfaces impacted during the work.

The Contractor shall perform a pre-final visual of the removal area and adjacent surfaces prior to requesting that the Owner's agent/site representative conduct a final visual inspection. The pre-final visual performed by the Contractor shall verify that all materials have been completely removed from the work area as specified, and all poly sheeting or tape placed over any vents or equipment, which has been removed. The Contractor will also verify that all perimeter poly sheeting on adjacent surfaces has been picked up, and all debris generated by the roofing work such as gutters, flashing, roofing products, paper, nails, screw, etc. have been placed into the waste container.

Protection of Accessible Attic Areas

Any plumbers plenums which may be located below areas where roof removal will take place and the roof deck is not constructed of plywood or solid sheet metal, shall be protected with poly barriers prior to work being performed. Any and all debris which may get into a plumbers plenum will be the responsibility of the Contractor and must be cleaned up by the abatement contractor. A final visual inspection by Owner's agent/site representative will be required prior to allowing the abatement contractor to move to the next designated removal location.

Caulking and Poly Barrier Requirements

Roof removal may cause dust and debris to enter attic areas through gaps between roof deck boards. This dust and debris could enter the interior building areas through gaps and penetrations in the ceilings. The

Contractor shall caulk all identifiable gaps in the ceilings (excluding areas specified to be protected with poly barriers). Typically this will require caulking along curtain tracks, lowering lighting trim to caulk around junction boxes, and caulking gaps around the ceiling edges. The Contractor is responsible for all costs of decontamination and clearance sampling of interior areas, other than inaccessible attics and plumbing plenums, if dust and debris fallout occurs.

All caulking work shall be performed using an Owner approved, paintable material which matches the existing color of the surface, and shall be applied to industry standards with a smooth finish. Caulking must be performed at least five days prior to roof removal work to allow Owner's agent/site representative time to inspect the work completed.

Exterior corridor areas shall not require caulking, however, all grooves shall be thoroughly cleaned of debris by HEPA vacuuming immediately following roof removal. When construction of an overhang or covered walkway is such that prolonged fallout of roofing debris can be expected to occur, the Contractor shall install and maintain a poly barrier below the roof substrate until debris fallout has ceased.

Where exposed tongue and groove wood or roofing substrates are visible, which do not provide a solid barrier between the roof deck and the interior of a building exist, the Contractor may choose to install poly barriers in lieu of caulking. These poly barriers must be air tight and secured to the building surfaces. Spray glue shall not be used to attach any materials to any building surfaces. These poly barriers shall remain in place for the duration of the roof removal and roof replacement activities. During the removal of the poly barriers, the Contractor shall carefully process all asbestos debris captured, either by wetting, HEPA vacuuming, or both, to prevent loss of debris and contamination of interior spaces. The Contractor is responsible for any damages to interior surfaces, and shall repair all finishes to the Owner's satisfaction.

Part 23.5 - Vinyl Floor Tile (VFT) & Associated Adhesive Abatement Requirements General Requirements

For the purposes of this project any direction to remove asbestos-containing or assumed asbestos-containing VFT shall include the full removal by the abatement contractor of the adjacent base cove, as well as, the adhesive/mastic used to secure the VFT and/base cove regardless of its asbestos content. Any mastic which has not been tested for asbestos content must be assumed to contain asbestos and removed by the abatement contractor prior to the performance of a final visual by the Owner's agent/site representative, and final air testing of the containment.

Removal of more than 100 square feet of contiguous asbestos-containing VFT shall require a full enclosure/containment be constructed prior to removal. Any full enclosure/containment constructed for the purposes of removing asbestos-containing VFT, and/or the adhesive/mastic used to secure the VFT and/base cove, shall include critical barriers, a temporary poly ceiling fully connected to poly walls, a sufficient number of DOP tested negative air units to attain a level of at least -0.025" of negative air pressure within the containment, a circular recording manometer, and at a minimum, a three-stage decontamination unit with an operational shower and water filtration system. The filtration system must have at least a 5.0 micron particle size collection capability. Documentation of this capability shall be provided to Owner's agent/site representative.

Whenever and wherever possible, the Contractor shall enclose multiple rooms within a building or wing into a single containment. Where rooms are joined by a common interior hallway or have a common exterior walkway, multiple spaces shall be joined together creating one containment using poly enclosures. Where multiple rooms in a building do not have a common interior hallway, multiple rooms shall be joined using a common work chamber built by the Contractor. The common work chamber shall be constructed of wood studs and plywood sheeting for security purposes, and shall be part of the decontamination chamber. Decontamination units and joined "common areas" outside of a building shall have lockable doors or gates created with temporary fencing for security during off-hours.

Altadena Library

Where appropriate floor tile adhesive/mastic may be removed either by solvent or wet buffing with a solvent. Bead blasting of materials will only be allowed with approval of Owner. Contractor must declare use of bead blasting to Owner/Owner's Representative prior to use of this method. If a solvent is used, the negative air unit exhaust shall be directed downwind of make-up air vents a sufficient distance to preclude the re-entrainment of vapors back into the building. Any solvents used for removing adhesive/mastic shall be non-toxic, low odor, non-flammable, and compatible with the new flooring adhesive/mastic.

A safety data sheet for the solvent(s) proposed for use shall be provided in the pre-construction submittal package, all solvent(s) must be approved by the Owner's agent/site representative prior to their use.

Except as amended here and in the "Scope of Work" Section, all other Sections of this exhibit shall be followed. No removal of VFT, VFT adhesive/mastic, carpets over VFT, or base cove with "assumed" or known asbestos-containing adhesive shall be performed prior to the approval of the Owner's agent/site representative.

Contractor Responsibilities

1. The Contractor shall provide all necessary notifications, equipment, tools, materials, lighting, labor, etc. to perform the work. Notification as appropriate to OSHA, EPA, or the delegated Air Quality Management District is the responsibility of the Contractor.

2. All HEPA equipment to be used on the project must be delivered to the site empty of any debris, clean, free of dust, and in full operating condition. HEPA equipment must be DOP tested at the beginning of the set-up phase and prior to installation into the containment or use on the project. Any equipment removed from the site for more than 10 working days must be DOP tested again prior to re-use on the project.

3. DOP certification testing shall be observed and witnessed by an Owner's agent/site representative. Copies of DOP test results and certification must be submitted to Owner's agent/site representative within 24 hours of the testing being performed.

4. All poly sheeting to be used for the construction of full enclosures/containments must be fire retardant. SDS information reflecting this requirement must be submitted prior to use.

5. All personnel used by the Contractor to conduct removal or handling of asbestos-containing waste materials must possess a current accreditation certificate as a worker or contractor/supervisor as described in 40 CFR Part 763, Appendix C to subpart E, Asbestos Model Accreditation Plan.

6. The Contractor shall be responsible for all clean-up and costs associated with the decontamination of occupied spaces adjacent to any containment where removal of asbestos-containing material is conducted. The Contractor shall also be responsible for damage to building finishes and costs associated with removal of tape glue, staining of wall finishes, or destruction of wall surface integrity. It is the responsibility of the Contractor to identify with the General Contractor all aspects of the project requirements pertaining to these types of damages.

Owner Responsibilities

1. The Owner shall provide the Contractor with access to the building during scheduled work hours through their representative. This representative is expected to be the General Contractor in charge of the site. The Owner shall also be responsible for arming and disarming alarm systems on buildings where work will be performed.

2. The Owner shall also provide the Contractor access to water and electrical hook-ups if available. However, the Contractor is responsible for all connections, electrical cords, GFCI's, water hoses, and hose bibs

necessary for attachment. GFCI's are required to be used by the Contractor on all electrical circuits in use.

General VFT & Adhesive/Mastic Removal Instructions and Requirements

1. For the purposes of this project, removal of VFT and associated adhesive/mastic by any method shall be performed by personnel who are properly trained and accredited to perform Class II Work in public buildings, and are currently approved to conduct work on the project.

2. No personnel are allowed into the containment area during actual removal work without proper respiratory and personal protective equipment. At a minimum, this shall include half-face negative pressure respirators, full body coveralls, rubber boots, and gloves. During removal of adhesive/mastic with solvent or other organic based liquid, combination respiratory cartridges (organic vapor/HEPA) shall be worn, by workers to protect against asbestos and the solvent. Rubber gloves shall also be worn to protect workers skin from the solvent material. **No street clothes or shoes shall be worn inside containment during the removal process**.

3. All doors, windows, and penetrations into the room(s) shall be sealed with poly sheeting. All ventilation systems shall be locked-out and sealed with critical barriers of either poly sheeting or plywood sheeting. **No spray glue may be used on any Owner property or building surface.**

4. Full enclosure of the walls and ceiling with poly sheeting will be required, no matter what method of removal is used. Support of ceiling poly will be at the discretion of the Contractor. Ceiling may be constructed of one layer of 4 mil poly sheeting. Walls shall be constructed of one layer of 6 mil poly, and include a splash guard. The splashguard shall be a minimum of 4 feet in height from the base of the wall upward.

5. Based on the size of the enclosure/containment, a three stage decontamination unit shall be put into place and be fully operable. The clean room of any three-stage decontamination unit must be at least 5' in width, 8' in length, and 8' in height.

6. Sufficient negative air units shall be installed which will provide a minimum of four air changes per hour and -0.025" air pressure differential. A manometer with an accurate circular or equivalent recording chart must be installed and operational. The manometer chart(s) shall reflect the location, times, and dates of all measurements recorded. Once these requirements have been met and the negative pressure has been established, the Contractor shall request a pre-start visual inspection from Owner's agent/site representative.

7. When the Contractor has passed the pre-start visual inspection, removal of base cove/boards may be conducted. Base cove adhesive shall be removed completely on hard surfaced walls where damage to the substrate will not occur, or only to a point of smoothing out high spots on walls, which will become damaged due to the work to be performed. Full removal is not expected unless the Contractor is notified in writing on these types of soft substrate surfaces.

8. Sufficiently wet VFT with amended water prior to and during the removal phase of work, and place into waste containers for disposal. Acceptable methods of containing VFT waste materials include placing VFT into clear properly labeled 6 mil poly bag and deposit this bag into a lined fiberboard drum. The drum shall be sealed when filled and placed into a waste container for disposal.

9. Method of removal pertaining to asbestos-containing adhesive/mastic shall be at the discretion of the Contractor, except methods, which are noted in this Exhibit that are prohibited. Hand scraping, solvents, and wet buffing with solvents are acceptable methods. If the Contractor chooses to use solvents, exhaust of negative air units shall be directed downwind as much as possible, or a sufficient length of exhaust hose will be required to prevent re-entrainment of the vapors.

10. Any solvents used for removing adhesive/mastic shall be non-toxic, low odor, and non-flammable. A SDS for the solvent shall be provided and subject to approval by the Owner's agent/site representative prior to use.

11. Upon completing the removal of all floor tiles and adhesive/mastic, the Contractor shall remove the splashguard from the containment walls, and conduct wet wiping on all surfaces within the containment/enclosure.

12. If a solvent was used to remove any VFT adhesive/mastic, the Contractor shall wash the floors thoroughly using a solution of trisodium phosphate (TSP), or equivalent, and water. Sufficient water shall be used for final rinsing of the floor for a clean finish.

13. It is the sole responsibility of the Contractor to reduce concentrations of any solvents used to a level, which will allow new adhesive/mastic to be applied. Owner's agent/site representative will not test the floor for PH levels, and will not attest that the solvents used have been reduced in any way.

Final Visual Inspection

1. Upon the completion of all activities listed above, the asbestos contractor shall provide their own visual inspection prior to Owner's agent/site representative, and shall be present during the inspection by Owner's agent/site representative to remove/clean additional surfaces as needed, prior to encapsulation.

2. The final visual inspection will include an evaluation of all surfaces within the containment area, with emphasis placed on the completeness of materials removed from the floor area. Any three dimensional debris identified by the Owner's agent/site representative, which can be seen using a flashlight placed on the floor and directed across the floor, shall be removed as directed with the use of a HEPA vacuum and other tools as necessary to remove the material. The Contractor shall thoroughly clean all equipment inside the containment, including all parts of the negative air units, and new pre-filters shall be installed into all negative air units.

Final Lockdown-Encapsulation

1. The asbestos contractor may encapsulate the entire containment area upon completion of the final visual inspection by the Owner's agent/site representative, and acceptance of the work as complete.

Clearance Criteria

a. All clearance air samples will be analyzed by transmission electron microscopy (TEM), and performed by a NIST/NVLAP accredited laboratory. The clearance criteria for releasing the Contractor is the AHERA Standard, with the average of all air samples less than 70 asbestos structures per square millimeter. Aggressive air sampling will be used, which includes using a leaf blower in conjunction with fans to dislodge any remaining dust within the containment.

Disposal Requirements

1. All vinyl floor tile waste shall be disposed as hazardous asbestos waste and will require a Uniform Hazardous Waste Manifest. Package all solvent/mastic waste created during the project in sufficient absorbent to eliminate all free liquids, and place in a D.O.T. 7A Type A approved steel drum (49 CFR 178.350). Label the drum as required, and transport to an approved Class 1 landfill with a separate Uniform Hazardous Waste Manifest and Waste Profile Documentation.

2. The Contractor **SHALL NOT** sign any Hazardous Waste Manifests for the Owner. It shall be the responsibility of the Contractor to notify the Owner's agent/site representative and coordinate having any manifest properly signed by a Owner representative.

Altadena Library

Part 23.6 - Carpet Removal over Vinyl Floor Tile (VFT)/Tile Adhesive Requirements General Requirements

The following requirements are for use when the only removal to be performed is of carpet applied over existing VFT or bare VFT mastic. If the intended removal includes the underlying materials and/or any associated base cove, refer to and follow the requirements as set forth in Part 23.5 Vinyl Floor Tile (VFT) and Associated Adhesive Abatement Requirements.

For the purposes of this project, any direction to remove carpet from over known or assumed asbestos containing VFT or bare VFT mastic where the carpet is found to be directly adhered to those surfaces by carpet glues or carpet mastic the following requirements shall apply. These requirements shall be enforced regardless of the amount of floor tile/mastic expected to be impacted by the removal process.

1. The Contractor shall provide all necessary notifications, equipment, tools, materials, lighting, labor, etc. to perform the work. Notification as appropriate to OSHA, EPA, or the delegated Air Quality Management District is the responsibility of the Contractor.

2. All HEPA equipment to be used on the project must be delivered to the site empty of any debris, clean, free of dust, and in full operating condition. HEPA equipment must be DOP tested at the beginning of the set-up phase and prior to installation into the containment or use on the project. Any equipment removed from the site for more than 10 working days must be DOP tested again prior to re-use on the project.

3. DOP certification testing shall be observed and witnessed by an Owner's agent/site representative. Copies of DOP test results and certification must be submitted to Owner's agent/site representative within 24 hours of the testing being performed.
4. All poly sheeting to be used for the construction of enclosures/containments must be a fire rated material. SDS information reflecting this requirement must be submitted prior to use.

5. All personnel used by the Contractor to conduct removal of carpets or handling of asbestos-containing waste materials must possess a current accreditation certificate as an asbestos worker or contractor/supervisor as described in 40 CFR Part 763, Appendix C to subpart E, Asbestos Model Accreditation Plan.

6. The Contractor shall be responsible for all clean up and costs associated with the decontamination of occupied spaces adjacent to any containment where removal of ACM is conducted. The Contractor shall also be responsible for damage to building finishes and costs associated with removal of tape glue, staining of wall finishes, or destruction of wall surface integrity. It is the responsibility of the Contractor to identify with the General Contractor all aspects of the project requirements pertaining to these types of damages.

7. Whenever vinyl floor tiles are to be removed, the base cove shall also be removed as part of the project. When the Contractor has passed the pre-start visual inspection, removal of base cove/boards may be conducted. Base cove adhesive shall be removed completely on hard surfaced walls where damage to the substrate will not occur, or only to a point of smoothing out high spots on walls, which will become damaged due to the work to be performed. Full removal is not expected unless the Contractor is notified in writing on these types of soft substrate surfaces. To minimize damage to the existing paint above the base cove, the contractor shall use a utility knife to cut score the paint at the intersection of the base cove. This will allow removal of the base cove with minimal damage to the paint layer.

Altadena Library

Owner Responsibilities

1. The Owner shall provide the Contractor with access to the building during scheduled work hours through their representative. This representative is expected to be the General Contractor in charge of the site. The Owner representative shall also be responsible for arming and disarming alarm systems on buildings where work will be performed.

2. The Owner shall also provide the Contractor access to water and electrical hook-ups if available. However, the Contractor is responsible for all connections, electrical cords, GFCI's, water hoses, and hose bibs necessary for attachment. GFCI's are required to be used by the Contractor on all electrical circuits in use.

General Carpet Removal Instructions and Requirements

1. Carpet removal shall be performed by personnel who are properly trained and accredited to perform Cal/OSHA Class II Work in public buildings, and are currently approved to conduct work on the project.

2. No personnel are allowed into the containment area during actual removal work without proper respiratory and personal protective equipment. At a minimum, this shall include half-face negative pressure respirators with P-100 (HEPA) cartridges and full body coveralls.

3. All ventilation systems shall be locked-out and sealed with critical barriers of poly sheeting. Other penetrations such as doors, vents, etc. must also be sealed with either tape or poly sheeting as appropriate to secure the work area. A single stage cubicle unit of appropriate size for the work to be performed shall be placed on the entrance to the room. At a minimum this unit must be 3' X 3' X 6' in height. **No spray glue may be used on any Owner property or building surface.**

4. A remote clean-up and decontamination unit shall be put into place in a location considered to be central to the work being performed. This decontamination unit shall be equipped with a full shower unit, overflow pan, filtration unit, soap, warm and cold water, towels, etc. as required in other sections of these specifications. Decontamination procedures will be based on the actual amount of asbestos- containing materials impacted during the carpet removal. As a guide, if more than 100 square feet of VFT are impacted during carpet removal, the personnel performing the work shall shower at the end of each work period. If less than 100 square feet of VFT or VFT mastic are impacted during the process modified worker decontamination practices may be used.
5. A sufficient number of pressure differential units shall be installed which will provide a negative air flow and minimum of 4 air changes per hour. A manometer will not be required. Once these requirements have been met and the enclosure area has been established, the Contractor shall request a pre-start visual inspection from Owner's agent/site representative.

6. When the Contractor has passed the pre-start visual inspection, removal of carpet may be conducted.

7. VFT adhered to the surface of the existing substrate will be removed from the carpet utilizing hand methods and hand tools as needed. These tiles shall be placed into waste containers for disposal. If all VFT has been removed from the carpet the carpet may be disposed as regular waste with no restrictions. However, the carpet may not be salvaged without written authorization from the Owner.

8. Any carpet removed from bare VFT mastic and the mastic remains adhered to the carpet will require the carpet be wrapped in two layers of polyethylene sheeting properly labeled to meet Cal/OSHA requirements and disposed as a non-hazardous asbestos containing waste in an appropriate landfill permitted to accept such waste.

Final Visual Inspection

1. Regardless of the amount of VFT or VFT mastic impacted, upon the completion of all activities listed

above, the asbestos contractor shall provide their own visual inspection prior to Owner's agent/site representative, and shall be present during the inspection by Owner's agent/site representative to remove/clean additional surfaces as needed.

2. The final visual inspection will include an evaluation of all surfaces within the containment area, with emphasis placed on the cleanliness of the work area. All surfaces, fixtures, and cabinetry exposed to the work shall be wet wiped and found to be free of existing dust and possible debris generated during the carpet removal process. Any loose or broken tiles and tile debris must be removed by the contractor prior to acceptance of the work area as complete.

3. Lockdown of the removal area will not be required.

Clearance Criteria

1. Owner's representative will determine if clearance air samples will be required based on actual impact of VFT or VFT mastic determined by the final visual inspection. If clearance air monitoring is performed, all samples will be analyzed by transmission electron microscopy (TEM), and performed by a NIST/NVLAP accredited laboratory. The clearance criteria for releasing the Contractor will be the AHERA Standard, with the average of all air samples less than 70 asbestos structures per square millimeter. Aggressive air sampling will be used, which includes using a leaf blower in conjunction with fans to dislodge any remaining dust within the containment.

Disposal Requirements

1. All vinyl floor tile waste shall be disposed as hazardous asbestos waste and will require a Uniform Hazardous Waste Manifest. The Contractor **SHALL NOT** sign any Hazardous Waste Manifests for the Owner. It shall be the responsibility of the Contractor to notify the Owner's agent/site representative and coordinate having any manifest properly signed by a Owner representative.

Part 23.7 - Boiler Unit Removal Requirements

Regardless of boiler size or method of removal, the entire Boiler Room shall be wet wiped and cleaned of all visible dust, dirt, etc. prior to final visual inspection and clearance air monitoring to be performed by the Owner's Representative. If the boiler unit is to be demolished in place full enclosure shall be required. This will include poly barriers on floors, walls, and ceilings as appropriate in addition to all other requirements set forth in this document, which constitutes a full enclosure.

Removal of the unit whole will still require at a minimum the following:

1. All critical openings shall be sealed with at least one layer of six mil thick poly sheeting.

2. Negative pressure shall be established and a circular graph-recording manometer shall be attached to the containment per Section 13.

3. A three-stage decontamination unit with an operable shower shall be attached to the entrance of the containment.

4. HEPA-filtered vacuums and wet wiping techniques shall be used for detail cleaning of all surfaces.

5. Before beginning the operation, repairs shall be performed on any damaged thermal system insulation in the room, which is not scheduled, for removal or replacement during the boiler removal operation.

Altadena Library

Part 23.8 - Sheetrock and Joint Compound Abatement Requirements

General Requirements

For the purposes of this project any direction to remove sheetrock and joint compound wall and ceiling system materials known to contain <1% asbestos as a composite material and verified by the point count method shall include the full removal by the abatement contractor of all nails, screws, or other fastening units which have visible sheetrock and/or joint compound remaining, as well as, all dust, debris, and waste generated by the removal work.

Removal of more than 100 square feet of contiguous asbestos-containing sheetrock and joint compound wall and/or ceiling systems shall require a full enclosure/containment be constructed prior to removal. Any full enclosure/containment constructed for the purposes of removing asbestos-containing sheetrock and joint compound wall and/or ceiling system materials, shall include critical barriers, a temporary poly ceiling fully connected to poly walls (as appropriate for surfaces not being removed), a sufficient number of DOP tested negative air units to attain a level of at least -0.025" of negative air pressure within the containment, a circular recording manometer, and at a minimum, a three-stage decontamination unit with an operational shower and water filtration system. The clean room of any three stage decontamination unit must be at least 5' in width, 8' in length, and 8' in height. The filtration system must have at least a 1.0 micron particle size collection capability. Documentation of this capability shall be provided to Owner’s agent/site representative.

Removal of less than 100 square feet of asbestos containing sheetrock and joint compound wall and/or ceiling system materials shall require a full enclosure/containment be constructed prior to removal. However, the use of a two-stage decontamination unit will not be required and negative pressure requirements may be reduced to verification of negative airflow. All other containment requirements apply.

Whenever and wherever possible, the Contractor shall enclose multiple rooms within a building or wing into a single containment. Where rooms are joined by a common interior hallway or have a common exterior walkway, multiple spaces shall be joined together creating one containment using poly enclosures. Where multiple rooms in a building do not have a common interior hallway, multiple rooms shall be joined using a common work chamber built by the Contractor. The common work chamber shall be constructed of wood studs and plywood sheeting for security purposes, and shall be part of the decontamination chamber. Decontamination units and joined “common areas” outside of a building shall have lockable doors or gates created with temporary fencing for security during off-hours.

Except as amended here and in the “Scope of Work” Section, all other Sections of this exhibit shall be followed. No removal of sheetrock and joint compound wall and/or ceiling system materials shall be performed prior to the approval of the Owner’s agent/site representative.

Contractor Responsibilities

1. Except as amended here and in Section 24, Asbestos Specification/Procedures, all other Sections of this Specification shall be followed.

2. The Contractor shall provide all necessary notifications, equipment, tools, materials, lighting, labor, etc. to perform the work. Notification as appropriate to OSHA, EPA, or the delegated Air Quality Management District is the responsibility of the Contractor.

3. All HEPA equipment to be used on the project must be delivered to the site empty of all debris, clean, free of dust, and in full operating condition. HEPA equipment to be used inside any building must have been DOP tested within the last 90 days. This DOP certification must be verified by Owner’s agent/site representative prior to its use.

4. DOP certification testing shall be observed and witnessed by an Owner’s agent/site representative. Copies of DOP test results and certification must be submitted to Owner’s agent/site representative within 24 hours of the testing being performed.

5. All poly sheeting to be used for the construction of enclosures/containments must be fire retardant. SDS information reflecting this requirement must be submitted prior to use.

6. All personnel used by the Contractor to conduct removal or handling of asbestos-containing waste materials must possess a current accreditation certificate as a worker or contractor/supervisor as described in 40 CFR Part 763, Appendix C to subpart E, Asbestos Model Accreditation Plan.

7. The Contractor shall be responsible for all clean-up and costs associated with the decontamination of occupied spaces adjacent to any containment where removal of asbestos-containing material is conducted. The Contractor shall also be responsible for damage to building finishes and costs associated with removal of tape glue, staining of wall finishes, or destruction of wall surface integrity. It is the responsibility of the Contractor to identify with the General Contractor all aspects of the project requirements pertaining to these types of damages.

Owner Responsibilities

1. The Owner shall provide the Contractor with access to the building during scheduled work hours through their representative. This representative is expected to be the General Contractor in charge of the site. The Owner shall also be responsible for arming and disarming alarm systems on buildings where work will be performed.

2. The Owner shall also provide the Contractor access to water and electrical hook-ups if available. However, the Contractor is responsible for all connections, electrical cords, GFCI's, water hoses, and hose bibs necessary for attachment. GFCI's are required to be used by the Contractor on all electrical circuits in use.

General Sheetrock and Joint Compound Wall and Ceiling Systems Removal Instructions and Requirements

1. For the purposes of this project, removal of sheetrock and joint compound wall and ceiling systems by any method shall be performed by personnel who are properly trained and accredited to perform Class II Work in public buildings, and are currently approved to conduct work on the project.

2. No personnel are allowed into the containment area during actual removal work without proper respiratory and personal protective equipment. At a minimum, this shall include half-face negative pressure respirators, full body coveralls, rubber boots, and gloves. **No street clothes or shoes shall be worn inside containment during the removal process**.

3. All doors, windows, and penetrations into the room(s) shall be sealed with poly sheeting. All ventilation systems shall be locked-out and sealed with critical barriers of either poly sheeting or plywood sheeting.

4. Full enclosure of the walls and ceiling with poly sheeting (as applicable) will be required, no matter what method of removal is used. Support of ceiling poly will be at the discretion of the Contractor. Ceiling may be constructed of one layer of 4 mil poly sheeting. Walls shall be constructed of one layer of 6 mil poly.

5. Based on the size of the enclosure/containment, a three stage decontamination unit shall be put into place and be fully operable. The clean room of any three-stage decontamination unit must be at least 5' in width, 8' in length, and 8' in height.

6. Sufficient negative air units shall be installed which will provide a minimum of 4 air changes per hour and -0.025" air pressure differential. A manometer with an accurate circular or equivalent recording chart must be installed and operational. The manometer chart(s) shall reflect the location, times, and dates of all measurements recorded. Once these requirements have been met and the negative pressure has been established, the Contractor shall request a pre-start visual inspection

from Owner's agent/site representative.

7. When the Contractor has passed the pre-start visual inspection, removal of sheetrock and joint compound wall and ceiling systems may be conducted.

8. Sufficiently wet sheetrock and joint compound wall and ceiling systems to be removed with amended water prior to and during the removal phase of work, and place into waste containers for disposal. Acceptable methods of containing sheetrock and joint compound wall and ceiling system waste materials include placing waste into clear 6 mil poly bag and seal bag with appropriate amount of tape. This bag shall be cleaned of all visible dust and deposited into a second clear 6 mil poly bag and sealed with an appropriate amount of tape using the "goose neck" method. This second bag must then be labeled with the appropriate Cal/OSHA asbestos warning label.

9. Upon completing the removal of all sheetrock and joint compound wall and ceiling systems, the Contractor shall conduct wet wiping on all remaining surfaces within the containment/enclosure.

Final Visual Inspection

1. Upon the completion of all activities listed above, the asbestos contractor shall provide their own visual inspection prior to Owner's agent/site representative, and shall be present during the inspection by Owner's agent/site representative to remove/clean additional surfaces as needed, prior to encapsulation.

2. The final visual inspection will include an evaluation of all surfaces within the containment area, with emphasis placed on the completeness of materials removed. Any three dimensional debris identified by the Owner's agent/site representative, shall be removed as directed with the use of a HEPA vacuum and other tools as necessary to remove the material. The Contractor shall thoroughly clean all equipment inside the containment, including all parts of the negative air units, and new pre-filters shall be installed into all negative air units.

Final Lockdown-Encapsulation

1. The asbestos contractor may encapsulate the entire containment area upon completion of the final visual inspection by the Owner's agent/site representative, and acceptance of the work as complete.

Clearance Criteria

1. All clearance air samples will be analyzed by transmission electron microscopy (TEM), and performed by a NIST/NVLAP accredited laboratory. The clearance criteria for releasing the Contractor is the AHERA Standard, with the average of all air samples less than 70 asbestos structures per square millimeter. Aggressive air sampling will be used, which includes using a leaf blower in conjunction with fans to dislodge any remaining dust within the containment.

Disposal Requirements

1. All sheetrock and joint compound wall and ceiling system waste may be disposed as non-hazardous asbestos waste, in a landfill permitted to accept non-friable, non-hazardous asbestos containing material.

2. Waste material containers, including "burrito wrapped" material, shall have warning labels affixed. Contractor may either use the Cal/OSHA Title 8, 1529 (k)(8)(A-D) warning:

DANGER
CONTAINS ASBESTOS FIBERS
MAY CAUSE CANCER
CAUSES DAMAGE TO LUNGS

DO NOT BREATHE DUST
AVOID CREATING DUST

3. All non-hazardous asbestos containing waste shall be tracked utilizing some form of system which at a minimum includes: date, document number, generator name and mailing address, description of the waste, waste generating site address, contractor company name and address, special handling instructions, transporter company name, as well as name and address of facility accepting the waste.

Part 23.9 - Impact to and Removal of Transite Pipe, Shingle, or Sheeting Materials

Where transite pipe, shingles, or sheeting is to be impacted or removed the following procedures shall be performed:

1. All requirements of Cal/OSHA Section 1529 and US EPA AHERA regulations apply, and shall be followed, as well as, other applicable Federal, State, and local regulations as they pertain to training, work practices, air monitoring, waste disposal, etc.

2. Personal air monitoring shall be performed in accordance with Cal/OSHA Section 1529

3. Establishment of a work area restricting access to those personnel involved in the work, and posting of the work area is required.

4. An appropriately sized drop cloth of 6-10 mil poly sheeting sufficient in size to contain any debris generated during the removal shall be placed directly under the area to be worked to collect any fallen debris generated during the work.

5. Half-masks and disposable suits (at a minimum) shall be used during this work.

6. A HEPA vacuum must be in the immediate area ready for use.

7. Where the pipe must be cut the contractor may use any method applicable to performing the work. Any use of hand or mechanical saws, or other method which will produce dust and will require the use of the HEPA vacuum and engineering controls which will collect any and all dust generated during the sawing process.

8. The Contractor shall apply a sufficient amount of amended water to all pipe surfaces to be impacted during the work to keep them adequately wet.

9. All of the Contractor's materials, including poly sheeting, tools, etc. shall be properly decontaminated of visible dust and pipe debris utilizing wet cleaning methods and HEPA vacuuming prior to being removed at the completion of the work performed. Disposable materials must be properly disposed.

10. Transite waste generated may be disposed as non-hazardous asbestos waste, in a landfill permitted to accept non-friable, non-hazardous asbestos material. If the transite material is currently friable, or becomes friable during its removal, it shall be disposed of in a landfill permitted to accept friable asbestos waste.

    It is acceptable to dispose of non-friable transite waste after placing it into two 6 mil thick polyethylene bags properly sealed and marked to meet current OSHA requirements.

11. The Contractor is required to provide to Owner's Agent a copy of the "trip ticket" indicating the actual weight of waste material and the landfill accepting the waste.

Altadena Library
Part 23.10- Demolition with Selected Asbestos Containing Materials Left in Place

Under some circumstances, asbestos-containing materials may remain in or on a building during the building's demolition. This section describes the work practices and requirements for the demolition of a building with asbestos-containing materials remaining in place in or on the structure.

All friable, Category II non-friable materials, and all Category I non-friable materials that are expected to become friable during the demolition must be removed prior to the start of the demolition process. For example, surfacing materials, pipe wrap insulation, vinyl sheet flooring and associated backings, vinyl floor tiles and asbestos cement products must be removed from a building prior to its demolition. Should there be any question as to whether or not a material may remain in or on the building during the demolition, the Contractor shall ask for an opinion in writing from the Owner's agent/site representative. The determination of whether or not a material may remain in a building during the demolition is left solely to the determination of the Owner's agent/site representative.

The only asbestos-containing materials that may remain in or on a building during the building demolition include non-friable materials that the local Air Quality Management District or US EPA has determined may remain in or on the building during the demolition. Approval of this method is determined by the US EPA with the California Air Resources Board having jurisdiction in this county. In general, this will be limited to Category I non-friable materials such as roofing, rubber cove base and associated adhesives, paint, mastics, and other adhesives. In order to be considered for being left in or on the building during demolition, there must be a reasonable assumption that these materials will remain non-friable during the demolition.

The black floor mastic containing greater than 1% asbestos on the concrete may be left in place and demolished with the rest of the building as a non-hazardous asbestos waste, as long as, the materials do not become friable. The US EPA NESHAP has determined if this type of flooring mastic becomes friable during the course of the demolition, then it would be considered RACM. Removal of the concrete sections of floor containing the floor mastic using an excavator would not be considered a mechanical action that renders the floor mastic friable. Running over the concrete floor covered with the mastic using an excavator or other heavy equipment with metal tracks will render the concrete and mastic friable and shall not be allowed. The contractor can use an excavator or other heavy equipment with rubber tires on the concrete and is generally not considered to render the mastic friable. If a contractor uses a heavy equipment with metal track on this project, it will not be allowed to go onto the concrete floor that has black mastic, whether the concrete is covered with carpeting, linoleum, vinyl flooring, or other materials. All work will stop at the direction of Atlas if the contractor uses mechanical means that renders the asbestos containing materials left in place friable.

Should the building and materials meet the criteria listed above, the building may be demolished without the prior removal of those materials. However, if previously unidentified materials are discovered during the demolition process, the Contractor must stop demolition and notify the Owner's agent/site representative of the existence of the new material. Under no circumstances may the Contractor continue to disturb the new material until the new material has been properly investigated and the Contractor given permission to proceed by the Owner's agent/site representative.

The demolition of any building on this project with ACM, ACBM, or ACCM remaining in place must be conducted by a California licensed asbestos contractor with current and valid registration with the California Division of Occupational Safety and Health Asbestos Contractors' Registration Unit.

The Federal Occupational Safety and Health Administration (OSHA) has defined the demolition of buildings that contain Class II materials (non-friable materials) to be Class II work. Therefore the training, work practices, and procedures of Class II work must be followed. The following requirements summarize the requirements for Class II work as listed in the Asbestos Standard for the Construction Industry (Title 8 CCR 1529) for work such as demolition where specific controls have not been listed in the standard.

The supervisor must meet the training requirements for a "competent" person for Class II work as listed in Title 8 CCR 1529 (o)(4)(A). In summary, the supervisor must be an accredited supervisor as set for in the EPA's Model Accreditation Program (40 CFR Part 763, Subpart E). A Competent Person must be present

during the course of the asbestos related work. An AHERA accredited asbestos Contractor/Supervisor meets the training and definition of a Competent Person.

The workers must at a minimum meet the training requirements as listed in Title 8 CCR 1529 (8)(k)(9)(D). In summary, they must have a minimum of eight hours of training that includes the subjects listed in Title 8 CCR 1529 (k)(9)(H).

The following procedures must be followed:

1. The work shall be performed using wet methods. At a minimum, one worker must direct a water spray onto the portion of the building being demolished. The amount of water utilized must be adequate to prevent any release of visible dust into the air. The Contractor is responsible for controlling and channeling the flow of the waste water in a manner that meets local ordinances and regulatory agency requirements. The debris generated during the demolition process must be visually wet at all times prior to and while it is being containerized.

2. Effort should be made to remove the sections of asbestos-containing materials in as intact a condition as possible.

3. Debris must be containerized as described below. Debris must be containerized or kept wet during any work breaks. No loose debris may be left on the site overnight. Any building partially impacted by the work which will not be totally demolished by the end of the day must be completely wetted prior to the end of the shift.

4. Debris must be placed in a container that can be closed or sealed with poly sheeting. The container must have the inside lined with a minimum of two layers of reinforced ten millimeter thick poly sheeting with enough sheeting remaining on all sides to allow for burrito wrapping of the load. The two layers of poly sheeting must be independently closed and sealed with tape and spray glues. This wrapped material must then be labeled with the sign described in Title 8 CCR 1529 (k)(8) DANGER, CONTAINS ASBESTOS FIBERS, AVOID CREATING DUST, CANCER AND LUNG DISEASE HAZARD

5. Nonhazardous waste data forms for each container must be supplied to the Owner's agent/site representative no later than the end of each day.

6. Contractor shall provide personal air monitoring for Class II as described in Title 8 CCR 1529 (f)(3)(A).

7. The Contractor shall develop a regulated area that keeps unauthorized persons out of the work area.

8. All personnel in the regulated area must wear, at a minimum, disposable clothing and a half-face respirator with P-100 (HEPA) cartridges.

9. Regardless of any exposure monitoring, the Contractor will require all workers to wear at a minimum protective suits and half-face negative pressure respirators. This requirement does not relieve the Contractor of performing personal monitoring of its workers.

Part 23.11 - Contaminated Attic Space Procedures

The District considers all existing attic spaces throughout the District to be contaminated with asbestos containing roofing debris unless otherwise determined or reported. The District has restricted access to all attic spaces to properly trained and protected personnel. Excluded from this restriction is opening a ceiling access hatch and entering the attic space with the upper body. Physical access into an attic space which includes a person placing their entire body in the attic space with intent to access other areas of the attic space is prohibited by unprotected and untrained personnel. No entry into these spaces shall be made

regardless of duration of time or intent without compliance with the requirements outlined in this Part of the project specifications.

Activities expected to take place in contaminated attic spaces most closely resemble the definition of “Class IV” work which is defined by Cal/OSHA in CCR; Title 8, Section 1529, as maintenance and custodial activities during which employees contact but do not disturb asbestos containing material (ACM) or presumed asbestos containing material (PACM).

To comply with the various regulations pertaining to this type of work in contaminated attic spaces, the following procedures are to be followed by individuals entering these areas.

1. Personnel assigned to enter contaminated attic spaces shall receive a minimum of two hours of asbestos awareness training. This training must include the following:

   The possible health affects of asbestos exposure,
   the types of asbestos materials normally encountered in such spaces,
   the known and possible hazards that may be found in such spaces,
   the purpose and proper use of protective clothing,
   the proper selection, use, and limitations of respirators.

2. Personnel assigned to wear respirators must be included in a respirator protection program as outlined in California General Industry Safety Order 8 CCR 1544. All full body entry into an attic space with the intent to access the attic space will require use of at least a half-face negative pressure respirator with HEPA filters.

3. Prior to entry of a contaminated attic space each employee must pass a medical evaluation to ensure their fitness to wear a respirator.

4. A certified asbestos competent person must select the appropriate type of respirator(s) for the airborne asbestos levels anticipated to be encountered during such work.

5. Each employee assigned a respirator must successfully pass a qualitative or quantitative fit test prior to entry of a contaminated space.

6. A six (6) mil poly drop sheet must be placed at the entry to the space (approximately 6' X 6' in size) prior to entry.

7. Clean, potable water must be made available at the entry/exit for use to wash hands, faces, and equipment upon exiting from the space.

8. Employees entering contaminated attic spaces shall don two (2) sets of whole body coveralls, including head and foot covering. Appropriate type gloves for the work to be conducted must also be worn.

9. Disposal bags (6 mil poly), with the appropriate labeling, shall be made available at the entry/exit for disposal of contaminated protective clothing. One bag to be placed inside the space at the exit point and one shall be placed outside the space at the exit point.

10. Personnel working in contaminated attic spaces shall be instructed not to touch or disturb any suspect asbestos debris or materials encountered. If the extent of contamination is such that the employees can not perform their work without disturbing the material or debris, they shall exit the space until such time a certified asbestos abatement contractor has removed the material or debris and thoroughly encapsulated the area.

11. All tools or other equipment used in the course of the work shall be wiped down with clean, damp rags, prior to being removed from the space.

12. Prior to exiting the contaminated attic space, personnel shall remove their outer set of coveralls immediately adjacent to the exit point, leaving their respirator in place and dispose of the used coveralls in the waste bag.

13. Upon exiting the contaminated attic space, personnel shall remove the inner (or remaining) set of coveralls and place these in the waste bag provided for this purpose.

14. Personnel shall wash their hands prior to carefully removing their respirator and disposing of the filters in the waste bag provided.

15. Personnel shall at this time wash their faces and complete the decontamination of their respirators.

Part 23.12 - Non-Friable, Non-Hazardous, Glazing Abatement Requirements General Requirements

1. Removal of non-friable, non-hazardous, asbestos-containing glazing materials shall be coordinated and scheduled to be performed when there are favorable weather conditions, such as, low winds and no rain. If possible the work should be conducted when the interior space adjacent to the removal area is unoccupied.

2. Work should be halted if wind conditions occur which can or does cause removed glazing materials to be blown off the perimeter poly sheeting, or beyond the designated removal area perimeter.

3. No cutting, sanding, grinding, or removal by any other method which will result in the glazing being crumbled, crushed, or turned in to powder is to be used without review and approval by the Owner and the Owner's Representative.

General Glazing Removal Instructions and Requirements

1. Removal of non-friable, asbestos-containing, glazing materials, is designated as Class II work. Half-face, negative pressure respirators and disposable coveralls shall be used at a minimum by all workers, at all times, when within the regulated area.

2. All glazing materials shall be removed in an intact state to the extent feasible utilizing hand tools such as a hammer and chisel, or other implement or tool suitable for this type of work. At no time may power tools be used while following these removal requirements.

3. All glazing materials are to be pre-wet with an amended water solution or liquid encapsulant prior to removal, and as needed during removal.

4. All associated surfaces where removal of glazing has taken place shall be wet wiped and HEPA vacuumed prior to removal of the regulated area or any interior poly sheeting/critical barrier. Particular attention shall be directed at assuring all loose debris has been cleaned from the removal surfaces.

5. Upon completion of all activities worker shall clean exposed skin with hot soap and water, and check clothing for any glazing chips. Remove chips by hand or utilize a HEPA filter equipped vacuum.

Pre-Abatement Preparation Requirements

1. The worker may either seal the interior window surface with poly sheeting to create a critical barrier, or place one layer of 6 mill poly sheeting on the floor beneath the window incase a window pane is broken during removal. These critical barriers or floor coverings shall be installed prior to the initiation

of the removal work, and removed upon completion of the removal work as appropriate.

2. If the interior space must remain occupied a critical barrier must be installed on the interior surface of the window or opening where removal must occur. This may be waved and a layer of sheeting may be placed on the floor or adjacent surfaces if the interior space is going to remain unoccupied during the entire removal operation.

3. The perimeter of the work area where glazing removal is to be conducted, shall be posted with barrier tape at a distance of at least 20 feet from the edge of the removal area. This barrier tape will provide a buffer zone, and assist in the restriction of non-removal personnel.

4. Poly sheeting shall be placed on the ground directly below the work area or on adjacent surfaces for a distance sufficient to contain all debris which may be generated during the work. The poly sheeting should be secured to the ground using tape, weights, or other means to assure the poly will remain in place and not be picked up by wind or become a trip hazard.

Posting and Label Requirements for:

Regulated Area

Access to regulated areas shall be posted as outlined by Cal/OSHA Title 8, 1529 (k)(7)(B) 1 and 2 with warning signs and barrier tape bearing the following information:

DANGER ASBESTOS
CANCER AND LUNG DISEASE HAZARD
AUTHORIZED PERSONNEL ONLY
RESPIRATORS AND PROTECTIVE CLOTHING ARE
REQUIRED IN THIS AREA

These postings are required to warn non-abatement personnel of the restricted access, and potential hazard which exists in the vicinity of the regulated area.

If an NEA indicates no respirators are required to be worn to perform the work, be sure to remove the requirement for “respirators and protective clothing”.

Work Area Perimeter

Work area perimeters shall be posted with barrier tape bearing one of the following descriptions:

CAUTION in black letters on a solid yellow background.
DANGER in black letters on a solid red background.
DANGER ASBESTOS HAZARD in black letters on a solid red background.

Waste Material Containers

Waste material containers, shall have warning labels affixed in accordance with Cal/OSHA Title 8, 1529 (k)(8)(A-D).

DANGER
CONTAINS ASBESTOS FIBERS
MAY CAUSE CANCER

CAUSES DAMAGE TO LUNGS
DO NOT BREATHE DUST
AVOID CREATING DUST

Waste Disposal

1. Glazing waste may be disposed as non-hazardous asbestos waste, in a landfill permitted to accept non-friable, non-hazardous asbestos-containing material as long as the removal work was performed by hand utilizing hand tools, and the materials were not crushed, pulverized, or turned into powder during the removal process. If this does occur the waste must be reclassified as friable. If the asbestos-containing glazing material is currently friable, or becomes friable during its removal, it shall be disposed of in a landfill permitted to accept friable, hazardous, asbestos waste.

Part 23.13 - Subfloor Crawl Space Dirt Removal Requirements General Requirements

Direction to remove loose surface dirt from throughout a subfloor space contaminated with friable asbestos containing material (ACM) or dust from friable ACM shall be performed within a full enclosure. All loose dirt shall be removed to as required such as “hard pack”, as defined in other Sections of the Project Documents, or determined by the Owner’s Representative in a specific “Scope of Work” to be performed related to this work.

Any full enclosure/containment constructed for removing loose surface dirt, shall include critical barriers at all vents, openings, penetrations, voids, etc., a sufficient number of DOP challenge tested negative air units to attain a level of at least -0.03" of negative air pressure within the subfloor containment space and a minimum of four (4) air changes an hour, a manometer with digital readout capabilities, and at a minimum, a three-stage decontamination unit with an operational shower and water filtration system. The clean room of any three stage decontamination unit must be at least 5' in width, 8' in length, and 8' in height. “Pop up” 3' X 3' style prefabricated units will not be allowed for this work. The filtration system must have at least a 1.0 micron particle size collection capability prior to release of the water into the treated water system. Documentation of this capability shall be provided to Owner’s agent/site representative.

Except as amended here and in the “Section 24”, all other Sections of this exhibit shall be followed which apply to creation of containments specifically or asbestos related work practices. No removal of dirt suspected of being contaminated with friable ACM or dust from friable ACM shall be performed prior to the Contractor receiving approval from the Owner’s agent/site representative.

Contractor Responsibilities

1. Except as amended here and in Section 24, Asbestos Specification/Procedures, all other Sections of this Specification shall be followed.

2. The Contractor shall provide all necessary notifications, equipment, tools, materials, lighting, labor, etc. to perform the work. Notification as appropriate to OSHA, EPA, or the delegated Air Quality Management District is the responsibility of the Contractor.

3. All HEPA equipment to be used on the project must be delivered to the site empty of all debris, clean, free of dust, and in full operating condition. HEPA equipment to be used on the project must be DOP challenge tested at the site. This DOP challenge test and certification process must be verified by Owner’s agent/site representative prior to its use.

4. DOP certification testing shall be observed and witnessed by an Owner's agent/site representative. Copies of DOP test results and certification must be submitted to Owner's agent/site representative within 24 hours of the testing being performed.

5. All poly sheeting to be used for the construction of enclosures/containments must be fire retardant. SDS information reflecting this requirement must be submitted prior to use.

6. All personnel used by the Contractor to conduct removal or handling of asbestos-containing waste materials must possess a current accreditation certificate as a worker or contractor/supervisor as described in 40 CFR Part 763, Appendix C to subpart E, Asbestos Model Accreditation Plan.

7. The Contractor shall be responsible for all clean-up and costs associated with the decontamination of occupied spaces adjacent to any containment where removal of ACM or dirt contaminated with ACM is conducted. The Contractor shall also be responsible for damage to building finishes and costs associated with removal of tape glue, staining of wall finishes, or destruction of wall surface integrity. It is the responsibility of the Contractor to identify with the General Contractor all aspects of the project requirements pertaining to these types of damages.

Owner Responsibilities

1. The Owner shall provide the Contractor with access to the building during scheduled work hours through their representative. This representative is expected to be the General Contractor in charge of the site.

2. The Owner shall also provide the Contractor access to water and electrical hook-ups. However, the Contractor is responsible for all connections, electrical cords, GFCI's, water hoses, and hose bibs necessary for attachment. GFCI's are required to be used by the Contractor on all electrical circuits in use.

General Removal Instructions and Requirements

1. Prior to removal of loose dirt from the subfloor spaces all thermal system insulation TSI materials will be removed utilizing the procedures and work practices outlined in Section 23 of this Exhibit. Removal of loose dirt by any method shall be performed by personnel who are properly trained and accredited to perform Class I Work in public buildings, and are currently approved to conduct work on the project.

2. No personnel are allowed into the subfloor containment area for any reason before or during actual removal work without proper respiratory and personal protective equipment. At a minimum this shall include half-face negative pressure respirators, full body coveralls, rubber boots, and gloves prior to starting dirt removal work, and full face powered air purifying respirators after dirt removal work has begun. **No street clothes or shoes shall be worn under full body coveralls or inside containment once removal of dirt begins regardless of amount of time to be spent in containment**.

3. All openings, doors, hatches, voids, penetrations, etc. into the contained space shall be sealed with poly sheeting. All HVAC ducts which may be present shall be wrapped with one layer of poly sheeting to prevent any dust being pulled into the duct system while work is being performed. **No spray glue may be used on any exterior surface of a building.**

4. Removal of loose dirt over a surface area greater than 25 square feet will require the construction and use of a three stage decontamination unit. This decontamination unit must be directly attached to the entrance to the subfloor space and fully operable with working shower and hot water heater, as well as properly stocked with towels, soap, and shampoo. The clean room of any three stage decontamination unit must be at least 5' in width, 8' in length, and 8' in height. "Pop up" 3' X 3' style

prefabricated units will not be allowed for this work. The filtration system must have at least a 1.0 micron particle size collection capability prior to release of the water into the treated water system.

5. Sufficient negative air units shall be installed which will provide a minimum of 4 air changes per hour and -0.03" air pressure differential. A manometer with an accurate circular, or equivalent recording chart must be installed and operational. The manometer chart(s) shall reflect the location, times, and dates of all measurements recorded. Once these requirements have been met and the negative pressure has been established, the Contractor shall request a pre-start visual inspection from Owner's agent/site representative.

6. When the Contractor has passed the pre-start visual inspection, removal of loose surface dirt may be conducted.

7. Sufficiently wet materials to be removed with amended water prior to and during the removal phase of work, and place into waste containers for disposal.

8. Upon completing removal of all loose surface dirt, the Contractor shall conduct wet wiping of all remaining wall and subfloor ceiling components to remove settled dust from those surfaces.

Industrial Vacuums

It is expected industrial type vacuum systems will be used to perform removal of loose dirt in subfloor spaces. Use of such equipment will require construction of an enclosure around the unit which will at a minimum enclose the hopper and bagging hose. This enclosure will be placed under negative pressure and also monitored with a manometer with digital readout capabilities. Bagging of waste is expected to be in containers appropriate for the amount of work being performed. All waste containers regardless of size or type of construction must be properly labeled.

Final Visual Inspection

1. Upon completion of all activities listed above, the asbestos contractor shall provide their own visual inspection prior to Owner's agent/site representative, and shall be present during the inspection by Owner's agent/site representative to remove any additional dirt and/or clean additional surfaces as needed, prior to encapsulation.

2. The final visual inspection will include an evaluation of all surfaces within the containment area, with emphasis placed on the completeness of materials removed. The Contractor shall thoroughly clean all equipment inside the containment, including all parts of the negative air units exposed to the subfloor. New pre-filters shall be installed into all negative air units.

Final Lockdown-Encapsulation

1. The asbestos contractor shall encapsulate the entire containment area upon completion of the final visual inspection by the Owner's agent/site representative, and acceptance of the work as complete. Lock down of the subfloor will be performed using an acceptable bridging encapsulant. To assure complete coverage of the subfloor interior surfaces to include all ceiling, wall and dirt floors will require the contractor add a color to the encapsulant which will be visibly different in color than the colors generally found within a subfloor space. This color will be used to assure prior to conducting clearance air monitoring within the subfloor that all surfaces have been locked down and no loose dust on building surfaces remain.

Clearance Criteria

1. All clearance air samples will be analyzed by transmission electron microscopy (TEM), and performed by a NIST/NVLAP accredited laboratory. The clearance criteria for releasing the Contractor is the

AHERA Standard, with the average of all air samples less than 70 asbestos structures per square millimeter. Aggressive air sampling will be used, which includes using a leaf blower in conjunction with fans to dislodge any remaining dust within the subfloor containment. Leaf blower and fans will not be directed at remaining dirt surfaces but toward building components.

Disposal Requirements

1. All dirt waste shall be disposed as hazardous asbestos waste, in a landfill permitted to accept friable, hazardous ACM.

2. All waste containers shall have stick-on labels as per OSHA and Cal/EPA requirements. All waste containers shall be labeled in accordance with Cal/EPA regulations that require a "Caution" label and a "Hazardous Waste" label with the generator's name, address, and Manifest Document number.

3. If bulk loading of waste into “burrito wrap” style bags is to be performed contractor is responsible for assuring the waste facility is aware of this type of bagging and will accept the waste upon its arrival. Bulk loading of dirt waste into large “burrito wrap” style containers will result in heavy stresses upon the poly sheeting. Contractor must submit written directions indicating the requirements to be used to create such waste containers. Contractor may not use these container bags until approved by Owner’s Representative.

Part 23.14 - Subfloor Enclosure Requirements

Creation of enclosures within a contaminated subfloor space will be necessary in anticipation of other trades performing work in specific areas, which will not require impact to the dirt floor of the space. These other trades will need to have access to these enclosures without the need for respirators, full body coveralls, gloves, and asbestos related training. As a result the enclosure must be sturdy and remain in place until all other trade work has been completed.

It is expected the subfloor enclosure will be accessed from within the building. Contractor will construct the enclosure by also accessing the space to be enclosed from within the building. As a result, the contractor shall be required to construct a two-stage decontamination unit in place over any subfloor access hatch. This decontamination unit will be used to protect the building’s interior spaces from being contaminated by dust from the subfloor space. Contractor shall also provide a DOP challenge tested, HEPA equipped, pressure differential unit to provide negative airflow into the decontamination unit. The unit shall be attached to the decontamination unit opposite the entrance to assure air is pulled into the decontamination unit. All exhaust from this unit shall be exhausted to the building’s exterior. The unit shall remain on continuously until final air clearance has been achieved.

General Removal Instructions and Requirements

1. Enclosure walls and floors must be constructed of at least one layer of fire-rated, 10 mil re-enforced poly sheeting. This poly sheeting shall cover the dirt floor surface and extend from the floor surface to the underside of the subfloor ceiling.

2. Enclosure walls shall be installed at a minimum of 5' beyond the edge of any work to be performed to allow for adequate workspace by other trades.

3. Poly sheeting shall be secured to the underside of the subfloor ceiling in a manner sufficient to provide maximum strength to reduce possible breaching of the wall systems while regular work is being performed. Contractor may use any appropriate method deemed necessary to accomplish this goal to include fasteners, staples, fur strips, tape, etc. Tape alone will not be acceptable to accomplish this goal.

4. Poly sheeting shall be secured at corners and along walls at floor level in a manner to keep the containment from being pulled in or collapsing into the work space being provided. Contractor shall fasten the walls and floor of the enclosure at sufficient points to prevent this from occurring.

5. Poly sheeting shall be sealed at all points necessary to make the barrier system air tight regarding the walls and floor to keep the containment from becoming contaminated from air within the remaining subfloor space.

6. Upon completing construction of the enclosure the contractor shall wet wipe and clean all enclosed surfaces to include poly walls, poly floors, ceiling components, and any other surfaces which may remain within the enclosure system. If any thermal system insulation is located within, the enclosure contractor must repair any damages, clean all surfaces, and apply appropriate labels to the material to assure it is properly identified as asbestos. If the materials are to be removed, they shall be removed by glove bag technique only.

7. Upon completion of wet cleaning of the enclosure interior the Owner's Representative shall perform a final visual inspection for completeness of cleaning.

8. Upon acceptance of the containment as clean, the contractor shall encapsulate the enclosure interior surfaces with an acceptable encapsulant.

9. Owner's representative shall perform final clearance air monitoring upon completion of all tasks related to the construction of the enclosure and prior to allowing other trades access to the enclosure. All clearance air samples will be analyzed by transmission electron microscopy (TEM), and performed by a NIST/NVLAP accredited laboratory. The clearance criteria for releasing the Contractor is the AHERA Standard, with the average of all air samples less than 70 asbestos structures per square millimeter. Aggressive air sampling will be used, which includes using a leaf blower in conjunction with fans to dislodge any remaining dust within the subfloor containment. Leaf blower and fans will not be directed at remaining dirt surfaces but toward building components.

Part 23.15 - Subfloor Space Pony Wall Installation, Dirt Removal Requirements General Requirements

Direction to remove loose surface dirt from throughout a subfloor space contaminated with friable asbestos containing material (ACM) or dust from friable ACM shall be performed within a full enclosure. All loose dirt shall be removed to as required such as "hard pack", as defined in other Sections of the Project Documents, or determined by the Owner's Representative in a specific "Scope of Work" to be performed related to this work.

Any full enclosure/containment constructed for removing loose surface dirt, shall include critical barriers at all vents, openings, penetrations, voids, etc., a sufficient number of DOP challenge tested negative air units to attain a level of at least -0.025" of negative air pressure within the subfloor containment space and a minimum of four (4) air changes an hour, a manometer with digital readout capabilities, and at a minimum, a three-stage decontamination unit with an operational shower and water filtration system. The clean room of any three stage decontamination unit must be at least 5' in width, 8' in length, and 8' in height. "Pop up" 3' X 3' style prefabricated units will not be allowed for this work. The filtration system must have at least a 1.0 micron particle size collection capability prior to release of the water into the treated water system. Documentation of this capability shall be provided to Owner's agent/site representative.

Except as amended here and in the "Section 24", all other Sections of this exhibit shall be followed which apply to creation of containments specifically or asbestos related work practices. No removal of dirt suspected of being contaminated with friable ACM or dust from friable ACM shall be performed prior to the Contractor receiving approval from the Owner's agent/site representative.

Altadena Library

Contractor Responsibilities

1. Except as amended here and in Section 24, Asbestos Specification/Procedures, all other Sections of this Specification shall be followed.

2. The Contractor shall provide all necessary notifications, equipment, tools, materials, lighting, labor, etc. to perform the work. Notification as appropriate to OSHA, EPA, or the delegated Air Quality Management District is the responsibility of the Contractor.

3. All HEPA equipment to be used on the project must be delivered to the site empty of all debris, clean, free of dust, and in full operating condition. HEPA equipment to be used on the project must be DOP challenge tested at the site. This DOP challenge test and certification process must be verified by Owner's agent/site representative prior to its use.

4. DOP certification testing shall be observed and witnessed by an Owner's agent/site representative. Copies of DOP test results and certification must be submitted to Owner's agent/site representative within 24 hours of the testing being performed.

5. All poly sheeting to be used for the construction of pony walls to create enclosures/containments must be 10 mils thick, re-enforced, and fire retardant. SDS information reflecting this requirement must be submitted prior to use.

6. All personnel used by the Contractor to conduct removal or handling of asbestos-containing waste materials must possess a current accreditation certificate as a worker or contractor/supervisor as described in 40 CFR Part 763, Appendix C to subpart E, Asbestos Model Accreditation Plan.

7. The Contractor shall be responsible for all clean-up and costs associated with the decontamination of occupied spaces adjacent to any containment where removal of ACM or dirt contaminated with ACM is conducted. The Contractor shall also be responsible for damage to building finishes and costs associated with removal of tape glue, staining of wall finishes, or destruction of wall surface integrity. It is the responsibility of the Contractor to identify with the General Contractor all aspects of the project requirements pertaining to these types of damages.

Owner Responsibilities

1. The Owner shall provide the Contractor with access to the building during scheduled work hours through their representative. This representative is expected to be the General Contractor in charge of the site.

2. The Owner shall also provide the Contractor access to water and electrical hook-ups if available. However, the Contractor is responsible for all connections, electrical cords, GFCI's, water hoses, and hose bibs necessary for attachment. GFCI's are required to be used by the Contractor on all electrical circuits in use.

General Removal Instructions and Requirements

1. Prior to removal of loose dirt from the subfloor spaces all thermal system insulation TSI materials will be removed utilizing the procedures and work practices outlined in Section 23 of this Exhibit. Removal of loose dirt by any method shall be performed by personnel who are properly trained and accredited to perform Class I Work in public buildings, and are currently approved to conduct work on the project.

2. No personnel are allowed into the subfloor containment area for any reason before or during actual removal work without proper respiratory and personal protective equipment. At a minimum this shall include half-face negative pressure respirators, full body coveralls, rubber boots, and gloves prior to

starting dirt removal work, and full face powered air purifying respirators after dirt removal work has begun. **No street clothes or shoes shall be worn under full body coveralls or inside containment once removal of dirt begins regardless of amount of time to be spent in containment**.

3. All openings, doors, hatches, voids, penetrations, etc. into the contained space shall be sealed with poly sheeting. All HVAC ducts, which may be present, shall be wrapped with one layer of poly sheeting to prevent any dust being pulled into the duct system while work is being performed. **No spray glue may be used on any exterior surface of a building.**

4. Removal of loose dirt over a surface area greater than 25 square feet will require the construction and use of a three-stage decontamination unit. This decontamination unit must be directly attached to the entrance to the subfloor space and fully operable with working shower and hot water heater, as well as properly stocked with towels, soap, and shampoo. The clean room of any three-stage decontamination unit must be at least 5' in width, 8' in length, and 8' in height. "Pop up" 3' X 3' style prefabricated units will not be allowed for this work. The filtration system must have at least a 1.0-micron particle size collection capability prior to release of the water into the treated water system.

   When less than 25 square feet of surface area and less than 25 linear feet of thermal system insulation is to be removed, refer to "Subfloor Enclosure Requirements".

5. Sufficient negative air units shall be installed which will provide a minimum of 4 air changes per hour and -0.03" air pressure differential. A manometer with an accurate circular or equivalent recording chart must be installed and operational. The manometer chart(s) shall reflect the location, times, and dates of all measurements recorded. Once these requirements have been met and the negative pressure has been established, the Contractor shall request a pre-start visual inspection from Owner's agent/site representative.

6. When the Contractor has passed the pre-start visual inspection, removal of loose surface dirt may be conducted.

7. Sufficiently wet materials to be removed with amended water prior to and during the removal phase of work, and place into waste containers for disposal.

8. Upon completing removal of all loose surface dirt, the Contractor shall conduct wet wiping of all remaining wall and subfloor ceiling components to remove settled dust from those surfaces.

Industrial Vacuums

It is expected industrial type vacuum systems will be used to perform removal of loose dirt in subfloor spaces. Use of such equipment will require construction of an enclosure around the unit, which will at a minimum enclose the hopper and bagging hose. This enclosure will be placed under negative pressure and also monitored with a manometer with digital readout capabilities. Bagging of waste is expected to be in containers appropriate for the amount of work being performed. All waste containers regardless of size or type of construction must be properly labeled.

Final Visual Inspection

1. Upon completion of all activities listed above, the asbestos contractor shall provide their own visual inspection prior to Owner's agent/site representative, and shall be present during the inspection by Owner's agent/site representative to remove any additional dirt and/or clean additional surfaces as needed, prior to encapsulation.

2. The final visual inspection will include an evaluation of all surfaces within the containment area, with emphasis placed on the completeness of materials removed. The Contractor shall thoroughly clean

all equipment inside the containment, including all parts of the negative air units exposed to the subfloor. New pre-filters shall be installed into all negative air units.

Final Lockdown-Encapsulation

1. The asbestos contractor shall encapsulate the entire containment area upon completion of the final visual inspection by the Owner's agent/site representative, and acceptance of the work as complete. Lock down of the subfloor will be performed using an acceptable bridging encapsulant. To assure complete coverage of the subfloor interior surfaces to include all ceiling, wall and dirt floors will require the contractor add a color to the encapsulant, which will be visibly different in color than the colors generally found within a subfloor space. This color will be used to assure prior to conducting clearance air monitoring within the subfloor that all surfaces have been locked down and no loose dust on building surfaces remain.

Clearance Criteria

1. All clearance air samples will be analyzed by transmission electron microscopy (TEM), and performed by a NIST/NVLAP accredited laboratory. The clearance criteria for releasing the Contractor is the AHERA Standard, with the average of all air samples less than 70 asbestos structures per square millimeter. Aggressive air sampling will be used, which includes using a leaf blower in conjunction with fans to dislodge any remaining dust within the subfloor containment. Leaf blower and fans will not be directed at remaining dirt surfaces but toward building components.

Disposal Requirements

1. All dirt waste shall be disposed as hazardous asbestos waste, in a landfill permitted to accept friable, hazardous ACM.

2. All waste containers shall have stick-on labels as per OSHA and Cal/EPA requirements. All waste containers shall be labeled in accordance with Cal/EPA regulations that require a "Caution" label and a "Hazardous Waste" label with the generator's name, address, and Manifest Document number.

3. If bulk loading of waste into "burrito wrap" style bags is to be performed contractor is responsible for assuring the waste facility is aware of this type of bagging and will accept the waste upon its arrival. Bulk loading of dirt waste into large "burrito wrap" style containers will result in heavy stresses upon the poly sheeting. Contractor must submit written directions indicating the requirements to be used to create such waste containers. Contractor may not use these container bags until approved by Owner's Representative.

Part 23.16 - Installation of "Rat Slab" in Sublfoor Crawl Space Requirements General Requirements

No direction relating to actual installation of "Rat Slab" materials is included here. This information is related to additional requirements for the work to be performed within a subfloor space known or assumed to be contaminated with asbestos.

Prior to installation of "Rat Slab" materials within a subfloor contaminated with asbestos the subfloor must be properly sealed and placed under negative pressure. Removal of all remaining thermal system insulation (TSI) or other friable asbestos containing material (ACM) must be performed prior to the installation of the "Rat Slab" materials.

Any full enclosure/containment constructed for the purpose of installing a "Rat Slab" will require installation of critical barriers at all vents, openings, penetrations, voids, etc., a sufficient number of DOP challenge tested negative air units to attain a level of at least -0.03" of negative air pressure within the subfloor containment

space and a minimum of four (4) air changes an hour, a manometer with digital readout capabilities, and at a minimum, a three-stage decontamination unit with an operational shower and water filtration system. The clean room of any three stage decontamination unit must be at least 5' in width, 8' in length, and 8' in height. “Pop up” 3' X 3' style prefabricated units will not be allowed for this work. The filtration system must have at least a 1.0 micron particle size collection capability prior to release of the water into the treated water system. Documentation of this capability shall be provided to Owner’s agent/site representative.

Except as amended here and in the “Section 24”, all other Sections of this exhibit shall be followed which apply to creation of containments specifically or asbestos related work practices. No removal of TSI, visible TSI debris or associated dirt suspected of being contaminated with friable ACM or dust from friable ACM shall be performed prior to the Contractor receiving approval from the Owner’s agent/site representative.

Contractor Responsibilities

1. Except as amended here and in Section 24, Asbestos Specification/Procedures, all other Sections of this Specification shall be followed.

2. The Contractor shall provide all necessary notifications, equipment, tools, materials, lighting, labor, etc. to perform the work. Notification as appropriate to OSHA, EPA, or the delegated Air Quality Management District is the responsibility of the Contractor.

3. All HEPA equipment to be used on the project must be delivered to the site empty of all debris, clean, free of dust, and in full operating condition. HEPA equipment to be used on the project must be DOP challenge tested at the site. This DOP challenge test and certification process must be verified by Owner’s agent/site representative prior to its use.

4. DOP certification testing shall be observed and witnessed by an Owner’s agent/site representative. Copies of DOP test results and certification must be submitted to Owner’s agent/site representative within 24 hours of the testing being performed.

5. All poly sheeting to be used for the construction of pony walls to create enclosures/containments must be 10 mils thick, re-enforced, and fire retardant. SDS information reflecting this requirement must be submitted prior to use.

6. All personnel used by the Contractor to conduct removal or handling of asbestos-containing waste materials must possess a current accreditation certificate as a worker or contractor/supervisor as described in 40 CFR Part 763, Appendix C to subpart E, Asbestos Model Accreditation Plan.

7. The Contractor shall be responsible for all clean-up and costs associated with the decontamination of occupied spaces adjacent to any containment where removal of ACM or dirt contaminated with ACM is conducted. The Contractor shall also be responsible for damage to building finishes and costs associated with removal of tape glue, staining of wall finishes, or destruction of wall surface integrity. It is the responsibility of the Contractor to identify with the General Contractor all aspects of the project requirements pertaining to these types of damages.

Owner Responsibilities

1. The Owner shall provide the Contractor with access to the building during scheduled work hours through their representative. This representative is expected to be the General Contractor in charge of the site.

2. The Owner shall also provide the Contractor access to water and electrical hook-ups. However, the Contractor is responsible for all connections, electrical cords, GFCI’s, water hoses, and hose bibs necessary for attachment. GFCI’s are required to be used by the Contractor on all electrical circuits in use.

Altadena Library

General Removal Instructions and Requirements

1. All TSI materials will be removed utilizing the procedures and work practices outlined in Section 23 of this Exhibit. Removal of TSI or loose dirt contaminated with TSI debris by any method shall be performed by personnel who are properly trained and accredited to perform Class I Work in public buildings, and are currently approved to conduct work on the project.

2. No personnel are allowed into the subfloor containment area for any reason before or during actual removal work without proper respiratory and personal protective equipment. At a minimum this shall include half-face negative pressure respirators, full body coveralls, rubber boots, and gloves prior to starting dirt removal work, and full face powered air purifying respirators after dirt removal work has begun. **No street clothes or shoes shall be worn under full body coveralls or inside containment once removal of dirt begins regardless of amount of time to be spent in containment**.

3. All openings, doors, hatches, voids, penetrations, etc. into the contained space shall be sealed with poly sheeting. All HVAC ducts which may be present shall be wrapped with one layer of poly sheeting to prevent any dust being pulled into the duct system while work is being performed. **No spray glue may be used on any exterior surface of a building.**

4. Removal of TSI in excess of 25 linear feet or TSI contaminated loose dirt over a surface area greater than 25 square feet will require the construction and use of a three-stage decontamination unit. This decontamination unit must be directly attached to the entrance to the subfloor space and fully operable with working shower and hot water heater, as well as properly stocked with towels, soap, and shampoo. The clean room of any three-stage decontamination unit must be at least 5' in width, 8' in length, and 8' in height. "Pop up" 3' X 3' style prefabricated units will not be allowed for this work. The filtration system must have at least a 1.0 micron particle size collection capability prior to release of the water into the treated water system.

   When less than 25 square feet of surface area and less than 25 linear feet of thermal system insulation is to be removed, refer to "Subfloor Enclosure Requirements".

5. Sufficient negative air units shall be installed which will provide a minimum of 4 air changes per hour and -0.03" air pressure differential. A manometer with an accurate circular or equivalent recording chart must be installed and operational. The manometer chart(s) shall reflect the location, times, and dates of all measurements recorded. Once these requirements have been met and the negative pressure has been established, the Contractor shall request a pre-start visual inspection from Owner's agent/site representative.

6. When the Contractor has passed the pre-start visual inspection, removal of TSI and TSI contaminated loose surface dirt may be conducted.

7. Sufficiently wet materials to be removed with amended water prior to and during the removal phase of work, and place into waste containers for disposal.

8. Upon completing removal of all TSI and TSI contaminated loose surface dirt the Owner's Representative will conduct a final visual inspection to verify this task has been satisfactorily completed.

Industrial Vacuums

If industrial type vacuum systems will be used to perform removal of loose dirt in subfloor spaces use of such equipment will require construction of an enclosure around the unit, which will at a minimum enclose the hopper and bagging hose. This enclosure will be placed under negative pressure and also monitored with

a manometer with digital readout capabilities. Bagging of waste is expected to be in containers appropriate for the amount of work being performed. All waste containers regardless of size or type of construction must be properly labeled.

"Rat Slab" Installation

The following items shall be required during "Rat Slab" installation activities:

1. Contractor will maintain 0.03" of negative pressure at all times during installation of "Rat Slab" materials.

2. Three stage decontamination unit with functional shower and all other requirements shall remain in place and be used by all personnel who must enter the subfloor space during installation of "Rat Slab" materials.

3. All personnel shall wear at a minimum half-face negative pressure respirators while inside the subfloor containment space.

4. All personnel shall at a minimum have Hazard Communication" training relating to asbestos as required by OSHA and in compliance with all OSHA requirements.

5. All personnel shall wear full body coveralls, appropriate work boots and appropriate work gloves while inside the subfloor containment space.

6. All personnel shall enter and egress through the three stage decontamination unit and take a full body shower prior to exiting the containment area.

7. All tools shall be properly cleaned of visible dust and dirt prior to removal from the subfloor containment space.

8. Upon completion of "Rat Slab" installation, contractor shall complete final cleaning of all visible dust from underside of ceiling and other surfaces within the subfloor containment.

Final Visual Inspection

1. Upon completion of all activities listed above, the asbestos contractor shall provide their own visual inspection prior to Owner's agent/site representative, and shall be present during the inspection by Owner's agent/site representative to remove any additional dirt and/or clean additional surfaces as needed, prior to encapsulation.

2. The final visual inspection will include an evaluation of all surfaces within the containment area, with emphasis placed on the completeness of materials removed. The Contractor shall thoroughly clean all equipment inside the containment, including all parts of the negative air units exposed to the subfloor. New pre-filters shall be installed into all negative air units.

Final Lockdown-Encapsulation

1. The asbestos contractor shall encapsulate the entire containment area upon completion of the final visual inspection by the Owner's agent/site representative, and acceptance of the work as complete. Lock down of the subfloor will be performed using an acceptable encapsulant. To assure complete coverage of the subfloor interior surfaces to include all ceiling, wall and "Rat Slab" surfaces will require the contractor add a color to the encapsulant which will be visibly different in color than the colors generally found within a subfloor space and the "Rat Slab". This color will be used to assure prior to conducting clearance air monitoring within the subfloor that all surfaces have been locked down and no loose dust on building surfaces remain.

Altadena Library

Clearance Criteria

1. All clearance air samples will be analyzed by transmission electron microscopy (TEM), and performed by a NIST/NVLAP accredited laboratory. The clearance criteria for releasing the Contractor is the AHERA Standard, with the average of all air samples less than 70 asbestos structures per square millimeter. Aggressive air sampling will be used, which includes using a leaf blower in conjunction with fans to dislodge any remaining dust within the subfloor containment. Leaf blower and fans will not be directed at remaining dirt surfaces but toward building components.

Disposal Requirements

1. All dirt waste shall be disposed as hazardous asbestos waste, in a landfill permitted to accept friable, hazardous ACM.

2. All waste containers shall have stick-on labels as per OSHA and Cal/EPA requirements. All waste containers shall be labeled in accordance with Cal/EPA regulations that require a "Caution" label and a "Hazardous Waste" label with the generator's name, address, and Manifest Document number.

3. If bulk loading of waste into “burrito wrap” style bags is to be performed contractor is responsible for assuring the waste facility is aware of this type of bagging and will accept the waste upon its arrival. Bulk loading of dirt waste into large “burrito wrap” style containers will result in heavy stresses upon the poly sheeting. Contractor must submit written directions indicating the requirements to be used to create such waste containers. Contractor may not use these container bags until approved by Owner’s Representative.

Part 23.17 - Stucco/Texture Removal and Containment Requirements General Requirements

Direction to remove major areas of stucco/texture surfacing materials regardless of asbestos content from exterior building components either by hand or by forced air methods shall be performed within a full enclosure. Extent of removal concerning stucco/texture surfacing materials is not included in this Part. That information shall be provided by others in appropriate project documents.

Any full enclosure/containment constructed for removing stucco/texture surfacing materials either by hand or by forced air methods shall include critical barriers at all vents, openings, penetrations, voids, etc. into the building, a sufficient number of DOP challenge tested negative air units to attain a level of at least -0.03" of negative air pressure within the containment space and a minimum of four (4) air changes an hour, a manometer with digital readout capabilities, and at a minimum, a three-stage decontamination unit with an operational shower and water filtration system. The clean room of any three stage decontamination unit must be at least 5' in width, 8' in length, and 8' in height. “Pop up” 3' X 3' style prefabricated units will not be allowed for this work. The filtration system must have at least a 1.0 micron particle size collection capability prior to release of the water into the treated water system. Documentation of this capability shall be provided to Owner’s agent/site representative.

Except as amended here and in the “Section 24”, all other Sections of this Exhibit shall be followed which apply to creation of containments specifically for asbestos related work practices. No removal of stucco/ texture surfacing materials shall be performed prior to the Contractor receiving approval from the Owner’s agent/site representative.

Contractor Responsibilities

1. Except as amended here and in Section 24, Asbestos Specification/Procedures, all other Sections of this Exhibit shall be followed.

2. The Contractor shall provide all necessary notifications, equipment, tools, materials, lighting, labor, etc. to perform the work. Notification as appropriate to OSHA, EPA, or the delegated Air Quality Management District is the responsibility of the Contractor.

3. All HEPA equipment to be used on the project must be delivered to the site empty of all debris, clean, free of dust, and in full operating condition. HEPA equipment to be used on the project must be DOP challenge tested at the site. This DOP challenge test and certification process must be verified by Owner's agent/site representative prior to its use.

4. DOP certification testing shall be observed and witnessed by an Owner's agent/site representative. Copies of DOP test results and certification must be submitted to Owner's agent/site representative within 24 hours of the testing being performed.

5. All poly sheeting to be used for the construction of enclosures/containments must be fire retardant. SDS information reflecting this requirement must be submitted prior to use.

6. All personnel used by the Contractor to conduct removal or handling of asbestos-containing waste materials must possess a current accreditation certificate as a worker or contractor/supervisor as described in 40 CFR Part 763, Appendix C to subpart E, Asbestos Model Accreditation Plan.

7. The Contractor shall be responsible for all clean-up and costs associated with the decontamination of occupied spaces adjacent to any containment where removal of asbestos containing stucco/texture is conducted. The Contractor shall also be responsible for damage to building finishes and costs associated with removal of tape glue, staining of wall finishes, or destruction of wall surface integrity. It is the responsibility of the Contractor to identify with the General Contractor all aspects of the project requirements pertaining to these types of damages.

Owner Responsibilities

1. The Owner shall provide the Contractor with access to the building during scheduled work hours through their representative. This representative is expected to be the General Contractor in charge of the site.

2. The Owner shall also provide the Contractor access to water and electrical hook-ups if available. However, the Contractor is responsible for all connections, electrical cords, GFCI's, water hoses, and hose bibs necessary for attachment. GFCI's are required to be used by the Contractor on all electrical circuits in use.

General Removal Instructions and Requirements

1. Removal of stucco/texture by any method and regardless of asbestos content shall be performed by personnel who are properly trained and accredited to perform Class I Work in public buildings, and are currently approved to conduct work on the project.

2. No personnel are allowed into the containment area for any reason during actual removal work without proper respiratory and personal protective equipment. At a minimum this shall include half-face negative pressure respirator if only hand scrapping is being performed. At a minimum this shall include full-face PAPR if air blasting methods are being employed. Regardless of the method used, full body coveralls, rubber boots, and gloves shall always be required while inside the containment. **No street clothes or shoes shall be worn by workers under full body coveralls or inside containment once removal has begun**.

3. All openings, doors, hatches, voids, penetrations, etc. which may lead into the building shall be sealed with poly sheeting. **No spray glue may be used on any exterior surface of a building.**

4. Removal of stucco/texture regardless of asbestos content over a surface area greater than 25 square feet will require the construction and use of a three stage decontamination unit. This decontamination unit must be directly attached to the entrance of the containment and fully operable with working shower and hot water heater, as well as properly stocked with towels, soap, and shampoo. The clean room of any three stage decontamination unit must be at least 5' in width, 8' in length, and 8' in height. "Pop up" 3' X 3' style prefabricated units will not be allowed for this work. The filtration system must have at least a 1.0 micron particle size collection capability prior to release of the water into the treated water system.

5. Sufficient negative air units shall be installed which will provide a minimum of 4 air changes per hour and -0.03" air pressure differential. A manometer with digital readout capability must be installed and operational. Once these requirements have been met and the negative pressure has been established, the Contractor shall request a pre-start visual inspection from Owner's agent/site representative.

6. When the Contractor has passed the pre-start visual inspection, removal of stucco/texture may be conducted.

7. Sufficiently wet materials to be removed with amended water prior to and during the removal phase of work, and place into waste containers for disposal.

8. Upon completing removal of all stucco/texture, the Contractor shall conduct wet wiping of all remaining wall surfaces, poly barriers, scaffolding, etc. to remove settled dust from those surfaces.

Final Visual Inspection

1. Upon completion of all activities listed above, the asbestos contractor shall provide their own visual inspection prior to Owner's agent/site representative, and shall be present during the inspection by Owner's agent/site representative to remove any additional dirt and/or clean additional surfaces as needed, prior to encapsulation.

2. The final visual inspection will include an evaluation of all surfaces within the containment area, with emphasis placed on the completeness of materials removed. The Contractor shall thoroughly clean all equipment inside the containment, including all parts of the negative air units exposed to the work performed. New pre-filters shall be installed into all negative air units.

Final Lockdown-Encapsulation

1. Lock down-encapsulation of the containment shall be performed using one of two methods based on the needs of the project.

   A. **Hand Wipe Method:** The needs of the project may require the remaining building component surfaces have no new film materials applied to them. If this is required the asbestos abatement contractor shall use clean wet cloths/towels to wipe existing surface dust off of remaining building components. These cloths/towels will be wetted with clean water and no chemicals or treatments will be added. All poly sheeting scaffolding and other components used to create the containment will be hand wiped with wetted cloths/towels which are treated with lock down-encapsulation chemicals to remove possible surface dust and lock down-encapsulate the surfaces of these items. This method can be used prior to the final visual to complete the final cleaning process.

   B. **Aerial Dispersal Method**: The asbestos contractor shall lock down-encapsulate the entire containment area upon completion of the final visual inspection by the Owner's agent/site representative, and acceptance of the work as complete.

Altadena Library

Clearance Criteria (If Required)

1. All clearance air samples will be analyzed by transmission electron microscopy (TEM), and performed by a NIST/NVLAP accredited laboratory. The clearance criteria for releasing the Contractor is the AHERA Standard, with the average of all air samples less than 70 asbestos structures per square millimeter. Aggressive air sampling will be used, which includes using a leaf blower in conjunction with fans to dislodge any remaining dust within the containment.

Disposal Requirements

1. All waste containing less than 1% asbestos shall be properly disposed as a non-hazardous asbestos containing waste at an appropriate landfill. All waste containing greater than 1% asbestos shall be properly disposed as hazardous asbestos waste, in a landfill permitted to accept friable, hazardous ACM.

2. All waste containers shall have labeling in accordance with OSHA, DOT, EPA and DTSC requirements. All "Hazardous Waste" shall also include a Waste manifest with the generator's name, address, and Manifest Document number.

3. If bulk loading of waste into “burrito wrap” style bags is to be performed contractor is responsible for assuring the waste facility is aware of this type of bagging and will accept the waste upon its arrival. Bulk loading of waste into large “burrito wrap” style containers will result in heavy stresses upon the poly sheeting. Contractor must submit written directions indicating the requirements to be used to create such waste containers. Contractor may not use these container bags until approved by Owner’s Representative.

Part 23.18 - Fireproofing Abatement Requirements General Requirements

All fireproofing material regardless of amount shall be removed in a negative pressure enclosure/containment. The enclosure shall include critical barriers, two layers of plastic on walls if the walls are not being removed, a sufficient number of DOP tested negative air units to attain a level of at least -0.030" of negative air pressure within the containment, a digital recording manometer with a minimum of displaying three digits after the zero (0.000). At a minimum, a three-stage decontamination unit with an operational shower and water filtration system. The clean room of any three stage decontamination unit must be at least 5' in width, 8' in length, and 7' in height. The water filtration system must have at least a 1.0 micron particle size collection capability. Documentation of this capability shall be provided to Owner’s agent/site representative.

When possible, the Contractor shall enclose multiple rooms within a building into a single containment. Where rooms are joined by a common interior hallway or have a common exterior walkway, multiple spaces shall be joined together creating one containment using poly enclosures. The common work chamber shall be constructed of metal or wood studs and plywood sheeting for security purposes if outside of a building. Decontamination units and joined “common areas” outside of a building shall have lockable doors or gates created with temporary fencing for security during off-hours.

Contractor Responsibilities

1. Except as amended here and in Section 24, Asbestos Specification/Procedures, all other Sections of this Specification shall be followed.

2. The Contractor shall provide all necessary notifications, equipment, tools, materials, lighting, labor, etc. to perform the work. Notification as appropriate to OSHA, EPA, or the delegated Air Quality Management District is the responsibility of the Contractor.

3. All HEPA equipment to be used on the project must be delivered to the site empty of all debris, clean, free of dust, and in full operating condition.

4. DOP certification testing shall be observed and witnessed by the Owner's asbestos consultant. Copies of DOP test results and certification shall be submitted to Owner's agent/site representative within 24 hours of the testing being performed.

5. All poly sheeting to be used for the construction of enclosures/containments shall be fire rated. SDS information reflecting this requirement shall be submitted prior to use.

6. All personnel used by the Contractor to conduct removal or handling of asbestos-containing waste materials shall possess a current accreditation certificate as a worker or contractor/supervisor as described in 40 CFR Part 763, Appendix C to subpart E, Asbestos Model Accreditation Plan.

7. The Contractor shall be responsible for all clean-up and costs associated with the decontamination of occupied spaces adjacent to any containment where removal of asbestos-containing material is conducted. The Contractor will be responsible for damage to building finishes and costs associated with removal of tape glue, staining of wall finishes, or destruction of wall surface integrity.

Owner Responsibilities

1. The Owner shall provide the Contractor with access to the building during scheduled work hours through their representative. This representative is expected to be the General Contractor in charge of the site. The Owner shall also be responsible for arming and disarming alarm systems on buildings where work will be performed.

2. The Owner shall also provide the Contractor access to water and electrical hook-ups if available. However, the Contractor is responsible for all connections, electrical cords, GFCI's, water hoses, and hose bibs necessary for attachment. GFCI's are required to be used by the Contractor on all electrical circuits in use.

General Requirements

1. Removal of fireproofing by multiple methods and techniques shall be performed by personnel who are trained and accredited to perform Class I work in public buildings, and are currently approved to conduct work on the project.

2. Water blasting of fireproofing is not allowed on this project.

3. No personnel are allowed into the containment area during actual removal work without proper respiratory and personal protective equipment. At a minimum this shall include half-face negative pressure respirators, full body coveralls, rubber boots, and gloves.

4. All doors, windows, and penetrations into the room(s) shall be sealed with poly sheeting. All ventilation systems shall be locked-out and sealed with critical barriers of either poly sheeting or plywood sheeting.

5. Full enclosure of the walls and ceiling with poly sheeting (as applicable) will be required, no matter what method of removal is used. Support of ceiling poly will be at the discretion of the Contractor. Ceiling may be constructed of one layer of 4 mil poly sheeting. Walls shall be constructed of two layers of 4 mil poly.

6. A three-stage decontamination unit is required and shall be comprised of zippered doors between the chambers. Flapped doors will not be acceptable. The decontamination unit shall be cleaned daily of all debris, bags, tape, towels, etc. and shall remain clean during the day. The clean room of any three

stage decontamination unit shall be at least 5' in width, 8' in length, and 7' in height. Multiple showers are required if the number of asbestos workers exceeds ten per Title 8 3366 Washing Facilities. When there are less than five employees, the same shower may be used by both sexes if the shower room can be locked from the inside.

7. Since all asbestos workers will be required to shower upon leaving the work area, all workers shall wear a bathing suit under the full body coverall. The shower shall have hot and cold water, shampoo, soap and clean dry towels for drying. **No street clothes or shoes shall be worn inside containment by the asbestos contractor employees during the removal process**. The contractor cannot wear leatherwork boots in the shower, so steel toed rubber boots are required to be worn. Rubber boots shall be left in the equipment room before entering the shower and they can be washed at the end of the work day and placed inside of asbestos waste bag, taped closed and removed.

8. Sufficient negative air units shall be installed which will provide a minimum of 4 air changes per hour and a minimum of -0.030" air pressure differential, while the zippered doors are opened for bag-out of waste. A digital manometer recording shall be made of all days when in use. The manometer tapes shall reflect the location, times, and dates of all measurements recorded. Once these requirements have been met and the negative pressure has been established, the Contractor shall request a pre-start visual inspection from Owner's agent/site representative.

9. When the Contractor has passed the pre-start visual inspection by the asbestos consultant, removal of fireproofing may be conducted.

10. Sufficiently wet fireproofing to be removed with amended water prior to and during the removal phase of work, and place into waste containers for disposal. Acceptable methods of containing the waste material include placing waste into a 6 mil poly bag and seal the bag using tape. This bag shall be moved to the waste load out shower, cleaned of all visible dust and deposited into a second 6 mil poly bag and sealed with tape using the "goose neck" method. This second bag must then be labeled with the appropriate asbestos warning labels for the regulated asbestos containing material (RACM). It is acceptable to have the waste manifest information placed inside of the second bag between the two bags as long as the writing on the waste manifest information can be read.

11. No fireproofing shall be allowed to remain on the floor of the containment at the end of each work shift. All fireproofing removed on a shift shall be placed in waste containers. During asbestos removal, all floors of the containment shall remain wet by frequent wetting with amended water. At no time shall the floor of the containment be dry.

12. The contractor shall clean all surfaces of the substrate using whatever tools to effectively clean and remove the material. On metal fluted decks where fireproofing material is removed, all fluted openings shall be cleaned of debris using small tools rags, brushes, etc. as necessary to reach the remove the material. Upon completing the removal of all fireproofing, the Contractor shall conduct wet wiping on all remaining surfaces within the containment/enclosure. Use of an airless spray to detail clean the fluted openings is an acceptable cleaning technique.

Final Visual Inspection

1. Upon the completion of all activities listed above, the asbestos contractor shall provide their own visual inspection prior to Owner's asbestos consultant shall be present during the inspection by Owner's asbestos consultant to remove/clean additional surfaces as needed, prior to encapsulation.

2. The final visual inspection will include an evaluation of all surfaces within the containment area, with emphasis placed on the completeness of materials removed. Any three dimensional debris identified by the Owner's asbestos consultant, shall be removed as directed with the use of a HEPA vacuum and other tools as necessary to remove the material. The Contractor shall thoroughly clean all

equipment inside the containment, including all parts of the negative air units, and new pre-filters shall be installed into all negative air units.

Final Lockdown-Encapsulation

1. The asbestos contractor may encapsulate the entire containment area upon completion of the final visual inspection by the Owner's agent/site representative, and acceptance of the work as complete.

Clearance Criteria

a. All clearance air samples will be analyzed by transmission electron microscopy (TEM), and performed by a NIST/NVLAP accredited laboratory. The clearance criteria for releasing the Contractor is the AHERA Standard, with the average of all air samples less than 70 asbestos structures per square millimeter. Aggressive air sampling will be used, which includes using a leaf blower in conjunction with fans to dislodge any remaining dust within the containment.

Disposal Requirements

1. All fireproofing waste shall be disposed as friable hazardous asbestos waste at a landfill permitted to accept friable, hazardous asbestos containing material.

SECTION 24. ASBESTOS SPECIFICATIONS/PROCEDURES

Part 24.1 - Contacts

Matt Reilly, Atlas Technical Consultants, 925-344-1872

Part 24.2 - Removal Locations

Refer to architectural drawings for this site identifying the buildings and work included in the project and scope of work outline. The General Contractor and his Sub-contractor are responsible for estimating the amount of asbestos-containing materials to be disturbed or removed as revealed on the mandatory bid walk, and provided in the project specifications and architectural drawings. The drawings will also provide the Contractor with locations where work is to be performed to allow computation of the quantities of materials to be impacted or removed.

The asbestos contractor shall provide a complete copy of this specification to their onsite competent person for reference while conducts work on the project. A copy of these specifications shall remain onsite by the asbestos contractor for the duration of the project.

Part 24.3 - Materials to be Abated

Refer to the architectural drawings and project specifications for designations and instructions pertaining to what materials are to be removed or impacted during this project. Directions pertaining to materials to be impacted or removed during this project are NOT included in this Exhibit. This exhibit includes work practices and procedures for those materials that are impacted by the planned renovation/demolition.

Areas of roofs, walls, floors, and/or ceilings may require penetrations be made during the project which may involve asbestos containing materials (ACM) depending upon the location of penetrations. Prior to impacting any building materials which are listed as "suspect" for containing asbestos by the US EPA the Contractor should refer to Section 25, Asbestos Results List for information pertaining to specific Asbestos Containing Materials (ACM) or products known to exist on the site. Materials suspected of containing asbestos but which have not been tested are "assumed" to contain asbestos.

A hazardous materials inspection was conducted by Atlas Technical Consultants for the Altadena Main Library, in preparation of this project. The contractor shall refer to the Hazardous Materials Survey report prepared on October 15, 2021 which includes all suspect building materials that were sampled and analyzed

for asbestos and included an assessment for lead in paint and ceramic products.

Materials commonly excluded from being suspected for containing asbestos include but are not limited to: unwrapped pink and yellow fiberglass insulating materials or products, foam insulation, wood, metal, plastic, or glass. All other types of building materials or coatings on the materials listed above are commonly listed as “suspect” and must be tested prior to impact by a Contractor.

Attic spaces at this site may already be contaminated with asbestos roofing debris from prior roofing replacement projects, but is unknown. If ceiling systems are removed and it is discovered that suspect roofing debris is present, the contractor shall stop work and bring it to the attention of the project manager to assess the potential for asbestos.

Any instruction in the project specifications or architectural drawings designating the removal of VFT shall include the removal of the associated floor tile adhesive/mastic and base cove mastic as well. Both of these materials must be assumed to contain asbestos unless reported otherwise in Section 25 of this Exhibit.

Part 24.4 - Containment and Abatement Requirements

The general guidelines in these specifications shall be followed by the asbestos abatement contractor for all work on this project. All requirements of Cal/OSHA Section 1529 and US EPA AHERA regulations apply, and shall be followed, as well as, other applicable regulations.

The Contractor shall follow all requirements set forth in Section 23, Specific Procedures and Requirements when disturbing or removing specific asbestos containing materials.

All asbestos related work shall be performed within negative pressure work enclosures for any class of asbestos work. The term “containment” or “enclosure” shall be construed to mean a containment which is constructed to enclose a work area (as defined in Section 2), and meet all applicable requirements set forth in Sections 2 through 20 of this Specification and all governing regulatory agency requirements. Each containment shall be tailored to meet the needs of the “work area” to be enclosed and include all requirements as set forth in the above related sections and government regulations applicable to asbestos related work.

Sufficient negative air units shall be installed which will provide a minimum of 4 air changes per hour and a minimum of -0.030" air pressure differential, while the zippered doors are opened for bag-out of waste. A digital manometer recording shall be made of all days when in use. The digital recording manometer shall have at a minimum the ability of displaying three digits after the zero (0.000). The manometer tapes shall reflect the correct location, times, and dates of all measurements recorded. Once these requirements have been met and the negative pressure has been established, the Contractor shall request a pre-start visual inspection from Owner’s asbestos consultant.

A three-stage decontamination unit is required and shall be comprised of zippered doors between the chambers. Flapped doors will not be acceptable. The decontamination unit shall be cleaned daily of all debris, bags, tape, towels, etc. and shall remain clean during the day. The clean room of any three-stage decontamination unit shall be at least 5' in width, 8' in length, and 7' in height. Multiple showers are required if the number of asbestos workers exceeds ten per Title 8 3366 Washing Facilities. When there are less than five employees, the same shower may be used by both sexes if the shower room can be locked from the inside.

Part 24.5 - Contractor Assist Requirements

The asbestos contractor shall provide "contractor assist" services for electrical, plumbing, mechanical, and other trades as necessary and agreed to with the General Contractor, for work to be conducted in spaces such as attics, wall cavities, and mechanical rooms where asbestos contamination is present, or where ACM are to be disturbed in order to perform the work.

Altadena Library

Contractor assist work shall require the asbestos contractor to construct a mini-cube enclosure, create access to the contaminated area, and wet wipe or HEPA vacuum all dust and debris from the immediate work area as needed to create a "clean" environment for the trade workers to work. All procedures specified in Section Mini-Cube Enclosure Requirements shall be followed.

Part 24.6 - Worker Protection

At a minimum half-face respirator with P-100 (HEPA) cartridges, disposable coveralls, and hard sole shoes shall be used during the removal and disposal of all asbestos containing material. Full-face powered air purifying respirators (PAPR) with P-100 cartridges are required for all Class I work. Workers wearing tennis shoes, sandals, or soft sole type shoes will not be allowed to work on roofs or inside containments regardless of the activity being performed. Worker protection for all other work areas shall comply with Cal/OSHA requirements and shall follow the respirator selection as specified in Title 8 section 5144.

Part 24.7 - Electrical and Water Hook-Ups

The Owner shall provide access for electrical and water hook-ups when available. The Contractor shall install a temporary electrical spider box to an existing electrical panel using a licensed qualified electrical contractor. The Contractor is responsible for all hook-ups, electrical cords, water hoses, and hose bibs necessary for attachment.

Part 24.8 - Visual and Air Clearance Criteria

The Contractor shall perform a pre-final visual of the removal area and adjacent surfaces prior to requesting that Owner's asbestos consultant conduct a final visual inspection. The pre-final visual performed by the Contractor shall verify that all materials have been completely removed from the work area, and that the work area meets the requirements specified in Section 17.

Upon completion of the pre-final visual inspection by the Contractor, a final visual of the containment area will be performed by Owner's asbestos consultant. The Contractor shall not be released to encapsulate the containment until receiving acceptance by Owner's asbestos consultant confirming the removal area and the containment have met the criteria of Owner's asbestos consultant for completeness of removal of asbestos materials and cleanliness of the containment barriers and surfaces.

Clearance air sampling will be performed following passing the visual inspection, encapsulation of the containment has taken place and a sufficient amount of time has passed to allow the encapsulant to dry. All clearance air samples will be analyzed by transmission electron microscopy (TEM), and performed by a NIST/NVLAP accredited laboratory. The clearance criteria for releasing the Contractor is the AHERA Standard, with the average of all air samples less than 70 asbestos structures per square millimeter. Aggressive air sampling will be used, which includes using a leaf blower in conjunction with fans to dislodge any remaining dust within the containment.

Part 24.9 - Owner's Responsibility

Not Used.

Part 24.10 - Disposal Requirements

Disposal of all friable hazardous asbestos containing waste must be tracked utilizing a current copy of a Uniform Hazardous Waste form. These forms are to be properly filled out by the Contractor and signed by an authorized Owner's representative. All non-friable non-hazardous asbestos waste shall be tracked using a Bill of Lading or equivalent and signed by an authorized Owner's representative. No individual or representative other than the Owner's designated representative is permitted to sign Uniform Hazardous Waste forms or bill of Lading or equivalent for the Owner.

It shall be the responsibility of the Contractor to notify Owner's agent/site representative and coordinate having a hazardous waste manifest properly signed by a Owner representative.

Part 24.11 - Work Periods

Work periods shall be scheduled with Owner's agent/site representative at least 48 hours prior to the start of any shift. If weekend work is to be conducted, shift times are to be established and approved by Owner's agent/site representative. All shifts are to consist of 8 hours and will begin at the time specified and agreed to by Owner's agent/site representative and the abatement contractor.

Altadena Library

Part 24.12 - Pre-Construction Submittal List

1. _____ Copy of State of California - Contractor's State License

2. _____ Copy of State of California CSLB Active License

3. _____ Copy of State of California CSLB Asbestos Certification

4. _____ Copy of Department of Industrial Relations; Division of Occupational Safety and Health; Certificate of Registration for Asbestos-related Work

5. _____ Copy of signed statement from company officer listing citations and pending proceedings against the Contractor, or if there have been no citations, a copy of the statement that no actions by regulatory agencies have occurred in the last three years signed by an officer of the company.

6. _____ General Liability Insurance Certificate

    a) ___ Occurrence
    b) ___ Asbestos/Lead Activities or Abatement Certificate
    c) ___ Owner Named as Additional Insured
    d) ___ Consultant Named as Additional Insured

7. _____ Auto Insurance

8. _____ Workers' Compensation Insurance

9. _____ Statement of Non-use of Sub-contractors or

    a) ___ Name of Each Sub-contractor
    b) ___ License Number for Each Sub-contractor
    c) ___ General Liability Insurance Certificate for Each Sub-contractor

        1) ___ Minimum Coverage of $1,000,000.00
        2) ___ Owner Named as Additional Insured
        3) ___ Consultant Named as Additional Insured

    d) ___ Auto Insurance Certificate for Each Sub-contractor
    e) ___ Workers' Compensation Insurance Certificate for Each Sub-contractor

        1) ___ Owner Named as Additional Insured
        2) ___ Consultant Named as Additional Insured

10. _____ Written Notification to CAL/OSHA

11. _____ Written Notification to SCAQMD

12. _____ Copies of City Permits (e.g. Parking or Waste container) or Statement That no Permits are Required

13. _____ Statement That no Equipment Will be Rented for use With Asbestos or a Statement From Each Rental Company Acknowledging Their Equipment Will be Exposed to Asbestos

Altadena Library

14. _____ Non-Emergency Telephone Numbers

    a) ___ Local Police Department
    b) ___ Sheriff Department
    c) ___ Fire Department
    d) ___ Emergency Medical Facility and Directions to That Facility From the Site

15. _____ Written Emergency Plans

16. _____ Written Work Plan

17. _____ Written Schedule

18. _____ Worker Documentation (Must Include at Least One Supervisor)

    a) ___ Training Records for Asbestos - AHERA (Supervisor and Worker)*
    b) ___ Medical Examination Written Opinion Final Report for Each Employee*
    c) ___ Respiratory Fit Tests for Each Employee*

19. _____ Equipment list, SDS for all materials to be used on the project, including but not limited to, spray glue, encapsulants, wetting agents, mastic remover, etc.

20. _____ Name of laboratory/person used for PCM analysis and copy of current NVLAP Certificate of Accreditation (if applicable), and most recent AIHA Proficiency Analytical Testing (PAT) Program results.

21. _____ Written Statement That OSHA Monitoring Will be Performed During the Project

22. _____ Manufacturers documentation of 5.0 micron filter capability required for waste water

23. _____ Name of Transporter

24. _____ Hazardous Waste Transporter Registration (if applicable) Is required only if work to be conducted involves the removal and disposal of “hazardous” asbestos waste as determined either by definition or designated within the Asbestos Abatement Specifications/Procedures and associated attached Exhibits.

25. _____ Waste Facility Documentation

    a) ___ Name and Site Address
    b) ___ EPA Identification Number (if applicable)
    c) ___ Copy of Current Permit Authorizing Asbestos Waste Receipt and Disposal

26. _____ Signed Copy of Competent Person Form Acknowledging Reading and Understanding the Specifications (Last Page of Forms Sections of Document) <u>This must be signed by the asbestos Contractor/Supervisor who will onsite, not in the contractor’s office.</u>

<u>Note:</u> Items 9, 12, 13, and 21 may be addressed in a single letter as applicable.

* No Contractor’s worker will be allowed to conduct asbestos related work, enter a containment, or regulated area prior to verification of AHERA, respirator, and medical

documentation. This verification must either be onsite or faxed to Owner's agent/site representative prior to entry.

Part 24.13 - Interim Construction Submittals

Upon request by the Owner or Owner's Representative, the Contractor shall provide copies of documentation identified to be pertinent to the project.

Part 24.14 - Post Construction Submittal List

Contractor shall provide the following post-construction submittals to Owner's Representative within thirty (30) days of the completion of asbestos abatement work.

1. _____ Copies of revised notifications to regulatory agencies.
2. _____ Information on all new workers not covered by the pre-construction submittals and not submitted during the project.
3. _____ A copy of worker exposure monitoring results collected in compliance with DOSH regulations (Title 8 CCR, Section 1529) including daily/representative/full-shift/breathing-zone air samples, and 30-minute excursion samples.
4. _____ A copy of the worker/visitor log showing the following for all persons entering the work area: date, name, social security number, entering, and leaving times, company or agency represented, and reason for entry. The Contractor's time records will not be accepted in lieu of a worker/visitor log.
5. _____ Copies of all accident reports submitted during the course of work. **If no accidents occur during the project this should be stated in writing by the Contractor.**
6. _____ Receipts from the landfill operator acknowledging the Contractor's delivery of wastes, including dates, container types and quantities, tare weights or material delivered, and all appropriate signatures.
7. _____ A complete record of the air filtration devices used certifying DOP testing (if performed) and a circular chart recording, indicating continuous operation and documenting differential air pressure.
8. _____ Copies of DOP Testing Performed on HEPA Equipment not Previously Submitted
9. _____ Manometer graphs identifying project name, date, and location.
10. _____ A copy of the asbestos waste record showing dates, times, manifest numbers, quantities of wastes, types of containers removed from the work area, the hauler, and the signature of the recorder.
11. _____ A Land Disposal Restrictions Notification and Certification
12. _____ Completed Uniform Hazardous Waste forms
13. _____ Other Documents as Requested

Altadena Library

SECTION 25. ASBESTOS RESULTS LIST

Any material not specified on the following list which the Contractor encounters at this site must be considered as “suspect” and “assumed” to contain asbestos per US EPA. The only items excluded from this statement are; bare wood, glass, and metal.

Table 1 – Asbestos Survey Results

Sample Number	Homogeneous Material	Location	Approximate Quantity	Asbestos Content
001	Carpet Mastic, Under Green 2’ x 2’ Carpet	Main Floor, Fiction Reading Area	900 SF	ND

Note 1.: **Category I Non-friable ACM** is asbestos-containing packings, gaskets, resilient floor covering, and asphalt roofing products containing more than one percent asbestos by area.

Note 2.: **Category II Non-friable ACM** is any material, excluding Category I non-friable ACM, containing more than one percent asbestos, which is non-friable such as transite and other concrete based products.

Note 3.: **Regulated Asbestos-Containing Material (RACM)** is any friable material, any Category I non-friable ACM which has become friable, any Category I non-friable ACM which will be or has been subjected to sanding, grinding, cutting, or abrading, any Class II non-friable ACM that has a high probability of becoming or has become crumbled, pulverized, or reduced to a powder by the forces expected to act on the material in the course of demolition or renovation operations.

Note 4.: **Asbestos Containing Construction Materials (ACCM)** is a manufactured construction material containing greater than 0.1% asbestos by weight by the PLM method.

Altadena Library

Note 5.: The terms “assume” and “presume” mean the named material is considered positive for containing asbestos and must be treated accordingly, until properly sampled in compliance with 40 CFR, Part 763 Asbestos-Containing Materials in Schools; Final Rule and Notice.

Competent Person Acknowledgment

The Cal/OSHA standard for asbestos related construction work, found in 8 CCR, 1529, outlines specific duties and qualifications of the "Competent Person." Find below a overview of these qualifications and responsibilities. The competent person must be authorized by their employer to take prompt corrective measures to eliminate hazards on the job and protect their workers safety. The competent person must be the Supervisor onsite who is capable of:

- Identifying existing and predictable hazards in the surroundings or working conditions which are unsanitary, hazardous, or dangerous to employees.
- Identifying existing asbestos hazards in the work place and selecting the appropriate control strategy for asbestos exposure.

The duties of the competent persons include, but are not limited to:

- Frequent and regular inspections of the job site, materials, and equipment.
- Supervise or perform the set-up of the regulated area and/or containment.
- Ensure the integrity of the regulated area and/or containment.
- Set up procedures to control entry to and exit from the regulated area and/or containment.
- Supervise all employee exposure monitoring and assure it is conducted according to regulatory requirements.
- Ensure that employees working within the regulated area(s) wear respirators and protective clothing as required by regulation.
- Ensure that employees working set up, use, and remove engineering controls, use work practices and personal protective equipment in compliance with the regulations.
- Ensure that employees use hygiene facilities and observe the decontamination procedures specified in the regulation.
- Ensure through continuing onsite surveillance that engineering controls are functioning properly and employees are using proper work practices.
- Ensure that notification requirements of the regulation are met.

Additionally, the EPA requires the competent person to be trained in the Federal NESHAP regulations, the means to comply with them, and be on site during all removal operations.

I_____have the authority to take prompt corrective measures to eliminate hazards on the job and protect workers safety. Furthermore, I have read and understand my duties as outlined above and under the applicable regulations, and will exercise them to best of my ability.

REQUIREMENTS FOR THE DISTURBANCE OF LEAD IN CONSTRUCTION

PART 1.0 GENERAL REQUIREMENTS

1.1 Introduction

These specifications are designed to minimize and control potential lead hazards during the disturbance of materials that contain lead. These procedures and precautions apply to the disturbance of lead that may result from the preparation of surfaces prior to painting, from the drilling into, cutting into, or removal of building components containing or covered with lead, or the demolition of buildings and/or structures that contain lead either in or on their surfaces.

The primary focus of these specifications is to address the work practices and procedures that the Contractor and/or other subcontractors must follow when conducting activities that may disturb lead in paint or other coatings or lead in ceramic tile glaze.

Lead in measurable amounts is common in paints, varnishes, stains, and ceramic tiles found in buildings constructed prior to 1978. All interior and exterior painted, stained or varnished building surfaces are assumed to contain various concentrations of lead. The Contractor or other subcontractors may also encounter other building products such as lead sheeting, roof flashing or roof vents that may contain lead until proven otherwise.

The Contractor and other subcontractors working on this project must treat these suspect lead-containing products as containing lead unless the materials have been tested and proven not to contain lead. Unless tested, California Division of Occupational Safety and Health (DOSH) regulations will apply if any of these surfaces or materials will be disturbed during the project work.

This specification requires that DOSH and California Department of Public Health (CDPH) regulations regarding the training of workers disturbing lead and work practices employed during that disturbance be utilized on this project. The training requirements for workers and supervisors on this project are summarized in Part 1.5. Lead Training Requirements. The Contractor and other subcontractors disturbing lead must be familiar with the CDPH requirements regarding containment of lead debris and the DOSH Lead in Construction Standard. Those requirements are summarized below in Part 1.3 Regulatory Compliance.

In summary, the Contractor and subcontractors shall utilize engineering controls to limit the release of lead dust or debris. These engineering controls may include, but are not limited to, using wet methods, using tools with vacuum recovery systems with High Efficiency Air Particulate (HEPA) filtration, using vacuums with HEPA filtration, using negative air pressure differential systems, and by the prompt cleanup of any lead-containing debris that the work might produce. Dry scraping, sanding, grinding, or abrading lead-containing materials is not permitted. All work that disturbs lead will require a containment. The containment may be as simple as plastic sheeting on the floor or ground when drilling minor penetrations or scraping paint on exterior surfaces. For the demolition of ceramic tile and any painted wall systems, it is likely to require the Contractor construct a full containment for the area and utilize a negative air pressure differential system. The requirements for work practices and containment are described in Part 3.5 Work Site Preparation & Containment Requirements.

The requirements of this specification apply to all employers who have employees who may reasonably be exposed to lead on this project. This includes the Contractor, who will normally be an environmental contractor such as an asbestos abatement contractor, or a painting contractor utilizing CDPH lead certified workers and supervisors. In addition, this specification applies to all subcontractors conducting work on this project who have employees who may disturb lead by drilling, cutting, scraping, or demolishing materials containing lead.

No Contractor shall begin work which will disturb known or suspect lead-containing surfaces or materials in a manner that may expose a worker to lead containing dust, create a potential for building contamination, or create possible lead containing waste, until all required pre-construction documentation has been reviewed and written approval has been received from the Owner and/or Project Monitor/Project Supervisor.

Activities expected to disturb lead-containing materials include, but are not limited to, painting preparation work such as scraping or sanding, penetration of painted surfaces through drilling or cutting, demolition of painted surfaces, removal of painted building components, and removal, drilling, or cutting of ceramic wall tiles. If the Contractor or subcontractors are observed conducting such activities without having written approval from the Owner and/or Project Monitor, they will be instructed to stop work. Work will not be allowed to resume until the Owner and/or Project Monitor provides approval for the work to begin.

This project involving potential disturbance of lead in the various painted materials is not considered a lead abatement project. The renovation project at this site would be considered “lead related construction work”; therefore, it is Atlas opinion the contractor is not required to submit a CDPH Form 8551 for this project.

1.2 Definitions

Action Level - Airborne exposure to lead at or above 30 µg/m3 over an eight-hour-time-weighted average as discussed in 8 CCR 1532.1. Typically, when employees are exposed over the Action Level, the employer must provide blood testing, training in compliance with 8 CCR 1532, and air sampling.

Air Filtration Unit - A portable exhaust system equipped with HEPA filtration and capable of maintaining a constant low velocity air flow into contaminated areas from adjacent uncontaminated areas. At a minimum, the air intake for the air filtration device must have a pre-filter on it which can be changed within the containment area. In most cases, air filtration devices will need to pass challenge testing by DOP before they are allowed to be used on site.

Airlock - A system for permitting ingress and egress with minimum air movement between a contaminated area and an uncontaminated area, typically consisting of two curtained doorways separated by a distance of at least three feet such that one passes through one doorway into the airlock, allowing the doorway sheeting to overlap and close off the opening before proceeding through the second doorway, thereby preventing flow-through contamination.

Air Monitoring - The process of measuring the content of a known volume of air collected during a specific period.

Blood Testing - Blood testing for lead and zinc protoporphyrin in compliance with the requirements for medical surveillance as listed in 8 CCR 1532.1.

Cal/OSHA - California Division of Occupational Safety and Health. A California agency that implements and enforces numerous health and safety standards regarding lead.

Certified Lead Supervisor and Worker - Supervisors and workers currently certified by the California Department of Public Health (CDPH).

Challenge Testing - Process used to verify that HEPA-filtered equipment does not leak or exhaust asbestos, lead, or other particulate. This testing must be done by a testing company, not affiliated with the Contractor, and approved by the Owner and Project Monitor. Challenge testing normally uses an oil mist as the challenge agent and measures how much, if any, of the agent is exhausted from the machine being tested.

Clean Room - An uncontaminated area or room, which is a part of the worker decontamination enclosure system with provisions for storage of workers' street clothes and clean protective equipment. The term also includes the uncontaminated area or room of a Waste Transfer Airlock.

Containment - Isolation of the work area from the rest of the building to prevent escape of lead in dust, debris or in the air.

Contractor - The Contractor is the person or entity identified as such in the Contract Documents as being responsible for the environmental work as done in response to and in accordance with this document. References to the "Contractor" include the Contractor's authorized representatives. The Contractor may be a sub-contractor to the Primary Contractor. The Contractor normally will be responsible for paint preparation work that disturbs lead, paint scraping done prior to the demolition of structures, or the demolition of ceramic tile. The Contractor will typically need to use CDPH certified lead workers and supervisors to conduct their work that disturbs lead. Those employers disturbing smaller amounts of lead such as through drilling, cutting, or small component removal are typically known as a subcontractor for the purposes of this specification.

Critical Barrier - Critical Barriers are used to restrict water and airflow. Critical Barriers are the barriers placed over openings in the walls and ceilings of a work area in order to ensure that lead dust cannot escape the work area via these openings. Unless otherwise specified in these Specifications, critical barriers shall be constructed of at least one layer of six-mil thick poly.

Curtained Doorway - A device to allow ingress or egress from one room to another while permitting minimal air movement between the rooms. These are typically constructed by placing two overlapping sheets of plastic over an existing or temporarily framed doorway, securing each along the top of the doorway, securing the vertical edge of one sheet along one vertical side of the doorway and securing the vertical edge of the other sheet along the opposite vertical side of the doorway. Other effective designs are permissible as long as they are approved by the Project Monitor.

Decontamination Enclosure System - A series of connected rooms, separated from the work area and from each other by air locks, for the decontamination of workers, containers, and equipment. This unit shall be constructed with at least two layers of six-mil poly for the floors, walls, and ceiling. The floor of the dirty room shall consist of two layers of six mil poly plus a third layer of poly, four mil or thicker, to be used as a removable drop layer. Drop layer is to be removed as needed, but at least daily.

CDPH - California Department of Public Health. State agency that regulates the disturbance of lead in public buildings and on all structures in California. This agency and relevant regulations are primarily concerned with preventing childhood lead poisoning.

DOP - Dioctylphthalate particles, a testing agent for the efficiency of HEPA filters.

DOT - Department of Transportation, a Federal agency that has regulations and labeling requirements for the transportation of hazardous waste.

DTSC - Department of Toxic Substances Control, a department within the California Environmental Protection Agency charged with implementing and enforcing hazardous waste regulations.

Dust or Debris - Any visible dust or debris remaining in work area will be considered lead-containing residue.

EPA - U.S. Environmental Protection Agency, a Federal agency that developed and enforces various asbestos and lead regulations.

HVAC - Heating, ventilation and air conditioning system.

HEPA Filter - A high efficiency particulate air filter capable of removing particles 0.3 microns in diameter from an air stream with 99.97% efficiency.

HEPA-Filtered-Vacuum Recovery System - This is a mechanical tool that has a shroud or covering over the area of a surface disturbed by a mechanical system in order to eliminate or significantly reduce the amount of dust released to the ambient air by the mechanical process. The shroud must be attached to a working vacuum with HEPA filtration.

HEPA Vacuum - A vacuum system equipped with HEPA filtration. Typically, these units will need to be challenge tested before being allowed to be used inside of buildings on this project.

Lead-Based Paint - Materials meeting the definition of lead-based paint as defined by the California Department of Public Health and the United States Environmental Protection Agency. Currently defined as containing lead in concentrations equal to or greater than 1.0 mg/cm^2, 5000 ppm, or 0.5% by weight.

Lead-Containing Material - Materials that contain measurable, quantifiable amounts of lead. The disturbance of these materials is regulated by Cal/OSHA.

Lead-Containing Hazardous Waste - Materials required by the State of California to be packaged, labeled, transported, and disposed of as a lead hazardous waste.

Lead-Containing Waste Material - Lead-containing waster material that does not need to be treated as a lead-containing hazardous waste.

Lead Project Management or Monitoring Firm – The firm hired by Owner to provide third-party oversight of the disturbance of lead performed on the Owner's property by the Contractor or subcontractors.

Mil - A unit of length or thickness equal to one thousandth of an inch. Generally used when referring to the thickness of plastic (poly) sheeting used to contain the regulated area.

Movable Object - An unattached piece of equipment or furniture in the work area, which can be removed from the work area.

Negative Air Machines - See Air Filtration Units.

NIOSH - The National Institute for Occupational Safety and Health. All respirators used on this project must be approved by NIOSH.

Outside Air - The air outside buildings and structures.

Owner - Property owner where the disturbance of lead will take place. For example, this may be a private building owner or manager, a government body such as a city or county agency, a military base, or a Owner district. This includes the Owner's authorized representatives and employees.

PEL - Permissible Exposure Limit (as used in 8 CCR 1532.1)

Permissible Exposure Limit (PEL) - Airborne exposure to lead above 50 $\mu g/m^3$ over an eight-hour, time-weighted average as discussed in 8 CCR 1532.1. Typically, when employees are exposed over the PEL, the employer must provide blood testing, respirators, protective clothing, shower decontamination, CDPH certification, regulated areas, and air sampling.

Poly - Flame-retardant polyethylene sheeting used to seal critical barriers, create cleaning barriers and drop layers, and to protect surfaces from damage or contamination.

Primary Contractor - The Contractor may not work directly for the Owner but instead subcontract with another contractor such as a general contractor or demolition contractor. The Primary Contractor is the entity responsible for hiring the Contractor if it is not the Owner.

Pre-start Meeting - Meeting held before the beginning of the project in which final details of the project are discussed and Contractor provides project monitor with pre-job submittal packet.

Project Monitor - An individual qualified by virtue of experience and education, designated as the Owner's representative and responsible for overseeing the work that disturbs lead on this project.

Project Monitoring - Activities undertaken by the Project Monitoring Firm for the purpose of monitoring the work done by the Contractor on this project in regards to the disturbance of lead.

Regulated Area - Term used by Cal/OSHA in 8 CCR 1532.1 to indicate a work area where exposure to airborne lead might exceed the Permissible Exposure Limit or where "Trigger Activities" may be performed. The area must be demarcated with signs and barriers designed to keep unauthorized people out of the area. Additionally "Regulated Area" means any measure used to restrict access to an area where personnel impacting lead-containing materials are required to wear respiratory protection and/or protective clothing by the project specifications regardless of airborne concentration of lead.

Shower Room - A room between the clean room and the equipment room in the decontamination enclosure with hot and cold or warm running water controllable at the tap and suitably arranged for complete showering during decontamination. Unless specified elsewhere in these specifications, or determined otherwise by the program monitor, the shower shall be on a metal pan to contain water splashed, leaked or spilled out of the shower unit.

Specifications - These written requirements describing procedures the Contractor must follow for this project.

Subcontractor - Contractors working for the Primary (General) Contractor but who are not primarily responsible for environmental work. For example, they may be responsible for, demolition, electrical, plumbing, general construction, minor painting, or other special trades.

Submittals - Pre-construction, interim construction, and post construction documents submitted by the contractor to the Owner as indicated in General Requirements and Bidding Requirements.

Trigger Task - Term commonly used to describe the tasks described by Cal/OSHA in 8 CCR 1532.1 (d)(2). These are tasks or activities that Cal/OSHA believes are expected to result in airborne exposures over the PEL until air monitoring proves otherwise. In brief, trigger tasks include manual demolition, scraping, sanding, using HEPA-attached equipment, using heat guns to remove lead paint, welding, torch cutting, and using other more aggressive techniques. (This is a summary list and does not list all tasks that are considered trigger tasks.) In addition, trigger tasks include any activity reasonably expected to result in airborne exposures to lead above the Permissible Exposure Limit.

View Ports - Clear windows into the regulated work area that allow authorized persons to view work activities inside the regulated area without entering the area. The view ports must be of sufficient number, constructed of materials of sufficient clarity, and be located in areas determined and/or approved of by the Project Monitor. All regulated work areas including mini-enclosures will require view ports unless specifically determined not to be feasible by the Project Monitor.

Visible Emissions - Any emissions containing particulate material that are visually detectable without the aid of instruments. For example, dust, debris, and water leaks are considered visible emissions.

Waste Load-out/Transfer System - A decontamination system utilized for transferring containerized waste from inside to outside of the work area. A series of connected rooms used for the load-out of lead-containing materials that have been properly containerized.

Waste Bags - Waste bags for lead-containing waste must be a minimum of six-mil thickness. In general, double bagging will be required.

Waste Containers - Waste containers are the containers into which lead-containing waste is placed. They may be bags of at least six-mil thickness, metal or fiber barrels, or other containers such as cardboard boxes approved by the Project Monitor. The Contractor is responsible for assuring that the type of container chosen is acceptable to the waste landfill to which the waste will be transported. Waste containers must be labeled according to the requirements of the California Department of Occupational Safety and Health (Cal/OSHA), Department of Toxic Substances Control (DTSC), Department of Transportation (DOT), and the Environmental Protection Agency (EPA).

Waste Transfer Airlock - A decontamination system utilized for transferring containerized waste from inside to outside of the work area.

Wet Cleaning - The process of eliminating lead contamination from building surfaces and objects by using cloths, mops, or other utensils, which have been dampened with water and afterwards thoroughly decontaminated or disposed of as lead-contaminated waste.

Work Area - Designated rooms, spaces, or areas of the project in which the disturbance of lead is to be undertaken or which may become contaminated as a result of such action. A contained work area is a work area, which has been sealed off from adjacent areas.

Work Plan - Contractor's written plan describing how the Contractor will perform the work in compliance with these specifications. The work plan shall include information on preparation of the work area, personal protective equipment, employee experience, training and assigned responsibilities during the project. It will also list decontamination procedures for personnel, work area and equipment, removal methods and procedures, required air monitoring program, procedures for handling and disposing of waste materials and procedures for final decontamination and cleanup.

Worker - A person who successfully meets the training requirements for the disturbance of lead as described in these specifications.

8 CCR 1532.1 - Chapter 8 of the Labor Code, California Code of Regulations, Section 1532.1: Lead (Known as the Lead Standard for the Construction Industry)

8 CCR 1544 - Chapter 8 of the Labor Code, California Code of Regulations, Section 1544: Respiratory Protection Standard.

1.3 Regulatory Compliance

Various agencies regulate work that disturbs lead-containing materials. The following is a summary of the most important agencies and regulations that apply during the disturbance of lead during construction work. This list is not to be considered comprehensive. The Contractor is responsible for complying with all applicable federal, state, and local regulations that may apply to the specific work they are conducting.

1.3.1 Environmental Protection Agency (EPA)

Lead: Identification of Dangerous Levels of Lead; Final Rule (40 CFR Part 745 Subpart D)

The EPA defines lead-based paint as paint and coatings that contain lead in concentrations equal to

or more than one milligram per square centimeter (1 mg/cm^2), 5000 parts per million (5000 ppm), or one half of one percent (0.5%) by weight. EPA regulations apply to all housing and child-occupied facilities built before 1978. When the term "lead-based paint" is used in the context of these specifications, the term is used only to refer to paint that contains lead in concentrations equal to or greater than that defined by the EPA as lead-based paint. (This is to differentiate lead-based paint from the term "lead-containing paint" as used for compliance with Cal/OSHA.)

1.3.2 Housing and Urban Development (HUD)

Requirements for Notification, Evaluation and Reduction of Lead-Based Paint Hazards in Federally Owned Residential Property and Housing Receiving Federal Assistance (24 CFR Part 35)

The HUD Rule for Federal Housing (shortened name) applies to all residential properties built before 1978 that receive Federal financial assistance. This regulation uses the same definition of lead-based paint as the EPA. The work practices and procedures described in these specifications are designed to comply with occupant and worker protection regulations as mandated by OSHA and Cal/OSHA regulations for work that disturbs lead and **are not** designed to comply with all the requirements of 24 CFR Part 35. Should this project be covered by this regulation, the Owner may require additional practices and procedures in the scope of work for activities conducted in properties covered by the HUD Rule for Federal Housing.

1.3.3 California Department of Public Health (CDPH)

Accreditation, Certification, and Work Practices For Lead-Based Paint And Lead Hazards (Title 17, CCR, Division 1, Chapter 8, Sections 35000-361000)

This regulation primarily applies to residential and public buildings located in California. The definition of a public building is one that is "generally accessible to the public." Some aspects of this regulation, particularly those that pertain to the definition of "presumed lead-based paint" and the containment requirements for disturbing lead-based paint **apply to all structures** in California.

This CDPH regulation definition of lead-based paint is identical to the EPA/HUD definition of 1 mg/cm^2, 5000 ppm, and 0.5% by weight. In addition, this regulation requires all paint on structures in California to be treated as "presumed lead-based paint" unless the paint is on a home built after 1978 or a Owner built after 1992. Therefore, the paint in all owner's buildings covered by this project that were constructed before 1993 must be treated as lead-based paint unless tested and proved otherwise as described elsewhere in these specifications.

The CDPH regulation differentiates between work that disturbs lead as part of renovation or maintenance work and work that disturbs lead as part of "abatement" work as defined in Title 17. The work practices and procedures described in these specifications are designed to comply with occupant and worker protection regulations as mandated by Cal/OSHA regulations for work that disturbs lead as part of renovation, demolition, and maintenance work. These specifications are not designed to comply with the requirements for abatement as defined in the CDPH Title 17 regulation. Unless stated specifically otherwise in these specifications, the Owner does not anticipate any work being done as part of this project that meets the definition of abatement as used in Title 17. Therefore, unless specifically directed otherwise by this specification or by the direction of the Owner and/or Project Monitor, the Contractor and/or subcontractors shall NOT submit Form 8551, "ABATEMENT OF LEAD HAZARDS," to the CDPH since that form provides inappropriate notice for the work done on this project. The Contractor may be required to complete and submit this form should the scope of the work or the work practices change.

This regulation has significant penalties associated with the creation of "lead hazards." Lead hazards are defined as: "...disturbing lead based paint or presumed lead-based paint without containment, or any other nuisance which may result in persistent and quantifiable lead exposure." The requirements

discussed in Part 3.5 Work Site Preparation & Containment Requirements are designed to meet CDPH requirements. Should a Contractor and/or subcontractor conduct work without a containment or release lead-contaminated dust or debris outside of the containment, they are in violation of this regulation. The Project Monitor will stop all work, consider the Contractor and/or subcontractor to be in violation of these specifications and the contract documents. Work will not be allowed to begin again until the Contractor and/or subcontractor takes adequate steps to correct their violation and convinces the Owner and/or Project Monitor that the violation will not occur again.

1.3.4 California Division of Occupational Safety and Health Administration (DOSH)
Lead Standard for the Construction Industry (8 CCR 1532.1)

This standard regulates work done by employees who may disturb lead as part of demolition, construction, renovation or maintenance work. Painting activities that may disturb lead are covered by this standard. General construction work that disturbs lead is covered, as is the demolition of building components or entire structures.

Cal/OSHA regulates lead whenever lead is determined to exist in a material. When the term "lead-containing paint" is used in the context of these specifications, the term is used to refer to paint that contains lead in an amount equal to or above the reporting limit for the laboratory analysis or that detected by an X-ray Fluorescent Analyzer (XRF).

In addition, Cal/OSHA uses the EPA/HUD/CDPH definition of lead-based paint (1.0 mg/cm^2, 5000 ppm, or 0.5% by weight) for their pre-job notification requirements discussed in Part 1.4 Lead-Work Pre-Job Notification Requirements.

The following information summarizes the significant requirements in the Cal/OSHA standard. This summary is not meant to substitute for the Contractor reading and being familiar with the Cal/OSHA requirements.

a. The Cal/OSHA lead standard is very complex. Cal/OSHA regulates lead in materials when a laboratory can quantify the amount of lead. This means materials are regulated even when they contain very small amounts of lead. The standard sets an "Action Level" for airborne lead at or above 30 $\mu g/m^3$ over an eight-hour-time-weighted average. Typically, if employees are expected to be exposed to this airborne lead level, the employer must conduct air sampling, provide blood lead testing, and provide specialized training. The standard sets a "Permissible Exposure Limit" or "PEL" for airborne lead at or above 50 $\mu g/m^3$ over an eight-hour-time-weighted average. The employer must continue the requirements needed at the Action Level but must now provide respirators, protective clothing, a shower decontamination system, and a written compliance program.

b. In 8 CCR 1532.1 (p), employers are required to notify Cal/OSHA before employees conduct a trigger task that will disturb more than 100 square or linear feet of material that contains lead in concentrations equal to or above 1.0 mg/cm^2, 5000 ppm, or 0.5% by weight. The notification also applies to welding or torch cutting that takes more than one hour in a shift. Trigger tasks are described in 8 CCR 1532.1 (d)(2). In brief, they include manual demolition, scraping, sanding, using HEPA-attached equipment, using heat guns to remove lead paint, welding, torch cutting, and using other more aggressive techniques. This is a summary list and does not list all task that are considered trigger tasks.

c. The California standard defines lead-containing paint at the Consumer Product Safety Commission's (CPSC) level of 0.06% by weight or 90 ppm for non-trigger tasks. The lead standard would not apply if the paint contains less than 90 ppm and the employees do not conduct trigger tasks. However if the employees do conduct trigger tasks, the entire

standard applies.

d. Cal/OSHA requires CDPH lead training and certification for any supervisors or workers who are "shown to be exposed" to airborne lead levels above the PEL in residential or public buildings. The Owner and Project Monitor/Project Supervisor believe that there is a reasonable expectation that those workers scraping paint prior to repainting, and those demolishing ceramic tile are likely to be exposed over the PEL. Therefore, on this project, that work must be done by CDPH certified workers and supervisors.

e. Cal/OSHA requires the supervisor to establish a "regulated area" whenever employees may be exposed to airborne lead over the PEL or if they will perform trigger tasks as defined in 8 CCR 1532.1 (d)(2). The establishment of regulated areas is discussed in Part 3.5 Work Site Preparation & Containment Requirements.

1.4 Lead-Work Pre-Job Notification Requirements

The Contractor is responsible for complying with the Lead-Work Pre-Job Notification as specified in 8 CCR 1532.1 (p). If notification is required for this project, the Contractor must provide the notification to Cal/OSHA and provide a copy of this notification to the Owner and/or Project Monitor as part of the Contractor's pre-work submittal package.

Unless the material is tested as described elsewhere in these specifications, the Contractor and subcontractors must anticipate notifying Cal/OSHA if they plan to manually demolish or perform another type of trigger task (such as paint scraping or sanding) on any painted surface or ceramic wall surface on this project if the amount of material to be disturbed equals or is greater than 100 square feet.

Notification to Cal/OSHA is not required if the paint on the painted surface is primarily intact (not loose and peeling) and the painted material is removed in a manner that does not disturb the paint. For example, door or window frames may be removed without providing the notification if the paint or coating on the frames is intact and the building components can be removed without significantly disturbing the coating.

Unless stated otherwise in these specifications, or directed otherwise by the Project Monitor/Project Supervisor, the Contractor and/or subcontractors shall NOT submit Form 8551, "ABATEMENT OF LEAD HAZARDS," to the CDPH since that form provides inappropriate notice for the work done on this project since no lead "abatement" as defined by CDPH will be conducted as part of this project.

1.5 Lead Training Requirements

At a minimum, the Contractor and subcontractors must meet the lead training requirements as specified by 8 CCR 1532.1. This will include training all employees who drill, cut, scrape, abrade, remove, clean up debris, or in any other way are exposed to lead from painted surfaces or ceramic tile found on the buildings or structures covered by this project. The different types of training are summarized below for the typical types of work that are expected to disturb lead on this project.

1.5.1 Minimal Training Required For All Workers Exposed To Lead

This training will be sufficient for those who disturb lead in only minor ways. Those disturbing lead in more significant amounts will need to meet the training requirements stated in Part 1.5.2 or 1.5.3.

For example, this training applies to those workers who, for a total of less than one hour in an eight- hour shift, will drill or cut through painted surfaces, remove painted components (when the paint is intact), or remove ceramic tile significantly intact. *(This time frame is guidance and not an official Cal/OSHA time frame. This time frame is suggested because it is thought that these tasks, done for*

such a short time frame, do not pose a realistic chance that workers will be exposed over the Action Level based on an eight-hour time-weighted average.) In some cases, however, depending on the surface and type of work being conducted, the Project Monitor may determine that more training is needed even if the worker disturbs lead for less than an hour. In general, workers with this training conducting this type of minimal disturbance of lead will not need to wear respirators while conducting this work.

The training must comply with the training requirements as listed 8 CCR 1532.1(l)(1)(A). In summary, this training must comply with Hazard Communication Training for lead as discussed in 8 CCR 5194. This training is also known as "hazard communication," or "lead awareness" training and is usually done in less than hour depending on the work the employee will conduct.

The Contractor and subcontractors will need to provide the Owner and/or Project Monitor written proof that this training has been provided before workers will be allowed to conduct work that disturbs lead even in minimal amounts.

Proof of this training is not required if the employees are trained to the levels listed in Part 1.5.2 and/or 1.5.3.

1.5.2 Required Training For Those Exposed Over the Action Level Or Who Conduct Trigger Tasks

This training must be done for all those workers who conduct trigger tasks or are expected to be exposed above the Action Level. Typically, this training will be required for workers who conduct a trigger task such as paint scraping or manual demolition of painted components and the work will take more than one hour in an eight-hour shift. (This is a guidance and not an Cal/OSHA time frame.) The Project Monitor may determine that this training is needed for some workers who conduct tasks for even less than an hour.

The training must comply with the training requirements as listed 8 CCR 1532.1 (l)(1)(B) and (l)(2)(A- H). In summary, the standard requires the worker to be trained in series of subjects. The length of training depends on the experience and previous training of the worker, the type of work they will conduct, and whether or not they already have been trained and approved to wear respirators. Workers receiving this training and conducting this type of work will typically need to wear respirators and protective clothing while they conduct the work.

An environmental contractor, or a contractor with environmental work experience, previous training, and a written respiratory protection program generally conducts this type of work. The Owner and Project Monitor do not recommend subcontractors attempt this type of work. However, subcontractors will be allowed to conduct this type of work on this project if they can demonstrate proof of training and carry out the work according to these specifications.

The Contractor and subcontractors will need to provide the Owner and/or Project Monitor written proof that this training has been provided all workers conducting the tasks that require this training.

This training is not required if the employees are trained to the levels listed in Part 1.5.3.

1.5.3 Required Training For Those Who Are Reasonably Expected To Be Exposed Over The PEL And/Or Conduct Trigger Tasks On Over 100 Square Feet of Material

Workers and supervisors must be CDPH Certified Lead-Related Construction Workers, Supervisors if they will conduct trigger tasks, or other work reasonably expected to exceed the PEL and/or conduct this work on over 100 square feet of material. *(This is a guidance amount and not a Cal/OSHA regulatory requirement. However this amount of material and type of work is reasonably*

expected to potentially release airborne exposures over the PEL and thus trigger the CDPH certification requirement.) This includes work such as the manual demolition of painted surfaces, ceramic walls, paint

preparation work (sanding and scraping), and other tasks as described in 8 CCR 1532.1 (d)(2). Proof of training will be a currently valid CDPH certification card. Workers who can show a completed course completion form and a completed application form for certification will be allowed to work pending their being fully certified.

Exception: Licensed asbestos contractors performing paint scraping work on the outside of buildings only for the purpose of removing loose and peeling paint prior to the demolition of the building, or the demolition of a structure, will not be required to have the workers or on-site supervisor be CDPH certified. They must, however, show proof of training in compliance with 8 CCR 1532.1 (l)(2) for employees who may be exposed above the Action Level. In summary they must meet the training requirements of this specification as stated in Part 1.5.2. In addition, however, the Contractor must have a CDPH certified supervisor approve the containment setup at the start of each shift that will disturb lead, approve the work practices and personal protective equipment worn by the workers, verify that proper air monitoring is being collected, must be able to return to the site within two hours if requested by the Project Monitor, and must approve the final cleanup of the work area prior to a visual inspection of the work area being conducted by the Project Monitor. The certified supervisor will always be required to approve the initial set up of the containment, personal protection, and work practices at the start of the job, but then depending on the quality of the work demonstrated, the Project Monitor may not require the certified supervisor to inspect the work site at the start of each shift. This exemption will be revoked should air sampling on this project demonstrate airborne lead levels above the Action Level on workers or supervisors.

1.6 Required Submittal Documents

While additional documents may be required by the scope of work for this project, at a minimum, the Contractor will be required to provide the Owner and/or Project Monitor with the following documents regarding the Contractor's ability to safely disturb lead-containing materials.

1.6.1 Submittals Prior To The Start Of Work

All Contractors and subcontractors who will have employees disturb lead on this project must, at a minimum, provide proof of item number 1.6.1.e.1., lead hazard communication training in compliance with 8 CCR 1532.1 (l)(A)(1). This is the only submittal that must be provided by these employers as long as they do not disturb conduct more disturbance of lead than is described in Part 1.5.1.

The following submittals must be provided by all Contractors and subcontractors who will, at a minimum, have employees who will conduct trigger tasks for more than one hour per shift, will potentially be exposed above the Action Level, or will conduct other activities as determined by the Project Monitor that may result in significant exposure to lead.

a. A written lead compliance plan in compliance with 8 CCR 1532.1 must be provided that includes the following:

   1. A description of equipment and materials, controls, crew size, job responsibilities, and operations and maintenance procedures for each activity in which lead is disturbed and potentially emitted;

   2. A description of specific control methods (wet methods, engineering controls, etc.) that will be used to ensure workers are not exposed above the PEL;

   3. Technology considered in meeting the Cal/OSHA permissible exposure level (PEL);

   4. Air monitoring data documenting sources of lead emissions;

   5. A detailed implementation schedule for the compliance plan, including the schedule for inspections by a competent person;

6. A description of the lead work practice program, which will be used to control worker exposures. This includes the use of protective work clothing, equipment, hygiene facilities and practices, and housekeeping practices;

7. A description of the steps the Contractor or subcontractor will take to minimize the generation of hazardous waste produced on this project. This includes, but is not necessarily limited to how the contractor will separate waste streams. For example, how will the Contractor or subcontractor keep potentially hazardous waste such as paint chips and dust from being disposed of with other potentially non-hazardous construction materials and debris?

Note: If a Contractor or subcontractor is found conducting lead-related work not specifically mentioned and described in the compliance plan, the work will be stopped until a compliance plan including that work is submitted, reviewed, and approved by the Owner and/or Project Monitor.

b. Copy of the Contractor or subcontractor's written respirator program in accordance with the requirements of 8 CCR 1544.

c. Proof that all employees expected to wear respirators on this project have medical approval to wear a respirator.

d. Copies of respiratory fit-tests for all workers expected to wear a respirator on this project. Fit testing must be done as required by and in accordance with 8 CCR 1544.

e. Proof of training required by Part 1.5 for type of work employee will do.

1. Proof of Hazard Communication Training for Lead done within the last calendar year for those exposed to lead or who will perform trigger tasks for less than one hour. *(Proof may be a certificate or written statement stating training was completed and a list of names of those individuals who were trained. Proof of this training is not needed if employee provides proof of training required by items e. 2, or e 3.)*

2. Proof of training in compliance with 8 CCR 1532.1 (l)(2) done within the last calendar year for all employees who will conduct trigger tasks as defined in 8 CCR 1532.1 (d)(2) for more than one hour or who will reasonably be expected to be exposed to lead above the Action Level. *(Proof may be a certificate or written statement stating training was completed and a list of names of those individuals who were trained.)*

3. Proof of CDPH lead certification for those workers who will conduct trigger tasks as defined in 8 CCR 1532.1 (d)(2) or will reasonably be expected to be exposed to airborne levels of lead above the PEL on projects that will disturb more than 100 square feet of lead-containing material. *(Proof of certification will be a currently valid CDPH certification card as a worker or supervisor. Workers who can show proof of a valid course completion form and application being submitted to CDPH, will be allowed to work while awaiting full certification from CDPH.)*

4. Proof of current CDPH certification as a lead supervisor for the on-site competent person for projects involving the conduction of trigger tasks or other activities reasonably expected to exceed the PEL on all projects that will disturb more than 100 square feet of lead-containing material. *(Proof of valid certification will be a currently valid CDPH certification card a worker.)*

5. If exception to requirement for CDPH certified supervisor listed in Part 1.5.3 is requested, then provide proof of CDPH certified supervisor who will verify containment, personal protection and work practices, and will be able to respond to the project within two hours of request by the Project Monitor.

f. Copies of all current SDS for chemicals used on this project.

g. Manufacturers' certifications that high efficiency particulate air (HEPA) vacuums, pressure differential units and other local exhaust ventilation equipment conform to ANSI Z9.2-79 for all HEPA-filtered equipment that will be used on this project. *(This is proof that the equipment is actually HEPA filtered. This is separate from the challenge testing requirement needed for equipment used in interior spaces.)*

h. Name and contact information of independent testing company who will challenge test all vacuums and air filtration devices used on this project (in interior spaces).

I. Statement regarding compliance with all Cal/OSHA exposure monitoring required for this project.

j. Name and contact information for laboratory who will analyze air samples or waste samples and documentation of their certification to conduct such analysis.

k. Name of Waste Transporter who will transport hazardous waste on this project and documentation that the Transporter is allowed to transport lead hazardous waste.

l. Name of Waste Landfill to which lead hazardous waste will be sent and documentation that such landfill is allowed to accept such waste.

m. Should waste water filtration be required on this project, submit manufactures documentation pertaining to the capability of waste water filters to filter particles of, at a minimum, five micrometers in size.

n. List of all rented equipment to be used within a lead regulated area, or a statement that no rental equipment will be used on this project.

1. If rental equipment is to be used, submit written statements from each rental company indicating the rental company's acknowledgment that the equipment is provided for and may be used in areas where airborne levels of asbestos and/or lead may be present.

o. Submit emergency plans. At a minimum submit the following:

1. Submit non-emergency telephone numbers, other then 911, for the appropriate Police, Sheriff, and Fire Departments.

2. Name, pager or cell phone numbers of the on-site supervisor and his immediate company supervisor.

3. Submit detailed written directions from the project site to the medical facility to be

used in case of an emergency. Also include a map which sufficiently shows the route to be taken from the site to the designated medical facility.

4. Submit written emergency procedures pertinent to the work to be performed and which can be implemented by site personnel if the need arises.

p. Local sanitation district Wastewater Discharge Permit for Surface Washers (if required).

q. Cal OSHA Notification. This is required for this work on all projects that will disturb more than 100 square feet of lead-containing material.

The above listed documents must be provided prior to the start of work that will disturb lead. Under no circumstances will workers or supervisors be allowed to work on this project prior to the receipt, review, and acceptance of this documentation by the Owner and/or Project Monitor. In addition, documentation for rental equipment must be provided before the equipment may be used in a lead regulated area. All delays resulting from the failure of the Contractor and/or subcontractors to provide this information in the required time frame is solely the responsibility of the Contractor and/or subcontractor.

The Contractor must use the Pre-Work Submittal Checklist provided at the end of these specifications to provide the Owner and/or Project Monitor these submittals. Failure to use the form will likely lead to the rejection of the submittal package and a delay in the project that will be the sole responsibility of the Contractor and/or subcontractor.

The Contractor is responsible for maintaining current documents and resubmitting copies to the Owner and/or Project Monitor for any worker whose documents expire during the project. Any worker observed on a job site who either is not approved to conduct work by the Owner and/or Project Monitor or has been approved but documentation pertaining to training, medical evaluation, or respiratory fit testing has expired, will be instructed to stop work until these documents are received by the Owner and/or Project Monitor and the worker is approved to perform work that disturbs lead.

1.6.2 Submittals Provided During The Work Or Following Completion Of The Work If Applicable

Depending on the document, these documents must be provided the Owner and/or Project Monitor on an ongoing basis during the work, or if appropriate following completion of the physical activities associated with the project. The documents must be received and approved by the Owner and/or Project Monitor before the work is considered complete. (Failure to provide these documents means the work is not complete, even though the physical activities may be completed.)

a. Daily sign-in sheet for each worker entering a lead regulated area.

b. The Contractor must provide the results of exposure sampling done to comply with the requirements of 8 CCR 1532.1 (d) and the requirements of this specification.

c. The Contractor must provide blood sampling and analysis results of lead (BLL) and zinc protoporphyrin (ZPP) levels for all workers who are represented by air monitoring results that exceed the Action Level. Typically, the Project Monitor will require blood lead sampling for all workers on a work shift if one or more air sampling results for that shift is above the Action Level.

d. The written results of the blood sampling analysis must be provided the Owner and/or Project Monitor within 21 days of the exposure over the Action Level or within 12 days of the completion of the project, whichever comes first.

e. Copies of job progress reports and project documentation. This must include the names of all employees onsite, the hours worked and a brief description of the work completed at the site(s).

f. The Contractor must provide all waste disposal documentation.

1.7 Third-party Oversight

The Owner is utilizing the services of Atlas as an independent third-party consultant to provide oversight of all work that disturbs lead on this project. The Contractor shall treat this third-party consultant as a designated representative of the Owner. The third-party consultant for this project is known as the Project Monitor. The Project Monitor is expected to perform some or all of the following activities on this project, but may also conduct other activities as needed:

a. Visually monitor the work practices of the Contractor's employees to determine that the work is being done in compliance with these specifications. The Project Monitor may conduct this activity on a continual basis or may make unannounced random visits to the project site to check on the Contractor's performance.

b. Visually inspect for the presence of visible emissions suspected to contain lead.

c. Conduct personal and area air monitoring in accordance with accepted methods.

d. Collect bulk samples of relevant materials to determine the presence or absence of lead.

e. Visually inspect the work area for cleanliness after completion of the work.

1.8 Air Sampling By The Owner and/or Project Monitor

The Owner and/or Project Monitor may determine it appropriate to collect air samples to evaluate the effectiveness of the Contractor is engineering controls and work practices. The Contractor and/or subcontractors shall allow the Project Monitor to attach and collect personal air samples on the workers and shall instruct the workers to comply with the directions for that sampling as given by the Project Monitor.

Air sampling may also be used to verify the effectiveness of the Contractor's containment system. The Project Monitor may choose to collect area air samples within the work area. These samples results may be used to generate an eight-hour, time-weighted average. The result of area samples in a lead work area should normally be far below what the workers are breathing. Therefore should the Project Monitor collect area air samples within the work area that result in exposures above half the Action Level (15 $\mu g/m^3$), the Project Monitor will require the Contractor and/or subcontractors to re-evaluate their work practices, engineering controls, and containment system.

The Project Monitor may also choose to collect area samples downwind, outside of the regulated work area. These sample results will be compared to background air samples upwind or samples collected prior to the beginning of work. Sample results indicating airborne lead emissions at or above 5 $\mu g/m^3$ above background levels will be interpreted to mean that the Contractor and/or subcontractors containment or engineering controls are inadequate. This may result in the temporary stoppage of work until the Project Monitor is assured that airborne lead levels will significantly diminish by the change in work practices or engineering controls.

1.9 Notification of Employers of Employees in Adjacent Areas

The Contractor and subcontractors who will disturb lead are responsible for ensuring that employers of employees in areas adjacent to the work being conducted have been notified that work disturbing lead will take place.

Typically this notification is in addition to the posting of lead regulated area signs. In summary, this notice shall be provided to all other contractors and subcontractors in areas adjacent to the work. Those employers must be notified in advance of any upcoming work that will disturb or impact lead in a manner that may generate airborne levels of lead that could present a potential exposure to workers at or above the Permissible Exposure Limit (PEL) as defined in 8 CCR 1532.1©. This notice shall also provide information on the control measures being implemented and a warning that the employer's employees are to remain outside of the posted regulated areas. The Contractor and/or subcontractors anticipating the need for such notification shall coordinate this notification with the Owner and/or Primary Contractor.

1.10 Suspension Of Work

The Owner and/or Project Monitor may suspend all work that disturbs lead if any controls (such as barriers) fail, if debris known or suspected to contain lead is detected outside the containment, or if work is on the exterior of a structure and wind speeds are more than fifteen miles per hour, or if in the judgement of the Project Monitor, other factors exist that determine the work must be stopped because of the potential for the creation of lead hazards. For example, the Project monitor may conduct perimeter monitoring and discover that lead is being released in concentrations at 5 µg/m^3 above background levels or work area air monitoring that is above half the Action Level. In either case, the Owner and/or Project Monitor may suspend work until more effective containment, work practices, and engineering controls are utilized.

1.11 Pre-Start Meeting

The Project Monitor typically recommends that there be a pre-start meeting with the Contractor or subcontractor's representative and the Project Monitor approximately five days prior to the expected start of work. The Contractor will be expected to provide the majority of pre-work submittals described in Part 1.6.1 at that meeting. This meeting is designed to answer questions about the project and address issues of concern of either the Contractor, subcontractor, or Project Monitor. Should this meeting be determined not to be necessary, the submittals must be delivered to the Owner and/or Project Monitor no later than five working days in advance of the work.

1.12 Testing For Lead In Paints, Coatings, Ceramic Tile, And Other Materials

Lead is common in the paint and ceramic wall tile in buildings the age of buildings on this project. Therefore, it is not anticipated there will be a need for additional testing. However, in some cases, it may be in the interest of the contractor and/or subcontractors to determine the exact concentration of lead in the paint or coating since that will affect Cal/OSHA and CDPH compliance issues. For example, many interior surfaces will contain paint, which contains less than 600 parts per million lead. Should the paint be tested and that discovered, much of the Cal/OSHA lead standard and not all of the CDPH Title 17 standard will apply.

For example, should the paint contain less than 600 parts per million lead, the contractor and/or subcontractors could drill into or conduct other non-trigger tasks on this material without extensive training. Also, the demolition of these surfaces would not trigger prior notification to Cal/OSHA.

Should the contractor and/or subcontractor wish the paint or ceramic tile to be tested, they will need to request this of the Project Monitor. This testing must be done by Atlas. The Project Monitor will be able to assist the contractor and/or subcontractor in determining if testing the material is likely to be worthwhile for the contractor and/or subcontractor.

PART 2.0 MATERIALS AND EQUIPMENT

2.1 Fire Resistant Plastic Sheeting (Poly)

All plastic sheeting used on this project must be fire resistant whether used inside or outside of buildings.

2.2 Challenge Testing Of HEPA Filtration Systems

All HEPA-equipped vacuums and air filtration units to be used on this project in interior spaces during operations that may disturb lead must be challenge tested and meet ANSI requirements using DOP or an equivalent testing agent. Except for HEPA air filtration units used to create negative pressure differentials for the demolition of ceramic tile, this testing must take place within ten calendar days prior to their use and after replacement of any HEPA filter removed from previously tested equipment. Air filtration units used in conjunction with the demolition of ceramic walls must be challenge tested on site. They do not need to be retested as long as they remain on site. They will need to be retested if they are moved off site. Copies of all testing certifications must be provided to the Owner and Project Monitor prior to use of the equipment.

Exception: Subcontractors using HEPA vacuums for incidental cleanup of lead dust resulting from the minimal disturbance of lead as discussed in Part 1.5.1 are exempt from the challenge-testing requirement unless, in the judgement of the Project Monitor, there is a reasonable expectation that the subcontractor's HEPA vacuums are leaking.

2.3 Vacuum-Assisted Tools

When using power tools to disturb lead, the Contractor shall only use tools that have a HEPA-filtered-vacuum recovery system.

2.4 Power Washing

No high pressure or water blasting tools may be used if the spray will contact lead-containing paint.

For the purposes of this specification, power washing is defined as: The use of a low pressure "power washer" to rinse and/or wash stable, painted or coated surfaces to remove dust, dirt, grime, and other foreign matter in preparation for re-painting." Under no circumstance may power washing be used to remove lead-containing paints or coatings from surfaces. Before using power washing, all areas of loose, peeling, cracking,

or unstable coatings must first be prepared for re-painting using the appropriate methods and personnel protective equipment as specified by Cal/OSHA and CDPH regulations, and these specifications. Typically, this means all loose and peeling paint must be removed by hand scraping and sanding or the use of mechanical tools equipped with HEPA filtration.

Should a Contractor or subcontractor use power washing in a manner that releases paint from the surface, and that paint also not be contained, the Contractor or subcontractor will be responsible for all costs associated with the Owner hiring and environmental contractor to clean up the area. The area to be cleaned will be determined by the Project Monitor and will extend past the point of visually apparent debris.

Prior to performing power wash operations the Contractor must determine if the local sanitation district requires a Wastewater Discharge Permit for Surface Washers. Should this permit be required, the Contractor is responsible for obtaining it, accurately completing it and adhering to the permit requirements.

2.5 Personal Protective Equipment

The Contractor shall use respirators and personal protective equipment as required by 8 CCR 1532.1 and as appropriate based on personal air monitoring results. All respirators must be approved by NIOSH.

Respirator fit test records and the respiratory protection program shall be retained on site as part of the project documentation if respiratory protection is used on this project. Disposable dust/mist respirators shall not be used.

At a minimum, half-face respirators with P-100 (HEPA) cartridges will be required during surface preparation where there is manual scraping or sanding that will take more than one hour to complete. Dry scraping or sanding, mechanical scraping, abrading, sanding, or similar actions will trigger the need for respirators regardless of the duration of the activity.

Regardless of the duration of the work, all workers scraping lead-containing paint or removing or demolishing ceramic tile must wear disposable protective clothing. Workers demolishing surfaces that contain ceramic tile must wear full body protective clothing including hoods and gloves.

At a minimum, the Contractor and subcontractors must ensure that no lead dust or debris is tracked out of the contained, regulated area. The Contractor and subcontractors must ensure that all those allowed into the regulated area wear adequate foot coverings that ensure that they will not track contaminated material out of the area when the leave.

2.6 Rental Equipment

Any equipment rented for the purpose of disturbing lead or used within a lead regulated area must be accompanied with documentation verifying that the rental agency has been notified, and acknowledges receipt of notification that the equipment being rented will be used for work inside a lead regulated area. This documentation must be submitted to the Project Monitor/Project Supervisor prior to the equipment being used on the job site.

PART 3.0 EXECUTION

3.1 Summary

Contractors and subcontractors conducting lead related construction work will be evaluated on a performance standard, which includes, but is not limited to, cleanliness of work area, work practices as verified by exposure monitoring, containment set up, and ultimately, the cleanup of paint chips, dust, and debris.

Any work practice that creates paint chips, dust, glazed ceramic or painted debris must be conducted within a regulated area as defined in 8 CCR 1532.1 and within a containment at least as stringent as required by Title 17 and/or described in these specifications.

The containment system shall be designed and constructed to prevent visible dust or debris from escaping the work area as well as the escape of airborne lead emissions at or above 10 µg/m^3 above background levels. Should dust or debris generated by the work be found outside the containment, or the airborne lead outside the containment exceed background levels, the Project Monitor will determine that the containment is inadequate, in violation of Title 17 requirements, and work will be stopped until the Contractor and/or subcontractors redesign the containment to be more effective.

3.2 PEL and Action Level Compliance Requirements

Contractors and subcontractors strictly adhering to the requirements listed in the specifications who conduct minimal disturbance of lead such as by the conduction of trigger task work amounting to less than one hour, may begin work assuming the Cal/OSHA Permissible Exposure Limit (PEL) will not be exceeded.

Contractors and subcontractors not strictly conforming to suggested work practices must start work assuming the PEL will be exceeded. This means they must comply with all OSHA requirements specified for work that results in exposures over the PEL. This will include, but is not limited to, complying with requirements for training, personal protection, regulated area development, blood testing, personal air monitoring, the development of a written compliance plan, and the notification of employers in adjacent areas.

Contractors and subcontractors must assume the PEL will be exceeded each time they conduct trigger activities that will exceed one hour in duration. This will trigger the need to wear respirators and protective clothing, meet the training requirements specified earlier in these specifications, conduct personal air sampling, develop a written compliance plan and all other actions described as necessary by 8 CCR 1532.1 and these specifications.

3.2.1 Personal Air Sampling

The Contractor and subcontractors are responsible for conducting personal air monitoring during disturbance of lead in compliance with the requirements of 8 CCR 1532.1. At a minimum, Contractors and subcontractors shall conduct representative exposure monitoring on workers on a daily basis whenever those workers will conduct trigger task activities that will take longer than one hour to complete in an eight-hour shift. In addition, air sampling must be done for any work for which the Project Monitor believes has a reasonable potential for generating airborne lead at or above the Action Level. The Project Monitor will not allow work to proceed if the Contractor is not prepared to conduct the necessary air monitoring.

Sample information must include (but is not restricted to) the name of the individuals wearing the samples, the individuals' Social Security Number or Company ID number, the date the samples were collected, identification by unique method of the area where the work is being performed, and identification of the work being performed. EXAMPLE: James Black, 000-11-222, 06/25/03, Bill Jackson Elementary Owner, Building H, Classroom 5, East covered walkway, paint surface preparation work.

Laboratory results shall be provided to the Owner and/or Project Monitor within 72 hours of sample collection. Paper copies must be received within 14 days of the Contractor receiving the results from the laboratory. Contractor and/or subcontractor must submit proof that laboratory has the required licenses to analyze air samples for lead.

Should they wish to make use of the exceptions to air sampling stated in 8 CCR 1532.1 (d)(3)© & (D), the Contractor and/or subcontractors must submit the required information to the Owner and/or Project Monitor and receive written approval from the Owner and/or Project Monitor prior to reducing the personal protection, containment, or engineering controls stated in this specification. In general, air sampling results that are intended for use to reduce personal protection requirements must be collected on this project. Air sampling results from other projects will not be allowed to create a negative exposure assessment for use on this project.

Contractor and/or subcontractors must submit a signed statement that they will conduct personal air sampling according to Cal/OSHA requirements for all work where that sampling is required by these specifications. Typically sampling will be required whenever the Contractor and/or subcontractor conduct a trigger task for more than one hour in an eight or more hour shift.

3.3 Work Involving Whole Component Removal or Demolition Of Entire Structures

Intact lead-containing paint on construction debris is generally not considered a hazardous waste in California. However, loose and peeling paint on structures may result in all construction debris from that site being considered a hazardous waste.

Therefore prior to the demolition or removal of painted material and the disposal of that material, all loose, peeling or flaking paint must be removed. This includes objects such as fences, built-in furniture or cabinets, other similar structures, as well as entire structures being demolished.

Any paint debris generated during this work must be separated into appropriate waste streams and handled as a hazardous waste, or as deemed appropriate as discussed in Part 3.11 Lead Waste Management.

The manual demolition or removal of painted components involving over 100 square feet of material does not trigger the Cal/OSHA pre-work notification as stated in 8 CCR 1532.1 (p) if the paint is intact and will largely remain undisturbed by the removal or demolition process. For example, if door or window frames with intact paint are removed, and the amount of material is over 100 square feet, the Cal/OSHA notification does not need to be provided if the paint is intact and will not be disturbed by the removal process.

3.4 Prohibited Work Practices

The following work activities are prohibited on the project:

a. Open-flame burning or torching.

b Machine sanding or grinding of lead materials or surfaces coated with lead unless the machine is equipped with a HEPA-filtered-vacuum recovery system.

c. Un-contained hydro-blasting or high-pressure washing.

d. The use of power washing to remove loose and peeling paint.

e. Abrasive blasting or sandblasting without a HEPA-filtered-vacuum recovery system or done outside of a negative pressure enclosure.

f. Heat guns operating above 1,100 ˚F.

g. Dry scraping, except for limited areas where electrical hazards create a higher risk than lead or unless specifically approved by the Project Monitor.

h. Use of methylene chloride based paint strippers.

3.5 Competent Person

The Contractor and/or subcontractors disturbing lead shall have a competent person (as defined by Cal/OSHA for construction activities) onsite at all times to supervise and oversee all activities, which may disturb materials containing lead. This person must be a CDPH Certified Lead Supervisor for all work that involves the conduction of trigger tasks on more than 100 square feet of lead-containing material.

The above requirement is not required for environmental contractors conducting work limited to the removal of loose and peeling paint on structures scheduled for demolition. In those situations, the on-site supervisor must meet the lead training requirements as stated in Part 1.5.2 Required Training for those exposed over the Action Level or who conduct trigger tasks. In addition, the Contractor must have a CDPH certified supervisor approve the containment setup at the start of each shift that will disturb lead, approve the work practices and personal protective equipment worn by the workers, verify that proper air monitoring is being collected, be able to return to the site within two hours if requested by the Project Monitor, and approve the final cleanup of the work area prior to a visual inspection of the work area being conducted by the Project Monitor. *The certified supervisor will always be required to approve the initial set up of the containment, personal protection, and work practices at the start of the job, but then depending on the quality of the work demonstrated, the Project Monitor may not require the certified supervisor to inspect the work site at the start of each shift.* This exemption will be revoked should air sampling on this project demonstrate airborne lead exposures to workers or supervisors are above the Action Level.

Altadena Library

3.6 Work Site Preparation & Containment Requirements

The Contractor and/or subcontractor is required to contain the disturbance of lead in a manner that prevents lead-contaminated dust, debris, water, or air from leaving the regulated work area in an uncontrolled fashion. The containment must be developed in compliance with the requirements of Title 17 and these specifications. The presence of lead dust, debris, or air above background levels will indicate that the containment is inadequate. Work will be stopped and the Contractor and/or subcontractor must adjust work practices, engineering controls, or the containment in a manner that convinces the Project Monitor/Project Supervisor that the material will no longer be able to escape the regulated work area.

3.6.1 Exterior Work Site Preparation & Containment

The Contractor and subcontractors are responsible for ensuring that building occupants and those in adjacent areas are not exposed to lead dust or debris as they enter or exit buildings. The Contractor and subcontractors shall ensure that building occupants and others in the adjacent area do not enter the lead regulated area and have a safe means of access and egress to the building.

For exterior work site preparation, one layer of six-mil poly sheeting shall be placed on the ground extending at least ten feet beyond the perimeter of surfaces included in the work. This poly sheeting must be extended a minimum of twenty feet for a multistory building. Depending on wind conditions, the poly may need to be extended further than the ten and twenty foot minimums. The poly on the ground must be adequate to catch all lead-containing debris and water. For example, if the work involves the scraping of paint, all paint chips, dust, debris and water that is released by the work must be contained on the poly.

The poly must be secured to the side of the building or structure with tape, or other anchoring system, so that there is no gap between the poly and the building or structure. The poly installed to cover ground or landscaping shall be installed in a manner to ensure that it will not blow away or billow from the wind. The use of weights such as wood is acceptable as long as the poly does not billow or blow in a manner that releases lead dust or debris off it.

The exterior of all windows located within ten feet of any disturbance of lead must be sealed by covering them with at least one layer of six-mil thick poly sheeting. All ventilation machinery within 20 feet of the disturbance should be sealed by at least one layer of six-mil thick poly sheeting. Keep all windows within 20 feet of working surfaces closed, including windows of adjacent structures.

Should the disturbance of paint involve removing paint from the exterior of a window, then the Contractor or subcontractor must seal the inside of the window with two layers of six-mil thick poly. The Project Monitor will typically waive the requirement to seal the inside of the window with two layers of poly if the disturbance of lead involves less than 5% of the painted surface area of an exterior window.

Those in adjacent areas must be kept a sufficient distance from any chance of encountering lead dust and debris. Therefore, the Contractor shall erect barrier tape at a distance sufficient from the poly barriers to ensure that those passing by the area are not directly adjacent to the poly containment barriers. In general, the barrier tape should be at least five feet from the edge of the poly placed on ground surfaces if those surfaces are accessible to unauthorized persons. The area off the poly sheeting, but inside of the barrier tape, is still part of the regulated area however and is not allowed to have any lead dust or debris present at any time.

The Contractor and/or subcontractor must post the regulated area sign as described in 8 CCR 1532.1 (m) (WARNING, LEAD WORK AREA, POISON, NO SMOKING OR EATING.) The posting may be done by wording on the barrier tape or by suspending OSHA-approved signs with the wording on the tape barriers or on readily apparent surfaces visible to persons outside the area.

All those entering the regulated area must sign in on a roster that documents their presence in the area. This roster must be provided the Owner and/or Project Monitor on a daily or weekly basis as determined by the Project Monitor.

Work disturbing lead shall not be conducted on exterior surfaces if wind speeds are greater than 15 miles per hour or, in the judgement of the Project Monitor, pose a risk of blowing lead dust or debris out of the regulated area.

In addition, for work done on ladders or man lifts, the Project Monitor is likely to require the workers to scrape loose and peeling paint directly into a container, rather than let the loose debris float down and possibly off the containment barrier. Typically, the Project Monitor/Project Supervisor will allow the workers to scrape loose and peeling paint into a cardboard box held in one hand while scraping with the other hand.

Work must stop and cleanup occur before rain begins.

The Contractor shall not leave debris or poly sheeting out overnight if work is not completed. The Contractor shall keep all debris in a secured area until final disposal.

3.6.2 Interior Site Preparation & Containment

For interior work site preparation, one layer of six-mil poly sheeting must be placed on the entire floor. However, the entire floor area need not be covered by poly for large interior areas where the disturbance of lead is limited to the perimeter of the area. If the entire floor area is not covered with poly, the poly must extend out a minimum of ten feet from those areas where lead will be disturbed. The poly sheeting must be secured to the wall using tape so there is no gap between the floor and the wall. The poly must also be secured to the floor.

If individual rooms are being worked in, seal all doorways with a primitive airlock flap to prevent contamination of other areas of the building. Post the regulated area signs, as required by 8 CCR 1532.1 (m), at the entrance to the regulated area and all other entry points to the area.

All those entering the regulated area must sign in on a roster that documents their presence in the area. This roster must be provided the Owner and/or Project Monitor on a daily or weekly basis as determined by the Project Monitor.

If feasible, turn off all HVAC systems in the regulated work area. In addition, seal all ventilation systems in the regulated work area with a minimum of one layer of six-mil poly. Any exceptions to this requirement must be approved by the Project Monitor. Typically, the Project Monitor will require all ventilation system ducts and/or registers to be sealed with poly if they are within 20 feet of the disturbance of lead even if they are turned off. Seal all furniture or other equipment that must remain in place with a layer of four or six-mil poly. A minimum of six-mil poly is required for all work disturbing ceramic tile.

Small amounts of ceramic tile, such as covering less than two square feet, may be removed using this type of interior containment if the tiles are removed using hand tools and remain substantially intact during the removal process. Additional requirements for interior site preparation are required when surfaces covered by lead-containing ceramic tile are demolished. Those requirements are discussed in Part 3.6.3.

3.6.3 Containment Requirements- Removal of Ceramic Tiles or use of Mechanical Means

This part primarily addresses work that will involve the demolition of building surfaces covered by lead-containing ceramic tile. These requirements shall also apply shall the Contractor and/or subcontractors disturb lead-containing material, in an interior space, using mechanical or blasting methods without a HEPA-filtered recovery system approved by the Project Monitor.

Altadena Library

In addition to the requirements stated in Part 3.6.2, the demolition of ceramic tile that involves the breakage or cutting of the tile must be done inside a negative air pressure containment system. The negative air pressure must be generated using an air filtration unit that has been challenge tested on site as described in Part 2.2 Challenge Testing Of HEPA Filtration Systems.

Seal all critical barriers between the work area and the adjacent areas with a minimum of six-mil thick poly. Critical barriers are any openings in the surface areas of the regulated work area through which air, dust, or water might pass. This includes, but is not necessarily limited to all windows, doors, HVAC vents and units.

All objects or equipment that cannot be removed from the area must be covered and tape sealed with a minimum of six-mil thick poly. Any exceptions to this requirement must be specifically approved by the Project Monitor.

Typical decontamination requirements for paint scraping and most manual demolition are discussed in Part 3.6.4 Decontamination Procedures. However, the decontamination procedures surrounding the demolition of ceramic tile are much more stringent and are described below.

All regulated work areas where ceramic tile will be broken, or other tasks that will, in the opinion of the Project Monitor/Project Supervisor, generate significant amounts of lead dust, must include a personal decontamination area and the supervisor must ensure that, at a minimum, the following procedures are followed.

a. Work That Disturbs Less Than 100 Square Feet Of Lead-Containing Material

Work involving the demolition of less than 100 square feet of lead-containing material, including ceramic tile, is not expected to result in airborne exposures over the PEL. Therefore, the personal decontamination system may, at a minimum, be a one stage decontamination system that separates the work area from the adjacent areas.

1. This must, at a minimum, include an airlock chamber between the work area and the adjacent areas. Each side of the air lock must be covered by poly curtains. At no time, including during the removal of waste containers, may the poly doors be open on both sides of this chamber at the same time. This chamber must be a minimum of three feet by three feet by six feet tall. There must be a clean poly drop cloth measuring at least five feet by five feet immediately outside this air lock onto which workers will step after exiting the air lock. This poly drop cloth must be kept visually clean of dust and debris at all times. This poly drop cloth shall be removed at the end of the work shift and replaced with a new clean poly drop cloth at the start of the next shift.

2. The workers must be able to remove their protective clothing and wash off their respirator before leaving the work area. The supervisor must ensure that they do not track lead containing materials out of the work area on their feet. Footwear worn out of the work area must have been covered by protective booties if worn in the work area. Following removal of the protective covering over the footwear, all footwear worn in the work are must be HEPA vacuumed before allowing it to be worn out of the regulated area. Footwear that can be washed before leaving the work area doesnot need to be covered by protective booties as long as the exterior of the footwear is thoroughly washed prior to being worn outside of the regulated area.

3. After they leave the decontamination chamber, workers must go directly to a nearby location where they must throughly wash their hands and face. Cal/OSHA specifically states that the supervisor must ensure this washing takes place.

4. Special attention must be given that workers do not track lead dust out of the work area on the soles of their feet or shoes.

5. Following the exit of workers from the work area, whether leaving for breaks or at the end of the day, the supervisor must visually inspect the area outside the decontamination system to verify that no dust or debris is being tracked out.

6. The Contractor shall not permit the storage or consumption of food and/or beverages inside the containment or within any of the decontamination chambers. Food or drink consumption within containment may result in the worker(s) dismissal from the site for the duration of the project.

7. Work will be stopped if the Project Monitor determines that the decontamination system is not kept in acceptable condition or used properly.

b. Work That Disturbs More Than 100 Square Feet Of Lead-Containing Material

For all work that disturbs more than 100 square feet of wall ceramic tile, the decontamination system must be a full, three-stage decontamination chamber with a shower as described below.

1. The three-stage decontamination unit with shower must be contiguous with the containment unless determined infeasible by the Project Monitor.

2. The worker decontamination enclosure system shall consist of at least a clean room, a shower room, and an equipment room, separated from the work area by airlock chambers. The airlock chambers shall be at least three feet square in size. All fabricated units shall have, at a minimum, two layers of six-mil poly sheeting.

3. Entry and exit from all airlock chambers and the decontamination enclosure system chambers shall be through doorways designed to restrict air movement between chambers when not in use. The dirty side shall have an extra layer of six-mil poly sheeting on the floor as a an extra drop cloth and it shall be replaced at least daily.

4. The clean room shall be sized and equipped to adequately accommodate the work crew. Lighting, heat and electricity shall be provided as necessary for comfort. This area must remain clean. If in the judgement of the Project Monitor, equipment storage or other activities taking place in this area affect the cleanliness of the area, the Contractor may be required to move that storage and those activities away from the designated clean area.

5. The shower room shall contain one or more showers as necessary to adequately accommodate workers and shall meet OSHA requirements for temporary shower facilities. The shower enclosure shall be constructed to ensure against leakage of any kind. In addition, the shower shall be a separate unit from the decontamination unit walls. The shower unit cannot be made from poly. Metal or hard plastic is acceptable. An adequate supply of soap, shampoo and towels shall be supplied by the Contractor and available at all times.

6. Shower water shall be drained, collected and filtered through a system with at least a five micrometer particle size collection capability. Filtered waste water shall be disposed of into a sanitary sewage system. Under no circumstances may it be

released where it might enter a storm drain.

7. The shower chamber shall be, at a minimum, three feet by three feet wide by a minimum of six feet in height. The shower chamber shall be constructed so that no water from the shower can spray out of the chamber, nor any water run down the sides of the poly and escape the chamber system. The Contractor must have a back-up containment system to control leaks from the shower, connections and hoses. This can be either a secondary metal pan under the shower or a series of poly barriers, separate from the construction of the chamber, that are solely for the purpose of collecting water that might leak out of the shower system.

8. Each decontamination chamber shall have, at least, a four inch lip of poly from the floor up the wall to prevent possible transfer of water and debris between chambers. Excess poly at the corners of this floor is to be fitted to the sides of the chamber by folding poly and taping, as opposed to cutting away excess poly and taping seams. For some projects, particularly those where the decontamination chambers are located on surfaces needing special protection from water, the Project Monitor may determine additional precautions are necessary such as requiring the shower chamber to have an overflow pan, in which the shower unit sits, that is capable of holding two inches of water. The filter system and any hose connections transferring contaminated water shall be located in a secondary containment, such as a metal pan. Any leakage shall be double-bagged or re-filtered. Should this requirement for an additional metal pan under the shower be required, it will be identified elsewhere in these specifications and discussed at the bid walk.

9. Unless otherwise specified in these specifications, the minimum size of the decontamination chambers shall be the following:

Clean Change Room	five feet x six feet x six feet high
Shower	three feet x three feet x six feet high
Dirty Change Room	five feet x six feet x six feet high
Air Lock Chambers	three feet x three feet x six feet high

10. The Dirty Change Room may be part of the work area as long as a separate drop cloth is placed down before the entrance to the first airlock chamber and this drop cloth dust not contain significant quantities of debris from the work area.

11. There must be a clean poly drop cloth measuring at least five feet by five feet immediately outside the clean side airlock onto which workers will step after exiting the airlock. This poly drop cloth must be kept visually clean of dust and debris at all times. This poly drop cloth shall be removed at the end of the work shift and replaced with a new clean poly drop cloth at the start of the next shift.

12. Special attention must be given that workers do not track lead dust out of the work area on the soles of their feet or shoes. Footwear worn out of the work area must have been covered by protective booties if worn in the work area. Following removal of the protective covering over the footwear, all footwear worn in the work are must be HEPA vacuumed before allowing it to be worn out of the regulated area. Footwear that can be washed before leaving the work area does not need to be covered by protective booties as long as the exterior of the footwear is thoroughly washed prior to being worn outside of the regulated area.

13. Following the exit of workers from the work area, whether leaving for breaks or at the end of the day, the supervisor must visually inspect the area outside the

decontamination system to verify that no dust or debris is being tracked out.

14. The Contractor shall not permit the storage or consumption of food and/or beverages inside the containment or within any of the decontamination chambers. Food or drink consumption within containment may result in the worker(s) dismissal from the site for the duration of the project.

15. Work will be stopped if the Project Monitor determines that the decontamination system is not kept in acceptable condition or used properly.

3.6.4 Decontamination Procedures

Decontamination procedures shall be established by the Contractor and subcontractor depending upon the airborne concentrations of lead as well as the amount of dust and debris created by the work. At a minimum, the decontamination procedures shall be in compliance with 8 CCR 1532.1 (l)(1-5). As stated in 8 1532.1 (l)(1-5), the Contractor shall assure that these decontamination facilities are used by the supervisor and workers.

For work that does not exceed the PEL, and/or does not include the disturbance of more than 100 square feet of material, the Contractor and/or subcontractor must assure that a hand-washing station is available and used by the supervisor and workers. For work that exceeds the PEL, or involves the breakage of ceramic tile in amounts over 100 square feet, the Contractor must ensure that workers shower, at a minimum at the end of the work shift as required by 8 CCR 1532.1.

3.6.5 Avoiding Contamination Of Adjacent Areas By Proper Decontamination

Should the Owner and/or Project Monitor discover that an occupant of the regulated area left the regulated area without properly decontaminating; the Contractor will be required to clean the adjacent areas that in the opinion of Project Monitor may have been exposed to lead dust or debris from this action. Failure to properly decontaminate is demonstrated by wearing protective clothing outside the regulated area that was previously worn in the area or by wearing footwear outside the regulated area that was not properly covered and/or decontaminated. The failure to adequately decontaminate will trigger the following cleaning. In all areas determined necessary by Project Monitor, the Contractor will be required to HEPA vacuum, then wet wash, then HEPA vacuum again all potentially contaminated areas and items to the satisfaction of the Project Monitor. The Project Monitor will not need to demonstrate the need for this cleaning by the presence of visible dust and will not need to collect settled dust samples in order to require the Contractor to implement the cleaning routine.

3.6.6 Approval Prior To Start Of Work

The Project Monitor shall visually inspect any regulated area for compliance with this specification before the contractor and/or subcontractor may begin work that may disturb lead. The contractor and/or subcontractors may not begin work disturbing lead without approval from the Project Monitor. The contractor and/or subcontractor must contact the Project Monitor sufficiently in advance of needing the visual inspection and coordinate with the Project Monitor in order to minimize any delays resulting from the need for this visual inspection.

Typically, once the Project Monitor has reviewed the contractor and/or subcontractors regulated work area set up, the work site supervisor will be told that they may start work at future regulated work areas without prior authorization from the Project Monitor as long as they assure the Project Monitor that the containment and work practices will be implemented as approved by the Project Monitor.

3.7 Wet Work Practices

Unless determined infeasible by the Project Monitor, all disturbance of lead-containing materials must utilize wet methods for dust suppression.

3.8 Prompt Cleanup Of Debris

Removed lead-containing material shall be kept wet and promptly placed in the type of waste containers required by this specification. The Contractor and subcontractors are encouraged to place debris in containers shortly after it has been removed. However, at a minimum, all bulk debris must be containerized before any work stoppages such as for breaks, lunch, or the end of a shift. Bulk debris must be kept adequately wet until it is containerized. The Contractor must plan only to disturb amounts of material that can be cleaned up and containerized before the next work stoppage. Delays and additional costs incurred by the Contractor for failing to adequately calculate the amount of time needed to clean up debris will be the sole responsibility of the Contractor. For example, if a crew must work overtime to containerize debris before ending the shift, those additional costs are the sole responsibility of the Contractor.

The Contractor and/or subcontractor must not allow excessive amounts of dust and debris to gather on the floor containment barriers. If in the opinion of the Project Monitor, too much debris is being allowed to gather on the floor poly, the Project Monitor will require the Contractor or subcontractor to either assign a worker to conduct continual cleanup, or the workers scraping paint or conducting other work disturbing lead will have to contain the debris before it falls to the ground. Typically this is done by scraping paint directly into a cardboard box held by the worker as he or she scrapes off the loose and peeling paint.

3.9 Final Cleanup Of The Work Area

3.9.1 Exterior Work Areas

The Contractor and/or subcontractor must HEPA vacuum up all visible dust and debris off containment barriers. Then gently roll and/or fold poly barriers in on themselves in order to avoid releasing any remaining dust to adjacent areas during this process.

The final step will be to vacuum up any visible dust or debris in the work area or regulated area that is suspected to contain lead. The area must be visually clean of all lead-related dust and debris, and all poly barriers must be removed before the workers leave the job site. The regulated area barrier tape and/or signs must be taken down. Critical barriers erected on windows and HVAC systems may be left in place if work will take place in those same areas during the next work shift. Otherwise those barriers must also be removed before the workers leave at the end of the shift.

3.9.2 Cleanup Of Interior Work Areas

All cleanup of the interior work area shall be performed using a HEPA vacuum and wet washing techniques. All surface areas in the work area that reasonably could have been exposed to airborne lead must be HEPA vacuumed and/or wet washed. This includes wall surfaces when the work included ceramic tile demolition. Ceilings must also be cleaned if the ceilings are less than five feet above the area where ceramic tiles were disturbed. For example, if the ceramic tile wainscoting extended six feet up the wall, and the ceiling is at eleven feet or lower, the ceiling will need to be vacuumed. If, however, the ceiling is above eleven feet, it will not need to be cleaned. This is based on the assumption that lead dust is unlikely to migrate up more than five feet. If in the judgement of the supervisor or Project Monitor the ceiling may be contaminated, the ceiling shall be cleaned regardless of how far it is above the disturbance of the tile.

3.10 Final Inspection Of The Work Area

The Project Monitor will inspect work areas for visual signs of dust and debris related to the disturbance of lead. The Project Monitor will not inspect or evaluate the quality of paint preparation work such as paint scraping. The contractor who will be painting the prepared surfaces is responsible for the quality and workmanship of the surface preparation. However, if the work involves the removal of loose and peeling paint

prior to the demolition of a structure, the Project Monitor will evaluate the completeness of that work.

For exterior work, the Project Monitor will visually inspect the work area to determine that there is no visible dust or debris still in the area that is reasonably expected to have been generated by the work. All poly barriers (except for on critical barriers in areas needed for the next shift) and barrier tape and signs must be removed.

Until told otherwise by the Project Monitor, the supervisor must notify the Project Monitor in advance of the end of the shift in order for the Project Monitor to visually inspect the work area prior to the workers leaving for the day. Typically this will not be required after the workers demonstrate that they consistently properly clean the work area before leaving.

For interior work, the Project Monitor will conduct a thorough visual inspection for dust and debris that may be related to the disturbance of lead. All surface areas must be clean. Residue dust will be assumed to contain lead and must be cleaned.

Until told otherwise by the Project Monitor, the supervisor shall notify the Project Monitor when the supervisor believes the work is complete and ready for a visual inspection. Prior to calling the Project Monitor for the visual inspection, the supervisor must personally inspect the area and determine that it is clean and ready for a final inspection.

The Project Monitor typically will not collect dust wipe samples to verify the cleanliness of an area unless specifically stated otherwise elsewhere in these specifications. However, dust wipes may be collected in either of the following circumstances. In both cases the supervisor will be told of the possibility of the collection of dust wipes and encouraged to conduct extra cleaning of the areas.

a. Ceramic Tile Removal Closely Adjacent To Kindergarten Classrooms, Daycare Facilities, or Food Preparation Areas Including Kitchens and Eating Areas.

   The Project Monitor is likely to conduct dust wipe sampling on the floor in the area between the decontamination unit and occupied areas of the property where children under the age of six routinely may be present. The supervisor will be told in advance that this testing will take place and is encouraged to clean the area between the decontamination area and where the sample will be collected. This sample will be collected within 20 feet of the decontamination chambers unless the Project Monitor believes that poor work practices or decontamination procedures have contaminated the area as discussed below.

b. Failure To Comply With Work Practices, Engineering Controls, Or Decontamination Procedures

   If in the judgement of the Project Monitor, the Contractor and/or subcontractor has not followed the requirements of this specification regarding work practices, engineering controls, and decontamination procedures, the Project Monitor will collect dust wipe samples in areas believed contaminated by the Contractor or subcontractors' actions. The supervisor of the project will be told in advance if such testing will be conducted and given time to clean those areas. For example, Part 3.6.5. describes actions that will lead to additional cleaning by the

Contractor.

Should dust wipe sampling be necessary, the Project Monitor will conduct such testing with the specified intent of verifying whether the containment process and decontamination processes used by the Contractor and/or subcontractor were adequate in preventing the release of lead dust from the work area. The samples will be collected according to the procedures required in Title 17. The containment will be judged appropriate if the results of the samples do not indicate a dust lead hazard for floors as specified in Title 17.

3.11 Power Washing of Exterior Building Surfaces

For the purposes of this procedure power washing is defined as the use of a low pressure "power washer" to rinse and/or wash stable, painted or coated surfaces to remove dust, dirt, grime, and other foreign matter in preparation for re-painting. In no circumstance is this to be construed as water blasting, and is not intended nor shall be used to remove lead-containing paints or coatings from surfaces. Loose and peeling paint must be removed by the other methods described in this specification before power washing may be conducted. Should power washing begin to release paint from the substrate, the Contractor must stop the power washing process and remove the loose material following the procedures described in these specifications.

3.11.1 Waste Water Discharge Permits

Many local sanitation districts require the completion and submission of a waste discharge permit prior to allowing the use of power washers. Therefore, prior to performing power- wash operations, the Contractor must obtain a Wastewater Discharge Permit for Surface Washers, if required, from the local Sanitation District, Water Quality Division; Industrial Waste Section, and adhere to the permit requirements. It is the Contractor's responsibility to obtain and properly fill out a current copy of this permit if it is required.

3.11.2 Required Work Practices For Power Washing

Where power washing of exterior surfaces of buildings coated with lead-containing paint(s) or seal coats is specified, or in those areas where the Contractor opts to use power washing to prepare surfaces, all of the following conditions must be met prior to uncontrolled washing without waste water control/collection measures. The following test is conducted prior to allowing the beginning of full power washing in order to verify that measurable amounts of lead are not being released by the washing process. Once it is determined that the washing process does not release lead, the Contractor will be allowed to proceed with power washing with only minimal additional requirements.

a. The Contractor in coordination with the Project Monitor shall select a minimum of one test area typical of the surfaces to be power washed. This area shall be100 or more square feet in area. On some sites where the building surfaces are different, the Project Monitor may require more than one area to be tested.

b. The Contractor shall construct a floor containment for the test areas. The containment must be designed to capture and collect all wash water and any paint chips generated during the assessment. Typically the Contractor simply needs to use poly on the ground to create a basin like effect which will capture the spray water.

c. The Project Monitor will first collect a sample of source water such as from the hose tap. The Contractor will then be asked to power wash the test area in a similar manner as to how the building as a whole will be power washed. Work shall be halted if the washing process causes delamination of paint from the test area surfaces. Modifications to the methods and work practices shall be made prior to resumption of power washing and these modifications must be approved by the Project Monitor prior to their implementation.

d. The Project Monitor will collect one or more samples of the water runoff that was captured by the Contractor following power washing the test area. As long as there are no visible paint chips in the water and/or the amount of water is not excessive, the Contractor may release the captured water as long as it is absorbed by landscaping or will evaporate. No waste water resulting from power washing operations may be allowed to drain into any storm drain as required by the State of California.

e. The Project Monitor will send these samples to a laboratory for lead in water analysis. The sample results for the source water will be compared to the water runoff sample. If similar amounts of lead are present in each, the Project Monitor will reach the conclusion that the power washing process is unlikely to release lead into the water or surrounding area during the power washing process. Typically the power washing process does not release lead as long as loose and peeling paint was removed prior to the start of power washing.

f. The Owner will pay for the collection of these water samples and their laboratory analysis.

g. The Project Monitor will notify the Contractor as soon as the results of the testing process are known. Typically the Contractor will be given permission to begin power washing. The Project Monitor and the Contractor will need to discuss alternatives to power washing in the unlikely situation that the water test shows lead contamination in the runoff water.

h. The Contractor shall assume that the testing and water analysis process will take three workdays. For example, if the test is done on the morning of the first day, the water samples will arrive at the laboratory on the morning of the second day. The results of the sampling process will be available on the afternoon of the third day. Since no power washing will be allowed until this testing process shows acceptable results, the Contractor must build this testing process into the work schedule. The Contractor may choose to accelerate the testing process but this will mean that the Contractor, rather than the Owner, will pay for the transportation of the samples to the laboratory and for the rush laboratory analysis. Even under “rush” conditions, it is very unlikely that the entire process could be completed in one day. The Contractor may want to schedule the testing process prior to the completion of other paint preparation work in order to have the results by the time the paint preparation work is complete.

I. Upon receiving approval to begin power washing, the Contractor will be allowed to proceed power washing the building. The Contractor must, however, notify the Project Monitor 24 hours in advance of the beginning of power washing in order for the Project Monitor to monitor the process should he or she feel that is appropriate.

j. Employee protective measures such as disposable clothing and respirators will not be required as power washing is not likely to result in airborne exposures of lead above the Action Level.

k. Wastewater produced from power washing operations which does not contain chips of paint may be allowed to soak into the ground below the area being washed. If the area located below or around the surface to be washed does not allow for absorption into the ground, the water must be directed toward an area on the property that will allow for absorption into the ground or evaporation. The Contractor must take steps to ensure that no wastewater enters storm drains. This is State and Federal law. This runoff cannot go into a storm drain regardless of the lead content of the water.

3.12 Lead Waste Management

Proper testing and disposal of all waste material is the responsibility of the Contractor.

The Contractor must plan the work in order to minimize the generation of hazardous waste during the disturbance of lead-containing materials. The Contractor must create separate waste streams as necessary. This particularly includes the separation of any loose paint chips, flakes, or ceramic tile debris from other construction debris. All waste streams must be identified by the Contractor before the work begins and separated during the course of the project to minimize costs of disposal.

The Contractor is responsible for all costs associated with the testing, removal, packing, loading, shipping, and disposal of lead containing waste generated during this project. This does not include wastewater testing done to determine if power washing is permitted. The cost of that testing will be covered by the Owner.

The Contractor is required to comply with all regulations in Title 8 Section 1532.1 Lead in Construction and Cal/EPA Title 22 for waste classification and disposal.

3.12.1 Lead Waste Testing

The Contractor must conduct appropriate waste stream characterization testing and/or filtering prior to disposal of waste products such as water, sand, paint chips, vacuum debris, and filters generated during surface preparation activities. Once completed, the test analysis results must be submitted to the Owner and/or Project Monitor for review. The Contractor is responsible for all costs associated with waste stream testing. Contractors may choose to avoid some waste testing by presuming that the waste is a lead hazardous waste. Waste must be tested if the Contractor wishes to treat it as a non-hazardous waste.

The Contractor may not remove or dispose of the identified materials from the job site until this review has been completed and the Contractor has been informed by the Owner and/or Project Monitor of their concurrence that the materials have been properly tested and meet the requirements allowing the materials to be classified as non-hazardous.

3.12.2 Hazardous Waste Manifests

For all hazardous waste that requires an EPA manifest, the Contractor must coordinate with the Owner for signature of the manifest. In general, the Contractor must notify the Owner a minimum of 24 hours in advance of the need for a signature. Hazardous waste cannot be transported without an authorized signature so it is the responsibility of the Contractor to coordinate with the Owner the time waste transporters will need the signature. Delays resulting from the failure of the Contractor to obtain an authorized signature from the Owner will be the sole responsibility of the Contractor, unless the Owner was provided 24 hour in advance notice and the transporter arrived on time during the regular work hours of the Owner.

3.12.3 Waste Containers

All debris generated in the regulated work area shall be placed in containers approved by the Project Monitor. The containers shall be leak tight and meet the requirements as stated in these specifications. Bags and other containers shall not be overfilled.

If in the judgement of the Project Monitor, the Contractor’s method of containerizing debris is inadequate and either results in the release of dust or debris or is reasonably expected to result in such a release, the Contractor will be forbidden to continue waste containerization or load out until the containers meet the approval of the Project Monitor. This may result in the Contractor being required to change from one type of container to another. It must be understood that the Contractor is responsible for proper containerization of waste and therefore, will be required to provide for adequate and appropriate containers regardless of cost

incurred due to failure of one system of containerization being required over another.

When utilizing bags to contain lead hazardous waste, two bags at least six-mil in thickness must be used. The inner bag may be sealed with adequate amounts of tape necessary to secure the opening of the bag. Only the second or final bag must be gooseneck sealed.

Regardless of the wastes characterization or designation as construction debris or hazardous waste, all waste containers shall be stored in designated and secure areas separate from the work area prior to testing and/or disposal.

The Contractor is responsible for proper storage and labeling of all hazardous waste containers while they are being used as storage and before they leave the job site according to the requirements of DTSC and DOT.

Building components such as wood with loose and flaking paint must, at a minimum, be wrapped in one layer of six-mil poly and adequately sealed with tape to secure the containerized material.

Concentrated lead waste such as sludge from paint stripping operations, lead containing paint chips and/or dust, HEPA vacuum contents and filters must be assumed to be hazardous waste until properly tested and must, at a minimum, be placed in poly lined, DOT approved steel drums.

Hard edged materials such as floor tile, gypsum board, plaster, stucco, ceramic tile, and other materials that may tear bags must be assumed to be hazardous waste until properly tested and must, at a minimum, be placed in poly lined, ridged-walled containers such as fiber drums or cardboard boxes as the final container.

Sharp edged components with peeling, blistering or flaking paint (e.g., nails, screws, metal lath, tin sheeting, door frames, etc.) must, at a minimum, be wrapped in one layer of six-mil poly sheeting, or a single six-mil thick bag and adequately sealed with tape to secure the containerized material.

3.13 Alternative Work Plans

The Contractor and/or subcontractors may submit alternate work plans to the suggested work practices and containment strategies as stated in these specifications. These alternate work plans or containment strategies must be approved by Owner and/or Project Monitor prior to their implementation.

PART 4.0 DOCUMENTATION SUBMITTAL REQUIREMENTS

Pre-Start Submittal Form

This form must be completed, signed, and submitted with the Contractor and/or subcontractors' documents required prior to the start of work. This form and these documents must be submitted to the Owner and/or Project Monitor/Supervisor in the time specified in the project documents prior to the start of work disturbing lead.

Please attach submittals in the order listed below. Please check off each item that is submitted. Write NA in spaces for which you believe the requirement is Not Applicable.

All Contractors and subcontractors who will have employees disturb lead on this project must, at a minimum provide proof of item number 1.6.1.e.1., lead hazard communication training in compliance with 8 CCR 1532.1 (L)(A)(1). This is the only submittal that must be provided by these employers as long as they do not disturb more lead than is described in Part 1.5.1.

The following submittals must be provided by all Contractors and subcontractors who will, at a minimum, have employees who will conduct trigger tasks for more than one hour per shift, will potentially be exposed above

the Action Level, or will conduct other activities as determined by the Project Monitor that may result in significant exposure to lead.

4.1 - Pre-Construction Submittal List

a. ____ A written lead compliance plan in compliance with 8 CCR 1532.1 must be provided that includes the following:

1. ____ A description of equipment and materials, controls, crew size, job responsibilities, and operations and maintenance procedures for each activity in which lead is disturbed and potentially emitted;

2. ____ A description of specific control methods (wet methods, engineering controls, etc.) that will be used to ensure workers are not exposed above the PEL;

3. ___ Technology considered in meeting the Cal/OSHA permissible exposure level (PEL);

4. ____ Air monitoring data documenting sources of lead emissions;

5. ___ A detailed implementation schedule for the compliance plan, including the schedule for inspections by a competent person;

6. ___ A description of the lead work practice program, which will be used to control worker exposures. This includes the use of protective work clothing, equipment, hygiene facilities and practices, and housekeeping practices;

7. ____ A description of the steps the Contractor or subcontractor will take to minimize the generation of hazardous waste produced on this project. This includes, but is not necessarily limited to how the contractor will separate waste streams. For example, how will the Contractor or subcontractor will keep potentially hazardous waste such as paint chips and dust from being disposed of with other potentially non-hazardous construction materials and debris.

b. ____ Copy of the Contractor or subcontractor has written respirator program in accordance with the requirements of 8 CCR 1544.

c. ____ Proof that all employees expected to wear respirators on this project have medical approval to wear a respirator.

d. ____ Copies of respiratory fit-tests for all workers expected to wear a respirator on this project. Fit testing must be done as required by and in accordance with 8 CCR 1544.

e. Proof of training required by Part 1.5 for type of work employee will do.

1. ___ Proof of Hazard Communication Training for Lead for those exposed to lead or who will perform trigger tasks for less than one hour. *(Proof may be a certificate or written statement stating training was completed and a list of names of those individuals who were trained. Proof of this training is not needed if employee provides proof of training required by items e. 2, or e. 3.)*

2. ____ Proof of training in compliance with 8 CCR 1532.1 (l)(2) for all employees who will conduct trigger tasks as defined in 8 CCR 1532.1 (d)(2) for more than one hour or who will reasonably be expected to be exposed to lead above the Action Level. *(Proof may be a certificate or written statement stating training was completed and*

a list of names of those individuals who were trained.) Not required if providing proof of training required in item e.3 and/or item e.4.

3. ____ Proof of CDPH lead certification for those workers who will conduct trigger tasks as defined in 8 CCR 1532.1 (d)(2) or will reasonably be expected to be exposed to airborne levels of lead above the PEL. This is required for this work on all projects that will disturb more than 100 square feet of lead-containing material. *(Proof of certification will be a currently valid CDPH certification card as a worker or supervisor. Workers who can show proof of a valid course completion form and application being submitted to CDPH, will be allowed to work while awaiting full certification from CDPH.)*

4. ____ Proof of current CDPH certification as a lead supervisor for the on-site competent person for projects involving the conduction of trigger tasks or other activities reasonably expected to exceed the PEL. This is required for this work on all projects that will disturb more than 100 square feet of lead-containing material. (*Proof of valid certification will be a currently valid CDPH certification card)*

5. ____ If exception to requirement for CDPH certified supervisor listed in Part 1.5.3 is requested, then provide proof of CDPH certified supervisor who will verify containment, personal protection and work practices, and will be able to respond to the project within two hours of request by the Project Monitor. *(Only applicable for paint scraping work done prior to the demolition of buildings or structures.)*

f. _____ Copies of all current SDS for chemicals used on this project.

g. ____ Manufacturers' certifications that high efficiency particulate air (HEPA) vacuums, pressure differential units and other local exhaust ventilation equipment conform to ANSI Z9.2-79 for all HEPA-filtered equipment that will be used on this project. *(This is proof that the equipment is actually HEPA filtered. This is separate from the challenge testing requirement needed for equipment used in interior spaces.)*

h. ____ Name and contact information of independent testing company who will challenge test all vacuums and air filtration devices used on this project (in interior spaces).

I._____Statement regarding compliance with all Cal/OSHA exposure monitoring required for this project.

j. ____ Name and contact information for laboratory who will analyze air samples or waste samples and documentation of their certification to conduct such analysis.

k. ____ Name of Waste Transporter who will transport hazardous waste on this project and documentation that the Transporter is allowed to transport lead hazardous waste.

l. _____ Name of Waste Landfill to which lead hazardous waste will be sent and documentation that such landfill is allowed to accept such waste.

m. ___ Should wastewater filtration be required on this project, submit manufactures documentation pertaining to the capability of wastewater filters to filter particles of, at a minimum, five micrometers in size.

n. ____ List of all rented equipment to be used within a lead regulated area, or a statement that no rental equipment will be used on this project.

1. ____ If rental equipment is to be used, submit written statements from each rental company indicating the rental company's acknowledgment that the equipment is provided for and may be used in areas where airborne levels of asbestos and/or lead may be present.

o. ____ Submit emergency plans. At a minimum submit the following:

1. ____ Submit non-emergency telephone numbers, other then 911, for the appropriate Police, Sheriff, and Fire Departments.

2. ____ Name, pager or cell phone numbers of the on-site supervisor and his immediate company supervisor.

3. ____ Submit detailed written directions from the project site to the medical facility to be used in case of an emergency. Also, include a map, which sufficiently shows the route to be taken from the site to the designated medical facility.

4. ____ Submit written emergency procedures pertinent to the work to be performed and which can be implemented by site personnel if the need arises.

p. ____ Local sanitation district Wastewater Discharge Permit for Surface Washers (if required).

q.____Cal OSHA Notification. This is required for this work on all projects that will disturb more than 100 square feet of lead-containing material.

The above listed documents must be provided in the time specified in the project documents prior to the start of work that will disturb lead. Under no circumstances will workers or supervisors be allowed to work on this project prior to the receipt of this documentation by the Owner and/or Project Monitor. In addition, documentation regarding rental equipment, but must be provided before the equipment may be used in a lead regulated area. All delays resulting from the failure of the Contractor and/or subcontractors to provide this information in the required time frame is solely the responsibility of the Contractor and/or subcontractor.

4.2 Submittals Provided During The Work (Or Following Completion Of The Work If Applicable)

The following documents must be provided the Owner and/or Project Monitor following completion of the physical activities associated with the project. The following documents must be received and approved by the Owner and/or Project Monitor before the work is considered complete. (Failure to provide these documents means the work is not complete, even though the physical activities may be completed.)

a. Daily sign-in sheet for each worker entering a lead regulated area.

b. The Contractor must provide the results of exposure sampling done to comply with the requirements of 8 CCR 1532.1 (d) and the requirements of this specification.

c. The Contractor must provide blood sampling and analysis results of lead (BLL) and zinc protoporphyrin (ZPP) levels for all workers who are represented by air monitoring results that exceed the Action Level. Typically, the Project Monitor will require blood lead sampling for all workers on a work shift if one or more air sampling results for that shift is above the Action Level.

The written results of the blood sampling analysis must be provided the Owner and/or Project Monitor within 21 days of the exposure over the Action Level or within 12 days of the completion of the project, whichever comes first.

d. Copies of job progress reports and project documentation. This must include the names of all employees onsite, the hours worked and a brief description of the work completed at the site(s).

e. The Contractor must provide all waste disposal documentation.

4.3 Lead Results List

Table 3 – Positive XRF Survey Results

Sample No.	XRF Results (mg/cm^2)	Condition of Paint	Approx Qty	Building/ Floor/ Room/ Area	Location	Surface	Substrate	Color
13	16.9	Intact	250 SF	Main Floor	Women's Restroom	Wall Tile	Ceramic	White
21	16.9	Intact	250 SF	Main Floor	Men's Restroom	Wall Tile	Ceramic	White
46	16.9	Intact	240 SF	Second Floor	Women's Restroom	Wall Tile	Ceramic	White
51	16.8	Intact	240 SF	Second Floor	Men's Restroom	Wall Tile	Ceramic	White

END TABLE OF CONTENTS

SECTION 01 11 00 – SUMMARY OF WORK

PART 1 - GENERAL

1.1 SUMMARY

A. Anderson Brule Architects, Inc. has prepared Contract Documents titled Altadena Main Library, Bid Set dated August 15, 2025. Work of the Contract can be summarized by reference to the Contract Documents which include the Agreement, Contract Conditions, Project Manual (General Requirements and Specifications), Drawings, documents referenced by any of these, and addenda and modifications issued prior to the signing of the Agreement.

B. Work of the Project includes all labor, materials and equipment necessary for the Contractor to fulfill all its obligations pursuant to the Contract Documents, including but not limited to the following:
   1. Project administration including preparation, research and distribution of project correspondence and submittals.
   2. Schedule preparation and maintenance.
   3. Guarantees and warranties.
   4. Temporary protection.
   5. Temporary utilities and facilities, including mobilization and demobilization,
   6. Material handling and storage.
   7. Safety Equipment.

C. Work includes providing systems to control temperature and humidity in the existing library building and the new addition. For the Project to fulfill design criteria and function as intended migration of moisture through building elements must be controlled and eliminated to the fullest extent possible. To ensure the completed Project functions as intended, exercise special care in the installation of the Work including but not limited to the following components
   1. Vapor Barriers: Continues barrier to the transmission of vapor through the assembly in which they occur. Seal all penetrations and terminations.
   2. Prevent infiltration, migration of water vapor and condensation. Seal frames of doors, and windows, penetrations for mechanical, plumbing and electrical systems and penetrations through exterior walls. Insulate exterior work.

D. Time to Complete the Work: Contractor shall achieve Substantial Completion as certified by the Architect within the time stipulated in the Supplementary General Conditions.

1.2 PROJECT INFORMATION

A. Project Identification: Altadena Main Library Renovations, ABA Project 21-1101-0.
   1. Project Location: 600 E. Mariposa Street, Altadena, CA 91001.

B. Owner: Altadena Library District, 600 E. Mariposa St. Altadena, CA 91001.
   1. Owner's Representative: Nikki Winslow, Library Director.

C. Architect: Anderson Brule Architects, 325 S. First Street, San Jose, CA 95113.
   1. Architect's Representative: Mark Schoeman, Principal.

D. Architect's Consultants: Architect has retained the following design professionals, who have prepared designated portions of the Contract Documents:
   1. Structural Engineer: Miyamoto International, 1450 Halyard Drive, W. Sacarmento, CA 95691.
      a. Contact: Traci Wong.
   2. Civil Engineer: DCGA Engineers, 4750 E. Ontario Mills Parkway, Ontario, CA 91764.
      a. Contact: Jessie Peng.
   3. MEP/Fire Supression: VCA Engineers, 1041 S. Garfield Ave, Alhambra, CA 91801.
      a. Contact: Tony Ramirez.
   4. Landscape Architect: Department of Space, 480 N. Indian Hill Blvd, Claremont CA 91711.
      a. Contact: Ben McCoy.
   5. Acoustical Engineer: Waveguide, LLC, 6060 Center Drive, Los Angeles, CA 90045.
      a. Contact: Brandon Mosst.

E. Construction Manager:
   a. Construction Manager Representative:

1.3 PROJECT CONDITIONS

A. Contractor Use of Premises: During the entire construction period the Contractor shall have the use of the premises for construction operations.

B. Project Site: Premises available to the Contractor for performance of the Work are restricted to area bounded by the Work Limit Line indicated During the entire construction period the Contractor shall have the use of these premises for their construction operations. Do not disturb areas outside the Work Limit Line.
   1. Work areas will not be available beyond the interval stipulated for execution of the Work.

C. Owner reserves the right to place and install equipment and to occupy completed areas of the Project, before Substantial Completion, provided such occupancy does not interfere with completion of the Work. Such placement of equipment and partial occupancy shall not constitute acceptance of the total Work.
   1. Contractor shall be responsible for the following for partial occupancy by the Owner. Provide a Certificate of Occupancy from authorities having jurisdiction. Ensure mechanical and electrical systems are fully operational and required tests and inspections have been or will be successfully completed.
   2. Where Owner has partial occupancy, they will operate and maintain mechanical and electrical systems serving those portions of the building and assume responsibility for maintenance and custodial service for those portions of building.

1.4 PROCEDURAL REQUIREMENTS

A. Administration and Conduct of the Work: Carried-out with the maximum possible consideration to conservation of energy, water and materials, and to the recovery and recycling of waste and scrap. Refer to other Sections for required disposition of salvage materials which are the Owner's property.
   1. Material and Product Requirements: In addition to specific requirements for content, origin of resources, and limitation and exclusion of certain compounds, the Contractor shall, to the maximum extent possible, provide materials, equipment and products that are resource-efficient, have recycled-content, are non-toxic, and environmentally sensitive.

2. Means and Methods of Construction: Contractor shall utilize those that will minimize the potential for damage and adverse impact to the environment regardless of whether such impact is transitory or long-term.

B. Hot Work: Procedures that may elevate the risk of fire due to heat, sparks, open flame or any other cause. Useful guidelines for how work procedures may be found in Factory Mutual's FM Global Loss Prevention Data Sheet Hot Work Management 10-3. Provide advance notification as required and perform the following as a minimum.
1. Remove combustible materials, debris and dust within 35 feet of work area and protect combustible materials that cannot be removed.
2. Enclose fire risk with non-combustible screens, blankets and other suitable protection.
3. Provide fire watch during and following performance of the work at the work site and all adjacent floors or locations as appropriate to the hazard.
4. Supplement normal fire extinguishing equipment during the fire watch period.

C. Work Under Separate Contracts: Owner reserves the right to issue other contracts for work on the site which may be constructed concurrently with these Contracts.
1. Cooperate fully with separate contractors so work on those contracts may be carried out smoothly, without interfering with or delaying work under this Contract or other contracts.
2. Coordinate the Work of this Contract with work performed under separate contracts.

1.5 OWNER-FURNISHED PRODUCTS

A. Owner will furnish products indicated. The Contractor shall provide all work necessary for systems necessary to support and serve Owner furnished equipment including but not limited supplemental structure and connections to building mechanical, plumbing, electrical, communications and controls systems.
1. Owner responsibilities will be to arrange and pay for delivery of Owner-furnished items according to Contractor's Construction Schedule. Provide necessary submittals such as Shop Drawings, Product Data, and Samples for the Contractor's information and coordination of the Work. Replacement of items damaged, defective or missing at the time of inspection during delivery and receipt at the Project.
2. Contractor responsibilities shall be to designate delivery dates for Owner-furnished items in Contractor's Construction Schedule (subject to Owner's agreement). Review submittals and return them to the Architect noting discrepancies, anticipated problems in use of product, and coordination with the Work. Receive, unload, handle, protect and store Owner-furnished items at the Project site. Contractor shall replace Owner-furnished items damaged following receipt at the Project and damage resulting from Contractor's operations. Coordination of the Work with Owner-furnished items and incorporate these items into the Work. Instruction of Owner staff, Warranty and maintenance required after installation.
3. Owner and Contractor will be mutually responsible to inspect delivered items at the Project for damage, defects, and missing items, items will be inspected on the day they arrive at the Project. Arrange for manufacturer's field services during and subsequent to installation and for ensuring the Work qualifies for any special warranty required.

1.6 MISCELLANEOUS PROVISIONS

A. Plumbing, Mechanical Electrical and Communications Work of Sections in Division 2 through 14: Comply with applicable requirements of Sections in Division 22, Division 23, Division 26 and Division 27 and other requirements of the Contract.

1. Service Connections: Provided as necessary for normal function of each unit of general work.
2. General Work: Coordinate for proper connection and utilization of available services, as necessary and required.

B. Supervision and Administration of the Work: Carried-out with the maximum possible consideration to conservation of energy, water and materials, and to the recovery and recycling of surplus material not to be delivered to the Owner and waste generated by the Work.

1.7 WORK RESTRICTIONS - REFERENCE SECTION 01 14 00.

PART 2 - PRODUCTS -- Not Used

2.1 PRE-ORDERED PRODUCTS

PART 3 - EXECUTION -- Not Used

3.1 SCHEDULE OF PRE-ORDERED PRODUCTS

END OF SECTION

SECTION 01 14 00 – WORK RESTRICTIONS

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes restriction on Contractor access and use of the premises for Work of the Contract. These requirements are in addition to requirements for Owner occupancy in Section 01 11 00 and requirements contained in technical Sections of the Project Manual.
   1. Do not disturb portions of the premises outside the Work limit line.
   2. Do not encumber the site with materials or equipment. Stockpiling and storage of materials, recycling and debris shall be contained within the area designated by the Work limit line.
   3. Contractor shall carry out the work so that the City’s emergency operations including Public Safety and 911 are not disrupted at any time.

1.2 CONTRACTOR USE OF PREMISES

A. The Contract Sum shall include all expenses, fees and costs directly and indirectly associated with limitations on access and traffic routes, delivery, storage and loading areas, traffic planning and control, after-hours and premium time and off-site storage resulting from Contract requirements and restrictions.
   1. Where Owner's facilities and services made available for the Contractor's use are not adequate to fulfill Contract requirements and facilitate efficient and timely execution of the Work the Contractor shall provide supplemental facilities and services as necessary to ensure efficient and timely execution of the Work at no change in Contract amount.

B. Throughout the Contract time use and maintain the existing facilities in a safe condition, secured against damage due to weather exposure and other potential sources of loss. Damage or loss occurring during construction operations shall be remediated at no additional cost to the Owner.
   1. Keep traffic areas such as hallways, stairs, walks, sidewalks and roadways free of encumbrance due to the Work.
   2. The Work area shall be designated Smoke Free, use of tobacco products shall not be permitted, neither shall open fires be permitted.
   3. Use of existing toilet by contractor personnel is not permitted. Provide temporary facilities per Section 01 50 00 requirements.
   4. Perform the Work without disruption to required building exits and exit routes and established traffic ways, both pedestrian and vehicular. Exit discharge shall provide a barrier free route of travel to an area of refuge acceptable to fire authorities and sufficiently sized to provide safe refuge to double the number of people for which the exit is sized.

C. Work requiring access to areas outside of the Contract area and work causing noise and vibration that may interfere with the Owner's occupancy must be scheduled at the Owner's convenience and performed outside the Owner's normal operating hours of 7 AM through 5 PM weekdays or as otherwise approved in advance by the Owner.

1.3 TRAFFIC, ACCESS AND PARKING

A. Contractor's Access to Project: Limited to designated approaches and shall not interfere with the Owner's occupancy.
   1. Keep existing driveways, parking areas, public transportation stops, walkways and entrances clear and available to the Owner and the public at all times; do not use for parking or storage of materials.
   2. Conduct the Work to allow uninterrupted access for emergency vehicles and services to the Project, and all adjacent areas.
   3. Promptly clean up debris and construction material dropped on traffic and loading areas maintain service access ways and streets to the satisfaction of the Owner's Representative.

B. When alternative routing and scheduling to avoid interference with routine street and sidewalk traffic would prevent proper performance of the Work, provide a satisfactory detour affording safe passage of traffic around or over the interference. Temporary construction support facilities shall comply with Section 01 50 00 requirements.
   1. Provide advance notice to the Owner where traffic interference and detours may impact Owner occupancy and/or emergency vehicle access.

C. Protect finished surfaces and assemblies and facilities on permanent access routes from damage due to Contractor activities.

D. Construction staging and limited parking will be available on the Owner's adjacent lot for the duration of the project. The Owner assumes no liability for vehicles, equipment or materials staged or stored on said site. Changes in parking provided by the Owner shall not be a basis for claims against the Owner.

E. Do not park trucks, store materials or cross over landscaped areas. Any plant materials damaged as a result of the performance of this work will either be replaced with new plant materials equal in size to those damaged or by payment of an amount representing the value of the damaged material as determined by the Owner.

F. Permission for access to the site may be revoked for any and all persons who violate the Owner's traffic regulations, including speed limits, parking restrictions and permit requirements.
   1. Compliance with Owner Vehicular Access Requirements: The Contractor's responsibility for Contractor personnel, operating forces and deliveries.
   2. Lock automotive type vehicles such as passenger cars and trucks and other mechanized and motorized construction equipment, when parked and unattended, prevent unauthorized use. Do not leave vehicles or equipment unattended with the motor running or the ignition key in place.

1.4 ADVANCE NOTICE REQUIREMENTS

A. Provide minimum 7 days advance notice to the Owner for activities that could affect the Owner's normal occupancy; scheduling of such activities is subject to Owner approval. The Owner shall have the right to require alternative scheduling or sequencing of Work with neither penalty nor modification to Contract Time and Sum when necessary to prevent disruption of Owner's occupancy. All costs and damages incurred by the Owner due to Contractor's failure to comply with advance notice and scheduling requirements shall be the responsibility of the Contractor.

1. Access and Contractor operations outside of conventional business hours require advance approval by Owner and coordination with Owner's security program.
2. Access to areas outside of the Work Limit Line, and work causing noise or vibration that may interfere with the Owner's occupancy: Coordinate with and approved by the Owner in advance of execution.
3. Should the Contractor, in the performance of the work, disturb, disconnect or damage any existing utilities required to remain in service, all expense arising from such disturbance, replacing or repair thereof shall be borne by the Contractor.

B. Interruption of Utilities Serving Owner Occupied Areas: Minimum 7 days advance notice and Owner approval is required regardless of magnitude or duration. Schedule utility interruption for times that will minimize disruption to Owner occupancy. Submit completed SHUTDOWN REQUEST at least fourteen days prior to requested shutdown date.
1. Identify existing utilities whether indicated or not and protect from damage.

C. Hot Work Permit: 7 days advance notice is required for activities that may elevate fire hazard or otherwise produce gases or particulates capable of activating ionization or smoke/heat detectors. Such work may include but is not limited to concrete cutting, brazing, grinding, welding and soldering. Notice requirements include submittal of a completed HOT WORK PERMIT, a sample of which is attached at the end of this Section. Alarm events resulting from Contractor's failure to comply with advance notice and permit requirements shall be the Contractor's responsibility without modification to Contract Amount nor Time.

D. Traffic Interruption: Provide 7 days advance notice and obtain written authorization Comply with Utility Shutdown requirements for elevator service interruption as necessary to provide required accessibility upgrades.

1.5 DAMAGE AND RESTORATION

A. Restore or replace as directed by the Owner's Representative damage to existing and new Work including but not limited to landscaping, paving, roads and sidewalks damaged as a result of the performance of this work at no change in Contract amount.

B. Restoration: Equal to the physical and aesthetic characteristics of the original work. Finishes shall match the appearance of similar existing adjacent work. Comply with repair requirements for cutting and patching work.

C. Remove and replace unacceptable restoration work; where work can not be acceptably restored as determined by the Owner's Representative provide new work as directed.

1.6 WORK RESTRICTIONS

A. Comply with restrictions on construction operations.
1. Comply with limitations on use of public streets, work on public streets, rights of way, and other requirements of authorities having jurisdiction.

B. On-Site Work Hours: Limit work to normal business hours, Monday through Friday, unless otherwise indicated. Work hours may be modified to meet Project requirements if approved by Owner and authorities having jurisdiction.
1. Weekend Hours: Coordinate restrictions with Owner.
2. Early Morning Hours: Coordinate restrictions with Owner where permitted by local AHJ and Zoning regulations and restrictions on noisy work.

3. Hours for Utility Shutdowns: Utility service including, but not limited to electrical power, light, heat, water, gas, steam, compressed air, oxygen, suction, telephone, must be maintained. Arrangements shutdowns with the Owner.
4. Hours for [Core Drilling] <Insert noisy activity>: [Coordinate restrictions with Owner]<Insert Owner's restrictions>.

C. On-Site Workday Restrictions: Do not perform work resulting in utility shutdowns or resulting in noisy activity on-site during work black-out days indicated in Owner's schedule.
1. Notify [Architect] [Construction Manager] [Owner] not less than [two] <Insert number> days in advance of proposed utility interruptions.
2. Obtain [Architect's] [Construction Manager's] [Owner's] written permission before proceeding with utility interruptions.

D. Noise, Vibration, Dust, and Odors: Coordinate operations that may result in high levels of noise and vibration, dust, odors, or other disruption to Owner occupancy with Owner.
1. Notify [Architect] [Construction Manager] [Owner] not less than [two] <Insert number> days in advance of proposed disruptive operations.
2. Obtain [Architect's] [Construction Manager's] [Owner's] written permission before proceeding with disruptive operations.

E. Smoking and Controlled Substance Restrictions: Use of tobacco products, vaping products, alcoholic beverages, and other controlled substances on the Project site or on any Owner's property is not permitted.

F. Pet Restrictions: Pets are not permitted on the Project site or any Owner's property, unless the pet is a service animal. Service animals must be properly restrained at all times.

G. Employee Identification: [Provide] [Owner will provide] identification tags for Contractor personnel working on Project site. Require personnel to use identification tags at all times.

H. Employee Screening: Comply with Owner's requirements for [drug] [and] [background] screening of Contractor personnel working on Project site.
1. Maintain list of approved screened personnel with Owner's representative.

PART 2 - PRODUCTS - Not Used

PART 3 - EXECUTION - Not Used

END OF SECTION

SECTION 01 23 00 – ALTERNATES

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes administrative and procedural requirements for Alternates.

B. Related Sections: Sections referenced in Schedule of Alternates contain requirements necessary to achieve the Work described under each Alternate.

C. Alternate: An amount proposed by Proposer and stated in required Proposal submittals, to be added to or deducted from the stipulated sum for the Work amount when the Owner elects to implement the Scope of Work represented by the corresponding alternate as defined by the Contract Documents and including miscellaneous devices, appurtenances and accessories necessary and required for a complete installation regardless of whether specifically mentioned as part of the alternate.
   1. Alternate Amounts: Valid for 90 days from the submittal due date, and the Owner shall have the right to modify the Contract in accordance with the requirements for each and any Alternate at the amount quoted during that period.
   2. No adjustment to Contract Time will be made on the basis of acceptance or rejection of any Alternate(s).

D. Submittals: Notification of status of Alternates, accepted, rejected and deferred for later consideration; include description of accepted alternates effect on related and adjacent Work, and negotiated modifications to Alternates.

E. Sequencing and Scheduling: Modify and adjust adjacent work as required to ensure that work effected by each accepted Alternate is complete and fully integrated into the project.

PART 2 - PRODUCTS - Not Used

PART 3 - EXECUTION

3.1 SCHEDULE OF ALTERNATES

A. Provide the work of each Alternate as identified herein and as required by the Contract documents. There shall be no change in the Contract Time nor required completion date for incorporation of any Alternate. Adjustments shall be limited to the sum indicated.
   1. Alternate 1, AD1: Provide all new work for Mariposa North Patio and Sliding Doors.
   2. Alternate 2, AD2: Provide all new work for Meeting Room Addition. See Sheet AD7.
   3. Alternate 3, AD3: Provide Children’s Area Ceiling.

END OF SECTION

SECTION 01 25 00 - SUBSTITUTION PROCEDURES

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes administrative and procedural requirements for substitutions.

1.2 DEFINITIONS

A. Substitutions: Changes in products, materials, equipment, and methods of construction from those required by the Contract Documents.
   1. Substitutions for Cause: Changes proposed by Contractor that are required due to changed Project conditions, such as unavailability of product, regulatory changes, or unavailability of required warranty terms.
   2. Substitutions for Convenience: Changes proposed by Contractor or Owner that are not required to meet other Project requirements but may offer advantage to Contractor or Owner.

1.3 ACTION SUBMITTALS

A. Substitution Requests: Submit documentation identifying product or fabrication or installation method to be replaced. Include Specification Section number and title and Drawing numbers and titles.
   1. Substitutions shall be accompanied by a completed Substitution Request Form.
   2. Sequentially number substitution Requests.
   3. Documentation: Show compliance with requirements for substitutions and the following, as applicable:
      a. Statement indicating why specified product, fabrication, or installation method cannot be provided, if applicable.
      b. Coordination of information, including a list of changes or revisions needed to other parts of the Work and to construction performed by Owner and separate contractors that will be necessary to accommodate proposed substitution.
      c. Detailed comparison of significant qualities of proposed substitutions with those of the Work specified. Include annotated copy of applicable Specification Section. Significant qualities may include attributes, such as performance, weight, size, durability, visual effect, sustainable design characteristics, warranties, and specific features and requirements indicated. Indicate deviations, if any, from the Work specified.
      d. Product Data, including drawings and descriptions of products and fabrication and installation procedures.
      e. Samples, where applicable or requested.
      f. Certificates and qualification data, where applicable or requested.
      g. List of similar installations for completed projects, with project names and addresses as well as names and addresses of architects and owners.
      h. Material test reports from a qualified testing agency, indicating and interpreting test results for compliance with requirements indicated.
      i. Research reports evidencing compliance with building code in effect for Project, from ICC-ES.

j. Detailed comparison of Contractor's construction schedule using proposed substitutions with products specified for the Work, including effect on the overall Contract Time. If specified product or method of construction cannot be provided within the Contract Time, include letter from manufacturer, on manufacturer's letterhead, stating date of receipt of purchase order, lack of availability, or delays in delivery.
k. Cost information, including a proposal of change in cost, if any, in the Contract Sum.
l. Contractor's certification that proposed substitution complies with requirements in the Contract Documents, except as indicated in substitution request, is compatible with related materials and is appropriate for applications indicated.
m. Contractor's waiver of rights to additional payment or time that may subsequently become necessary because of failure of proposed substitution to produce indicated results.

4. Electronic Submission: Submit Substitution requests electronically in accordance with following requirements:
   a. Assemble complete substitution request package for each specification section into a single indexed file incorporating required information for the substitution request as specified in this Section with completed Substitution Request form and including links enabling navigation to each item.
      1) Substitution requests not including the Substitution Request form will be returned as "Not Reviewed."
5. Name file with a sequentially numbered submittal number or other unique identifier, including revision identifier.
6. Metadata: Include the following information as keywords in the electronic submittal file metadata:
   a. Project name.
   b. Number and title of appropriate Specification Section.
   c. Manufacturer name.
   d. Product name.
   e. Keynote or finish code.
7. Architect's Action: If necessary, Architect will request additional information or documentation for evaluation within seven days of receipt of a request for substitution. Architect will notify Contractorof acceptance or rejection of proposed substitution within 15 business days of receipt of request, or seven days of receipt of additional information or documentation, whichever is later.
   a. Forms of Acceptance: Change Order, Construction Change Directive, or Architect's Supplemental Instructions for minor changes in the Work.
   b. If Architect does not issue a decision on use of a proposed substitution within time allocated above, originally specified product is to be used.

1.4 QUALITY ASSURANCE

A. Compatibility of Substitutions: Investigate and document compatibility of proposed substitution with related products and materials. When compatibility is not readily apparent and can only be verified by a testing procedure or if specifically requested by Architect or Owner, engage a qualified testing agency to perform compatibility tests recommended by manufacturers.

1.5 PROCEDURES

A. Coordination: Revise or adjust affected work as necessary to integrate work of the approved substitutions.

1.6 SUBSTITUTIONS

A. The Contract Documents are intended to produce a building of consistent character and quality of design for components of the building. The Architect will judge the design and appearance of proposed substitutions on the basis of their suitability in relation to the overall design of the Project.
   1. In order to permit coordinated design of color and finishes furnish the substituted material in any color, finish, texture, or pattern which would have been available from the manufacturer originally specified, at no additional cost to the Owner.
   2. Additional cost, or loss or damage arising from the substitution of materials or methods for those originally specified shall be borne by the Contractor, notwithstanding approval or acceptance of such substitution by the Owner or the Architect, unless such substitution was made at the written request or direction of the Owner or the Architect.

B. Substitutions that materially affect the work, regardless of effect on Contract Price or Contract Time, shall require AHJ approval. Such substitutions will be processed in compliance with Section 01 26 00 "Contract Modification Procedures."

C. Substitutions during Bidding: No substitutions will be allowed during bidding. Bidders to provide base bid per contract documents and basis of design products.
   1. If Bidder can add value by providing substitution, Bidder to submit voluntary alternate identifying cost reduction and/or value added along with substitution documentation required by this Section.

D. Substitutions after Award of Contract:
   1. Substitution for Cause: Submit requests for substitution immediately on discovery of need for change, but not later than 15 working days prior to time required for preparation and review of related submittals.
      a. Conditions: Architect, in consultation with Owner, will consider Contractor's request for substitution when the following conditions are satisfied. If the following conditions are not satisfied, Architect will return requests without action, except to record noncompliance with these requirements:
         1) Requested substitution is consistent with the Contract Documents and will produce indicated results.
         2) Substitution request is fully documented and properly submitted.
         3) Requested substitution will not adversely affect Contractor's construction schedule.
         4) Requested substitution has received necessary approvals of authorities having jurisdiction.
         5) Requested substitution is compatible with other portions of the Work.
         6) Requested substitution has been coordinated with other portions of the Work.
         7) Requested substitution provides specified warranty.
         8) If requested substitution involves more than one contractor, requested substitution has been coordinated with other portions of the Work, is uniform and consistent, is compatible with other products, and is acceptable to all contractors involved.
   2. Substitutions for Convenience: Architect will consider requests for substitution if received within 35 days after the Notice to Proceed. Requests received after that time may be considered or rejected at discretion of Architect.
      a. Conditions: Architect will consider Contractor's request for substitution when the following conditions are satisfied. If the following conditions are not

satisfied, Architect will return requests without action, except to record noncompliance with these requirements:

1) Requested substitution offers Owner a substantial advantage in cost, time, energy conservation, or other considerations, after deducting additional responsibilities Owner must assume. Owner's additional responsibilities may include compensation to Architect for redesign and evaluation services, increased cost of other construction by Owner, and similar considerations.
2) Requested substitution does not require extensive revisions to the Contract Documents.
3) Requested substitution is consistent with the Contract Documents and will produce indicated results.
4) Substitution request is fully documented and properly submitted.
5) Requested substitution will not adversely affect Contractor's construction schedule.
6) Requested substitution has received necessary approvals of authorities having jurisdiction.
7) Requested substitution is compatible with other portions of the Work.
8) Requested substitution has been coordinated with other portions of the Work.
9) Requested substitution provides specified warranty.
10) If requested substitution involves more than one contractor, requested substitution has been coordinated with other portions of the Work, is uniform and consistent, is compatible with other products, and is acceptable to all contractors involved.

Proposed Substitution: _____

Manufacturer: _____ Address: _____ Phone: _____

Trade Name: _____ Model No.: _____

Installer: _____ Address: _____ Phone: _____

History: ☐New Product ☐1-4 years old ☐5-10 years old ☐More than 10 years old

Differences between proposed substitution and specified product: _____

☐Point-by-point comparative data attached – **REQUIRED FOR SUBSTITUTION TO BE CONSIDERED BY A/E**

Reason for NOT providing specified item: _____

Proposed substitution affects other parts of work: ☐No ☐Yes; explain: _____

Proposed substitution changes Contract Time: ☐No ☐ Yes [Add/Deduct] days.

Savings to Owner for Accepting Substitution: ($)

The Undersigned General Contractor/Construction Manager Certifies:

- Proposed substitution has been fully investigated and determined to be equal or superior in all respects to specified products.
- Same warranty will be furnished for proposed substitution as for specified product.
- Same maintenance service and source of replacement parts, as applicable, is available.
- Proposed substitution will have no adverse effect on other trades and will not affect or delay progress schedule.
- Proposed substitution does not affect dimensions and functional clearances.
- Payment will be made for changes to building design, including A/E design, detailing, and construction costs caused by the substitution.
- The following supporting data is attached to this request and verifies the above statements:

  ☐ Drawings
  ☐ Product Data
  ☐ Samples
  ☐ Tests
  ☐ Reports

SECTION 01 26 00 - CONTRACT MODIFICATION PROCEDURES

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes administrative and procedural requirements for handling and processing Contract modifications.

B. Related Requirements:
   1. Section 0` 15 00 Substitution Procedures for administrative procedures for handling requests for substitutions made after the Contract award.

1.2 DEFINITIONS

A. Changes in the Work: After the execution of the Contract, and without invalidating the Contract by the following methods Change Order, Construction Change Directive, or Supplemental Instruction, subject to the limitations established in the Contract and in this section.

B. Reason Codes: All change documents prepared by the Architect will be issued to with a defined reason code identifying they reason for the change to the documents.

   1. Reason Codes:

      a. Scope Revision.
      b. Unforeseeable Condition.
      c. Fast-Track Driven.
      d. Jurisdictional Agency.
      e. Builder (GC, CM, DB).
      f. Design Errors.
      g. Design Omissions.

1.3 ARCHITECT INITIATED CONTRACT MODIFICATIONS

A. Supplemental Instructions (SI): Architect will issue Supplemental Instructions (SI) authorizing minor changes in the Work, not involving adjustment to the Contract Sum or the Contract Time.

   1. Proceeding with the SI confirms agreement with the Architect's determination that the proposed changes do not involve adjustment to the Contract Sum or the Contract Time.
   2. If the Contractor believes the information provided in the SI involves an adjustment to the Contract Sum or the Contract Time, notify the Architect within three days of receipt and proceed with submitting a Change Order Proposal.

B. Proposal Request (PR): Architect will issue a detailed description of proposed changes in the Work that may require adjustment to the Contract Sum or the Contract Time. If necessary, the description will include supplemental or revised Drawings and Specifications.

   1. Proposal Requests issued by Architect are not instructions either to stop work in progress or to execute the proposed change.

2. Upon receipt of Proposal Request, review the proposal scope impact on current construction schedule and critical path.
   a. Notify the Owner and Architect within three days if maintaining the construction critical path schedule requires the Proposal Request to be converted to a Construction Change Directive.
   b. Within time specified in Proposal Request or 20 days, when not otherwise specified, after receipt of Proposal Request, submit a quotation esxtimating cost adjustments to the Contract Sum and the Contract Time necessary to execute the change.

C. Construction Change Directive (CCD): Architect may issue a Construction Change Directive instructing the Contractor to proceed without delay with a change in the Work, for subsequent inclusion in a Change Order.

1. Construction Change Directive contains a complete description of the change in the Work. It also designates method to be followed to determine change in the Contract Sum or the Contract Time.
2. If the Construction Change Directive provides for an adjustment to the Contract Sum, the adjustment will be based on one of the following methods:

   a. Mutual acceptance of a lump sum properly itemized and supported by sufficient substantiating data to permit evaluation.
   b. Unit prices stated in the Contract Documents or subsequently agreed upon.
   c. Cost to be determined in a manner agreed upon by the parties and a mutually acceptable fixed or percentage fee.

3. By signing and returning a Construction Change Directive, the Contractor agrees to the terms set forth including the change in the Work, Cost, and Time.

   a. The amount of credit to be allowed by the Contractor to the Owner for a deletion or change that results in a net decrease in the Contract Sum shall be actual net cost as confirmed by the Architect. When both additions and credits covering related Work or substitutions are involved in a change, the allowance for overhead and profit shall be figured on the basis of net increase, if any, with respect to that change.
   b. Pending final determination of the total cost of a Construction Change Directive to the Owner, the Contractor may request payment for Work completed under the Construction Change Directive in Applications for Payment.
   c. Architect will make an interim determination for purposes of monthly certification for payment for those costs and certify for payment the amount that the Architect determines, in the Architect's professional judgment, to be reasonably justified.
   d. Architect's interim determination of cost will adjust the Contract Sum on the same basis as a Change Order.

4. Documentation:

   a. Time and Material Basis Work: Maintain detailed records required by the Construction Change Directive.
   b. After completion of work for the Construction Change Directive, submit a Change Order with required documentation per the requirements and in the same form as required for a Change Order Proposal.

1.4 CONTRACTOR INITIATED CONTRACT MODIFICATIONS

A. Change Order Proposal (COP): Submit a Change Order Proposal to the Architect for the following conditions:

1. Contractor Initiated Proposals.
2. Proposal Request Response.
3. Administrative Change Orders.

B. Change Order Proposal Forms: Use form attached to this Section.

1. Change Order Proposals not including this form will be returned not reviewed.
2. Summary Form: Summary Form shall include total cost of change order proposal.
   a. Contractor Contingencies: Identify where costs allocated to Contractor and indicate reserved contingency after Change Order Proposal.
   b. Owner Contingencies: Identify where costs allocated to Owner Contingency and indicate reserved contingency after Change Order Proposal.
   c. Value-Added /Non-Value-Added Costs Breakdown:
      1) COP Summary: List Value-Added Costs and Non-Value-Added Costs.
      2) Value-Added Costs: Costs that would have incurred should the work have been included in the original contract documents.
      3) Non-Value-Added Costs: Costs that are included in the Change Order proposal for doing or bidding the work at the time the change is identified.
      4) Example: The omission of a door and frame.
         a) Value Added Costs: The cost to provide the door if it was in the original contract. Including the cost of the door, frame and hardware, wiring of the door hardware, and labor to install.
         b) Non-Value-Added Costs: Demolition work associated with providing the door and frame, reframing the wall to install the door and frame, additional shipping costs if discovered after door shipment, mark-up associated with Change Proposal if not Cost+ Contract.
3. Submit original Subcontractor Back-Up Information:
   a. Material take-offs on contract drawings and/or Proposal Request documents:
      1) Itemized analysis of quantity of material additions.
      2) Itemized analysis of quantity of material reductions.
   b. Material quotes and invoices:
      1) Itemized analysis of material costs.
      2) Itemized analysis of material credits.
   c. Equipment quotes and invoices:
      1) Itemized analysis of analysis of Equipment costs.
      2) Itemized analysis of analysis of Equipment credits.
   d. Labor Costs:
      1) Itemized analysis of analysis of Labor costs.
      2) Itemized analysis of analysis of Labor credits.
         a) Additional charges for Supervision will not be allowed unless Construction Schedule is modified, or overtime is required as part of Change Order Proposal.

e. Indicate applicable taxes, delivery charges, and amounts of trade discounts.

4. Updated Construction Schedule: Indicate the effect of the change, including, but not limited to:

a. Changes in activity duration.
b. Changes to start and finish times, and activity relationships.
c. Provide an analysis of using available float versus an extension of Contract Time.

5. Incomplete Change Order Proposals will be returned without review for revision to conform to the requirements.

a. Failure to conform to the requirements creating a delay in review shall not be the basis for additional Contract Sum or additional Contract Time.

C. Contractor Initiated Proposals:

1. RFI Response: After notification to the Architect, submit a Change Order Proposal within fifteen days.
2. Supplemental Instructions: After notification to the Architect, submit a Change Order Proposal within fifteen days.
3. Latent or Changed Conditions: Notify the Architect immediately when conditions are found, submit a Change Order Proposal within fifteen days.

a. In addition to requirements stipulated in the Change Order Proposal Form provide the following:

1) Include a statement outlining reasons for the change and the effect of the change on the Work. Provide a complete description of the proposed change.
2) If the proposed change requires substitution of one product or system for product or system specified comply with requirements in Section 01 25 00 "Substitution Procedures."

4. Delay Claims: Notify the Owner and Architect immediately when conditions are found, but no later than within ten days of delay event.

a. In addition to requirements stipulated in Change Order Proposal Form, provide the following:

1) Include documentation of delay origin and impact on the critical path.

b. Delay Claims based on the requirements to furnish drawings, specifications, or instructions, or to return submittals will be rejected when the Architect is in compliance with the procedures specified in Section 01 33 00 "Submittal Procedures."

D. Proposal Request Response: Submit a Change Order Proposal within fifteen days.

E. Administrative Change Orders:

1. Allowance Adjustment: Prior to substantial completion issue an administrative change order to refund allowance reserves.

a. Itemize each allowance reserve refunded.
b. Included Itemized list of Proposal Requests that charged against the allowance and amount charged by each.

1.5 CHANGE ORDER PROCEDURES

A. On Owner's approval of a Change Order Proposal, issue a Change Order for Owner's and Architect's signatures and proceed promptly with the work.

B. On Owner's approval of a Change Order Proposal, the Architect will issue a Change Order for Owner's and Contractor's signatures and proceed promptly with the work.

1. All change orders that materially affect the work, shall require AHJ approval. Architect will submit Change Order to AHJ for approval prior to Owner approval.

END OF SECTION

SECTION 01 29 00 - PAYMENT PROCEDURES

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes administrative and procedural requirements necessary to prepare and process Applications for Payment.

B. Related Requirements:
1. Section 01 26 00 Contract Modification Procedures for administrative procedures for handling changes to the Contract.
2. Section 01 32 00 Construction Progress Documentation for administrative requirements governing the preparation and submittal of the Contractor’s construction schedule.

1.2 DEFINITIONS

A. Schedule of Values: A statement furnished by Contractor allocating portions of the Contract Sum to various portions of the Work and used as the basis for reviewing Contractor's Applications for Payment.

B. Contract Sum: The Contract Sum is stated in the Agreement and, including authorized adjustments, is the total amount payable by the Owner to the Contractor for performance of the Work under the Contract Documents.

1.3 SCHEDULE OF VALUES

A. Coordination: Coordinate preparation of the schedule of values with preparation of Contractor's construction schedule.
1. Coordinate line items in the schedule of values with items required to be indicated as separate activities in Contractor's construction schedule, including the following:
   a. Application for Payment forms with Continuation Sheets.
   b. Submittals Schedule.
   c. Contractor's Construction Schedule.
2. Submit the schedule of values to Architect at earliest possible date, but no later than days before the date scheduled for submittal of initial Applications for Payment.

B. Format and Content: Use Project Manual table of contents as a guide to establish line items for the schedule of values. Provide at least one line item for each Specification Section.
1. Identification: Include the following Project identification on the schedule of values:
   a. Project name and location.
   b. Owner's name.
   c. Owner's Project number.
   d. Name of Architect.
   e. Architect's Project number.
   f. Contractor's name and address.
   g. Date of submittal.
2. Arrange schedule of values consistent with format of [AIA Document G703] <Insert name and designation of standard form>.

3. Arrange the schedule of values in tabular form, with separate columns to indicate the following for each item listed:
   a. Related Specification Section or division.
   b. Description of the Work.
   c. Name of subcontractor.
   d. Name of manufacturer or fabricator.
   e. Name of supplier.
   f. Change Orders (numbers) that affect value.
   g. Dollar value of the following, as a percentage of the Contract Sum to nearest one-hundredth percent, adjusted to total 100 percent. Round dollar amounts to whole dollars, with total equal to Contract Sum.
      1) Labor.
      2) Materials.
      3) Equipment.
4. Provide a breakdown of the Contract Sum in enough detail to facilitate continued evaluation of Applications for Payment and progress reports. Coordinate with the Project Manual table of contents. Provide multiple line items for principal subcontract amounts in excess of percent of the Contract Sum.
5. Round amounts to nearest whole dollar; total shall equal the Contract Sum.
6. Provide a separate line item in the schedule of values for each part of the Work where Applications for Payment may include materials or equipment purchased or fabricated and stored, but not yet installed.
   a. Differentiate between items stored on-site and items stored off-site.
   b. Provide separate line items in the Schedule of Values for initial cost of materials, for each subsequent stage of completion, and for total installed value of that part of the Work.
7. Allowances: Provide a separate line item in the schedule of values for each allowance. Show line-item value of unit-cost allowances, as a product of the unit cost, multiplied by measured quantity. Use information indicated in the Contract Documents to determine quantities.
8. Purchase Contracts: Provide a separate line item in the schedule of values for each Purchase contract. Show line-item value of Purchase contract. Indicate Owner payments or deposits, if any, and balance to be paid by Contractor.
9. Overhead Costs, Proportional Distribution: Include total cost and proportionate share of general overhead and profit for each line item.
10. Temporary Facilities: Show cost of temporary facilities and other major cost items that are not direct cost of actual work-in-place as separate line items.
11. Closeout Costs. Include separate line items under Contractor and principal subcontracts for Project closeout requirements in an amount totaling five percent of the Contract Sum and subcontract amount.
12. Schedule of Values Revisions: Revise the schedule of values when Change Orders or Construction Change Directives result in a change in the Contract Sum. Include at least one separate line item for each Change Order and Construction Change Directive.

1.4 APPLICATIONS FOR PAYMENT

A. Each Application for Payment following the initial Application for Payment shall be consistent with previous applications and payments, as certified by Architect and paid for by Owner.

B. Payment Application Times: The date for each progress payment is indicated in the Owner/Contractor Agreement. The period of construction work covered by each Application for Payment is the period indicated in the Agreement.

C. Payment Application Times: Submit Application for Payment to Architect by the 25th of the month. The period covered by each Application for Payment is one month, ending on the last day of the month.
   1. Submit draft copy of Application for Payment seven days prior to due date for review by Architect.

D. Application for Payment Forms: Use AIA Document G702 and AIA Document G703 or other forms acceptable to the Owner as form for Applications for Payment.

E. Application Preparation: Complete every entry on form. Notarize and execute by a person authorized to sign legal documents on behalf of Contractor. Architect will return incomplete applications without action.
   1. Entries shall match data on the schedule of values and Contractor's construction schedule. Use updated schedules if revisions were made.
   2. Include amounts for work completed following previous Application for Payment, whether or not payment has been received. Include only amounts for work completed at time of Application for Payment.
   3. Include amounts of Change Orders and Construction Change Directives issued before last day of construction period covered by application.
   4. Indicate separate amounts for work being carried out under Owner-requested project acceleration.
   5. Applications for Payment shall not include requests for payment for portions of the Work for which the Contractor does not intend to pay a Subcontractor or supplier unless such Work has been performed by others whom the Contractor intends to pay.

F. Stored Materials: Include in Application for Payment amounts applied for materials or equipment purchased or fabricated and stored, but not yet installed. Differentiate between items stored on-site and items stored off-site.
   1. Provide certificate of insurance, evidence of transfer of title to Owner, and consent of surety to payment for stored materials.
   2. Provide supporting documentation that verifies amount requested, such as paid invoices. Match amount requested with amounts indicated on documentation; do not include overhead and profit on stored materials.
   3. Provide summary documentation for stored materials indicating the following:
      a. Value of materials previously stored and remaining stored as of date of previous Applications for Payment.
      b. Value of previously stored materials put in place after date of previous Application for Payment and on or before date of current Application for Payment.
      c. Value of materials stored since date of previous Application for Payment and remaining stored as of date of current Application for Payment.

G. Submittal Schedules: With each Application for Payment, submit Three-Month Look Ahead Submittal Schedule as specified in Section 01 33 00 "Submittal Procedures."

H. Transmittal: Submit three signed and notarized original copies of each Application for Payment to Architect by a method ensuring receipt within 24 hours. Include waivers of lien and similar attachments if required.

1. Transmit each copy with a transmittal form listing attachments and recording appropriate information about application.

I. Waivers of Mechanic's Lien: With each Application for Payment, submit waivers of mechanic's lien from entities lawfully entitled to file a mechanic's lien arising out of the Contract and related to the Work covered by the payment.
   1. Submit partial waivers on each item for amount requested in previous application, after deduction for retainage, on each item.
   2. When an application shows completion of an item, submit conditional final or full waivers.
   3. Owner reserves the right to designate which entities involved in the Work must submit waivers.
   4. Waiver Forms: Submit executed waivers of lien on forms acceptable to Owner.

J. Initial Application for Payment: Administrative actions and submittals that must precede or coincide with submittal of first Application for Payment include the following:

   1. List of subcontractors.
   2. Schedule of values.
   3. Contractor's construction schedule (preliminary if not final).
   4. Products list (preliminary if not final).
   5. Sustainable design action plans, including preliminary project materials cost data.
   6. Schedule of unit prices.
   7. Initial submittal list.
   8. Overall Submittal schedule.
   9. List of Contractor's staff assignments.
   10. List of Contractor's principal consultants.
   11. Copies of building permits.
   12. Copies of authorizations and licenses from authorities having jurisdiction for performance of the Work.
   13. Initial progress report.
   14. Report of preconstruction conference.
   15. Certificates of insurance and insurance policies.
   16. Performance and payment bonds.
   17. Data needed to acquire Owner's insurance.

K. Application for Payment at Substantial Completion: After Architect issues the Certificate of Substantial Completion, submit an Application for Payment showing 100 percent completion for portion of the Work claimed as substantially complete.
   1. Include documentation supporting claim that the Work is substantially complete and a statement showing an accounting of changes to the Contract Sum.
      a. Complete administrative actions, submittals, and Work preceding this application, as described in Section 01 77 00 "Closeout Procedures."
   2. This application shall reflect Certificate(s) of Substantial Completion issued previously for Owner occupancy of designated portions of the Work.

L. Final Payment Application: After completing Project closeout requirements, submit final Application for Payment with releases and supporting documentation not previously submitted and accepted, including, but not limited, to the following:
   1. Evidence of completion of Project closeout requirements.
   2. Certification of completion of final punch list items.
   3. Insurance certificates for products and completed operations where required and proof that taxes, fees, and similar obligations were paid.
   4. Updated final statement, accounting for final changes to the Contract Sum.

5. AIA Document G706.
6. AIA Document G706A.
7. AIA Document G707.
8. Evidence that claims have been settled.
9. Final meter readings for utilities, a measured record of stored fuel, and similar data as of date of Substantial Completion or when Owner took possession of and assumed responsibility for corresponding elements of the Work.
10. Final liquidated damages settlement statement.
11. Proof that taxes, fees, and similar obligations are paid.
12. Waivers and releases.

PART 2 - PRODUCTS (NOT USED)

PART 3 - EXECUTION (NOT USED)

END OF SECTION 01 29 00

SECTION 01 31 00 - PROJECT MANAGEMENT AND COORDINATION

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes administrative provisions for coordinating construction operations on Project, including, but not limited to, the following:

1. General coordination procedures.
2. Coordination drawings.
3. RFIs.
4. Project meetings.

B. Related Requirements:

1. Section 01 32 00 Construction Progress Documentation for preparing and submitting Contractor's construction schedule.
2. Section 0 73 00 Execution for procedures for coordinating general installation and field engineering services, including establishment of benchmarks and control points.
3. Section 01 77 00 Closeout Procedures for coordinating closeout of the Contract.

1.2 DEFINITIONS

A. BIM: Building Information Modeling.

B. RFI: Request for Information. Request from Owner, Architect, or Contractor seeking information required by or clarifications of the Contract Documents.

1. A document submitted by the Contractor seeking interpretation or clarification of the Contract Documents.
2. A properly prepared request for information or interpretation shall include a detailed written statement that indicates the specific Drawing(s) or Specification(s) in need of clarification and the nature of the clarification requested.
    a. Drawings shall be identified by Drawing number, Drawing Sheet and location.
    b. Specifications shall be identified by Section number, page and paragraph.
    c. Requests for information: Request made by Contractor concerning information not indicated on Drawings nor contained in Project Manual that is required to properly perform the work.
    d. Requests for Interpretation: Request made by Contractor in accordance with the Contract for construction.

C. Improper RFIs:

1. RFIs that are not properly prepared.
2. Improper RFI's will be rejected by the Architect. The Contractor will be notified by the Architect upon rejection of improper RFIs.

D. Frivolous RFIs:

1. RFIs which request information that is clearly shown on the Contract Documents as determined by Architect.
    a. Contractor is responsible to review all coordination questions and relay information within the documents to subcontractors, vendors, and/or suppliers.

2. The Contractor may be assessed $100.00 for each frivolous RFI during Project Closeout.

E. Neither improper nor frivolous RFIs will be allowed as basis for Change Orders claiming additional costs and/or time extensions.Superintendent: Represents the Contractor with any the necessary assistants who are in attendance at the Project site during the performance of the work.

1.3 INFORMATIONAL SUBMITTALS

A. Subcontract List: Prepare a written summary identifying individuals or firms proposed for each portion of the Work, including those who are to furnish products or equipment fabricated to a special design. Include the following information in tabular form:

1. Name, address, telephone number, and email address of entity performing subcontract or supplying products.
2. Number and title of related Specification Section(s) covered by subcontract.
3. Drawing number and detail references, as appropriate, covered by subcontract.

B. Key Personnel Names: Within 15 days of starting construction operations, submit a list of key personnel assignments, including superintendent and other personnel in attendance at Project site. Identify individuals and their duties and responsibilities. List addresses, cellular telephone numbers, and e-mail addresses. Provide names, addresses, and telephone numbers of individuals assigned as alternates in the absence of individuals assigned to Project.

1. Objection to the Superintendent: Within 14 days of receipt of the information, the Owner, through the Architect will notify the Contractor, stating the reasonable objection to the proposed superintendent or if the Owner requires additional time for review.
2. Do not employ any individual to whom the Owner or Architect has made reasonable and timely objection.
3. Do not change the superintendent without the Owner's consent.

1.4 GENERAL COORDINATION PROCEDURES

A. Coordination: Coordinate construction operations included in different Sections of the Specifications to ensure efficient and orderly installation of each part of the Work. Coordinate construction operations included in different Sections that depend on each other for proper installation, connection, and operation.

1. Schedule construction operations in sequence required to obtain the best results, where installation of one part of the Work depends on installation of other components, before or after its own installation.
2. Coordinate installation of different components to ensure maximum performance and accessibility for required maintenance, service, and repair.
3. Make adequate provisions to accommodate items scheduled for later installation.
4. Where availability of space is limited, coordinate installation of different components to ensure maximum performance and accessibility of required maintenantce, service, and repair of all components, including mechanical and electrical.

B. Concealed or Unknown Conditions: If conditions are encountered which are subsurface or otherwise concealed or unknown physical conditions of an unusual nature are found to exist proceed as follows:

1. Promptly provide notice to the Owner and the Architect before conditions are disturbed and in no event later than fourteen days after first observance of the conditions.
2. The Owner and the Architect will review the conditions:
    a. If the Owner and the Architect determines cause for an increase or decrease in the Contract Sum or Contract Time, submit a Change Order Proposal as specified in Section 01 26 00 "Contract Modification Procedures."
    b. If the Owner and the Architect determines that the condition does not change the Contract Sum or Contract Time, the Architect will promptly notify the Owner and Contractor, stating the reasons.
3. If the Contractor disputes the Owner and the Architect's determination, submit a Change Order Proposal as specified in Section 01 26 00 "Contract Modification Procedures."

C. Priority of Construction Space:

1. Coordinate installation of different components to ensure performance and accessibility for required maintenance, service, and repair of components, including mechanical and electrical.
2. Following is the Order of Priority of Construction Space:
    a. First: Ductwork.
    b. Second: Fire protection piping.
    c. Third: Other piping.
    d. Fourth: Conduit.

D. Prepare memoranda for distribution to each party involved, outlining special procedures required for coordination. Include such items as required notices, reports, and list of attendees at meetings.

1. Prepare similar memoranda for Owner and separate contractors if coordination of their Work is required.

E. Administrative Procedures: Coordinate scheduling and timing of required administrative procedures with other construction activities and scheduled activities of other contractors to avoid conflicts and to ensure orderly progress of the Work. Such administrative activities include, but are not limited to, the following:

1. Preparation of Contractor's construction schedule.
2. Preparation of the schedule of values.
3. Installation and removal of temporary facilities and controls.
4. Delivery and processing of submittals.
5. Progress meetings.
6. Preinstallation conferences.
7. Project closeout activities.
8. Startup and adjustment of systems.

F. Conservation: Coordinate construction activities to ensure that operations are carried out with consideration given to conservation of energy, water, and materials. Coordinate use of temporary utilities to minimize waste.

1.5 COORDINATION DRAWINGS

A. Coordination Drawings, General: Prepare coordination drawings according to requirements in individual Sections, and additionally where installation is not completely indicated on Shop Drawings, where limited space availability necessitates coordination, or if coordination is required to facilitate integration of products and materials fabricated or installed by more than one entity.

1. Content: Project-specific information, drawn accurately to a scale large enough to indicate and resolve conflicts. Do not base coordination drawings on standard printed data or reproductions of the Contract Documents which in their original, copied, or electronic file form are the Architect's instrument of service and are protected under copyright laws. Include the following information, as applicable:

a. Use applicable Drawings as a basis for preparation of coordination drawings. Prepare sections, elevations, and details as needed to describe relationship of various systems and components.
b. Coordinate the addition of trade-specific information to coordination drawings in a sequence that best provides for coordination of the information and resolution of conflicts between installed components before submitting for review.
c. Indicate functional and spatial relationships of components of architectural, structural, civil, mechanical, and electrical systems.
d. Indicate space requirements for routine maintenance and for anticipated replacement of components during the life of the installation.
e. Show location and size of access doors required for access to concealed dampers, valves, and other controls.
f. Indicate required installation sequences.
g. Indicate dimensions shown on Drawings. Specifically note dimensions that appear to be in conflict with submitted equipment and minimum clearance requirements. Provide alternative sketches to Architect indicating proposed resolution of such conflicts. Minor dimension changes and difficult installations will not be considered changes to the Contract.

B. Trade Coordination:

1. Drawings contain diagrammatic layouts and indicate general arrangement of systems, piping conduit, etc.
2. Prior to installation of material and equipment, review and coordinate Work with Architectural and Structural Contract Documents for exact space conditions; where not readily discernable, request information from Architect before proceeding.
3. Check Contract Documents of other trades to verify extent of material and equipment to be installed in spaces available and consider layout alternatives so that all requirements can be accommodated.
4. Maintain maximum headroom at locations without finished ceilings.
5. Maintain finished ceiling heights as indicated.
6. Coordinate installations with other trades to prevent conflict with Work of other trades and cooperate in making reasonable modifications in layout as needed.

C. Coordination Drawing Organization: Organize coordination drawings as follows:

1. Floor Plans and Reflected Ceiling Plans: Show architectural and structural elements, and mechanical, plumbing, fire-protection, fire-alarm, and electrical Work. Show locations of visible ceiling-mounted devices relative to acoustical ceiling grid. Supplement plan drawings with section drawings where required to adequately represent the Work.
2. Plenum Space: Indicate subframing for support of ceiling and wall systems, mechanical and electrical equipment, and related Work. Locate components within

plenums to accommodate layout of light fixtures and other components indicated on Drawings. Indicate areas of conflict between light fixtures and other components.

3. Mechanical Rooms: Provide coordination drawings for mechanical rooms, showing plans and elevations of mechanical, plumbing, fire-protection, fire-alarm, and electrical equipment.
4. Structural Penetrations: Indicate penetrations and openings required for other disciplines.
5. Slab Edge and Embedded Items: Indicate slab edge locations and sizes and locations of embedded items for metal fabrications, sleeves, anchor bolts, bearing plates, angles, door floor closers, slab depressions for floor finishes, curbs and housekeeping pads, and similar items.
6. Mechanical and Plumbing Work: Show the following:
    a. Sizes and bottom elevations of ductwork, piping, and conduit runs, including insulation, bracing, flanges, and support systems.
    b. Dimensions of major components, such as dampers, valves, diffusers, access doors, cleanouts and electrical distribution equipment.
    c. Fire-rated enclosures around ductwork.
7. Electrical Work: Show the following:
    a. Runs of vertical and horizontal conduit 1-1/4 inches (32 mm) in diameter and larger.
    b. Runs of vertical and horizontal conduit less than 1-1/4 inches (32 mm) in diameter when in groups of 10 or more conduits.
    c. Light fixture, exit light, emergency battery pack, smoke detector, and other fire-alarm locations.
    d. Panel board, switchboard, switchgear, transformer, busway, generator, and motor-control center locations.
    e. Location of pull boxes and junction boxes, dimensioned from column center lines.
8. Fire-Protection System: Show the following:
    a. Locations of standpipes, mains piping, branch lines, pipe drops, and sprinkler heads.
9. Minimum Head Clearance: Provide the bottom elevations of the lowest piping, ductwork, or electrical conduits to confirm clearance.
10. Review: Architect will review coordination drawings to confirm that, in general, the Work is being coordinated, but not for the details of the coordination, which are Contractor's responsibility. If Architect determines that coordination drawings are not being prepared in sufficient scope or detail, or are otherwise deficient, Architect will so inform Contractor, who shall make suitable modifications and resubmit.
11. Coordination Drawing Submittal: Submit coordination drawings electronically according to requirements in Section 01 33 00 "Submittal Procedures."

D. Coordination Digital Data Files: Prepare coordination digital data files according to the following requirements:

1. File Preparation Format: Same digital data software program, version, and operating system as original Drawings.
2. File Submittal Format: Submit or post coordination drawing files using 3D Portable Data File (PDF) format.
3. Architect will furnish Contractor one set of digital data files of Drawings for use in preoaring coordination digital files as specified in related Section 01 11 50 Electronic Drawings.

a. Architect makes no representations as to the accuracy or completeness of digital data files as the related to Drawings.
b. Digital Data Software Program: Drawings are available in AutoCAD format.
c. Contractor shall execute a data licensing agreement in the form of Agreement included in this Project Manual or an Agreement form acceptable to Owner and Architect.

1.6 ADMINISTRATIVE AND SUPERVISORY PERSONNEL

A. General: In addition to Project Superintendent, provide other administrative and supervisory personnel as required for proper performance of the Work.
1. Include special personnel required for coordination of operations with other contractors.

B. Key Personnel Names: Within 15 days of starting construction operations, submit a list of key personnel assignments, including Superintendent and other personnel in attendance at Project Site. Identify individuals and their duties and responsibilities; list names, addresses, and telephone numbers of individuals assigned as standbys in the absence of individuals assigned to the Project.
1. Post copies of list in Project meeting room, in temporary field office, and by each temporary telephone. Keep list current at all times.

1.7 REQUEST FOR INFORMATION (RFI)

A. Prior to submitting each RFI, first carefully study and compare the Contract Documents, field conditions, other Owner provided information, Contractor prepared Coordination Drawings, and prior Project correspondence and documentation to determine that the information to be requested is not reasonably obtainable from such sources.

B. Immediately on discovery of the need for additional information, clarification, or interpretation of the Contract Documents, prepare and submit an RFI.

C. Email each RFI as a PDF electronic file to the Architect andcopy the Owner..

D. Submit each RFI sufficiently in advance of the date by which such information is required to maintain the latest construction schedule.

1. Clearly identify the required response time and if the item is critical and requires an expedited review.
2. RFI Item Number: Each RFI should be provided a unique sequential number in three-digit format; such as -001, -002, etc.; this number stays constant on each revision.
3. RFI Revision Number: Each RFI revision should be given a unique sequential number in two-digit format; such as -00, 01, -02, etc.; with -00 as the original RFI.

E. RFI Content: Include a detailed, legible description of item needing information or interpretation and the following:

1. Project name.
2. Owner name.
3. Owner's Project number.
4. Name of Architect.
5. Date.
6. Name of Contractor.
7. RFI number, numbered sequentially.

8. RFI subject.
9. Referenced specification section number(s) and title and related paragraphs, as appropriate.
10. Referenced drawing number(s) and detail(s) references, as appropriate.
11. Field dimensions and conditions, as appropriate.
12. Primary Discipline of RFI, based on the following:
    a. Architectural.
    b. Structural.
    c. Mechanical.
    d. Electrical.
    e. Plumbing.
    f. Fire Protection.
    g. Lighting.
    h. AV/Telecom.
    i. Civil.
    j. Landscape.
    k. Other.
13. Indicate if an expedited review is requested.
14. Contractor's suggested resolution.
    a. If Contractor's suggested resolution impacts the Contract Time or the Contract Sum, Contractor shall state impact in the RFI.
15. Contractor's signature.
16. Attachments: Include sketches, descriptions, measurements, photos, Product Data, Shop Drawings, coordination drawings, and other information necessary to fully describe items needing interpretation.
    a. Include dimensions, thicknesses, structural grid references, and details of affected materials, assemblies, and attachments on attached sketches.

F. RFI Forms: Utilize the form bound in Project Manual or software-generated form with substantially the same content as indicated above, acceptable to Architect, submitted by electronic mail (e-mail).
1. Identify each page with the RFI number and sequential page number.
2. Provide attachments for software-generated forms in Adobe Acrobat PDF format.

G. Contractor shall endeavor to keep the number of RFIs to a minimum.

H. RFIs shall be originated by the Contractor.
1. RFIs from subcontractors or material suppliers shall be submitted through, reviewed by and signed by the Contractor prior to submittal to the Architect and Construction Manager.
2. RFIs from subcontracors or material suppliers sent directly to the Construction Manager of Architect, or to the Architects consultants, shall not be accepted and will be returned unanswered.

I. Contractor shall carefully study the Contract Documents to assure that the requested information is not available therein.
1. RFI’s that request information available in the Contraract Documents will be deemed either ‘improper ‘or ‘frivolous’ as noted above.

J. In instances of RFIs issued requesting a ‘coordination issue’ clarification, Contractor shall include a proposed solution, using drawings or sketches drawn to scale, or photographs annotated to illustrate proposed intent.
   1. RFI’s that request information available in the Contraract Documents will be deemed either ‘improper ‘or ‘frivolous’ as noted above.

K. Architect's Action: Architect will review each RFI, determine action required, and respond. Allow five days for Architect's response for each RFI. RFIs received by Architect after 1:00 p.m. will be considered as received the following working day.
   1. Architect will endeavor to return expedited review requests.
   2. The following Contractor-generated RFIs will be returned without action:
      a. Requests for approval of submittals.
      b. Requests for approval of substitutions.
      c. Requests for approval of Contractor's means and methods.
      d. Requests for coordination information already indicated in the Contract Documents.
      e. Requests for adjustments in the Contract Time or the Contract Sum.
      f. Requests for interpretation of Architect's actions on submittals.
      g. Incomplete RFIs or inaccurately prepared RFIs.
   3. Architect's action may include a request for additional information, in which case Architect's time for response will date from time of receipt by Architect of additional information.
   4. Frivolous RFIs: The Contractor may be invoiced by the Owner for any costs incurred for professional services, which shall be deducted from the next progress payment, for each RFI requesting an interpretation or decision of a matter where the information sought is equally available to the party making such request, or as otherwise defined in this section as frivolous.
      1) Architect will not be responsible for entering information in the Contractor's construction administration system.

L. RFI Log: Prepare, maintain, and submit a tabular log of RFIs organized by the RFI number. Submit log weekly. Include items from "RFI Content" paragraph above.

M. On receipt of Architect's action, update the RFI log and immediately distribute the RFI response to affected parties. Review response and notify Architect within seven days if Contractor disagrees with response.

1.8 DIGITAL PROJECT MANAGEMENT PROCEDURES

A. Use of Architect's Digital Data Files: Digital data files of Architect's BIM model will be provided by Architect to the Owner for Contractor's use during construction.
   1. Upon Contractor's execution of Digital Data Transfer agreement acceptable to the Architect and Owner, Owner will furnish Contractor one (1) set of Digital Data of Drawings for use in preparing coordination Digital Data files.
      a. Subcontractors and other parties granted access by Contractor to Architect’s digital data files shall execute a data licensing agreement in the form of Agreement acceptable to Owner and Architect.
   2. Digital Data may be used by Contractor to incorporate additional Digital Data without modifying data received while preparing Coordination Drawings and Shop Drawings.
   3. Digital Data may be used and modified by the Contractor as required to fulfill obligations for delivery of the Project Record Drawings.

4. Architect makes no representations as to the accuracy or completeness of Digital Data files as they relate to Contract Drawings, as such, only the Architect's stamped Construction Documents shall be utilized and relied upon for construction purposes.

B. PDF Document Preparation: Where PDFs are required to by submitted to Architect, prepare as follows:
   1. Assemble complete submittal package into a single, indexed file, incorporating submittal requirements of a single Specification Section and transmittal form with links enabling navigation to each item.
   2. Nake file with Submittal number or other unique identifier, including revision identifier.
   3. Certifications: Where digitally submitted certificates and certifications are required, provide a digital signature with digital certificate where indicated.

C. Web-Based Project Management Software Package: Provide, administer, and use web-based Project management software package for purposes of hosting and managing Project communication and documentation until Final Completion.

   1. Web-based Project management software includes, at a minimum, the following features:

      a. Compilation of Project data, including Contractor, subcontractors, Architect, Architect's consultants, Owner, and other entities involved in Project. Include names of individuals and contact information.
      b. Access control for each entity for each workflow process, to determine entity's digital rights to create, modify, view, and print documents.
      c. Document workflow planning, allowing customization of workflow between project entities.
      d. Creation, logging, tracking, and notification for Project communications required in other Specification Sections, including, but not limited to, RFIs, submittals, Minor Changes in the Work, Construction Change Directives, and Change Orders.
      e. Track status of each Project communication in real time, and log time and date when responses are provided.
      f. Procedures for handling PDFs or similar file formats, allowing markups by each entity. Provide security features to lock markups against changes once submitted.
      g. Processing and tracking of payment applications.
      h. Processing and tracking of contract modifications.
      i. Creating and distributing meeting minutes.
      j. Document management for Drawings, Specifications, and coordination drawings, including revision control.
      k. Management of construction progress photographs.
      l. Mobile device compatibility, including smartphones and tablets.

   2. Provide up to seven Project management software user licenses for use of Owner, Architect, and Architect's consultants. Provide eight hours of software training for web-based Project software users.
   3. At completion of Project, provide digital archive in format that is readable by common desktop software applications in format acceptable to Architect and Owner. Provide data in locked format to prevent further changes.

1.9 ARCHITECT’s SUPPLEMENTAL INSTRUCTIONS (ASI)

A. An ASI is a written supplemental instruction issued and signed by the Architect for minor changes to the Work, without change in Contract Sum or Contract Time.

B. Architect Authority:
   1. The Architect has the authority to order minor changes in the Work not involving any adjustment to the Contract Sum, an extension of the Contract Time or a change which is inconsistent with the intent of the Contract Documents.
   2. The Contractor shall carry out such written orders promptly.

1.10 PROJECT MEETINGS

A. General: Schedule and conduct meetings and conferences at Project site unless otherwise indicated.

   1. Attendees: Inform participants and others involved, and individuals whose presence is required, of date and time of each meeting. Notify Owner and Architect of scheduled meeting dates and times a minimum of seven days prior to meeting.
   2. Agenda: Prepare the meeting agenda. Distribute the agenda to invited attendees.
   3. Minutes: Entity responsible for conducting meeting will record significant discussions and agreements achieved. Distribute the meeting minutes to everyone concerned, including Owner and Architect, within three days of the meeting.

B. Preconstruction Conference: Conduct a preconstruction conference at the project site or a location and time convenient to the Owner and Architect, before starting construction, but no later than 15 days after execution of the Agreement.

   1. Attendees: Authorized representatives of Owner Architect, and their consultants; Contractor and its superintendent; major subcontractors; suppliers; and other concerned parties shall attend the conference. Participants at the conference shall be familiar with Project and authorized to conclude matters relating to the Work.
   2. Agenda: Discuss items of significance that could affect progress, including the following:
      a. Tentative construction schedule.
      b. Phasing.
      c. Critical work sequencing and long lead items.
      d. Designation of key personnel and their duties.
      e. Lines of communications.
      f. Use of web-based Project software.
      g. Procedures for processing field decisions and Change Orders.
      h. Procedures for RFIs.
      i. Procedures for testing and inspecting.
      j. Procedures for processing Applications for Payment.
      k. Distribution of the Contract Documents.
      l. Submittal procedures.
      m. Preparation of Record Documents.
      n. Use of the premises and existing building.
      o. Work restrictions.
      p. Working hours.
      q. Owner's occupancy requirements.
      r. Responsibility for temporary facilities and controls.
      s. Procedures for moisture and mold control.
      t. Procedures for disruptions and shutdowns.
      u. Construction waste management and recycling.
      v. Parking availability.
      w. Office, work, and storage areas.
      x. Equipment deliveries and priorities.
      y. First aid.
      z. Security.

aa. Progress cleaning.

3. Minutes: Entity responsible for conducting meeting will record and distribute meeting minutes.

C. Preinstallation Conferences: Conduct a preinstallation conference at Project site before each construction activity when required by other Sections and when required for coordination with other construction.

1. Scheduling: Schedule preinstallation conferences on same day as progress meetings attended by Architect.
2. Attendees: Installer and representatives of manufacturers and fabricators involved in or affected by the installation and its coordination or integration with other materials and installations that have preceded or will follow, shall attend the meeting. Advise Architect of scheduled meeting dates.
3. Agenda: Review progress of other construction activities and preparations for the particular activity under consideration, including requirements for the following:

a. Contract Documents.
b. Options.
c. Related RFIs.
d. Related Change Orders.
e. Purchases.
f. Deliveries.
g. Submittals.
h. Sustainable design requirements.
i. Review of mockups.
j. Possible conflicts.
k. Compatibility requirements.
l. Time schedules.
m. Weather limitations.
n. Manufacturer's written instructions.
o. Warranty requirements.
p. Compatibility of materials.
q. Acceptability of substrates.
r. Temporary facilities and controls.
s. Space and access limitations.
t. Regulations of authorities having jurisdiction.
u. Testing and inspecting requirements.
v. Installation procedures.
w. Coordination with other work.
x. Required performance results.
y. Protection of adjacent work.
z. Protection of construction and personnel.

4. Record significant conference discussions, agreements, and disagreements, including required corrective measures and actions.
5. Reporting: Distribute minutes of the meeting to each party present and to other parties requiring information.
6. Do not proceed with installation if the conference cannot be successfully concluded. Initiate whatever actions are necessary to resolve impediments to performance of the Work and reconvene the conference at earliest feasible date.

D. Project Closeout Conference: Conduct a project closeout conference, at a time convenient to Owner and Architect, but no later than 90 days prior to the scheduled date of Substantial Completion.

1. Conduct the conference to review requirements and responsibilities related to Project closeout.
2. Attendees: Authorized representatives of Owner, Owner's Commissioning Authority, Architect, and their consultants; Contractor and its superintendent; major subcontractors; suppliers; and other concerned parties shall attend the meeting. Participants at the meeting shall be familiar with Project and authorized to conclude matters relating to the Work.
3. Agenda: Discuss items of significance that could affect or delay Project closeout, including the following:

    a. Preparation of Record Documents.
    b. Procedures required prior to inspection for Substantial Completion and for final inspection for acceptance.
    c. Procedures for completing and archiving web-based Project software site data files.
    d. Submittal of written warranties.
    e. Requirements for preparing operations and maintenance data.
    f. Requirements for delivery of material samples, attic stock, and spare parts.
    g. Requirements for demonstration and training.
    h. Preparation of Contractor's punch list.
    i. Procedures for processing Applications for Payment at Substantial Completion and for final payment.
    j. Submittal procedures.
    k. Coordination of separate contracts.
    l. Owner's partial occupancy requirements.
    m. Installation of Owner's furniture, fixtures, and equipment.
    n. Responsibility for removing temporary facilities and controls.

4. Minutes: Entity conducting meeting will record and distribute meeting minutes.

E. Progress Meetings: Conduct progress meetings at regular intervals.

1. Coordinate dates of meetings with preparation of payment requests.
2. Attendees: In addition to representatives of Owner, Owner's Commissioning Authority and Architect, each contractor, subcontractor, supplier, and other entity concerned with current progress or involved in planning, coordination, or performance of future activities shall be represented at these meetings. Participants at the meeting shall be familiar with Project and authorized to conclude matters relating to the Work.
3. Agenda: Review and correct or approve minutes of previous progress meeting. Review other items of significance that could affect progress. Include topics for discussion as appropriate to status of Project:

    a. Contractor's Construction Schedule: Review progress since the last meeting. Determine whether each activity is on time, ahead of schedule, or behind schedule, in relation to Contractor's construction schedule. Determine how construction behind schedule will be expedited; secure commitments from parties involved to do so. Discuss whether schedule revisions are required to ensure that current and subsequent activities will be completed within the Contract Time.

        1) Review schedule for next period.

    b. Review present and future needs of each entity present, including the following:

        1) Interface requirements.
        2) Sequence of operations.
        3) Resolution of BIM component conflicts.

4) Status of submittals.
5) Deliveries.
6) Off-site fabrication.
7) Access.
8) Site use.
9) Temporary facilities and controls.
10) Progress cleaning.
11) Quality and work standards.
12) Status of correction of deficient items.
13) Field observations.
14) Status of RFIs.
15) Status of Proposal Requests.
16) Pending changes.
17) Status of Change Orders.
18) Pending claims and disputes.
19) Documentation of information for payment requests.

4. Minutes: Entity responsible for conducting the meeting will record and distribute the meeting minutes to each party present and to parties requiring information.

a. Schedule Updating: Revise Contractor's construction schedule after each progress meeting, where revisions to the schedule have been made or recognized. Issue revised schedule concurrently with the report of each meeting.

1.11 ARCHITECT'S ADMINISTRATION OF THE CONTRACT

A. The Architect will provide administration of the Contract as the Owner's representative during construction until the date that the Architect certifies the Final Certificate for Payment.

B. The Architect will visit the site at intervals appropriate to the stage of construction, or as otherwise agreed with the Owner, to become generally familiar with the progress and quality of the portion of the Work completed.

1. To determine in general if the Work observed is being performed in a manner indicating that the Work, when fully completed, will be in accordance with the Contract Documents.
2. The Architect will not be required to make exhaustive or continuous on-site inspections to check the quality or quantity of the Work.
3. The Architect will not have control over, charge of, or responsibility for the construction means, methods, techniques, sequences, or procedures, or for the safety precautions and programs in connection with the Work.
4. The Architect will not be responsible for the Contractor's failure to perform the Work in accordance with the requirements of the Contract Documents

C. Communications: Include the Architect in communications that relate to or affect the Architect's services or professional responsibilities.

1. Communications by and with the Architect's consultants are through the Architect.
2. Communications by and with Subcontractors and suppliers are through the Contractor.

PART 2 - PRODUCTS (NOT USED)

PART 3 - EXECUTION

3.1 ATTACHMENTS

A. Request for Information (RFI) Form

END OF SECTION

Request No.	[XXXXX]	Date	[Month 00, Year]
Project Name	[Project Name]	To	
Project No.	[XXXXXX.XX]		[Address]
Subject	[Subject of RFI]		[City, State, Zip]
		Attention	

Specification Section No. & Paragraph **(Required)**	[Section No. & paragraph]	Drawing & Details Affected **(Required)**	[Drawing & details affected]

Primary Discipline of Request For Information:

☐ Architectural ☐ Structural ☐ Mechanical ☐ Electrical ☐ Plumbing ☐ Fire Protection ☐ Lighting

☐ AV/Telecom ☐ Civil ☐ Landscape ☐ Other

CONTRACTOR'S/BIDDER'S REQUEST (attached referenced documents)

[Write Request Here]

☐ Required to Complete Shop Drawing Submittal ☐ Required to Complete Field Coordination ☐ Required to Complete Bid

CONTRACTOR'S/BIDDER'S RECOMMENDATION

[Write Recommendation Here]

☐ Request has a Potential Schedule Impact ☐ Request has a Potential Cost Impact

CONTRACTOR'S / BIDDER'S REPRESENTATION

Undersigned warrants that Contractor has thoroughly researched the documents, and the information requested does not exist or cannot be ascertained from the information given in the documents.

Contractor's signature and date

Signature Date

Distribution: ☐ Owner ☐ _____ ☐ _____ ☐ _____ ☐ _____ ☐ _____ ☐ _____

☐ Project File

Note: This reply is not an authorization to proceed with work involving additional cost, time, or both. If any reply requires a Change to the Contract Documents, a Change Order, Construction Change Directive, or a Minor Change in the work must be executed in accordance with the Contract Documents.

SECTION 01 32 00 - CONSTRUCTION PROGRESS DOCUMENTATION

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes administrative and procedural requirements for documenting the progress of construction during performance of the Work, including the following:

1. Startup construction schedule.
2. Construction Schedule.
3. Construction schedule updating reports.
4. Daily construction reports.
5. Material location reports.
6. Site condition reports.
7. Unusual event reports.

B. Related Requirements:
1. Section 01 33 00 Submittal Procedures for submitting schedules and reports.
2. Section 01 40 00 Quality Requirements for submitting a schedule of test and inspections.

1.2 DEFINITIONS

A. Activity: A discrete part of a project that can be identified for planning, scheduling, monitoring, and controlling the construction Project. Activities included in a construction schedule consume time and resources.

1. Critical Activity: An activity on the critical path that must start and finish on the planned early start and finish times.
2. Predecessor Activity: An activity that precedes another activity in the network.
3. Successor Activity: An activity that follows another activity in the network.

B. Cost Loading: The allocation of the schedule of values for completing an activity as scheduled. The sum of costs for all activities must equal the total Contract Sum.

C. CPM: Critical path method, which is a method of planning and scheduling a construction project where activities are arranged based on activity relationships. Network calculations determine the critical path of Project and when activities can be performed.

D. Critical Path: The longest connected chain of interdependent activities through the network schedule that establishes the minimum overall Project duration and contains no float.

E. Event: The starting or ending point of an activity.

F. Float: The measure of leeway in starting and completing an activity.

1. Float time is not for the exclusive use or benefit of either Owner or Contractor, but is a jointly owned, expiring Project resource available to both parties as needed to meet schedule milestones and Contract completion date.
2. Free float is the amount of time an activity can be delayed without adversely affecting the early start of the successor activity.

3. Total float is the measure of leeway in starting or completing an activity without adversely affecting the planned Project completion date.

G. Resource Loading: The allocation of labor and equipment necessary for completing an activity as scheduled.

H. Time: Unless otherwise provided, Contract Time is the period of time, including authorized adjustments, allotted in the Contract Documents for Substantial Completion of the Work.

1. The date of commencement of the Work is the date established in the Agreement.
2. The date of Substantial Completion is the date certified by the Architect in accordance with Section 01 77 00 "Closeout Procedures."
3. Day: Refers to a calendar day of contract time, unless otherwise specifically defined.

1.3 INFORMATIONAL SUBMITTALS

A. Format for Submittals: Submit required submittals in PDF file.

B. Startup construction schedule.

1. Submittal of cost-loaded startup construction schedule will not constitute approval of schedule of values for cost-loaded activities.

C. Startup Network Diagram: Of size required to display entire network for entire construction period. Show logic ties for activities.

D. Construction Schedule: Initial schedule, of size required to display entire schedule for entire construction period.

E. CPM Reports: Concurrent with CPM schedule, submit each of the following reports. Format for each activity in reports to contain activity number, activity description, cost and resource loading, original duration, remaining duration, early start date, early finish date, late start date, late finish date, and total float in calendar days.
1. Activity Report: List of activities sorted by activity number and then early start date, or actual start date if known.
2. Logic Report: List of preceding and succeeding activities for each activity, sorted in ascending order by activity number and then by early start date, or actual start date if known.
3. Total Float Report: List of activities sorted in ascending order of total float.
4. Earnings Report: Compilation of Contractor's total earnings from the Notice to Proceed, unless otherwise indicated in the Owner-Contractor Agreement, until most recent Application for Payment.

F. Construction Schedule Updating Reports: Submit with Applications for Payment.

G. Daily Construction Reports: Submit at [weekly] [monthly] intervals.

H. Material Location Reports: Submit at [weekly] [monthly] intervals.

I. Site Condition Reports: Submit at time of discovery of differing conditions.

J. Unusual Event Reports: Submit at time of unusual event.

K. Qualification Data: For scheduling consultant.

1.4 COORDINATION

A. Coordinate Construction Schedule with the schedule of values, submittal schedule, progress reports, payment requests, and other required schedules and reports.
   1. Secure time commitments for performing critical elements of the Work from entities involved.
   2. Coordinate each construction activity in the network with other activities, and schedule them in proper sequence.

1.5 CONSTRUCTION SCHEDULE

A. Computer Scheduling Software: Prepare schedules using current version of a program that has been developed specifically to manage construction schedules.

B. Scheduling Consultant: To provide planning, evaluation, and reporting, using CPM scheduling.

C. Time Frame: Extend schedule from date established for the Notice to Proceed, unless otherwise indicated in the Owner-Contractor Agreement to date of [Substantial Completion] [Final Completion].
   1. Contract completion date shall not be changed by submission of a schedule that shows an early completion date, unless specifically authorized by Change Order.

D. Activities: Treat each floor or separate area as a separate numbered activity for each main element of the Work. Comply with the following:
   1. Activity Duration: Define activities so no activity is longer than 20 days, unless specifically allowed by Architect.
   2. Temporary Facilities: Indicate start and completion dates for the following as applicable:
      a. Securing of approvals and permits required for performance of the Work.
      b. Temporary facilities.
      c. Construction of mock-ups, prototypes, and samples.
      d. Owner interfaces and furnishing of items.
      e. Interfaces with Separate Contracts.
      f. Regulatory agency approvals.
      g. Punch list.
   3. Procurement Activities: Include procurement process activities for long lead-time items, including Owner-Furnished/Contractor-Installed (OFCI) items, Owner-Furnished/Owner-Installed (OFOI) items and other major items, requiring a cycle of more than 60 days, as separate activities in schedule. Procurement cycle activities include, but are not limited to, submittals, approvals, purchasing, fabrication, and delivery.
      a. Submittal Review Time: Include review and resubmittal times indicated in Section 01 33 00 "Submittal Procedures" in schedule.
   4. Startup and Testing Time: Include no fewer than 15 days for startup and testing.
   5. Commissioning Time: Include no fewer than 15 days for commissioning.
   6. Substantial Completion: Indicate completion in advance of date established for Substantial Completion and allow time for Architect's administrative procedures necessary for certification of Substantial Completion.
   7. Punch List and Final Completion: Include not more than 30 days for completion of punch list items and Final Completion.

E. Constraints: Include constraints and work restrictions indicated in the Contract Documents and as follows in schedule and show how the sequence of the Work is affected.
   1. Phasing: Arrange list of activities on schedule by phase.

2. Work under More Than One Contract: Include a separate activity for each contract.
3. Work by Owner: Include a separate activity for each portion of the Work performed by Owner.
4. Products Ordered in Advance: Include a separate activity for each product. Include delivery date indicated in Section 01 10 00 "Summary." Delivery dates indicated stipulate the earliest possible delivery date.
5. Owner-Furnished Products: Include a separate activity for each product. Include delivery date indicated in Section 01 10 00 "Summary." Delivery dates indicated stipulate the earliest possible delivery date.
6. Work Restrictions: Show the effect of the following items on the schedule:
    a. Coordination with existing construction.
    b. Limitations of continued occupancies.
    c. Uninterruptible services.
    d. Partial occupancy before Substantial Completion.
    e. Use-of-premises restrictions.
    f. Provisions for future construction.
    g. Seasonal variations.
    h. Environmental control.

F. Milestones: Include milestones indicated in the Contract Documents in schedule, including, but not limited to, the Notice to Proceed, Substantial Completion, and Final Completion
1. Temporary enclosure and space conditioning.

G. Cost Correlation: Superimpose a cost correlation timeline, indicating planned and actual costs. On the line, show planned and actual dollar volume of the Work performed as of planned and actual dates used for preparation of payment requests.
1. See Section 01 29 00 "Payment Procedures" for cost reporting and payment procedures.

H. Upcoming Work Summary: Prepare summary report indicating activities scheduled to occur or commence prior to submittal of next schedule update. Summarize the following issues:
1. Unresolved issues.
2. Unanswered Requests for Information.
3. Rejected or unreturned submittals.
4. Notations on returned submittals.
5. Pending modifications affecting the Work and the Contract Time.

I. Construction Schedule Updating: At monthly intervals, update schedule to reflect actual construction progress and activities. Issue schedule one week before each regularly scheduled progress meeting.

1. Revise schedule immediately after each meeting or other activity where revisions have been recognized or made. Issue updated schedule concurrently with the report of each such meeting.
2. Include a report with updated schedule that indicates every change, including, but not limited to, changes in logic, durations, actual starts and finishes, and activity durations.
3. As the Work progresses, indicate Final Completion percentage for each activity.

J. Recovery Schedule: When periodic update indicates the Work is 14 or more calendar days behind the current approved schedule, submit a separate recovery schedule indicating means by which Contractor intends to regain compliance with the schedule. Indicate changes to working hours, working days, crew sizes, equipment required to achieve compliance, and date by which recovery will be accomplished.

K. Distribution: Distribute copies of approved schedule to Architect, Construction Manager, Owner, separate contractors, testing and inspecting agencies, and other parties identified by Contractor with a need-to-know schedule responsibility.

1. Post copies in Project meeting rooms and temporary field offices.
2. When revisions are made, distribute updated schedules to the same parties and post in the same locations. Delete parties from distribution when they have completed their assigned portion of the Work and are no longer involved in performance of construction activities.

1.6 GANTT-CHART SCHEDULE REQUIREMENTS

A. Gantt-Chart Schedule: Submit a comprehensive, fully developed, horizontal, Gantt-chart-type, Construction Schedule within 30 days of date established for the Notice to Proceed, unless otherwise indicated in the Owner-Contractor Agreement.

1. Base schedule on the startup construction schedule and additional information received since the start of Project.

B. Preparation: Indicate each significant construction activity separately. Identify first workday of each week with a continuous vertical line.

1. For construction activities that require three months or longer to complete, indicate an estimated completion percentage in 10 percent increments within time bar.

1.7 CPM SCHEDULE REQUIREMENTS

A. Prepare network diagrams using AON (activity-on-node) format.

B. CPM Schedule: Prepare Construction Schedule using a[cost- and resource-loaded,] time-scaled CPM network analysis diagram for the Work.

1. Develop network diagram in sufficient time to submit CPM schedule, so it can be accepted for use no later than [60] <Insert number> days after date established for the Notice to Proceed, unless otherwise indicated in the Owner-Contractor Agreement.

a. Failure to include any work item required for performance of this Contract will not excuse Contractor from completing all work within applicable completion dates.

2. Conduct educational workshops to train and inform key Project personnel, including subcontractors' personnel, in proper methods of providing data and using CPM schedule information.
3. Establish procedures for monitoring and updating CPM schedule and for reporting progress. Coordinate procedures with progress meeting and payment request dates.
4. Use "one day" as the unit of time for individual activities. Indicate nonworking days and holidays incorporated into the schedule to coordinate with the Contract Time.

1.8 REPORTS

A. Daily Construction Reports: Prepare a daily construction report recording the following information concerning events at Project site:

1. List of subcontractors at Project site.
2. List of separate contractors at Project site.
3. Approximate count of personnel at Project site.

4. Equipment at Project site.
5. Material deliveries.
6. High and low temperatures and general weather conditions, including presence of rain or snow.
7. Testing and inspection.
8. Accidents.
9. Meetings and significant decisions.
10. Unusual events.
11. Stoppages, delays, shortages, and losses.
12. Meter readings and similar recordings.
13. Emergency procedures.
14. Orders and requests of authorities having jurisdiction.
15. Change Orders received and implemented.
16. [Construction] [Work] Change Directives received and implemented.
17. Services connected and disconnected.
18. Equipment or system tests and startups.
19. Partial completions and occupancies.
20. Substantial Completions authorized.

B. Material Location Reports: Prepare and submit a comprehensive list of materials delivered to and stored at Project site. List to be cumulative, showing materials previously reported plus items recently delivered. Include with list a statement of progress on and delivery dates for materials or items of equipment fabricated or stored away from Project site. Indicate the following categories for stored materials:

1. Material stored prior to previous report and remaining in storage.
2. Material stored prior to previous report and since removed from storage and installed.
3. Material stored following previous report and remaining in storage.

C. Site Condition Reports: Immediately on discovery of a difference between site conditions and the Contract Documents, prepare and submit a detailed report. Submit with a Request for Information. Include a detailed description of the differing conditions, together with recommendations for changing the Contract Documents.

D. Unusual Event Reports: When an event of an unusual and significant nature occurs at Project site, whether or not related directly to the Work, prepare and submit a special report. List chain of events, persons participating, responses by Contractor's personnel, evaluation of results or effects, and similar pertinent information. Advise Owner in advance when these events are known or predictable.

1. Submit unusual event reports directly to Owner within one day(s) of an occurrence. Distribute copies of report to parties affected by the occurrence.

PART 2 - PRODUCTS (NOT USED)

PART 3 - EXECUTION (NOT USED)

END OF SECTION

SECTION 01 33 00 - SUBMITTAL PROCEDURES

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes:

1. Submittal schedule requirements.
2. Administrative and procedural requirements for submittals.

1.2 WORK NOT INCLUDED

A. Submittals which are not required will not be reviewed by the Architect.

B. The Contractor may require subcontractors to provide drawings, setting iiagrams or similar information as part of the coordination of the Work. The Architect willnot review this data.

C. Material Safety and Data Sheets (MSDS) – Limitation of Review: Certain Submittals required provision of these documents by the Contractor. These documents contain information necessary for toperation of the facility. The Architet’s review of these submittals is limited to noting inclusion of the document for the Owner’s use. No further review or comment on MSDS documents by Architect shall be performed or inferred.

1.3 DEFINITIONS

A. Action Submittals: Written and graphic information and physical samples that require Architect's responsive action. Action submittals are those submittals indicated in individual Specification Sections as "action submittals."

B. Informational Submittals: Written and graphic information and physical samples that do not require Architect's responsive action. Submittals may be rejected for not complying with requirements. Informational submittals are those submittals indicated in individual Specification Sections as "informational submittals."

C. Product Data: Illustrations, standard schedules, performance charts, instructions, brochures, diagrams, and other information furnished by the Contractor to illustrate materials or equipment for some portion of the Work.

D. Samples: Physical examples that illustrate materials or workmanship, and establish standards by which the Work will be judged.

E. Shop Drawings: Drawings, diagrams, schedules, and other data specially prepared for the Work by the Contractor or a Subcontractor, Sub-subcontractor, manufacturer, supplier, or distributor to illustrate some portion of the Work.

1.4 GENERAL REQUIREMENTS

A. Shop Drawings, Product Data, Samples, and similar submittals are not Contract Documents. Their purpose is to demonstrate how the Contractor proposes to conform to the

information given and the design concept expressed in the Contract Documents for those portions of the Work for which the Contract Documents require submittals.

B. Refer to Section 01 31 00 "Project Management and Coordination" for the use of Architect's Digital Data Files in the preparation of Shop drawings.

C. Concurrent Submittals: Provide submittals for each specification section concurrently for delivery to Architect unless otherwise specified. Failure to concurrently submit may result in Architect returning submittals without review.

1. Where calculations are required to be submitted, submit concurrently with the initial submittal.

D. Accompany submittals with a completed Submittal Identification Sheet attached to this Section.

1. Submittal Identification Sheet will be the cover sheet for each submittal.
2. Submittals not including Submittal Identification Sheet will be returned as "Not Reviewed."
3. If a Contractor proposes to use their own Transmittal Form in lieu of the Submittal Identification Sheet, the proposed Form must be reviewed by, and determined to be acceptable to, the Architect prior to submitting the first Submittal, and not include less than the information contained within the left side of the Submittal Identification Sheet.

E. Submittals Provided for scope of Work not under Architect's Contract and Delegated Design: The project may require Architects review of submittals for Work prepared under the responsible charge of Design Professionals that are not under the Architect's contract.

1. Provide submittals for work signed and stamped by such design professionals, licensed in the project's jurisdiction, for the Architect's review.
2. Where calculations are required to be submitted, submit concurrently with the initial submittal. Submittals without the required calculations, will be returned without Architect's action.
3. Architect's action will be limited to review for compliance with design concept and contract documents.

1.5 SUBMITTAL SCHEDULE

A. General Requirements:

1. The Architect may withhold action on submittals until the complete Initial Submittal List and Overall Submittal Schedule have been submitted and reviewed.
2. Review of submittals without submission and approval of Initial Submittal List and Overall Submittal Schedule does not relieve Contractor of responsibility to provide Initial Submittal List and Overall Submittal Schedule for approval.
3. Failure to submit either Initial Submittal List or Overall Submittal Schedule relieves Architect of constraints on review periods.
4. Failure to submit an Initial Submittal List, the Overall Submittal Schedule, or to provide submittals in accordance with the Overall Submittal Schedule, will not entitle the Contractor to any increase in Contract Sum or extension of Contract Time.
5. Architect may withhold review of Pay Applications until the complete Initial Submittal List and Overall Submittal Schedule have been submitted and approved.
6. Architect may return submittals as unreviewed if received in advance of the dates indicated in the submittal schedule or those submittals which are not listed in the submittal schedule.

B. Initial Submittal List: Submit to Architect at earliest possible date, but no later than 15 days after Award of Contract, a list of submittals.

1. Format: Arrange the following information in a tabular format:

a. Specification Section number and title.
b. Identification of critical submittals requiring an expedited review process by the Architect.

2. Architect's Action: Note any submittals required to be submitted concurrently for coordination during review.
3. Owner's Action: Note any submittals required to be reviewed by Owner or Owner's Consultants.

C. Overall Submittal Schedule: Submit to Architect concurrently with the Initial Submittal List, an overall submittal schedule, arranged in chronological order by dates required by the construction schedule.

1. Include time required for review, ordering, manufacturing, fabrication, and delivery when establishing dates.
2. Include additional time required for making corrections or revisions to submittals noted by Architect and additional time for handling and reviewing submittals required by those corrections.
3. Coordinate submittal schedule with list of subcontracts, the schedule of values, and Contractor's construction schedule.
4. List those submittals required to maintain orderly progress of the Work and those required early due to long lead time for manufacture or fabrication.

a. Clearly identify those critical submittals that will require an expedited review process by the Architect.
b. Architect’s Action: Approval of the list and timing of critical submittals in relationship to the overall submittal workflow and schedule.

5. Align the submittal sequence to the anticipated sequence of construction.
6. Format: Arrange the following information in a tabular format:

a. Scheduled date for first submittal.
b. Specification Section number and title.
c. Submittal Category: Action; informational.
d. Name of subcontractor.
e. Description of the Work covered.
f. Scheduled date for Architect's final release or review.
g. Scheduled dates for purchasing.
h. Scheduled date of fabrication.
i. Scheduled dates for installation.
j. Activity or event number.

D. Three-Month Look Ahead Submittal Schedule: Submit as an informational submittal, in conjunction with each Pay Application, a detailed submittal schedule covering the next three-month time period, to reflect changes in status and timing for submittals.

1. Pay Applications will not be reviewed without concurrent submission of three-Month Look Ahead submittal schedule.
2. Successive three-month look ahead submittal schedules are a revision of the original submittal.
3. Format: Same as Overall Submittal Schedule.
4. Clearly identify those critical submittals that will require an expedited review process by the Architect.

1.6 SUBMITTAL PROCEDURES

A. Provide submittals required by individual Specification Sections as follows:

1. Submittals: Email as PDF electronic files to the Owner and Architect.

a. Include project name and Submittal Identification Number in subject line of email.
b. Large File Transfer: For files too large for email, transmit using secure file transfer service site and submit transmittal via email to Architect as indicated above, indicating submittal has been uploaded to transfer service site.
c. Submittals received by Architect after 1:00 p.m. will be considered as received the following business day.

2. Certificates and Certifications Submittals:

a. Provide a digital signature with digital certificate on electronically submitted certificates and certifications where indicated.

B. Submittals: Identify and incorporate information in each electronic submittal file. Submittals which fail to conform to the file naming convention will be returned as "Not Reviewed."

1. Index or bookmark submittal for each unique submittal type.
2. Name submittal files per the following protocol: ProjectIdentifierSpecificationSection-SubmittalItem-SubmittalRevision_SubmittalType-Optional Description.

a. Project Identifier: ABA Project number 2111010.
b. Separator: Provide underscore immediately after Project Identifier.
c. Specification Section Number: Only section numbers listed in the Project Manual are acceptable.
d. Submittal Item Number: Each item indicated in specification section as a submittal should be provided a unique sequential number in three-digit format, proceeded by a dash, such as -001, -002, etc.; this number stays constant on a resubmittal.
e. Submittal Revision Number: Each submittal should be given a unique sequential revision number in two-character format, proceeded by a dash, such as -R1, -R2, etc., which modifies the original number of -00.
f. Separator: Provide underscore immediately after Submittal Revision Number.
g. Submittal Type: Two-character submittal type identifier per schedule below:

1) PD: Product Data
2) SD: Shop Drawing
3) DD: Delegated Design
4) LD: Sustainable Design Submittal or LEED Submittal
5) MW: Manufacturer's Warranty
6) ER: Evaluation Reports
7) PT: Product Lab Test Reports/Data
8) FR: Field Test Report
9) MS: Material Sample
10) PC: Product Certification
11) CC: Contractor Certification/Qualification
12) IC: Installer Certification
13) IN: Installation Certification
14) QD: Qualification Data
15) MI: Manufacturer's Installation Instructions
16) OM: Operations and Maintenance Data/Manuals
17) RD: Record Documents

h. Optional Description: Up to 25-character optional description of the submittal, separated from the Submittal Type by a dash.

1) Example: -Structural Steel Seq A.

3. Submittals that fail to conform to the file naming convention will be returned as "Not Reviewed."
4. Example of File Naming Protocol for submittals from Section 05 54 00:

a. Action Submittals:

1) Product Data: "Project Identifier"_05 54 00-001-00_PD-CFMF.
2) Shop Drawings: "Project Identifier"_05 54 00-003_SD-CFMF.
3) Delegated-Design Submittal: "Project Identifier"_05 54 00-004-00_DD-CFMF-CFMF Delegated Design.

b. Informational Submittals:

1) Welding Certificates: "Project Identifier"_05 54 00-005_IC-CFMF Welding Cert.
2) Qualification Data: "Project Identifier"_05 54 00-006-R2_QD-CFMF Qual Data.
3) Product Test Reports: "Project Identifier"_05 54 00-007-00_PT-CFMF Test Reports.

C. Options: Identify options requiring selection by Architect.

D. Deviations and Additional Information: On attached separate sheet, prepared on Contractor's letterhead, record relevant information, requests for data, revisions other than those requested by Architect on previous submittals, and deviations from requirements in Contract Documents, including minor variations and limitations. Include same identification information as related submittal.

1. Deviations: Encircle or otherwise specifically identify deviations from Contract Documents on submittals.

E. Coordination: Coordinate preparation and processing of submittals with performance of construction activities.

1. Coordinate each submittal with fabrication, purchasing, testing, delivery, other submittals, and related activities that require sequential activity.
2. Submit submittal Items required for each Specification Section concurrently unless partial submittals for portions of the Work are indicated on approved submittal schedule.
3. Submit action submittals and informational submittals required by the same Specification Section as separate packages under separate transmittals.
4. Coordinate transmittal of submittals for related parts of the Work specified in different Sections, so processing will not be delayed because of need to review submittals concurrently for coordination.

a. Architect will return a submittal as "Not Reviewed" on a submittal requiring coordination with other submittals until related submittals are received.

F. Processing Time: Allow sufficient time for Architect's review of submittals as determined by Architect. After review and approval of submittal schedule, allow time for submittal review, including time for resubmittals, as follows. Time for review commences on Architect's receipt of submittal. Submittals received by Architect after 1:00 p.m. will be considered as received the following working day. No extension of the Contract Time will be authorized because of failure to transmit submittals enough in advance of the Work to permit processing, including resubmittals.

1. Initial Review: Allow 15 days for initial review of each submittal except for critical submittals identified and agreed to by the Architect on the approved Submittal Schedule. Allow additional time if coordination with subsequent submittals is required. Architect will advise Contractor when a submittal being processed must be delayed for coordination.
2. Intermediate Review: If intermediate submittal is necessary, process it in same manner as initial submittal.
3. Resubmittal Review: Allow 15 days for review of each resubmittal, or as indicated by Architect on approved Submittal Schedule.
4. Sequential Review: Where sequential review of submittals by Architect's consultants, Owner, or other parties is indicated, allow 21 days for initial review of each submittal, or as indicated by Architect on approved Submittal Schedule.
5. Concurrent Consultant Review: Where the Contract Documents indicate that submittals may be transmitted simultaneously to Architect and to Architect's consultants, allow 15 days for review of each submittal. Submittal will be returned to Architect, before being returned to Contractor.

    a. Submit one copy of submittal to concurrent reviewer in addition to specified number of copies to Architect.

G. Resubmittals: Make resubmittals in same form and number of copies as initial submittal.

1. Note date and content of previous submittal.
2. Note date and content of revision in label or title block, and clearly indicate extent of revision.
3. Resubmit submittals until they are marked "No Exceptions Taken" or "Make Corrections Noted" and initialed by Architect.

H. Distribution: Furnish copies of final submittals to manufacturers, subcontractors, suppliers, fabricators, installers, authorities having jurisdiction, and others as necessary for performance of construction activities. Show distribution on transmittal forms.

I. Use for Construction: Retain complete copies of submittals on Project site. Use only final action submittals that are marked with approval notation from Architect's action stamp.

1.7 SUBMITTAL REQUIREMENTS

A. Product Data: Collect information into a single submittal for each element of construction and type of product or equipment.

1. If information must be specially prepared for submittal because standard published data are unsuitable for use, submit as Shop Drawings, not as Product Data.
2. Mark each copy of each submittal to show which products and options are applicable.
3. Include the following information, as applicable:

    a. Manufacturer's product specifications, including performance characteristics written to match specified terminology for ease of comparison.
    b. Manufacturer's Instructions: Prepare written or published information that documents manufacturer's recommendations, guidelines, and procedures for installing or operating a product or equipment. Include name of product and name, address, and telephone number of manufacturer. Include the following, as applicable:

        1) Preparation of substrates.
        2) Required substrate tolerances.
        3) Sequence of installation or erection.
        4) Required installation tolerances.

5) Required adjustments.
6) Recommendations for cleaning and protection.

c. Standard color charts.
d. Manufacturer's catalog cuts.
e. Wiring diagrams showing factory-installed wiring and controls.
f. Printed performance curves.
g. Operational range diagrams.
h. Mill reports.
i. Standard product operation and maintenance manuals.
j. Statement of compliance with specified referenced standards.
k. Testing by recognized testing agency.
l. Application of testing agency labels and seals.
m. Notation of coordination requirements.
n. Availability and delivery time information.
o. Clearances required to other construction, if not indicated on accompanying Shop Drawings.
p. Additional information as required by Specifications.

4. Submit Product Data before or concurrent with Samples.
5. Submit Product Data as a PDF electronic file.
6. Safety Data Sheets (SDS) and Material Safety Data Sheets (MSDS): Submit information directly to Owner; do not submit to Architect.

a. Architect will not review submittals containing SDS or MSDS sheets, unless otherwise required.

B. Shop Drawings: Prepare Project-specific information, drawn accurately to scale.

1. Preparation: Fully illustrate requirements in the Contract Documents. Include the following information, as applicable:

a. Dimensions.
b. Identification of products.
c. Compliance with specified standards.
d. Notation of coordination requirements.
e. Notation of dimensions established by field measurement.
f. Relationship and attachment to adjoining construction clearly indicated.
g. Seal and signature of professional engineer if specified.
h. Additional information as required by Specifications.

2. Do not include the phrase "by others," except when relating to materials, products or equipment not included in the Work of the Contract.
3. Sheet Size: Except for templates, patterns, and similar full-size Drawings, submit Shop Drawings on sheet layouts of at least 8-1/2 by 11 inches (215 by 280 mm), but no larger than 30 by 42 inches (750 by 1067 mm).
4. Submit Shop Drawings in the following format: PDF electronic file.
5. Paper Submittals: Prepare submittals in paper form only when directed by Architect and prepare as required per "Submittal packaging" article.

a. For 8-1/2 by 11-inch (215.9 by 279.4 mm) shop drawings in excess of 20 pages, submit two (2) full size hard copies, in addition to the electronic PDF file. Architect will return only the annotated electronic PDF file.
b. For 11 by 17-inch (279.4 by 431.8 mm) shop drawings in excess of 20 pages submit two (2) full size hard copies, in addition to the electronic PDF file. Architect will return only the annotated electronic PDF file.

c. For shop drawings larger than 11 by 17-inch (279.4 by 431.8 mm) format, submit two (2) full size hard copies, in addition to the electronic PDF file. Architect will return only the annotated electronic PDF file.

6. Submittals will be clear and legible. The Architect reserves the right to reject in full any submittal due to illegibility, as determined solely by the Architect, without any impact to the allowed review time. Dimensions and text will be a minimum of 10-point font or 0.389 inches (9.88 mm) in height. Drawings not conforming to this requirement will be rejected without review.

C. Coordination Drawings: Refer to Division 01 Section "Project Management and Coordination" for requirements for coordination drawings.

D. Samples: Submit Samples for review of type, color, pattern, and texture for a check of these characteristics with other materials.

1. Transmit Samples that contain multiple, related components, such as accessories together in one submittal package.
2. Identification: Permanently attach label on unexposed side of Samples that includes the following:

a. Indicate name of firm or entity that prepared each submittal on label or title block.
b. Project name and submittal number.
c. Generic description of Sample.
d. Product name and name of manufacturer.
e. Sample source.
f. Number and title of applicable Specification Section.
g. Specification paragraph number and generic name of each item.

3. Provide corresponding electronic submittal including "Submittal Identification Sheet," digital image file of the Sample concurrent with submission of physical sample.

a. Received date by Architect will correspond with receipt of physical submittal.

4. Disposition: Maintain sets of approved Samples at Project site, available for quality-control comparisons throughout the course of construction activity. Sample sets may be used to determine final acceptance of construction associated with each set.

a. Samples that may be incorporated into the Work are indicated in individual Specification Sections. Such Samples must be in an undamaged condition at time of use.
b. Samples not incorporated into the Work, or otherwise designated as Owner's property, are the property of Contractor.

5. Samples for Initial Selection: Submit manufacturer's color charts consisting of units or sections of units, showing the full range of colors, textures, and patterns available.

a. Number of Samples: Submit two full set(s) of available choices where color, pattern, texture, or similar characteristics are required to be selected from manufacturer's product line. Architect will return submittal with options selected.

6. Samples for Verification: Submit full-size units or Samples of size indicated, prepared from same material to be used for the Work, cured and finished in manner specified, and physically identical with material or product proposed for use, and that show full range of color and texture variations expected. Samples include, but are not limited to, the following: partial sections of manufactured or fabricated components; small cuts or containers of materials; complete units of repetitively used materials;

swatches showing color, texture, and pattern; color range sets; and components used for independent testing and inspection.

a. Number of Samples: Submit three sets of Samples. Architect will retain one Sample set; the remainder will be returned. The Contractor is required to retain one returned Sample set as a project control Sample.

1) Submit a single Sample where assembly details, workmanship, fabrication techniques, connections, operation, and other similar characteristics are to be demonstrated.
2) If variation in color, pattern, texture, or other characteristic is inherent in material or product represented by a Sample, submit at least three sets of paired units that show approximate limits of variations.

E. Qualification Data: Prepare written information that demonstrates capabilities and experience of firm or person. Include lists of completed projects with project names and addresses, contact information of architects and owners, and other information specified.

F. Certificates:

1. Certificates and Certifications Submittals: Submit a statement that includes signature of entity responsible for preparing certification. Certificates and certifications will be signed by an officer or other individual authorized to sign documents on behalf of that entity. Provide a notarized signature where indicated.
2. Installer Certificates: Submit written statements on manufacturer's letterhead, certifying that Installer complies with requirements in the Contract Documents and, where required, is authorized by manufacturer for this specific Project.
3. Manufacturer Certificates: Submit written statements on manufacturer's letterhead, certifying that manufacturer complies with requirements in the Contract Documents. Include evidence of manufacturing experience where required.
4. Material Certificates: Submit written statements on manufacturer's letterhead, certifying that material complies with requirements in the Contract Documents.
5. Product Certificates: Submit written statements on manufacturer's letterhead, certifying that product complies with requirements in the Contract Documents.
6. Welding Certificates: Prepare written certification that welding procedures and personnel comply with requirements in the Contract Documents. Submit record of AWS B2.1/B2.1M on AWS forms. Include names of firms and personnel certified.

G. Test and Research Reports: Schedule tests and reports in accordance with Division 01 Section "Quality Requirements" and as follows:

1. Compatibility Test Reports: Submit reports written by a qualified testing agency, on testing agency's standard form, indicating and interpreting results of compatibility tests performed before installation of product. Include written recommendations for substrate preparation and primers required.
2. Field Test Reports: Submit written reports indicating and interpreting results of field tests performed either during installation of product or after product is installed in its final location, for compliance with requirements in the Contract Documents.
3. Material Test Reports: Submit reports written by a qualified testing agency, on testing agency's standard form, indicating and interpreting test results of material for compliance with requirements in the Contract Documents.
4. Preconstruction Test Reports: Submit reports written by a qualified testing agency, on testing agency's standard form, indicating and interpreting results of tests performed before installation of product, for compliance with performance requirements in the Contract Documents.
5. Product Test Reports: Submit written reports indicating that current product produced by manufacturer complies with requirements in the Contract Documents. Base

reports on evaluation of tests performed by manufacturer and witnessed by a qualified testing agency, or on comprehensive tests performed by a qualified testing agency.

6. Manufacturer's Field Reports: Prepare written information documenting factory-authorized service representative's tests and inspections. Include the following, as applicable:

    a. Name, address, and telephone number of factory-authorized service representative making report.
    b. Statement on condition of substrates and their acceptability for installation of product.
    c. Statement that products at Project site comply with requirements.
    d. Summary of installation procedures being followed, whether they comply with requirements and, if not, what corrective action was taken.
    e. Results of operational and other tests and a statement of whether observed performance complies with requirements.
    f. Statement whether conditions, products, and installation will affect warranty.
    g. Other required items indicated in individual Specification Sections.

7. Research/Evaluation Reports: Submit written evidence, from a model code organization acceptable to authorities having jurisdiction, that product complies with building code in effect for Project. Include the following information:

    a. Name of evaluation organization.
    b. Date of evaluation.
    c. Time period when report is in effect.
    d. Product and manufacturers' names.
    e. Description of product.
    f. Test procedures and results.
    g. Limitations of use.

1.8 CONTRACTOR'S REVIEW

A. Action Submittals and Informational Submittals: Review each submittal and check for coordination with other Work of the Contract and for compliance with the Contract Documents. Note corrections and field dimensions. Mark with approval stamp before submitting to Architect.

1. Do not perform a portion of the Work for which the Contract Documents require submittals and review until the respective submittal has been approved by the Architect.
2. Contractor to verify, prior to submission:

    a. Field Measurements.
    b. Field Construction Criteria.
    c. Catalog Numbers and Similar Data.
    d. Quantities.
    e. Coordination with other requirements.

3. Contractor's responsibility regarding errors and omissions in submittals is not relieved by Architect's review of submittals.
4. Contractor's responsibility regarding deviations in submittals from requirements of Contract Documents is not relieved by Architect's review of submittals, unless Architect gives written acceptance of specific deviations as approved by Owner.
5. When work is directly related and involves more than one trade, coordinate submittal with other trades and submit under one cover.

6. After a submittal has been submitted for review, no changes may be made to that Submittal other than changes resulting from review notes made by the Architect unless such changes are clearly identified and circled before being resubmitted. Any failure to comply with this requirement will nullify and invalidate the Architect's review.

B. Approval Stamp: Stamp each Submittal Identification Form with Contractor's stamp certifying that submittal has been reviewed, checked, and approved for compliance with the Contract Documents.

1.9 ARCHITECT'S ACTION

A. The Architect will review or take other appropriate action upon the Contractor's submittals, but only for the limited purpose of checking for conformance with information given and the design concept expressed in the Contract Documents.

1. Review of submittals is not conducted for the purpose of determining the accuracy and completeness of other details such as dimensions and quantities, or for substantiating instructions for installation or performance of equipment or systems, which remain the responsibility of the Contractor.

B. Action Submittals: Architect will review each submittal, make marks to indicate corrections or modifications required, and return it. Architect will indicate on "Submittal Identification Sheet" for each submittal to indicate action taken, as follows:

1. "Reviewed":

a. No further review of submittal is required.

2. "Furnish as Corrected":

a. If Contractor complies with noted corrections, fabrication may proceed and resubmission is not required, unless otherwise noted.
b. If for any reason the Contractor cannot comply with the noted corrections, fabrication shall not proceed and Contractor shall resubmit, following procedures outlined hereinbefore.

3. "Revise and Resubmit":

a. Contractor shall revise and resubmit for review. Fabrication shall not proceed.

4. "Rejected":

a. Submittal is not in compliance with the Contract Documents and is not acceptable. Provide new submittal.

C. Informational Submittals: Architect will review each submittal and will not return it or will return it if it does not comply with requirements. Architect will forward each submittal to appropriate party.

D. Partial submittals prepared for a portion of the Work will be reviewed when use of partial submittals has received prior approval from Architect.

E. Incomplete submittals are unacceptable, will be considered nonresponsive, and will be returned for resubmittal without review.

F. Architect will return without review submittals received from sources other than Contractor.

G. Submittals not required by the Contract Documents will be returned by Architect with the "Not Required for Review" action taken.

H. Submittals Provided for scope of Work not under Architect's Contract or Delegated Design: Architect will review each submittal, make marks to indicate compliance with Design Concept and Contract Documents only, and return it. Architect will indicate on Submittal Identification Sheet for each submittal to indicate action taken, as follows:

1. "Submittal is in Compliance with Design Concept and Contract Documents."
2. "Submittal is NOT in Compliance with Design Concept and Contract Documents."

PART 2 - PRODUCTS (Not Used)

PART 3 - EXECUTION

END OF SECTION

SECTION 01 35 35 – CONSTRUCTION INDOOR AIR QUALITY

PART 1 - GENERAL

1.1 SUMMARY

A. This Section describes construction Indoor Air Quality (IAQ) goals and includes administrative and procedural requirements for the development and execution of a construction air quality management plan to maintain the highest indoor air quality during the Work and following completion of it.

1.2 PERFORMANCE REQUIREMENTS

A. The Contractor shall apply their greatest skill and attention to anticipate and prevent conditions that could compromise indoor air quality during and following construction due to construction means, methods, process, sequence and materials. Particular attention shall be given to the following.
   1. Eliminating the use of materials containing Volatile Organic Compounds (VOC), formaldehyde and certain chemical compounds for which limitations are specified in an attachment to Section 01 60 00 and select construction materials and processes that will eliminate potential IAQ pollutants and contaminants from the Work.
   2. Protect the ventilation system components during construction and clean contaminated components after construction is complete.

B. Contractor's IAQ Management Plan shall conform to recommendations of SMACNA Guidelines for Occupied Buildings under Construction, Chapter 3 Control Measures for the following.
   1. HVAC protection.
   2. Source control.
   3. Pathway interruption.
   4. Housekeeping.
   5. Scheduling.

1.3 SUBMITTALS

A. IAQ Management Plan for the construction and pre-occupancy phases of the project.

B. Construction Photographs: Digital, color images, 640 by 480 pixels on CD-ROM documenting construction IAQ management measures implemented during the Work such as duct protection measures and measures to protect on-site stored or installed absorptive materials from moisture. Provide annotation for images including date, time and subject.

C. Product Data: Filtration media used during construction and installed immediately prior to occupancy with MERV values highlighted.

1.4 QUALITY ASSURANCE

A. Indoor Air Quality Management Plan: For the construction and pre-occupancy phases of the Project provide the following as a minimum.

1. Construction Period: Meet or exceed the minimum requirements of the Sheet Metal and Air Conditioning National Contractors Association (SMACNA) IAQ Guidelines for Occupied Buildings under Construction.
2. Protect stored and installed absorptive materials from exposure to moisture and where practical provide conditioning period in controlled environment to reduce moisture content of materials where protection failed or was otherwise ineffective.
3. Conduct a minimum two-week building flush-out following Substantial Completion of the Work and prior to Final Acceptance.
4. HVAC Protection: Shut down the return side of the HVAC system whenever possible during heavy construction. If the system must remain operational during construction include the following strategies that apply:
    a. Fit the return side of the HVAC system with temporary filters.
    b. Isolate the return side of the HVAC system from the surrounding environment as much as possible (e.g., place all tiles for the ceiling plenum, repair all ducts and air handler leaks).
    c. Damper off the return system in the heaviest work areas and seal the return system openings with plastic.
    d. Upgrade the filter efficiency where major loading is expected to affect operating HVAC system.
    e. Clean permanent return air ductwork per National Air Duct Cleaning Association standards upon completion of all construction and finish installation work.
    f. Install new clean media just prior to substantial completion and occupancy that has a Minimum Efficiency Reporting Value (MERV) of 13 as determined by ASHRAE 52.2-1999.
5. Source Control: Provide non-toxic formulations of materials and products and comply with chemical compound limitations throughout the work including but not limited to adhesives, coatings, substrate products, sealants, and cleaning products.
6. Pathway Interruption: Prevent contamination of clean spaces. Include the following strategies that apply:
7. Use 100 percent outside air ventilation (when outside temperatures are between 55 degrees F and 85 degrees F and humidity is between 30 and 60 percent) with air exhausted directly to the outside during installation of finishes and other VOC emitting materials.
8. Erect some type of barrier between work areas or between the inside and outside of the building to prevent unwanted airflow from dirty to clean areas.
9. Housekeeping: Reduce construction contamination in the building prior to occupancy through HVAC and regular space cleaning activities.
    a. Store building materials in a weather tight, clean area prior to unpacking for installation.
    b. Check for possible damage to building materials from high humidity.
    c. Clean all coils, air filters, and fans before testing and balancing procedures are performed.
10. Agenda items for discussion and monitoring of IAQ procedures and maintenance at Periodic Progress Meetings.
    a. Schedule coordination for flush out field quality control for IAQ testing/monitoring.

B. Scheduling: Specify construction sequencing to reduce absorption of VOC’s by materials that act as sinks or contaminant sources. Complete application of wet and odor-emitting materials such as paints, sealants, and coatings before installing sink materials such as ceiling tiles, carpets, insulation, gypsum products, and fabric-covered furnishings are installed.

1. Protect stored on-site or installed absorptive materials from exposure to moisture through precipitation, plumbing leaks, or condensation from the HVAC system to prevent microbial contamination.
2. Conduct a two-week building flush-out with new filtration media at 100% outside air after construction ends and prior to occupancy. Filtration media shall have a Minimum Efficiency Reporting Value (MERV) of 13 as determined by ASHRAE 52.2-1999. Replace filtration media used during flush-out prior to occupancy.

C. Draft IAQ Management Plan Review Meeting: Once the Owner and Architect have reviewed the Draft IAQ Management Plan and prior to construction at the site, schedule and conduct a meeting to review the Draft IAQ Management Plan and discuss procedures, schedules and specific requirements for IAQ during the construction and pre-construction phases of the building. Discuss coordination and interface between the Contractor and other construction activities. Identify and resolve problems with compliance to the requirements. Record minutes of the meeting, identify all conclusions reached and matters requiring further resolution.
1. Attendees: The Contractor and related Contractor personnel associated with the work of this Section, including personnel to be in charge of the IAQ management program, Architect, Owner and such additional personnel as the Architect or Owner deem appropriate.

D. Final IAQ Management Plan: Make any revisions to the Draft IAQ Management Plan agreed upon during the meeting identified in item (C) above and incorporate resolutions agreed to be made subsequent to the meeting. Submit the revised plan to the Owner and Architect for approval within 10 calendar days of the meeting.

PART 2 - PRODUCTS - NOT USED

PART 3 - EXECUTION

3.1 APPLICATION

A. Manager: The Contractor shall designate an on-site party (or parties) responsible for instructing workers and overseeing and the IAQ Management Plan for the Project.

B. Progress Meetings: Construction related IAQ procedures shall be included in the pre-construction and construction progress meeting agendas.

C. Distribution: The Contractor shall distribute copies of the IAQ Management Plan to the Job Site Foreman, each Subcontractor, the Owner, and the Architect.

D. Instruction: The Contractor shall provide on-site instruction of the IAQ procedures and ensure that all participants in the construction process understand the importance of the goals of the IAQ Management Plan.

END OF SECTION

SECTION 01 35 73 - DELEGATED DESIGN PROCEDURES

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes procedures for portions of Work under this Contract that are defined as Delegated Design components and systems in applicable Sections.

1.2 DEFINITIONS

A. Delegated Design: Professional design service or certification specifically required of the Contractor in Sections of the Project Manual.

B. Contractor's Design Professional: Design Professional registered in the State in which the Project is located and engaged by Contractor, subcontractor, or supplier to provide drawings, calculations and specifications required for Delegated Design components and systems.

C. Delegated Design Submittal: Submittal prepared by Contractor for work as specified.

D. Deferred Submittal: Construction documents for those components of the Work that cannot be fully detailed on the approved construction documents because of variations in product design and manufacture and have been specifically approved by the AHJ for submittal review and approval after original permit approval.

E. AHJ: Authorities Having Jurisdiction.

F. Seal: Certification that drawings, calculations, and specifications were designed and prepared under direct supervision of Architect or Professional Engineer whose name appears on the submittal.

1.3 GENERAL REQUIREMENTS

A. Delegated Design Components and systems: Refer to individual Project Manual Sections for work requiring Delegated Design.

B. Performance and Design Criteria for Delegated Design Criteria: Provide products and systems complying with specific performance and design criteria indicated.

1. If criteria indicated are insufficient to perform services or certification required, submit a written request for additional information to Architect.

2. The Owner and the Architect shall be entitled to rely upon the adequacy and accuracy of the services, certifications, and approvals performed or provided by the Contractor's design professionals.

C. Delegated Design components and systems shown in Contract Documents are shown for design intent. Contractor is responsible for designing, providing, coordinating, and installing Delegated Design components including specified products.

1. Where Delegated Design components and systems are attached to structural frame or supplemental to structural frame, design for anticipated loads specified on structural drawings, inherent gravity loads supported by system and coordinated with Contractor, and other loads included in applicable codes.
    a. Clearly define load reactions at interface between Delegated Design components and systems and structural frame to allow for review by Engineer of Record.
2. Design non-structural components and systems in compliance with applicable regulations, performance criteria, and submittal requirements as specified in the respective sections.
3. Coordinate Delegated Design components and systems with appropriate subcontractors.

D. Pre-Submittal Meeting: Meet with Architect, subcontractors, and Contractor's Design Professional to discuss requirements of work, submittals, scheduling, and sequencing of Delegated Design components and systems.

1.4 RESPONSIBILITIES

A. Contractor's Responsibilities:

1. Provide services or certifications by Contractor's Design Professional.
2. Include costs for Delegated Design in Contract Sum, including Contractor Design Professional fees, testing and inspection reports, documentation and shop drawings, field reviews and field review reports, and letters of general conformity.
3. Coordinate and assume complete responsibility for design, documentation, calculations, submittals, permits, fabrication, transportation, and installation of components requiring Delegated Design.
4. Coordinate components requiring Delegated Design with adjacent or related systems, whether included in Contract Documents or other Delegated Design components. Ensure complete and operational systems designed to perform their intended use are provided.
5. Ensure Delegated Design executes design intent indicated in the Contract Documents. and meets or exceeds requirements of applicable codes, standards, regulations, of the Contract Documents.
6. Where specified, submit Delegated Design documents to AHJ for review, in a manner that will not adversely affect Project's construction schedule.

B. Contractor's Design Professional: Design Professional engaged by Contractor, or Contractor's subcontractor or supplier, to provide drawings, calculations, reports, tests, and specifications required for Delegated Design components and systems in accordance with criteria specified in Contract Documents, including documentation required by AHJ when required. Responsibilities of Contractor's Design Professional include, but are not limited to, the following:

1. Preparation of Delegated Design Submittals:
    a. For structural applications, refer to Structural Drawings or applicable Specification Sections for structural performance criteria. Include provisions for wind, gravity, lateral, and seismic loads and include design for life safety, sizing of supports, anchors, framing, connections, spans, and other required characteristics.
    b. For non-structural applications, comply with performance criteria and AHJ requirements specified in applicable Section.
    c. Where calculations are required, submit at the same time as initial submittal.

2. Periodic field review of Delegated Design work:

   a. Provide Contractors Design Professional field reviews at intervals necessary and appropriate to progress of the Work to allow to be familiar with progress and quality of Work and to determine if work covered by Delegated Design is proceeding in general conformity with the Delegated Design submittal and Contract Documents, including reviewed shop drawings and design calculations. Provide field review report within 3 days of field review.
   b. Review of associated mock-ups and off-site fabrication where applicable. Submit field review report within 3 days after each mock up and offsite fabrication visit to Architect and AHJ as required by applicable building codes.
   c. Upon completion of Delegated Design components of the Work, prepare and submit to Architect, and AHJ as required, a letter of general conformity for Delegated Design components of the Work, certifying that they have been supplied and installed in accordance with the requirements of the submittal, AHJ and Contract Documents.

1.5 SCHEDULING

A. Schedule design process and submittals required for Delegated Design portions to comply with Project Construction Schedule.

   1. Allow sufficient time for Architect, Architect's consultants, and where applicable, AHJ, review of Delegated Design submittals. Include time estimate and coordination of schedule for review of Delegated Design submittals provided by Architect.

B. When Delegated Design submittal is included in documents submitted for building permit, schedule and sequence Architect's review of Delegated Design submittal prior to permit submittal.

C. Owner is not responsible to pay for any delays, additional products, additional hours of Work, or overtime, restocking or rework required due to failure by Contractor or subcontractor to coordinate their Work with Work of other trades on Project or to provide Delegated Design component and system in a timely manner to meet project schedule.

1.6 ACTION SUBMITTALS

A. Delegated Design Submittal Schedule: In compliance with the Submittal Schedule specified in Section 01 33 00 "Submittal Procedures."

B. Progress Submittal: Submit preliminary drawings and product data prior to performing engineering calculations and shop drawings.

C. Final Submittal: Submit final Delegated Design documents to Architect and AHJ as required for review and approval based on submittal schedule as specified in Section 01 33 00 "Submittal Procedures." Include the following:

   1. Complete criteria.
   2. Design assumptions.
   3. Details.
   4. Calculations for required engineering, including but not limited to, structural, mechanical, plumbing, fire protection, and electrical work as applicable.
   5. Reactions to structure where applicable.
   6. Submittal stamped and signed by Contractor's Design Professional responsible for preparation of submittals.
   7. Instructions for fabrication, assembly, installation, and interface with other trades.

1.7 INFORMATION SUBMITTALS

A. Subcontractor and Contractor's Design Professional List: Submit list of Delegated Design subcontractors and Contractor's Design Professionals in accordance with requirements specified in Division 01 Section "Submittal Procedures" for Subcontract List.

1. Submit Subcontractor and Contractor's Design Professional list to AHJ, when required.

B. Field Review Reports: By the Contractor's Design Professional.

C. Certifications: From the Delegated Design Professional certifying the Work is in accordance with the design criteria.

1. Indicate that products and systems comply with performance and design criteria in the Contract Documents. Include list of codes, loads, and other factors used in performing these services.

D. Engineer Qualifications: For Delegated Design Professional's qualifications.

1.8 PROCEDURES FOR DELEGATED DESIGN SUBMITTALS

A. Comply with requirements for submittals as specified in Section 01 33 00 "Submittal Procedures."

1. Submit Delegated Design documents for approval prior to fabrication.
2. Comply with Delegated Design submittal schedule.

B. Progress Submittal Process: Provide progress submittal to Architect approximately 4 weeks prior to final submittal. Submit Progress Submittal prior to performing engineering calculations.

1. Progress Submittal Contents:

a. Narrative reflecting understanding of basis of design for delegated design work, including structural and thermal performance.
b. Design drawings showing critical details.
c. Proposed list of initial submittal documents.
d. Engineer's qualifications.

2. Documents will be reviewed by Architect for consistency with specified criteria. Corrections, if any, will be identified and returned to Contractor.
3. Clearly identify deviations and proposed alternates to materials and systems specified in this Project Manual.

C. Final Submittal Process:

1. Submit final and complete Delegated Design documents to Architect as required for review and approval.
2. Complete submittal will be reviewed by Architect for consistency with specified criteria. Corrections, if any, will be identified and returned to Contractor.
3. Contractor makes corrections and returns submittal to Architect within one week of receipt.
4. No contract time extensions will be granted for document modification caused by non-conformance with specified criteria.
5. AHJ Review:

a. Once reviewed and approved by Architect, Architect submits documents to AHJ for review and comment.
b. Architect will receive AHJ comments and forward to Contractor.

c. Do not contact AHJ directly to discuss submittal without Architect's prior approval. If approval given, copy Architect on correspondence and meeting reports.
d. After submittal receives AHJ final approval, Architect provides one copy of stamped sets for Contractor's fabrication and construction.
e. Take steps required to obtain AHJ approval, including submittal changes or corrections required by AHJ and provide coordination and management necessary to obtain AHJI approval, including resubmittals, meetings where required by Architect, correspondence, and communications.

1.9 SUBMITTAL PROCEDURES FOR DEFERRED APPROVALS

A. Documentation: Where portion of construction cannot be adequately detailed on approved plans due to variations in product design and manufacture, approval of submittal for such portion, when specifically accepted by AHJ, may be deferred until material suppliers are selected:

1. Project Drawings clearly indicate that deferred approval by AHJ is required for indicated portions of work prior to fabrication and installation.
2. Contract Documents define performance criteria for deferred approval.
3. Contractor's Architect or Engineer shall stamp and sign Drawings and Specifications for deferred approval items.

a. The Architect or Engineer in general responsible charge of design of Project will submit Drawings and Specifications for deferred approval item to AHJ, with notation indicating that deferred approval documents have been found to be in general conformance with performance criteria.

1.10 ARCHITECTS ACTION

A. Architect's review of Delegated Design submittals will indicate compliance with Design Concept and Contract Documents only. Architect will indicate action taken on "Delegated Design Submittal Identification Sheet" for each submittal as follows:

1. "Submittal is in Compliance with Design Concept and Contract Documents".
2. "Submittal is NOT in Compliance with Design Concept and Contract Documents"

PART 2 - PRODUCTS (Not Used)

PART 3 - EXECUTION (Not Used)

END OF SECTION

SECTION 01 40 00 - QUALITY REQUIREMENTS

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes administrative and procedural requirements for quality assurance and quality control.

B. Testing and inspection services are required to verify compliance with requirements specified or indicated. These services do not relieve Contractor of responsibility for compliance with the Contract Document requirements.

1. Specific quality-assurance and quality-control requirements for individual work results are specified in their respective Specification Sections. Requirements in individual Sections may also cover production of standard products.
2. Specified tests, inspections, and related actions do not limit Contractor's other quality-assurance and quality-control procedures that facilitate compliance with the Contract Document requirements.
3. Services of testing laboratories and Special Inspectors as specified are intended for the Owner's verification of the Contractor's compliance with the requirements of the Contract Documents. Specified tests, inspections, and related actions do not limit Contractor's other quality-assurance and -control procedures that facilitate compliance with the Contract Document requirements or relieve the Contractor of the responsibility for compliance with the Contract Document requirements.
4. Requirements for Contractor to provide quality-assurance and quality-control services required by Architect, Owner, Commissioning Authority, or authorities having jurisdiction are not limited by provisions of this Section.
5. The services and quantities of testing specified are approximate and may vary. Actual services and quantities of testing will be determined by the Owner**,** and/or Architect , and Commissioning Authority during the construction period.
6. Specific test and inspection requirements are not specified in this Section.

1.2 DEFINITIONS

A. Delegated Design: Refer to definitions and requirements for Delegated Design in Section 01 35 73 "Delegated Design Procedures."

B. Experienced: When used with an entity or individual, "experienced," unless otherwise further described, means having successfully completed a minimum of five previous projects similar in nature, size, and extent to this Project; being familiar with special requirements indicated; and having complied with requirements of authorities having jurisdiction.

C. Field Quality-Control Tests and Inspections: Tests and inspections that are performed on-site for installation of the Work and for completed Work.

D. Installer/Applicator/Erector: Contractor or another entity engaged by Contractor as an employee, subcontractor, or sub-subcontractor, to perform a particular construction operation, including installation, erection, application, assembly, and similar operations.

1. Use of trade-specific terminology in referring to a Work result does not require that certain construction activities specified apply exclusively to specific trade(s).

E. Mockups: Physical assemblies of portions of the Work constructed to establish the standard by which the Work will be judged. Mockups are not Samples.

F. Preconstruction Testing: Tests and inspections performed specifically for Project before products and materials are incorporated into the Work, to verify performance or compliance with specified criteria. Unless otherwise indicated, copies of reports of tests or inspections performed for other than the Project do not meet this definition.

G. Product Tests: Tests and inspections that are performed by a nationally recognized testing laboratory (NRTL) in accordance with 29 CFR 1910.7, by a testing agency accredited in accordance with NIST's National Voluntary Laboratory Accreditation Program (NVLAP), or by a testing agency qualified to conduct product testing and acceptable to authorities having jurisdiction, to establish product performance and compliance with specified requirements.

H. Source Quality-Control Tests and Inspections: Tests and inspections that are performed at the source (e.g., plant, mill, factory, or shop).

I. Testing Agency: An entity engaged to perform specific tests, inspections, or both. The term "testing laboratory" has the same meaning as the term "testing agency."

J. Quality-Assurance Services: Activities, actions, and procedures performed before and during execution of the Work, to guard against defects and deficiencies and substantiate that proposed construction will comply with requirements.

K. Quality-Control Services: Tests, inspections, procedures, and related actions during and after execution of the Work, to evaluate that actual products incorporated into the Work and completed construction comply with requirements. Contractor's quality-control services do not include contract administration activities performed by Architect.

1.3 CONFLICTING REQUIREMENTS

A. Conflicting Standards and Other Requirements: If compliance with two or more standards or requirements is specified and the standards or requirements establish different or conflicting requirements for minimum quantities or quality levels, inform the Architect regarding the conflict and obtain clarification prior to proceeding with the Work. Refer conflicting requirements that are different, but apparently equal, to Architect for clarification before proceeding.

B. Minimum Quantity or Quality Levels: The quantity or quality level shown or specified is the minimum provided or performed. The actual installation may comply exactly with the minimum quantity or quality specified, or it may exceed the minimum within reasonable limits. To comply with these requirements, indicated numeric values are minimum or maximum, as appropriate, for the context of requirements. Refer uncertainties to Architect for a decision before proceeding.

1.4 INFORMATIONAL SUBMITTALS

A. Contractor's Quality-Control Plan: For quality-assurance and quality-control activities and responsibilities.

B. Qualification Data: For Contractor's quality-control personnel.

C. Contractor's Statement of Responsibility: When required by authorities having jurisdiction, submit copy of written statement of responsibility submitted to authorities having jurisdiction before starting work on the following systems:

1. Seismic-force-resisting system, designated seismic system, or component listed in the Statement of Special Inspections.
2. Primary wind-force-resisting system or a wind-resisting component listed in the Statement of Special Inspections.

D. Testing Agency Qualifications: For testing agencies specified in "Quality Assurance" Article to demonstrate their capabilities and experience. Include proof of qualifications in the form of a recent report on the inspection of the testing agency by a recognized authority.

E. Schedule of Tests and Inspections: Prepare in tabular form and include the following:

1. Specification Section number and title.
2. Entity responsible for performing tests and inspections.
3. Description of test and inspection.
4. Identification of applicable standards.
5. Identification of test and inspection methods.
6. Number of tests and inspections required.
7. Time schedule or time span for tests and inspections.
8. Requirements for obtaining samples.
9. Unique characteristics of each quality-control service.

F. Reports: Prepare and submit certified written reports and documents as specified.

G. Permits, Licenses, and Certificates: For Owner's record, submit copies of permits, licenses, certifications, inspection reports, releases, jurisdictional settlements, notices, receipts for fee payments, judgments, correspondence, records, and similar documents established for compliance with standards and regulations bearing on performance of the Work.

1.5 CONTRACTOR'S QUALITY-CONTROL PLAN

A. Quality-Control Plan, General: Submit quality-control plan within 10 days of Notice to Proceed, and not less than five days prior to preconstruction conference. Submit in format acceptable to Architect. Identify personnel, procedures, controls, instructions, tests, records, and forms to be used to carry out Contractor's quality-assurance and quality-control responsibilities and to coordinate Owner's quality-assurance and quality-control activities. Coordinate with Contractor's Construction Schedule.

B. Quality-Control Personnel Qualifications: Engage qualified personnel trained and experienced in managing and executing quality-assurance and quality-control procedures similar in nature and extent to those required for Project.

1. Project quality-control manager may also serve as Project superintendent.
2. .

C. Submittal Procedure: Describe procedures for ensuring compliance with requirements through review and management of submittal process. Indicate qualifications of personnel responsible for submittal review.

D. Testing and Inspection: In quality-control plan, include a comprehensive schedule of Work requiring testing or inspection, including the following:

1. Contractor-performed tests and inspections, including subcontractor-performed tests and inspections. Include required tests and inspections and Contractor-elected tests and inspections. Distinguish source quality-control tests and inspections from field quality-control tests and inspections.
2. Special inspections required by authorities having jurisdiction and indicated on the Statement of Special Inspections.
3. Owner-performed tests and inspections indicated in the Contract Documents.

E. Continuous Inspection of Workmanship: Describe process for continuous inspection during construction to identify and correct deficiencies in workmanship in addition to testing and inspection specified. Indicate types of corrective actions to be required to bring the Work into compliance with standards of workmanship established by Contract requirements and approved mockups.

F. Monitoring and Documentation: Maintain testing and inspection reports, including log of approved and rejected results. Include Work Architect has indicated as nonconforming or defective. Indicate corrective actions taken to bring nonconforming Work into compliance with requirements. Comply with requirements of authorities having jurisdiction.

1.6 REPORTS AND DOCUMENTS

A. Test and Inspection Reports: Prepare and submit certified written reports specified in other Sections. Include the following:

1. Date of issue.
2. Project title and number.
3. Name, address, telephone number, and email address of testing agency.
4. Dates and locations of samples and tests or inspections.
5. Names of individuals making tests and inspections.
6. Description of the Work and test and inspection method.
7. Identification of product and Specification Section.
8. Complete test or inspection data.
9. Test and inspection results and an interpretation of test results.
10. Record of temperature and weather conditions at time of sample-taking and testing and inspection.
11. Comments or professional opinion on whether tested or inspected Work complies with the Contract Document requirements, and identification of source of failure and consideration for repair.
12. Name and signature of laboratory inspector.
13. Recommendations on retesting and reinspecting.

B. Manufacturer's Technical Representative's Field Reports: Prepare written information documenting manufacturer's technical representative's tests and inspections specified in other Sections. Include the following:

1. Name, address, telephone number, and email address of technical representative making report.
2. Statement on condition of substrates and their acceptability for installation of product.
3. Statement that products at Project site comply with requirements.
4. Summary of installation procedures being followed, whether they comply with requirements and, if not, what corrective action was taken.
5. Results of operational and other tests and a statement of whether observed performance complies with requirements.
6. Statement of whether conditions, products, and installation will affect warranty.
7. Other required items indicated in individual Specification Sections.

C. Factory-Authorized Service Representative's Reports: Prepare written information documenting manufacturer's factory-authorized service representative's tests and inspections specified in other Sections. Include the following:

1. Name, address, telephone number, and email address of factory-authorized service representative making report.
2. Statement that equipment complies with requirements.
3. Results of operational and other tests and a statement of whether observed performance complies with requirements.
4. Statement of whether conditions, products, and installation will affect warranty.
5. Other required items indicated in individual Specification Sections.

D. Permits, Licenses, and Certificates: For Owner’s records, submit copies of permits, licenses, certifications, inspection reports, releases, jurisdictional settlements, notices, receipts for fee payments, judgements, correspondence, records, and similar documents, established for compliance with standards and regulations bearing on performance of the Work.

1.7 QUALITY ASSURANCE

A. Qualifications paragraphs in this article establish the minimum qualification levels required; individual Specification Sections specify additional requirements.

B. Manufacturer Qualifications: A firm experienced in manufacturing products or systems similar to those indicated for this Project and with a record of successful in-service performance, as well as sufficient production capacity to produce required units. As applicable, procure products from manufacturers able to meet qualification requirements, warranty requirements, and technical or factory-authorized service representative requirements.

C. Fabricator Qualifications: A firm experienced in producing products similar to those indicated for this Project and with a record of successful in-service performance, as well as sufficient production capacity to produce required units.

D. Installer Qualifications: A firm or individual experienced in installing, erecting, applying, or assembling work similar in material, design, and extent to that indicated for this Project, whose work has resulted in construction with a record of successful in-service performance.

E. Professional Engineer Qualifications: A professional engineer who is legally qualified to practice in jurisdiction where Project is located and who is experienced in providing engineering services of the kind indicated. Engineering services are defined as those performed for installations of the system, assembly, or product that is similar in material, design, and extent to those indicated for this Project.

F. Specialists: Certain Specification Sections require that specific construction activities be performed by entities who are recognized experts in those operations. Specialists will satisfy qualification requirements indicated and engage in the activities indicated.

1. Requirements of authorities having jurisdiction supersede requirements for specialists.

G. Testing and Inspecting Agency Qualifications: An NRTL, an NVLAP, or an independent agency with the experience and capability to conduct testing and inspection indicated, as documented in accordance with ASTM E329, and with additional qualifications specified in individual Sections; and, where required by authorities having jurisdiction, that is acceptable to authorities.

H. Manufacturer's Technical Representative Qualifications: An authorized representative of manufacturer who is trained and approved by manufacturer to observe and inspect installation of manufacturer's products that are similar in material, design, and extent to those indicated for this Project.

I. Factory-Authorized Service Representative Qualifications: An authorized representative of manufacturer who is trained and approved by manufacturer to inspect, demonstrate, repair, and perform service on installations of manufacturer's products that are similar in material, design, and extent to those indicated for this Project.

J. Preconstruction Testing: Where testing agency is indicated to perform preconstruction testing for compliance with specified requirements for performance and test methods, comply with the following.

1. Contractor's responsibilities, including the following:
    a. Provide test specimens representative of proposed products and construction.
    b. Submit specimens in a timely manner with sufficient time for testing and analyzing results to prevent delaying the Work.
    c. Provide sizes and configurations of test assemblies, mockups, and laboratory mockups to adequately demonstrate capability of products to comply with performance requirements.
    d. Build site-assembled test assemblies and mockups, using installers who will perform same tasks for Project.
    e. When testing is complete, remove test specimens and test assemblies and mockups; do not reuse products on Project.
2. Testing Agency Responsibilities: Submit a certified written report of each test, inspection, and similar quality-assurance service to Architect and Commissioning Authority, with copy to Contractor. Interpret tests and inspections, and state in each report whether tested and inspected Work complies with or deviates from the Contract Documents.

K. Mockups: Before installing portions of the Work requiring mock-ups, build mock-ups for each form of construction and finish required to comply with the following requirements, using materials indicated for the completed work:
1. Build mock-ups in location and of size indicate or, if not indicated, as directed by the Architect.
2. Notify the Architect seven days in advance of dates and times when mockups will be constructed.
3. Employ supervisory personnel who will oversee mick-up construction. Employ workers that will be employed during the construction of the Project.
4. Demonstrate the proposed range of aesthetic effects and workmanship.
5. Obtain Architect’s approval of mock-ups before starting work, fabrication, or construction.
    a. Allow seven days for initial review and each re-review of each mock-up.
6. Maintain mock-ups during construction in an undisturbed condition as a standard for judging the completed Work.
7. Demolish and remove mock-ups when directed unless otherwise indicated.

L. Integrated Exterior Mockups: Construct integrated exterior mock-up according to approved Shop Drawings. Coordinate installation of exterior envelope materials and products for which mockups are required in individual Spec Sections, along with supporting materials.

1.8 QUALITY CONTROL

A. Owner Responsibilities: Where quality-control services are indicated as Owner's responsibility, Owner will engage a qualified testing agency to perform these services.

1. Owner will furnish Contractor with names, addresses, and telephone numbers of testing agencies engaged and a description of types of testing and inspection they are engaged to perform.
2. Payment for these services will be made from testing and inspecting allowances, as authorized by Change Orders.
3. Costs for retesting and reinspecting construction that replaces or is necessitated by Work that failed to comply with the Contract Documents will be charged to Contractor, and the Contract Sum will be adjusted by Change Order.

B. Contractor Responsibilities: Tests and inspections not explicitly assigned to Owner are Contractor's responsibility. Perform additional quality-control activities, whether specified or not, to verify and document that the Work complies with requirements.

1. Unless otherwise indicated, provide quality-control services specified and those required by authorities having jurisdiction. Perform quality-control services required of Contractor by authorities having jurisdiction, whether specified or not.
2. Engage a qualified testing agency to perform quality-control services.

    a. Contractor will not employ same entity engaged by Owner, unless agreed to in writing by Owner.

3. Notify testing agencies at least hours in advance of time when Work that requires testing or inspection will be performed.
4. Where quality-control services are indicated as Contractor's responsibility, submit a certified written report, in duplicate, of each quality-control service.
5. Testing and inspection requested by Contractor and not required by the Contract Documents are Contractor's responsibility.
6. Submit additional copies of each written report directly to authorities having jurisdiction, when they so direct.

C. Testing Agency Responsibilities: Cooperate with Architect, Commissioning Authority and Contractor in performance of duties. Provide qualified personnel to perform required tests and inspections.

1. Notify Architect, Commissioning Authority and Contractor promptly of irregularities or deficiencies observed in the Work during performance of its services.
2. Determine the locations from which test samples will be taken and in which in-situ tests are conducted.
3. Conduct and interpret tests and inspections, and state in each report whether tested and inspected Work complies with or deviates from requirements.
4. Submit a certified written report, in duplicate, of each test, inspection, and similar quality-control service through Contractor, identifying of source of failure and consideration for repair.
5. Do not release, revoke, alter, or increase the Contract Document requirements or approve or accept any portion of the Work.
6. Do not perform duties of Contractor.

D. Manufacturer's Field Services: Where indicated, engage a factory-authorized service representative to inspect field-assembled components and equipment installation, including service connections. Report results in writing as specified in Section 01 33 00 "Submittal Procedures."

E. Manufacturer's Technical Services: Where indicated, engage a manufacturer's technical representative to observe and inspect the Work. Manufacturer's technical representative's services include participation in preinstallation conferences, examination of substrates and conditions, verification of materials, observation of Installer activities, inspection of completed portions of the Work, and submittal of written reports.

F. Contractor's Associated Requirements and Services: Cooperate with agencies and representatives performing required tests, inspections, and similar quality-control services, and provide reasonable auxiliary services as requested. Notify agency sufficiently in advance of operations to permit assignment of personnel. Provide the following:

1. Access to the Work.
2. Incidental labor and facilities necessary to facilitate tests and inspections.
3. Adequate quantities of representative samples of materials that require testing and inspection. Assist agency in obtaining samples.
4. Facilities for storage and field curing of test samples.
5. Delivery of samples to testing agencies.
6. Preliminary design mix proposed for use for material mixes that require control by testing agency.
7. Security and protection for samples and for testing and inspection equipment at Project site.

G. Coordination: Coordinate sequence of activities to accommodate required quality-assurance and quality-control services with a minimum of delay and to avoid necessity of removing and replacing construction to accommodate testing and inspection.

H. Schedule of Tests and Inspections: Prepare a schedule of tests, inspections, and similar quality-control services required by the Contract Documents as a component of Contractor's quality-control plan. Coordinate and submit concurrently with Contractor's Construction Schedule. Update and submit with each Application for Payment.

1. Distribution: Distribute schedule to Owner, Architect, Commissioning Authority, testing agencies, and each party involved in performance of portions of the Work where tests and inspections are required.

1.9 SPECIAL TESTS AND INSPECTIONS

A. Special Test and Inspections: Owner will engage a qualified testing agency to conduct special tests and inspections required by authorities having jurisdiction as the responsibility of the Owner, and as follows:

1. Verifying that manufacturer maintains detailed fabrication and quality control procedures and reviews the completeness and adequacy of those procedures to perform the Work.
2. Notifying Architect, Commissioning Authority, and Contractor promptly of irregularities and deficiencies observed in the Work during performance of its services.
3. Submitting a certified written report of each test, inspection, and similar quality control service to Architect and Commissioning Authority with copy to Contractor and to authorities having jurisdiction.
4. Submitting a final report of special test and inspections at Substantial Completion, which includes a list of unresolved deficiencies.

5. Interpreting test and inspections and stating in each report whether tested and inspected work complies with or deviates from the Contract Documents.
6. Retesting and reinspecting corrected work.

PART 2 - PRODUCTS (NOT USED)

PART 3 - EXECUTION

3.1 TEST AND INSPECTION LOG

A. Test and Inspection Log: Prepare and maintain a record of tests and inspections. Include the following:

1. Date test or inspection was conducted.
2. Description of the Work tested or inspected.
3. Date test or inspection results were transmitted to Architect.
4. Identification of testing agency or special inspector conducting test or inspection.

B. Maintain log at Project site. Post changes and revisions as they occur. Provide access to test and inspection log for Architect's, Commissioning Authority's, reference during normal working hours.

1. Submit log at Project closeout as part of Project Record Documents.

3.2 REPAIR AND PROTECTION

A. General: On completion of testing, inspection, sample-taking, and similar services, repair damaged construction and restore substrates and finishes.

1. Provide materials and comply with installation requirements specified in other Specification Sections or matching existing substrates and finishes. Restore patched areas and extend restoration into adjoining areas with durable seams that are as invisible as possible. Comply with the Contract Document requirements for cutting and patching in Section 01 73 00 "Execution."

B. Protect construction exposed by or for quality-control service activities.

C. Repair and protection are Contractor's responsibility, regardless of the assignment of responsibility for quality-control services.

END OF SECTION

SECTION 01 42 00 - REFERENCES

PART 1 - GENERAL

1.1 DEFINITIONS

A. General: Basic Contract definitions are included in the Conditions of the Contract.

B. "Approved": When used to convey Architect's action on Contractor's submittals, applications, and requests, "approved" is limited to Architect's duties and responsibilities as stated in the Conditions of the Contract.

C. "Directed": A command or instruction by Architect. Other terms including "requested," "authorized," "selected," "required," and "permitted" have the same meaning as "directed."

D. "Indicated": Requirements expressed by graphic representations or in written form on Drawings, in Specifications, and in other Contract Documents. Other terms including "shown," "noted," "scheduled," and "specified" have the same meaning as "indicated."

E. "Regulations": Laws, ordinances, statutes, and lawful orders issued by authorities having jurisdiction, and rules, conventions, and agreements within the construction industry that control performance of the Work.

F. "Furnish": Supply and deliver to Project site, ready for unloading, unpacking, assembly, installation, and similar operations.

G. "Install": Unload, temporarily store, unpack, assemble, erect, place, anchor, apply, work to dimension, finish, cure, protect, clean, and similar operations at Project site.

H. "Provide": Furnish and install, complete and ready for the intended use.

I. "Project Site": Space available for performing construction activities. The extent of Project site is shown on Drawings and may or may not be identical with the description of the land on which Project is to be built.

J. "Contract Limit": Space available for performing construction activities; the primary area of Work may be indicated by a Limit of Construction line on Drawings but Work necessary to complete the Project can also occur beyond this limit. The extent of Project site is shown on Drawings and may or may not be identical with the description of the land on which Project is to be built.

K. "Remove": Detach items from existing construction and legally dispose of them off-site, unless indicated to be removed and salvaged or removed and reinstalled.

L. "Remove and Salvage": Detach items from existing construction and deliver them to Owner.

M. "Salvage": Carefully detach from existing construction, in a manner to prevent damage, and deliver to Owner. Include fasteners or brackets needed for reattachment elsewhere.

N. "Remove and Reinstall": Detach items from existing construction, prepare them for reuse, and reinstall them where indicated.

O. "Existing to Remain": Existing items of construction that are not to be removed and that are not otherwise indicated to be removed, removed and salvaged, or removed and reinstalled.

P. "Demolish": Tearing down, destruction, breakup, razing or removal of the whole or part of a building or structure, or a free-standing machinery or equipment that is directly related to the function of the structure.

Q. "Recycle": Recovery of demolition waste for subsequent processing in preparation for reuse.

R. "Permanent Enclosure": As determined by Architect, the condition at which roofing is insulated and weathertight; exterior walls are insulated and weathertight; and all openings are closed with permanent construction or substantial temporary closures equivalent in weather protection to permanent construction.

1.2 INDUSTRY STANDARDS

A. Applicability of Standards: Unless the Contract Documents include more stringent requirements, applicable construction industry standards have the same force and effect as if bound or copied directly into the Contract Documents to the extent referenced. Such standards are made a part of the Contract Documents by reference.

B. Publication Dates: Comply with standards in effect as of date of the Contract Documents unless otherwise indicated.

1. For standards referenced by applicable building codes, comply with dates of standards as listed in building codes.

C. Copies of Standards: Each entity engaged in construction on Project should be familiar with industry standards applicable to its construction activity. Copies of applicable standards are not bound with the Contract Documents.

1. Where copies of standards are needed to perform a required construction activity, obtain copies directly from publication source.

1.3 ABBREVIATIONS AND ACRONYMS

A. Industry Organizations: Where abbreviations and acronyms are used in Specifications or other Contract Documents, they shall mean the recognized name of the entities indicated in Gale's "Encyclopedia of Associations: National Organizations of the U.S." or in Columbia Books' "National Trade & Professional Associations of the United States."

B. Code Agencies: Where abbreviations and acronyms are used in Specifications or other Contract Documents, they shall mean the recognized name of the entities in the following list. This information is believed to be accurate as of the date of the Contract Documents.

1. DIN - Deutsches Institut für Normung e.V.; www.din.de.
2. IAPMO - International Association of Plumbing and Mechanical Officials; www.iapmo.org.
3. ICC - International Code Council; www.iccsafe.org.
4. ICC-ES - ICC Evaluation Service, LLC; www.icc-es.org.

5. CBC-California Building Code.

C. Federal Government Agencies: Where abbreviations and acronyms are used in Specifications or other Contract Documents, they shall mean the recognized name of the entities in the following list. Information is subject to change and is up to date as of the date of the Contract Documents.
   1. CPSC - Consumer Product Safety Commission; www.cpsc.gov.
   2. DOC - Department of Commerce; National Institute of Standards and Technology; www.nist.gov.
   3. EPA - Environmental Protection Agency; www.epa.gov.
   4. OSHA - Occupational Safety & Health Administration; www.osha.gov.

D. State Government Agencies: Where abbreviations and acronyms are used in Specifications or other Contract Documents, they shall mean the recognized name of the entities in the following list. This information is subject to change and is believed to be accurate as of the date of the Contract Documents.
   1. CBHF; State of California; Department of Consumer Affairs; Bureau of Electronic and Appliance Repair, Home Furnishings and Thermal Insulation; www.bearhfti.ca.gov.
   2. CCR; California Code of Regulations; Office of Administrative Law; California Title 24 Energy Code; www.calregs.com.
   3. CDHS; California Department of Health Services; (See CDPH).
   4. CDPH; California Department of Public Health; Indoor Air Quality Program;www.cdph.ca.gov/Programs/CCDPHP/DEODC/EHLB/IAQ/Pages/Main-Page.aspx.
   5. CPUC; California Public Utilities Commission; www.cpuc.ca.gov.
   6. SCAQMD; South Coast Air Quality Management District; www.aqmd.gov.

1.4 REPORTING AND RESOLVING DISCREPANCIES

A. Report in writing at once to Owner, with copies to Architect, all conflicts, errors, ambiguity or discrepancy within the Contract Documents or between the Contract Documents and provisions of laws or regulations applicable to the performance ot the Work or of standards, specifications, manual, codes or instructions of manufacturers or suppliers. Do not proceed with the Work affected until directions to do so is given by the Architect.

PART 2 - PRODUCTS (NOT USED)

PART 3 - EXECUTION (NOT USED)

END OF SECTION

SECTION 01 50 00 - TEMPORARY FACILITIES AND CONTROLS

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes requirements for temporary utilities, support facilities, and security and protection facilities.

1.2 USE CHARGES

A. General: Installation, removal, and use charges for temporary facilities to be included in the Contract Sum unless otherwise indicated. Allow other entities engaged in the Project to use temporary services and facilities without cost, including, but not limited to, Owner's construction forces, Architect, occupants of Project, testing agencies, and authorities having jurisdiction.

B. Arrangements for Site Utility Usage:
   1. Water and Sewer Service from Existing System: Water from Owner’s existing water system is available for use without metering and without payment of use charges. Provide connections and extensions of services as required for construction operations.
   2. Electric Power Service from Existing System: Electric power from Owner’s existing water system is available for use without metering and without payment of use charges. Provide connections and extensions of services as required for construction operations.

1.3 INFORMATIONAL SUBMITTALS

A. Site Utilization Plan: Show temporary facilities, temporary utility lines and connections, staging areas, construction site entrances, vehicle circulation, and parking areas for construction personnel.

B. Implementation and Termination Schedule: Within [**15**] <**Insert number**> days of date established for commencement of the Work, submit schedule indicating implementation and termination dates of each temporary utility.

C. Project Identification and Temporary Signs: Show fabrication and installation details, including plans, elevations, details, layouts, typestyles, graphic elements, and message content.

D. Site Safety Plan: Show detailed site safety requirements, in compliance with OSHA, AHJ, and Owner requirements, including, but not limited to, the following:

   1. Safety goals statement.
   2. Construction site rules and regulations.
   3. List of responsible personnel.
   4. Operating procedures and safety precautions.
   5. Extreme weather conditions.
   6. Emergency contact information.
   7. Reporting instructions and procedures.
   8. Personal Protective Equipment (PPE) requirements for staff and visitors on site.

E. Fire-Safety Program: Show compliance with requirements of NFPA 241 and authorities having jurisdiction. Indicate Contractor personnel responsible for management of fire-prevention program.

F. Moisture- and Mold-Protection Plan: Describe procedures and controls for protecting materials and construction from water absorption and damage and mold.

1. Describe delivery, handling, storage, installation, and protection provisions for materials subject to water absorption or water damage.
2. Indicate procedures for discarding water-damaged materials, protocols for mitigating water intrusion into completed Work, and requirements for replacing water-damaged Work.
3. Indicate sequencing of work that requires water, such as sprayed fire-resistive materials, plastering, and terrazzo grinding, and describe plans for dealing with water from these operations. Show procedures for verifying that wet construction has dried sufficiently to permit installation of finish materials.
4. Indicate methods to be used to avoid trapping water in finished work.
5. Document visible signs of mold that may appear during construction.
6. Basement: Monitor below grade spaces and crawlspaces for humidity

G. Dust- and HVAC-Control Plan: Submit coordination drawing and narrative that indicates the dust- and HVAC-control measures proposed for use, proposed locations, and proposed time frame for their operation. Include the following:

1. Locations of dust-control partitions at each phase of work.
2. HVAC system isolation schematic drawing.
3. Location of proposed air-filtration system discharge.
4. Waste-handling procedures.
5. Other dust-control measures.

H. Noise and Vibration Control Plan: Identify construction activities that may impact the occupancy and use of existing spaces within the building or adjacent existing buildings, whether occupied by others, or occupied by the Owner. Include the following:

1. Methods used to meet the goals and requirements of the Owner.
2. Concrete cutting method(s) to be used.
3. Location of construction devices on the site.
4. Show compliance with the use and maintenance of quieted construction devices for the duration of the Project.

I. Protection of Air Resources Plan: Not less than 10 days before the Pre-construction meeting, prepare and submit a plan that identifies controls to limit disturbance on site and site dust limitation.

1. Make record within each daily report of non-road, on-road diesel equipment and diesel generators present on site; and for first occurrence of diesel equipment's appearance, provide record that compliance documents have been reviewed and certified by Contractor.

1.4 QUALITY ASSURANCE

A. Electric Service: Comply with NECA, NEMA, and UL standards and regulations for temporary electric service. Install service to comply with NFPA 70.

B. Tests and Inspections: Arrange for authorities having jurisdiction to test and inspect each temporary utility before use. Obtain required certifications and permits.

1.5 PROJECT CONDITIONS

A. Temporary Use of Permanent Facilities: Engage Installer of each permanent service to assume responsibility for operation, maintenance, and protection of each permanent service during its use as a construction facility before Owner's acceptance, regardless of previously assigned responsibilities.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Pavement: Comply with [**Section 32 12 16 "Asphalt Paving."**] [**Section 32 13 13 "Concrete Paving."**] [**Division 32 pavement Sections.**]

B. Chain-Link Fencing: Minimum 2-inch (50-mm), 0.148-inch- (3.8-mm-) thick, galvanized-steel, chain-link fabric fencing; minimum 6 feet (1.8 m) high with galvanized-steel pipe posts; minimum 2-3/8-inch- (60-mm-) OD line posts and 2-7/8-inch- (73-mm-) OD corner and pull posts, with 1-5/8-inch- (42-mm-) OD top rails.

C. Portable Chain-Link Fencing: Minimum 2-inch (50-mm), 0.148-inch- (3.8-mm-) thick, galvanized-steel, chain-link fabric fencing; minimum 6 feet (1.8 m) high with galvanized-steel pipe posts; minimum 2-3/8-inch- (60-mm-) OD line posts and 2-7/8-inch- (73-mm-) OD corner and pull posts, with 1-5/8-inch- (42-mm-) OD top and bottom rails. Provide concrete or galvanized-steel bases for supporting posts.

D. Wood Enclosure Fence: Plywood, [6 feet (1.8 m)] [8 feet (2.4 m)] high, framed with four 2-by-4-inch (50-by-100-mm) rails, with preservative-treated wood posts spaced not more than 8 feet (2.4 m) apart.

E. Lumber and Plywood: Comply with requirements in Section [06 10 00 **Rough Carpentry**] [**061053 Miscellaneous Rough Carpentry**].

F. Gypsum Board: Minimum 1/2 inch (12.7 mm) thick by 48 inches (1219 mm) wide by maximum available lengths; regular-type panels with tapered edges. Comply with ASTM C 36/C 36M.

G. Polyethylene Sheet: Reinforced, fire-resistive sheet, 10-mil (0.25-mm) minimum thickness, with flame-spread rating of 15 or less in accordance with ASTM E84 and passing NFPA 701 Test Method 2.

H. Dust-Control Adhesive-Surface Walk-Off Mats: Provide mats, minimum 36 by 60 inches (914 by 1524 mm).

I. Insulation: Unfaced mineral-fiber blanket, manufactured from rock wool; with maximum flame-spread and smoke-developed indexes of 25 and 50, respectively.

2.2 TEMPORARY FACILITIES

A. Field Offices:

1. Prefabricated or mobile units with serviceable finishes, temperature controls, and foundations adequate for normal loading.

B. Common-Use Field Office: Of sufficient size to accommodate needs of Owner, Architect, and construction personnel office activities and to accommodate Project meetings specified in other Division 01 Sections. Keep office clean and orderly. Furnish and equip offices as follows:
   1. Conference room of sufficient size to accommodate meetings of 10 individuals. Provide electrical power service and 120-V ac duplex receptacles, with no fewer than one receptacle on each wall. Furnish room with conference table, chairs, and 4-foot-(1.2-m-) square tack and marker boards.
   2. Lighting fixtures capable of maintaining average illumination of 20 fc (215 lx) at desk height.

C. Storage and Fabrication Sheds: Provide sheds sized, furnished, and equipped to accommodate materials and equipment for construction operations.
   1. Store combustible materials apart from building.

2.3 EQUIPMENT

A. Personal Protective Equipment (PPE): Provide standard PPE for visitors on site, including hard hats, protective eyewear, high visibility vests, and gloves.

B. Fire Extinguishers: Portable, UL rated; with class and extinguishing agent as required by locations and classes of fire exposures.

C. Air-Filtration Units: Primary and secondary HEPA-filter-equipped portable units with four-stage filtration. Provide single switch for emergency shutoff. Configure to run continuously.

PART 3 - EXECUTION

3.1 TEMPORARY FACILITIES, GENERAL

A. Conservation: Coordinate construction and use of temporary facilities with consideration given to conservation of energy, water, and materials. Coordinate use of temporary utilities to minimize waste.
   1. Salvage materials and equipment involved in performance of, but not actually incorporated into, the Work. See other Sections for disposition of salvaged materials that are designated as Owner's property.

3.2 INSTALLATION, GENERAL

A. Locate facilities where they will serve Project adequately and result in minimum interference with performance of the Work. Relocate and modify facilities as required by progress of the Work.
   1. Locate facilities to limit site disturbance as specified in Section 01 11 00 "Summary."

B. Provide each facility ready for use when needed to avoid delay. Do not remove until facilities are no longer needed or are replaced by authorized use of completed permanent facilities.

3.3 TEMPORARY UTILITY INSTALLATION

A. General: Install temporary service or connect to existing service.

1. Arrange with utility company, Owner, and existing users for time when service can be interrupted, if necessary, to make connections for temporary services.

B. Sewers and Drainage: Provide temporary utilities to remove effluent lawfully.

1. Connect temporary sewers to as directed by authorities having jurisdiction.

C. Water Service:

1. Install water service and distribution piping in sizes and pressures adequate for construction.
2. Connect to Owner's existing water service facilities. Clean and maintain water service facilities in a condition acceptable to Owner. At Substantial Completion, restore these facilities to condition existing before initial use.

D. Sanitary Facilities: Provide temporary toilets, wash facilities, safety shower and eyewash facilities, and drinking water for use of construction personnel. Comply with requirements of authorities having jurisdiction for type, number, location, operation, and maintenance of fixtures and facilities.

1. Use of Permanent Toilets: Use of Owner's existing or new toilet facilities [will be permitted, as long as facilities are cleaned and maintained in a condition acceptable to Owner. At Substantial Completion, restore these facilities to condition existing before initial use].

E. Electric Power Service:

1. Connect to Owner's existing electric power service. Maintain equipment in a condition acceptable to Owner.

F. Lighting: Provide temporary lighting with local switching that provides adequate illumination for construction operations, observations, inspections, and traffic conditions.

1. Install and operate temporary lighting that fulfills security and protection requirements without operating entire system.

G. Telephone Service: Provide temporary telephone service in common-use facilities for use by construction personnel. Install Wi-Fi cell phone access equipment and one land-based telephone line(s) for each field office.

1. At each telephone, post a list of important telephone numbers.

a. Police and fire departments.
b. Ambulance service.
c. Contractor's home office.
d. Contractor's emergency after-hours telephone number.
e. Architect's office.
f. Construction Manager's home office.
g. Engineers' offices.
h. Owner's office.
i. Principal subcontractors' field and home offices.

H. Electronic Communication Service: Provide secure Wi-Fi wireless connection to internet with provisions for access by Architect and Owner.

I. Project Computer: Provide a computer in the primary field office adequate for use by Architect and Owner to access Project electronic documents and maintain electronic communications.

3.4 SUPPORT FACILITIES INSTALLATION

A. Comply with the following:

1. Provide construction for temporary field offices, shops, and sheds located within construction area or within 30 feet (9 m) of building lines that is noncombustible in accordance with ASTM E136. Comply with NFPA 241.
2. Utilize designated area within existing building for temporary field offices.
3. Maintain support facilities until Architect schedules Substantial Completion inspection. Remove before Substantial Completion. Personnel remaining after Substantial Completion will be permitted to use permanent facilities, under conditions acceptable to Owner.

B. Temporary Use of Planned Permanent Roads and Paved Areas: Locate temporary roads and paved areas in same location as permanent roads and paved areas. Construct and maintain temporary roads and paved areas adequate for construction operations. Extend temporary roads and paved areas, within construction limits indicated, as necessary for construction operations.

1. Coordinate elevations of temporary roads and paved areas with permanent roads and paved areas.
2. Prepare subgrade and install subbase and base for temporary roads and paved areas in accordance with Section 31 23 16 "Earth Moving."
3. Recondition base after temporary use, including removing contaminated material, regrading, proofrolling, compacting, and testing.
4. Delay installation of final course of permanent hot-mix asphalt pavement until immediately before Substantial Completion. Repair hot-mix asphalt base-course pavement before installation of final course in accordance with Section 32 12 16 "Asphalt Paving."

C. Traffic Controls: Comply with requirements of authorities having jurisdiction.

1. Protect existing site improvements to remain, including curbs, pavement, and utilities.
2. Maintain access for fire-fighting equipment and access to fire hydrants.

D. Parking: Provide temporary parking areas for construction personnel.

E. Protection of Air Resources: Comply with requirements of authorities having jurisdiction.

1. Prevent creation of dust, air pollution, and odors.
2. Sequence construction to avoid disturbance to site to the greatest extent possible.
3. Store volatile liquids, including fuels and solvents, in closed containers.
4. Properly maintain equipment to reduce gaseous pollutant emissions.

F. Dewatering Facilities and Drains: Comply with requirements of authorities having jurisdiction. Maintain Project site, excavations, and construction free of water.

1. Dispose of rainwater in a lawful manner that will not result in flooding Project or adjoining properties or endanger permanent Work or temporary facilities.
2. Remove snow and ice as required to minimize accumulations.

G. Project Signs: Provide Project signs as indicated. Unauthorized signs are not permitted.

1. Identification Signs: Provide Project identification signs as indicated on Drawings.
2. Temporary Signs: Provide other signs as indicated and as required to inform public and individuals seeking entrance to Project.

a. Provide temporary, directional signs for construction personnel and visitors.

3. Maintain and touch up signs, so they are legible at all times.

H. Waste Disposal Facilities:

1. Comply with requirements specified in Section 01 74 19 "Construction Waste Management and Disposal."

I. Lifts and Hoists: Provide facilities necessary for hoisting materials and personnel.

1. Truck cranes and similar devices used for hoisting materials are considered "tools and equipment" and not temporary facilities.

J. Temporary Stairs: Until permanent stairs are available, provide temporary stairs where ladders are not adequate.

K. Existing Stair Usage: Use of Owner's existing stairs will be permitted, provided stairs are cleaned and maintained in a condition acceptable to Owner. At Substantial Completion, restore stairs to condition existing before initial use.

1. Provide protective coverings, barriers, devices, signs, or other procedures to protect stairs and to maintain means of egress. If stairs become damaged, restore damaged areas, so no evidence remains of correction work.

L. Temporary Use of Permanent Stairs: Use of new stairs for construction traffic will be permitted, provided stairs are protected and finishes restored to new condition at time of Substantial Completion.

M. Existing Structures: Provide and maintain shoring, bracing, and structural supports as required to preserve stability and prevent movement, settlement or collapse of construction and finishes to remain.

3.5 SECURITY AND PROTECTION FACILITIES INSTALLATION

A. Protection of Existing Facilities: Protect existing vegetation, equipment, structures, utilities, and other improvements at Project site and on adjacent properties, except those indicated to be removed or altered. Repair damage to existing facilities.

B. Environmental Protection: Provide protection, operate temporary facilities, and conduct construction as required to comply with environmental regulations and that minimize possible air, waterway, and subsoil contamination or pollution or other undesirable effects.

1. Comply with work restrictions specified in Section 01 10 00 "Summary."

C. Temporary Erosion and Sedimentation Control: Provide measures to prevent soil erosion and discharge of soil-bearing water runoff and airborne dust to undisturbed areas and to adjacent properties and walkways, according to requirements of EPA Construction General Permit or authorities having jurisdiction, whichever is more stringent.

1. Verify that flows of water redirected from construction areas or generated by construction activity do not enter or cross tree- or plant-protection zones.
2. Inspect, repair, and maintain erosion- and sedimentation-control measures during construction until permanent vegetation has been established.
3. Clean, repair, and restore adjoining properties and roads affected by erosion and sedimentation from Project site during the course of Project.
4. Remove erosion and sedimentation controls and restore and stabilize areas disturbed during removal.

D. Noise Control: Perform construction operations to minimize noise. Perform noise-producing work in less sensitive hours of the day or week as directed by Owner.

1) More than 12 minutes in any hour: 70 dB.
2) More than 3 minutes in any hour: 80 dB.

E. Stormwater Control: Comply with requirements of authorities having jurisdiction. Provide barriers in and around excavations and subgrade construction to prevent flooding by runoff of stormwater from heavy rains.

F. Tree and Plant Protection:

1. Comply with requirements specified in Section 01 56 39 "Temporary Tree and Plant Protection."
2. Install temporary fencing located as indicated or outside the drip line of trees to protect vegetation from damage from construction operations. Protect tree root systems from damage, flooding, and erosion.

G. Pest Control: Engage pest-control service to recommend practices to minimize attraction and harboring of rodents, roaches, and other pests and to perform extermination and control procedures at regular intervals, so Project will be free of pests and their residues at Substantial Completion. Perform control operations lawfully, using materials approved by authorities having jurisdiction.

H. Site Enclosure Fence: Before construction operations begin, furnish and install site enclosure fence in a manner that will prevent people from easily entering site except by entrance gates.

1. Extent of Fence: As required to enclose entire Project site or portion determined sufficient to accommodate construction operations.
2. Maintain security by limiting number of keys and restricting distribution to authorized personnel.

I. Security Enclosure and Lockup: Install temporary enclosure around partially completed areas of construction. Provide lockable entrances to prevent unauthorized entrance, vandalism, theft, and similar violations of security. Lock entrances at end of each workday.

J. Barricades, Warning Signs, and Lights: Comply with requirements of authorities having jurisdiction for erecting structurally adequate barricades, including warning signs and lighting.

K. Temporary Egress: Provide temporary egress from existing occupied facilities as indicated and as required by authorities having jurisdiction. Provide signage directing occupants to temporary egress.

L. Covered Walkway: Erect structurally adequate, protective, covered walkway for passage of individuals through or adjacent to Project site, including public sidewalks and streets. Coordinate with entrance gates, other facilities, and obstructions. Comply with regulations of authorities having jurisdiction and requirements indicated on Drawings.

1. Provide wood-plank overhead decking, protective plywood enclosure walls, handrails, barricades, warning signs, exit signs, lights, safe and well-drained walkways, and similar provisions for protection and safe passage.
2. Paint and maintain appearance of walkway for duration of the Work in a manner approved by Owner and Architect.

M. Temporary Enclosures: Provide temporary enclosures for protection of construction, in progress and completed, from exposure, foul weather, other construction operations, and similar activities. Provide temporary weathertight enclosure for building exterior.

1. Where heating or cooling is needed and permanent enclosure is incomplete, insulate temporary enclosures.

N. Temporary Fire Protection: Install and maintain temporary fire-protection facilities of types needed to protect against reasonably predictable and controllable fire losses. Comply with NFPA 241; manage fire-prevention program.

1. Prohibit smoking in construction areas. Comply with additional limits on smoking specified in other Sections.
2. Supervise welding operations, combustion-type temporary heating units, and similar sources of fire ignition in accordance with requirements of authorities having jurisdiction.
3. Develop and supervise an overall fire-prevention and -protection program for personnel at Project site. Review needs with local fire department and establish procedures to be followed. Instruct personnel in methods and procedures. Post warnings and information.
4. Provide temporary standpipes and hoses for fire protection. Hang hoses with a warning sign, stating that hoses are for fire-protection purposes only and are not to be removed. Match hose size with outlet size and equip with suitable nozzles.

3.6 MOISTURE AND MOLD CONTROL

A. Moisture and Mold Protection: Protect stored materials and installed Work in accordance with Moisture and Mold Protection Plan.

B. Exposed Construction Period: Before installation of weather barriers, when materials are subject to wetting and exposure and to airborne mold spores, protect as follows:

1. Protect porous materials from water damage.
2. Protect stored and installed material from flowing or standing water.
3. Keep porous and organic materials from coming into prolonged contact with concrete.
4. Remove standing water from decks.
5. Keep deck openings covered or dammed.

C. Partially Enclosed Construction Period: After installation of weather barriers but before full enclosure and conditioning of building, when installed materials are still subject to infiltration of moisture and ambient mold spores, protect as follows:

1. Do not load or install drywall or other porous materials or components, or items with high organic content, into partially enclosed building.
2. Keep interior spaces reasonably clean and protected from water damage.
3. Periodically collect and remove waste containing cellulose or other organic matter.
4. Discard or replace water-damaged material.
5. Do not install material that is wet.
6. Discard and replace stored or installed material that begins to grow mold.
7. Perform work in a sequence that allows wet materials adequate time to dry before enclosing the material in gypsum board or other interior finishes.

D. Controlled Construction Period: After completing and sealing of the building enclosure but prior to the full operation of permanent HVAC systems, maintain as follows:

1. Control moisture and humidity inside building by maintaining effective dry-in conditions.
2. Use temporary or permanent HVAC system to control humidity within ranges specified for installed and stored materials.
3. Comply with manufacturer's written instructions for temperature, relative humidity, and exposure to water limits.

a. Remove and replace materials that cannot be completely restored to their manufactured moisture level within [**48**] <**Insert time period**> hours.

3.7 OPERATION, TERMINATION, AND REMOVAL

A. Supervision: Enforce strict discipline in use of temporary facilities. To minimize waste and abuse, limit availability of temporary facilities to essential and intended uses.

B. Maintenance: Maintain facilities in good operating condition until removal.

1. Maintain operation of temporary enclosures, heating, cooling, humidity control, ventilation, and similar facilities on a 24-hour basis where required to achieve indicated results and to avoid possibility of damage.
2. Operate Project-Identification signage lighting from dusk until 12:00 midnight.

C. Temporary Facility Changeover: Do not change over from using temporary security and protection facilities to permanent facilities until Substantial Completion.

D. Termination and Removal: Remove each temporary facility when need for its service has ended, when it has been replaced by authorized use of a permanent facility, or no later than Substantial Completion. Complete or, if necessary, restore permanent construction that may have been delayed because of interference with temporary facility. Repair damaged Work, clean exposed surfaces, and replace construction that cannot be satisfactorily repaired.

1. Materials and facilities that constitute temporary facilities are property of Contractor. Owner reserves right to take possession of Project identification signs.
2. At Substantial Completion, repair, renovate, and clean permanent facilities used during construction period. Comply with final cleaning requirements specified in Section 01 77 00 "Closeout Procedures."

END OF SECTION

SECTION 01 56 39 - TEMPORARY TREE AND PLANT PROTECTION

PART 1 - GENERAL

1.1 RELATED SECTIONS

A. Documents affecting work of this Section include, but are not necessarily limited to, General Conditions, Supplementary Conditions, Special Conditions and Division 1.

B. Related Work Specified Elsewhere:
1. General Contract Conditions.
2. Division 2 Section “Selective Demolition.”
3. Division 31 Sections “Site Clearing”.
4. Tree relocation program for palm trees.

1.2 CONDITIONS AND REQUIREMENTS

A. Prior to any demolition on the site, Contractor shall provide the Owner’s Representative with evidence of a contract with an ISA (International Society of Arboriculture) Certified Arborist who will be responsible for supervising implementation of the tree and plant protection measures described herein.

B. Protection and welfare of all existing trees within the Contract Limits which are noted to remain, including trimming, cabling, and repair of such trees as necessary as shown on the Drawings and as specified throughout the entire construction period.

C. Contractor shall submit tree maintenance plan for Owner’s Representative's approval.

D. Provide monthly tree maintenance reports for review by Owner’s Representative.

E. Protection of any existing irrigation system servicing trees to remain.

F. Completely coordinate with all work.

1.3 DEFINITIONS

A. "Injury" is defined, without limitation, as any bruising, scarring, tearing, or breaking of roots, branches, or trunk.

B. "Drip line" is defined as the outermost limits of the tree canopy.

1.4 QUALITY ASSURANCE

A. General Responsibility: The Contractor shall be directly responsible for protection and welfare of existing trees within the Contract Limits which are noted to remain. This responsibility shall continue throughout the full construction period until the entire project is completed and accepted by the Owner and through completion of the guarantee period.

B. Qualifications of Workmen: Trimming shall be performed only by an ISA (International Society of Arboriculture) certified arborist. Provide at least one (1) person approved by the Owner's Representative who shall be present at all times during tree protection and trimming operations, who shall be thoroughly familiar with the type of work involved, and who shall direct all protection and trimming work.

C. Reference Standards: Published specifications, standards, tests, or recommended methods of trade, industry, or governmental organizations apply to work of this section.

D. International Society of Arboriculture (ISA) "Plant Appraisal", 8th edition, prepared by the Council of Tree and Landscape Appraisers (CTLA).

1.5 JOB CONDITIONS

A. Prior to performing any work of this Contract, Contractor shall call for a site meeting with the Landscape Architect and representatives of the Owner. This meeting shall occur prior to construction of any nature on site. The purpose of the meeting shall be to establish the conditions of all existing trees to be preserved upon receipt of the site by the Contractor.

1.6 GUARANTEE

A. Contractor shall guarantee that all plants covered by the provisions of this Section will be healthy and in flourishing condition of active growth one (1) year from the date of Substantial Completion.

B. During the warranty period the Contractor shall be liable for damages to all trees covered by the provisions of this Section and shall pay compensation to the Owner. Compensation to the Owner shall be as outlined in Paragraph 3.6.

C. Contractor will not be held responsible for failures due to neglect by the Owner, vandalism, etc., during the warranty period. Report such conditions to the Owner's Representative.

PART 2 - PRODUCTS

2.1 MATERIALS

A. General: Use only new materials of brands and types noted on the Drawings, specified herein, or equal.

2.2 TREE PROTECTION FENCING

A. Tree Protection Fence: As described in drawing notes. If not provided on drawings tree fence to be eight (8) foot high chain link fence, sturdy and capable of acting as a barrier against objects, vehicles, etc., and designed so as to allow for relocations as required and shall have gate access to inside for care of tree. It shall be continuously maintained and repaired as necessary. Metal shall be galvanized.

B. Install tree protection fencing around trees to be preserved at a distance required from the base of the trunk to the drip line of the tree. Fencing shall remain until landscape work has commenced, and it shall then be removed as directed by the Owner's Representative.

C. During the course of construction, relocation of the fence may be required to facilitate construction. The Contractor shall do so as directed by the Owner's Representative at no additional expense to the Owner.

PART 3 - EXECUTION

3.1 PROTECTION OF TREES

A. Water: Provide ample water supply of potable quality and sufficient quantity for all operations required under this Section.

B. The existing trees to be preserved presently are in excellent condition. Trees shall not be allowed to deteriorate and shall be maintained in a healthy and vigorous condition during the course of construction and Maintenance Period.

C. During the course of construction the Contractor shall take all necessary precautions, as outlined herein, to protect the existing trees to be preserved from injury or death. Protection shall be given to the roots, trunk, and foliage of all existing trees to remain.

D. Trees, subject to the provisions of this Section, which have been injured, shall be repaired immediately by an approved, ISA certified arborist. Repair shall include removal of rough edges and sprung bark and severely injured branches as directed by the Owner's Representative.

E. Tree protection fencing shall be installed for the protection of existing trees to be preserved. No construction, demolition, or work of any nature will be allowed within the fenced area without prior written approval by the Owner's Representative.
   1. Approval by the Owner's Representative for work within the fenced area shall not release the Contractor from any of the provisions specified herein for the protection of existing trees to be preserved.
   2. During the course of construction of approved work within the fenced area, no roots larger than two (2) inches in diameter shall be cut without prior written approval by the Owner's Representative.

F. During construction the existing site surface drainage patterns shall not be altered within the area of drip line.

G. Do not permit the following within drip line of any existing tree to be preserved:
   1. Storage or parking of automobiles or other vehicles.
   2. Stockpiling of building materials or refuse of excavated materials.
   3. Skinning or bruising of bark.
   4. Use of trees as support posts, power poles, or signposts; anchorage for ropes, guy wires, or power lines; or other similar functions.
   5. Dumping of poisonous materials on or around trees and roots. Such materials include but are not limited to paint, petroleum products, dirty water, or other deleterious materials.
   6. Cutting of tree roots by utility trenching, foundation digging, placement of curbs and trenches, and other miscellaneous excavation without prior written approval by the Owner's Representative.
   7. Damage to trunk, limbs, or foliage caused by maneuvering vehicles or stacking material or equipment too close to the tree.

8. Compaction of the root area by movement of trucks or grading machines; storage of equipment, gravel, earth fill, or construction supplies; etc.
9. Excessive water or heat from equipment, utility line construction, or burning of trash under or near shrubs or trees.
10. Damage to root system from flooding, erosion, and excessive wetting and drying resulting from dewatering and other operations.

3.2 TREE REMOVAL

A. Trees designated for removal shall be removed to a point at least one (1) foot below the lowest level of sub-grade upon which fill will be placed.

B. Soil within a radius of ten (10) feet of the removed tree under paved area shall receive soil sterilization before further preparation of the sub-grade.

3.3 TRIMMING OF TREES

A. In company with the Owner's Representative and an ISA certified arborist, ascertain the limbs and roots which are to be trimmed, and clearly mark them to designate the approved point of cutting.

B. A consulting arborist, certified by the International Society of Arboriculture (ISA), shall be engaged to direct removal of branches from trees and large shrubs which are to remain if required to clear for new construction.

C. Dead and damaged trees that are determined by the Owner's Representative and arborist to be incapable of restoration to normal growth pattern shall be removed.

D. Cut evenly, using proper tools and skilled workmen, to achieve neat severance with the least possible damage to the tree.

E. In the case of root cuts, apply wet burlap or other protection, approved as noted herein, to prevent drying out, and maintain in a wet condition as long as necessary for temporary protection.

3.4 GRADING AND FILLING AROUND TREES

A. Maintain existing grade within drip line of trees unless otherwise indicated. Any grade change shall be limited to six (6) inches of cut or fill from the original grade and shall be accomplished by hand.

B. Lowering Grades: where existing grade is above new finish grade shown around trees, carefully hand excavate within drip line to new grade. Cut roots exposed by excavation to approximately three (3) inches below elevation of new finish grade.

C. Raising Grades: permitted only as acceptable to Owner's Representative.

D. If building pads or foundations are to be constructed within the fenced areas or if the existing landscape is to be altered by the addition of fill or reduced by excavation, the Owner's Representative shall be notified prior to this work. Measures as approved by the Owner's Representative, such as small retaining walls or sub-grade aeration lines.

3.5 REPAIR COMPENSATION

A. Damage to existing tree crowns or roots over one (1) inch in diameter shall be immediately reported to Owner's Representative in writing, and at the direction of the Owner's Representative, repaired immediately at the Contractor's expense by an approved, ISA certified arborist.

B. An ISA certified arborist shall direct repair of trees damaged by construction operations. Repairs shall be made promptly after damage occurs to prevent progressive deterioration of damaged trees. Repairs or replacement, if directed, shall be at Contractor's expense.

C. Damaged tree limbs or trees which have died as a result of injury during construction shall remain the property of the Owner and shall remain or be removed by the Contractor as directed by the Owner's Representative.

3.6 MAINTENANCE

A. Contractor shall be responsible to perform regular inspections of existing trees to be preserved and submit written proposals to the Owner's Representative for additional maintenance work as may be required to ensure the health and general well-being of the trees. Contractor shall retain, at the direction of the Owner's Representative additional specialists as may be required to perform this work.

B. Provide type-written monthly Maintenance reports for review by Owner's Representative.
1. Identify each tree, by genus, species and the number indicated on the Drawings.
2. Relate days on which fertilizing, mulching, pruning and spraying occurred.
3. Relate days on which watering occurred, including times and duration of watering.
4. Report on each tree's general health and condition.

C. The maintenance of the trees shall comply with standard horticultural practice for the correct watering, fertilizing, pruning and spraying of specimen boxed trees.
1. Fertilizing: All trees are to be fertilized before, during, and after construction by pumping under pressure directly 18 inches into the root zone as directed by the Consulting Arborist.
2. Root Hormone: The following shall apply to each tree:
   a. Tree basins shall be constructed at rims or outer edge of the tree root ball so that applied water will remain on top of the root ball.
   b. Root hormone shall be applied at the rate of two (2) ounces of root hormone dissolved in a two (2) gallon bucket of water, poured on top of the root ball and contained thereon by the basin rims. Immediately after root hormone application, the tree basin shall be filled with water and allowed to settle within the soil.

      The application shall be repeated. The tree basin shall be filled with water and allowed to settle within the soil. The application of water shall be repeated twice.

3. Vertical mulch pockets filled with pea gravel, course sand and root hormone shall be installed at no additional cost to the Owner if soil or environmental conditions detract from tree basin root ball feeding. Do not damage tree roots.

a. Vertical mulch pockets, 18-inches to 2-inches deep and two (2) inches in diameter, spaced around root ball of tree. Verify effectiveness of root feeding and watering and advise Owner's Representative of any feeding inadequacies.

D. The Contractor shall keep the tree preservation area free from weeds and debris at all times.

E. Irrigation: During construction the existing trees to be preserved shall, at the direction of the Owner's Representative, be given deep watering (be irrigated). Quantities and lengths of time are variable and shall depend upon seasonal rainfall.

END OF SECTION

SECTION 01 60 00 - PRODUCT REQUIREMENTS

PART 1 - GENERAL

1.1 SUMMARY

1.2 Section includes administrative and procedural requirements for selection of products for use in Project; product delivery, storage, and handling; manufacturers' standard warranties on products; special warranties; and comparable products.DEFINITIONS

A. Products: Items obtained for incorporating into the Work, whether purchased for Project or taken from previously purchased stock. The term "product" includes the terms "material," "equipment," "system," and terms of similar intent.

1. Named Products: Items identified by manufacturer's product name, including make or model number or other designation shown or listed in manufacturer's published product literature that is current as of date of the Contract Documents.
2. New Products: Items that have not previously been incorporated into another project or facility. Salvaged items or items reused from other projects are not considered new products. Items that are manufactured or fabricated to include recycled content materials are considered new products, unless indicated otherwise.
3. Comparable Product: Product by named manufacturer that is demonstrated and approved through the comparable product submittal process described in Part 2 "Comparable Products" Article, to have the indicated qualities related to type, function, dimension, in-service performance, physical properties, appearance, and other characteristics that equal or exceed those of specified product.

B. Substitutions: Changes in products, materials, equipment, and methods of construction from those required by the Contract Documents and proposed by Contractor. As specified in Section 01 25 00 "Substitution Procedures."

C. Basis-of-Design Product Specification: A specification in which a single manufacturer's product is named and accompanied by the words "basis-of-design product," including make or model number or other designation. Published attributes and characteristics of basis-of-design product establish salient characteristics for the purpose of evaluation.

1. Evaluation of Comparable Products: In addition to the basis-of-design product description, product attributes and characteristics may be listed to establish the significant qualities related to type, function, in-service performance and physical properties, weight, dimension, durability, visual characteristics, and other special features and requirements for purposes of evaluating comparable products of additional manufacturers named in the specification.

D. Subject to Compliance with Requirements: Where the phrase "Subject to compliance with requirements" introduces a product selection procedure in an individual Specification Section, provide products qualified under the specified product procedure. In the event that a named product or product by a named manufacturer does not meet the other requirements of the specifications, select another named product or product from another named manufacturer that does meet the requirements of the specifications; submit a comparable product request or substitution request, if applicable.

E. Comparable Product Request Submittal: An action submittal requesting consideration of a comparable product, including the following information:

1. Identification of basis-of-design product or fabrication or installation method to be replaced, including Specification Section number and title and Drawing numbers and titles.
2. Data indicating compliance with the requirements specified in Part 2 "Comparable Products" Article.
3. Architects's Action: If necessary, Architect will request additional information or documentation for evaluation withion one week of receipt of a comparable product request. Architect will notify Contractor of approval or rejection of proposed comparable product request within 15 working days of receipt of request, or seven days of receipt of additional information or documentation, whichever is later.
    a. Form of Approval: As specified in Section 01 33 00 Submittal Procedures.
    b. Use product specified if Architect does not issue a decision on use of a comparable product request within the time allocated.

F. Basis-of-Design Product Specification Submittal: An action submittal complying with requirements in Section 01 33 00 "Submittal Procedures."

G. Substitution: Refer to Section 01 25 00 "Substitution Procedures" for definition and limitations on substitutions.

1.3 GENERAL REQUIREMENTS

A. If the Contract Documents are not in concurrence regarding the quantity or quality of products, submit a Request For Information (RFI) to the Architect as specified in Section 01 31 00 "Project Management and Coordination."

B. If the Contractor fails to make such a request, it is presumed that the most expensive has been accommodated in the Bid.

1.4 QUALITY ASSURANCE

A. Compatibility of Options: If Contractor is given option of selecting between two or more products for use on Project, select product compatible with products previously selected, even if previously selected products were also options.

1. Resolution of Compatibility Disputes between Multiple Contractors:

    a. Contractors are responsible for providing products and construction methods compatible with products and construction methods of other contractors.
    b. If a dispute arises between the multiple contractors over concurrently selectable but incompatible products, Architect will determine which products shall be used.

B. Asbestos Content: All products furnished and/or installed for this Project must be 100 percent free of asbestos containing materials.

C. Electrical Products and Materials: All electrical products and materials furnished and/or installed for this Project must bear the Underwriter's Laboratories (U.L.), or other accepted agencies listing label. Any Project-related modification to these products must be in compliance with the National Electrical Code requirements and listed by U.L.

D. Identification of Products: Except for required labels and operating data, do not attach or imprint manufacturer or product names or trademarks on exposed surfaces of products or equipment that will be exposed to view in occupied spaces or on the exterior.

1. Labels: Locate required product labels and stamps on a concealed surface, or, where required for observation following installation, on a visually accessible surface that is not conspicuous.
2. Equipment Nameplates: Provide a permanent nameplate on each item of service- or power-operated equipment. Locate on a visually accessible but inconspicuous surface. Include information essential for operation, including the following:

    a. Name of product and manufacturer.
    b. Model and serial number.
    c. Capacity.
    d. Speed.
    e. Ratings.

3. See individual identification Sections in Divisions 21, 22, 23, and 26 for additional equipment identification requirements.

1.5 COORDINATION

A. Modify or adjust affected work as necessary to integrate work of approved comparable products and approved substitutions.

1.6 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Deliver, store, and handle products, using means and methods that will prevent damage, deterioration, and loss, including theft and vandalism. Comply with manufacturer's written instructions.

1. Coordinate deliveries to the site with the Owner, Architect so as to allow for inspection by these parties prior to incorporation in the Work.
2. Any materials which the Owner, Architect determines cannot be received on site will be stored off-site in a secure location, at no additional cost to the Contract, until they can be received at the site. Contractor/Subcontractor must insure off-site storage against damage or loss and provide record of material insurance to the Owner.
3. Provide signed material receipts to the Owner upon request.

B. Delivery and Handling:

1. Schedule delivery to minimize long-term storage at Project site and to prevent overcrowding of construction spaces.
2. Coordinate delivery with installation time to ensure minimum holding time for items that are flammable, hazardous, easily damaged, or sensitive to deterioration, theft, and other losses.
3. Deliver products to Project site in an undamaged condition in manufacturer's original sealed container or other packaging system, complete with labels and instructions for handling, storing, unpacking, protecting, and installing.
4. Inspect products on delivery to determine compliance with the Contract Documents and that products are undamaged and properly protected.

C. Storage:

1. Contractor is responsible for designating and allotting on-site storage space. Any relocation of stored materials necessitated by Work progress will be accomplished promptly without additional cost to the Contract.
2. Provide a secure location and enclosure at Project site for storage of materials and equipment.
3. Store products to allow for inspection and measurement of quantity or counting of units.

4. Store materials in a manner that will not endanger Project structure.
5. Store products that are subject to damage by the elements under cover in a weathertight enclosure above ground, with ventilation adequate to prevent condensation and with adequate protection from wind.
6. Store cementitious products and materials on elevated platforms.
7. Protect foam plastic from exposure to sunlight, except to extent necessary for period of installation and concealment.
8. Comply with product manufacturer's written instructions for temperature, humidity, ventilation, and weather-protection requirements for storage.
9. Provide a secure location and enclosure at Project site for storage of materials and equipment by Owner's construction forces. Coordinate location with Owner.

1.7 WARRANTY

A. Materials and equipment furnished under the Contract will be of good quality and new unless the Contract Documents require or permit otherwise. The Work will conform to the requirements of the Contract Documents and will be free from defects, except for those inherent in the quality of the Work the Contract Documents require or permit.

1. Work, materials, or equipment not conforming to these requirements may be considered defective.

B. The Contractor's warranty excludes remedy for damage or defect caused by abuse, alterations to the Work not executed by the Contractor, improper or insufficient maintenance, improper operation, or normal wear and tear and normal usage.

1.8 PRODUCT WARRANTIES

A. Warranties specified in other Sections shall be in addition to, and run concurrent with, other warranties required by the Contract Documents. Manufacturer's disclaimers and limitations on product warranties do not relieve Contractor of obligations under requirements of the Contract Documents.

1. Manufacturer's Warranty: Written standard warranty form furnished by individual manufacturer for a particular product and issued in the name of the Owner or endorsed by manufacturer to Owner.
2. Special Warranty: Written warranty required by the Contract Documents to provide specific rights for Owner and issued in the name of the Owner or endorsed by manufacturer to Owner.

B. Special Warranties: Prepare a written document that contains appropriate terms and identification, ready for execution.

1. Manufacturer's Standard Form: Modified to include Project-specific information and properly executed.
2. Specified Form: When specified forms are included in the Project Manual, prepare a written document, using indicated form properly executed.
3. See other Sections for specific content requirements and particular requirements for submitting special warranties.

C. Submittal Time: Comply with requirements in Section 01 77 00 "Closeout Procedures."

PART 2 - PRODUCTS

2.1 PRODUCT SELECTION PROCEDURES

A. General Product Requirements: Provide products that comply with the Contract Documents, are undamaged and, unless otherwise indicated, are new at time of installation.

1. Provide products complete with accessories, trim, finish, fasteners, and other items needed for a complete installation and indicated use and effect.
2. Standard Products: If available, and unless custom products or nonstandard options are specified, provide standard products of types that have been produced and used successfully in similar situations on other projects.
3. Owner reserves the right to limit selection to products with warranties meeting requirements of the Contract Documents.
4. Where products are accompanied by the term "as selected," Architect will make selection.
5. Where products are accompanied by the term "match sample," sample to be matched is Architect's.
6. Descriptive, performance, and reference standard requirements in the Specifications establish salient characteristics of products.
7. Or Equal: For products specified by name and accompanied by the term "or equal," "or approved equal," or "or approved," comply with requirements in "Comparable Products" Article to obtain approval for use of an unnamed product.

a. Submit additional documentation required by Architect in order to establish equivalency of proposed products. Unless otherwise indicated, evaluation of "or equal" product status is by the Architect, whose determination is final.

B. Product Selection Procedures:

1. Basis-of-Design Product: Where Specifications name a product, or refer to a product indicated on Drawings, and include a list of manufacturers, provide the specified or indicated product or a comparable product by one of the other named manufacturers. Drawings and Specifications may additionally indicate sizes, profiles, dimensions, and other characteristics that are based on the product named. Comply with requirements in "Comparable Products" Article for consideration of an unnamed product by one of the other named manufacturers.

a. For approval of products by unnamed manufacturers, comply with requirements in Section 01 25 00 "Substitution Procedures" for substitutions.

C. Visual Matching Specification: Where Specifications require the phrase "match Architect's sample," provide a product that complies with requirements and matches Architect's sample. Architect's decision will be final on whether a proposed product matches.

1. If no product available within specified category matches and complies with other specified requirements, comply with requirements in Section 01 25 00 "Substitution Procedures" for proposal of product.

D. Visual Selection Specification: Where Specifications include the phrase "as selected by Architect from manufacturer's full range" or a similar phrase, select a product that complies with requirements. Architect will select color, gloss, pattern, density, or texture from manufacturer's product line that includes both standard and premium items.

1. Standard Range: Where Specifications include the phrase "standard range of colors, patterns, textures" or similar phrase, Architect will select color, pattern, density, or texture from manufacturer's product line that does not include premium items.

2. Full Range: Where Specifications include the phrase "full range of colors, patterns, textures" or similar phrase, Architect will select color, pattern, density, or texture from manufacturer's product line that includes both standard and premium items.

2.2 COMPARABLE OR EQUIVALENT PRODUCTS

A. Conditions for Consideration of Comparable Products: Architect will consider Contractor's request for comparable product when the following conditions are satisfied. Provide information below on the Comparable Product Request Form. If the following conditions are not satisfied, Architect may return requests without action, except to record noncompliance with the following requirements:

1. Evidence that proposed product does not require revisions to the Contract Documents, is consistent with the Contract Documents, will produce the indicated results, and is compatible with other portions of the Work.
2. Detailed comparison of significant qualities of proposed product with those of the named basis-of-design product. Significant product qualities include attributes, such as type, function, in-service performance and physical properties, weight, dimension, durability, visual characteristics, and other specific features and requirements.
3. Evidence that proposed product provides specified warranty.
4. List of similar installations for completed projects, with project names and addresses and names and addresses of architects and owners, if requested.
5. Samples, if requested.

B. Submittal Requirements: Incorporate specified submittal requirements of individual Specification Section in combined submittal for comparable products. Approval by the Architect of Contractor's request for use of comparable product and of individual submittal requirements will also satisfy other submittal requirements.

PART 3 - EXECUTION (Not Used)

END OF SECTION

SECTION 01 71 23 – FIELD ENGINEERING

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes requirements for establishment of control points, elevations and reference grids to control elevations and dimensions for accurate location of the Work.

1.2 SUBMITTALS

A. Submittals:
   1. Survey Notes: Submit to Architect prior to finalizing survey.

B. Record Property Survey: As required for Record Documents, show significant features (real property) that have resulted from construction of the project. Provide certification, signed by the Surveyor, that principal lines and levels of the project are accurately positioned as shown on the survey.
   1. Submit digital file on media and in format conforming to Project requirements.

1.3 QUALITY ASSURANCE

A. Qualifications: Land Surveyor or Professional Engineer experienced and specializing in land survey work and registered in the State of California to perform Work of this section.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Stakes: Stakes shall have the following minimum nominal dimensions. Hubs shall be 2 by 2 by 8 inches. Grade, reference, slope, and other stakes shall be 1 by 2 by 18 inches. Lath shall be 3/8" x 2" x 4" feet. Other dimensions and materials may be used, such as steel reinforcing bars and metal pins. The top two inches of all slope, grade, reference, clearing and structure stakes shall be painted and marked with plastic flagging.

B. Marking Stakes: All stakes shall be legibly marked with a stake pencil that leaves an imprint.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verification of Conditions: Verify information shown on drawings against Owner provided data, record documents of prior construction, property survey and existing benchmarks prior to laying out the Work. Locate benchmarks and establish a minimum of three permanent control points; record locations with vertical and horizontal data.

B. Deviations between the horizontal or vertical alignment data shown on the Drawings and the alignment observed on the ground shall be referred to the Architect. Fixing of these areas with approved markers shall be deferred until these differences are reconciled.

C. Location of Existing Utilities and Improvements: Verify locations in field. Location indicated on drawings is approximate and may differ from actual location.

D. The Contractor must comply with all applicable State of California, AHJ and Utility service provider notification requirements for line locations prior to start of the Work. When interruption of utility service is required for the Work, the Contractor shall be responsible for temporary services and protection of work to remain.
   1. Notify the utility and the Architect upon discovery of uncharted utilities and provide complete information of service type, ownership, and location.
   2. The Contractor shall be responsible for all losses and expense incurred due to utility damage and unscheduled interruption resulting from the Work.

3.2 PERFORMANCE

A. Working from the lines and levels documented by the Owner’s property survey, establish and maintain benchmarks and points to set locations, lines and levels for the Work as needed to properly place each element of the Project. Calculate and measure required dimensions as shown within recognized tolerances. Do not scale dimensions from drawings. Advise lower tier contractors of Project locations, lines and levels established for their use.
   1. Record locations and elevations of adjoining structures, pavements, and improvements, monitor for settlement, displacement and other conditions that might be construed as damage incidental to Work.

B. Before proceeding with the layout of actual work, verify the layout information shown on the drawings in relation to the property survey and existing benchmarks. As work proceeds, check every major element for line, level and plumb. Maintain a surveyor's log or record book of such checks; make this log or record book available for the Architect's reference. Record deviations from required lines and levels and advise promptly upon detection of deviations that exceed indicated or recognized tolerances. Record accepted deviations on record drawings. Locate, lay-out, and maintain the following until construction is complete and accepted:
   1. Site Improvements: Pavements, grading stakes, utility slopes, and invert locations.
   2. Building Lines and Levels: Batter boards, column grids, floor levels, and control points for mechanical and electrical Work.
   3. Existing Utilities: Control points for relocation.

C. Do not begin construction work until stakes, marks, and controls established by the Contractor for that particular construction item are approved in writing by the Architect. Approval of the construction staking work shall not relieve the Contractor of responsibility for maintaining survey work and correcting errors, whether the errors are discovered during the actual survey work or in subsequent phases of the project.

D. Before substantial completion, prepare a Record Project survey showing significant features (real property) that have resulted from construction of the project. Include on the survey a certification, signed by the Surveyor, to the effect that principal lines and levels of the project are accurately positioned as shown on the survey.

E. Tolerances: Maintain a neat, well-organized log of survey work. Record deviations from required lines and levels, notify Architect when deviations exceed typical and specified tolerances. Conform to tolerances specified in individual Sections and the following:
   1. Cut and Fill Depths: Within 0.5 ft. for consecutive locations.
   2. Finished Grades: 0.1 ft.

END OF SECTION

SECTION 01 73 00 - EXECUTION

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes general administrative and procedural requirements governing execution of the Work, including, but not limited to, the following:

1. Construction layout.
2. Field engineering.
3. Installation.
4. Uncovering and Correction of the Work.
5. Coordination of Owner's portion of the Work.
6. Progress cleaning.
7. Starting and adjusting.
8. Protection of installed construction.
9. Correction of the Work.

1.2 OWNER'S SURVEY

A. Property Survey: Provided by the Owner describing the physical characteristics, legal limitations, and utility locations for the site of the Project, and a legal description of the site.

1. The Contractor will be entitled to rely on the accuracy of information furnished by the Owner but will exercise proper precautions relating to the safe performance of the Work.

1.3 CONTRACTOR EXAMINATION OF EXISTING CONDITIONS

A. The Contract Documents are complementary. Before starting each portion of the Work, study and compare the Contract Documents relative to that portion of the Work, as well as information furnished by the Owner. Take field measurements of existing conditions related to that portion of the Work and observe conditions at the site affecting it.

B. These obligations are for the purpose of facilitating coordination and construction by the Contractor and are not for the purpose of discovering errors, omissions, or inconsistencies in the Contract Documents; however, the Contractor shall promptly report to the Architect any errors, inconsistencies or omissions discovered by or made known to the Contractor as a Request For Information per Section 01 31 00 "Project Management and Coordination."

1.4 INFORMATIONAL SUBMITTALS

A. Qualification Data: For land surveyor.

B. Certified Surveys: Submit two copies signed by land surveyor or professional engineer.

C. Certificates: Submit certificate signed by land surveyor or professional engineer, certifying that location and elevation of improvements comply with requirements.

D. Landfill Receipts: Submit copy of receipts issued by a landfill facility, licensed to accept hazardous materials, for hazardous waste disposal.

1.5 CLOSEOUT SUBMITTALS

A. Final Property Survey: Submit 10 copies showing the Work performed and record survey data.

1.6 QUALITY ASSURANCE

A. Land Surveyor Qualifications: A professional land surveyor who is legally qualified to practice in jurisdiction where Project is located and who is experienced in providing land-surveying services of the kind indicated.

B. Professional Engineer Qualifications: Refer to Section 01 40 00 "Quality Requirements."

C. Manufacturer's Installation Instructions: Obtain and maintain on-site manufacturer's written recommendations and instructions for installation of specified products and equipment.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Comply with requirements specified in other Sections.

1. For projects requiring compliance with sustainable design and construction practices and procedures, use products for patching that comply with sustainable design requirements.

B. In-Place Materials: Use materials for patching identical to in-place materials. For exposed surfaces, use materials that visually match in-place adjacent surfaces to the fullest extent possible.

1. If identical materials are unavailable or cannot be used, use materials that, when installed, will provide a match acceptable to Architect for the visual and functional performance of in-place materials. Use materials that are not considered hazardous.

C. Cleaning Agents: Use cleaning materials and agents recommended by manufacturer or fabricator of the surface to be cleaned. Do not use cleaning agents that are potentially hazardous to health or property or that might damage finished surfaces.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Existing Conditions: The existence and location of underground and other utilities and construction indicated as existing are not guaranteed. Before beginning sitework, investigate and verify the existence and location of underground utilities, mechanical and electrical systems, and other construction affecting the Work.

1. Before construction, verify the location and invert elevation at points of connection of sanitary sewer, storm sewer, gas service piping, and water-service piping; underground electrical services; and other utilities.
2. Furnish location data for work related to Project that must be performed by public utilities serving Project site.

B. Examination and Acceptance of Conditions: Before proceeding with each component of the Work, examine substrates, areas, and conditions, with Installer or Applicator present where

indicated, for compliance with requirements for installation tolerances and other conditions affecting performance. Record observations.

1. Examine roughing-in for mechanical and electrical systems to verify actual locations of connections before equipment and fixture installation.
2. Examine walls, floors, and roofs for suitable conditions where products and systems are to be installed.
3. Verify compatibility with and suitability of substrates, including compatibility with existing finishes or primers.

C. Proceed with installation only after unsatisfactory conditions have been corrected. Proceeding with the Work indicates acceptance of surfaces and conditions.

3.2 PREPARATION

A. Existing Utility Information: Furnish information to local utility and Owner that is necessary to adjust, move, or relocate existing utility structures, utility poles, lines, services, or other utility appurtenances located in or affected by construction. Coordinate with authorities having jurisdiction.

B. Field Measurements: Take field measurements as required to fit the Work properly. Recheck measurements before installing each product. Where portions of the Work are indicated to fit to other construction, verify dimensions of other construction by field measurements before fabrication. Coordinate fabrication schedule with construction progress to avoid delaying the Work.

C. Space Requirements: Verify space requirements and dimensions of items shown diagrammatically on Drawings.

D. Review of Contract Documents and Field Conditions: Immediately on discovery of the need for clarification of the Contract Documents, submit a request for information to Architect in accordance with requirements in Section 01 31 00 "Project Management and Coordination."

3.3 CONSTRUCTION LAYOUT

A. Verification: Before proceeding to lay out the Work, verify layout information shown on Drawings, in relation to the property survey and existing benchmarks and existing conditions. If discrepancies are discovered, notify Architect promptly.

B. Engage a land surveyor or professional engineer experienced in laying out the Work, using the following accepted surveying practices:

1. Establish benchmarks and control points to set lines and levels at each story of construction and elsewhere as needed to locate each element of Project.
2. Establish limits on use of Project site.
3. Establish dimensions within tolerances indicated. Do not scale Drawings to obtain required dimensions.
4. Inform installers of lines and levels to which they must comply.
5. Check the location, level and plumb, of every major element as the Work progresses.
6. Notify Architect when deviations from required lines and levels exceed allowable tolerances.
7. Close site surveys with an error of closure equal to or less than the standard established by authorities having jurisdiction.

C. Site Improvements: Locate and lay out site improvements, including pavements, grading, fill and topsoil placement, utility slopes, and rim and invert elevations.

D. Building Lines and Levels: Locate and lay out control lines and levels for structures, building foundations, column grids, and floor levels, including those required for mechanical and electrical work. Transfer survey markings and elevations for use with control lines and levels. Level foundations and piers from two or more locations.

E. Record Log: Maintain a log of layout control work. Record deviations from required lines and levels. Include beginning and ending dates and times of surveys, weather conditions, name and duty of each survey party member, and types of instruments and tapes used. Make the log available for reference by Architect.

3.4 FIELD ENGINEERING

A. Reference Points: Locate existing permanent benchmarks, control points, and similar reference points before beginning the Work. Preserve and protect permanent benchmarks and control points during construction operations.

1. Do not change or relocate existing benchmarks or control points without prior written approval of Architect. Report lost or destroyed permanent benchmarks or control points promptly. Report the need to relocate permanent benchmarks or control points to Architect before proceeding.
2. Replace lost or destroyed permanent benchmarks and control points promptly. Base replacements on the original survey control points.

B. Benchmarks: Establish and maintain a minimum of two permanent benchmarks on Project site, referenced to data established by survey control points. Comply with authorities having jurisdiction for type and size of benchmark.

1. Record benchmark locations, with horizontal and vertical data, on Project Record Documents.
2. Where the actual location or elevation of layout points cannot be marked, provide temporary reference points sufficient to locate the Work.
3. Remove temporary reference points when no longer needed. Restore marked construction to its original condition.

C. Certified Survey: On completion of foundation walls, major site improvements, and other work requiring field-engineering services, prepare a certified survey showing dimensions, locations, angles, and elevations of construction and sitework.

D. Final Property Survey: Engage a land surveyor or professional engineer to prepare a final property survey showing significant features (real property) for Project. Include on the survey a certification, signed by land surveyor or professional engineer, that principal metes, bounds, lines, and levels of Project are accurately positioned as shown on the survey.

1. Show boundary lines, monuments, streets, site improvements and utilities, existing improvements and significant vegetation, adjoining properties, acreage, grade contours, and the distance and bearing from a site corner to a legal point.
2. Recording: At Substantial Completion, have the final property survey recorded by or with authorities having jurisdiction as the official "property survey."

3.5 INSTALLATION

A. Locate the Work and components of the Work accurately, in correct alignment and elevation, as indicated.

1. Make vertical work plumb and make horizontal work level.

2. Where space is limited, install components to maximize space available for maintenance and ease of removal for replacement.
3. Conceal pipes, ducts, and wiring in finished areas unless otherwise indicated.
4. Maintain minimum headroom clearance of 96 inches (2440 mm) in occupied spaces and 90 inches (2300 mm) in unoccupied spaces, unless otherwise indicated on Drawings.
5. Install materials, products, and equipment such that manufacturer's labels do not appear on exposed surfaces of the finished work, except in unfinished portions of the building such as mechanical equipment rooms.
6. Install materials, products, and equipment so they are readily accessible for operation, maintenance, and repair. Minor deviations from Drawings may be made to accomplish required accessibility, but changes involving extra cost shall not be made without prior written approval.

B. Comply with manufacturer's written instructions and recommendations for installing products in applications indicated.

C. Install products at the time and under conditions that will ensure satisfactory results as judged by Architect. Maintain conditions required for product performance until Substantial Completion.

D. Conduct construction operations, so no part of the Work is subjected to damaging operations or loading in excess of that expected during normal conditions of occupancy of type expected for Project.

E. Sequence the Work and allow adequate clearances to accommodate movement of construction items on-site and placement in permanent locations.

F. Tools and Equipment: Select tools or equipment that minimize production of excessive noise levels.

G. Templates: Obtain and distribute to the parties involved templates for Work specified to be factory prepared and field installed. Check Shop Drawings of other portions of the Work to confirm that adequate provisions are made for locating and installing products to comply with indicated requirements.

H. Attachment: Provide blocking and attachment plates and anchors and fasteners of adequate size and number to securely anchor each component in place, accurately located and aligned with other portions of the Work. Where size and type of attachments are not indicated, verify size and type required for load conditions with manufacturer.

1. Mounting Heights: Where mounting heights are not indicated, mount components at heights directed by Architect.
2. Allow for building movement, including thermal expansion and contraction.
3. Coordinate installation of anchorages. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry. Deliver such items to Project site in time for installation.

I. Joints: Make joints of uniform width. Where joint locations in exposed Work are not indicated, arrange joints for the best visual effect, as judged by Architect. Fit exposed connections together to form hairline joints.

3.6 UNCOVERING OF THE WORK

A. Prematurely Covered Work: Uncover the portion of the Work prematurely covered contrary to the Contract Documents, as requested in writing by the Architect, for the Architect's examination.

1. Replace work without a change in the Contract Time or sum.

B. Architect's Request to Uncover Work: Uncover the portion of the Work as requested in writing by the Architect.

1. Work in accordance with the Contract Documents: Submit a change order as an adjustment to the Contract Sum and Contract Time.
2. Work not in accordance with the Contract Documents: Submit a change order as a credit to the Owner for an adjustment of the Contract Sum. Adjustments for Contract Time will not be permitted.

3.7 COORDINATION OF OWNER'S PORTION OF THE WORK

A. Site Access: Provide access to Project site for Owner's construction personnel and Owner's separate contractors.
1. Refer to Section 01 11 00 "Summary" for other requirements for Owner-furnished, Contractor-installed and Owner-furnished, Owner-installed products.

B. Coordination: Coordinate construction and operations of the Work with work performed by Owner's construction personnel and Owner's separate contractors.

1. Construction Schedule: Inform Owner of Contractor's preferred construction schedule for Owner's portion of the Work. Adjust construction schedule based on a mutually agreeable timetable. Notify Owner if changes to schedule are required due to differences in actual construction progress.
2. Preinstallation Conferences: Include Owner's construction personnel and Owner's separate contractors at preinstallation conferences covering portions of the Work that are to receive Owner's work. Attend preinstallation conferences conducted by Owner's construction personnel if portions of the Work depend on Owner's construction.

C. Owner-Furnished Owner-Installed (OFOI) Products: As specified in Section 01 11 000 "Summary."

1. Provide mechanical and electrical service lines and support systems for such products, where indicated. Final connections from service lines to the equipment will be provided by the Owner, unless otherwise indicated.

3.8 PROGRESS CLEANING

A. Clean Project site and work areas daily, including common areas. Enforce requirements strictly. Dispose of materials lawfully.

1. Comply with requirements in NFPA 241 for removal of combustible waste materials and debris.
2. Do not hold waste materials more than seven days during normal weather or three days if the temperature is expected to rise above 80 deg F (27 deg C).
3. Containerize hazardous and unsanitary waste materials separately from other waste. Mark containers appropriately and dispose of legally, in accordance with regulations.

a. Use containers intended for holding waste materials of type to be stored.

4. Coordinate progress cleaning for joint-use areas where Contractor and other contractors are working concurrently.

B. Site: Maintain Project site free of waste materials and debris.

C. Work Areas: Clean areas where Work is in progress to the level of cleanliness necessary for proper execution of the Work.

1. Remove liquid spills promptly.
2. Where dust would impair proper execution of the Work, broom-clean or vacuum the entire work area, as appropriate.

D. Installed Work: Keep installed work clean. Clean installed surfaces in accordance with written instructions of manufacturer or fabricator of product installed, using only cleaning materials specifically recommended. If specific cleaning materials are not recommended, use cleaning materials that are not hazardous to health or property and that will not damage exposed surfaces.

E. Concealed Spaces: Remove debris from concealed spaces before enclosing the space.

F. Exposed Surfaces: Clean exposed surfaces and protect as necessary to ensure freedom from damage and deterioration at time of Substantial Completion.

G. Waste Disposal:

1. Do not bury or burn waste materials on-site.
2. Do not wash waste materials down sewers or into waterways. Comply with waste disposal requirements in Section 01 74 19 "Construction Waste Management and Disposal."

H. During handling and installation, clean and protect construction in progress and adjoining materials already in place. Apply protective covering where required to ensure protection from damage or deterioration at Substantial Completion.

I. Clean and provide maintenance on completed construction as frequently as necessary through the remainder of the construction period. Adjust and lubricate operable components to ensure operability without damaging effects.

J. Limiting Exposures: Supervise construction operations to ensure that no part of the construction, completed or in progress, is subject to harmful, dangerous, damaging, or otherwise deleterious exposure during the construction period.

3.9 STARTING AND ADJUSTING

A. Start equipment and operating components to confirm proper operation. Remove malfunctioning units, replace with new units, and retest.

B. Adjust equipment for proper operation. Adjust operating components for proper operation without binding.

C. Test each piece of equipment to verify proper operation. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

D. Manufacturer's Field Service: Comply with qualification requirements in Section 01 40 00 "Quality Requirements."

3.10 PROTECTION AND REPAIR OF INSTALLED CONSTRUCTION

A. Provide final protection and maintain conditions that ensure installed Work is without damage or deterioration at time of Substantial Completion.

B. Repair Work previously completed and subsequently damaged during construction period. Repair to like-new condition.

C. Protection of Existing Items: Provide protection and ensure that existing items to remain undisturbed by construction are maintained in condition that existed at commencement of the Work.

D. Comply with manufacturer's written instructions for temperature and relative humidity.

3.11 CORRECTION OF THE WORK

A. Before Substantial Completion: Promptly correct Work rejected by the Architect or failing to conform to the requirements of the Contract Documents.

1. Costs of correcting, including but not limited to, additional testing and inspections, uncovering and replacement, and compensation for the Architect's services will be at the Contractor's expense.
2. After Substantial Completion: Correct promptly any of the Work found to be not in accordance with the requirements of the Contract Documents.

    a. Notification: The Owner will notify the Contractor promptly after discovery of the condition to be corrected.

        1) During the one-year period for correction of Work, if the Owner fails to notify the Contractor and give the Contractor an opportunity to make the correction, the Owner waives the rights to require correction by the Contractor and to make a claim for breach of warranty.
        2) If the Contractor fails to correct nonconforming Work within a reasonable time during that period after receipt of notice from the Owner or Architect, the Owner may correct it.

3. Period for correction of Work: Extended with respect to portions of Work first performed after Substantial Completion by the period of time between Substantial Completion and the actual completion of that portion of the Work.

    a. The one-year period for correction of Work shall not be extended by corrective Work performed by the Contractor.
    b. Compliance with the Contract Documents are not encumbered by the period for correction of Work.

B. Work by Others: The Contractor shall bear the cost of correcting destroyed or damaged construction of the Owner or Separate Contractors, whether completed or partially completed, caused by the Contractor's correction or removal of Work that is not in accordance with the requirements of the Contract Documents.

C. Repair or remove and replace damaged, defective, or nonconforming Work. Restore damaged substrates and finishes.

1. Comply with requirements in Section 01 73 29 "Cutting and Patching."
2. Repairing includes replacing defective parts, refinishing damaged surfaces, touching up with matching materials, and properly adjusting operating equipment.

D. Repair Work previously completed and subsequently damaged during construction period. Repair to like-new condition.

E. Restore permanent facilities used during construction to their specified condition.

F. Remove and replace damaged surfaces that are exposed to view if surfaces cannot be repaired without visible evidence of repair.

G. Repair components that do not operate properly. Remove and replace operating components that cannot be repaired.

H. Remove and replace chipped, scratched, and broken glass or reflective surfaces.

I. Acceptance of Nonconforming Work: If the Owner prefers to accept Work that is not in accordance with the requirements of the Contract Documents, the Owner may do so instead of requiring its removal and correction, in which case the Contract Sum will be reduced as appropriate and equitable. Such adjustment shall be affected whether or not final payment has been made.

END OF SECTION 01 73 00

SECTION 01 73 29 - CUTTING AND PATCHING

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes procedural requirements for cutting and patching.

B. Contractor is responsible for cutting, fitting, and patching required for alteration Work or to correct or modify newly installed construction, including but not limited to:

1. Coordination between trades.
2. Performing sequential excavation and backfill.
3. Completing the Work or making its several parts fit together properly or integrate with other Work.
4. Uncovering portions of the Work to provide for installation of ill-timed Work.
5. Removing and replacing defective Work.
6. Removing and replacing Work not conforming to requirements of Contract Documents.
7. Removing samples of installed Work as specified for testing.
8. Providing routine penetrations of non-structural surfaces for installation of materials such as piping and electrical conduit.

1.2 DEFINITIONS

A. Cutting: Removal of in-place construction necessary to permit installation or performance of other Work.

B. Patching: Fitting and repair work required to restore surfaces to original conditions after installation of other Work.

1.3 PREINSTALLATION MEETINGS

A. Cutting and Patching Conference: Conduct conference at Project site.

1. Prior to commencing work requiring cutting and patching, review extent of cutting and patching anticipated and examine procedures for ensuring satisfactory result from cutting and patching work. Require representatives of each entity directly concerned with cutting and patching to attend, including the following:

a. Contractor's superintendent.
b. Trade supervisor responsible for cutting operations.
c. Trade supervisor(s) responsible for patching of each type of substrate.
d. Mechanical, electrical, and utilities subcontractors' supervisors, to the extent each trade is affecting by cutting and patching operations.

2. Review areas of potential interference and conflict. Coordinate procedures and resolve potential conflicts before proceeding.

1.4 QUALITY ASSURANCE

A. Structural Elements: When cutting and patching structural elements, notify Architect of locations and details of cutting and await directions from Architect before proceeding. Shore, brace, and support structural elements during cutting and patching. Do not cut and patch

structural elements in a manner that could change their load-carrying capacity or increase deflection.

1. A structural element includes any load-bearing, lateral force-resistant member, and wind or seismic movement resisting construction.
2. Take precautions and exercise care to ensure Work is removed neatly and without movement or settlement to remainder of building. Contractor will be held liable for any damage, movement, settlement caused thereby or resulting therefrom.

B. Operational Elements: Do not cut and patch operating elements and related components in a manner that results in reducing their capacity to perform as intended or that results in increased maintenance or decreased operational life or safety.

C. Other Construction Elements: Do not cut and patch other construction elements or components in a manner that could change their load-carrying capacity, that results in reducing their capacity to perform as intended, or that results in increased maintenance or decreased operational life or safety.

D. Visual Requirements: Do not cut and patch construction in a manner that results in visual evidence of cutting and patching. Do not cut and patch construction exposed on the exterior or in occupied spaces in a manner that would, in Architect's opinion, reduce the building's aesthetic qualities. Remove and replace construction that has been cut and patched in a visually unsatisfactory manner.

E. Manufacturer's Installation Instructions: Obtain and maintain on-site manufacturer's written recommendations and instructions for installation of products and equipment.

F. Qualifications: Workers to have minimum three (3) years of experience in working with materials being cut and patched.

1.5 WARRANTY

A. Existing Warranties: Remove, replace, patch, and repair materials and surfaces cut or damaged during cutting and patching operations, by methods and with materials so as not to void existing warranties.

PART 2 - PRODUCTS

2.1 MATERIALS

A. General: Comply with requirements specified in other Sections.

B. In-Place Materials: Use materials identical to in-place materials.

1. For exposed surfaces, use materials that visually match in-place adjacent surfaces to the fullest extent possible.
2. If identical materials are unavailable or cannot be used, use materials that, when installed, will match the visual and functional performance of in-place materials.

C. Materials used for sealing openings shall have a fire rating equal to or greater than the rating of the floor, ceiling or partition and shall comply with applicable codes.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine surfaces to be cut and patched and conditions under which cutting and patching are to be performed.

1. Compatibility: Before patching, verify compatibility with and suitability of substrates, including compatibility with in-place finishes or primers.
2. Proceed with installation only after unsafe or unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Temporary Support: Provide temporary support of Work to be cut.

B. Protection: Protect in-place construction during cutting and patching to prevent damage. Provide protection from adverse weather conditions for portions of Project that might be exposed during cutting and patching operations.

C. Adjacent Occupied Areas: Avoid interference with use of adjoining areas or interruption of free passage to adjoining areas.

D. Existing Utility Services and Mechanical/Electrical Systems: Where existing services/systems are required to be removed, relocated, or abandoned, bypass such services/systems before cutting to minimize interruption to occupied areas.

3.3 PERFORMANCE

A. General: Employ skilled workers to perform cutting and patching. Proceed with cutting and patching at the earliest feasible time, and complete without delay.

1. Cut in-place construction to provide for installation of other components or performance of other construction, and subsequently patch as required to restore surfaces to their original condition.
2. Restore Work and surfaces with new products in accordance with requirements of the Contract Documents.

B. Cutting: Cut in-place construction by sawing, drilling, breaking, chipping, grinding, and similar operations, including excavation, using methods least likely to damage elements retained or adjoining construction. Employ original Installer for cutting and patching of newly installed construction; comply with original Installer's written recommendations.

1. In general, use hand or small power tools designed for sawing and grinding, not hammering and chopping. Cut holes and slots as small as possible, neatly to size required, and with minimum disturbance of adjacent surfaces. Temporarily cover openings when not in use.
2. Finished Surfaces: Cut or drill from the exposed or finished side into concealed surfaces.
3. Concrete and Masonry: Cut using a cutting machine, such as an abrasive saw or a diamond-core drill.
4. Excavating and Backfilling: Comply with requirements in applicable Sections where required by cutting and patching operations.

5. Mechanical and Electrical Services: Cut off pipe or conduit in walls or partitions to be removed. Cap, valve, or plug and seal remaining portion of pipe or conduit to prevent entrance of moisture or other foreign matter after cutting.
6. Proceed with patching after construction operations requiring cutting are complete.

C. Patching: Patch construction by filling, repairing, refinishing, closing up, and similar operations following performance of other Work. Patch with durable seams that are as invisible as possible. Provide materials and comply with installation requirements specified in other Sections.

1. Inspection: Where feasible, test and inspect patched areas after completion to demonstrate integrity of installation.
2. Exposed Finishes: Restore exposed finishes of patched areas and extend finish restoration into retained adjoining construction in a manner that will eliminate evidence of patching and refinishing.

    a. Refinish entire surfaces as necessary to provide an even new finish.
    b. For continuous surfaces, refinish to nearest intersection.
    c. For assemblies, entirely refinish.
    d. Clean piping, conduit, and similar features before applying paint or other finishing materials.
    e. Restore damaged pipe covering to its original condition.

3. Floors and Walls: Where walls or partitions that are removed extend one finished area into another, patch and repair floor and wall surfaces in the new space. Provide an even surface of uniform finish, color, texture, and appearance. Remove in-place floor and wall coverings and replace with new materials, if necessary, to achieve uniform color and appearance.

    a. Patch subfloors under removed partitions, fixed equipment, etc. by cutting back, applying underlayment, concrete fill, or other acceptable leveling fill as necessary to provide subfloor that is level with adjacent existing subfloors and properly prepare to receive finish flooring.
    b. In renovated rooms/areas to receive new floor finishes, remove existing finish flooring and related materials and prepare subfloor by cutting back, applying concrete fill or other acceptable leveling fill as necessary to provide subfloor that is level and properly prepared to receive new floor finish as required by Room Finish Schedule and material manufacturers written recommendations.
    c. In renovated rooms/areas to receive new wall finishes, those portions of existing walls that remain shall have their surfaces patched, cut back, or brought forward as necessary, and prepared as required to receive the new finishes per Room Finish Schedule.
    d. Where patching occurs in a painted surface, prepare substrate and apply primer and intermediate paint coats appropriate for the substrate over the patch and apply final paint coat over entire unbroken surface containing the patch. Provide additional coats until patch blends with adjacent surfaces.
    e. In rooms or areas where patching is required on one wall only, that entire wall is to be refinished to match the existing finish and color, including existing painted doors, door frames and window frames if they occur in that wall.
    f. In rooms or areas where patching is required on two or more walls, all walls, including painted doors, door frames and painted window frames, are to be refinished.

4. Ceilings: Patch, repair, or rehang in-place ceilings as necessary to provide an even-plane surface of uniform appearance.

a. In rooms or areas where patching is required in an existing plaster or gypsum wallboard ceiling, the entire ceiling is to be repainted. In rooms where patching is required in existing acoustic tile ceilings, patch ceilings with matching type and pattern of acoustic tile, clean all remaining tile and apply one coat of white latex paint by roller over all tile surfaces. Clean all exposed metal suspension system.

5. Fire-Resistive Materials: Patch and repair to restore fire protection to original condition.
6. Exterior Building Enclosure: Patch components in a manner that restores enclosure to a weathertight condition and ensures thermal and moisture integrity of building enclosure.
7. Openings created as a result of removal of materials must be patched to match adjacent construction as to materials and finishes, unless otherwise indicated.

   a. Provide lintels where openings are cut through existing masonry or concrete walls. Refer to Lintel Schedule as indicated on the Drawings.

8. Close up the unused portion of the opening with materials matching adjacent construction where existing equipment is removed and new equipment is installed in the existing opening.
9. When new rubber or vinyl stair treads, risers, and landings, are installed at existing stairs, paint all exposed steel.
10. Paint all exposed insulated or non-insulated pipes and ducts in finished rooms or areas.
11. Patch and repair the floor, walls, and ceiling where existing equipment or assemblies are removed.

D. Roofing:

1. Before commencing with cutting and patching of roofing, consult with the Owner regarding the existence of an outstanding roofing warranty. If such a warranty exists, obtain written approval of the methods to be used from the roofing manufacturer who issued the warranty so as not to affect the value of the warranty.
2. If necessary, cutting and patching of roofing to be performed by roofing manufacturer authorized personnel only.
3. Cut, patch, repair and extend roofing and insulation as follows:

   a. Where disturbed or damaged by alteration Work or activities related to same.
   b. Where new Work connects to existing construction.

4. Protect roof areas penetrated for alterations against damage and leaks. Do not leave roof openings uncovered or unprotected overnight or during any periods of rainy or inclement weather.
5. Remove loose aggregate, if applicable, and store away from work area.
6. Work shall be performed in a manner to provide for permanent water-tight splice or repair.
7. Roof repair and alteration Work and materials shall match existing roofing materials and construction.
8. Upon completion and inspection of splice or repair Work, remove debris from the roof and replace the aggregate as required.
9. Protect undisturbed existing and newly repaired roofing subject to traffic and damage.

3.4 CLEANING

A. Clean areas and spaces where cutting and patching are performed.

B. Completely remove paint, mortar, oils, putty, and similar materials from any surface not intended to receive these materials.

END OF SECTION

SECTION 01 74 19 - CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes administrative and procedural requirements for the following:
   1. Construction Waste Management Plan.
      a. Construction Waste Management requirements based upon Local Agency regulations and Owner’s recycling targets.
   2. Recycling nonhazardous demolition and construction waste.
   3. Disposing of nonhazardous demolition and construction waste.

B. Regulatory Requirements: Contractor is responsible for knowing and complying with regulatory requirements, including but not limited to Federal, State, and local requirements, pertaining to legal disposal of all construction and demolition waste materials.

1.2 REFERENCES

A. California Code of Regulations, Title 24, Part 11 California Green Building Stnadrards Code, “CAL-Green.”

B. Local Agency Construction and Demolition Waste Recyling Ordinances, as applicable.

1.3 PROJECT CONDITIONS

A. Environmental Requirements: Conduct cleaning and waste-disposal operations in compliance with all CAL-Green and Local Agency Construction and Demolition Debris Waster Reduction and Recycling requirements.

B. Comply fully with Federal and local environmental and anti-pollution regulations.
   1. Do not dispose of volatile waste, oil or solvents in storm or sanitary drains.
   2. Burning or burial of debris, rubbish, or other waste material in the premises is not permitted.

1.4 DEFINITIONS

A. Construction Waste: Building, structure, and site improvement materials and other solid waste resulting from construction, remodeling, renovation, or repair operations. Construction waste includes packaging.

B. Demolition Waste: Building, structure, and site improvement materials resulting from demolition operations.

C. Disposal: Removal of demolition or construction waste and subsequent salvage, sale, recycling, or deposit in landfill, incinerator acceptable to authorities having jurisdiction, or designated spoil areas on Owner's property.

D. Recycle: Recovery of demolition or construction waste for subsequent processing in preparation for reuse.

E. Salvage: Recovery of demolition or construction waste and subsequent sale or reuse in another facility.

F. Salvage and Reuse: Recovery of demolition or construction waste and subsequent incorporation into the Work.

G. Source Separation: The act of keeping different types of waste materials separate beginning from the first time they become waste.

H. Trash: Any product or material unable to be reused, returned, recycled, or salvaged.

I. Waste: Extra material or material that has reached the end of its useful life in its intended use. Waste includes salvageable, returnable, recyclable, and reusable material.

1.5 MATERIALS OWNERSHIP

A. Unless otherwise indicated, demolition and construction waste become property of Contractor.

B. Historic items, relics, antiques, and similar objects including, but not limited to, cornerstones and their contents, commemorative plaques and tablets, and other items of interest or value to Owner that may be uncovered during demolition remain the property of Owner.

1. Carefully salvage in a manner to prevent damage and promptly return to Owner.

1.6 ACTION SUBMITTALS

A. Waste Management Plan: Prepare and submit plan within 7 days of date established for the Notice of Award.

1.7 INFORMATIONAL SUBMITTALS

A. Waste Reduction Progress Reports: Concurrent with each Application for Payment, submit report. Use Agency required forms. Include the following information:

1. Material category.
2. Generation points of waste.
3. Total quantity of waste in tons.
4. Quantity of waste salvaged, both estimated and actual in tons.
5. Quantity of waste recycled, both estimated and actual in tons.
6. Total quantity of waste recovered (salvaged plus recycled) in tons.
7. Total quantity of waste recovered (salvaged plus recycled) as a percentage of total waste.

B. Demonstrate compliance with California Code of Regulations, Title 24, Part 11 California Green Building Standards Code, “CAL-Green” 5.408.2, and all applicable local codes and ordinances to the satisfaction of the enforcing agency.

1. Recycling and Processing Facility Records: Indicate receipt and acceptance of recyclable waste by recycling and processing facilities licensed to accept them. Include manifests, weight tickets, receipts, and invoices.
2. Landfill and Incinerator Disposal Records: Indicate receipt and acceptance of waste by landfills and incinerator facilities licensed to accept them. Include manifests, weight tickets, receipts, and invoices.

C. Statement of Refrigerant Recovery: Signed by refrigerant recovery technician responsible for recovering refrigerant, stating that all refrigerant that was present was recovered and that recovery was performed according to EPA regulations. Include name and address of technician and date refrigerant was recovered.

D. Submit certification from any recycling services that are not listed in the Local Agency Waste Management Authority's Builder's Guide.

E. Submit with all Pay Applications, certification letter, waste management lob and receipts from all recycled and waste off-haul. Certification letter to state that under the penalty of perjury all materials removed from site during the building period are included within the attached receipts and provide summary. Project inspector to verify all loads prior to off-haul and initial receipts prior to submitting with pay application.

1.8 PERFORMANCE REQUIREMENTS

A. General: Recycle or salvage for reuse a minimum of 65% of non-hazardous construction and demolition debris, or meet a location construction waste ordinance, whichever is more stringent.
   1. Calculate the amount of meterials diverted by weight or by volume, but not both.
   2. Exceptions: Excavated soil andland clearing debris, as specified below.

B. Excavated Soil and Land Clearning Debris: Recycle or salvage for reuse 100 percent of trees, stumps. Rocks and associated vegetation and soils resulting primarily from land cleaning activities.

C. Practice efficient waste management in the use of materials in the course of Work. Use all reasonable means to divert construction and demolition waste from landfills and incinerators. Facilitate recycling and salvaging of materials.

1.9 QUALITY ASSURANCE

A. Waste Management Coordinator Qualifications: Experienced firm, or individual employed and assigned by General Contractor, with a record of successful waste management coordination of projects with similar requirements. Superintendent may serve as Waste Management Coordinator.

B. Refrigerant Recovery Technician Qualifications: Certified by EPA-approved certification program.

C. Regulatory Requirements: Comply with transportation and disposal regulations of authorities having jurisdiction.

D. Waste Management Conference(s): Conduct conference(s) at Project site to comply with requirements in Section 01 31 00 "Project Management and Coordination." Review methods and procedures related to waste management including, but not limited to, the following:
   1. Review and discuss waste management plan including responsibilities of each contractor and waste management coordinator.
   2. Review requirements for documenting quantities of each type of waste and its disposition.

3. Review and finalize procedures for materials separation and verify availability of containers and bins needed to avoid delays.
4. Review procedures for periodic waste collection and transportation to recycling and disposal facilities.
5. Review waste management requirements for each trade.

1.10 WASTE MANAGEMENT PLAN

A. General: Develop and implement a Waste Management Plan that complies with applicable Local Agency Construction and Demolition (C&D) Waste Recycling ordinance, and with California Code of Regulations, Title 24, Part11 California Green Building Standards Code, “CAL-Green” 5.408.
1. Identifies materials to be diverted from disposal by efficient usage, recycling, reuse on the Project, or salvage for future use, or sale.
2. Determines if materials will be sorted on-site or mixed.
3. Identifies diversion facilities where material collected will be taken.
4. Specifies that quantities of diverted material will be calculated by weight or volume, but not both.

PART 2 - PRODUCTS

2.1 FIRE PROTECTION

A. Store volatile waste in covered metal containers.

B. Remove volatile waste from premises daily.

2.2 CLEANING MATERIALS

A. Cleaning Agents: Use cleaning materials and agent recommended by manufacturer or fabricator of the surface to be cleaned. Do not use cleaning agents that are potentially hazardous to health or property or that might damage finished surfaces.
1. Use cleaning materials only on surfaces recommended by cleaning material manufacturer or by the manufacturer of the surface to be cleaned.

B. Use cleaning products that comply with Green Seal’s GS-37, or if GS-37 is not applicable, use products that comply with the California Code of Regulations maximum allowable VOC levels.

2.3 PERFORMANCE REQUIREMENTS

A. General: Achieve end-of-Project rates for salvage/recycling of 65 percent by weight of total nonhazardous solid waste generated by the Work. Practice efficient waste management in the use of materials in the course of the Work. Use all reasonable means to divert construction and demolition waste from landfills and incinerators. Facilitate recycling and salvage of materials, including the following:

1. Demolition Waste:

a. Asphalt paving.
b. Concrete.
c. Concrete reinforcing steel.

d. Brick.
e. Concrete masonry units.
f. Wood studs.
g. Wood joists.
h. Plywood and oriented strand board.
i. Wood paneling.
j. Wood trim.
k. Structural and miscellaneous steel.
l. Rough hardware.
m. Roofing.
n. Insulation.
o. Doors and frames.
p. Door hardware.
q. Windows.
r. Glazing.
s. Metal studs.
t. Gypsum board.
u. Acoustical tile and panels.
v. Carpet.
w. Carpet pad.
x. Demountable partitions.
y. Equipment.
z. Cabinets.
aa. Plumbing fixtures.
bb. Piping.
cc. Supports and hangers.
dd. Valves.
ee. Sprinklers.
ff. Mechanical equipment.
gg. Refrigerants.
hh. Electrical conduit.
ii. Copper wiring.
jj. Lighting fixtures.
kk. Lamps.
ll. Ballasts.
mm. Electrical devices.
nn. Switchgear and panelboards.
oo. Transformers.

2. Construction Waste:

a. Masonry and CMU.
b. Lumber.
c. Wood sheet materials.
d. Wood trim.
e. Metals.
f. Roofing.
g. Insulation.
h. Carpet and pad.
i. Gypsum board.
j. Piping.
k. Electrical conduit.
l. Packaging: Regardless of salvage/recycle goal indicated in "General" Paragraph above, salvage or recycle 100 percent of the following uncontaminated packaging materials:

1) Paper.
2) Cardboard.
3) Boxes.
4) Plastic sheet and film.
5) Polystyrene packaging.
6) Wood crates.
7) Wood pallets.
8) Plastic pails.

m. Construction Office Waste: Regardless of salvage/recycle goal indicated in "General" Paragraph above, salvage or recycle 100 percent of the following construction office waste materials:

1) Paper.
2) Aluminum cans.
3) Glass containers.

PART 3 - EXECUTION

3.1 PLAN IMPLEMENTATION

A. General: Implement approved waste management plan. Provide handling, containers, storage, signage, transportation, and other items as required to implement waste management plan during the entire duration of the Contract.

1. Comply with operation, termination, and removal requirements in Section 01 50 00 "Temporary Facilities and Controls."

B. Training: Train workers, subcontractors, and suppliers on proper waste management procedures, as appropriate for the Work.

1. Distribute waste management plan to everyone concerned within three days of submittal return.
2. Distribute waste management plan to entities when they first begin work on-site. Review plan procedures and locations established for salvage, recycling, and disposal.

C. Site Access and Temporary Controls: Conduct waste management operations to ensure minimum interference with roads, streets, walks, walkways, and other adjacent occupied and used facilities.

1. Designate and label specific areas on Project site necessary for separating materials that are to be salvaged and recycled.
2. Comply with Section 01 50 00 "Temporary Facilities and Controls" for controlling dust and dirt, environmental protection, and noise control.

D. Waste Management in Historic Zones or Areas: Transportation equipment and other materials shall be of sizes that clear surfaces within historic spaces, areas, rooms, and openings, by 12 inches (300 mm) or more.

3.2 SALVAGING DEMOLITION WASTE

A. Comply with requirements in Section 02 41 16 Demolition for salvaging demolition waste.

B. Salvaged Items for Reuse in the Work: Salvage items for reuse and handle as follows:

1. Clean salvaged items.
2. Pack or crate items after cleaning. Identify contents of containers with label indicating elements, date of removal, quantity, and location where removed.
3. Store items in a secure area until installation.
4. Protect items from damage during transport and storage.
5. Install salvaged items to comply with installation requirements for new materials and equipment. Provide connections, supports, and miscellaneous materials necessary to make items functional for use indicated.

C. Salvaged Items for Sale and Donation: Not permitted on Project site.

D. Salvaged Items for Owner's Use: Salvage items for Owner's use and handle as follows:

1. Clean salvaged items.
2. Pack or crate items after cleaning. Identify contents of containers with label indicating elements, date of removal, quantity, and location where removed.
3. Store items in a secure area until delivery to Owner.
4. Transport items to Owner's storage area designated by Owner.
5. Protect items from damage during transport and storage.

E. Doors and Hardware: Brace open end of door frames. Except for removing door closers, leave door hardware attached to doors.

F. Equipment: Drain tanks, piping, and fixtures. Seal openings with caps or plugs. Protect equipment from exposure to weather.

G. Plumbing Fixtures: Separate by type and size.

H. Lighting Fixtures: Separate lamps by type and protect from breakage.

I. Electrical Devices: Separate switches, receptacles, switchgear, transformers, meters, panelboards, circuit breakers, and other devices by type.

3.3 RECYCLING DEMOLITION AND CONSTRUCTION WASTE, GENERAL

A. General: Recycle paper and beverage containers used by on-site workers.

B. Recycling Incentives: Revenues, savings, rebates, tax credits, and other incentives received for recycling waste materials shall be shared equally by Owner and Contractor.

C. Preparation of Waste: Prepare and maintain recyclable waste materials according to recycling or reuse facility requirements. Maintain materials free of dirt, adhesives, solvents, petroleum contamination, and other substances deleterious to the recycling process.

D. Procedures: Separate recyclable waste from other waste materials, trash, and debris. Separate recyclable waste by type at Project site to the maximum extent practical according to approved construction waste management plan.

1. Provide appropriately marked containers or bins for controlling recyclable waste until removed from Project site. Include list of acceptable and unacceptable materials at each container and bin.

a. Inspect containers and bins for contamination and remove contaminated materials if found.

2. Stockpile processed materials on-site without intermixing with other materials. Place, grade, and shape stockpiles to drain surface water. Cover to prevent windblown dust.
3. Stockpile materials away from construction area. Do not store within drip line of remaining trees.
4. Store components off the ground and protect from the weather.
5. Remove recyclable waste from Owner's property and transport to recycling receiver or processor as often as required to prevent overfilling bins.

3.4 RECYCLING DEMOLITION WASTE

A. Asphalt Paving: Grind asphalt to maximum 1-1/2-inch (38-mm) size.

1. Crush asphaltic concrete paving and screen to comply with requirements in Section 31 23 13 "Earth Moving" for use as general fill.

B. Asphalt Paving: Break up and transport paving to asphalt-recycling facility.

C. Concrete: Remove reinforcement and other metals from concrete and sort with other metals.
1. Crush concrete and screen to comply with requirements in Section 31 23 13 "Earth Moving" for use as satisfactory soil for fill or subbase.

D. Masonry: Remove metal reinforcement, anchors, and ties from masonry and sort with other metals.

1. Clean and stack undamaged, whole masonry units on wood pallets.

E. Wood Materials: Sort and stack members according to size, type, and length. Separate lumber, engineered wood products, panel products, and treated wood materials.

F. Metals: Separate metals by type.

1. Structural Steel: Stack members according to size, type of member, and length.
2. Remove and dispose of bolts, nuts, washers, and other rough hardware.

G. Gypsum Board: Stack large clean pieces on wood pallets or in container and store in a dry location. Remove edge trim and sort with other metals. Remove and dispose of fasteners.

H. Acoustical Ceiling Panels and Tile: Stack large clean pieces on wood pallets and store in a dry location.

I. Metal Suspension System: Separate metal members, including trim and other metals from acoustical panels and tile, and sort with other metals.

J. Carpet : Roll large pieces tightly after removing debris, trash, adhesive, and tack strips.

1. Store clean, dry carpet in a closed container or trailer provided by carpet reclamation agency or carpet recycler.

K. Carpet Tile: Remove debris, trash, and adhesive.

1. Stack tile on pallet and store clean, dry carpet in a closed container or trailer provided by carpet reclamation agency or carpet recycler.

L. Piping: Reduce piping to straight lengths and store by material and size. Separate supports, hangers, valves, sprinklers, and other components by material and size.

M. Conduit: Reduce conduit to straight lengths and store by material and size.

N. Lamps: Separate lamps by type and store according to requirements in 40 CFR 273.

3.5 DISPOSAL OF WASTE

A. General: Except for items or materials to be salvaged or recycled, remove waste materials from Project site and legally dispose of them in a landfill or incinerator acceptable to authorities having jurisdiction comply with applicable Local Agency Construction and Demolition (C&D) Waste Recycling ordinance, and with California Code of Regulations, Title 24, Part11 California Green Building Standards Code, “CAL-Green” 5.408.

B. Comply with City of Los Angeles Citywide Construction and Demolition (C&D) Waste Recycling Ordinance.
   1. All mixed C&D waste generated within City limits is required to be taken to City-certified C&D waste processors.
   2. All Haulers responsible for handling C&D waste must obtain a Private Solid Waste Hauler Permit from City of Los Angeles Bureau of Sanitation prior to collecting, hauling and transporting C&D waste.

C. Recycling Receivers and Processors:
   1. Obtain forms necessary to apply for a Waste Haulter Permit, or a list of City Permitted Waste Haulers, or a current list of City Certified Processing Facilities from the City of Los Angeles Bureau of Sanitation.
      a. C&D Recycling Coordinator (212)485-2260.
         www.lacitysan.or/solid_Resources/recycling.c&d.htm.

D. Burning: Do not burn waste materials.

END OF SECTION

SECTION 01 77 00 - CLOSEOUT PROCEDURES

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes administrative and procedural requirements for Contract closeout, including, but not limited to, the following:

1. Substantial Completion procedures.
2. Final completion procedures.
3. List of incomplete items.
4. Submittal of Project warranties.
5. Final cleaning.
6. Repair of the Work.

1.2 DEFINITIONS

A. List of Incomplete Items: Contractor-prepared list of items to be completed or corrected, prepared for the Architect's use prior to Architect's inspection, to determine if the Work is substantially complete.

B. Substantial Completion: The stage in the progress of the Work when the Work or designated portion is sufficiently complete in accordance with the Contract Documents so that the Owner can occupy or utilize the Work for its intended use and when only minor items can be corrected or completed without any material interference with the Owner's use of the work remaining to be corrected or completed.

1. When the Contractor considers that the Work, or a portion which the Owner agrees to accept separately, is substantially complete, the Contractor shall prepare and submit to the Architect a comprehensive list of items to be completed or corrected prior to final payment. Failure to include an item on such list does not alter the responsibility of the Contractor to complete all Work in accordance with the Contract Documents.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of cleaning agent.

B. Contractor's List of Incomplete Items: Initial submittal at Substantial Completion.

C. Certified List of Incomplete Items: Final submittal at Final Completion.

1.4 CLOSEOUT SUBMITTALS

A. Certificates of Release: From authorities having jurisdiction.

B. Certificate of Insurance: For continuing coverage.

C. Field Report: For pest-control inspection.

1.5 MAINTENANCE MATERIAL SUBMITTALS

A. Schedule of Maintenance Material Items: For maintenance material submittal items required by other Sections.

1.6 SUBSTANTIAL COMPLETION PROCEDURES

A. Submit a written request for inspection to determine Substantial Completion a minimum of 10 days prior to date the Work will be completed and ready for final inspection and tests. Include with the request the following:

1. Contractor's List of Incomplete Items: Prepare and submit a list of items to be completed and corrected (Contractor's "punch list"), indicating the value of each item on the list and reasons why the Work is incomplete.
2. Submittals Prior to Substantial Completion: Complete the following a minimum of days prior to requesting inspection for determining date of Substantial Completion. List items below that are incomplete at time of request.

a. Certificates of Release: Obtain and submit releases from authorities having jurisdiction, permitting Owner unrestricted use of the Work and access to services and utilities. Include occupancy permits, operating certificates, and similar releases.
b. Submit closeout submittals specified in other Division 01 Sections, including Project Record Documents, operation and maintenance manuals, damage or settlement surveys, property surveys, and similar final record information.
c. Submit closeout submittals specified in individual Sections, including specific warranties, workmanship bonds, maintenance service agreements, final certifications, and similar documents.
d. Deliver certificates of inspection confirming compliance with applicable codes and regulations for the following:

1) Elevators.
2) Plumbing and drainage.
3) Heating, ventilating and air conditioning.
4) Fire protection.
5) Electrical.

e. Submit maintenance material submittals specified in individual Sections, including tools, spare parts, extra materials, and similar items, and deliver to location designated by Architect. Label with manufacturer's name and model number.

1) Schedule of Maintenance Material Items: Prepare and submit schedule of maintenance material submittal items, including name and quantity of each item and name and number of related Specification Section. Obtain Architect's signature for receipt of submittals.

f. Submit testing, adjusting, and balancing records.
g. Submit changeover information related to Owner's occupancy, use, operation, and maintenance.

B. Procedures Prior to Substantial Completion: Complete the following a minimum of 10 days prior to requesting inspection for determining date of Substantial Completion. List items below that are incomplete at time of request.

1. Advise Owner of pending insurance changeover requirements.
2. Make final changeover of permanent locks and deliver keys to Owner. Advise Owner's personnel of changeover in security provisions.

3. Complete startup and testing of systems and equipment.
4. Perform preventive maintenance on equipment used prior to Substantial Completion.
5. Instruct Owner's personnel in operation, adjustment, and maintenance of products, equipment, and systems. Submit demonstration and training video recordings specified in Section 01 79 00 "Demonstration and Training."
6. Advise Owner of changeover in utility services.
7. Participate with Owner in conducting inspection and walkthrough with local emergency responders.
8. Terminate and remove temporary facilities from Project site, along with mockups, construction tools, and similar elements.
9. Complete final cleaning requirements.
10. Touch up paint and otherwise repair and restore marred exposed finishes to eliminate visual defects.

C. Inspection: On receipt of written request for inspection, Architect will either proceed with inspection or notify Contractor of unfulfilled requirements. Architect will prepare the Certificate of Substantial Completion after inspection or will notify Contractor of items, either on Contractor's list or additional items identified by Architect, that must be completed or corrected before certificate will be issued.

1. Request reinspection when the Work identified in previous inspections as incomplete is completed or corrected.
2. Results of completed inspection will form the basis of requirements for Final Completion.

1.7 FINAL COMPLETION PROCEDURES

A. Submittals Prior to Final Completion: Before requesting final inspection for determining Final Completion, complete the following:

1. Submit a final Application for Payment in accordance with Section 01 29 00 "Payment Procedures."
2. Certified List of Incomplete Items: Submit certified copy of Architect's Substantial Completion inspection list of items to be completed or corrected (punch list), endorsed and dated by Architect. Certified copy of the list will state that each item has been completed or otherwise resolved for acceptance.
3. Certificate of Insurance: Submit evidence of final, continuing insurance coverage complying with insurance requirements.
4. Submit pest-control final inspection report.

B. Inspection: Submit a written request for final inspection to determine acceptance a minimum of 10 days prior to date the Work will be completed and ready for final inspection and tests. On receipt of request, Architect and Construction Manager will either proceed with inspection or notify Contractor of unfulfilled requirements. Architect will prepare a final Certificate for Payment after inspection or will notify Contractor of construction that must be completed or corrected before certificate will be issued.

1. Request reinspection when the Work identified in previous inspections as incomplete is completed or corrected.

1.8 LIST OF INCOMPLETE ITEMS

A. Organization of List: Include name and identification of each space and area affected by construction operations for incomplete items and items needing correction including, if necessary, areas disturbed by Contractor that are outside the limits of construction.

1. Organize list of spaces in sequential order, starting with exterior areas first and proceeding from lowest floor to highest floor listed by room or space number.
2. Organize items applying to each space by major element, including categories for ceilings, individual walls, floors, equipment, and building systems.
3. Include the following information at the top of each page:
    a. Project name.
    b. Date.
    c. Name of Architect.
    d. Name of Contractor.
    e. Page number.
4. Submit list of incomplete items in the following format:
    a. MS Excel Electronic File: Architect will return annotated file.

1.9 SUBMITTAL OF PROJECT WARRANTIES

A. Time of Submittal: Submit written warranties on request of Architect for designated portions of the Work where warranties are indicated to commence on dates other than date of Substantial Completion, or when delay in submittal of warranties might limit Owner's rights under warranty.

B. Partial Occupancy: Submit properly executed warranties within days of completion of designated portions of the Work that are completed and occupied or used by Owner during construction period by separate agreement with Contractor.

C. Organize warranty documents into an orderly sequence based on the table of contents of Project Manual.

D. Warranty Electronic File: Provide warranties and bonds in PDF format. Assemble complete warranty and bond submittal package into a single electronic PDF file with bookmarks enabling navigation to each item. Provide bookmarked table of contents at beginning of document.
    1. Submit on digital media acceptable to Architect.

E. Warranties in Paper Form:
    1. Bind warranties and bonds in heavy-duty, three-ring, vinyl-covered, loose-leaf binders, thickness as necessary to accommodate contents, and sized to receive 8-1/2-by-11-inch (215-by-280-mm) paper.
    2. Provide heavy paper dividers with plastic-covered tabs for each separate warranty. Mark tab to identify the product or installation. Provide a typed description of the product or installation, including the name of the product and the name, address, and telephone number of Installer.
    3. Identify each binder on the front and spine with the typed or printed title "WARRANTIES," Project name, and name of Contractor.

F. Provide additional copies of each warranty to include in operation and maintenance manuals.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Cleaning Agents: Use cleaning materials and agents recommended by manufacturer or fabricator of the surface to be cleaned. Do not use cleaning agents that are potentially hazardous to health or property or that might damage finished surfaces.

1. Use cleaning products that comply with Green Seal's GS-37, or if GS-37 is not applicable, use products that comply with the California Code of Regulations' maximum allowable VOC levels.

PART 3 - EXECUTION

3.1 FINAL CLEANING

A. General: Perform final cleaning. Conduct cleaning and waste-removal operations to comply with local laws and ordinances and Federal and local environmental and antipollution regulations.

B. Cleaning: Employ experienced workers or professional cleaners for final cleaning. Clean each surface or unit to condition expected in an average commercial building cleaning and maintenance program. Comply with manufacturer's written instructions.

1. Complete the following cleaning operations before requesting inspection for certification of Substantial Completion for entire Project or for a designated portion of Project:

a. Clean Project site of rubbish, waste material, litter, and other foreign substances.
b. Sweep paved areas broom clean. Remove petrochemical spills, stains, and other foreign deposits.
c. Rake grounds that are not planted, mulched, or paved to a smooth, even-textured surface.
d. Remove tools, construction equipment, machinery, and surplus material from Project site.
e. Clean exposed exterior and interior hard-surfaced finishes to a dirt-free condition, free of stains, films, and similar foreign substances. Avoid disturbing natural weathering of exterior surfaces. Restore reflective surfaces to their original condition.
f. Remove debris and surface dust from limited-access spaces, including roofs, plenums, shafts, trenches, equipment vaults, manholes, attics, and similar spaces.
g. Clean flooring, removing debris, dirt, and staining; clean in accordance with manufacturer's instructions.
h. Vacuum and mop concrete.
i. Vacuum carpet and similar soft surfaces, removing debris and excess nap; clean in accordance with manufacturer's instructions if visible soil or stains remain.
j. Clean transparent materials, including mirrors and glass in doors and windows. Remove glazing compounds and other noticeable, vision-obscuring materials. Polish mirrors and glass, taking care not to scratch surfaces.
k. Remove labels that are not permanent.

l. Touch up and otherwise repair and restore marred, exposed finishes and surfaces. Replace finishes and surfaces that cannot be satisfactorily repaired or restored or that already show evidence of repair or restoration.

1) Do not paint over "UL" and similar labels, including mechanical and electrical nameplates.

m. Wipe surfaces of mechanical and electrical equipment, elevator equipment, and similar equipment. Remove excess lubrication, paint and mortar droppings, and other foreign substances.

n. Clean plumbing fixtures to a sanitary condition, free of stains, including stains resulting from water exposure.

o. Replace disposable air filters and clean permanent air filters. Clean exposed surfaces of diffusers, registers, and grills.

p. Replace parts subject to unusual working conditions.

q. Clean ducts, blowers, and coils if units were operated without filters during construction or that display contamination with particulate matter on inspection.

r. Clean luminaires, lamps, globes, and reflectors to function with full efficiency.

s. Replace burned out bulbs, and those noticeably dimmed by hours of use. Comply with requirements for new fixtures.

t. Clean strainers.

u. Leave Project clean and ready for occupancy.

C. Pest Control: Comply with pest control requirements in Section 01 50 00 "Temporary Facilities and Controls." Prepare written report.

D. Comply with safety standards for cleaning. Do not burn waste materials. Do not bury debris or excess materials on Owner's property. Do not discharge volatile, harmful, or dangerous materials into drainage systems. Remove waste materials from Project site and dispose of lawfully.

E. Construction Waste Disposal: Comply with waste-disposal requirements in Section 01 74 19 Construction Waste Management and Disposal.

3.2 REPAIR OF THE WORK

A. Complete repair and restoration operations required by Section 01 73 00 "Execution" before requesting inspection for determination of Substantial Completion.

END OF SECTION

SECTION 01 78 23 - OPERATION AND MAINTENANCE DATA

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes administrative and procedural requirements for preparing operation and maintenance manuals, including the following:

1. Operation and maintenance documentation directory manuals.
2. Emergency manuals.
3. Systems and equipment operation manuals.
4. Systems and equipment maintenance manuals.
5. Product maintenance manuals.

1.2 DEFINITIONS

A. System: An organized collection of parts, equipment, or subsystems united by regular interaction.

B. Subsystem: A portion of a system with characteristics similar to a system.

1.3 CLOSEOUT SUBMITTALS

A. Manual Content Submittal: Submit operation and maintenance manuals indicated. Provide content for each manual as specified in individual Specification Sections, and as reviewed and approved at the time of Section submittals. Submit reviewed manual content formatted and organized as required by this Section.

1. Architect will comment on whether content of operation and maintenance submittals is acceptable.
2. Where applicable, clarify and update reviewed manual content to correspond to revisions and field conditions.

B. Format: Submit operation and maintenance manuals in the following format:

1. Submit on digital media acceptable to Architect. Enable reviewer comments on draft submittals.
2. Submit three paper copies. Architect will return two copies.

C. Initial Manual Submittal: Submit draft copy of each manual at least 30 days before commencing demonstration and training. Architect will comment on whether general scope and content of manual are acceptable.

D. Final Manual Submittal: Submit each manual in final form prior to requesting inspection for Substantial Completion and at least 15 days before commencing demonstration and training. Architect will return copy with comments.

1. Correct or revise each manual to comply with Architect's comments. Submit copies of each corrected manual within 15 days of receipt of Architect's comments and prior to commencing demonstration and training.

E. Comply with Section 01 77 00 "Closeout Procedures" for schedule for submitting operation and maintenance documentation.

1.4 COORDINATION

A. Where operation and maintenance documentation include information on installations by more than one factory-authorized service representative, assemble and coordinate information furnished by representatives and prepare manuals.

1.5 FORMAT OF OPERATION AND MAINTENANCE MANUALS

A. Manuals, Paper Copy: Submit manuals in the form of hard-copy, bound and labeled volumes.

1. Binders: Heavy-duty, three-ring, vinyl-covered, loose-leaf or post-type binders, in thickness necessary to accommodate contents, sized to hold 8-1/2-by-11-inch (215-by-280-mm) paper; with clear plastic sleeve on spine to hold label describing contents and with pockets inside covers to hold folded oversize sheets.

a. If two or more binders are necessary to accommodate data of a system, organize data in each binder into groupings by subsystem and related components. Cross-reference other binders if necessary to provide essential information for proper operation or maintenance of equipment or system.
b. Identify each binder on front and spine, with printed title "OPERATION AND MAINTENANCE MANUAL," Project title or name, and subject matter of contents, and indicate Specification Section number on bottom of spine. Indicate volume number for multiple-volume sets.

2. Dividers: Heavy-paper dividers with plastic-covered tabs for each section of the manual. Mark each tab to indicate contents. Include typed list of products and major components of equipment included in the section on each divider, cross-referenced to Specification Section number and title of Project Manual.
3. Protective Plastic Sleeves: Transparent plastic sleeves designed to enclose diagnostic software storage media for computerized electronic equipment. Enclose title pages and directories in clear plastic sleeves.
4. Supplementary Text: Prepared on 8-1/2-by-11-inch (215-by-280-mm) white bond paper.
5. Drawings: Attach reinforced, punched binder tabs on drawings and bind with text.

a. If oversize drawings are necessary, fold drawings to same size as text pages and use as foldouts.
b. If drawings are too large to be used as foldouts, fold and place drawings in labeled envelopes and bind envelopes in rear of manual. At appropriate locations in manual, insert typewritten pages indicating drawing titles, descriptions of contents, and drawing locations.

1.6 REQUIREMENTS FOR EMERGENCY, OPERATION, AND MAINTENANCE MANUALS

A. Organization of Manuals: Unless otherwise indicated, organize each manual into a separate section for each system and subsystem, and a separate section for each piece of equipment not part of a system. Each manual shall contain the following materials, in the order listed:

1. Title page.
2. Table of contents.
3. Manual contents.

B. Title Page: Include the following information:

1. Subject matter included in manual.
2. Name and address of Project.

3. Name and address of Owner.
4. Date of submittal.
5. Name and contact information for Contractor.
6. Name and contact information for Construction Manager.
7. Name and contact information for Architect.
8. Name and contact information for Commissioning Authority.
9. Names and contact information for major consultants to the Architect that designed the systems contained in the manuals.
10. Cross-reference to related systems in other operation and maintenance manuals.

C. Table of Contents: List each product included in manual, identified by product name, indexed to the content of the volume, and cross-referenced to Specification Section number in Project Manual.

1. If operation or maintenance documentation requires more than one volume to accommodate data, include comprehensive table of contents for all volumes in each volume of the set.

D. Manual Contents: Organize into sets of manageable size. Arrange contents alphabetically by system, subsystem, and equipment. If possible, assemble instructions for subsystems, equipment, and components of one system into a single binder.

E. Identification: In the documentation directory and in each operation and maintenance manual, identify each system, subsystem, and piece of equipment with same designation used in the Contract Documents. If no designation exists, assign a designation according to ASHRAE Guideline 4, "Preparation of Operating and Maintenance Documentation for Building Systems."

1.7 OPERATION AND MAINTENANCE DOCUMENTATION DIRECTORY MANUAL

A. Operation and Maintenance Documentation Directory: Prepare a separate manual that provides an organized reference to emergency, operation, and maintenance manuals. List items and their location to facilitate ready access to desired information. Include the following:

1. List of Systems and Subsystems: List systems alphabetically. Include references to operation and maintenance manuals that contain information about each system.
2. List of Equipment: List equipment for each system, organized alphabetically by system. For pieces of equipment not part of system, list alphabetically in separate list.
3. Tables of Contents: Include a table of contents for each emergency, operation, and maintenance manual.

1.8 EMERGENCY MANUALS

A. Emergency Manual: Assemble a complete set of emergency information indicating procedures for use by emergency personnel and by Owner's operating personnel for types of emergencies indicated.

B. Content: Organize manual into a separate section for each of the following:

1. Type of emergency.
2. Emergency instructions.
3. Emergency procedures.

C. Type of Emergency: Where applicable for each type of emergency indicated below, include instructions and procedures for each system, subsystem, piece of equipment, and component:

1. Fire.
2. Flood.
3. Gas leak.
4. Water leak.
5. Power failure.
6. Water outage.
7. System, subsystem, or equipment failure.
8. Chemical release or spill.

D. Emergency Instructions: Describe and explain warnings, trouble indications, error messages, and similar codes and signals. Include responsibilities of Owner's operating personnel for notification of Installer, supplier, and manufacturer to maintain warranties.

E. Emergency Procedures: Include the following, as applicable:

1. Instructions on stopping.
2. Shutdown instructions for each type of emergency.
3. Operating instructions for conditions outside normal operating limits.
4. Required sequences for electric or electronic systems.
5. Special operating instructions and procedures.

1.9 SYSTEMS AND EQUIPMENT OPERATION MANUALS

A. Systems and Equipment Operation Manual: Assemble a complete set of data indicating operation of each system, subsystem, and piece of equipment not part of a system. Include information required for daily operation and management, operating standards, and routine and special operating procedures.

1. Engage a factory-authorized service representative to assemble and prepare information for each system, subsystem, and piece of equipment not part of a system.
2. Prepare a separate manual for each system and subsystem, in the form of an instructional manual for use by Owner's operating personnel.

B. Content: In addition to requirements in this Section, include operation data required in individual Specification Sections and the following information:

1. System, subsystem, and equipment descriptions. Use designations for systems and equipment indicated on Contract Documents.
2. Performance and design criteria if Contractor has delegated design responsibility.
3. Operating standards.
4. Operating procedures.
5. Operating logs.
6. Wiring diagrams.
7. Control diagrams.
8. Piped system diagrams.
9. Precautions against improper use.
10. License requirements including inspection and renewal dates.

C. Descriptions: Include the following:

1. Product name and model number. Use designations for products indicated on Contract Documents.
2. Manufacturer's name.
3. Equipment identification with serial number of each component.
4. Equipment function.
5. Operating characteristics.

6. Limiting conditions.
7. Performance curves.
8. Engineering data and tests.
9. Complete nomenclature and number of replacement parts.

D. Operating Procedures: Include the following, as applicable:

1. Startup procedures.
2. Equipment or system break-in procedures.
3. Routine and normal operating instructions.
4. Regulation and control procedures.
5. Instructions on stopping.
6. Normal shutdown instructions.
7. Seasonal and weekend operating instructions.
8. Required sequences for electric or electronic systems.
9. Special operating instructions and procedures.

E. Systems and Equipment Controls: Describe the sequence of operation, and diagram controls as installed.

F. Piped Systems: Diagram piping as installed and identify color coding where required for identification.

1.10 SYSTEMS AND EQUIPMENT MAINTENANCE MANUALS

A. Systems and Equipment Maintenance Manuals: Assemble a complete set of data indicating maintenance of each system, subsystem, and piece of equipment not part of a system. Include manufacturers' maintenance documentation, preventive maintenance procedures and frequency, repair procedures, wiring and systems diagrams, lists of spare parts, and warranty information.

1. Engage a factory-authorized service representative to assemble and prepare information for each system, subsystem, and piece of equipment not part of a system.
2. Prepare a separate manual for each system and subsystem, in the form of an instructional manual for use by Owner's operating personnel.

B. Content: For each system, subsystem, and piece of equipment not part of a system, include source information, manufacturers' maintenance documentation, maintenance procedures, maintenance and service schedules, spare parts list and source information, maintenance service contracts, and warranties and bonds as described below.

C. Source Information: List each system, subsystem, and piece of equipment included in manual, identified by product name, and arranged to match manual's table of contents. For each product, list name, address, and telephone number of Installer or supplier and maintenance service agent, and cross-reference Specification Section number and title in Project Manual and drawing or schedule designation or identifier where applicable.

D. Manufacturers' Maintenance Documentation: Include the following information for each component part or piece of equipment:

1. Standard maintenance instructions and bulletins; include only sheets pertinent to product or component installed. Mark each sheet to identify each product or component incorporated into the Work. If data include more than one item in a tabular format, identify each item using appropriate references from the Contract Documents. Identify data applicable to the Work and delete references to information not applicable.

a. Prepare supplementary text if manufacturers' standard printed data are not available and where the information is necessary for proper operation and maintenance of equipment or systems.

2. Drawings, diagrams, and instructions required for maintenance, including disassembly and component removal, replacement, and assembly.
3. Identification and nomenclature of parts and components.
4. List of items recommended to be stocked as spare parts.

E. Maintenance Procedures: Include the following information and items that detail essential maintenance procedures:

1. Test and inspection instructions.
2. Troubleshooting guide.
3. Precautions against improper maintenance.
4. Disassembly; component removal, repair, and replacement; and reassembly instructions.
5. Aligning, adjusting, and checking instructions.
6. Demonstration and training video recording, if available.

F. Maintenance and Service Schedules: Include service and lubrication requirements, list of required lubricants for equipment, and separate schedules for preventive and routine maintenance and service with standard time allotment.

1. Scheduled Maintenance and Service: Tabulate actions for daily, weekly, monthly, quarterly, semiannual, and annual frequencies.
2. Maintenance and Service Record: Include manufacturers' forms for recording maintenance.

G. Spare Parts List and Source Information: Include lists of replacement and repair parts, with parts identified and cross-referenced to manufacturers' maintenance documentation and local sources of maintenance materials and related services.

H. Maintenance Service Contracts: Include copies of maintenance agreements with name and telephone number of service agent.

I. Warranties and Bonds: Include copies of warranties and bonds and lists of circumstances and conditions that would affect validity of warranties or bonds.

1. Include procedures to follow and required notifications for warranty claims.

J. Drawings: Prepare drawings supplementing manufacturers' printed data to illustrate the relationship of component parts of equipment and systems and to illustrate control sequence and flow diagrams. Coordinate these drawings with information contained in record Drawings to ensure correct illustration of completed installation.

1. Do not use original project record documents as part of maintenance manuals.

1.11 PRODUCT MAINTENANCE MANUALS

A. Product Maintenance Manual: Assemble a complete set of maintenance data indicating care and maintenance of each product, material, and finish incorporated into the Work.

B. Content: Organize manual into a separate section for each product, material, and finish. Include source information, product information, maintenance procedures, repair materials and sources, and warranties and bonds, as described below.

C. Source Information: List each product included in manual, identified by product name, and arranged to match manual's table of contents. For each product, list name, address, and telephone number of Installer or supplier and maintenance service agent, and cross-reference Specification Section number and title in Project Manual and drawing or schedule designation or identifier where applicable.

D. Product Information: Include the following, as applicable:

1. Product name and model number.
2. Manufacturer's name.
3. Color, pattern, and texture.
4. Material and chemical composition.
5. Reordering information for specially manufactured products.

E. Maintenance Procedures: Include manufacturer's written recommendations and the following:

1. Inspection procedures.
2. Types of cleaning agents to be used and methods of cleaning.
3. List of cleaning agents and methods of cleaning detrimental to product.
4. Schedule for routine cleaning and maintenance.
5. Repair instructions.

F. Repair Materials and Sources: Include lists of materials and local sources of materials and related services.

G. Warranties and Bonds: Include copies of warranties and bonds and lists of circumstances and conditions that would affect validity of warranties or bonds.

1. Include procedures to follow and required notifications for warranty claims.

PART 2 - PRODUCTS (NOT USED)

PART 3 - EXECUTION (NOT USED)

END OF SECTION

SECTION 01 78 39 - PROJECT RECORD DOCUMENTS

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes administrative and procedural requirements for Project Record Documents, including the following:

1. Record Job Set Drawings.
2. As-Constructed Record Drawings.
3. As-Constructed Record Digital Data Files.
4. Record Job Specifications.
5. As-Constructed Record Specifications.
6. Record Product Data.
7. Miscellaneous Record Submittals.

1.2 DEFINITIONS

A. As-Designed Record Document: Record document which may include revisions to issued contract documents, reflecting significant changes in the Work made during construction.

B. As-Constructed Record Document: Record document which may include revisions to issued contract documents, reflecting significant changes in the Work made during construction, which are based on data furnished by the contractor or other parties, engineers, or their consultants.

1.3 CLOSEOUT SUBMITTALS

A. Record Job Set Drawings:

1. Submit scanned PDF electronic file(s) of marked-up paper copy.
2. Submit one set(s) of prints.

B. As-Constructed Record Drawings: Comply with the following:

1. Initial Submittal:

a. Submit Annotated PDF electronic file.
b. Architect will indicate whether general scope of documentation, additional information required, and quality of documentation are acceptable.

2. Final Submittal:

a. Submit Annotated PDF electronic file and set(s) of plots.
b. Plot each drawing file, whether or not changes and additional information were recorded.

C. As-Constructed Record Digital Data Files: In coordination with As-Constructed Record Drawings provide files as outlined corresponding with PDF sheets. Submit in the following formats:

1. Native model authoring software.

2. buildingSMART IFC.

D. Record Job Specifications:

1. Submit annotated PDF electronic files.
2. Submit one printed set(s).

E. As-Constructed Record Specifications:

1. Submit annotated PDF electronic files.
2. Submit one printed set(s).

F. Record Product Data:

1. Submit annotated PDF electronic files.
2. Submit one printed set(s).
3. Where record Product Data are required as part of operation and maintenance manuals, submit duplicate marked-up Product Data as a component of manual.

G. Miscellaneous Record Submittals: See other Specification Sections for miscellaneous record-keeping requirements and submittals in connection with various construction activities.

1. Submit annotated PDF electronic files.
2. Submit one printed set(s).

H. Reports: Submit written report weekly indicating items incorporated into Project Record Documents concurrent with progress of the Work, including revisions, concealed conditions, field changes, product selections, and other notations incorporated.

1.4 RECORD DRAWINGS

A. Record Job Set Drawings: Maintain one set of marked-up paper copies of the Contract Drawings and Shop Drawings, incorporating new and revised drawings as modifications are issued.

1. Preparation: Mark record prints to show the actual installation, where installation varies from that shown originally. Require individual or entity who obtained record data, whether individual or entity is Installer, subcontractor, or similar entity, to provide information for preparation of corresponding marked-up record prints.

a. Give particular attention to information on concealed elements that would be difficult to identify or measure and record later.
b. Accurately record information in an acceptable drawing technique.
c. Record data as soon as possible after obtaining it.
d. Record and check the markup before enclosing concealed installations.
e. Cross-reference record prints to corresponding photographic documentation.

2. Content: Types of items requiring marking include, but are not limited to, the following:

a. Dimensional changes to Drawings.
b. Revisions to details shown on Drawings.
c. Depths of foundations.
d. Locations and depths of underground utilities.
e. Revisions to routing of piping and conduits.
f. Revisions to electrical circuitry.

g. Actual equipment locations.
h. Duct size and routing.
i. Locations of concealed internal utilities.
j. Changes made by Change Order or Construction Change Directive.
k. Changes made following Architect's written orders.
l. Details not on the original Contract Drawings.
m. Field records for variable and concealed conditions.
n. Record information on the Work that is shown only schematically.

3. Mark the Contract Drawings and Shop Drawings completely and accurately. Use personnel proficient at recording graphic information in production of marked-up record prints.
4. Mark record prints with erasable, red-colored pencil. Use other colors to distinguish between changes for different categories of the Work at same location.
5. Mark important additional information that was either shown schematically or omitted from original Drawings.
6. Note Construction Change Directive numbers, alternate numbers, Change Order numbers, and similar identification, where applicable.
7. Organize record prints into manageable sets.

a. Prints: Bind each set with durable paper cover sheets. Include identification on cover sheets.
b. Scanned PDF: Bookmarked by discipline and sheet, compiled to align with originally issued documents.

B. As-Constructed Record Drawings: Identify and date each As-Constructed Record Drawing; include the designation "AS- CONSTRUCTED PROJECT RECORD DRAWING" in a prominent location.

1. Architect will furnish Contractor via Owner digital data files of the As-Designed Record Documents for use in preparation of the As-Constructed Record Drawings.

a. See Section 01 31 00 "Project Management and Coordination" for requirements related to use of Architect's digital data files.

C. As-Constructed Record Digital Data Files: Immediately before inspection for Certificate of Substantial Completion, review marked-up record prints with Architect. When authorized, prepare a full set of corrected digital data files of the Contract Drawings, as follows:

1. Incorporate changes and additional information previously marked on record prints. Delete, redraw, and add details and notations where applicable.
2. Refer instances of uncertainty to Architect for resolution.
3. Architect will furnish Contractor via Owner digital data files of the As-Designed Record Documents for use in preparation of the As-Constructed Digital Data Files.

a. See Section 01 31 00 "Project Management and Coordination" for requirements related to use of Architect's digital data files.
b. Architect will provide data file layer information. Record markups in separate layers.
c. Record three-dimensional model with elements developed to LOD 500.

4. Organize digital data information into separate electronic files that correspond to each sheet of the Contract Drawings. Name each file with the sheet identification. Include identification in each digital data file.
5. Identification:

a. Project name.
b. Date.

c. Designation "AS-CONSTRUCTED PROJECT RECORD DRAWING."
d. Name of Architect.
e. Name of Contractor.

1.5 RECORD SPECIFICATIONS

A. Record Job Specifications: Maintain one set of marked-up paper copies of the Project Manual, incorporating new and revised specifications as modifications are issued.

1. Preparation: Mark Specifications to indicate the actual product installation, where installation varies from that indicated in Specifications, addenda, and Contract modifications.

a. Give particular attention to information on concealed products and installations that cannot be readily identified and recorded later.
b. Mark copy with the proprietary name and model number of products, materials, and equipment furnished, including substitutions and product options selected.
c. Record the name of manufacturer, supplier, Installer, and other information necessary to provide a record of selections made.
d. For each principal product, indicate whether Record Product Data has been submitted in operation and maintenance manuals instead of submitted as Record Product Data.
e. Note related Change Orders and Record Drawings where applicable.

B. As-Constructed Record Specifications: Identify and date each Specification; include the designation "AS-CONSTRUCTED PROJECT RECORD SPECIFICATION" in a prominent location.

1.6 RECORD PRODUCT DATA

A. Recording: Maintain one copy of each submittal during the construction period for Project Record Document purposes. Post changes and revisions to Project Record Documents as they occur; do not wait until end of Project.

B. Preparation: Mark Product Data to indicate the actual product installation where installation varies substantially from that indicated in Product Data submittal.

1. Give particular attention to information on concealed products and installations that cannot be readily identified and recorded later.
2. Include significant changes in the product delivered to Project site and changes in manufacturer's written instructions for installation.
3. Note related Change Orders, Record Specifications, and Record Drawings where applicable.
4. Include Record Product Data directory organized by Specification Section number and title, electronically linked to each item of Record Product Data.

1.7 MISCELLANEOUS RECORD SUBMITTALS

A. Assemble miscellaneous records required by other Specification Sections for miscellaneous record keeping and submittal in connection with actual performance of the Work. Bind or file miscellaneous records and identify each, ready for continued use and reference.

B. Include miscellaneous record submittals directory organized by Specification Section number and title, electronically linked to each item of miscellaneous record submittals.

1.8 MAINTENANCE OF RECORD DOCUMENTS

A. Maintenance of Record Documents: Store Record Documents in the field office apart from the Contract Documents used for construction. Do not use Project Record Documents for construction purposes. Maintain Record Documents in good order and in a clean, dry, legible condition, protected from deterioration and loss. Provide access to Project Record Documents for Architect's reference during normal working hours.

PART 2 - PRODUCTS (NOT USED)

PART 3 - EXECUTION (NOT USED)

END OF SECTION

SECTION 01 79 00 - DEMONSTRATION AND TRAINING

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes administrative and procedural requirements for instructing Owner's personnel, including the following:

1. Demonstration of and instruction in the operation and maintenance of systems, subsystems, and equipment.

1.2 INFORMATIONAL SUBMITTALS

A. Instruction Program: Submit outline of instructional program for demonstration and training, including a list of training modules and a schedule of proposed dates, times, length of instruction time, and instructors' names for each training module. Include learning objective and outline for each training module.

1. Indicate proposed training modules using manufacturer-produced demonstration and training video recordings for systems, equipment, and products in lieu of video recording of live instructional module.

B. Qualification Data: For facilitator, instructor, videographer.

C. Attendance Record: For each training module, submit list of participants and length of instruction time.

D. Evaluations: For each participant and for each training module, submit results and documentation of performance-based test.

1.3 CLOSEOUT SUBMITTALS

A. Demonstration and Training Video Recordings: Submit copies within seven days of end of each training module.

1. Identification: On each copy, provide an applied label with the following information:

a. Name of Project.
b. Name and address of videographer.
c. Name of Architect.
d. Name of Construction Manager.
e. Name of Contractor.
f. Date of video recording.

2. Transcript: Prepared and bound in format matching operation and maintenance manuals. Mark appropriate identification on front and spine of each binder. Include a cover sheet with same label information as the corresponding video recording. Include name of Project and date of video recording on each page.
3. Transcript: Prepared in PDF electronic format. Include a cover sheet with same label information as the corresponding video recording and a table of contents with links to corresponding training components. Include name of Project and date of video recording on each page.

4. At completion of training, submit complete training manual(s) for Owner's use prepared in same PDF electronic file format on portable storage device required for operation and maintenance manuals specified in Section 01 78 23 "Operation and Maintenance Data."

1.4 QUALITY ASSURANCE

A. Facilitator Qualifications: A firm or individual experienced in training or educating maintenance personnel in a training program similar in content and extent to that indicated for this Project, and whose work has resulted in training or education with a record of successful learning performance.

B. Instructor Qualifications: A factory-authorized service representative, complying with requirements in Section 01 40 00 "Quality Requirements," experienced in operation and maintenance procedures and training.

C. Videographer Qualifications: A professional videographer who is experienced photographing demonstration and training events similar to those required.

D. Preinstruction Conference: Conduct conference at Project site to comply with requirements in Section 01 31 00 "Project Management and Coordination." Review methods and procedures related to demonstration and training including, but not limited to, the following:
1. Review and finalize instruction schedule and verify availability of educational materials, instructors' personnel, audiovisual equipment, and facilities needed to avoid delays.
2. Review required content of instruction.
3. For instruction that must occur outside, review weather and forecasted weather conditions and procedures to follow if conditions are unfavorable.

1.5 COORDINATION

A. Coordinate instruction schedule with Owner's operations. Adjust schedule as required to minimize disrupting Owner's operations and to ensure availability of Owner's personnel.

B. Coordinate instructors, including providing notification of dates, times, length of instruction time, and course content.

C. Coordinate content of training modules with content of approved emergency, operation, and maintenance manuals. Do not submit instruction program until operation and maintenance data have been reviewed and approved by Architect.

PART 2 - PRODUCTS

2.1 INSTRUCTION PROGRAM

A. Program Structure: Develop an instruction program that includes individual training modules for each system and for equipment not part of a system, as required by individual Specification Sections.

B. Training Modules: Develop a learning objective and teaching outline for each module. Include a description of specific skills and knowledge that participant is expected to master.

For each module, include instruction for the following as applicable to the system, equipment, or component:

1. Basis of System Design, Operational Requirements, and Criteria: Include the following:

    a. System, subsystem, and equipment descriptions.
    b. Performance and design criteria if Contractor is delegated design responsibility.
    c. Operating standards.
    d. Regulatory requirements.
    e. Equipment function.
    f. Operating characteristics.
    g. Limiting conditions.
    h. Performance curves.

2. Documentation: Review the following items in detail:

    a. Emergency manuals.
    b. Systems and equipment operation manuals.
    c. Systems and equipment maintenance manuals.
    d. Product maintenance manuals.
    e. Project Record Documents.
    f. Identification systems.
    g. Warranties and bonds.
    h. Maintenance service agreements and similar continuing commitments.

3. Emergencies: Include the following, as applicable:

    a. Instructions on meaning of warnings, trouble indications, and error messages.
    b. Instructions on stopping.
    c. Shutdown instructions for each type of emergency.
    d. Operating instructions for conditions outside of normal operating limits.
    e. Sequences for electric or electronic systems.
    f. Special operating instructions and procedures.

4. Operations: Include the following, as applicable:

    a. Startup procedures.
    b. Equipment or system break-in procedures.
    c. Routine and normal operating instructions.
    d. Regulation and control procedures.
    e. Control sequences.
    f. Safety procedures.
    g. Instructions on stopping.
    h. Normal shutdown instructions.
    i. Operating procedures for emergencies.
    j. Operating procedures for system, subsystem, or equipment failure.
    k. Seasonal and weekend operating instructions.
    l. Required sequences for electric or electronic systems.
    m. Special operating instructions and procedures.

5. Adjustments: Include the following:

    a. Alignments.
    b. Checking adjustments.
    c. Noise and vibration adjustments.
    d. Economy and efficiency adjustments.

6. Troubleshooting: Include the following:
    a. Diagnostic instructions.
    b. Test and inspection procedures.
7. Maintenance: Include the following:
    a. Inspection procedures.
    b. Types of cleaning agents to be used and methods of cleaning.
    c. List of cleaning agents and methods of cleaning detrimental to product.
    d. Procedures for routine cleaning.
    e. Procedures for preventive maintenance.
    f. Procedures for routine maintenance.
    g. Instruction on use of special tools.
8. Repairs: Include the following:
    a. Diagnosis instructions.
    b. Repair instructions.
    c. Disassembly; component removal, repair, and replacement; and reassembly instructions.
    d. Instructions for identifying parts and components.
    e. Review of spare parts needed for operation and maintenance.

PART 3 - EXECUTION

3.1 PREPARATION

A. Assemble educational materials necessary for instruction, including documentation and training module. Assemble training modules into a training manual organized in coordination with requirements in Section 01 78 23 "Operation and Maintenance Data."

B. Set up instructional equipment at instruction location.

3.2 INSTRUCTION

A. Facilitator: Engage a qualified facilitator to prepare instruction program and training modules, to coordinate instructors, and to coordinate between Contractor and Owner for number of participants, instruction times, and location.

B. Engage qualified instructors to instruct Owner's personnel to adjust, operate, and maintain systems, subsystems, and equipment not part of a system.
    1. Architect will furnish an instructor to describe basis of system design, operational requirements, criteria, and regulatory requirements.
    2. Owner will furnish Contractor with names and positions of participants.

C. Scheduling: Provide instruction at mutually agreed-on times. For equipment that requires seasonal operation, provide similar instruction at start of each season.
    1. Schedule training with Owner with at least seven days' advance notice.

D. Training Location and Reference Material: Conduct training on-site in the completed and fully operational facility using the actual equipment in-place. Conduct training using final operation and maintenance data submittals.

E. Evaluation: At conclusion of each training module, assess and document each participant's mastery of module by use of a demonstration performance-based test.

F. Cleanup: Collect used and leftover educational materials and. Remove instructional equipment. Restore systems and equipment to condition existing before initial training use.

3.3 DEMONSTRATION AND TRAINING VIDEO RECORDINGS

A. General: Engage a qualified commercial videographer to record demonstration and training video recordings. Record each training module separately. Include classroom instructions and demonstrations, board diagrams, and other visual aids, but not student practice.

1. At beginning of each training module, record each chart containing learning objective and lesson outline.

B. Digital Video Recordings: Provide high-resolution, digital video in MPEG format, produced by a digital camera with minimum sensor resolution of 12 megapixels and capable of recording in full HD mode.

1. Submit video recordings on thumb drive or electronic media storage acceptable to owner.
2. File Hierarchy: Organize folder structure and file locations according to Project Manual table of contents. Provide complete screen-based menu.
3. File Names: Utilize file names based on name of equipment generally described in video segment, as identified in Project specifications.
4. Contractor and Installer Contact File: Using appropriate software, create a file for inclusion on the equipment demonstration and training recording that describes the following for each Contractor involved on the Project, arranged according to Project Manual table of contents:

a. Name of Contractor/Installer.
b. Business address.
c. Business phone number.
d. Point of contact.
e. Email address.

C. Recording: Mount camera on tripod before starting recording, unless otherwise necessary to adequately cover area of demonstration and training. Display continuous running time.

1. Film training session(s) in segments not to exceed 15 minutes.

a. Produce segments to present a single significant piece of equipment per segment.
b. Where a training session on a particular piece of equipment exceeds 15 minutes, stop filming and pause training session. Begin training session again upon commencement of new filming segment.

D. Light Levels: Verify light levels are adequate to properly light equipment. Verify equipment markings are clearly visible prior to recording.

1. Furnish additional portable lighting as required.

E. Narration: Describe scenes on video recording by audio narration by microphone while or by dubbing audio narration off-site after video recording is recorded. Include description of items being viewed.

F. Transcript: Provide a transcript of the narration. Display images and running time captured from videotape opposite the corresponding narration segment.

G. Preproduced Video Recordings: Provide video recordings used as a component of training modules in same format as recordings of live training.

END OF SECTION

SECTION 01 81 13.71 - SUSTAINABLE DESIGN REQUIREMENTS - CALGREEN NON-RESIDENTIAL MANDATORY

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes: General requirements and procedures for compliance with and certification from 24 CCR 11 (hereafter, "CALGreen").

1. Some CALGreen requirements depend on product selections and may not be specifically identified as CALGreen requirements. Compliance with CALGreen requirements may be used as one criterion to evaluate substitution requests and comparable product requests.
2. Copies of CALGreen project checklists are attached at the end of this Section for information only. The checklists are for Mandatory Measures, with additional available for the voluntary CALGreen Tier 1 and Tier 2 levels of certification.

    a. Some CALGreen requirements depend on Architect's design and other aspects of Project that are not part of the Work of the Contract.

1.2 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site. Review CALGreen requirements and action plans for compliance with requirements. Also, reference Section 01 31 00 "Project Management and Coordination" for further information.

1.3 ADMINISTRATIVE REQUIREMENTS

A. Submit documentation to enforcing agency for credits that are the responsibility of Contractor, that depend on product selection or product qualities, or that depend on Contractor's procedures until enforcing agency has made its determination on Project's CALGreen certification application.

1. Document correspondence with review team, as assigned by the enforcing agency, as informational submittals.

B. Environmental Management System: Document the following:

1. Environmental policy.
2. Regulatory compliance and training.
3. Environmental risk assessment that shows sensitive environmental areas and ranks potential risks that may arise from the construction.
4. Environmental risk management strategies.
5. Environmental management roles, responsibilities, and reporting structure for the construction phase.
6. Site and work instructions for site personnel, outlining environmental procedures during construction.
7. Environmental inspection checklists.
8. Records of compliance.

1.4 ACTION SUBMITTALS

A. General: Submit additional sustainable design submittals required by other Specification Sections.

B. Sustainable design submittals are in addition to other submittals.

1. If submitted item is identical to that submitted to comply with other requirements, include an additional copy with other submittal as a record copy of compliance with indicated CALGreen requirements instead of separate sustainable design submittal. Mark additional copy "Sustainable Design Submittal."

C. Sustainable Design Documentation Submittals:

1. Stormwater pollution prevention plan.
2. Product data for irrigation system components, including, but not limited to, the following:

a. Sprinkler Heads: Indicate degree of head rotation and spray characteristics/pattern.
b. Controllers and sensors.

3. Product data and schedules for plumbing fixtures and fittings. Include rated capacities and WaterSense certification where applicable.
4. Product data for residential appliances, indicating that products are Energy Star rated.
5. Environmental management system documents.
6. Lighting controls.
7. Environmental product declarations.
8. Third-party certifications based on multiple-attribute standards.
9. Third-party-certified life-cycle product assessments.
10. Product data, manufacturer’s certifications, chain-of-custody certification, or other documentation acceptable to authorities having jurisdiction; for products containing composite wood, agrifiber products, or wood glues, indicate compliance with California Air Resource Board's "Airborne Toxic Control Measure to Reduce Formaldehyde Missions from Composite Wood."
11. Construction waste management plan complying with Section 01 74 19 "Construction Waste Management and Disposal."
12. Product data and laboratory test reports for adhesives and sealants indicating VOC content and compliance with requirements for low-emitting materials.
13. Certificates for carpet and undercarpet adhesives indicating compliance with Carpet and Rug Institute’s Green Label Plus testing program.
14. Product data and laboratory test reports for paints and coatings indicating VOC content and compliance with requirements for low-emitting materials.
15. Laboratory test reports for hard flooring, insulation, acoustical ceilings, and wall coverings, indicating compliance with requirements for low-emitting materials, as defined in "Low-Emitting Materials" Article.
16. IAQ testing report from testing and inspecting agency indicating results of IAQ testing and documentation that show compliance with IAQ testing procedures and requirements.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Provide products and procedures necessary to comply with CALGreen requirements referenced in the Evaluations. Although other Sections may specify some requirements that contribute to referenced CALGreen requirements, determine additional materials and procedures necessary to comply with CALGreen requirements indicated.

2.2 LOW-EMITTING MATERIALS

A. Adhesives and Sealants:

1. For field applications inside the building, adhesives and sealants shall comply with the following VOC content limits:

a. Wood Glues: 30 g/L.
b. Metal-to-Metal Adhesives: 30 g/L.
c. Adhesives for Porous Materials (except Wood): 50 g/L.
d. Subfloor Adhesives: 50 g/L.
e. Plastic Foam Adhesives: 50 g/L.
f. Carpet Adhesives: 50 g/L.
g. Carpet Pad Adhesives: 50 g/L.
h. VCT and Asphalt Tile Adhesives: 50 g/L.
i. Cove Base Adhesives: 50 g/L.
j. Gypsum Board and Panel Adhesives: 50 g/L.
k. Rubber Floor Adhesives: 60 g/L.
l. Ceramic Tile Adhesives: 65 g/L.
m. Multipurpose Construction Adhesives: 70 g/L.
n. Fiberglass Adhesives: 80 g/L.
o. Contact Adhesive: 80 g/L.
p. Structural Glazing Adhesives: 100 g/L.
q. Wood Flooring Adhesive: 100 g/L.
r. Single-Ply Roof Membrane Adhesive: 250 g/L.
s. Special-Purpose Contact Adhesive (Contact Adhesive That Is Used to Bond Melamine Covered Board, Metal, Unsupported Vinyl, Rubber, or Wood Veneer 1/16 Inch or Less in Thickness to Any Surface): 250 g/L.
t. Plastic Cement Welding Compounds: 250 g/L.
u. ABS Welding Compounds: 325 g/L.
v. CPVC Welding Compounds: 490 g/L.
w. PVC Welding Compounds: 510 g/L.
x. Adhesive Primer for Plastic: 550 g/L.
y. Architectural Sealants: 250 g/L.
z. Nonmembrane Roof Sealants: 300 g/L.
aa. Single-Ply Roof Membrane Sealants: 450 g/L.
bb. Other Sealants: 420 g/L.

2. For field applications inside the building, adhesives and sealants must comply with the requirements of SCAQMD Rule 1168 or local code when tested in accordance with the California Department of Public Health's "Standard Method for the Testing and Evaluation of Volatile Organic Chemical Emissions from Indoor Sources Using Environmental Chambers."

B. Carpet, cushion, and undercarpet adhesives will comply with CRI's Green Label Plus testing program.

C. Paints: For field applications inside the building, wall paints must comply with local code requirements when tested in accordance with the California Department of Public Health's "Standard Method for the Testing and Evaluation of Volatile Organic Chemical Emissions from Indoor Sources Using Environmental Chambers."

D. Resilient Flooring: Flooring must be certified by the Resilient Floor Covering Institute and/or be compliant when tested in accordance with the California Department of Public Health's "Standard Method for the Testing and Evaluation of Volatile Organic Chemical Emissions from Indoor Sources Using Environmental Chambers." Flooring must also comply with the Collaborative for High Performance Schools (CHPS) requirements.

E. Thermal Insulation: Provide insulation complying with CALGreen Tier 1 or 2 requirements.

F. Ceiling and Wall Panels: Acoustical ceiling and wall-cladding products must comply with the VOC emissions limits defined in the CHPS criteria and be listed in the CHPS Pre-Approved Products database or have a Greenguard Certification Program.

PART 3 - EXECUTION

3.1 CONSTRUCTION WASTE MANAGEMENT

A. CALGreen requires use of a construction waste management plan outlining how waste will be divided on the construction site, as well as how often it will be hauled to a landfill or recycling center and by whom.

B. CALGreen includes a sample plan outlining all specific requirements of the plan.

C. Comply with Section 01 74 19 "Construction Waste Management and Disposal."

D. Comply with execution requirements of related Section and applicable local codes and ordinances.

E. Comply with sustainable design of Project as represented by Drawings and Specifications.

3.2 COMMISSIONING

A. CALGreen requires commissioning of the building mechanical and electrical systems to ensure proper installation and optimized performance as the building starts to be occupied. It also requires a systematic quality assurance process that spans the entire design and construction process and includes verifying and documenting that building systems and components are planned, designed, installed, tested, operated, and maintained to meet Owner?s project requirements.

B. Comply with Section 01 91 13 "General Commissioning Requirements." [

3.3 INDOOR-AIR-QUALITY ASSESSMENT

A. Air-Quality Testing:

1. Conduct baseline IAQ testing, after substantial completion of construction and prior to occupancy, in accordance with the EPA's "Testing for Indoor Air Quality - Section 01 81 09."
2. Verify compliance with standards and limits in the EPA's "Testing for Indoor Air Quality - Section 01 81 09."

    a. Carbon monoxide maximum is 9 ppm, not to exceed outdoor levels by 2 ppm.
    b. Formaldehyde maximum is 27 ppb.
    c. Particulates maximum is 50 micrograms per cubic meter.
    d. 4-Phenylcycohexene maximum is 6.5 micrograms per cubic meter.
    e. Total VOC maximum is 300 micrograms per cubic meter.

3. For each sampling point where the maximum concentration limits are exceeded, take corrective action until air samples indicate compliance.
4. For each sampling point where airborne mold and mildew indoor species distribution varies by more than 10 percent from exterior sampling specification, identify source of mold and mildew and remediate with corrective action, then retest until compliant results are attained.
5. If noncompliant test results occur, provide a written report describing source(s) of noncompliant condition(s) and corrective action(s) implemented.

END OF SECTION 01 81 13.71

SECTION 01 91 13 - GENERAL COMMISSIONING REQUIREMENTS

PART 1 - GENERAL

1.1 SCOPE

A. This Section includes specifications for the implementation, tracking and verification of the commissioning process.

B. Commissioning is a comprehensive and systematic process to verify that the building systems perform as designed to meet the Owner's requirements. Commissioning during the construction, acceptance, and warranty phases is intended to achieve the following specific objectives:
   1. Verify and document that equipment is installed and started per manufacturer's recommendations and to industry accepted minimum standards.
   2. Verify and document that equipment and systems receive complete operational checkout by installing contractors.
   3. Verify and document equipment and system performance.
   4. Verify the completeness of operations and maintenance materials.
   5. Confirm that the Owner's operating personnel are adequately trained on the operation and maintenance of building equipment.

C. The commissioning process does not take away from or reduce the responsibility of the system designers or installing contractors to provide a finished and fully functioning product.

D. The purpose of this Section is to specify the responsibilities and participation in the commissioning process for the following:
   1. Division 21 - Fire Suppression.
   2. Division 22 - Plumbing.
   3. Division 23 - HVAC.
   4. Division 26 - Electrical.
   5. Division 27 - Communications.
   6. Division 28 - Electronic Safety & Security.

E. Building Enclosure Commissioning responsibilities are located in Division 01 Section "Building Enclosure Commissioning."

1.2 DEFINITIONS

A. Commissioning (Cx): The process of ensuring that systems are designed, installed, functionally tested, and performing in conformity with Owner's Project Requirements (OPR), the design intent (Basis of Design (BoD)), and that the building operator has received complete equipment and systems documentation and training.

B. Commissioning Provider (CxP): The entity identified to lead, monitor, coordinate and report on project commissioning activities.

C. Commissioning Plan: A detailed plan of the organization, schedule, allocation of resources, procedures, and documentation requirements of the commissioning process.

D. Construction Verification (CV): A quality control verification process performed by the installer as building assemblies, components, equipment, and systems are being installed which documents that the materials, installation procedures, interfaces with other trades, start-up, testing, and operation are correct, complete and in compliance with contract documents and manufacturer's recommendations and are ready for functional performance testing.

E. Functional Performance Tests (FPT): Contractor testing of installed building assemblies, components, equipment, systems, and interfaces which confirms correct performance through all operating modes and compliance with contract documents and manufacturer's recommendations.

F. Commissioning Report: A document that records the activities and results of the commissioning process.

1.3 COORDINATION

A. Commissioning Team: The members of the commissioning team consist of the Commissioning Provider (CxP), the Owner's Project Manager (OPM), the Construction Manager or General Contractor (CM or GC), the design Architect and Engineers (A/E), the Mechanical Contractor (MC), the Electrical Contractor (EC), the Testing, Adjusting, and Balancing Contractor (TAB), the Controls Contractor (CC), the Communications and Technology Contractor (CTC), the Owner's maintenance staff, and any other installing Subcontractors or suppliers of equipment.

B. Management: The GC that is awarded the project shall not include the cost of the Commissioning Provider in their price. The GC (and their Subcontractors) shall include cost for their involvement in the commissioning process as described in this Section and other related commissioning sections, including completion of construction verification checklists, demonstration of installed equipment to the commissioning team members during the functional performance testing portion of the project.

C. Scheduling: The CM/GC shall integrate all commissioning activities into the master construction schedule. A timeline determined by the commissioning agent will be dedicated for system commissioning. The MEP Contractors shall coordinate their commissioning schedule needs with CM prior to the start of construction to ensure inclusion into the overall construction schedule. The CxP will work with the OPM and CM/GC to schedule commissioning activities. All parties will address scheduling issues in a timely manner in order to expedite the commissioning process.

D. Tracking Contractor Required Testing: Each Contractor is responsible for completing various tests per their associated specifications. Each Contractor will forward a list of their associated tests to the CxP, who will generate an overall list for tracking purposes.

1.4 COMMISSIONING PROCESS

A. The following activities describe the commissioning tasks and the general order in which they occur. The CxP coordinates all activities.
   1. Scoping Meeting: All members of the design and construction team that will be involved in the commissioning process meet and agree on the scope of work, tasks, schedules, deliverables, and responsibilities for implementation of the Commissioning Plan.

2. Commissioning Plan: The Commissioning Plan developed by the CxP provides guidance in the execution of the commissioning process. The Specifications take precedence over the Commissioning Plan.
3. Submittals: Contractor submittals, including detailed start-up procedures, applicable to systems being commissioned is submitted to the CxP to be reviewed concurrent with the A/E's review. The CxP will review Contractor submittals for compliance with OPR and BoD.
4. Site Visits: Commissioning is a team effort requiring the cooperation of all parties. Contractors are to proactively carry out their commissioning responsibilities and are to assist the CxP during site visits in performing commissioning tasks. This includes providing access to and demonstrating the installation, operation and testing of commissioned systems; responding to CxP requests for information; carrying out proactive and corrective actions; and accurate reporting on system status and conditions.
5. Start-Up/Construction Verification Checklists: The CxP works with the Subcontractors to develop startup plans and documentation formats, including providing the Subcontractors with construction verification checklists to be completed prior to the acceptance testing process.
6. Functional Performance Testing: The CxP develops specific equipment and system functional performance test procedures. The Subcontractors review the procedures. The procedures are executed by the Subcontractors, under the direction of, and documented by the CxP.
7. Deficiencies and Resolution: The CxP documents items of non-compliance in materials, installation, or operation in an Issues Log. The items are corrected at the Sub's expense and the equipment or systems are retested. Each Contractor is responsible for completing action items in a timely manner that are noted in the Issues Log as their responsibility. Timely response and successful completion are a requirement to avoid withholding of payment. The CM/GC will be responsible for any cost associated with the CxP for retesting.
8. Operations and Maintenance Documentation: The CxP reviews the Operation and Maintenance documentation provided by the Subcontractors for completeness.
9. Training: The CxP reviews the training provided by the Subcontractors and verifies that it is completed.
10. Seasonal Testing: Deferred or seasonal testing is conducted, as required.
11. Warranty Review: The CxP will review status of warranty and building performance issues with the OPM, A/E, CM/GC roughly 10 months after occupancy.

1.5 RESPONSIBILITIES

A. The responsibilities of various parties in the commissioning process are provided in this Section. Note that the services for the Owner's Project Manager, Design Team, and Commissioning Provider are not included in this contract. The Contractor is not responsible for providing their services. Their responsibilities are listed here to clarify the commissioning process.

B. Commissioning Provider (CxP): The CxP is not responsible for design concept, design criteria, code compliance, general construction scheduling, cost estimating, or construction management. The CxP may assist with problem-solving deficiencies, but ultimately that responsibility resides with the General Contractor and the A/E. The primary role of the CxP is to develop and coordinate the execution of a testing plan to verify and document that systems are functioning in accordance with the design intent and the Construction Documents.
1. Construction and Acceptance Phase:

a. Coordinates and directs all commissioning activities. Work with the CM/GC and OPM to confirm that commissioning activities are scheduled.
b. Maintain an up-to-date Commissioning Plan.
c. Plan and conduct the commissioning scoping meeting.
d. Request and review additional information required to perform commissioning tasks, including Operation and Maintenance materials, Contractor start-up and checkout procedures, and sequences of operation.
e. Review Contractor submittals applicable to commissioned systems.
f. Assist Subcontractors with the development of start-up and checkout plans.
g. Write and distribute construction verification checklists to be completed by the responsible Subcontractor.
h. Perform site visits, as necessary, to observe component and system installations. Attend construction job-site meetings, as necessary, to monitor construction and commissioning progress.
i. Review completed construction verification checklist and start-up reports.
j. Assist with coordination of start-up requirements with TAB requirements.
k. Write functional performance test procedures for equipment and systems.
l. Coordinate, witness, and document functional performance tests completed by installing contractors. Coordinate retesting as necessary until satisfactory performance is verified.
m. Maintain a master deficiency and resolution record. Provide the OPM with written progress reports and test results with recommended actions.
n. Review the training proposed by the Contractors for the Owner's operating personnel.
o. Review the Operation and Maintenance manuals.
p. Prepare a final commissioning report.

2. Warranty Period:
a. Coordinate and supervise required seasonal or deferred testing and deficiency corrections.
b. Assist in the development of a preventative maintenance plan and review as-built documentation.

C. Design Team (A/E):
1. Construction and Acceptance Phase:
a. Attend commissioning scoping meeting and additional meetings, as necessary.
b. Provide design intent and sequence of operation documentation as required by the CxP.
c. Assist in resolution of system deficiencies identified during commissioning.
d. Review and approve the operations and maintenance manuals.

2. Warranty Period:

a. Assist in resolution of system deficiencies identified during warranty period commissioning.
b. Attend the end-of-warranty review walkthrough to assist in identifying issues requiring resolution and the action plan to do so.

D. Owner's Project Manager (OPM):
1. Construction and Acceptance Phase:

a. Manage the contract of the CxP.
b. Attend commissioning scoping meeting and additional meetings, as necessary.
c. Arrange for facility operating and maintenance personnel to participate in commissioning activities and training sessions.
d. Provide final approval for the completion of the commissioning work.

2. Warranty Period:

    a. Ensure that any seasonal or deferred testing and any deficiency issues are addressed.
    b. Attend the end-of-warranty review.

E. General Contractor or Construction Manager (CM or GC):
1. Construction and Acceptance Phase:
    a. Facilitate the coordination of the commissioning work by the CxP.
    b. Attend commissioning scoping meeting and additional meetings, as necessary.
    c. Furnish copies of construction documents, addenda, change orders and approved submittals and shop drawings related to commissioned equipment to the CxP.
    d. Confirm that Subcontractors execute their quality assurance and commissioning responsibilities according to the Specifications and Commissioning Plan.
    e. Ensure CxP access to observe and witness equipment system installation and operation.
    f. Coordinate the training of Owner personnel, according to the Specifications.
    g. Prepare Operation and Maintenance manuals, according to the Specifications, including updating original sequences of operation to as-built conditions.
    h. Attend regularly scheduled commissioning meetings.
2. Warranty Period:
    a. Confirm that Subcontractors execute required seasonal or deferred functional performance testing.
    b. Confirm that Subcontractors correct deficiencies and make necessary adjustments to Operation and Maintenance manuals and as-built drawings for issues identified during the warranty period.
    c. Attend the end-of-warranty review.

F. Equipment Suppliers:
1. Provide requested submittal data, including detailed start-up procedures and specific responsibilities of the Owner to keep warranties in effect.
2. Provide information requested by CxP regarding equipment sequence of operation and testing procedures.
3. Assist in equipment testing and training per agreements with Subcontractors.

G. Mechanical, Electrical, Plumbing, Controls, TAB, and other Subcontractors:

H. Installing Subcontractors shall fill out construction verification checklists generated by the CxP.
1. The Subcontractor responsible for the startup and operational checkout of each commissioned system shall participate in functional performance testing and execute the test plans generated by the CxP.
2. Attend regularly scheduled commissioning meetings.
3. Ensure CxP access to observe and witness equipment system installation and operation
4. Submit required Contractor quality assurance test reports to Architect and Commissioning Provider for review.
5. Submit completed start-up reports for commissioned equipment signed by the factory-trained and authorized representatives performing the associated work.
6. Submit Testing and Balancing plan for review and completed TAB report to Architect and Commissioning Provider for review.

7. Submit completed System Readiness Checklists, with completed startup sheets attached, to Commissioning Provider. System functional performance testing shall not commence until the system is documented as ready for testing.
8. Submit operation and maintenance (O&M) manuals for systems being commissioned to Architect and Commissioning Provider for review.
9. Provide training for the Owner's facility staff for regular operations, maintenance, and troubleshooting.
10. Refer to applicable quality assurance and commissioning sections as noted in Article 1.2 for additional responsibilities.

PART 2 - PRODUCTS

2.1 TEST EQUIPMENT

A. All standard testing equipment required to perform startup and initial checkout and required functional performance testing shall be provided by the Division Contractor for the equipment being tested. Equipment to be calibrated within the past year and in accordance with the manufacturer's recommendations.

B. Contractors to provide the electronic means (equipment) required to enter construction verification data from on-site if the Commissioning Provider utilizes a web-based program.

C. Proprietary test equipment and software required by any equipment manufacturer for programming and/or start-up, whether specified or not, shall be provided by the manufacturer of the equipment. Manufacturer shall provide the test equipment, demonstrate its use, and assist in the commissioning process as needed.

D. All testing equipment shall be of sufficient quality and accuracy to test or measure system performance as required by the specifications.

E. Datalogging equipment or software required to test equipment provided by the CxP shall not become the property of the CM/GC or Owner.

PART 3 - EXECUTION

3.1 MEETINGS

A. Pre-Construction Scoping Meeting: The CxP will schedule, plan, and conduct a pre-construction scoping meeting with the entire commissioning team in attendance. The CM/GC will ensure all relevant Subcontractors attend. The CxP will present an overview of the project's commissioning process and the commissioning team members will be identified and their responsibilities reviewed.

B. Miscellaneous Meetings: Other meetings will be planned and conducted by the CxP as construction progresses. Each Contractor is required to attend all meetings related to commissioning (pre-construction, construction progress, commissioning meetings, etc.) and to have personnel requested by CxP in attendance to facilitate quality control and coordinate

commissioning efforts. Contractors are to provide a review of project progress, a report on the status of issues, commissioning tasks, and scheduling for future commissioning tasks.

C. Warranty Review Meeting: Within 10 months of substantial completion and prior to completion of the warranty period, CxP will coordinate and facilitate a review meeting. The intent of the meeting will be to review the project design, construction, turnover, operation, and warranty issues. Contractor is required to have key project personnel in attendance and participating in the review for the purposes of making future project delivery improvements.

D. The CxP will distribute meeting minutes to all parties.

3.2 REPORTING

A. The CM/GC shall include the CxP on all OAC construction meeting minutes distribution.

B. The CM/GC shall include the CxP on all Requests For Information (RFI) and Change Order Requests (COR) related to commissioned equipment and systems.

C. The CxP will regularly communicate with all members of the commissioning team, apprising them of commissioning progress and scheduling changes through memos, progress reports, etc.

D. The CM/GC will respond to the CxPs deficiency record with resolution updates

E. The CM/GC will provide documentation as required for the CxP to compile a final Commissioning Report which summarizes all the tasks, findings, and documentation of the commissioning process. The report addresses the actual performance of the building systems in reference to the design intent and contract documents. The report includes a summary of commissioning activities, contact and warranty information, completed construction verification checklists, functional performance testing records, diagnostic monitoring results, identified deficiencies, recommendations for warranty review meeting, and ongoing commissioning effort.

3.3 SUBMITTALS

A. Refer to Division 01 General Requirements and Section "Submittals" and relevant Division sections for requirements.

B. The CM/GC shall provide the CxP submittals related to the commissioned equipment to review for conformance to the Construction Documents as it relates to the commissioning process. The review is intended primarily to aid in the development of functional performance test procedures.

C. The CM/GC shall respond to request for additional information from the CxP as needed to facilitate the commissioning process.

D. The CxP may request additional design and operations narrative from the design team and Controls Contractor regarding sequences of operations.

3.4 START-UP AND CONSTRUCTION VERIFICATION CHECKLISTS

A. The following procedures apply to all equipment to be commissioned, according to Article 1.7, Commissioning Scope.

B. Start-Up Plans:
1. The responsible Contractors shall develop detailed start-up plans for all equipment to be commissioned. The CxP will review start-up plans to confirm that there is written documentation that each of the manufacturer-recommended procedures is completed.
2. Subcontractors and equipment suppliers schedule startup and checkout with the OPM, CM/GC, and CxP.
3. All work to be installed in accordance with the manufacturer's instructions. The Subcontractors and vendors execute manufacturer installation procedures and start-up documentation. A copy of completed start-up checklists shall be provided to the CxP.
4. The start-up plans and documentation may be provided to the OPM and A/E for review.

C. Construction Verification Checklists:
1. The construction verification checklists are a formalized means to provide individual workers the criteria for a successful installation, adherence to the construction documents and to easily track construction progress.
2. Each assembly, component, equipment, system, and interface to be commissioned shall be verified by the installer at the site while work is underway and documented on the construction verification checklists. The Contractor is responsible for successfully completing installations, documenting this on the construction verification checklist forms, and correcting all deficiencies.
3. Construction verification checklists are developed by the CxP for all major equipment and systems being commissioned. The checklist documents all equipment components are installed and functional and confirms the as-built status of the equipment or system. These checklists also assist in confirming that the systems are complete and operational, so that the functional performance testing can be scheduled.
4. Construction verification checklists will be electronic and available via a web-based program. It is the Contractor's responsibility to have an electronic means of entering this data from on site.
5. Construction verification checklists shall be filled out and signed by the installing subcontractor for each piece of equipment. Only individuals who have completed or witnessed the line item task shall complete and sign the checklists.
6. Contractor shall periodically review the construction verification checklist schedule with the CxP allowing advance notice of activities of five (5) business days so that the CxP may witness as deemed necessary.
7. Calibration of all sensors shall be included as part of the construction verification checklists performed by the Contractors.

D. Deficiencies, Non-Conformance, and Approval in Checklists and Startup:
1. The Subcontractors shall clearly list any items of the start-up and construction verification procedures not successfully completed at the bottom of the form or on an attached sheet. The procedures form and any outstanding deficiencies are provided to the CxP within two (2) days of test completion.
2. The CxP will verify the accuracy of the completed start-up forms and construction checklists compared with actual field installation and recommends approval to the OPM.
3. If CxP identifies more than a 10 percent discrepancy rate during confirmation of construction verification checklists, the Contractor shall correct all deficiencies and revalidate all items covered by that checklist and resubmit new checklists.

4. The cost of reconfirmation of construction verification checklists due to equipment or construction deficiencies is the responsibility of the Contractor and subject to deductive change order at Owner's/Construction Manager's discretion. Correction of deficiencies and revalidation are the responsibility of the Contractor and are not subject to time extensions or delay claims.

3.5 FUNCTIONAL PERFORMANCE TESTING

A. Functional performance testing for each system in the commissioning scope shall be executed by the Subcontractor responsible for the startup and operational checkout of the system.

B. The following procedures apply to all equipment to be commissioned, according to Article 1.7, Commissioning Scope. This sub-section applies to all commissioning functional performance testing for all divisions.

C. Objectives and Scope: The objective of functional performance testing is to demonstrate that each system is operating according to the documented design intent and Construction Documents. Functional performance testing comprises a full range of tests to verify that all components, equipment, systems, and interfaces between systems operate correctly. This includes all operating modes, interlocks, control sequences, and responses to emergency conditions. All verification procedures are directed, witnessed, and documented by the CxP.

D. Development of Test Procedures: The CxP develops specific test procedures and forms to verify and document proper operation of each piece of equipment and system. Prior to execution, the CxP provides the test procedures to the Subcontractors who review the tests for feasibility, safety, equipment, and warranty protection. The CxP may submit the tests to the A/E team for review.

E. Test Methods:
1. Functional performance testing and verification may be achieved by direct manipulation of system inputs (i.e., heating or cooling sensors), manipulation of system inputs with the building automation system (i.e. software override of sensor inputs), trend logs of system inputs and outputs using the building automation system, or short-term monitoring of system inputs and outputs using standalone data loggers. A combination of methods may be required to completely test the complete sequence of operations. The CxP determines which method, or combination, is most appropriate.
2. Setup: Each test procedure is performed under conditions that simulate normal operating conditions as closely as possible. The Sub executing the test provides all necessary system modifications to produce the specified conditions (flows, pressures, temperatures, etc.) necessary to execute the test. At completion of the test, the Sub returns all affected building equipment and systems to their pre-test conditions.
3. Sampling: Multiple identical pieces of non-life-safety or non-critical equipment may be functionally tested using a sampling strategy. The CxP shall establish sampling protocol with approval of the OPM, and at the time of testing select sample test locations for identical pieces of equipment. Where simulation of conditions or altering of setpoints or values is required to achieve an operating or failure mode for testing, the Contractor must receive CxP approval. If, after three attempts at testing the specified sample percentage, failures are still present, then all remaining units are tested at the Contractors' expense.

F. Coordination and Scheduling: Every effort will be made to expedite the testing process and minimize unnecessary delays, while not compromising the integrity of the procedures.

G. Contractor shall coordinate functional performance testing with CxP, the CM, and the Owner and notify them five (5) business days prior to testing so that they may witness and document the test results. All Contractors involved with specific assemblies, components, equipment, systems, and interfaces shall have qualified installers and technicians present at the same time working together to perform testing and demonstrate correct performance through all operating and failure modes and compliance with contract documents and manufacturer's recommendations.

H. With Owner and CM oversight, the CxP is responsible for witnessing functional performance testing and recording the results and deficiencies. The following sequential priorities are followed:

1. Equipment is not "temporarily" started (for heating or cooling), until pre-start checklist items and all manufacturers' pre-start procedures are completed and moisture, dust, and other environmental and building integrity issues have been addressed.
2. Functional performance testing does not begin until construction verification, start-up, controls verification of installation (all sequences and points), and TAB is completed for a given system.
3. The controls system and equipment it controls are not functionally tested until all points have been calibrated and construction verification checklists are completed.

I. Contractors are responsible for completing and coordinating their work with all trades prior to testing, preplanning testing procedures, ensuring necessary staff and resources are on hand, and expediting testing. This includes, but is not limited to, completing testing and balancing by the HVAC Contractor required for successful functional performance testing, pre-testing of the systems (completing FPT) prior to testing with CxP. Pre-testing will include submission of trending per the request of CxP. Failure to complete or coordinate work, preplan, or have staff and resources available to carry out testing will result in retesting.

J. Problem Solving: The CxP may recommend solutions to deficiencies identified during functional testing. However, the burden of responsibility to solve, correct, and retest deficiencies is with the CM/GC, Subcontractors, and A/E.

3.6 DOCUMENTATION, NON-CONFORMANCE, AND APPROVAL OF TESTS

A. Documentation:
1. The CxP witnesses and documents the results of all functional performance tests using forms developed for that purpose. Prior to testing, these forms are provided to the OPM for review and approval.

B. Non-Conformance:
1. The CxP records the results of the functional test on the procedure or test form. All deficiencies identified during the verification testing are documented on a standard Issues Log form and reported to the PM, Contractors, and Subcontractors. The deficiency report includes all details of the components or systems found to be non-compliant with the parameters of the test plans. The report details the adjustments or alterations required to correct system operation and identifies the responsible party.
2. Corrections of minor deficiencies identified may be made during the tests at the discretion of the CxP. In such cases, the deficiency and resolution will be documented on the procedure form.
3. Deficiencies that cannot be corrected during testing will be documented on the Issues Log and subject to retest. Retesting will continue until no deficiencies remain or by Owner's request.

4. Retesting is required when testing cannot be successfully completed. Deficiencies requiring include:
   a. Incomplete work and/or coordination with others.
   b. Inadequate preparation of systems for testing.
   c. Inadequate preplanning.
   d. Inadequate staff, equipment, tools, or resources for testing.
   e. Material, equipment, or construction deficiencies.
   f. Incomplete or failed test due to reasons under the Contractor's responsibility.
5. If there is a dispute about a deficiency or who is responsible:
   a. The deficiency is documented on the Issues Log and a copy given to the OPM and CM/GC.
   b. Resolutions are made at the lowest management level possible. Additional parties are brought into the discussions as needed. Final interpretive authority is with the A/E team. Final acceptance authority is with the PM. The CxP documents the resolution process.
   c. Once the interpretation and resolution have been decided, the appropriate party corrects the deficiency and notifies the CxP that the equipment is ready to be retested.
   d. The CxP reschedules the test, and the test is repeated until satisfactory performance is achieved.

C. Cost of Retesting:
1. The cost of retesting is the responsibility of the Contractor and subject to deductive change order. Correction of deficiencies and retesting are the responsibility of the Contractor and are not subject to time extensions or delay claims.

D. Approval:

1. The CxP makes formal approval of the functional performance test after review. The CxP recommends acceptance of each test to the OPM. The OPM gives final approval on each test.

3.7 OWNER'S TRAINING

A. Refer to Division 01 General Requirements and Section "Demonstration and Training" and relevant Division sections for requirements.

B. The Contractor is responsible for developing a cohesive training plan for all Divisions and Sections of work where training is specified. See technical sections for specified minimum training hours for each component and system.

C. The CM/GC shall provide the CxP a preliminary training plan and schedule related to the commissioned equipment to review and finalize incorporating comments received. The plan should include agendas including topics and objectives to be covered for each section, the instructor's name and contact information, the anticipated duration and schedule for each session, a formal training record listing of attendees, and a training evaluation form. Develop the training schedule, including number of hours for each component or system, in coordination with the CxP and CM that complies with the Owner's and CxP's personnel availability.

D. The CxP shall provide each trainee with a Training Evaluation Form and at completion of training, collect forms for review. Based on evaluations and OPM training review, Contractor shall repeat training sessions which were determined were inadequate or incomplete.

3.8 O&M DATA AND CLOSEOUT SUBMITTALS

A. Refer to Division 01 General Requirements and Section "Closeout Submittals" and relevant Division sections for requirements.

B. The CM/GC shall provide the CxP closeout submittals related to the commissioned equipment to review and compile into a Recommissioning Systems Manual as required.

3.9 DEFERRED TESTING

A. Unforeseen Deferred Tests: If any test cannot be completed due to the building structure, required occupancy condition, or other deficiency, the functional testing may be delayed upon approval of the OPM. These tests are conducted in the same manner as the seasonal tests as soon as possible.

B. Seasonal Testing: Seasonal variation in operations or control strategies may require additional testing during the opposite season to verify performance of the HVAC system and controls. During the warranty period, seasonal testing and other deferred testing is completed as required to fully test all sequences of operation. The CxP coordinates these activities. Tests are executed and documented, with deficiencies corrected by the appropriate Subcontractors. Any final adjustments to the Operation and Maintenance manuals and as-builts due to the testing are also completed.
   1. Two additional functional performance sessions are to be completed for the following systems:
      a. Air Handling Units / Rooftop Units.
      b. Chilled Water Systems.
      c. Heating Hot Water Systems.

END OF SECTION 01 91 13

SECTION 02 41 16 - DEMOLITION

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes: Furnishing labor, materials and equipment necessary for demolition, dismantling, cutting and alterations as indicated, specified, or required for completion of the Work. Includes items such as the following:
   1. Protection of existing improvements to remain.
   2. Cleaning existing improvements to remain.
   3. Disconnecting and capping utilities.
   4. Removing debris, waste materials, and equipment.
   5. Removal of items for performance of the Work.
   6. Salvageable items to be retained by the Owner.

B. In general, the Contractor shall endeavor to limit conventional demolition to those elements and materials not dismantled for required salvage and those that cannot otherwise be cost effectively recovered for reuse and recycling. The Contractor's work plan shall favor means and methods that result in the lowest percentage and volume of removed improvements and materials being disposed of as waste by burning, at a landfill and similar disposal.

C. Related Requirements:
   1. Division 01 - General Requirements.
   2. Section 01 11 00 - Summary of Work.
   3. Section 01 50 00 - Construction Facilities and Temporary Controls.
   4. Section 01 73 29 - Cutting and Patching.
   5. Section 01 74 19 - Construction and Demolition Waste Management.
   6. Division 22 –- Plumbing.
   7. Division 23 –- HVAC.
   8. Division 26 –- Electrical.

1.2 SUBMITTALS

A. Shop Drawings: Submit Shop Drawings indicating the extent of items and systems to be removed. Indicate items to be salvaged or items to be protected during demolition. Indicate locations of utility terminations and the extent of abandoned lines to be removed. Include details indicating methods and location of utility terminations.

B. Procedural Proposal for Selective Demolition: Describe nature of the work, and performance; utilities that may be disturbed, relocated, and temporarily out-of-service; and proposed methods of protection, stabilization, and pollution control. Architect will not review for safety procedures nor the potential for damage and creation of hazardous conditions.

C. Regulatory Agency Authorization: Submit for Architect's review where written authorization is required for demolition work. This requirement shall not relieve Contractor of responsibility for obtaining required authorizations.

D. Hidden Conditions Report: Detailed descriptive report of nature and scope of conditions encountered.

1.3 QUALITY ASSURANCE

A. Perform the Work of this section by workers skilled in the demolition of buildings and structures. Perform the Work of this section under direct superintendence at all times.

B. Prior to commencement of Work, schedule a walkthrough with the OAR, to confirm Owner property items have been removed from scheduled Work areas. Identify and mark remaining property items and schedule their removal.

C. Coordinate demolition for the correct sequence, limits, and methods. Schedule demolition Work to create least possible inconvenience to the public and facility operations.

D. Related Standard: ANSI/ASSE A10.6.

1.4 PROJECT CONDITIONS

A. Drawings may not indicate in detail all demolition Work to be performed. Examine existing conditions to determine the full extent of required demolition.

B. Repair damage to existing improvements or damage due to excessive demolition.

C. Provide all measures to avoid excessive damage from inadequate or improper means and methods, improper shoring, bracing or support.

D. If conditions are encountered that varies from those indicated, promptly notify the Architect for clarification before proceeding.

E. Utility Services: Identification and location of utilities both inside and outside of buildings is the Contractor's responsibility. Maintain existing utilities indicated to remain in service, protect against damage due to demolition work.

F. Temporary Facilities and Controls: Minimize air, noise, water and soil pollution; provide as necessary to mitigate and abate nuisances resulting from demolition activities that may adversely affect Owner's occupancy, and to comply with regulatory requirements bearing on the Work.
   1. Prevent damage to the building due to exposure to weather. Provide weatherproof and insulated temporary enclosure and all other work necessary to prevent disruption to occupancy, damage and loss to the Library.
   2. Temporary shoring supports and all other facilities necessary for the Work are the Contractor's responsibility at no additional cost to the Owner.
   3. Environmental Controls: In enclosed spaces; Ambient temperature between 50- and 90-degrees F and adequate ventilation for safe working conditions.

PART 2 - PRODUCTS

2.1 HANDLING OF MATERIALS

A. Items scheduled for salvage by the Owner shall be delivered to a location designated by the OAR. Items shall be cleaned, packaged and labeled for storage.

B. Items scheduled for reuse shall be stored on the Project site and protected from damage, theft and other deleterious conditions.

PART 3 - EXECUTION

3.1 GENERAL

A. Protection:
1. Do not commence demolition until safety partitions, barricades, warning signs and other forms of protection are installed. Refer to Section 01 50 00 - Construction Facilities and Temporary Controls.
2. Provide safeguards, including warning signs, lights and barricades, for protection of workers, occupants, and the public.

B. If safety of existing construction appears to be endangered, take immediate measures to correct such conditions; cease operations and immediately notify the OAR.

C. Erect and maintain dust-proof partitions and closures as required to prevent the spread of dust or fumes to occupied portions of the building.

D. Provide weatherproof closures for exterior openings resulting from demolition work.

E. Locate, identify, and disconnect utility services not indicated to remain. Provide by-pass connections as necessary to maintain continuity of service to occupied areas of building.

3.2 DEMOLITION

A. Do not throw or drop materials. Furnish ramps or chutes as required by the Work.

B. Remove existing construction only to extent necessary for proper installation of Work and interfacing with existing construction. Cut back finished surfaces to straight, plumb or level lines as required for a smooth transition.

C. Where openings are cut oversize or in improper locations, replace or repair to required condition.

3.3 CUTTING EXISTING CONCRETE

A. Cutting of existing concrete shall be performed by skilled workers familiar with the requirements and space necessary for placing concrete. Perform concrete cutting with concrete cutting wheels and hand chisels. Do not damage concrete intended to remain.

B. Extent of cutting of structural concrete shall be as indicated on Drawings. Cutting of non-structural concrete shall be as indicated on Drawings or as reviewed by the Architect or structural engineer. Replace concrete demolished in excess of amounts indicated.

C. Prior to cutting or coring concrete, determine locations of hidden utilities or other existing improvements and provide necessary measures to protect them from damage.

3.4 REMOVAL OF EXISTING PLUMBING AND ELECTRICAL EQUIPMENT AND SERVICES

A. Remove existing plumbing and electrical equipment fixtures and services not indicated for reuse and not necessary for completion of the Work. Remove abandoned lines and cap unused portions of existing lines.

3.5 REMOVAL OF OTHER MATERIALS

A. Masonry: Cut back to joint lines and remove mortar without damaging units to remain. Allow space for repairs to backing where applicable.

B. Woodwork: Cut or remove to a joint or panel line.

C. Sheet Metal: Remove back to joint, lap, or connection. Secure loose and unfastened ends or edges and provide a watertight condition. Re-seal as required.

D. Glass: Remove broken or damaged glass and clean rebates and stops of glazing channels.

E. Modular materials such as acoustical ceiling panels, resilient tile, or ceramic tile: Remove to a natural joint without leaving damaged or defective Work where joining new Work. After flooring removal, clean substrates to remove setting materials and adhesives.

F. Plaster: Saw cut plaster on straight lines, leaving a minimum 2-inch width of firmly attached metal lath for installing new lath and plaster.

G. Remove existing improvements not specifically indicated or required but necessary to perform Work. Cut to clean lines, allowing for installation of Work.

H. Curtain Wall and Glazing: Salvage removed IGU's and selected portions of glazed curtain wall deliver to Owner as directed. Exercise care in removal work and anticipate subsequent installation of new building enclosure.

I. Exterior Demolition: Site clearing and grubbing is specified in Division 31 Sections. Completely demolish foundation walls below existing ground surface. Demolish and remove below-grade wood and metal construction. Break up below-grade concrete slabs.

1. Cut concrete and masonry at juncture with construction to remain.
2. Completely fill below-grade areas and voids resulting from demolition work. Provide fill complying with Section 31 10 00 requirements.

J. Paint, Adhesives and Coatings: Remove from substrate where these would impair appearance, durability and serviceability of new work; provide mechanical means to scarify substrate and establish appropriate profile with uniform texture for mechanical bond of new coating.
1. Coordinate with requirements for new work and finishes and verify that existing coatings and other conditions have been removed and each substrate is ready to receive new work with preparatory work limited to cleaning and priming.

K.

3.6 PATCHING

A. Patch or repair materials to remain when damaged by the performance of the Work of this section. Finish material and appearance of patch and/or repair Work shall match existing.

3.7 CLEANING

A. Clean existing materials to remain with appropriate tools and equipment.

B. Protect existing improvements during cleaning operations.

C. Debris shall be dampened by fog water spray prior to transporting by truck.

D. Debris pick-up area shall be kept broom-clean and shall be washed daily with clean water.

E. Remove waste and debris, other than items to be salvaged. Turn over salvaged items to Owner, or store and protect for reuse where required. Continuously clean up and remove items as demolition Work progresses.

F. Remove rubbish, debris, and waste materials and legally dispose of off the Project site.

END OF SECTION

SECTION 03 11 00 – CONCRETE FORMING

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes requirements for formwork for cast-in-place concrete.
   1. Comply with requirements and criteria in the General Notes on S-Series structural drawing sheets.

B. Products Installed but not furnished under this Section: Built-in sleeves, thimbles, dovetail slots, reglets, and anchors, wood blocking, inserts, and bolts for connection of other materials.

C. Related Sections:
   1. Section 03 20 00 Concrete Reinforcement.
   2. Section 03 30 00 Cast-In-Place Concrete.
   3. Section 07 13 00 Waterproofing at Pits and Sumps.
   4. Section 07 26 00 Vapor Control.
   5. Section 31 22 30 Grading.

D. Definitions: Comply with ACI 116R Cement and Concrete Terminology unless otherwise required.
   1. As-cast Concrete Surfaces Exposed to View: May be referred to as Smooth Form Finish and indicated on A-drawings. Characterization shall be for convenience only and shall not be interpreted as restricting the appearance, quality and character of the work required to texture alone. Unless otherwise required for as-cast appearance shall be dependent on processing of surfaces by neither additive nor subtractive means following removal of formwork.

1.2 ADMINISTRATIVE REQUIREMENTS

A. Coordinate formwork with requirements for components to be embedded in concrete including but not limited to conduit, mechanical, and plumbing penetrations, reinforcing and the following work:
   1. Division 05: Metal fabrications, stair, elevator and guardrail attachments.
   2. Division 11: Façade maintenance and fall protection equipment.

1.3 SUBMITTALS

A. Product Data: Include specifications and installation instructions for proprietary materials and items as required, including form coatings, manufactured form systems, ties, moisture barriers and accessories.
   1. Formwork Facing Materials: Data on form facing materials proposed for smooth-form finish. Indicate the number of reuses proposed for facing materials, criteria for evaluating whether facings are suitable for reuse and remedial measure to maintain prospective service life.

B. Shop Drawings: Indicate pertinent dimensions, materials, and arrangement of joints, ties and accessories for formwork and shores and reshores. Architect's review is for general

architectural applications and features only. Structural capacity to resist imposed loads is the responsibility of the Contractor.

1. Calculations and Drawings: Stamped by Registered Structural Engineer in the State where Project is located for conditions required by OSHA or constituting life-safety performance.
2. On-Grade Concrete Slab: Details of supports for reinforcing and stabilizing form-work features without puncturing vapor barrier.
3. As-Cast Concrete Surfaces Exposed to View in the Completed Work: Show the general construction of forms, formed joints, reveals, form tie locations, and pattern of form placement, and other items that affect the exposed concrete visually. Revise as necessary to represent formwork used in accepted mock-up and to accommodate proposed frequency of reutilization.
4. Formwork Facing Materials: Data on form facing materials proposed for as-cast finish. Indicate the number of reuses proposed for facing materials, criteria for evaluating whether facings are suitable for reuse and remedial measure to maintain prospective service life.
5. Components to be Embedded in Concrete Work: Provide comprehensive coordination drawing for location and installation of all items of the work in coordination with steel fabrications.
6. Indicate accommodation of characteristics of Project-specific mix design as necessary.

C. Reshoring and Backshoring Plans: When reshoring or backshoring are required or permitted, submit procedures and plans of operations, before use, sealed by a professional Engineer licensed in the state where Work will be performed.

D. Samples: When directed submit samples of formwork materials.

E. Quality Assurance:
1. Slab Survey Information: Reference 03 30 00 for survey and reporting requirements.

F. Mock-Up for Formed Concrete: Provide formwork as necessary for work of Section 03 30 00 and to demonstrate forming techniques proposed for use in the final work. Demonstrate schedule, sequence and method for form removal. Demonstrate procedure for reuse of formwork.
1. Coordinate with Section 03 30 00 for mix design requirements.
2. Demonstrate placement of form ties and related accessories; verify compliance with pattern and appearance requirements for the Work.

1.4 QUALITY ASSURANCE

A. Design, construct, erect, maintain and remove forms, shores and related structures for cast-in-place concrete work in compliance with requirements and tolerances in the American Concrete Institute Standard ACI 347, "Recommended Practice for Concrete Formwork." Formwork shall produce as-cast surfaces complying with Tolerance requirements of Section 03 30 00.

B. Forms and Shoring: Designed by the Contractor's Professional Engineer.

PART 2 - PRODUCTS

2.1 SYSTEM DESCRIPTION

A. Design Requirements: Formwork, shoring and bracing shall provide completed concrete surfaces conforming to sizes, shapes, lines, grades and dimensions indicated, with openings, offsets, keyways, recesses, anchorages, inserts and other features as required. Formwork shall be removable without damage to concrete and adjacent surfaces.
   1. Form, shoring and reshoring design shall be the sole responsibility of the Contractor and comply with ACI 301 and 318.
   2. Forms shall impart a uniform surface to the concrete that is free of mottling and color variation due to absorption of moisture, chemical reactions or other cause.
   3. Provide broad-footed pedestals or other accessory components to support chairs, form-boards and all similar components without puncturing vapor barrier at grade-supported concrete flatwork.

B. Performance Requirements: The Contractor shall determine construction loads and all other loads including safety factors that must be supported by formwork, shoring, re-shoring and related temporary supports throughout the course of the Work.
   1. Contractor shall ensure formwork, shoring and all related support work comply with regulatory requirements including but not limited to safety regulations and the following.
      a. ASCE 37, Design Loads on Structures during Construction.
   2. Concrete Forms: Deigned for specific characteristics of Project mix design including required admixtures, placement method, method of cure and finishing techniques.
   3. Concrete Forms: Deigned for Full Liquid Head loading, and as necessary to accommodate extended cure time of 56 days and other special conditions resulting from the use of high fly-ash content in the mix design.
   4. Board Formed Concrete: Exercise a high level of craftwork and skill in the design and construction of forms to produce controlled appearance required.

2.2 MATERIALS

A. Form Sheathing and Liners: Plywood, metal, metal-framed plywood faced and other acceptable panel-type materials, minimize number of joints and conform to join patterns where indicated. Contractor is encouraged to reduce materials consumption for the Work by utilizing form sheathing that may be reused. Consideration shall also be given to form liners where they will enable reuse of sheathing.
   1. Concrete Forming Panels: Comply with U.S. Product Standard PS-1 "B-B (Concrete Form) Plywood", Class I, Exterior Grade or better, mill-oiled and edge-sealed, with each piece bearing legible inspection trademark.
   2. Chamfer Strips: Prefabricated rigid wood or PVC chamfer strips to produce 0.75-inch radius unless otherwise indicated.
   3. Lumber: Dressed on two edges and one side.

B. Form Ties: Prefabricated, adjustable length, removable or snap-off metal ties; minimum 1-inch concrete coverage over embedded remnants and maximum 1 inch diameter holes from removed ties.
   1. Site fabricated and wire ties are not acceptable.
   2. Provide pre-cast concrete plugs coordinate with form-ties to fill holes following removal.

C. Form Release Coating: Provide water-based, VOC content 100 grams per liter or less, commercial formulation form-coating compounds compatible with forming materials and

subsequent coatings, adhesives and treatments that will not bond with, stain nor adversely affect concrete surfaces.

1. Atlas BioGuard (www.atlasform.com)
2. BioRelease EF (www.daytonsuperior.com)
3. Star Seal ER Bio_Release (www.vexcon.com)
4. SEI Form Release _ GCC_100 FRW _ Water Based (www.seichemical.com)

D. Sub-grade Pipe Penetration Flange: Cast iron providing mechanical joining of interior components and flexible exterior joint extending beyond the wall line minimum one length of ductile iron pipe. Size sleeve to accommodate pipe or other penetration with allowance for water-stopping filler.

E. Waterstops: Chemically modified hydrophilic rubber with integral stainless steel reinforcing mesh. Waterstop shall exhibit controlled expansion when exposed to water. Nominal 0.75 inch by 0.5-inch strips; MC-2010M by Adeka Ultra Seal (800) 999-3959, www.adeka.com.

1. Provide accessory components to seal waterstop joints, and for cleaning and priming of substrate and to bond seal to concrete approved by waterstop manufacturer.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Protection: Support imposed loads until concrete has cured adequately to support them. Provide crush plates and other protection to prevent damage to concrete surfaces during stripping.

B. Prevent movement and deformation of formwork and liners during concrete placement; shore, brace, block and support as necessary.

1. Below Grade Penetrations: Give particular attention to the stability of components and ensure they are tightly bonded in the completed concrete work such that they will not move or be subject to displacement nor otherwise compromise sub-grade waterproofing work of Section 07 13 26.
2. Provide specified flange for sub-grade pipe penetrations. Apply waterstop to seal bond surface of sleeve to concrete. Coordinate location and sizing of sleeve with mechanical, plumbing and electrical to be routed through the sleeve. Provide water-tight filling of annular gap as required for work of Section 07 13 26.

C. Prevent leakage of cement paste at joints, openings and penetrations in formwork.

1. Metal Decks with Concrete Topping: Seal edges and penetrations of decking to receive concrete and prevent seepage of cement paste.

D. Temporary Openings: At inconspicuous locations for cleanout and inspection of forms and placing of concrete.

E. Form all concrete surfaces. Do not use earth forms without prior written approval. Clean formwork and surfaces to receive concrete immediately prior to placement of concrete, remove debris and contaminants which might impair quality of completed work.

1. Formed Concrete Exposed to View: Provide Contractor's best craft, care and attention to achieve a controlled appearance of concrete work with the desired texture, features and characteristics. Unless otherwise acceptable, design formwork for pours to stop at floor lines (nominally 14 feet and 24 feet AFF).

F. Chamfer exposed corners and edges as indicated, using wood, metal, PVC or rubber chamfer strips fabricated to produce uniform smooth lines and tight edge joints. Kerf inserts for forming keyways, reglets, and recesses.

G. Construct formwork so concrete surfaces conform to the tolerance limits of ACI 117. As-cast Work Exposed to View: Set the facing materials in an orderly manner arranged per approved submittals, matching the Reference Control Sample and approved mock-up.

H. Waterproofing and Vapor Barrier: Coordinate formwork with Section 07 13 26 and Section 07 26 00 requirements. Vapor barrier at concrete flatwork shall be neither punctured nor damaged for any reason. Damage to vapor barrier will be grounds for rejection of the work and removal of work in-place as necessary for Contractor to replace damaged vapor barrier (repair of barrier will not be acceptable) without modification to Contract Sum nor Time. Necessary penetrations through waterproofing shall be sealed per Section 07 13 26 requirements.
   1. Should water accumulate on or above vapor barrier prior to placement of concrete the water shall be removed by pumping of other acceptable means. Neither puncture vapor barrier nor damage waterproofing to encourage drainage or run-off of water.

I. Re-Used Forms and Liners: Re-use limited to materials intended for multiple use. Prepare as specified for new, single-use forms, remove concrete and coating residues and restore as necessary to provide acceptable surface condition; damaged and deteriorated forms shall not be used.

J. Form Coatings: Apply to contact surfaces, comply with manufacturer's recommendations, prevent accumulation of coatings in formwork, and do not coat bond surfaces of existing concrete and embedded items.
   1. Coat forms and liners as necessary to prevent staining of concrete work.

3.2 JOINTS

A. Construction Joints: Horizontal and vertical, locate as indicated, and as specified in ACI 301, Section 2.2.2.5. Impair neither the strength nor appearance of the Work, place perpendicular to main reinforcement and with keyways 1.5 inches deep minimum, keyed bulkheads may be used.

B. Formwork Joints: Tight and regular, use minimum number of joints necessary for Work indicated.
   1. Form Ties: Provide as indicated in concrete work exposed to view in the interior of the building, exterior foundation walls, planter walls and seating walls. Where not indicated in Drawings, provide uniform, even spacing at cast-in-place concrete exposed to view.

C. Waterstops: Provide as a continuous seal at subgrade construction joints such as footing wall intersection, on-grade slab and wall, where new subgrade concrete work abuts existing concrete structure and at similar locations where subterranean water could enter the building due to joints in concrete work.

3.3 INSTALLATION OF EMBEDDED ITEMS

A. Embedded Items and Built-ins: Position in forms as necessary to accommodate Work of other trades, ensure correct placement, size and location for openings, recesses, anchors,

and items built into forms. Use setting diagrams, templates and directions provided by suppliers of items anchored to and cast into cast-in-place concrete.

B. Edge Forms and Screed Strips for Slabs: Set to obtain required elevations and contours in finished surface, support screed strips with strike-off templates or accepted compacting type screeds.
   1. Coordinate Metal Deck and Topping Slab edge with stair structure and slab edges exposed to view in completed structure.
   2. Exposed Slab Edge at Atrium: As indicated in Drawings and to comply with Section 05 12 00 requirements for exposed structural steel components.

3.4 SHORES AND SUPPORTS

A. Arrange shores as indicated on S-Series drawings and as otherwise required for the Work.

B. Shore construction to ensure distribution of loads throughout structure. Do not impose loading conditions for which the structure was not designed nor has not achieved sufficient strength to carry.

C. Remove shores and supports in a planned sequence, do not damage partially cured concrete. Prevent deflection and excessive loading of concrete.

3.5 REMOVAL OF FORMS

A. Formwork not supporting weight of concrete, may be removed after cumulatively curing at not less than 50 degrees F (10 degrees C) for 24 hours after placing concrete, provided concrete is sufficiently hard to not be damaged by stripping, and provided curing and protection operations are maintained.

B. Tolerances: Comply with ACI 117, except when specifically stated otherwise tolerances shall be total amount allowed; for example, a tolerance of 0.75 inch shall be interpreted to mean plus 0.375 and minus 0.375 inch for a total of 0.75 inch.
   1. Work the Architect determines has dimensional variations that adversely affect appearance and suitability for the purpose intended shall be replaced regardless of compliance with tolerance of ACI 117.
   2. To be acceptable Work must comply with tolerances when fully cured and temporary supports have been removed.

END OF SECTION

SECTION 03 20 00 – CONCRETE REINFORCEMENT

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes reinforcing bars, welded wire fabric, supports and accessories for cast-in-place concrete.
   1. Comply with requirements of the General Structural Notes on S0.01 AND S0.02; completed structures shall support loads and resist forces per criteria provided in Structural Design Criteria.

B. Related Sections:
   1. Section 03 11 00 Concrete Forming
   2. Section 03 30 00 Cast-In-Place Concrete

1.2 REFERENCES

A. Comply with requirements of the following, including modification required by applicable Codes.
   1. American Concrete Institute, ACI 315 Manual of Standard Practice for Detailing Reinforced Concrete Structures.
   2. American Concrete Institute, ACI 318 Building Code Requirements for Reinforced Concrete.
   3. American Welding Society, AWS D1.4 Structural Welding Code Reinforcing Steel.
   4. Concrete Reinforcing Steel Institute (CRSI), Manual of Standard Practice.
   5. ACI 347R – Guide to Formwork for Concrete
   6. California Building Code (CBC), 2022

B. Allowable Tolerances fabricating/placing tolerances shall be in conformance with ACI 301.

1.3 SUBMITTALS

A. Submit product data including specifications and installation instructions for all proprietary materials and reinforcement accessories.

B. Shop Drawings: For fabrication, bending, and placement of concrete reinforcement. Comply with ACI 315 show bar schedules, stirrup spacing, diagrams of bent bars, arrangement and support of concrete reinforcement, and coordination with embedded and cast-in items.

C. Mill Certificates: Submit steel producer’s certificates of mill tests for reinforcing steel.

1.4 QUALITY ASSURANCE

A. Fabricator of steel reinforcing shall comply with requirements for Local /Regional Materials and Referenced Standards.

1.5 DELIVERY, STORAGE AND HANDLING

A. Deliver reinforcement from the mill in securely tied bundles, each bundle limited to one size and grade of reinforcement. Identify each bundle with readily visible metal or plastic tags identifying the reinforcement by the same item marking as on the approved shop drawings; tags shall also identify the mill, heat or melt number, and the grade and size of reinforcement.

B. Each stack shall contain only bars with the same identifying label.

C. Store reinforcement off the ground, protected from the elements and foreign material which could adversely affect its bond with concrete.

PART 2 - PRODUCTS

2.1 REINFORCING MATERIALS

A. Reinforcing Bars: Provide Grade and Type as indicated in the General Structural Notes and as otherwise required for the Work.

B. Steel Wire:
1. Cold-Drawn Plain Wire: ASTM A 82.
2. Deformed Wire: ASTM A 496.

C. Welding Electrodes: AWS A5.1, low hydrogen, E70 series.

D. Supports for Reinforcement: Comply with CRSI specifications for bolsters, chairs, spacers and other devices for spacing, supporting and fastening reinforcing accurately in location required and to resist movement during concreting operations.
1. Exposed Concrete: Legs of supports in contact with forms or within ½" of exposed concrete surface, shall be plastic protected (CRSI, Class 1) or stainless steel protected (CRSI, Class 2).
2. Supports Standing on Vapor Barrier: Configure to prevent puncture and other damage to the vapor barrier.

E. Reinforcing Couplers: Type indicated on General Structural Notes and as otherwise required for the Work.

F. Deformed Bar Anchors: Nelson, flux filled deformed bar anchors, type D2L, as manufactured by Nelson Stud Welding or equal (no known equal)
1. Deformed Bar Anchor material shall be made from cold rolled, deformed steel reinforcing bars conforming to ASTM A496.
2. Deformed Bar Anchor material shall have a yield strength, fy, equal to 70,000 pounds per square inch.
3. Deformed Bar Anchor material shall have a tensile strength, fy, equal to 80,000 pounds per square inch.

2.2 FABRICATION

A. Coordinate reinforcing with anchors, shear studs, block-outs, conduits, sleeves, and other items, to be cast in concrete. Fabricate reinforcing to eliminate conflicts with the placement of embedded and cast-in items.

B. Field fabrication will be allowed only if Contractor has equipment to properly fabricate steel as determined by the Architect.

C. Fabrication of reinforcement shall begin only after approval of bar lists and shop drawings, with each item of reinforcement fabricated in conformance with such approved documents

PART 3 - EXECUTION

3.1 INSTALLATION

A. Accurately position, support and secure reinforcement against displacement by formwork, construction, or concrete placement operations. Locate and support reinforcing by metal chairs, runners, bolsters, spacers, and hangers, as required. Set wire ties so ends are directed into concrete, not toward exposed concrete surfaces.
   1. Coordinate reinforcing for on-grade concrete slabs with vapor barrier and waterproofing requirements.

B. Place reinforcement to obtain minimum concrete coverage acceptable to Architect and General Structural Notes. Continue reinforcement across construction joints.
   1. Allow observation by Architect at completion of placement.
   2. Reinforcing partially embedded in concrete shall not be field bent except as indicated or specifically approved in advance.
   3. Spacing. As indicated, and to comply with ACI 318.

C. Welding: Acceptable only where required on the drawings and shall comply with AWS D 1.4
   1. Welding material, wire cuttings, and tramp metal shall be thoroughly cleaned from forms for exposed concrete before any concrete is placed.
   2. Do not use tack welds in welding processes.
   3. Welding is not permitted within two bar diameters of cold bends.

D. Clean reinforcement of loose rust and mill scale, earth, ice, and contaminants that may inhibit or compromise bond with concrete.

E. Install welded wire fabric in as long lengths as practicable. Lap adjoining pieces at least one full mesh and lace splices with wire. Offset end laps in adjacent widths to prevent continuous laps in either direction.

3.2 FIELD QUALITY CONTROL

A. As a minimum, the Owner's Quality Control Inspector will test and inspect the work to comply with the requirements of CBC Chapter 17 Special Inspections and Tests and requirements of S0.01 and S0.02. In addition to other required inspections, the following are subject to Special Inspection.
   1. Placement of reinforcing steel.
   2.
   3. Installation of deformed bar anchors to be tested in accordance with Section 7.1 of AWS D1.1.
   4. Testing and inspection of mechanical splices and reinforcing couplers to conform to manufacturer's recommendations and ICC-ES requirements.
   5. Where reinforcement cannot otherwise be kept properly aligned, provide additional bracing ties, stirrups, and other items as necessary.

END OF SECTION

SECTION 03 30 00 – CAST IN PLACE CONCRETE

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes requirements for cast-in-place concrete as indicated and specified herein.
   1. Comply with requirements of the General Structural Notes on S-Series drawings; completed structures shall support loads and resist forces per criteria therein.

B. Definitions: Comply with ACI 116R Cement and Concrete Terminology unless otherwise required.

1.2 ADMINISTRATIVE REQUIREMENTS

A. Preinstallation Conference: Convene sufficiently in advance of the start of concrete work to allow for adjustments to work plan, means and methods as necessary to comply with Contract requirements. Review concrete design mixes, submittals, work schedule and sequence, inspection and testing protocols, curing requirements, finish appearance and coordination of penetrations to accommodate building services and other construction.
   1. Compliance with tolerance requirements for F_L and F_F measurements.
   2. Coordination with Section 03 35 20 for work of this Section to receive special concrete finish.
   3. In addition to lower tier contractors, the ready-mix producer and all other affected parties shall attend.

B. Coordinate Schedule and sequence for work of this Section with finish flooring in Sections 09 30 00, 09 65 00, 09 67 00 and 09 68 13 to permit a minimum of 90 days cure while protected from precipitation and other sources of moisture (including moisture generating construction operations) prior to earliest date for beginning of finish floor application.
   1. Coordination of measures to prevent excess moisture and alkalinity in concrete slabs for grade supported and composite construction. Perform work in accordance with Contractor's approved vapor emission control plan.

C. Wash-Down of Concrete Supply Trucks and Related Equipment: Not permitted on Site except where Contractor demonstrates acceptable means for collection and containment of effluent for return to ready-mix plant by supply vehicle.

1.3 SUBMITTAL.S

A. Product Data: Required for each material and product to be incorporated into the Work.
   1. Building Product Disclosure and Optimization – Environmental Product Declarations (EPD's): Provide Manufacturers Life Cycle Analysis conforming to ISO 14044, Product-specific Type III EPD.
   2. Building Product Disclosure and Optimization – Sourcing of Raw Materials, Recycled Content: Certification from manufacturer stating the percentage by weight of post-consumer and pre-consumer (post-industrial) recycled content.

B. Samples: Submit samples of materials as specified and as otherwise requested by Architect, including names, sources and descriptions.

C. Laboratory Test Reports: Required for concrete materials and mix design.

D. Material Certificates: Signed by manufacturer and Contractor; Submit in lieu of laboratory test reports as acceptable to Architect, demonstrate compliance with requirements.
1. Certification of admixtures compatibility by Contractor's approved technician.

E. Mix Design: Written proposal for each concrete mix and strength required submit 15 days prior to start of Work. The mix design shall list the following:
1. All materials and admixtures and their proportions.
2. Water-cement ratio, slump, and aggregate grading.
3. Evidence that mix design meets the strength requirements: Compression test data (field experience method) or results of testing (trial batch method) used to establish mix proportions.
4. Indicate materials sources for principal constituents.
5. Whether the mix is appropriate for pumping.
6. Evidence of ability of mix to meet requirements for limited shrinkage.
7. Evidence that mix design meets or exceeds the Global Warming Potential minimums listed in Section 2.4.

F. Submit schedule of concrete placement operations before commencing Work, show on one or more plans or elevations, locations of construction, contraction and expansion joints.
1. Contractor's Moisture Emission Control Plan: Provide as required for Project Coordination.

1.4 QUALITY ASSURANCE

A. Comply with the following except where otherwise indicated and where more stringent requirements obtain.
1. ACI 301 Specifications for Structural Concrete for Buildings.
2. ACI 303 Guide to Cast-In-Place Architectural Concrete.
3. ACI 304 Recommended Practice for Measuring, Mixing, Transporting and Placing Concrete.
4. ACI 305 Hot Weather Concreting.
5. ACI 306 Cold Weather Concreting.
6. ACI 309 Recommended Practice for Consolidation of Concrete.
7. ACI 318 Building Code requirements for Reinforced Concrete.
8. California Building Code (CBC), 2022.

B. Provide an admixture technician for the Work having ACI Level 2 Concrete Technician or other acceptable professional certificate and expert knowledge of the specific products and materials in the mix design including but not limited to admixtures. The technician shall approve each mix design proposed for the Work, assist in proportioning concrete materials for optimal results, and advise on proper admixture use, potential undesirable and uncontrolled effects and propose mix adjustment to meet Project conditions.

1.5 PROJECT CONDITIONS

A. Environmental Requirements: Do not place concrete when weather conditions may reduce performance characteristics, and prevent proper finishing, and curing.

B. Coordinate Schedule and sequence for work of this Section with finish flooring in Sections 09 30 13, 09 65 00, 09 67 00 and 09 68 13 to permit a minimum of 90 days cure while protected

from rain fall and other sources of excess moisture (including moisture generating construction operations) prior to earliest date for beginning of finish floor application.

1. Coordination of measures to prevent excess moisture and alkalinity in concrete slabs, both elevated and non-elevated.

PART 2 - PRODUCTS

2.1 CONCRETE

A. Portland Cement: ASTM C 150, Type II. Use one brand of cement throughout project, unless otherwise acceptable to Architect.

B. Normal Weight Aggregates: From a single source, comply with ASTM C 33, and as herein specified. Do not use aggregates containing deleterious nor alkali reactive substances.

C. Light Weight Aggregates shall conform to C330.

D. Water: Plant-batched concrete shall include a minimum of 6 percent recovered wash-down water measured by volume of total mix. Recovered wash-down water shall be treated by settling, filtration and other acceptable means to remove deleterious materials prior to incorporation into mix.

2.2 ADMIXTURES

A. Subject to compliance with specified requirements, provide one of the listed products for each admixture used; substitution proposals shall comply with requirements of Section 01 33 00.

B. Calcium chloride and admixtures containing more than 0.1 percent calcium chloride ions shall not be used.

C. Coordinate admixtures to ensure compatibility. Prevent unpredictable and noncontrolled side effects and reactions between mix components and provide certification of compatibility signed by Contractor’s admixture technician.

D. Air-Entraining: ASTM C 260.
   1. Darex AEA; GCP Applied Technologies.
   2. MB AE-90; Master Builders.

E. Water Reducer: ASTM C 494, Type A.
   1. Darex WRDA-79; GCP Applied Technologies.
   2. Pozzolith; Master Builders.

F. High Range Water Reducer: ASTM C 494 Type F or G, add at batch plant. Reduce water content 30 to 40 percent, extend plasticity up to 2.5 hours, increase concrete strength at all ages, and maintain, at varying temperature, setting characteristics similar to concrete without admixture.
   1. Rheobuild 1000; Master Builders.

G. Water-Reducing, Non-Chloride Accelerator Admixture: ASTM C 494, Type E.
   1. Darex WRDA Type III; GCP Applied Technologies.
   2. Pozzutec 20; Master Builders.

H. Water-Reducing, Retarding Admixture: ASTM C 494, Type D.

1. Daratard; GCP Applied Technologies.
2. Pozzolith 300-R; Master Builders.

I. Fly Ash: ASTM C 618 (including Table 2A) Type F or Type C, subject to approval of mix design data.

J. Ground Blast Furnace Slag: ASTM C 989.

2.3 ACCESSORIES

A. Non-Shrink Base Plate Grout: Premixed compound using natural non-metallic aggregate and conforming to Corps of Engineers' CRD-C621-81.
1. Compressive Strength: 2,400 psi in 48 hours and 5,000 psi minimum in 28 days.
2. Five-Star Grout by US Grout Corporation; Masterflow 880 grout by MasterBuilders; or approved.

B. High Strength Non-shrink Grout: Masterflow 928 grout by Master Builders; Sika Grout 212 by Sika Corporation or approved.
1. Fluid Grout: CRD-C611-81, flow of 22 to 30 seconds, one hour after batching, at 40 to 100 degrees F.
2. Strength: 2,500 psi at 24 hours, 4,500 psi at three days, and 7,000 psi at 28 days.

C. Absorptive Cover: Burlap cloth, 9 ounce per sq.yd. complying with AASHTO M 182, Class 2.

D. Moisture-Retaining Cover: Complying with ASTM C 171. Waterproof paper, or polyethylene film.

E. Evaporation Reducer: BASF Confilm, L&M E-CON or approved.

F. Epoxy Adhesive: ASTM C 881 Type, Grade and Class as required. Two component, moisture insensitive, shear bond to concrete of 1400 psi.
1. Subject to conformity to conditions of application and manufacturer's recommended uses the following may be acceptable: Sonnoborne, EpoGel; Master Builders, Brutem MP or Ceilcote 648 CP Plus; Sika, Sikadur 32 Hi-Mod.

G. Patching Mortars:
1. Vertical and non-traffic surfaces: Two-part latex cement and bonding agent suitable for interior and exterior repairs, and feather edge application to 0.0625-inch thickness; Set Latex Cement, Master Builders, or approved. Conventional portland cement mortar and latex additive or bonding agent are not acceptable.
2. Horizontal Trafficked Surfaces: One part (dilute with water) self-leveling, polymer modified industrial topping traffic surface. Repair damaged and rough floors not complying with required tolerances. ChemRex MBT Topping 112.

H. Densifier and Hardener: Comply with Section 03 35 200 and requirements for sealed concrete.

2.4 MIXES

A. Select mix designs based upon the minimum required strengths provided in the General Structural Notes and mixes that demonstrate a reduction in Global Warming Potential (GWP) for the region in units of kgCO2e from manufacturer's baseline mixes.

B. Source mixes within 10 miles of the project site.

C. Mix Design: As specified in ACI 301 for each type of concrete required, use laboratory trial batch or field experience methods.
   1. Mix Design Proposal: Submit in advance of production to avoid delay in Work, do not begin concrete production prior to Architect's review.

D. Standard Mix Characteristics: Comply with General Structural Notes.
   1. Flatwork to receive diamond polish finish shall use only one mix design; use of fly ash in this mix is not acceptable.
      a. Aggregate: 0.375-inch minus.

E. Admixtures: Comply with manufacturer's recommendations for use.
   1. Water Reducer: All concrete, except where high-range water reducer required, reduce water content by at least 12 percent.
   2. Air Entraining: Concrete exposed to weather, and freeze/thaw cycles; percentage required in ACI 301, measured per ASTM C 231 and C 138.
   3. Accelerator: Slabs placed in ambient temperatures below 50 degrees.

F. Transit Mixed Concrete: Conform to ASTM C 94; when air temperature is between 85 and 90 deg F (30 and 32 deg C), reduce mixing and delivery time from 1.5 hours to 75 minutes; when air temperature is above 90 deg F (32 deg C), reduce mixing and delivery time to 60 minutes.
   1. Do not add water after leaving the concrete plant.

G. Adjustment to Concrete Mixes: Mix design adjustments may be requested by Contractor when characteristics of materials, job conditions, weather, test results, or other circumstances warrant; Acceptable to Architect and at no change in Contract amount.
   1. Submit laboratory test data for revised mix design and strength results for approval before using in work.

2.5 SOURCE QUALITY CONTROL

A. Concrete Testing Service: Engage a Special Inspection and testing laboratory acceptable to Architect to perform material evaluation tests and design concrete mixes as indicated on S0.01 and as otherwise required for the Work.

B. Concrete supplier shall provide a knowledgeable, trained admixture technician and acceptable to the Architect to assist in proportioning concrete materials for optimal results and advise on proper admixture use and mix adjustment to meet Project conditions, at no change in contract amount.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Prior to placing concrete inspect placement of reinforcing, verify that formwork is ready to receive concrete, and that items to be cast-in and embedded are in place. Coordinate the Work of other trades to permit setting and installation of their Work.

3.2 INSTALLATION

A. Placing Concrete: Convey and deposit to ensure a continuous flow at delivery without separation of materials, limit drops to 60 inches for unexposed work and 36 inches for exposed work. Maintain reinforcing in proper position during placing.
   1. In Forms: Horizontal layers up to 24 inches deep, place each layer while preceding layer is still plastic, avoid cold joints between layers.
   2. Slabs: Place and consolidate in a continuous operation to limits of construction joints and to elevation indicated; Surfaces complying with flat and level tolerances requirements and as otherwise necessary for required specified.
      a. Topping Slabs for Composite Deck: Comply with recommendations of deck manufacturer for preparation and placement.

B. Consolidation: During placing by mechanical vibrating equipment, provide even dense surfaces, prevent honeycomb, rock pockets and voids.
   1. Do not use vibrator to transport concrete inside forms. Place at regular intervals within machine's visible effective range.
   2. Rapidly penetrate placed layer and at least 6-inches into preceding layer. Do not insert vibrator into lower layers of concrete that have begun to set.
   3. For exposed concrete keep vibrator on the unexposed side of reinforcing steel, or 2.5 inches away from form surface.

C. Contractor shall apply their best skill and attention to control materials and placement operations to ensure completed concrete slabs are acceptable for applied finish flooring and other finish treatments. Comply with ACI 302.1R recommendations for screeding, restraightening, and finishing operations for concrete surfaces and referenced Sections of ACI 301.
   1. Flatwork: Provide evaporation retarder throughout grade supported concrete and concrete at composite metal deck in the manufacturer's recommended sequence and application procedure.
   2. Utilize placement method and equipment to ensure compliance with F_F and F_L requirements.
   3. In addition to other means and methods, the following procedures may be representative of effort necessary to produce concrete work complying with specified tolerances.
      a. Following disappearance of bleed water, power float the surface across the width of the strip; following paste generating float passes re-straighten surface with 10-foot highway straight edge applied in two directions at 45-degree angle to strip.
      b. Power Trowel surface with multiple passes and re-straighten by multiple passes with highway straightedge.

D. Cold Weather Placing: Comply with ACI 306 and Section 5 of ACI 301. At ambient temperature below 40-degrees F (4-degrees C), uniformly heat water and aggregates before

mixing, provide a mixture temperature conforming to recommendations of ACI 306. Maintain protection for minimum times recommended in ACI 306.

1. Do not use frozen materials, nor material containing ice. Do not place concrete on frozen subgrade.

E. Hot Weather Placing: Comply with ACI 305. Cool water and aggregates before mixing, maintain concrete temperature at time of placement below 90 degrees F (32 degrees C). Cool reinforcing with wet burlap, keep steel temperature at or below ambient air temperature until embedment in concrete.

1. Use specified water reducer to control concrete temperature rise during adverse placing conditions.

F. Curing: Start initial curing as soon as free water has disappeared from concrete surface after placing and finishing. Begin final curing immediately following initial curing and before concrete has dried, and continue for seven days. Conform to ACI 308 and the following.

1. Moist Cure: Prevent drying of concrete, keep formwork and concrete continuously wet with water by flooding, fog spray or saturated absorptive cover.
   a. Absorptive Cover: Place contiguously over concrete surfaces in widest widths practical, with edges lapped 4 inches.
2. Moisture Retaining Cover: Place contiguously over concrete surfaces in widest widths practical, with edges lapped 4 inches and sealed with tape. Repair holes as they occur throughout curing period.
3. Monitor the curing operations as required to ensure the concrete surfaces remain fully wetted and that cover materials are not displaced during the full curing period; at a minimum, the curing method shall be checked every 8 hours, including Saturdays, Sundays, and holidays

G. Joints: Make panels and locate joints as indicated. See Section 07 92 00 for joint filler and sealant requirements. Abrasively treat bond surfaces at construction joints, base plates and similar. Clean and roughen the entire bond surface to a 0.25-inch amplitude, exposing coarse aggregate solidly embedded in mortar matrix. Roughen concrete surface while concrete is still green. Remove surface contaminants, laitance, loosened particles of aggregate and friable material.

1. Control Joints: Comply with ACI 301 5.3.5; saw-cut joints between finish and final set operations. Provide joint width of 0.0625 inch. Saw shall have mechanical means for limiting the depth of joint cuts. Properly maintain tools during cutting including changing of blades and anti-ravel skid-plate as required.
2. Construction Joints: Comply with Section 03 11 00 requirements.
3. Edges at Topping Slab Blockout: Where joint is exposed in completed work coordinate joint profile and appearance with requirements of Section 03 35 20.

3.3 FINISHING

A. Formed Surfaces: As specified herein, and as defined in the referenced subsections of ACI 301 Chapter 5, apply at following locations.

1. Formed Finish: 5.3.3.3.a; surfaces concealed by other construction, unless otherwise indicated; 5.3.3.4.a; surfaces with directly applied waterproofing, finish coatings, and coverings.
2. As-Cast, Smooth Form Finish: Work required to remain exposed to view with no additional processing or other applied finish.
3. Finish Processing of As-Cast Work: Working from as-cast smooth-formed surface apply to select components exposed to view in the completed Work.

a. Hand-stoned finish; corners consolidated and finished using a granite rubbing stone or other method per approved mock-up.

4. Adjacent Unformed Surfaces: 5.3.3.5
5. Cure: Moist cure.

B. Concrete designated CONC-5: At cast in place concrete stem walls, site retaining walls and where indicated in Drawings, form for smooth wall finish with reveals as detailed and at designated spacing. Strip formwork at Engineer of Record's earliest allowed interval and provide hand-stoned finish within 24 hours of form removal at surfaces exposed to view in final work.

C. Monolithic and Composite Slabs: As specified herein, and as defined in the referenced subsections of ACI 301 Chapter 5. In general, addition of water on site to ready mix concrete is not acceptable. It is understood that such adjustment to the mix may be desired by the Contractor, the Contractor shall keep accurate record of the specified batch, the quantity of water added and where the concrete was placed, failure to do so may result in rejection of the concrete. Where water is added the Contractor shall be responsible for elevated moisture levels and alkalinity, low strength development and any other defects.

1. Surfaces to receive bonded application of subsequent material including but not limited to paint, ceramic tile, and other finishes or coverings shall have a trowel finish per 5.3.4.2.c and coordinated with work of Division 9 Sections.
   a. When recommended by the manufacture of subsequent applied material provide surface texture with recommended amplitude.
2. Broom Finish: 5.3.4.2.d; provide at exterior traffic surfaces unless otherwise required, provide a 2-inch-wide smooth margin at all perimeter terminations. Coordinate final finish with Architect before application.
3. Slip Resistance of Interior Traffic Surfaces: Compliance with minimum recommendations for specific service environment and flooring type when evaluated per HB 198/AS 4663-2013 test pendulum slip test method.
4. Cure: Contractor option using either moist cure or absorptive cover methods. Provide specified evaporation retarder on all concrete slabs and composite metal deck slabs.

D. Concrete to receive special finishing work of Section 03 35 00 shall be protected from stains due to construction processes, and markings of any kind. Prevent conditions and damage that could alter the appearance of the finished concrete and coordinate with special finishing requirements.

3.4 MISCELLANEOUS CONCRETE ITEMS

A. Filling-In: Fill-in holes and openings left in concrete structures for passage of work by other trades, unless otherwise shown or directed, after work of other trades is in place. Mix, place and cure concrete as specified, to blend with in-place construction. Provide other miscellaneous concrete filling shown or required to complete work.

B. Interior Curbs: Monolithic finish, strip forms while concrete is still green, and steel-trowel to a hard, dense finish, radius corners, intersections and terminations one inch.

C. Equipment Bases and Foundations: Provide machine and equipment bases and foundations, as indicated. Set anchor bolts for machines and equipment to template at correct elevations, complying with certified diagrams or templates of manufacturer furnishing machines and equipment.

1. Grout base plates and foundations as indicated, using non-shrink base plate grout.

2. Provide high strength non-shrink grout to anchor reinforcing steel, threaded rods, and similar embedded items.

D. Steel Pan Stairs: Provide concrete fill for steel pan stair treads and landings and associated items. Cast-in safety inserts and accessories as shown on drawings. Screed, tamp, and finish concrete surfaces as scheduled.

E. Cast-In-Place Stairs: Comply with CBC Section 1009, ANSI 1264.1 and barrier free access requirements of ANSI A117.1
1. Dimensional Uniformity of Stairs: CBC Section 1009.7.
2. Ramps: Comply with CBC Section 1010, ANSI 1264.1, and applicable requirements of stair assemblies for uniformity in the Work.

F. Wash-Down of Concrete Supply Trucks and Related Equipment: Not permitted on Site except where Contractor demonstrates acceptable means for collection and containment of effluent for return to redi-mix plant by supply vehicle.

3.5 TOLERANCES

A. Compliance With Tolerances: Determined once concrete has fully cured, but not sooner than 28 days after placement. Concrete that does not conform to tolerances will be determined to be non-compliant. The Contractor shall correct concrete work to eliminate defects and variations exceeding specified tolerances.
1. General Tolerances: ACI 117 Section 4 except as otherwise required.
2. Conduct survey of supporting formwork and steel prior to concrete placement. Survey points shall be taken at columns and mid-points of bays between columns.
Re-survey at same locations once concrete is placed and hardened. If formwork and/or shoring utilized, conduct surveys prior to removal of formwork/shoring and within 1-day of removal.
3. Report all survey results within two (2) days of survey to design team.

B. On-Grade and Composite Slabs: Levelness requirements do not apply where sloped surface is required. Correct surfaces that do not conform to tolerance limitations by grinding high points and filling low points with approved leveling compound, except as otherwise required for work of Section 03 35 00.
1. Flatness and Level: ACI 117; Flat per Section 4.5.6 and ASTM E 1155.
2. Flatness and Level: F_F 30 and F_L 20 with minimum values not less than F_F 15 and F_L 10; except flatwork to receive diamond polished finish shall have F_F 50 and F_L 30 with minimum values not less than F_F 25 and F_L 15; evaluated per ACI 117 and ASTM E 1155.

C. Coordinate concrete work with requirements for applied finish flooring and other finish treatments. Contractor shall apply their best skill and attention to control materials and placement operations to ensure complete concrete slabs are acceptable for finish floor installation after testing per ASTM F 117 per Section 09 65 00 requirements.

3.6 CONCRETE SURFACE REPAIRS

A. The Contractor is responsible for correction work which does not conform to the specified requirements, including strength, tolerances and finishes. Correct deficient concrete as directed by the Architect.

B. Patching Defective Areas: Repair and patch defective areas with epoxy adhesive and patching mortar; cement mortar may be used only on uncured, green concrete and only when acceptable to Architect. Replace cured, and defective concrete that cannot be repaired to Architect's satisfaction.
   1. Exposed Surfaces: Blend patching mortar to match color and texture of adjacent cured concrete. Compact mortar in place and strike-off slightly higher than surrounding surface.

C. Cut out honeycomb, rock pockets, voids over 1/2 inch in any dimension, and holes left by tie rods and bolts, down to solid concrete but, in no case to a depth of less than 1-inch.
   1. Cut edges perpendicular to concrete surface. Clean patch area, dampen with water, and apply epoxy adhesive. Place patching mortar as recommended by manufacturer of epoxy adhesive.

D. Exposed Formed Surfaces: Repair defective concrete, replace concrete that cannot be repaired to satisfaction of Architect.
   1. Flush out form tie holes, fill with dry pack mortar, or precast cement cone plugs secured in place with epoxy adhesive.

E. Concealed Formed Surfaces: Repair defects effecting concrete durability, replace concrete that cannot be repaired to satisfaction of Architect.

F. Repair of Unformed Surfaces: Test slabs for flatness, levelness, and slope to drain.
   1. Repair surfaces containing defects effecting concrete performance including crazing, cracks wider than 0.01-inch cracks that penetrate to reinforcement, cracks that completely penetrate non-reinforced sections regardless of width, spalling, pop-outs, honeycomb, rock pockets and other objectionable conditions.
   2. Grind high areas after concrete has cured at least 14-days.
   3. Cut-out low areas and replace with fresh concrete during, or immediately after completion of surface finishing operations.

G. Perform structural repairs with prior approval of Architect for method and procedure, using specified epoxy adhesive and mortar.

H. Proprietary patching compounds and repair methods not specified above may be used, subject to acceptance of Architect.

3.7 FIELD QUALITY CONTROL

A. The Owner will employ a testing laboratory to perform tests and to submit test reports.

B. Sampling and testing for quality control during placement of concrete may include the following, as directed by Architect.
   1. Sampling Fresh Concrete: ASTM C 172, except modified for slump to comply with ASTM C 94.
   2. Slump: ASTM C 143; one test at point of discharge for each day's pour of each type of concrete; additional tests when concrete consistency seems to have changed.
   3. Air Content: ASTM C 173, volumetric method for lightweight or normal weight concrete; ASTM C 231 pressure method for normal weight concrete; one for each day's pour of each type of air- entrained concrete.
   4. Concrete Temperature: Test hourly when air temperature is 40-degrees F (4-degrees C) and below, and when 80-degrees F (27-degrees C) and above; and each time a set of compression test specimens made.

5. Compression Test Specimen: ASTM C 31; one set of 3 standard cylinders for each compressive strength test, unless otherwise directed. Mold and store cylinders for laboratory cured test specimens except when field-cure test specimens are required.
6. Compressive Strength Tests: ASTM C 39; one set for each 100-cubic yards or fraction thereof of each concrete class placed in any one day; or for each 5000-square foot of surface area placed; one specimen tested at 7-days, one specimen tested at 28-days, and one specimen retained in reserve for later testing if required.
    a. When total quantity of a given class of concrete is less than 50-cubic yards, strength tests may be waived by Architect if, in his judgment, adequate evidence of satisfactory strength is provided.
    b. When frequency of testing will provide less than 5 strength tests for a given class of concrete, conduct testing from at least 5 randomly selected batches or from each batch if fewer than 5 are used.
    c. When strength of field-cured cylinders is less than 85-percent of companion laboratory-cured cylinders, evaluate current operations and provide corrective procedures for protecting and curing the in-place concrete.
    d. Strength level of concrete will be considered satisfactory if averages of sets of three consecutive strength test results equal or exceed specified compressive strength, and no individual strength test result falls below specified compressive by more than 500 psi.

C. Test results will be reported in writing to Architect and Contractor within 24-hours that tests are made. Reports of compressive strength tests shall contain the project identification name and number, date of concrete placement, name of concrete testing service, concrete type and class, location of concrete batch in structure, design compressive strength at 28-days, concrete mix proportions and materials; compressive breaking strength and type of break for both 7-day tests and 28-day tests.

D. Nondestructive Testing: Impact hammer, sonoscope, or other nondestructive device may be permitted but shall not be used as the sole basis for acceptance or rejection.

E. Additional Tests:
1. The testing service will make additional tests of in-place concrete when test results indicate specified concrete strengths and other characteristics have not been attained in the structure, as directed by Architect.
2. Testing service may conduct tests to determine adequacy of concrete by cored cylinders complying with ASTM C 42, or by other methods as directed.
3. Contractor shall pay for such tests conducted, and any other additional testing as may be required, when unacceptable concrete is verified.
4. Where initial test for moisture or alkalinity indicate levels not acceptable for application of required finish floor, additional tests shall be made by the Owner's agent at the Contractor's expense, until results demonstrate acceptable levels have been achieved.

F. Field Testing of Walking Surface: Evaluated per ANSI B101.1 and ANSI B101.3; Static and Dynamic Coefficient of Friction not less than 0.42 and 0.35 respectively and comply with referenced NFSI performance characteristics.
1. Testing Incidence: Not fewer than one test specimens for every 500 square feet and as otherwise necessary for a representative sampling per the test methodology
2. Tribometer: Certified per ASTM F 2508

3.8 PROTECTION

A. Protect concrete from premature drying, temperature extremes, and mechanical injury. Comply with Section 5.3.6.4 of ACI 301.

END OF SECTION

SECTION 03 31 13 – SEALED CONCRETE

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes materials, mixes, accessories, and Work necessary and required for cast-in-place concrete as indicated and specified herein.

B. Definitions: Per ACI CT-13 and as follows.
1. Concrete Finishing: Leveling, smoothing, consolidating and otherwise treating surfaces of fresh, recently placed concrete necessary to produce surfaces on both concrete slabs and composite metal deck and concrete complying with the requirements of this Section.
2. Power Trowel: Motor-driven, radial arm, orbiting steel trowel machine used in concrete finishing process to produce a dense and hard surface on concrete slabs that is superior to hand-troweled work.
3. Sealed Concrete: Identifies concrete flatwork to receive specified finish system of potassium silicate surface hardener and burnished sealer.

C. Related Sections
1. 01 81 13.71 Sustainable Design Requirements – CALGreen Non-Residential Mandatory.
2. 03 30 00 Cast in Place Concrete.

1.2 REFERENCES

A. California Code of Regulations, Title 24, Part 11 California Green Building Standards (CALGreen).

B. California Building Code (CBC), International Building Code with California Amendments, California Code of Regulations, Title 24, Part 2.

C. ADA Standards – Americans with Disabilities Act (ADA) Standards for Accessible Design, 2010.

1.3 ADMINISTRATIVE REQUIREMENTS

A. Pre-Construction Conference: Held not less than 30 days prior to date scheduled for start of concrete work. Review concrete design mixes, submittals, work schedule and sequence to accommodate required mock-up, construction procedures, schedules for testing, inspection, and certifications. the finish appearance requirements, reveal locations, joint spacing.
1. Coordination for concrete work to remain exposed to view in the completed building including but not limited to as-cast finish concrete and concrete flatwork to receive special finish processes; address formwork, mix design, placement, finishing and curing requirements.
a. Review requirements for preventing marking, staining and damage to concrete substrates and provisions for protection of finished surfaces from subsequent construction activity.

b. Ensure all construction personnel are informed of concrete flatwork to remain exposed as finish flooring in the complete building and exercise necessary care in the conduct of the Work to ensure best possible appearance.

2. Where possible given the schedule and sequence of the Work the applicator for work of sealed concrete shall participate in the conference. Conduct a subsequent, conference to review approved preparation and finish process and field sample.

1.4 SUBMITTALS

A. Product Data: Required for each material and product to be incorporated into the Work.

B. CALGreen Submittals:
1. Product Data – VOC Limits: For adhesives, sealants, fillers and primers, documentation including printed statement of VOC contents, comply with limits specified.
2. Low VOC / No VOC Paints and Coatings: Provide certification that all primers and coatings meet VOC Emission Limits. List manufacturer, brand, application, type (flat or non-flat), and the VOC emissions (gal/L).

C. Provide narrative of work procedures and protection to prevent damage and degradation in appearance of concrete due to construction activities. Coordinate with construction schedule and identify sequence for application of concrete sealer.

D. As directed provide an approved field sample of sealed concrete prior to start of work.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. VOC limits for adhesives, sealants, fillers, primers and coatings: Comply with CALGreen limits.

2.2 MATERIALS

A. Concrete Densifier, Hardener and Sealer, Matte Finish: Basis of Design product is Curecrete Ashford Formula; chemically reactive, water-based surface penetrant producing crystalline structure filling concrete surface pores and voids.
1. Densifiers by ProSoCo (Consolideck) and Convergent Technologies (Pentra-Sil) may be acceptable with Architect approval, Reference Section 01 25 00 for Substitution Procedures.
2. Description: colorless, transparent, odorless, non-toxic and non-flammable concrete densifier, hardener and sealer allowing floor traffic within 3 hours, completing final chemically reactive process within 3 months, and developing a burnished concrete surface appearance over time.
a. Provide solvent free, zero VOC product.

B. Concrete Sealer, Gloss Finish: Waterborne concrete sealer producing a glossy, highly abrasion resistant floor finish.
1. Provide Basis of Design product LM Company SCOFIELD SelectSeal Plus, or equal, as approved by Architect. Reference Section 01 25 00 for Substitution Procedures.

2. Description: High-solids, low-odor, self-crosslinking, urethane fortified acrylic sealer manufactured for uncolored and colored interior concrete slab protection.
   a. VOC Content: 100 g/L or less.

C. Repair Underlayment and Overlayment: Cement-based, polymer-modified, self-leveling product applied in 1/8-inch thickness tapering to feathered edge and in 1/8-1/4-inch thickness fill (patch) over scarified surface, respectively.
1. Cement Binder:
2. Primer: As recommended by manufacturer for substrate, conditions and application.
3. Aggregate: Coarse sand; Well-graded, washed gravel, 1/8- ¼ as recommended by manufacturer.
4. Compressive Strength: 28-day compressive strength of 6,000 psi or greater when tested to ASTM C 109.

PART 3 - EXECUTION

3.1 CONCRETE SEALING

A. Clean floor to a roughness average 250 µin evaluated per CSDA Standard 115 Measuring Concrete Micro Surface Texture and as otherwise necessary to remove all evidence of construction wear, stains and soiling.

B. Apply specified solution at a rate approved method to ensure full wetting of surface without perched liquid on the surface or flood coat consistent with product manufacturer's instruction. Gently agitate solution during application to enhance absorption by the concrete where required. Surface shall appear damp or wet for 15 to 20 minutes following application unless otherwise indicated in manufacturer's standard installation instructions or where additional application must be provided.
1. Allow sufficient time for material to cure fully cure before use.

C. Examine floor to identify defects and characteristics that are not acceptable for sealer application; correct all unacceptable conditions as necessary.

D. Refine surface by tool processing to CSDA Standard 115 Surface Texture Grade B-3, Ra 64.

E. Apply specified sealer using pump-sprayer and microfiber mop unless otherwise acceptable. Follow cure mechanically burnish surface using propane driven machine and approved burnishing pads; make multiple passes in opposing directions as necessary to match appearance of approved Field Sample.
1. Slip Resistance of Finished Traffic Surfaces: Performance recognized as high traction and slip resistant by National Floor Safety Institute or other acceptable Standards body when evaluated as required for Field Quality Assurance requirements of this Section.

3.2 REPAIRS

A. Propose repair methods for Architect's review and approval; perform proposed repair testing on approved sample panel to verify patch color and texture match prior to repairing permanent Work. Remove and replace cast-in-place concrete that cannot be repaired and cured to the Architect's approval.

END OF SECTION

SECTION 03 35 20 – SPECIAL FINISHING

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes requirements for finished appearance of cast-in-place concrete slab indicated as SC1 on A-Series sheets and as otherwise required by the Contract Documents.

B. Definitions: As established by the Concrete Polishing Association of America (CPAA).

1.2 ADMINISTRATIVE REQUIREMENTS

A. Preinstallation Conference: Where possible given the schedule and sequence of the Work the applicator for work of this Section shall participate in the conference specified in Section 03 30 00 Cast-In-Place Concrete. The Contractor shall conduct a subsequent, additional conference to review approved Finish Process and mock-up. Identify corrective measure for non-compliant F_F and actions necessary to ensure quality results. Verify temporary controls, and protection are in place or will be available prior to start of work.
   1. Coordinate requirements for treatment of joints, embedded items including but not limited to radiant slab piping and embedded floor boxes, detail finishing and similar related tasks.
      a. Procedure for maintaining level transition across threshold of elevator openings and similar conditions
   2. Confirm work of this Section will be conducted to match the appearance of the approved mock-up at no additional cost to the Owner.
   3. Review requirements for preventing marking, staining and damage to concrete substrates and provisions for protection of finished surfaces from subsequent construction activity.

1.3 SEQUENCE

A. Special Finish on Concrete: Defer application of special finish to limit exposure of finish surfaces to subsequent construction activity. Coordinate construction sequence and finishing work avoid conditions that would restrict access for finishing equipment.
   1. Provide and maintain all necessary protection of processed surfaces to prevent damage, wear and alteration in appearance due to subsequent work activities of any nature. Ineffective and improperly maintain protection will basis for rejection of work and remedial measures necessary to correct unacceptable appearance and conditions.

1.4 SUBMITTALS

A. Product Data: Required for each material and product to be incorporated into the Work.

   1. Certification of Mix Design Review: Finish applicator’s review of the mix design submitted per Section 03 30 00 Cast-In-Place Concrete and all salient information on placement, and cure of concrete flatwork to receive special finish work of this Section.

2. Finishing Equipment: Provide equipment size, weight and intended role in finishing process and demonstrate suitability of specific equipment proposed for the Project giving particular attention to the location, size and configuration of the area to be finished.
3. Walking Surface Test Data: For similarly finished concrete flatwork previously produced by the Contractor's finish applicator demonstrating compliance with coefficient of friction and traction value requirements for work of this Section.

B. Shop Drawings: Indicate locations for field samples, and verification of location where Special Finish is required. Detail areas where hand tools are proposed for application of finish. Indicate control joints to be filled and location of F_F measurements and values associated with each location.

C. Finish Process: Submit written proposal 60 days prior to start of finish work of this Section and prior to mock-up submittal. Detail methods, equipment, personnel, and protective measures proposed for Work. Document process and schedule for each step in application of the required finish.
1. Maintenance Data: Complete information on procedures, equipment and materials necessary for routine maintenance of finished floors and periodic renovation of finish appearance.

D. Protection Plan: Provide a detailed narrative of measures proposed for prevention of wear, damage and alteration in appearance of Special Finished concrete work. The submittal will be reviewed only for compliance with requirements for advance planning of the work. The Architect will not determine the potential effectiveness of the proposed measures in preventing wear, damage and alteration in appearance.

E. Quality Assurance Submittals:
1. Applicator of Special Finish: Certification of qualifications and experience including experience with specific tools and processes proposed for use in this Project.
2. Qualifications of firm performing Micro surface texture measurements and walking surface traction evaluation; document instrument type to be used and calibration certification current as of date of field tests.

1.5 QUALITY ASSURANCE

A. Special Finish Concrete Work: Performed by expert entity having in-depth knowledge of a wide variety of finish methods and equipment suitable for the type of finish in the locations required for the Work. Applicator shall be approved by the manufacturer of the required finishing system and have a successful record of experience with this finish process and the equipment proposed for the Work. Submit documentation for five previous projects including equipment and methods used and the name of the equipment operator(s), complete information on the finishing process and photographic documentation of finishing from original surface to completion.
1. Individual in Responsible Control: For work of this Section have ACI Craftsman Certification as Commercial/Industrial Flatwork Specialist - High Tolerance or CPAA Craftsman Certification; individual shall be on site at all times work is actively in progress.

B. Qualifications of Field Testing Agent for Micro Surface Texture and Walking Surface: CSDA Certification as ST-115 Certified Operator; prior successful experience with ANSI B101.1 and 101.3 and familiarity with test instrumentation and calibration.

C. Special Finish Concrete Mock-up: Provide stepped mock-up and two finished mockups for both grade-supported and composite metal deck slabs. Initial mock-up, nominal 30 square feet as directed on concrete slab on ground floor level and elevated composite metal deck in suitable locations as determined by the Owner and General Contractor. Finish each mock-up using methods proposed in the Finish Process submittal. Provide a separate sample area of a size convenient to show graduated processing: initial step intended to remove imperfections and cement paste from slab surface and expose the sand and concrete matrix but not the coarse aggregate. Where initial mock-up is not acceptable provide subsequent mock-ups to test and validate revisions to finish procedure necessary to produce acceptable results; provide a minimum of four mock-ups at no additional cost to the Owner. Incorporate sample of joint pattern and hand tool finishing as directed. Approved, mock-up shall be maintained to verify acceptability of final work.
   1. Final Finish Surface: Demonstrate level of polish for consistency of appearance to be provided in the final work, and compliance with required clarity, sheen and walking surface requirements.
   2. When directed demonstrate repair techniques on the mock-up. Only approved techniques shall be used in the final work.
   3. Detail Tool Work: Demonstrate uniform appearance and texture match of perimeter and detail areas finished using hand-held tools and other specialized means and equipment to primary floor areas.

PART 2 - PRODUCTS

2.1 SYSTEM DESCRIPTION

A. Special Finished Concrete (PCI): Produced through a controlled incremental process. Generally subtractive processes are anticipated utilizing various methods and items of equipment appropriate for the work required and characterized as grinding by wet and dry processes and subsequent polishing. Either or both steps may require multiple grades of abrasive media, specialized tools and other work as established by the approved mock-up. The various steps, processes, means methods and equipment necessary to achieve the required finish are not limited by this Section; final determination of these shall be the responsibility of the Special Finish applicator as necessary to achieve the finish appearance specified herein and represented by approved submittals at no additional cost to the Owner.
   1. Initial grinding as determined necessary based on the average roughness, Ra determined in accordance with CSDA -ST-115 to produce the required finish surface and appearance, adapt process to multiple grindings with different grit and as otherwise necessary due to floor flatness, requirements for limited aggregate exposure and uniformity of appearance in finish surface.
      a. Filling Compound: In conjunction with initial grinding process provide regrouting and filling treatment with floor grinding per the manufacturer's recommended procedure. Provide corrective and remedial measures for cracks, voids and similar characteristics.
      b. Control Joints: Provide manufacturer's recommended traffic bearing filler suitable for required finish and complying with appearance requirements. Provide detail treatment and finish control joints and all other joint types present in the work.
   2. Chemical Treatment: Penetrating zero VOC calcium hydroxide reacting potassium-silicate treatment to harden and densify concrete surfaces by the formation of calcium silicate; provide multiple applications as necessary due to specific characteristics of the slab to be finished.

3. Mechanical Polishing of Hardener-Densifier: Using resin-bonded diamond pads remove scratch marks from previous polishing with metal bond pads and as necessary to fully activate the surface hardener-densifier chemical treatment and remove surplus residue.
   a. Adjust abrasive grit of pads and provide multiple grindings as necessary due to specific Project conditions and to ensure complete removal of surplus chemical treatment.
4. Mechanical Finish Polishing: Provide a minimum of four steps using graduated abrasive pads of resin bonded diamonds to achieve the required Surface Refinement.
5. Finishing Treatment: Soil and stain resisting penetrating surface impregnator; apply multiples coatings, but in no case less than two, as demonstrated to achieve acceptable finish appearance in approved submittals. Buff surface once material has fully cured per manufacturer's recommendations. Acceptable finish appearance may be achieved by providing the following surface characteristics.
   a. Reflective Clarity: ASTM D 5767, not less than 70.
   b. Reflective Sheen (Gloss): ASTM D 523 not less than 35.
6. Appearance of Finished Work: Provide uniform characteristics including but not limited to depth of removal of cement paste, degree of concrete matrix exposure, corresponding to CSDA ST-115 level 2 Sand Finish, and Surface Texture Grade A-3, gloss, slip resistance and all other aspects of appearance in the finished work.
   a. Provide corrective and remedial measures for cracks, voids and similar characteristics.
   b. Provide detail treatment and finish control joints and all other joint types present in the work.
   c. Provide remedial measures necessary to correct surfaces that exceeds F_F required for the Work
7. Slip Resistance of Finished Traffic Surfaces: Performance recognized as high-traction and slip resistant by National Floor Safety Institute or other acceptable Standards body when evaluated as required for Field Quality Assurance requirements of this Section.
8. Pass ANSI A137.1 Section 9.6 Dynamic Coefficient of Friction AcuTest and as otherwise necessary for compliance with barrier free access requirements.
9. Protection of Processed Concrete: Prevent wear, damage and alteration in appearance due to contact with oils, solvents, caustic substances and other materials utilized in the Work. Maintain areas routinely collect and dispose of dirt, debris, surplus materials, and other potential contaminants. Provide combination of sheet materials, traffic surfacing, padding and other protection as necessary for work activities and Project Schedule during and subsequent to the work of this Section.

2.2 MATERIALS

A. Products, Admixtures, Mix Design and Related Work: Per Section 03 30 00 Cast-In-Place Concrete and as otherwise required for work of this Section.

B. Special Finish System: Provide products of Husqvarna HiPER Floor system and associated equipment and consumables as necessary for required finish flooring system as demonstrated in approved submittals.
   1. Regrouting and Filling Treatment: Husqvarna GM 3000.
   2. Dustproof and Hardener: Zero VOC, chemically reactive liquid potassium-silicate Husqvarna Hiperhard.
   3. Finish Treatment: Husqvarna Hiperguard Premium Enhance sealer.
   4. Provide joint filler and all other accessory materials per the manufacturer's recommendations for the required finish.

PART 3 - EXECUTION

3.1 PREPARATION

A. Prior to starting work verify the following with work of Section 03 30 00 and provide corrective actions where necessary to comply with requirements of this Section.
   1. Identify F_F values of slab in each area where diamond polish finish is required and verify compliance with requirements in Section 03 30 00. Correct areas that deviate beyond specified tolerance until they are brought into compliance.
   2. Inspect flatwork to receive special finishing for stains, markings and conditions that alter or impair appearance of finished work. Identify unacceptable conditions for corrective action prior to start of special finishing work.

B. Joints: Coordinate joint location and installation with work of Section 03 30 00; provide for joint treatments as work of this Section.
   1. Provide filler matching appearance and characteristics of adjacent work where an open joint would be subject to damage due to finish application or subsequent traffic exposure.
      a. Provide detail treatment and finish control joints and all other joint types present in the work.

C. Fill cracks. correct unacceptable characteristics, damage and imperfections using products recommended by the applicator based on their prior successful experience, and per approved submittals.
   1. Block-outs: Coordinate with Section 03 11 00 and requirements for the work.

3.2 FINISH APPLICATION

A. Placement, curing, and initial finishing of concrete flatwork shall comply with Section 03 30 00 Cast-In-Place Concrete.

B. Perform finishing operations in as continuous an operation as possible. Provide uniform appearance throughout the finished Work.
   1. Provide uniform appearance across joints acceptable to Owner’s Representative.
   2. Use detail tools and other approved methods to achieve uniform finish appearance in areas not accessible to larger equipment; locations include but are not limited to perimeter walls, corners, stair treads and risers, and stair plinths, treads and risers. There shall be no visible difference between

C. Special Finish for Concrete Flatwork: Provide for cast-in-place concrete flatwork Scheduled as Coordinated with Finish Schedule designations. Per the approved finish process and as demonstrated in approved mock-up and other submittals as providing an acceptable match to the record control sample.
   1. Finishing process shall include application of surface hardener and densifier in the sequence and method determined by the applicator and per the manufacturer's recommended best practices for specific Project circumstances.
   2. Control work sequence and provide all temporary measures and controls necessary to replicate the appearance of the approved mock-up and match the record control sample.
   3. Surface Refinement: Incremental tool processing of concrete flatwork complying with CSDA Standard 115.
      a. Surface Texture Grade A-3, Ra 8 µin.
      b. Level 2 Sand Finish.

4. When necessary due to Project conditions or other considerations propose revisions to the Finish Process for review. Revisions to the Finish Process shall be provided at no additional cost to the Owner.

D. Coordinate subsequent work to ensure finished concrete is free from damage and deterioration at Substantial Completion.

3.3 FIELD QUALITY REPORT

A. Provide measuring and evaluation of concrete micro surface texture in accordance with CSDA-ST-115 Measuring Concrete Micro Surface Texture as work of this Section
1. Flatness and Level: F_F 50 and F_L 30 with minimum values not less than F_F 25 and F_L 15; evaluated per ACI 117 and ASTM E 1155.
2. Reflective Clarity and Gloss: Evaluate per ASTM D 5767 and ASTM D 523 following surface refinement and prior to additional work including but not limited to sealer application.

B. Field Testing of Walking Surface
1. Evaluated per ASTM E 303 or as modified for the British Pendulum Tester or AS/NZS 4586.
a. Testing Incidence: Not fewer than one test specimens for every 1000 square feet and as otherwise necessary for a representative sampling per the test methodology
b. Tribometer: Certified per ASTM F 2508

C. Review recommendation of the manufacturer of the specified Finish System materials for the finish floors including products, procedures and frequency.

END OF SECTION

SECTION 03 35 46 – VAPOR EMISSION CONTROL

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes requirements for treatment of newly placed concrete flatwork to prevent vapor emission and elevated pH.
   1. Unless otherwise acceptable to the Design-Builder vapor emission control specified in this Section shall be performed as work of Section 03 30 00 for cast-in-place concrete.

1.2 ADMINISTRATIVE REQUIREMENTS

A. Pre-Construction Conference: Coordinate with Pre-construction Conference requirements of Section 03 30 00 Article 1.5 paragraph H.
   1. Work Sequence: Timing for application of vapor emission control treatment and coordination with concrete finishing procedures and final curing of concrete.
      a. Concrete Curing: Review curing method and work sequence for coordination with vapor emission control application.
      b. Control Joints: Coordinate placement sequence with application of vapor emission control; unless otherwise acceptable place control joints prior to treatment application.
   2. Review annotated placement plan for all areas where vapor emission control treatment is required.
   3. Grade-Supported Slabs: Verify compliance with ASTM F710 as necessary for work to qualify with the required vapor emission control warranty.

1.3 SUBMITTALS

A. Product Data: Required for each material and product to be incorporated into the Work.

B. Annotated Placement Plan: Coordinate with work of Section 03 30 00 diagram placement areas and sequence for concrete flatwork and clearly indicate all portions required to receive vapor emission control treatment. Coordinate work sequence and timing with other concrete work including but not limited to finishing and curing to ensure efficient and timely progress of the work.

C. Preparation of Treated Concrete to Receive Applied Finish Floor Covering: Provide the Design-Builder with recommendation of the treatment manufacturer for procedures and products to be used to prepare concrete for finish floor application. Include without limitation recommendations for sealing of cracks, joints, abraded areas and other conditions that may void the specified Warranty or otherwise compromise vapor emission control performance.

1.4 SPECIAL WARRANTY

A. Vapor Emission Control: Provide manufacturer’s warranty against failure of treated concrete flatwork to prevent vapor emission and elevated pH in accordance with the manufacturer’s representations for a period of 15 years.

1. Perform work of this Section to ensure compliance with precedential conditions required for warranty coverage.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Vapor Emission Control Treatment: Basis of design is OBEX Creteseal CS200.
   1. Provide equipment and consumables as necessary and as otherwise recommended by the manufacturer for application of vapor emission control treatment.
   2. Provide ancillary material and equipment as necessary for coordination with concrete work of Section 03 30 00 and to otherwise prevent delay to the Schedule.

B. Subject to conformance with project requirements, vapor emission control products manufactured by Koster American Corp and Ardex Americas may be acceptable, with Architect approval per Section 01 25 00 requirements.

PART 3 - EXECUTION

3.1 VAPOR EMISSION CONTROL TREATMENT

A. Using means and methods and sequence recommended by the manufacturer and as coordinated with concrete work of Section 03 30 00 provide spray application at the recommended coverage rate for all areas receiving applied finish floor coverings indicated on Floor Finish Plans.

B. Coordinate concrete curing and other work requirements to be performed subsequent to vapor emission treatment application with requirements of Section 03 30 00.

END OF SECTION

SECTION 03 37 13 - SHOTCRETE

PART 1 - GENERAL

1.1 SECTION INCLUDES

A. Construction: Provide material, labor, equipment, services, test panels, tests and inspections necessary for the installation of shotcrete work. The work also includes the following:
   1. Installation of inserts, sleeves, dowels, anchor bolts and other items embedded in shotcrete, but furnished under other sections.

B. Engineering: Provide engineering services for the design and implementation of shotcrete mix designs.

C. Shotcrete may be used only where specifically noted on the Drawings. Where shotcrete may be used, it is the Contractor's responsibility to confirm which work, if any, is appropriate to be placed with shotcrete.

1.2 RELATED INFORMATION AND REQUIREMENTS

A. Drawings and general provisions of the Contract, including general conditions and Division 1 Specification Sections, specific Specification Sections listed below, and all other Specification Sections apply to this Section.
   1. Concrete Forming
   2. Concrete Reinforcing
   3. Cast-In-Place Concrete

1.3 DEFINITIONS

A. Shotcrete: Mortar or concrete pneumatically projected onto a surface at high velocity.

B. Dry-Mix Shotcrete: Shotcrete with most of the mixing water added at the nozzle.

C. Wet-Mix Shotcrete: Shotcrete with ingredients, including mixing water, mixed before introduction into delivery hose.

1.4 PREINSTALLATION MEETINGS

A. Review methods and procedures related to shotcrete, including but not limited to, the following:
   1. Qualification data, equipment, and facilities needed to advance work without delay.
   2. Shotvcrete finishes and finishing.
   3. Cold and hot weather shotcreting procedures.
   4. Construction joints.
   5. Forms and form-removal limitations.
   6. Reinforcement accessory installation.
   7. Shotcrete repair procedures.
   8. Protection of shotcrete.

B. Before submitting design mixtures, review each shotcrete design mixture and examine procedures for ensuring quality of shotcrete materials.

1.5 REFERENCE DOCUMENTS

A. Standards: Comply with the provisions of the documents listed below and with the requirements described in this Section. Use current editions of documents unless earlier editions are specifically referenced by the governing code or are otherwise indicated.
   1. CBC – 2022 California Building Standards Code.
   2. ACI - American Concrete Institute, Manual of Concrete Practice, including, but not limited to, the following sections:
      a. ACI 301 "Specification for Structural Concrete for Buildings".
      b. ACI 304R "Recommended Practice for Measuring, Mixing, Transporting and Placing Concrete".
      c. ACI 506R "Guide to Shotcrete".
      d. ACI 506.2 "Specification for Materials, Proportioning, and Application of Shotcrete."
   3. ASTM, American Society for Testing and Materials, designations referenced herein.

1.6 SUBMITTALS

A. General: Submittals shall be sent to the Architect, or Owner's Testing Agency, or both, as required herein for review prior to commencing the work. Review of submittals covers the general character of the details and to verify compliance with the performance requirements. Review does not cover checking of quantities, proportions or dimensions. Such review shall not relieve the Contractor from responsibility for executing the work in accordance with the Contract Documents.

B. Procedures: The Contractor shall submit a description of the shotcrete process proposed for use for review by the Architect and Owner's Testing Agency. The description shall include all proposed deviations from provisions of ACI 506R and ACI 506.2, requirements of these Specifications, and provisions of other specified reference specifications or standards.

C. Shop Drawings: The Contractor shall prepare and submit shop drawings to the Architect showing:
   1. Joints: Indicate details and locations of construction, control, and expansion joints.
   2. Penetrations and Openings: Indicate locations and sizes of penetrations in shotcrete members.
   3. Placing Sequence: The Contractor shall submit a proposed sequence for placing shotcrete to the Architect for review before commencing with the work. The sequence shall include the locations, extents, and structural members included in each placement as well as which side of the structural member has formwork.

D. Product Data and Certificates of Compliance: The Contractor shall submit manufacturer's data and certificates of compliance for each product to the Architect for review.

E. Qualifications: Contractor shall submit qualifications to the Architect and Owner's Testing Agency as follows:
   1. Shotcrete Foreman: Submit evidence of the following:
      a. Licensed to perform shotcrete work in the State of Oregon.
      b. Minimum of five years of experience of similar responsibility on other shotcrete projects of similar scope.
   2. Shotcrete Operator: Submit evidence of the following:

a. Licensed to perform shotcrete work in the State of Oregon.
b. Minimum of five years of experience successfully placing shotcrete on projects of similar scope.

F. Test Panels: Prepare preconstruction test panels at least 21 days prior to job placement, using the mix and equipment proposed for the project.
1. Each proposed nozzleman shall prepare a minimum 3 foot by 3 foot test panel demonstrating each shooting orientation for each shotcrete class.
2. Fabricate test panels in accordance with ASTM C1140 and CBC 1908.10 and as approved by the Architect.
3. The formwork shall be as specified and the reinforcing steel shall represent the most congested condition proposed for shotcrete. Specified curing and finishing measures for the concrete class shall be utilized.
4. Notify Owner's Testing Agency to observe placement of panels. Maintain panels at point of fabrication for 7 days and until Owner's Testing Agency has taken cores.
5. In the event of failure, nozzlemen shall be permitted one retest. Any nozzleman failing the second test shall not be permitted on the project.
6. Test panels will be removed from the site after acceptance of shotcrete work.

G. Architectural sample panels: Provide sample panels as specified in section titled "Cast-in-place Concrete".

H. Architectural mock-up: Provide one concrete mock-up as specified in section titled "Cast-in-place Concrete". One of the required test panels may also be used as the Architectural mock-up.

I. Mix Design: The Contractor shall submit shotcrete mix designs for review by the Architect and Owner's Testing Agency at least seven days before placing concrete. Review of mix designs covers general conformance with the specifications but does not constitute an approval of the mix proportions. Submit one mix design for each class of concrete. Each mix design shall include the following information:
1. Concrete class,
2. Member types and specific placement locations,
3. Material quantities per cubic yard,
4. Material ingredient certificates of compliance,
5. Coarse and fine aggregate sources, types, sizes, and gradation,
6. Admixture product data and dosage,
7. Design compressive strength, age (in days) required to reach design compressive strength, and compressive strength historic data,
8. Maximum water to cementitious materials ratio,
9. Unit weight of freshly mixed and oven-dry concrete,
10. Calculated percent water-soluble chloride ions (Cl^-) by weight of cement, considering the chloride ion content of all concrete ingredients,
11. Water-soluble chloride ion content historic data or trial batch test data, when required herein,
12. Contractor's Engineer's stamp and signature certifying that the concrete mix has been designed under the supervision of the Contractor's Engineer.

J. Contractor's quality control test and inspection reports: The Contractor shall submit quality control test and inspection reports to the Architect and Owner's Testing Agency for review.

1.7 TESTS AND INSPECTIONS

A. Notification:
1. The Contractor shall notify the Owner's Testing Agency of work to be tested and inspected. Notification shall be sufficiently in advance to allow scheduling of tests and inspections, but not less than 24 hours.
2. The Contractor shall immediately notify the Architect if the Owner's Testing Agency indicates that quality assurance tests and inspection requirements have not been met.
3. The Contractor shall notify the Architect 48 hours prior to placing shotcrete to facilitate structural observation.

B. Owner's Quality Assurance Tests and Inspections:
1. General: Quality assurance tests and inspections shall be the responsibility of the Owner. The Owner shall retain a testing agency, referred to herein as the Owner's Testing Agency, who shall perform the required tests and inspections, prepare written summary reports of tests and inspections, and review submittals.
2. Code Required Tests and Inspections: The Owner's Testing Agency shall perform tests and inspections in compliance with the CBC (1908.10) except where more restrictive requirements are specified herein.
3. Test Panel Tests and Inspections: Owner's Testing Agency shall provide full time inspection of the placement and construction of the test panels.
   a. Take six cores from each panel, three with reinforcement and three non-reinforced.
   b. Visually inspect and grade cores with reinforcement in accordance with Section 1.7 of ACI 506.2, "Shotcrete Core Grades". Samples taken from each test panel shall achieve a mean core grade of 2.0. No single core shall have a core grade exceeding 3.0
   c. Test panel shall be sawcut or broken at the discretion of the Owner's Testing Agency when required to determine the soundness and uniformity of the panel.
   d. Test non-reinforced cores for compressive strength at 7 days in accordance with ASTM C 42.
   e. The mock-up panel report is subject to the review and approval of the Architect.
4. Pre-Placement Inspection: Shotcrete shall not be placed until the screeds and reinforcement have been reviewed by the Owner's Testing Agency.
5. Job Site Special Inspections: The Owner's Testing Agency shall provide the following special inspections during the project construction:
   a. Special inspection of shotcrete placement as per CBC Chapter 17 is required. The special inspector shall check the materials, placing equipment, details of construction and construction procedure. The inspector shall furnish a verified report, based on personal knowledge, that the work has been performed, and materials used, and installed in accordance with, and in conformity to, the approved Drawings and Specifications.
   b. Special inspection of location of embedded items and anchor bolts and anchor rods.
6. Job Site Tests: Perform the following tests not less than once each shift nor less than once for each 50 cubic yards of shotcrete placed through the nozzle:
   a. Density, yield, and air content: ASTM C 138.
   b. Temperature: ASTM C 1064.
7. Collection of Test Cores: During the progress of the shotcrete work a set of three 3-inch minimum diameter cores shall be taken not less than once each shift nor less than once for each 50 cubic yards of shotcrete placed through the nozzle.
   a. Cores shall be taken and tested either from the structure, if approved by the Architect, or from separately gunned test panels in accordance with ASTM C 42

and ACI 506.2. If test panels are used, they shall be constructed in accordance with ASTM C 1140.

b. Cores shall be taken at least 14 days after shotcrete is placed. Core holes taken from the structure shall be plugged immediately after inspection of holes by special inspector. Do not cut steel reinforcement.

c. Prior to testing, cores shall be taken to the Owner's Testing Agency and soaked in water for a minimum period of 24 hours.

8. Laboratory Tests of Test Cores: Cores shall be tested in accordance with ASTM C 42 and the average compressive strength of each set of 3 cores taken from the structure or test panels must equal or exceed 0.85 f'_c* with no individual core in the set testing below 0.75f'_c*.

f'_c* = specified minimum 28-day compressive strength

a. Should the compressive strength of the test cores be less than the specified compressive strength, the shotcrete represented by the cores shall be considered defective work. The extent of the defective work shall be determined by the Architect.

C. Contractor's Quality Control Tests and Inspections:

1. General:

a. Quality control tests and inspections shall be the responsibility of the Contractor.

b. Where required herein, the Contractor shall demonstrate that quality control conforms to the requirements of the Contract Documents.

c. Quality Control Test and Inspection Reports shall be prepared and submitted for review.

2. Concrete Mix Trial Batching: Where required herein, the Contractor shall prepare shotcrete trial batches in accordance with ASTM C 192 as needed for preparation of test specimens. The number of batches and quantity of each batch shall be at least adequate to prepare the required number of test specimens for each of the required tests as follows. Test specimens for different tests may be taken from a single batch.

a. Compressive test specimens: Trial batch and test specimen quantity shall be in conformance with the requirements of the governing building code.

1.8 CONTRACTOR'S ENGINEERING SERVICES

A. General: Where engineering services are required herein, the Contractor shall retain either a Civil or Structural Engineer registered in the State of Oregon, referred to herein as the Contractor's Engineer.

1. Documents prepared by the Contractor's Engineer shall be stamped and signed.

B. Shotcrete mix designs shall be prepared, signed, and stamped by the Contractor's Engineer certifying that the mix design has been prepared under supervision and that the mix designs meet the requirements of the Contract Documents.

C. Temporary supports required for shotcrete test panels, sample panels, and/or mock-ups shall be designed by the Contractor's Engineer.

PART 2 - PRODUCTS

2.1 SHOTCRETE MATERIALS

A. Concrete materials shall conform to applicable requirements of Section Titled, “Cast-in-Place Concrete,” ACI 506R and ACI 506.2, except as otherwise specified herein.
   1. Aggregates:
      a. General: ASTM C 33 except as otherwise specified.
      b. Coarse Aggregates: ½” maximum crushed stone. Comply with gradation No. 3 requirements from ACI 506R.

2.2 SHOTCRETE EQUIPMENT

A. General: Equipment shall conform with the requirements of ACI 506R.

B. Mixing Equipment: Capable of thoroughly mixing shotcrete materials in sufficient quantities to maintain continuous placement.

C. Delivery Equipment: Capable of discharging shotcrete material mixture accurately, uniformly, and continuously.

2.3 SHOTCRETE MIX DESIGNS

A. General:
   1. Shotcrete mix designs shall be designed and documented by the Contractor’s Engineer.
   2. The Contractor shall review proposed shotcrete mix designs for compatibility with the intended placement requirements to ensure that the shotcrete, as designed, can be placed in accordance with the Contract Documents.
   3. The proportions of the shotcrete mixes shall be such as to produce shotcrete for each class of shotcrete that conforms to the specified minimum compressive strength, within the specified maximum water-cementitious materials ratio.
   4. Determination of the amount of water in the batch shall include water contained in the aggregates.
   5. The proportion of materials shall be accurately controlled so as to produce thorough & uniform hydration of the shotcrete which when shot will form a homogeneous mass containing neither sags nor dry sand formations.
   6. Architectural shotcrete shall be supplied, produced, and delivered from a single source.

B. Shotcrete Mix Requirements:
   1. Air content: Use of air entrainment admixtures shall not be permitted.
   2. Unit weight: Wet and dry unit weight shall be calculated in conformance with ASTM C 138 and ASTM C 567, respectively. Maximum unit dry weight shall be between 147 and 153 pounds per cubic foot (pcf).
   3. Shotcrete mixes shall be designed in accordance with the following requirements:

SHOTCRETE MIX REQUIREMENTS				
Concrete Class	Concrete Elements	Performance Criteria	Limiting Parameters	Additional Notes
		Minimum Compressive Strength (psi) (Note 2)	Maximum Water to Cementitious Materials Ratio (W / CM) (Note 3)	
A	Building Walls	5,000	0.45	4
B	Retaining Walls	4,000	0.45	4

Notes:

1. N/A stands for “not applicable”.
2. Based on 28-day minimum compressive strength. When 56-day minimum compressive strength is used, minimum 28-day compressive strength shall be 80% of required minimum 56-day compressive strength.
3. W = weight of water. CM = weight of cementitious materials (cement plus fly ash or ground blast furnace slag).
4. The mix design submittal for this class of shotcrete shall include evidence that the proposed mix meets each of the required performance criteria listed above through trial batch test data or historic data for the exact mix to be used on this project.

PART 3 - EXECUTION

3.1 PROTECTION OF MATERIALS

A. Protect materials from damage, weather, and contaminants such as grease, oil, and dirt.

3.2 PREPARATION

A. General: Before any shotcrete is placed, the Contractor shall ascertain that all reinforcing steel has been installed and blocked from the formed surface, and that all fittings, anchors, inserts, etc., to be embedded in the shotcrete have been placed as specified. The Contractor shall be responsible for maintaining the alignment of all work embedded in the shotcrete during its installation.

B. Preparation of Surfaces to Receive Shotcrete: Clean reinforcement of loose mill scale, rust, oil and other substances which will interfere with bond, in accordance with ACI 506R. Sandblast concrete, masonry or steel to which new shotcrete will be applied. Just before application, clean sandblast residue from surfaces. Keep concrete and masonry surfaces damp for several hours before application.

C. Reinforcing Steel: Comply with the requirements of CBC Section 1908.4 for reinforcing steel placement unless satisfactory shotcrete placement with the test panel demonstrates that deviations may be accepted. The Contractor shall propose revisions to the reinforcing steel layout shown on the drawings where appropriate to meet the requirements of CBC Section 1908.4 or to facilitate shotcrete placement.

D. Protection: Protect walls, floors, equipment and other items from damage by dust, rebound and water. Promptly clean all items contacted by dust or rebound by scraping, brushing or washing as surfaces permit.

E. Alignment Wires: Install 20-gage hard steel piano wire for alignment wires (horizontally and vertically) at corners and offsets not clearly established by forms, at exterior corners of walls, columns, beams, and other locations. Alignment wires may be used as screed guides. Alignment wires shall be tight, true to line, and placed so they may be further tightened.

3.3 PLACING

A. General: Place all shotcrete in accordance with the provisions of ACI 506.2. Do not place shotcrete unless in presence of special shotcrete inspector. Do not permit premixed material which stands more than 45 minutes to get to nozzle.

B. Gunning: Build up each layer of shotcrete with several passes of nozzle. Except when enclosing reinforcing steel, the nozzle shall be held at right angles to the surface to be shotcreted and at a distance from 2-1/2 to 3 ft. When enclosing reinforcing steel, the nozzle shall be held so as to direct the material behind the bars. Each side of each bar shall be shot separately. Application to walls shall begin at the bottom. Direct intermittent flowing shotcrete away from work until flow again becomes constant. Completely encase reinforcement with sound shotcrete. Thickness of layer, when gunning walls, is thickness at which shotcrete does not sag. Keep top surface of thick layers at about 45 degree slope. Any deposits of loose sand or rebound shall be removed from surfaces before shotcreting. A second experienced nozzleman equipped with an air jet shall attend the operators whenever reinforcing steel is being enclosed and shall precede the nozzle and blow out all rebound and sand which may have lodged behind the steel.

C. Preparation for Succeeding Layers: Allow preceding layer to take initial set. Remove laitance, loose material and rebound by brooming; remove laitance which has taken final set by sandblasting, then clean surface with air water jet. Cut out rebound pockets, unbonded areas, sags and other defects; replace with new shotcrete. Apply succeeding layer to dampened preceding layer.

D. Rebound: Keep rebound out of work. Do not use rebound; remove rebound from site daily.

E. Construction Joints: Slope shotcrete surface to shallow edge form (1” thick board laid flat). Do not use square construction joints except where noted on the Drawings. Remove rebound trapped at joints. Thoroughly clean and wet entire joint prior to application of additional shotcrete

F. Hot Weather Placing: During hot weather, mix, place, and protect shotcrete according to ACI 506.2.

G. Cold Weather Placing: During cold weather, mix, place, and protect shotcrete according to ACI 506.2.

3.4 FINISHING

A. See 03 30 00 Cas-in-Place Concrete.

3.5 CURING

A. See 03 30 00 Cas-in-Place Concrete.

3.6 PROTECTION

A. Protect shotcrete from damage from construction and weather.

B. Contact with shotcrete shall be avoided for at least 24 hours after placing.

C. Protect shotcrete during and after curing from damage during subsequent construction operations.

D. Shotcrete shall not be subjected to loads unless those loads are resisted directly by shoring until shotcrete has attained its specified compressive strength (14 day minimum) and until curing operations have been completed.

3.7 ACCEPTANCE CRITERIA

A. Shotcrete shall meet the following acceptance criteria:
1. Shotcrete shall conform to the established tolerances.
2. Shotcrete shall meet the established performance criteria.
3. Shotcrete shall be free from voids, rock pockets, cracks, pour joints, spalls, honeycombs, and air bubbles that adversely affect the structural adequacy.

B. Architectural shotcrete, in addition to the requirements above shall meet the additional criteria:
1. Architectural shotcrete shall be free from defects affecting color, texture, fins, voids, rock pockets, cracks, pour joints, spalls, honeycombs, and air bubbles that, in the opinion of the Architect, affect the appearance of the shotcrete.

3.8 CORRECTION OF DEFECTIVE WORK

A. Correction of defective work shall be the responsibility of the Contractor.

B. Work not in compliance with the requirements of the Contract Documents shall be considered defective, unless otherwise directed in writing by the Architect.

C. Corrected work shall conform to the requirements of the Contract Documents.

D. The Contractor shall prepare a submittal documenting the defective work and proposed corrections and submit to the Architect for review. The submittal shall include a description of the defective work, the location of defective work, and shall be accompanied by supporting sketches, photographs, or both. Additionally, the submittal shall include similar documentation of the Contractor’s proposed corrections.

E. Correction of defective work shall not commence until the Architect has reviewed and accepted the submittal.

F. Correction of defective work shall be inspected by the Owner’s Testing Agency.

3.9 CLEAN-UP

A. Remove from the site all debris resulting from the work of this Section.

END OF SECTION

SECTION 03 48 19 - PRECAST CONCRETE STAIR TREADS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:
   1. Precast concrete stair treads, risers and landings, anchored to supports on steel stairs.

B. Related Sections:

   1. Section 05 51 00 Architectural Metal Stairs: Stairs and stringers designed, fabricated and installed to meet applicable building codes, including weld plates for field attachment.

1.2 REFERENCES

A. American Society for Testing and Materials (ASTM):
   1. ASTM C33 Concrete Aggregates
   2. ASTM C139 Concrete Compressive Strength
   3. ASTM C 144 Aggregate for Masonry Mortar
   4. ASTM C 150 Portland cement
   5. ASTM C595 Standard Specification for Blended Hydraulic Cements
   6. ASTM C 642 Water Absorption, Density, Voids in Hardened Conc
   7. ASTM C 666 Rapid Freeze/Thaw Resistance of Conc
   8. ASTM C 979 Pigments for Integrally Colored Concrete
   9. ASTM C 1028 Coefficient of Friction

1.3 SUBMITTALS

A. Shop Drawings: Unit identification, dimensions, cross-section, and fabrication tolerances; Location, size, and type of reinforcement, joints, lift and support points, and components to connect precast concrete work to the primary structure; narrative of erection procedure.
   1. Provide setting drawings and templates showing recommended installation of anchorage devices.

B. Samples: Prior to starting fabrication of final work, submit two 12” wide by full depth samples of each type of stair tread unit and landing plank in profile and configuration indicated, demonstrating the full range of precast concrete color, surface variation and final finish texture required for exposed surfaces and including integral detectable warning stripes, for selection and approval.
   1. Apply sealer to one sample.

C. Manufacturer's Installation Details: Submit complete.

D. Warranty: Provide certified copies of manufacturer's product warranties.

1.4 SUBSTITUTIONS

A. Refer to Section Division 01 for Product Substitution requirements and procedures.

1.5 QUALITY ASSURANCE

A. Compliance with Regulations: Comply with requirements of state and local building codes and with rules and regulations relating to building accessibility.

B. Qualifications of Manufacturer: Company specializing in manufacture of precast concrete stair treads with a minimum of 10 continuous years of documented experience.

C. Treads and connection shall be capable of supporting dead loads plus a uniform live load of 100 pounds per square foot.

D. Erector Qualifications: PCI Certified Erector for Category A-Architectural Systems with 5 years successful experience with erection of precast concrete stair assemblies similar in complexity and scale to the Work; alternative means of demonstrating qualifications for control of appearance in the work including but not limited to work samples may be acceptable as required for Substitutions.

1.6 DELIVERY, STORAGE AND HANDLING

A. Deliver all materials to the installation site in the manufacturer's original packaging. Packaging shall contain manufacturer's name, customer name, order, identification number, and other related information.

B. Handle and store stair treads, risers and landings in accordance with manufacturer's recommendations:
   1. Store units at project site to prevent cracking, distortion, warping, staining, and physical damage and so that markings are visible.
   2. Lift and support units only at designated lifting or supporting points shown on final shop drawings.

C. Deliver loose connection hardware to be attached to other construction before start of such Work.
   1. Provide templates, setting diagrams, and instructions as necessary for proper installation of loose hardware.
   2. Coordinate with other trades for installation of items cast into Work.

1.7 WARRANTY

A. Provide warranty covering precast concrete stair treads, risers and landings against defects in material and workmanship for a period of 5 years. Unusual abuse and neglect are excepted.

PART 2 - PRODUCTS

2.1 MANUFACTURER

A. Basis of Design products as manufactured by Stepstone, Inc., 17025 South Main Street, Gardena, CA 90248; (310) 327-7474; www.stepstoneinc.com.

2.2 MATERIALS

A. Subject to conformance with requirements, provide CalArc "Steptreads", precast concrete, consisting of Portland cement, aggregate, color admixtures, and reinforcing, factory formed to profiles indicated.
   1. Portland Cement: ASTM C 150, Type III, high early strength.
   2. Aggregate: ASTM C 33.
   3. Color Admixture: By Davis Colors, or equal, as required to achieve color as selected.
   4. Aggregate for exposed aggregate surface: As selected.
   5. Reinforcement - Standard 2-1/2 inch treads: Galvanized welded wire mesh, No. 7 and No. 10, 2 inch by 6 inch.

B. Tread style:
   1. Closed Riser: (2-1/2 inch thickness)
      a. Classic profile with integral detectable aggregate warning stripe.

C. Provide starter nosings with integral detectable warning stripe to match tread style and color.

   1. Landings: Of size indicated or required, matching treads in color and texture.

2.3 COLORS AND FINISHES

A. Colors: Reference Drawings for requirements.

B. Finishes: Walking surfaces of treads and landings shall have minimum coefficient of friction of 0.60, wet and dry.
   1. Exposed surfaces: Sandblasted; of uniform appearance in color and texture, free of bug holes, chips, and spalls; match approved field sample.

C. Field Application of Sealer: Comply with requirements of Section 03 31 13 for sealed concrete and traffic surface slip resistance performance requirements.
   1. Conform to sealer manufacturer's recommendations for application and maintenance of sealer.
      a. In geographic regions exposed to freeze-thaw conditions field-applied sealing the entire precast tread, riser and landing plank surface area, including joints, after installation is mandatory.

2.4 PHYSICAL PROPERTIES

A. Compressive strength: Minimum 5,000 psi.

B. Size 12” wide x 2-1/2” thick; length as required for width of stair.

C. Weight:
   1. Open Riser: 30 pounds per square foot at 2-1/2 inches thick; 36 pounds per square foot at 3 inches thick.
   2. Closed Riser: 37.2 pounds per lineal foot at 12 inch depth.
   3. Long-Span Closed Riser: 48 pounds per lineal foot at 12 inch depth.
   4. Landing Units: 30 pounds per square foot at 2-1/2 inches thick; 36 pounds per square foot at 3 inches thick.

D. Water absorption: Not more than 6.0 % average, not more than 7.0 % for any individual unit for standard colors.

E. Unit size: Within 3/16 inch of designated length, width and thickness.

2.5 ATTACHMENT ACCESSORIES

A. For Bolting to Steel stringers:
   1. 11 gauge galvanized steel angles, 1-5/8” x 3” x 7-1/4” long.
   2. 4 gauge galvanized steel starter nosing brackets.
   3. Non-Corrosive threaded inserts with 3/8” bolts, flat washer and lock washer.

2.6 FABRICATION

A. Stair treads, risers and landing planks shall be hand-made, wet-cast of cement conforming to ASTM C 150, Type III, and aggregates conforming to ASTM C 33.

B. Reinforcement - Standard 2-1/2” thick treads: Galvanized welded wire mesh, No. 7 and No. 10, 2 inch by 6 inch.

C. Reinforcement – Landing Planks: Galvanized rebar cage.

2.7 SOURCE QUALITY CONTROL

A. Concrete for treads, risers and landing planks shall be tested frequently to assure that mixes provide units having not less than 5,000 psi compressive strength at 28 days (average test strength not less than 4,500 psi).

B. Minor chips, hairline cracks, air voids and slight variations in color and finish are normal in precast concrete. When viewed in typical daylight illumination form a distance of 20 feet, minor cracks and air voids that cannot be seen with the naked eye are not grounds for rejection.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify that structural components of stairs are in place, aligned and level, within tolerances for proper installation of stair treads and risers, and required structural inspections have been completed.

3.2 INSTALLATION - GENERAL

A. Installation shall comply with the requirements of applicable building codes and state and local jurisdictions.

B. Install stair treads aligned, level and with uniform treads and risers throughout the extent of the stair.
   1. Maintain horizontal and vertical joint alignment and uniform joint width as erection progresses.
   2. Field modification of stair treads is not acceptable; unapproved modifications are grounds for rejection and replacement.
   3. Remove dust and dirt from stair tread units using oil-free compressed air.

3.3 CLEANING

A. Clean exposed surfaces of stair treads and risers. Use cleaners approved by precast tread manufacturer for precast concrete finishes and colors.

3.4 SEALING

A. Apply sealer in accordance with manufacturer's standards, and as necessary to maintain precast stair tread manufacturer's full warranty. Reference Section 03 31 13 for additional requirements.

3.5 COMPLETION

A. Prohibit construction traffic from using stair once precast components have been installed or provide effective protection to ensure work is neither soiled nor damaged due to subsequent use.

B. After installation and before completion, inspect precast concrete treads, risers and landing planks for construction damage; replace and seal damages treads, risers and planks.

C. Immediately prior to final acceptance of project, clean precast concrete treads, risers and landing planks.

END OF SECTION

SECTION 04 01 20 - MASONRY RESTORATION AND CLEANING

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes requirements for cleaning, repointing, and general masonry restoration work.

B. Unit Prices:
1. Cost for repointing of masonry (inclusive for block and cast stone) per square foot; including grinding out joints and pointing with new mortar as required for work of this Section.
2. Cost for cleaning masonry (inclusive for block and, cast stone) per square foot using gentlest means possible to achieve the intended result as required for work of this Section.
3. Cost for replacing damaged CMU masonry per square foot; including removal of damaged block and replacement with original block salvaged from the building [not applicable to cast stone nor terra cotta] and pointing.

1.2 DEFINITIONS

A. Water Spray Pressures: For use in describing Work of this Section; measured at the nozzle.
1. Low Pressure: 50 psi maximum at 3 to 6 gallons per minute.
2. Medium Pressure: 500 to 800 psi; 3 to 6 gallons per minute

1.3 SUBMITTALS

A. Product Data: Required for each product proposed for use in Work, spray equipment, and proposed mortar mixes.

B. Shop Drawings: Installation of reinforcing, pins, anchors, inserts, and related materials to stabilize and strengthen existing assemblies.
1. Restoration Proposal: Materials, methods, equipment and protection for each phase of restoration process.
2. Hidden Conditions Report: Detailed narrative and graphic description of nature and scope of concealed conditions discovered during the work.

C. Samples: Demonstrate complete range of color, and texture to be expected in the final work, but not less than six units for each type.
1. Block: .
2. Mortar: Six inches by 0.5 inch in plastic channels.
3. Anchors and Reinforcing: Each type required.

D. Field Samples:
1. Match of New and Salvaged Block to Clean Original.
2. Mortar: Six inches by 0.5 inch in plastic channels.
3. Masonry Cleaning: Demonstrate proposed cleaning method using processes and solution intended for the final work. Anticipate providing at least four samples of ten square feet. The first sample shall use plain water or very dilute cleaning solution.

Successive samples will use incrementally stronger methods until the gentlest method capable of achieving the required result as judged by the Architect has been achieved. The methods used in the accepted sample will be those required for the final work.

E. Certifications: Written and graphic evidence satisfactory to the Owner, substantiating Contractor's qualifications to perform the Work.

1.4 QUALITY ASSURANCE

A. Qualifications: Contractor with five years successful experience in comparable masonry restoration projects.
   1. Foreman: On site at all times Work is under way, skilled in masonry restoration techniques required for this Project, and have worked with this firm on five previous projects.
   2. Nozzle Operator for Abrasive Cleaning: SSPC C-7 Certified abrasive blast nozzle operator.

B. Regulatory Requirements: Provide the following in compliance with requirements of agencies having jurisdiction:
   1. Cleaning operations and disposal of cleaning solution and rinse water.
   2. Protection: Barriers, sidewalk bridging and other protection.

C. Field Samples: 25 Square feet of each type; Locate in an unobtrusive area as directed. Additional sample panels will be required until results acceptable to the Owner are achieved using approved materials and methods at no change in Contract amount. Approved samples will be retained as job standards for determining acceptability of final Work.
   1. Masonry Cleaning, Patching and Repairing: Demonstrate proposed materials and methods.
   2. Repointing: Raking out of joints and pointing for mortar, and sealant joints.

1.5 PROJECT CONDITIONS

A. Environmental Requirements: Exterior masonry, ambient air temperature has been above 40 degrees F for four days and will remain so for not less than seven days following completion of work. Maintain conditions required as necessary due to prevailing weather without change in Contract amount.

B. Existing Conditions: Owner assumes responsibility neither for apparent, and actual condition nor safety of masonry assemblies to be restored.

C. Required Area of Masonry Restoration Work: Entire North elevation of… [reference building elevations, gridlines, vertical datum as necessary to convey full scope of work].
   1. Assumed Quantity of Masonry to be Re-pointed: 4,000 square feet any combination of blockand cast stone. The actual quantity of work required will be determined during the Work as necessary for the conditions encountered. Unit Price for Re-pointing will be used to determine the cost of the final quantity of work performed.
   2. Quantity of Masonry to be Cleaned: Entire area as described above. Cleaning shall include removal of roots, vine remnants and all other biological growth.
   3. Assume Quantity of Damaged Block to be Replaced: 100 square feet (limited to CMU masonry only). The actual quantity of work required will be determined during the Work as necessary for the conditions encountered. Unit Price for Block Replacement will be used to determine the cost of the final quantity of work performed – quantity may be adjusted upwards or down depending on actual quantity of work performed.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Cleaning Products: Sure-Klean Restoration Products, ProSoCo, Inc., Kansas City, KS.

B. Anchors: Subject to compliance with requirements, provide products of AA Wire Products Co., Dur-O-Wall, Inc., or Hohmann & Barnard, Inc.

C. Flexible Concealed Flashing: Afco Products Inc. Sandell Manufacturing Co., Inc., or York Manufacturing, Inc.

2.2 MORTAR MATERIALS

A. Portland Cement: ASTM C 150, Type I, complying with staining requirement of ASTM C 91, white and gray as required.

B. Hydrated Lime: ASTM C 207, Type S.

C. Aggregate for Mortar: ASTM C 144, grade as required to match appearance of clean existing mortar joints.
   1. Colored Mortar Aggregate: ASTM C 294, rounded sand required to match clean existing joints.

D. Colored Mortar Pigment: Natural and synthetic iron oxides and chromium oxides, compounded for use in mortar mixes.

E. Water: Clean, free of oils, acids, alkalis and organic matter.

2.3 CLEANING PRODUCTS

A. Chemical Cleaning System: Combinations of the following as shown by approved field samples to be necessary for cleaning each masonry material and soiling condition encountered:
   1. 766 Masonry Prewash.
   2. Sure-Klean Restoration Cleaner.
   3. Sure-Klean Heavy Duty Restoration Cleaner.
   4. 509 Paint Stripper.

B. Water: Clean, free of oils, acids, alkalis and organic matter.

2.4 EQUIPMENT

A. Spray Equipment: Controlled application of chemical solutions and water at specified rates and pressures measured at nozzle.

B. Brushes: Natural fiber bristle.

C. Grinders: Power operated hand saws and grinders will be permitted only on written approval of Owner's Representative based on submission by Contractor of an approved quality control program and demonstrated ability of operators to use tools without damage to masonry.

D. Mechanical Mixers: Clean and in good operating condition.

2.5 MIXES

A. Mortar: Measure cementitious and aggregate materials in a dry condition by known volume or equivalent weight. Mix materials in a clean mechanical mixer; once dry materials are thoroughly mixed, add water to produce damp, unworkable mix, maintain mortar in damp condition for one to two hours. Add water in small portions until workable consistency is obtained. Use mortar within 30 minutes of final mixing; do not retemper or use partially hardened material.

B. Repointing Mix: ASTM C 270, one part Portland cement, one part lime, six parts aggregate.

C. Mortar Color: Match clean existing mortar using colored aggregates and pigments as approved by Owner's Representative and as necessary to achieve required results, do not exceed pigment-to-cement ratio of 1-to-10, by weight.

D. Chemical Cleaning: Most dilute solution necessary to achieve results obtain in approved field samples.

2.6 ACCESSORIES

A. Dowels: A 316 stainless steel, 3/8-inch diameter, threaded rods.

B. Masonry Anchors: Provide type suited to specific conditions encountered at each repair; including condition of supporting structure and structural requirements for repaired assembly.
1. Bent-Wire Ties: Provide 1.5 inches embedment in masonry, and not less than 0.625-inch mortar cover on face joints. Wire diameter not more than half of joint thickness unless otherwise acceptable.
2. Flexible Anchors: 2-piece anchors that permit differential movement between wall and structure, and resist tension and compression forces perpendicular to plane of wall.
a. Concrete Framework: 12 gage sheet metal dovetail and wire tie anchor extending to within 1 inch of masonry face.
b. Steel Framework: bent-wire tie welded to steel and triangular tie extending to within 1 inch of masonry face.

C. Masonry Retrofit Anchors: Helical lateral anchor pins 8 mm diameter, Type 304 stainless steel. Lengths will vary.
1. Dryfix Masonry Pins helical wall anchor as manufactured by Helifix, Weston, Ontario, Canada. Use dry without epoxy.
2. Blok-Lok Helical Wall Ties, as manufactured by Blok-Lok Limited, Weston, Ontario, Canada

PART 3 - EXECUTION

3.1 PREPARATION

A. Protection: Prevent damage and injury to soil, vegetation, building surfaces, and finishes, automobiles and pedestrians during cleaning operations. Provide liquid strippable masking agent, polyethylene film and other protection as necessary.

1. Contain run-off from cleaning and dispose of in an approved manner, do not permit contact with soil.

B. Remove plant growth and soil from masonry joints and surfaces, cut roots and allow vegetation to dry before removal. Kill plant roots with ammonium sulfamate or approved treatment.

C. Examine terra cotta for cracks, spalls, and displacement. Using a plastic mallet, spot sound terra cotta at cracks and displaced units. Indicate hollow sounding units with nonpermanent chalk marking and review with Owner's Representative.

3.2 MASONRY CLEANING

A. Comply with ASTM D 5703 and requirements of this Section. Proceed with cleaning in an orderly manner, produce uniform appearance throughout, including corners, moldings, and interstices without damaging masonry surfaces. Comply with written recommendations of manufacturer of cleaning products.

B. Pre-wet masonry with low-pressure cold-water spray, apply prewash chemical cleaner by brush or roller use dwell time recommended by chemical cleaner manufacturer; rinse with medium-pressure cold water spray.

C. Apply chemical cleaner to wet masonry with low-pressure spray equipment, deep nap roller, or soft natural fiber brush; allow dwell time recommended by chemical cleaner manufacturer. Rinse masonry with medium pressure cold water spray, leave no chemical residue. Repeat chemical cleaning procedure once where necessary to achieve required results.

D. Contain cleaning solutions and rinse water, do not permit contamination of plantings, soils, and drainage systems.

3.3 REPOINTING

A. Preparing Joints: Remove mortar from open, shelled, cracked and defective joints to sound, solid mortar; provide uniform depth of not-less-than 3/4 inch nor more than 1-1/2 inches. Use masonry blade narrower than joint. Do not chip arrises. Do not widen joint, nor cut into adjacent units.
   1. Work not meeting approved job standard samples will be rejected, remove and correct as directed by Owner's Representative at no change in Contract amount.
   2. Brush, vacuum or flush joints, remove dirt and debris, rinse joints and clean bond surfaces of masonry and existing mortar.

B. Joint Pointing: Surfaces of joint shall be damp and free of standing water. Apply mortar in layers, compact each layer and allow to cure until thumbprint hard before placing next layer.
   1. Back-point uneven joints and joints more than 1 inch deep; apply mortar in 0.375-inch layers to uniform 0.5-inch depth.
   2. Point final 0.5 inch in three layers; each of the first two layers being approximately 0.1875 inch thick, and the final not less than 0.125 inch thick.
   3. Tool joints to match original appearance of joints, do not featheredge joints.
   4. Keep mortar damp (80 to 90 percent RH) for 72 hours by thoroughly soaking repointed joints at the beginning and end of each day until 72 hours are passed.

C. Sealant Joints: Refer to Section 07920 for requirements for resealing sealant joints.

3.4 MASONRY PATCHING

A. Repair cracks and voids less than 4 inches in greatest dimension; cut back area to a minimum depth of 1 inch, undercut edges to create a dovetail key for patch, remove debris and dirt.

B. Install patching dowels in epoxy, 2 inches into terra cotta body at opposing 45-degree angles, form a basket to hold mortar patch, space dowels 1 to 3 inches apart and 2 inches inside of edges. Provide a 0.5 to 1 inch of coverage between dowel end and face of masonry unit.

C. Paint isolated chips and spalls less than 1 inch in largest dimension with two coats masonry paint, comply with paint manufacturers recommendations for surface preparation, priming and application of paint.

3.5 CLEANUP

A. Remove excess mortar and foreign matter from masonry by using stiff natural fiber bristle brushes and low-pressure water spray. Remove mortar drops as they occur.

END OF SECTION

SECTION 04 22 00 – CONCRETE UNIT MASONRY

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes Work, materials and equipment necessary and required for a complete installation of concrete unit masonry of the types and configurations indicated. See Structural Notes on S-series drawing sheets for supplementary information; refer conflicts and ambiguities to Architect.

1.2 PROCEDURAL REQUIREMENTS

A. Preinstallation Conference: Comply with Project Meeting requirements. Review methods and procedures related to installation of concrete unit masonry work of this Section and coordination with other components and assemblies of the building cladding,
   1. Contractor's Project Schedule and work sequence, required tests and inspections.
   2. Coordination with work of Section 07 25 13, Section 07 92 00 and Section 08 44 00 for seals and transitions required to maintain integrity and performance of a continuous weather-resistive air barrier for the building enclosure complying with Performance Requirements.
   3. Coordination with Section 09 97 23 for application of high-performance urethane coating system on concrete masonry.

1.3 SUBMITTALS

A. Product Data: Manufacturer's product data for each type of manufactured product used in Work of this Section.

B. Shop Drawings: For fabrication, bending, and placement of concrete reinforcement. Comply with ACI 315 show bar schedules, stirrup spacing, diagrams of bent bars, arrangement and support of concrete reinforcement, and coordination with embedded and cast-in items.
   1. Shop Drawings: Fabrication, and placement of reinforcement, comply with ACI 315; show bar schedules, details, spacing, lateral ties and assemblies as required.
   2. Quality Control Submittals: Test reports in form required by test method, submit on same day test is made. Certification of product compliance with requirements.
      a. Testing Service: Certification of qualifications.

C. Samples: Provide 4 inch by 4-inch sets of three block faces for initial selection from manufacturer's complete range of standard and Premium colors, provide at least four color designations; provide separate set of full size block for final selection from initial color selection samples.

1.4 QUALITY ASSURANCE

A. Unit Masonry Mock-Up: Build full-height wall(s) and include masonry openings indicated. Provide bond, coursing and joint profiles as required for the Work.
   1. Mock-up will be reviewed for strict compliance with specified tolerances and aesthetic appearance of masonry work. Work product represented in the approved mock-up

shall be consistently reproduced in masonry work of this Section; work not conforming to control standard of the approved mock-up may be rejected.

2. Coordinate with work of Section 09 97 23 field sample application of high-performance urethane coating on unit masonry mock-up.

1.5 PROJECT CONDITIONS

A. Ambient air temperature above 40 degrees F during work, and for twenty-four hours prior to, and following stopping work.

1. Protect Work from damage due to exposure to extreme weather. Provide weather-resisting, and insulating enclosure, temporary heat and cooling as necessary. Replace Work damaged by extreme weather conditions.

PART 2 - PRODUCTS

2.1 SYSTEM DESCRIPTION

A. Concrete unit masonry assemblies required as work of this Section are a component of the continuous weather-resistive air barrier required for compliance with California Title 24 Building Energy Efficiency Standards. Both the unit masonry assemblies and seals between unit masonry and other construction at openings, penetrations and transitions between different assemblies, including but not necessarily limited to weather-resistive air barrier assembly and aluminum fenestration assemblies, are required work of this Section and shall have an air leakage rate not exceeding 0.40 cfm per square foot nor otherwise contribute to a whole building air leakage rate in excess of 0.40 cfm per square foot as demonstrated by field testing of the installed work.

B. Performance Requirements: Materials and construction conforming with ACI 530.1 Specifications for Masonry Structures.

1. See Structural Notes on S-Series drawing sheets for additional requirements; refer conflicts and ambiguities to Architect.
2. Limit linear shrinkage to not more than 0.065 percent.

2.2 MATERIALS

2.2 MATERIALS

A. Concrete Masonry Units: From a single source, sizes, configurations and dimensions indicated. Provide shapes for lintels, corners and special molded shapes as required. Exposed surfaces finished, without cores, provide end and corner units finished to match faces where surface is exposed to view at jambs of opening, wall ends and soffit of lintels.

1. Hollow Concrete Block: ASTM C 90, medium weight smooth face finish, with no water-repellant admixture. Provide units size, configuration and coursing as required.
   a. CMU-1: Approved dark grey color to match the Project Control Sample; subject to required appearance match as demonstrated in approved samples the basis of design is Basalite GFM [mix for enhanced smooth finish] CMU.
   b. CMU-2: Approved light/white grey color to match the Project Control Sample; subject to required appearance match as demonstrated in approved samples the basis of design is Basalite GFM [mix for enhanced smooth finish] CMU; Natural only as produced at Carson City, Nevada plant.

c. CMU-3: As required for CMU-2 for sizes required.
d. CMU-4: Standard gray block.

B. Mortar: ASTM C 150, Type I, or Type II Portland Cement natural color and white cement as necessary to produce color required. Provide pre-blended cement-lime mortar with no integral water-repellent admixture.

1. Hydrated Lime: ASTM C 207, Type S.
2. Mortar Aggregate: ASTM C 144, 100 percent passing the No. 16 sieve for joints less than 0.25 inch.
3. Color: ASTM C 979, Established by approved samples demonstrating acceptable match to concrete masonry units in the colors and finishes required.

C. Grout: ASTM C 476, Prepackaged, fine or coarse as suitable for placement method required. Provide high-range water reducing admixture or other approved means of limiting water content in mixed grout without compromising placement characteristics.

1. Grout Aggregate: ASTM C 404.

D. Reinforcing: Comply with requirements of Section 03 20 00 and the General Structural Notes.

2.2 MORTAR AND GROUT MIXES

A. Combine and thoroughly mix cementitious, water and aggregates in a mechanical batch mixer, in compliance with referenced ASTM standards for mixing time and water content. When the use of admixtures and is approved, comply with manufacturer's recommendations for use.

1. Masonry Cement: ASTM C 91
2. Water: Clean and potable.

B. Cement-Lime Mortar: ASTM C 270, and as specified.

1. Type S Mortar: one part cement, one half part lime, four parts sand; 28-day compressive strength of 1800 psi.

C. Grout for Unit Masonry: ASTM C 476, and of consistency at time of placement that will completely fill all spaces to receive grout.

1. Grout Consistency: Fine in spaces less than 2 inches in horizontal direction, coarse in spaces 2 inches or more in least horizontal dimension, unless otherwise indicated.

D. Accessories:

1. Wall Cavity Guard, Vents and Weeps: Nonwoven, mesh inserts of recycled polyester fiber, provide two layers staggered in height, 10 and 6 inches tall in thickness recommended by manufacturer for cavity indicated. Provide Vent and Weep inserts sized for head joints of the same material in color to blend with masonry work. Mortar Net, CavClear, or approved.
2. Masonry Cleaner: Provide biodegradable, non-toxic and non-etching products and materials to the maximum extent possible; ProSoCo Enviro Klean or approved. Utilize lowest concentration and dilute solutions capable of removing each stain and soil condition.

3. Flashing: Provide flashing, materials, types and assemblies as specified in Section 07 60 00 Flashing and Sheet Metal and as indicated on the Drawings.
4. Masonry Sealer: Low VOC, reactive polyurethane emulsion specifically formulated for use on masonry substrates and having a record of successful in-service performance. Edison Coatings, Inc. Aquathane UA-210 Type NCL with Type XL additive to second coat, flat gloss is the basis of design, FSC Coatings, Inc., RainGuard or equal.
   a. Primer: Comply with sealer manufacturer's recommendations for substarte type and conditions encountered at the time of application; Edison 240 is the basis of design, FSC Coatings, Inc., RainGuard or equal.

2.3 SOURCE QUALITY CONTROL

A. Masonry Preconstruction Testing Service: Contractor responsibility; testing shall conform to ASTM E 329 standards.

B. Unit Test: Test each type, class and grade of material.
   1. Concrete Masonry Units: ASTM C 140.
   2. Mortar Tests: ASTM C 780.

C. Prism Methods: For each wall type indicated test masonry prisms per ASTM E 447, Method B. Test one set of prisms at 7 days and one set at 28 days.
   1. Concrete Masonry Prisms: Height-to-thickness ratio not less than 1.33 nor more than 3.

D. Flexural Bond Strength Tests: ASTM E 518; place prism with tooled joints facing down.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify tolerances of adjoining materials, including alignment with plan dimensions, before beginning work. Commencement of masonry work indicates acceptance of surrounding conditions.
   1. Coordinate placement of dowels for reinforcing of masonry work with work of Section 03 20 00 Concrete Reinforcement ensure proper location and compliance with tolerances and clearances, including required coverage of rebar.
   2. Concrete foundations not having a level alignment within plus or minus 0.5 inch (total tolerance of 1 inch) for all points on the as-cast surface shall be corrected to comply with the tolerance specified in this Section prior to installation of masonry.

3.2 PREPARATION

A. Layout walls for accurate spacing of surface bond patterns with uniform joint widths, accurately locate openings, control joints, returns, and offsets.

   1. Brace walls against wind and earthquake loads until the wall has been grouted and integrated into the building structure.

B. Reinforcement: Clean of loose rust, mill scale, earth, ice, and materials which will reduce bond to mortar or grout; without kinks, bends, and reduced cross-section not shown on drawings.

1. Provide minimum clearance for reinforcing of 0.25 inch from the masonry. Provide minimum 1 inch of grout cover on horizontal reinforcing. Secure reinforcing prior to grouting at intervals not exceeding 200 bar diameters.

C. Place reinforcement at spacing and locations indicated and prevent displacement. Except as otherwise indicated, provide a clear distance between bars of one inch, or one bar diameter, whichever is greater.
1. Columns, Piers and Pilasters: 1.5 inches, or 1.5 times bar diameters, whichever is greater. Provide lateral ties as indicated.
2. Reinforcing Bars: Straight except for bends around corners and where bends or hooks are indicated.
3. Complete installation of all reinforcing prior to grouting masonry cells.

D. Splices: Lapped, and wire tied; at locations indicated unless otherwise acceptable to the Architect.
1. Minimum Lap: 18 inches, and as required by Structural plans.

E. Weld splices where indicated. Comply with the requirements of AWS D1.4 for welding materials and procedures.

F. Metal Ties: Mortar cover of 0.6250-inch exterior wall face; 0.5 inch elsewhere.

G. Preparation of Grout Spaces: Cleanout holes shall be provided through face of unit masonry for all cells at the bottom of each pour. Inspect and clean, remove dirt, mortar droppings, loose masonry and other foreign materials from grout spaces, and close cleanout holes with matching masonry units; brace closures to resist grout pressures.
1. Provide continuous unobstructed cell area not less than 2 inches by 3 inches.
2. Close cleanout holes so the surface is similar to the rest of the wall, face shell plugs shall cure at least 48 hours before grouting. Brace covers on the clean out holes as required to resist the pressure from the grout.

H. Cells of Reinforced Masonry Units: Grouted solid and vibrated in place; stop grout 1 inch below the top of a course to form a key off-set from masonry coursing. Prevent segregation of grout mix during transport and placement. Minimize grout splatter and ensure reinforcing and masonry unit surfaces are fully encased with each grout lift.
1. Grout beams in one continuous operation.
2. Low Lift Grouting: Lifts of 2 feet or less.
3. High Lift Grouting: Minimum dimensions of the grout space shall be 3 inches. Place grout in maximum 4-foot lifts, and then wait approximately 30 minutes between lifts. The full height of each pour shall be poured in 1 day. Maximum height of a pour is 12 feet.

3.3 ERECTION

A. Lay masonry in pattern indicated, provide uniform coursing, bonding, color and texture. Match new Work to existing adjacent work, and Work in-place unless otherwise indicated.
1. Bond Pattern: Running bond, unless otherwise indicated, center vertical joints above units in course below.
2. Adjusting Set Units: Do not strike nor force; remove unit, clean off mortar and reset in fresh mortar.
3. Mix mortar in proportion necessary to comply with Project performance requirements and referenced standards; incorporate water repellant admixture in exterior assemblies unless otherwise approved.

4. Provide Machine Ground finish surface on all exterior surfaces exposed to view and as required for interior surfaces exposed to view in select locations.

B. Maintain 0.375-inch joint width unless otherwise indicated, except for minor variations required to maintain bond alignment.
1. Concealed Joints: Tool flush, unless otherwise indicated.
2. Exposed Joints: Rodded, unless otherwise indicated.

C. Provide control joints to comply with NCMA recommendations and where shown on approved shop drawings. Interrupt reinforcement at movement joints unless otherwise indicated.
1. Movement Joints: Provide elastomeric sealant complying with Section 07920 requirements. Sealant color and tooling of joint shall provide close visual match to mortar joints.

D. Lay masonry units with full mortar coverage on horizontal and vertical bedding planes, do not slush head joints. Bed CMU webs in mortar at piers, columns, pilasters, and cells adjacent to cavities to be grouted. Provide full mortar bed including area under cells at starting course of footings where cells will not be grouted. Provide mortar types specified and where indicated.
1. Type S Mortar: Structural masonry.

E. Build-in items to be installed as work of this Section, fit solidly with masonry.
1. For items embedded in core, place layer of metal lath in the joint below and rod grout into core. Grout core for three courses under bearing plates, lintels, and similar items, unless otherwise indicated.
2. Provide EPS board insulation around perimeter of exterior frames.
3. Provide recess for flexible sealant around perimeter of exterior frames and openings as indicated.
4. Voids At Built-in Items: Grouted solid unless otherwise indicated.

F. Provide concealed flashing in masonry work at shelf angles, lintels, ledges and obstructions to the downward flow of water in the wall to divert water to the exterior. Install as indicated and as specified in Section 07 60 00, on smooth, even surfaces, sloped where required.
1. Penetrations and Joints: Sealed, overlap end joints 1.5 inches, interlock sheet metal flashings.
2. Extend flashings through exterior face of masonry and turn down to form drip, unless otherwise indicated.
3. Extend flashing the full length of lintels and shelf angles and minimum of 4 inches into masonry at each end; ends that are not interlocked shall be turned up 2 inches to form a pan.
4. Through-wall Flashing: From exterior face to within 0.5 inch of the interior face of masonry in exposed work; from exterior to interior and turn up 2 inches at interior surface in concealed work. Turn flashing up 4 inches in cavity.

G. Provide vertical and horizontal joints where shown. Interrupt reinforcement at movement joints unless otherwise indicated.
1. Build-in non-metallic joint fillers at locations indicated to accommodate forces, and movement anticipated and shown. Provide beneath shelf angles supporting masonry.
2. Expansion Joints: Install as indicated and as recommended by manufacturer. Overlap ends of units 4 inches in direction of water flow; seal ends below grade, and junctures with horizontal units.

H. Do not apply uniform loads for twelve hours nor concentrated loads for three days after building walls and columns.

I. Clean exposed surfaces of set masonry, remove mortar spills and loose units, prior to laying fresh masonry wet units lightly as necessary. After Work is thoroughly set and cured. Comply with masonry manufacturer's directions and applicable NCMA "Tek" bulletins.
   1. Remove mortar particles by hand using non-metallic tools.
   2. Chemical Cleaning: Provide for removal of efflorescence and other stains in accordance with approved samples. Comply with manufacturer's recommendations for cleaning. Use most dilute solution possible to obtain required results. Protect adjacent surfaces from damage, cover with strippable liquid masking agent, or other approved protection.

3.4 CONSTRUCTION TOLERANCES

A. Variation from Plumb: Do not exceed the following limits.
   1. Vertical surfaces and arrises 0.25 inch in 10 feet, 0.375 inch in single story up to 20 feet, and 0.5 inch in 40 feet or more.
   2. External corners, expansion joints, control joints and conspicuous lines, 0.25 inch in 20 feet and 0.5 inch in 40 feet or more.
   3. Vertical alignment of head joints plus or minus 0.25 inch in 10 feet, 0.5 inch maximum.

B. Variation from Level: Do not exceed the following limits.
   1. Bed joints, lintels, sills, parapets, and conspicuous lines: 0.25 inch in any bay or 20 feet maximum, 0.5 inch in 40 feet or more.
   2. Top of bearing walls: 0.125 inch between adjacent floor elements in 10 feet or 0.0625 inch within width of a single unit.

C. Variation of Linear Building Line: For position shown in plan and related portion of columns, walls, and partitions, do not exceed 0.5 inch in 20 feet and any bay, 0.75 inch in 40 feet or more.

D. Variation in Cross-Sectional Dimensions: For columns and thickness of walls, from dimensions shown, do not exceed minus 0.25 inch nor plus 0.5 inch.

E. Variation in Mortar Joint Thickness: plus or minus 0.125 inch from dimension indicated; maximum bed joint thickness limited to 0.5 inch.

3.5 FIELD QUALITY CONTROL

A. Unit Test: Each type, grade and class of masonry unit used in Work of this Section by the following methods.
   1. Concrete Masonry Units: ASTM C 140.

B. Prism Test: ASTM E 447, Method B for each type of wall construction indicated. Prepare prisms as specified for preconstruction testing.
   1. Sample Incidence: Two prisms for each 5000 sq. ft. of wall area installed.

C. Flexural Bond Strength Tests: ASTM E 518; place prism with tooled joints facing down.

D. Test each type of mortar used in accordance with ASTM C 780.
   1. Sample Incidence: As required to evaluate mortar from each increment of masonry units from which tests samples are taken.

E. Tests Results: Indicate compliance with requirements for Work to be accepted, and there shall be no other indication of noncompliance.

3.6 PROTECTION

A. Protection: During precipitation, and at end of each day's work, cover top of walls, openings, penetrations, and cavity with waterproof sheeting 24 inches down each side, secured in place.

B. Prevent grout, mortar and dirt from soiling masonry surfaces, cover masonry and adjacent ground surface as necessary; remove grout and mortar spills when they occur, do not permit to set.

C. Provide final protection and maintain conditions in a manner acceptable to Installer and Architect, maintain Work free of damage and deterioration until substantial completion.

END OF SECTION

SECTION 05 12 00 – STRUCTURAL STEEL FRAMING

PART 1 - GENERAL

1.1 SUMMARY

A. Extent of structural steel work is as indicated and scheduled.
   1. Comply with requirements of the General Structural Notes on S0.01 and S0.02; completed structures shall support loads and resist forces per criteria therein.

B. Related Sections:
   1. Section 05 30 00 Metal Decking.
   2. Section 05 50 00 Metal Fabrications.

1.2 SUBMITTALS

A. Product Data: Test reports, mill and manufacturer's specifications, and data required to show compliance with these specifications.
   1. Coatings data for shop applied coatings and demonstration of required coordination with filed applied coatings.

B. Shop Drawings: and include complete details and schedules for fabrication and erection procedures and sequence, connection, and anchorage of all structural members.
   1. Welding Symbols: Standard AWS, show size, length, and type.
   2. Bolts and Anchorages Identify Whether Installed in Shop or the Field: Shown on setting drawings, and templates regardless of entity providing them.
   3. Embeds: Provide location plan for all components fabricated as work of this Section to be embedded in concrete structure and coordinate placement of embedded components with work of Section 03 11 000 and Section 03 30 00.

C. Erection Plan: Sealed by an engineer registered in the state of the Project and includes erection sequence, bracing requirements, and details identifying stability requirements during construction.

D. Field Survey Report: Establish line and location, structure elevations, anchor points, and similar points and dimensions as required for field engineering. Highlight all discrepancies between contract documents and field conditions and indicate corrective measures.
   1. Certify the location of the structural steel as erected complies with Project requirements for elevation, location and alignment and is within the specified tolerances.

E. Certifications:
   1. Manufacturer's certified test reports for load indicator washers and tension control bolts
   2. Mill test reports for bolts, nuts and washers
   3. Welding Procedures: Approval by the Owner's Testing Agency.
   4. Welding Operator AWS Certification: In triplicate, Architect action not required.
   5. Quality Assurance Plan: Formal statement of quality control actions to be taken by Contractor's fabricator in their performance of the work.

F. Welding Procedures: AWS D1.1 and D1.8 for prequalified and non-prequalified welded joints. Document welding procedures proposed for the Work and qualification tests per AWS D1.1 for non-prequalified welded joints.

1.3 QUALITY ASSURANCE

A. Fabricator Qualifications: 5 years successful experience fabricating structural steel having elevated requirements for appearance for work exposed to view in the completed structure. Facilities, and personnel having capacity, and expertise necessary to produce the work of the quality and quantity required per the Contractor's Schedule.
   1. Fabricator: Participant in the AISC Certification program and is designated an AISC Certified Plant, Category QMS; alternative means of demonstrating qualifications for control of appearance in the work including but not limited to work samples may be acceptable as required for Substitutions
   2. Source Quality Control: System of standards and procedures applied by the fabricator ensuring work of this Section consistently achieves the characteristics, properties and attributes required within the specified tolerances such that it is fit for the use intended.

B. Welding Process and Operator Qualification: In accordance with AWS Standard Qualification Procedure.
   1. Comply with State of California and local jurisdiction requirements for welder and welding operator performance qualification.

C. Codes and Standards: Contractor responsibility to provide Work complying with contract requirements shall not be altered by statements made in referenced standards and documents. Comply with the following, except as otherwise indicated.
   1. AISC 303 "Code of Standard Practice for Steel Buildings and Bridges".
   2. AISC 360 “Specification for Structural Steel Buildings.
   3. AISC 341 “Seismic Provisions for Structural Steel Buildings”
   4. RCSC "Specifications for Structural Joints using ASTM A 325 or A 490 Bolts" approved by the Research Council on Structural Connections.
   5. AWS D1.1 "Structural Welding Code".
   6. AWS D1.8 “Structural Welding Code – Seismic Supplement”.
   7. ASTM A 6 "General Requirements for Delivery of Rolled Steel Plates, Shapes, Sheet Piling and Bars for Structural Use".

1.4 DELIVERY, STORAGE AND HANDLING

A. Protect steel from damage and deterioration, store off ground and to permit access for inspection. Repair and replace damaged material as directed.

B. Fasteners: Comply with storage requirements of AISC Specification for Structural Joints using ASTM A325 or A490 Bolts.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Work Exposed to View: Free of surface blemishes including pitting, seam marks, roller marks, rolled trade names and roughness. Remove blemishes prior to preparation and application of surface finish.

B. Structural Steel Shapes, Plates and Bars: ASTM A36 and A992 as applicable for components required.

C. Cold-Formed Steel Tubing: ASTM A 500, Grade B oe ASTM A 1085.

D. Steel Pipe: ASTM A 53, Type E or S, Grade B; or ASTM A 501.

E. Steel Castings: ASTM A 27, Grade 65-35, medium-strength carbon steel.

F. Headed Stud-Type Shear Connectors: ASTM A 29, Ac old finished carbon steel; with dimensions complying with AISC Specifications.

G. Anchor Bolts: ASTM A 307 or ASTM F1554, Grade 55 non-headed type unless otherwise indicated.

H. Unfinished Threaded Fasteners: ASTM A 307, Grade A, regular low- carbon steel bolts and nuts, hexagonal heads at exposed connections, hexagonal or square at other locations.

I. High-Strength Threaded Fasteners: Quenched and tempered, heavy hexagonal structural bolts, and nuts, with hardened washers.
   1. ASTM F 3125 Grade A325 or A490.
   2. ASTM F1852 Type1, with Treads included (N).
   3. Nuts shall conform to ASTM A563 and washers to ASTM F436
   4. Direct tension indicator washers may be used at Contractor's option.

J. Electrodes for Welding: Comply with AWS Code.

K. Non-Shrink Grout: Comply with requirements of Section 03 30 00.

L. Non-Shrink Grout: Natural aggregate, prepackaged and conform to ASTM C1107, provide Masterflow 928 by Master Builders or approved.
   1. Fluid Grout: Determined by flow cone, CRD-C611-81 with a flow of 22 to 29 seconds one hour after batching, at 40 to 100 degrees F.
   2. Strength: 2,500 psi at 24 hours, 4,500 psi at three days, and 5,000 psi minimum at 28 days.

2.2 FABRICATION

A. Shop assemble Work to greatest extent possible and minimize field handling. Comply with AISC Specifications, accurately align members and provide camber where indicated.
   1. Complete assembly before starting finishing operations. Mark and match-mark members for field assembly.

B. Connections: Provide as specified and as indicated.

1. High Strength Bolts: Conform to RCSC "Specifications for Structural Joints Using ASTM A 325 or A 490 Bolts" provide at following:
   a. Principal bolted connections.
   b. All bolted connections.

C. Welded Construction: Comply with AWS Code.

D. Shear Connectors: Shop weld. Space as indicated, prepare surfaces, and install as recommended by manufacturer.
   1. Headed Stud: Automatic end welding.

E. Steel Wall Framing: True, straight, and square.

F. Penetrations: Normal to surface unless otherwise required, neither flame-cut nor enlarge holes by burning; provide specialty items as indicated.

G. Expansion Joints: Provide in steel shelf angles; align with vertical expansion joints as indicated.

H. Hot-Dip Galvanizing: Comply with ASTM A 123; Coating Grade 100 on members exposed to weather and not less than Grade 65 for members required to be galvanized and not having exposure to weather.
   1. Galvanized Components Required to be Painted: Treat galvanized substrate as necessary to ensure effective bond of paint whether shop or field applied.

2.3 SOURCE QUALITY CONTROL

A. Mill Test Reports: Bolts, Nuts and Washers Complying with ASTM A325, Type 1, or ASTM A490 and Project requirements. Certification numbers shall appear on product containers and correspond to certification numbers on mill test report. Mill test report must be supplied to both purchaser and Owner's Testing Agency.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verification of Conditions: Prior to beginning erection, verify elevation of bearing surfaces, and anchor locations. Do not proceed with Work until conditions are satisfactory, start of erection will be interpreted as erector's acceptance of conditions.

3.2 PREPARATION

A. Temporary Support and Connections: Provide to align and stabilize members during erection. Fill holes with plug welds and grind smooth where Work will be exposed in completed structure.

B. Surface Preparation: Clean bearing and bonding surfaces. Comply with requirements of referenced AWS and AISC documents.

3.3 ERECTION

A. Bases and Bearing Plates: Plumb and level unless otherwise indicated; shim as necessary. Do not leave wedges exposed in permanent Work.
   1. Grouting: Fill all voids between bearing surfaces. Comply with grout manufacturer's recommendations for installation and curing. Finish exposed surfaces as indicated and required.
   2. Grouting: Comply with installation requirements of Section 03 30 00.

B. Steel Structure to Remain Exposed to View: Exercise a high degree of craftsmanship and care in handling and installing appropriate to finish grade components. Use tools and methods that will minimize the potential of damage to these components during the work. Protect installed work from damage during subsequent construction activities and damage from exposure to weather.
   1. Field Assembly: Accurately align members and adjust as necessary due to discrepancies in elevations and alignment before permanently fastening.

C. Steel Framing: Accurately set to lines and elevations indicated; conform to tolerances in referenced AISC documents.
   1. Allow for differential between temperature at time of erection, and mean service temperature anticipated for completed structure.
   2. Splices: As indicated.
   3. Seams in Cylindrical Members: Orient columns so that welded seams are towards the adjacent W18 beam. Orient all other components with seams up.

D. Welding: Comply with referenced AISC and AWS documents including temporary connections, alignment and bearing.
   1. Steel Structure to Remain Exposed to View Conceal field welds wherever possible, remove spatter and repair shop coatings. Visible welds shall present a neat, uniform appearance and consistent profile. Weld show-through shall be controlled such that welds are not readily visible in finished material when viewed at a distance of 10 feet.

E. Bolting: Comply with referenced AISC documents, furnish templates and other devices necessary for presetting bolts and anchors.
   1. Unfair Holes: Ream holes that must be enlarged. Drift pins and burning are not acceptable except in secondary bracing members.
   2. Bolts in Concrete and Masonry: Comply with installation requirements of Division 3 and Division 4.

F. Gas Cutting: Not permitted except for secondary members not under stress, finish cuts straight, and smooth, as required.

G. Repair of Shop Applied Coatings: Immediately after erection, prepare field welds, bolted connections, and damaged shop coatings. Recoat using approved field repair materials and methods. Provide a minimum dry film thickness of 4 mils. Prime paint repairs shall be invisible after final finish painting.
   1. Galvanizing: Comply with ASTM A 780 and provide uniform appearance in the repaired work.

3.4 FIELD QUALITY CONTROL

A. Engage an independent testing and inspection agency to inspect high-strength bolted connections and welded connections and to perform tests and prepare test reports.

1. Testing agency shall conduct and interpret tests and state in each report whether test specimens comply with requirements, and specifically state any deviations therefrom.
2. Provide access for testing agency to places where structural steel work is being fabricated or produced so that required inspection and testing can be accomplished.
3. Testing agency may inspect structural steel at plant before shipment; however, Architect reserves right, at any time before final acceptance, to reject material not complying with specified requirements.

B. Correct Work which inspections and laboratory test reports indicate does not in comply with requirements. Perform additional tests, at Contractor's expense, as required.

C. Inspections:
1. Bolted Connections: Requirements of referenced AISC documents.
2. Welds: Visual inspection and tested as follows:
   a. Liquid Penetrant Inspection: ASTM E 165.
   b. Magnetic Particle Inspection: ASTM E 109; performed on root pass and on finished weld. Cracks or zones of incomplete fusion or penetration not acceptable.
   c. Radiographic Inspection: ASTM E 94 and ASTM E 142; minimum quality level "2-2T".
   d. Ultrasonic Inspection: ASTM E 164.

D. Field Survey: Make an accurate survey of alignments and elevations of all steel members as noted on the drawings.
1. During construction of the steel frame, the Contractor shall survey the column locations and splice elevations as each column tier is erected. Submit survey reports indicating this information within 24 hours for review prior to erecting the subsequent tiers.
2. Permanent benchmarks shall be established by a registered professional engineer employed by the Contractor in accordance with the requirements of contract documents.
3. Should locations vary beyond the allowable tolerances, notify the Architect/Engineer and take necessary corrective measures and modify details and/or procedures as required and approved.

END OF SECTION

SECTION 05 30 00 – METAL DECKING

PART 1 - GENERAL

1.1 SUMMARY

A. Extent of metal decking is indicated on drawings, including basic layout and type of deck units required.

B. Related Sections:
1. Section 03 30 00 Cast-In-Place Concrete.
2. Section 05 12 00 Structural Steel.

1.2 SUBMITTALS

A. Product Data: Manufacturer's specifications, installation instructions and certification of compliance with requirements.
1. Test reports for mechanical fasteners and acoustic roof deck performance.

B. Shop Drawings: Plans, sections, and details to show deck type, gage, layout, span orientation, anchorage, end closure, sumps, cants, joints and accessories.
1. Primary and secondary structure and supplemental framing.
2. Size and location of holes penetrations, and openings through deck.
3. Types of welds and weld patterns, including weld washer requirements.
4. Location and patterns for button punching.
5. Layout of steel shear connector studs.

C. Quality Assurance:
1. Certificates for welding procedures and operators.
2. Mill Test Reports.

1.3 QUALITY ASSURANCE

A. Welding Qualifications: AWS D1.1 for welding processes and operators.

B. Regulatory Requirements: Provisions of the following codes and standards, unless otherwise required.
1. AISI Specification for the Design of Cold-Formed Steel Structural Members.
2. AWS D1.3 Structural Welding Code - Sheet Steel.
3. SDI Design Manuals for Floor Decks and Roof Decks.

C. Participate in Pre-Erection Conference as required by Section 05 12 00.
1. Verify Coordination of requirements for painted finish and ensure compatibility among coatings provided as work of other Sections and Schedule for field finish painting work of Section 09 90 00.

PART 2 - PRODUCTS

2.1 SYSTEMS DESCRIPTION

A. Design Requirements: Comply with Steel Deck Institute Design Manual SDI 31.
   1. Deck connections not sized on the drawings, shall be designed by the Contractor based on the manufacturer's minimum recommendations for the plan configurations and loading required.
      a. Button Punching: Roof deck side lap connections only where specifically indicated; other connections shall comply with manufacturer's recommendations.
   2. Secondary Framing: Support deck at edges, openings and columns as indicated and to provide deck flutes a minimum 2 inches of bearing. Where details are not applicable to Project conditions design and provide secondary framing complying with Section 05 12 00.
   3. Accessories: Provide types necessary to complete deck assembly required including but not limited to edge forms, end closures, sump pans, closure strips, and cover plates. Fabricate components to comply with requirements for decking. Provide tight-fitting closures for all openings, edges and penetrations configured for required fill in composite construction.

B. Performance Requirements: Comply with structural criteria in the General Structural Notes on S0.01 in addition to requirements of this Section. Capacity of decking shall be per the current ICC-ES Report.
   1. Install and anchor roof deck units to resist gross uplift loading indicated in General Structural Notes and as required for corners, edges, overhangs and areas of discontinuity.
   2. Roof deck and connections to the supporting structure shall resist uplift loads of 35 pounds per square foot or the loads indicated, whichever is greater.

2.2 MANUFACTURED COMPONENTS

A. Acceptable Manufacturers: Subject to decking compliance with Project requirements, provide products manufactured by a Steel Deck Institute member.

2.3 MATERIALS

A. Steel Sheet:
   1. Cold Rolled Steel: ASTM A 611, Grade C.
   2. Galvanized Steel: ASTM A 653, G60.

B. Structural Steel: ASTM A 36.

C. Shear Connectors:
   1. Headed Stud: ASTM A 108, Grade 1015 or 1020, cold finished carbon steel; in dimensions complying with AISC specifications.
   2. Strap: ASTM A 570, Grade D, hot-rolled carbon steel.

D. Paint: Manufacturer's standard baked-on, rust-inhibiting paint, for application to chemically cleaned and phosphate treated metal.
   1. Galvanizing Repair Paint: High zinc-dust content paint for repair of damaged galvanized surfaces.

E. Flexible Closures: Manufacturer's standard vulcanized, closed-cell, synthetic rubber.

F. Acoustic Closures: Manufacturer's standard mineral fiber.

G. Silicone Sheet Seals and Compression Seals: Comply with Section 07 92 00

2.4 FABRICATION

A. Metal Decking: Metal thickness, configuration, and cell depth, width, and interval indicated; comply with applicable SDI specifications for composite and noncomposite roof and floor deck.
   1. Non-composite Units: As indicated on S series structure drawings.
   2. Composite Units: Permanent form and positive bending reinforcement for structural concrete slab.

B. Cell Closure Strips: 18 gage (0.045 inch) sheet steel, form to provide tight-fitting closures at open ends and sides of cells.

PART 3 - EXECUTION

3.1 PREPARATION

A. Concrete Supporting Structure: Cured, dry, and achieved sufficient strength to support decking prior to installing units.

B. Prevent overloading of structure due to stock piling of material and installation of decking.

C. Do not use deck units for storage or working platforms until permanently secured.

3.2 INSTALLATION

A. Deck and Accessories: Comply with manufacturer's recommendations, final shop drawings, and specifications in compliance with SDI C, SDI NC, and SDI RD.
   1. Placement: Flat, true, square, and aligned, bearing uniformly on supporting structure, do not deform laps nor interlocks. Keep deck cells free of damage and debris.
   2. Fasten to structure free of warp and excessive deflection.
   3. Cut and fit to projections, and other Work.
   4. Provide supplemental structural steel support framing for metal deck where normal deck bearing is precluded by column flange plates or other framing members, and around minor openings where indicated.
   5. Place only reinforcing and items shown to be embedded in concrete fill on composite deck.

B. Welding: Manual shielded metal arc welding, comply with AWS requirements and procedures. Use welding washers where recommended by deck manufacturer.
   1. To the extent practical locate welds such that they will be concealed from view in the installed work, remove spatter and repair shop coatings. Visible welds shall present a neat, uniform appearance and consistent profile. Weld show-through shall be controlled such that welds are not readily visible in finished material when viewed at a distance of 12 feet.

C. Deck Fastening: Fusion welds or elongated welds of equal strength, at every support. Diameter and spacing of welds as follows.
   1. Floor Deck: 3/4 inch diameter, 12 inches center-to-center, not-less-than 2 welds per unit.
      a. End Closures: Tack weld, or self-tapping No. 8 machine screws at 4 feet center-to-center maximum.
   2. Roof Deck: 12 inches center-to-center at support, and as required for lateral force resistance, and diaphragm shear indicated.
   3. Floor Deck Side Laps: Fasten between supports 36 inch o.c., maximum.
   4. Roof Deck Side Laps: Fasten between supports as required to resist the diaphragm shears noted on the drawings.

D. Shear Connectors: Weld through deck to supports conform to manufacturers specifications. Do not weld through lapped ends nor multiple deck units.

E. Maintain deck strength, and continuity, reinforce penetrations and areas supporting concentrated point loads for other work. Provide the following as necessary and required:
   1. Joint Covers: As recommended by deck manufacturer unless otherwise indicated.
   2. Sump Pans: Fit to deck opening, recess 1-1/2 inch below deck surface, unless otherwise indicated, weld to deck at corners and 12 inches o.c.; cut and seal pan as required.
   3. Cant Strips: Weld to top surface, and steel framing at 12 inches o.c. Lap joints 3 inches, and anchor with galvanized sheet metal screws; anchor to nailers with galvanized nails.
   4. Closure Strips: Weld to open ends, edges of roof decking, and in voids between decking and other construction. Install sheet steel closures and angle flashings to close openings between deck and walls, columns, and openings.
      a. Provide flexible closure strips adhesively installed, at Contractor's option when acceptable to Architect.
   5. Sequence cutting of openings to maintain optimum deck strength during and after erection and to effectively contain cement paste when concrete is placed and finished.

F. Hanger Slots and Clips: Manufacturer's standard, UL approved devices to receive hangers for support of ceiling construction, air ducts, diffusers, and lighting fixtures. Install between cells of lower sheet at maximum 14 inches center-to-center each way, 9 inch from walls at ends, and 12 inches from walls at sides, unless otherwise indicated.

G. Concrete Placement on Composite Deck: Prevent damage to deck due to placing operations including overloading of deck, excessive deflection and denting of flutes. Verify reinforcing has been properly placed and supported, including reinforcing required for deck penetrations.

H. Repair of Shop Coating: Immediately after erection, clean field welds, connections, and damaged areas of shop coatings. Recoat damaged areas using same material used in shop, and blend into adjacent surface so that repair is not visible when viewed from a distance of 15 feet under any lighting condition. Coordinate with requirements for field finish painting in Section 09 90 00.

3.3 FIELD QUALITY CONTROL

A. Welded decking in place is subject to inspection and testing. Cost of removing and replacing portions of decking for testing purposes will be borne by Owner for Work found to be satisfactory. Remove and replace defective Work at no change in Contract Amount

END OF SECTION

SECTION 05 40 00 – COLD FORMED METAL FRAMING

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes requirements for cold formed metal framing systems having 14 and 16 gage components. Metal Framing Systems for units 18 gage and lighter are work of Section 09 22 16.

1.2 ADMINISTRATIVE REQUIREMENTS

A. Coordination: Work of this Section includes framing for support and attachment of other work, including but not limited to work of the Sections listed here. Coordinate location with requirements for the work to be attached and supported. Provide components configured for attachment requirements and sized to support imposed loads in compliance with system description requirements.
   1. Section 03 30 00 Cast-In-Place Concrete: Embeds for framing attachments to concrete structure.
   2. Section 05 50 00 Metal Fabrications: Support of channel revetments, steel trim components and other fabrications.
   3. Section 06 40 00 Architectural Woodwork: Support of custom casework assemblies.
   4. Section 08 41 00 Aluminum Storefront: Support of storefront assemblies
   5. Section 08 44 00 Glazed Aluminum Curtain Wall: Support of curtain wall.
   6. Section 10 71 13 Exterior Sun Control: Metal framing support of tributary load from sunshades.

B. Pre-Installation Conference: Comply with requirements for Project Meetings.
   1. Confirm the work has been properly coordinated for metal framing assemblies for support and attachment of other work as required.

1.3 SUBMITTALS

A. Product Data: include but is not limited to manufacturer's ICC-ES report for components and complete structural information necessary to demonstrate compliance for work of this Section with System Description and Project requirements.

B. Shop Drawings: Stamped by Registered Structural Engineer in the state where the Project is located, include calculations and the following.
   1. Member gages, spacing and sizes.
   2. Shop and field assembly details including cuts and connections.
   3. Type and location of welds, bolts and fastening devices.
   4. Supplemental strapping, bracing, splices, bridging, accessories, and details required for proper installation.
   5. Coordination details for related, supported or adjoining work.

C. Shop Drawings: Framing, supports, and assemblies required as work of this Section for connection and support of other work, including but not limited to the Sections noted under 1.2.A above shall be stamped by Contractor's California-Registered Structural Engineer

demonstrating compliance with System Description and Project requirements; include calculations and the following.

1. Member gages, spacing and sizes.
2. Shop and field assembly details including cuts and connections.
3. Type and location of welds, bolts and fastening devices.
4. Detail bracing, bridging and accessories necessary for complete stable installation.
5. Coordination details for related, supported and adjoining work.
6. Secondary supports and supplemental framing.

1.4 QUALITY ASSURANCE

A. Manufacturer: Provide products of a manufacturer complying with local/regional materials requirements. Member of Steel Stud Manufacturers' Association or Certified Steel Stud Assoc. (membership in the Steel Framing Industry Assoc. is not acceptable) and producing ICC-ES certified structural components.

PART 2 - PRODUCTS

2.1 SYSTEM DESCRIPTION

A. Design Requirements: Complete structural solution for metal framing assemblies is not provided by the contract documents; final design of metal framing assemblies is the Contractor’s responsibility as work of this Section. Provide components configured for assembly types and attachment requirements, sized to support loads imposed by the work to be supported.
   1. Comply with AISI Code of Standard Practice for Cold-Formed Steel Structural Framing and Specification for the Design of Cold Formed Steel Structural Members
   2. Fire-Rated Assemblies: UL Listed.
   3. Framing and Secondary Supports: Provide at each location necessary for the support and connection of work of other Sections. Coordinate requirements for location, extent, member type, gage, spacing and connection with the work to be supported. Transfer loads to primary structural system to comply with Performance Requirements of this Section and as necessary for the work being supported.
      a. Provide stud sizes necessary for wall assembly dimensions indicated; provide steel alloy type, gage, component spacing, connections and other details as necessary for the assembly to comply with System Description requirements.
   4. Design of embed for connection of structural metal framing assemblies to concrete structure is required work of this Section, and as indicated on S0.51 and S0.52
   5. Provide close coordination of structural metal framing is required as work of this Section to ensure the required support and attachment for work of other Sections.
   6. Metal framing including braces and secondary supports without limitation shall be concealed within wall assembly in dimension indicated or above finish ceilings, exposed braces are not acceptable.
      a. Coordinate metal framing assemblies with other work required in wall cavity and ceiling plenums to eliminate conflicts.

B. Performance Requirements: Structural Properties complying with AISI "Specification for Design of Cold-Formed Steel Structural Members"
   1. Metal Framing: Comply with criteria in the General Structural Notes on S0.01- S0.02 and resist tributary loads imposed by work to or supported by metal framing and transfer loads to the primary building structure.

2. Wind Design Pressure: Per 2022 CBC Chapter 16 requirements, but not less than 20 PSF.
3. Seismic: Comply with 2022 CBC requirements for ground motion, soil profile, Seismic Use Group and site specific conditions identified in documents incorporated by reference on sheet S0.01.
4. Deflection:
   a. Vertical Framing: When exposed to 0.7 times required total of gravity, wind, lateral and dead loads; Less than l / 600 at framing supporting precast concrete or masonry assemblies and l / 360 for framing supporting metal cladding and fenestration but in no case shall total deflection exceed 0.3 inch.
   b. Horizontal Framing for Ground Level Ceilings Indicated on A 120: Limit deflection to Less than l / 240 but in no case exceeding 0.75 inch for load conditions required.
   c. Ceiling support assembly shall brace masonry walls against lateral forces including but not limited to seismic forces and provide a diaphragm load path to the masonry walls.

2.2 METAL FRAMING

A. Provide manufacturer's standard steel runners (tracks), blocking lintels, clip angles, shoes, reinforcements, fasteners, and accessories as recommended by manufacturer for applications indicated, as needed to provide a complete metal framing system for each type of framing required.

B. Metal Framing Components: Cold formed, not less than 18 gage, provide heavier gages where required; ASTM A 1003 structural quality steel sheet; with ASTM A 653 G90 galvanized coating [zinc or equivalent zinc-aluminum alloy] having salt spray resistance per ASTM A 1004 not less than 250 hours; products with a secondary coating are not acceptable.
   1. Studs: ASTM C 955; Manufacturer's standard load-bearing "C"-shaped 14 and 16 gage steel studs of with 1.625" flange and flange return lip unless otherwise indicated; stud size and interval indicated.
   2. Tracks: Manufacturer's standard C-shape sections of size indicated, 14 and 16 gage components as indicated.
   3. Joists: Manufacturer's standard C-shape sections of size, shape, and gage indicated.
   4. Furring: Z Furring and Z Purlin conforming to ASTM C 955
   5. Edge-of-Slab Stud Clips: Cold-formed galvanized steel; DriftClip® DSLB by the Steel Network Inc., California Metal System, Inc. or equal.

C. Accessories:
   1. Track Gasket: Compressible, closed-cell strip of polyethylene or polystyrene to isolate metal track from concrete slab; Ownes Corning FoamSealR, Dow Sill Gasket, or equal. Gasket at fire rated partitions shall comply with Section 07 84 00 Firestopping requirements.

2.3 FABRICATION

A. When factory prefabrication of framing components into panels prior to erection is provided such work shall be plumb, square, true to line and braced against racking and damage due to handling and erection. Assembly shall comply with requirements for field-constructed work and shall have welded joints throughout unless other type of connection is required. Prevent damage to prefabricated panels during handling and installation.

B. Fastenings: Weld similar components; mechanically fasten or weld dissimilar components as standard with fabricator. Wire typing is not acceptable.

PART 3 - EXECUTION

3.1 PREPARATION

A. Metal Framing Systems: Approved submittals, ASTM C 1007, and manufacturer's recommendations, unless otherwise indicated. Coordinate installation with supporting structure, deck and slab edges, inserts, imbeds, anchors, supplementary framing, and blocking to develop full strength of metal framing system, and comply with Project requirements.
   1. Furnish inserts and imbeds to other trades for installations well in advance of time needed for coordination with other work.

B. Runner Tracks: Continuous sized to match studs, accurately align base and top of studs.
   1. Anchors: 24 inches center-to-center spacing for nail or powder-driven fasteners, 16 inches center-to-center for other types, and at corners and ends. Anchor tracks as recommended by manufacturer's for type of construction involved,
   2. Provide track gasket to isolate metal framing from concrete slab to prevent corrosion. At fire rated assemblies comply with Section 07 84 00 Firestopping requirements.

C. Studs: Plumb, unless otherwise indicated and as needed for diagonal bracing. Secure studs to top and bottom runner tracks at both inside and outside flanges; provide deflection head where shown.
   1. Edge-Of- Slab: Provide Drift Clips as specified and as shown on the Drawings.

D. Where stud system abuts structural columns or walls, including masonry walls, anchor ends of stiffeners to supporting structure unless otherwise indicated.
   1. Openings: Provide double stud at each jamb of openings larger than 2 square feet, except where more than 2 are recommended by manufacturer. Install runner tracks and jack studs above and below wall openings. Anchor tracks to jamb studs with stud shoes or by welding, and space jack studs same as full-height studs of wall.
   2. Frame both sides of expansion and control joints, with separate studs; do not bridge the joint with components of stud system.
   3. Install horizontal stiffeners in stud system, spaced (vertical distance) at not more than 54 inches on center. Weld at each intersection.

E. Supplementary Framing, Blocking and Bracing: Provide where walls are indicated to support fixtures, equipment, services, casework, heavy trim and furnishings, and similar work requiring attachment to the wall or partition.
   1. Blocking and Continuous Backing: 6-inch, 16 gage "C" stud at 24, 48 and 72 inches above finish floor unless otherwise required.
   2. Blocking and Continuous Backing: Provide studs and plate as indicated on A### and elsewhere on the drawings.
   3. Where type of supplementary support is not otherwise indicated, comply with stud manufacturer's recommendations and industry standards in each case, considering weight or loading resulting from item supported.

F. Joists: Level and plumb, braced as indicated with not less than 1.5-inch end bearing.
   1. Reinforce ends with end clips, steel hangers, steel angle clips, steel stud section, or as otherwise recommended by joist manufacturer.

2. Joist Reinforcing at Supports: As indicated and as recommended by joist manufacturer.
3. Secure joists to interior support systems to prevent lateral movement of bottom flange.

G. Ceiling Support Assemblies on Ground Level: Install perimeter joist track sized to match joists. Align and securely anchor or fasten track to supporting walls and to restrain bottom flange of joists from lateral movement.
1. Provide headers at openings of joist and joist track, nesting joists, or other acceptable combination of connected joists.
2. Install bridging at joist ends and at intervals required; weld or mechanically attached to joist flange or webs per approved design. Bridging shall be cold-rolled steel channel, joist-track solid blocking, steel sheet straps or combination.
3. Provide miscellaneous framing, stiffeners, closure pieces, anchors, and fasteners, to provide a complete and stable joist-framing assembly.

H. Deflection Heads and Movement Joints: Provide as indicated and as necessary for normal movement of structure in accordance with manufacturer's recommendations.

I. Field Repair of Shop-Applied Coatings: provide same coating system as used for shop applied work or an approved remedial system of the same manufacturer and prepare surfaces as necessary for remedial work.
1. Galvanizing: ASTM A 780, provide uniform protection in the repaired work.

END OF SECTION

SECTION 05 50 00 METAL FABRICATIONS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes metal fabrications not part of structural steel or other metal systems specified elsewhere, as indicated and scheduled.

B. Related Sections.
   1. Section 03 30 00 Cast in Place Concrete.

1.2 SUBMITTALS

A. Product Data: Manufacturer's specifications, and installation instructions for products used in Work of this Section.

B. Shop Drawings: Plans, elevations, structural calculations, field measurements, and details of sections, anchorages and accessories.
   1. Engineer's Stamp: Required on shop drawings and calculations.
   2. Templates: Provide for installation of anchors and bolts.
   3. Provide certification that galvanizing facility has equipment of sufficient size and capacity to comply with requirements for exposed galvanized steel components.

C. Samples: Two sets of materials and manufactured products used in Work of this Section.

D. Certificate of welding operator qualification.

1.3 QUALITY ASSURANCE

A. Qualifications:
   1. Engineer: Licensed professional in State where project is located.
   2. Welding Process and Operator: AWS D1.1, D1.2, and D1.3, AWS Code for manual shielded metal-arc welding, and remedial work.

B. Certify welding operators have passed AWS qualification tests.

1.4 PROJECT CONDITIONS

A. Field Measurements: Made prior to preparation of shop drawings, verify dimensions indicated, coordinate fabrication and construction schedules to avoid delay.

1.5 SEQUENCING AND SCHEDULING

A. Prevent delays, coordinate with other trades delivery and installation of anchors, inserts, and finished Work. Provide setting drawings, templates, and instructions for installation of items built into other assemblies.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Steel: Smooth, free of surface blemishes, pitting, seam marks, roller marks, and rolled trade names, Class, Grade, coatings and finish as indicated, unless otherwise required.
1. Plates, Shapes and Bars: ASTM A 36.
2. Bar Grating: ASTM A 569, and ASTM A 36.
3. Tubing: Cold formed, ASTM A 500; hot rolled, ASTM A 501.
4. Structural Sheet: Hot-rolled, ASTM A 1011; cold-rolled ASTM A 1008, Grade A.
5. Pipe: ASTM A 53; Schedule 40, Type and grade required for design loading, and fabrication process; black finish.
6. Castings: Gray Iron ASTM A 48, Class 30; Malleable Iron Castings ASTM A 47, Grade 32510; carbon Steel Castings ASTM A 27, Grade 70-36, Class 1.
7. Wire: ASTM A 510.

B. Aluminum Metals: Alloy specified unless otherwise indicated or required for application.
1. Sheet and Plate: ASTM B 209, alloy 5052-H32.
2. Extruded Bar: ASTM B 221, alloy 6061-T6.
3. Drawn Seamless Tube: ASTM B 210, alloy 6061.

C. Grout: As specified in Section 03 30 00.

D. Concrete: As specified in Section 03 30 00.

2.2 MANUFACTURED UNITS

A. Fasteners: Type, grade and class required, same metal as material fastened, except provide stainless steel fasteners for aluminum connections. Provide ASTM B 633 Class Fe/Zn 5 fasteners for exterior use, and fasteners in exterior walls except where stainless steel is required.
1. Steel Bolts and Nuts: ASTM A 307, Grade A, hexagon head, ASTM A 563.
2. Lag Bolts: ASME B18.2.1.
3. Machine Screws: ASME B18.6.3
4. Wood Screws: ASME B18.6.1, flat head unless otherwise required.
5. Anchor Bolts: ASTM F 1554, Grade 36, galvanized where required.
6. Threaded and Wedge Type Concrete Anchors: ASTM A 47malleable iron, ASTM A 27 cast steel with bolts, washers, and shims as necessary; hot-dip galvanized all components per ASTM A 153.
7. Expansion Anchors: Interior applications provide zinc plated carbon steel complying with exterior fastener requirement. Exterior applications provide ASTM F 593 stainless steel bolts and ASTM F 594 stainless steel nuts.
8. Plain Washers: ASME 18.22.1, carbon steel, round.
9. Lock Washers: ASME B18.21.1, carbon steel, helical spring.
10. Self-tapping/driving resistant to hydrogen embrittlement with tip and leading threads hardened to HRC 52 and shaft hardened to less than HRC 34 and complying with SAE J429 Grade 5 and ASTM A449 for strength and ductility. Provide fastener types, size, length and thread configuration necessary for each Project application and complying with ICC-ES Report for fastener performance characteristics. Screws: Corrosion preventing polymer coated, steel with hex washer head and bonded neoprene gasket, size and length per ICC-ES report and as required for Project specific applications. Organic polymer coating shall have a salt-spray resistance to red rust of more than

800 hours per ASTM B 117. ITW Buildex; Teks Maxiseal with Climaseal finish Textron Inc., Textron Fastening Systems; Elco Dril-Flex with Stalgard finish or approved.

B. Brackets, and Flanges: Same metal, type, and finish as supported member.

C. Woven Wire Cloth: Comply with ASTM E 2016 for patterns and configurations required.

2.3 FABRICATION

A. Shop Assembly: Required, minimize field assembly, disassemble only as necessary due to limitations of shipping and handling; mark units for reassembly and installation.

B. Material Size and Thickness: As indicated and required for strength and durability in finished product for use intended. Use structural steel shapes, plates and bars, unless otherwise required.

C. Form Work true to line and level with accurate angles and surfaces and straight sharp edges. Radius exposed edges approximately 1/32 inch unless otherwise indicated. Form bent-metal corners to smallest radius possible without causing grain separation or otherwise impairing work.

D. Weld corners, joints, and seams continuously. Comply with AWS standards. Grind exposed welds smooth and flush; match adjoining surfaces.

E. Provide continuously welded joints where indicated, at joints exposed to view in completed work, and in assemblies exposed to weather, unless otherwise acceptable. Where welds are not required join components by mechanical means, concealed from view at visible joints.
   1. Mechanical Joints: Tight abutting surfaces with flush transition between them, uniform in profile and appearance.
   2. Exposed Fasteners: Countersunk and contoured for heads to be flush to adjacent surface when installed; provide Phillips, Allen or tamper resistant heads as directed.
   3. Joints Exposed to Weather: Resistant to intrusion of water. Provide water-tight continuously welded joints unless otherwise required. Weep and ventilate assemblies that are not water-tight in a manner that will limit water penetration and prevent entrapment of water within the assembly.

F. Provide brackets, flanges, fittings, and anchors of type and spacing as necessary; coordinate with supporting structure.
   1. Work Set in Concrete and Masonry: Galvanized and sleeved as necessary to prevent corrosion. Furnish inserts to be installed in concrete and masonry in coordination with work sequence and schedule.
      a. Sleeve: Steel pipe or tube, 6 inches long and 0.5-inch ID oversize; hold top of sleeve 0.5 inch below concrete surface, close bottom with 1-inch oversized plate.

G. Cut, reinforce, drill and tap metal fabrications for penetrations, and to receive hardware, anchors, and attachments.

H. Rough Hardware: Custom fabricated miscellaneous steel and iron shapes, bolts, plates, anchors, hangers, and dowels; provide as indicated.
   1. Washers: Malleable iron for connections bearing on structural wood.

I. Loose Bearing and Leveling Plates: Flat, thickness, bearing, and anchorage required, for steel items bearing on masonry, and concrete.

J. Miscellaneous Framing and Supports: Items not part of structural steel framework; provide as necessary and required to complete work.

K. Elevator Ladders: Comply with ANSI A14.3 Safety requirements for fixed ladders. Where ASME A17.1 and / or CAL OSHA requirements diverge, the more stringent design and safety requirements shall apply.
   1. Rungs: Center inside rail, plug weld, and grind rail face smooth; provide non-slip surface on top of rung.
   2. Support: Top, bottom, and at 5 feet on-center interval.

L. Exterior Courtyard Gate: Provide fully welded, hinged gate panel frames with infill panels, cantilevered post gate supports, footing anchorage, hardware and finishes as required for manually operated, access-controlled swing gate(s) as shown in Drawing Plan, Elevation and details.
   1. Coordinate electrical work scope for low-voltage access control where indicated.
   2. Sizes: As indicated in Drawings.
   3. Frame: HSS in sizes and thickness indicated; provide mitered corners.
   4. Infill panels: Steel bar in sizes and thickness indicated, welded to frame as indicated.
   5. Gate hardware: Reference Section 08 71 00 for assigned Group.
   6. Finish: Apply Powder-coated finish to fully assembled, galvanized steel gates; color to match aluminum storefront system unless noted otherwise in Drawings.

M. Rooftop Mechanical Screen: Provide fully welded, cantilevered aluminum frame and panelized welded wire mesh as shown in Roof Plan, Section and Detail Drawings. Reference Drawing Sheets S0.41 and A721.
   1. Frame: Aluminum, Type 6061, provide members in sizes and at spacing indicated.
      a. Mechanical Frame posts are through-bolted to HSS 5 x 5 stub posts welded to structural steel roof framing.
      b. Provide Type 316 stainless steel bolts.
   2. Metal Panel: Basis of Design is McNichols Aluminum, Expanded Metal, flattened, alloy 3003-H14, ¾” No .081 (Heavy), 61% open panel, or as selected by Architect from available patterns.
      a. Panel Edge: U-Edging, Aluminum, alloy 3003-H14, 14-gauge; miter corners.
      b. Attachment: Aluminum Flat Bar, ¼” x 1” continuous, powder coated finish to match panel; predrill for ¼”-14 inch stainless steel hex washer head fasteners at 24 inches on center prior to finishing.
   3. Finishes:
      a. Frame: High Performance Paint System. Reference Section 09 96 00.
      b. Metal Panel, Trim and Hardware: Provide powder-coated finish to match Architect sample.
   4. Accessory Product
      a. Neoprene gasket: Closed cell neoprene sheet; provide in thickness to insure tight fit between HSS stub and 6x6 aluminum post interior.

2.4 FINISHING

A. Galvanizing: Required after fabrication for exposed and concealed components in exterior assemblies, such as shelf angles and similar supports, items in contact with concrete and as indicated.
   1. Iron and Steel Hardware: ASTM A 153.

2. Steel Shapes, and Assembled Products: ASTM A 123.
3. Structural Steel: ASTM A 123, Coating Grade 80.
4. Steel Sheet: ASTM A 653 G90 or equivalent.
5. Galvanized Components Exposed to View: Comply with ASTM A 384 for control of warpage and distortion of galvanized components. Galvanizing tank shall be of sufficient size to allow member to be fully coated in one immersion.
   a. ASTM A 653 G 210 galvanized components

B. Shop Painting: SSPC-PAL Specification No.1.
1. Surface Preparation: Exteriors (SSPC Zone IB): SSPC-SP6 Commercial Blast Cleaning; Interiors (SSPC Zone 1A): SSPC-SP3 Power Tool Cleaning.

C. Shop applied primers and finish coatings: compatible with specified field finishes and systems. Primers shall provide a sound foundation for field-applied topcoats.
1. Shop Primer for Ferrous Metal: Direct-to-metal, abrasion-resistant, rust-inhibiting barrier coat compatible with field applied finish specified in Section 09900.
2. Shop Primer for Ferrous Metal: Fast-curing, lead-free, abrasion-resistant, rust-inhibiting complying with performance requirements only of FS TT-P-86, Types I, II, and III.
3. Galvanizing Repair Paint: Military Specifications MIL-P-21035, or SSPC-Paint-20.
4. Shop Prime for Galvanized Steel: One coat of two-component, polyamide epoxy 4.0 to 6.0 mils dry film thickness, VOC content less than 150 grams per liter, PPG Pitt-Guard 97-145.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Installer shall examine conditions for installation of Work and notify Contractor of conditions detrimental to proper and timely completion. Do not proceed until unsatisfactory conditions are corrected. Start of installation interpreted as installer's acceptance of conditions.
1. Coordinate work of this Section with field conditions to ensure proper fit with actual constructed assemblies. Provide clearances necessary for proper operation of moving parts and equipment and as necessary for servicing and maintenance of adjacent work.

3.2 INSTALLATION

A. Set Work accurately in location, and elevation; align, plumb, level, true and free of rack, measured from established lines and levels. Cut, drill, and fit as necessary for required installation. Brace, support, and anchor Work during installation as necessary.
1. Elevator Hoist Beam: Center over rails and to permit rigging as required by Elevator Code; coordinate with Section 14 21 00.

B. Align connections accurately, form tight hairline joints. Unless otherwise required, weld connections which could not be shop welded due to shipping limitations. Grind exposed joints smooth and touch-up shop finish. Do not weld, cut or abrade units intended for bolted, and screwed field connections.

C. Properly secure Work to in-place construction, use lead expansion shields for anchors in masonry and concrete walls. Provide flanges, collars, and sleeves to conceal joints, and as required. Use concealed anchors unless otherwise indicated.

D. Install Work in accordance with product manufacturer's recommendations unless otherwise indicated. Fit rails, guards, and gratings around building structure, mechanical systems, and permanent obstructions.

E. Grouting: Place in accordance with manufacturer's instructions. Remove bond-reducing contaminants from bearing surfaces and roughen to improve bond. Support loose plates on wedges, or shims cut-off flush with plate edge before grouting. Pack grout solidly into annular spaces, and between bearing surfaces, ensure that no voids remain.

F. Comply with recommendations of NAAMM Metal Bar Grating Manual for installation, clearances, and anchoring of gratings.

G. Repair of Shop Applied Coatings: Immediately after erection, prepare field welds, and damaged areas of shop applied coatings, and recoat with material originally used. Comply with Section 09 91 13, 09 91 23 and 09 96 00 requirements for preparation and application and coordinate with filed applied finishes.

END OF SECTION

SECTION 05 51 00 – ARCHITECTURAL METAL STAIRS

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes requirements for Architectural Metal Stairs at Lower and Main Levels, as indicated on A001 and elsewhere on the drawings.

B. Related Sections:
1. Section 05 52 00 Metal Guards and Railings.
2. Section 05 52 13 Glazed Guards.
3. Section 05 50 00 Metal Fabrications.
4. Section 09 66 00 Terrazzo Flooring.
5. Section 21 13 00 Fire Suppression Sprinkler Systems.

1.2 ADMINISTRATIVE REQUIREMENTS

A. Provide for advance coordination for work of this Section with building structure for required connection and support and work of related Section as necessary to ensure compliance with System Description requirements. Prevent the need for subsequent modifications to completed work of this Section and work of the Related Sections.
1. Provide coordination of steel fabrication work of this Section with guardrail assemblies of Section 05 52 00, finish stainless steel cladding assemblies of Section 05 50 00 and precast terrazzo treads and landing platforms of Section 09 66 00.

1.3 SUBMITTALS

A. Product Data: Provide the following; when requested provide additional data for materials and manufactured products proposed for use in the Work;

B. Shop Drawings: Plans, elevations, structural calculations, field measurements, and details of sections, anchorages and accessories for stairs. Indicate coordination provisions for subsequent attachment of guardrail assembly, terrazzo fabrications and stainless-steel cladding. Include structural calculations and stamp of registered Engineer for Contractor designed Work.
1. Indicate dimensional tolerances for coordination with work of Related Sections and verify completed assembly compliance with dimensions and tolerances required for the Work.
2. Indicate erection aids, locations, method of attachment and subsequent removal following erection.
3. Coordination with components embedded in cast-in-place concrete and connections at building structure.
4. Coordination with sprinkler piping location, support from stair structure and routing.

C. Erection Plan: Indicate Contractor's sequence, means and methods including but not limited to temporary support and bracing, erection aids - type and locations proposed. The Plan is required only to demonstrate compliance with requirements to plan the work and compliance with requirements for installed stair assembly.

D. Certificates: Welding operator qualification.

1.4 QUALITY ASSURANCE

A. Welding Processes and Operator Qualifications: AWS D1.1, D1.2, and D1.3, AWS Code for manual shielded metal-arc welding, and remedial work. Certify welding operators have passed AWS qualification tests.

B. Fabricator: Participant in the AISC Certification program and is designated an AISC Certified Plant, Category STD; alternative means of demonstrating qualifications for control of appearance in the work including but not limited to work samples may be acceptable as required for Substitutions.

C. Coating Applicator: Staff of craft-workers who are SSPC Interim Status Certification as a Coating Application Specialist or AISC Certification for shop application of Complex Protective Coating Systems. or other acceptable SSPC certification demonstrating the necessary skill and experience who will be assigned to work of this Project as a supervisor or applicator of the coating systems required.

1.5 SYSTEM DESCRIPTION

A. Design Requirements: Comply with NAAMM Metal Stair Manual for Architectural Class assembly in configuration required for connection and support from primary building structure and to comply with requirements of Related Sections for glazed guards, precast terrazzo treads and architectural cladding.
   1. Stair Treads, and Landing Platforms: Completed assembly shall provide for support and connection of precast terrazzo treads, glazed guards and architectural metal cladding work as required for work of these Related Sections.
      a. Terrazzo Treads: Coordinate with Section 09 66 00 for precast stair treads and ensure required connection and support of treads.
   2. Glazed Guards and Handrails: Coordinate with Section 05 52 00 and ensure stair structure provides necessary attachment and support of loads imposed by guard assembly per System Description requirements of that Section.
   3. Coordinate stair structure fabrications and final assembly to comply with S0.01 and S0.02 and as otherwise required for the Work.
   4. Dimensional Uniformity: Comply with CBC Title 24, Part 2 Volume 1 Section 1009 and 1011 for stairways and Sections 1014 and 1015 for railings and guards.
   5. Fire Suppression Sprinklers: Final design of stair assembly shall provide for support of and fully concealed service pipe and locations of sprinkler heads as necessary for required coverage in coordination with finish cladding and as otherwise directed by the Architect.
   6. Stainless Steel Cladding: Coordinate with work of Section 05 50 00 for supplemental support components and final installation of architectural finish fabrications fully enclosing stair structure and glazed guard base shoe as required.

B. Performance Requirements: Primary stair
   1. Stair Treads and Landing Platforms: Comply with live and concentrated load requirements of CBC Title 24 Part 2 Volume 2 Section 1607 and as otherwise necessary for connection and support of precast terrazzo treads.
   2. Glazed Guards and Handrails: Coordinate with work of Section 05 52 00 and provide support and attachment of assemblies to ensure compliance with Performance Requirements of that Section.
   3. Allowable Deflection: Comply with CBC Title 24 Part 2 Volume 2 Section 1604.3.

1.6 MATERIALS

A. Steel: Smooth, free of surface blemishes, pitting, seam marks, roller marks, and rolled trade names, Class, Grade, coatings and finish as indicated, unless otherwise required.
   1. Plates, Shapes and Bars: ASTM A 36.
   2. Tubing: Cold formed, ASTM A 500; hot rolled, ASTM A 501.
   3. Structural Sheet: Hot-rolled, ASTM A 1011, Designation CS; cold-rolled ASTM A 1008 Designation CS.

B. Bolts, Fasteners and welding materials in accordance with approved Shop Drawings.

C. Expanded Metal: Flattened, hot rolled, mill finished, carbon steel 3/4 No. 9 diamond mesh, 0.923 Short Way of Design by 2.1 inch Long Way, 71 percent open area.

1.7 FABRICATION

A. Shop Assembly: Required, minimize field assembly, disassemble only as necessary due to limitations of shipping and handling; mark units for reassembly and installation.

B. Material Size and Thickness: As indicated and required for strength and durability in finished product for use intended. Use structural steel shapes, plates and bars, unless otherwise required.

C. Form Work true to line and level with accurate angles and surfaces and straight sharp edges. Radius exposed edges approximately 1/32 inch unless otherwise indicated. Form bent-metal corners to smallest radius possible without causing grain separation or otherwise impairing work.

D. Weld corners, joints, and seams continuously. Comply with AWS standards. Provide uniform size and profile in welds and coordinate joinery so as not conflict with finish cladding assembly and secondary supports.

E. Exposed Connections: Ensure the completed stair structure assembly will be fully enclosed by architectural cladding work of Section 05 50 00 including but not limited to portions of glazed guards indicated to be concealed.

F. Tolerance: Control and reduce deviations in dimensions from those indicated for the work and variations for like components in the final assembly to ensure required fit and appearance of the completed and finished stair and as necessary for incorporation of work of Related Sections having Architectural finish quality appearance.
   1. As a minimum, conventional tolerances shall be reduced by 30 percent for work of this Section.

1.8 SHOP PAINTING

A. Shop Prepare and Prime Steel Framed Stairs:
   1. Surface Preparation for Prime Paint: Comply with recommendation of the prime paint manufacturer for formation of durable paint bond to substrate; SP-3 Power Tool Cleaning shall be the minimum unless otherwise acceptable.
   2. Prime Paint: Provide an approved direct to metal, corrosion inhibiting primer having a record of successful in-service performance.

PART 2 - EXECUTION

2.1 EXAMINATION

A. In preparation of shop drawings, verify in field dimensions for stair rise, run and configuration and support and connection conditions to building structure and all other dimensions that may affect the work. Coordinate data with shop drawings and fabrication to avoid need for field modifications to Work.

B. Installer shall examine conditions for installation of Work and notify Contractor of conditions detrimental to proper and timely completion. Do not proceed until unsatisfactory conditions are corrected. Start of installation interpreted as installer's acceptance of conditions.

2.2 INSTALLATION

A. Stair Assembly Erection: Exercise a high degree of craftsmanship and care in handling and installing appropriate to finish grade components. Use tools and methods that will minimize the potential of damage to these components and compromise installation of subsequent finish work. Protect installed work from damage during subsequent construction activities and damage from exposure to weather. Set Work measured from established lines and levels accurately in location, and elevation; align, plumb, level, true, and free of racking and movement. Cut, drill, and fit as necessary for required installation. Brace, support, and anchor Work during installation as necessary with neither damage nor alteration affecting subsequent work.

B. Align connections accurately, form tight joints and durable and stable connections. Provide welded and bolted connections as approved for field joints. Welds shall be ground and finished where they may otherwise impede subsequent work of glazed guards and finish cladding.

C. Connect stair structure to primary building structure and support to comply with System Description.

D. Immediately after erection, prepare field welds, and damaged areas of shop applied paint, and repaint with material originally used for shop painting.

E. Tolerances for Field Erection: Comply with requirements for shop fabrication and assembly.

END OF SECTION

SECTION 05 52 00 - METAL GUARDS AND RAILINGS

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes requirements for custom guard and handrail assemblies at stairs, open side of floors and other required locations.

1.2 ADMINISTRATIVE REQUIREMENTS

A. Advance Planning and Coordination Procedures: Proactive for coordination of work of this Section with concrete work of Section [03 30 00 03 48 13], metal decking of Section 05 30 00 for guard support and connections at open side of floors, Section 05 50 00 for stair structure affecting guard connections and supports, and finish work. Ensure compliance with System Description and prevent the need for subsequent modifications to fabricated and installed work or Related Sections. Participation by all pertinent parties, including but not limited to Fabricator, Erector, Contractor and the design engineer for delegated design work.

B. Sequence and Schedule: Prevent trafficking of sensitive finish treatments on stair tread, risers and landings; delay application of finishes to prevent damage and wear without obstructing Project Schedule.

1.3 SUBMITTALS

A. Product Data: Provide the following; when requested provide additional data for materials and manufactured products proposed for use in the Work.

B. Shop Drawings: Plans, elevations, field measurements, details of sections, anchorage and accessories for guard assemblies. Document coordination for attachment of guard assembly to supports and integration with finishes. Include structural calculations, seal and signature of registered Engineer for design work delegated to the Contractor.

C. Samples: Provide three of each required for standard components of cable guardrail assemblies, custom guardrail stanchions, handrails and supports.
   1. Wire Mesh Guards: Provide wire mesh fabric, frame, fittings, tension rod and all hardware necessary for complete installation; wood top rail in profile, milled for continuous concealed flat bar, in species and finish indicated.
   2. Finish Sample: For one set of stanchion-rail samples provide stepped demonstration of mill finish, prepared surface, shop primer and field applied finish, coordinate with section 09 91 13, 09 91 23 and 09 96 00 for finish painting, and mechanical finish on stainless steel handrail.

D. Certificates:
   1. Welding operator qualification.

E. Mock-Up: Provide complete, full-size guard and handrail assembly as required for the Work and configured for stair mock-up specified in Section 05 50 00. Mock-up assembly shall be complete with all fittings, hardware, components and finishes.

1.4 QUALITY ASSURANCE

A. Welding Processes and Operator Qualifications: AWS D1.1, D1.2, and D1.3, AWS Code for manual shielded metal-arc welding, and remedial work. Certify welding operators have passed AWS qualification tests.

PART 2 - PRODUCTS

2.1 SYSTEM DESCRIPTION

A. Performance Requirements: Comply with barrier free access requirements of CBC Title 24 Chapter 11 and barrier free access requirements.
1. Handrails and Top rails: ASTM E 935; concentrated load: 200 foot-pounds applied in any direction; uniform load: 50 pounds per lineal foot applied concurrently vertically and horizontally normal to top rail.
2. Guardrails: Uniform load equivalent to 50 pounds per square foot of gross area of guard, including open areas; concurrent with top rail concentrated load for determining stress on supporting members.
3. Allowable Deflection: Comply with ICC Section 1604.3
4. Stress Due to Differential Loads: Accommodate to maintain specified performance requirements.

2.2 MATERIALS

A. Steel: Smooth, free of surface blemishes, pitting, seam marks, roller marks, and rolled trade names, Class, Grade, coatings and finish as indicated, unless otherwise required.
1. Plates, Shapes and Bars: ASTM A 36.
2. Tubing: Cold formed, ASTM A 500; hot rolled, ASTM A 501.
3. Structural Sheet: Hot-rolled, ASTM A 570, Grade 30; cold-rolled ASTM A 611, Grade A.

B. Stainless Steel: AISI Type 302/304, unless otherwise indicated.
1. Perforated Sheet: ASTM A 666; 14 Gage with 0.25-inch diameter holes, staggered on 0.375 inch centers, 40 percent open area having 0.5 inch wide blank margin on vertical edges. Orient perforations to align horizontally. Machine leveled to the following tolerances measured per ASTM A 505.
a. Flatness: 0.25 inch in any 36 inches.
b. Camber: 0.125 inch in any 48 inches.
c. Burrs: Not more than 0.003 inch maximum, do not reduce open area.
2. Tubing: ASTM A 554.
3. Plate: ASTM A 666.
4. Bar and Rod: ASTM A 276.

2.3 FABRICATION

A. Shop Assembly: Required, minimize field assembly, disassemble only as necessary due to limitations of shipping and handling; mark units for reassembly and installation.

B. Material Size and Thickness: As indicated, and required for strength and durability in finished product for use intended. Use structural steel shapes, plates and bars, unless otherwise required.

C. Form Work true to line and level with accurate angles and surfaces and straight sharp edges. Radius exposed edges approximately 1/32 inch unless otherwise indicated. Form bent-metal corners to smallest radius possible without causing grain separation or otherwise impairing work.

D. Weld corners, joints, and seams continuously. Comply with AWS standards. Grind exposed welds smooth, and flush; match adjoining surfaces.

E. Exposed Connections: Welded to greatest extent possible, otherwise, use concealed fasteners where possible. Provide uniform, hairline-tight joints, flush and smooth.
1. Exposed Fasteners : Provide acorn type cap head nuts as required.

2.4 HAND AND GUARD RAILINGS

A. Guardrails and Handrails on Open Side of Floors: Comply with requirements for stair assemblies and configurations indicated. Coordinate height of sloped assemblies with horizontal assemblies to maintain required heights at transition points.
1. Guardrails and Handrails: Custom fabrication of stainless steel plate and bar, with hardwood or stainless steel hand and top rails and stainless steel wire mesh infill panels as indicated in Drawings. Provide assemblies in configuration indicated.
a. Anchor Screws: 18-8 stainless steel, 1 inch, Number 7, countersunk square Allen drive wood screw.
b. Concrete inserts: Per Drawings and approved Shop Drawings; coordinate high-strength, no- shrink setting material with Section 03 30 00.
c. Brackets: Provide in type and spacing as indicated in approved Shop Drawings.
2. Stainless Steel and Steel Tube Handrail: Configuration, pipe sizes, and wall thickness indicated, but not less than required to support design loading in minimum number of joints to provide lengths indicated.
a. Joints: Butt-weld, weld with internal connectors, cope, and miter as indicated
b. Bends and Curves: Uniform, maintain constant pipe cross-section free of deformation throughout bend. Form by bending pipe in jigs and with prefabricated fittings
c. Close pipe ends with 3/16-inch-thick steel plate, return railing to wall unless otherwise indicated.
3. Standards: Stainless steel bar welded to top rail. Control weldments for uniform width and minimum visibility. Plug weld rods to steel angle top rail and grind smooth on bottom face of horizontal leg.
4. Toe Boards: Provide only where indicated and as shown, but no less than 1/8-inch plate 4 inches high, center between and weld to each railing post.

B. Curved Sections: Formed to regular, uniform curve of required radius.

C. Tolerances: For fully assembled units, not additive to tolerances for components specified in this Section nor work of other Sections.
1. Total Deviation from Plumb: 0.125 inch in four feet.
2. Deviation From True Lines: 0.25 inch in ten feet.
3. Deviation From True Curve: 0.375 inch, radius ten feet and greater.
4. Variation in Joint Width: 0.0625 inch in 5 ft; 0.1875 inch in 15 ft.

2.5 ELEVATED WALKWAY GUARDS

A. Work Scope to be finalized in Site Walk and field review of existing elevated walkway with Owner, Architect and Contractor prior to Bid, and may include but is not necessarily limited to the following:
   1. Selective removal, restoration and refinishing of existing 3/8-inch stainless steel elevated walkway tie-rods installed at 7.5 inches on center.
   2. Replacement of deformed or corroded elevated walkway tie-rods as determined by Owner/Architect, retrofitting matching 3/8-inch stainless steel tie-rods at existing horizontal steel framing elements.
   3. Placement of new elevated walkway 3/8-inch stainless steel tie-rods to match existing at 7.5 inches inches on center.
   4. Replacement of hardware identified for replacement.
   5. Placement of new, continuous, woven stainless steel wire as shown in Drawing details, supported top and bottom, woven, affixed and tensioned as indicated. Basis of Design wire fabric is Cambridge Architectural Mesh, Rigid Mesh.
   6. All new and replacement hardware shall be Type [316] [304] stainless steel.

B. Completed guard assembly shall meet CBC Title 24 Part 2 Section 1015 and 1607.9 structural criteria.

2.6 SHOP PAINTING

A. Shop Priming and Field Finishing of Steel Framed Stairs: Comply with requirements of Section 05 12 00 for exposed structural steel and Section 09 90 00 for field applied finish.
   1. Surface Preparation for Prime Paint: SP-6 Commercial Blast Cleaning using only abrasive media blasting, wheelabrator and similar tools are not acceptable. Preparation shall not impart surface texture that cannot be covered by the prime paint application.
   2. Material and fabrication defects and unacceptable characteristics revealed by surface preparation such as weld imperfections, delamination, scabs and slivers shall be corrected before completion of surface prep and primer application.

B. Prime Paint: One coat of two-component, white, polyamide epoxy 4.0 to 6.0 mils dry film thickness, 375 grams per liter maximum VOC, two-component polyamide epoxy. PPG Pitt-Guard 97-145; ICI Devran 220; S-W Recoatable Epoxy Primer B67; Tnemec Series 27 F.C. Typoxy; provide products of one manufacturer for prime and finish paints. Shop prime prepared substrates immediately following surface preparation. Field finish paint per Section 09 90 00 requirements coordinate paint products to ensure compatibility.

C. Hot-Dip Galvanizing: Per ASTM A 123 Coating Grade 100; provide on members exposed to weather, including but not limited to members in masonry cavity walls. Prepare per SP-3 except as otherwise necessary to remove unacceptable characteristics from work exposed to view and as required for application of other shop coatings.
   1. Galvanized Components Exposed to View: Comply with ASTM A 384 control warp and other distortion of galvanized components. Galvanizing tank shall be of sufficient size to allow member to be fully coated in one immersion. Prepare galvanized components required to be painted as necessary to ensure the formation of a durable paint film.
   2. Comply with ASTM D 6386 requirements for preparation of galvanized surfaces to be painted and as otherwise necessary to ensure a durable paint bond.
   3. Galvanizing Repair Paint: SSPC-Paint-20.

D. Surface Preparation: After inspection and before shipping, clean steel work to be painted. Remove loose rust, loose mill scale, and spatter, slag or flux deposits. Clean steel in accordance with Steel Structures Painting Council (SSPC) as follows:
   1. SP-1 "Solvent Cleaning".
   2. SP-2 "Hand Tool Cleaning".
   3. SP-3 "Power Tool Cleaning".
   4. SP-5 "White Metal Blast Cleaning".
   5. SP-6 "Commercial Blast Cleaning".
   6. SP-7 "Brush-off Blast Cleaning".

2.7 SHOP FINISHING

A. Comply with NAAMM "Metal Finishes Manual" for finish designations and application recommendations, except as otherwise indicated.
   1. Stainless Steel: ASTM A 480 No. 4. non directional polish. No Satin Brush, No. &, finish a number 6 surface with Tampico brushing
   2. Welds: Ground smooth, polished and passivated for seamless appearance.

B. After fabrication, finish joints, and bends, and repair damaged finish to match sheet finish. Prevent damage to finished material with temporary covering or other acceptable protection.

C. Transparent Handrail Finish: Reference Section 09 91 23 Interior Painting for transparent wood finish requirements.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Prior to preparation of shop drawings, verify in filed dimensions indicated, coordinate with shop drawings and fabrication to avoid need for field modifications to the Work.

B. Installer shall examine conditions for installation of Work, and notify Contractor of conditions detrimental to proper and timely completion. Do not proceed until unsatisfactory conditions are corrected. Start of installation interpreted as installer's acceptance of conditions.

3.2 INSTALLATION

A. Set Work accurately in location, and elevation; align, plumb, level, true, forming constant radius or line, and free of rack when measured from established lines and levels. Cut, drill, and fit as necessary for required installation. Brace, support, and anchor Work during installation as necessary.

B. Align connections accurately, form tight hairline joints. Unless otherwise required, provide bolted connections for field joints. Exposed welds shall be ground smooth and flush and finished for seamless appearance; repair shop applied coatings. Do not weld, cut or abrade units intended for bolted, and screwed field connections.

C. Properly secure Work to in-place construction. Provide flanges, collars, and sleeves to conceal joints, and as required. Use concealed anchors unless otherwise indicated.
   1. Exposed bolts shall have acorn type cap head nuts - provide cap head as finish nut over structural nut where necessary to comply with structural bolting requirements.

Align facets of stacked nuts for uniform appearance, and coordinate application of cap nut with special inspections requirements.

D. Immediately after erection, prepare field welds, and damaged areas of shop applied coatings paint, and repaint with material originally used for shop painting. Provide dry film thickness of 2.0 mils.
   1. Galvanizing: Comply with ASTM A 780 and provide uniform appearance in the repaired work.

E. Finish Painting: Field applied per Section 09 90 00 requirements.

3.3 FIELD QUALITY CONTROL

A. Hand and guardrail assemblies are subject to evaluation by the Owners Quality Control Agent per ASTM E 894 Test Method for Anchorage and E 935 Test Methods for Railing Systems.
   1. Owner may elect to have a representative sampling of each type of railing, cantilevered, wall mounted tested as necessary to verify compliance with Contract requirements.

END OF SECTION

SECTION 06 10 00 – ROUGH CARPENTRY

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes requirements for rough carpentry, and incidental carpentry for support or attachment of other work.

B. Related Sections:
1. Section 06 20 00 Finish Carpentry.
2. Section 06 40 00 Architectural Woodwork.

1.2 SUBMITTALS

A. Product Data: Manufacturer's product literature for fasteners, vapor barrier tape, building paper, sheathing, wood preservative materials, and application instructions.
1. Certifications: Demonstrate compliance with Quality Assurance, requirements.
2. Compliance with Local / Regional Materials requirements.
3. Schedule of Values Documentation: Added cost, if any, for sustainably sourced wood products. Value-added as a result of shop fabrication of certified wood products.
4. Document Chain of Custody from forest of origin through manufacturing and fabrication. Include certified status and location of forest of origin and location of manufacture (mill).

B. Evaluation Reports: ICC-ES Report with applicable Legacy ICBO Evaluation Report and Legacy NES Report Number for each type of fastener.

1.3 QUALITY ASSURANCE

A. Evidence of Grade: Conform to California Building Code Chapter 23 and DOC PS 20-20.
1. Rough Lumber: Stamp each piece of lumber and plywood with grade mark and trademark of Association having jurisdiction.
2. Acceptable Lumber Inspection Agencies: Any agency with rules approved by American Lumber Standards Committee.

B. Fire-Retardant Treated Wood: Mark each piece of wood with producer's stamp indicating compliance with specified requirements.

C. Preservative-Treated Wood: Provide lumber and plywood marked or stamped by an ALSC-accredited testing agency, certifying level and type of treatment in accordance with AWPA standards.

D. Moisture Content:
1. Certify that lumber and wood panels (surface dry, surface green, and kiln dried) contain no more than 15 percent moisture content when delivered to site.
2. Monitor moisture content of in-place wood and take remedial action to lower unacceptable moisture content.

E. Foreman Qualifications: Fifteen years successful experience with Work similar to that required for this Project, especially work involving exposed wood structure. The last three

years of their experience shall be with the firm they are presently working for. This foreman shall have authority to direct the work of this Section and shall be on site at all times work of exposed wood structure is in progress.

1. Certification of Qualifications: Five recent jobs similar to this Project, include project and contact name, location, and date.

1.4 DELIVERY, STORAGE, AND HANDLING

A. Store wood materials a minimum of 6 inches above ground on framework or blocking, away from dirt and moisture, well ventilated, and covered with waterproof covering.

B. Delivery Storage and Handling: Keep materials dry, and prevent exposure to weather; store in orderly, well-ventilated stacks. Conform to chain of custody requirements as necessary to maintain FSC certification.

1.5 COORDINATION

A. Coordinate rough carpentry of this Section with other Sections to make Work fit together.

B. Coordinate with other Sections for work mounted to or supported by wood framed assemblies provided as work of this Section.

PART 2 - PRODUCTS

2.1 LUMBER

A. Lumber Grading Rules: WWPA or WCLIB based on DOD PS 20.

B. Structural Lumber and Timber: Conform to Structural Drawings for wood framed construction subject to structural loading, including maximum allowable moisture content.

C. Non-Structural Framing Lumber: Include wood framed construction and components not subject to structural loading as defined by Structural Drawings.

1. Species: Douglas Fir-Larch.
2. Grade: WWPA or WCLIB, No. 2.

D. Condition of Seasoning (Moisture Content):

1. Nominal 2-inch Thickness: S-DRY, 15 percent maximum moisture content.
2. Nominal 4-inch Thickness or Greater: S-GRN. Air dry to 19 percent maximum moisture content.

2.2 WOOD PANEL PRODUCTS

A. General: APA Grade Stamp each panel. Conform to DOC PS 1 and DOC PS 2 for cross laminated veneer panel.

1. APA A-A Group 1, Exposure 1: Where face exposed both sides.
2. APA PS 1, A-D Group 1, Exposure 1: Face exposed one side.
3. APA PS 1, C-D Plugged Group 2, Exposure 1: Face unexposed.

4. APA, Exterior: Provide in lieu of Exposure 1 where panels are subject to permanent weather exposure or prolonged weather exposure of 6 months or more prior to being covered with weathertight construction.

B. Wall Sheathing: APA Plywood Rated Sheathing Exposure 1 or APA Structural I Rated Sheathing Exposure 1, 15/32 inch thick, except as otherwise shown on Structural Drawings.
1. Joints: Square edge.
2. APA Span Rating: Not less than Index 32/16.

C. Equipment Mounting Panels: Fire-retardant treated, APA C-D PLUGGED INT with exterior glue, 0.5 inch thick unless otherwise indicated.

2.3 ENGINEERED WOOD PRODUCTS

A. Structural Composite Lumber: Establish and monitor structural capacities conforming to ASTM D5456 required by CBC 2303.1.9 and as specified by the Structural Notes.

B. Structural Laminated Veneer Lumber (LVL): Trus Joist, Microllam, and as specified by the Structural Drawings.

C. Parallel Strand Lumber (PSL) Beams: Trus Joist, Parallam, for use in lieu of glue-laminated lumber at conditions not exposed to view and as specified by the Structural Drawings.

D. Laminated Strand Lumber (LSL): Trus Joist Timberstrand, accepted in lieu of dimensional lumber, and as specified by the Structural Drawings.

2.4 FASTENERS

A. Fastener Types, Sizes, Spacing, and Quantities: Provide fasteners and connectors including nails, spikes, screws, clips, bolts, and anchors required for installation of carpentry and millwork, conforming to CBC Table 2304.9.1, APA recommendations, and as shown on Structural Drawings.
1. Provide stainless steel or coated components specifically intended for use in corrosive environments and the specific type of preservative treatment incorporated into the wood.

B. Steel Drill Screws:
1. ASTM C1002, self-drilling, minimum 1-1/4-inch long, bugle head, corrosion-resistant polymer coating, conforming to ASTM B117.
2. Screws at Steel Framing: Type S, in lengths required to penetrate 3/8 inches beyond steel stud framing.

C. Nails, Spikes, Staples and Other Driven Fasteners: Conform to ASTM F1667 and CBC Section 2303.6.

D. Bolts and Lag Bolts: Conform to ASTM A307. Provide steel plate washers.

E. Metal Connectors: Simpson Strong-Tie Company or approved equivalent. Types indicated on drawings with minimum G-90 zinc coating.

2.5 ANCHORS

A. Conform to Structural Drawings, manufacturer's ICC ES Evaluation Reports, and manufacturer's instructions, including manufacturer's tables indicating design loads and recommended use for each fastener type.

B. Concrete Anchors:
1. Drive Anchors: As specified by the Structural Notes.
2. Expansion Anchors: As specified by the Structural Notes.
3. Adhesive Anchors: As specified by the Structural Notes.

C. Steel Anchors: Powder actuated fasteners or threaded bolts, nuts, and washers as indicated by the Structural Drawings and manufacturer's instructions.

D. Floor Plate and Sill Anchors: Conform to CBC Sections 2308.3.3, 2308.3.8, 2308.12.9, and to the Structural Drawings.
1. 5/8 galvanized steel bolts or approved anchors embedded minimum 7 inches into concrete and spaced as indicated on the Structural Drawings.
2. Provide at least 2 bolts or anchor straps at each plate located not more than 12 inches and not less than 4 inches from each end.
3. Bolt and tighten plate to foundation with nut and washer.

E. Bar or Strap Anchors: Conform to the Structural Drawings.

2.6 ROUGH HARDWARE

A. Framing Anchors, Beam, and Post Connectors: Designed to support imposed loads, conforming to the Structural Drawings.

B. Joist and Rafter Hangers: Conform to CBC Section 1715, as tested according to ASTM D1761, for vertical load-bearing capacity, torsional moment capacity, and deflection characteristics and as specified by the Structural General Notes.

2.7 ACCESSORIES

A. Construction Adhesives: Solvent based, conforming to APA Specification AFG-01, with maximum VOC based on current requirements of South Coast Air Quality Management District (SCAQMD) Rule No. 1168 on the interior of the building.
1. "Current requirements" refers to the date on which the materials are installed in the building.
2. Follow SCAQMD Rule No. 1168. Refer to http://www.aqmd.gov/rules for the actual current version of the rule that will be applicable at the date of installation during construction.
3. "Interior" refers to all building construction that is inside of the exterior weatherproofing material.

B. Sill Seal: Foam gasket and self-adhering membrane: Triple Guard Energy Sill Sealer by Protecto Wrap, or approved.

2.8 FINISHES

A. Carbon Steel Fasteners, Anchors, Straps, and Rough Hardware: ASTM A123 or ASTM A153, hot-dip galvanized.
   1. Exterior carbon steel in contact with concrete, G90. Stainless steel also is acceptable.
   2. Interior steel, G40 in dry conditions, G60 where subject to wetting. Stainless steel also is acceptable.
   3. Fasteners Placed in Chemically Treated Wood: Steel or coated components specifically intended for use with chemically treated wood products being incorporated into the Work.

B. Stainless Steel Fasteners and Anchors: ASTM A276 Type 316.

C. Electrolysis Protection: Isolate metal in contact with metals of dissimilar galvanic range by isolation methods including application of suitable primers, paints, or tapes.

2.9 WOOD TREATMENT

A. Wood Preservative (Pressure Treatment):
   1. Apply preservative treatment to all exterior lumber, including roofing nailers, curbs, and other wood in contact with concrete, and moist conditions.
   2. For above-ground use, use AWPA certified Ammonium Copper Quaternium (ACQ) or Copper Hydroxide Sodium Dimethyldithiocarbamate (CDDC) waterborne preservative with 0.25 pounds per cubic foot of wood retention.
   3. Approved Product: "Wolmanized Natural Select" by Arch Wood Protection, Inc. (Smyrna, GA; 770-801-6600); copper azole (CA) fungicide.
   4. For ground-contact use, use AWPA Treatment C-22 using CCA waterborne preservative with 0.40 pounds per cubic foot of wood retention.
   5. Treated lumber shall be kiln dried to a maximum moisture content of 15 percent; treated plywood shall be kiln dried to a maximum moisture content of 15 percent.
   6. Treated lumber shall bear the quality stamp of an inspection agency approved by the jurisdictional code authorities.

B. Isolation Membrane: Self-adhering non-asphalt based, breathable, waterproof membrane, GCP Applied Technologies Perm-A-Barrier VPS or approved equal.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify conditions ready to receive work of this Section before beginning. Notify the Owner in writing of conditions detrimental to the proper and timely completion of the work. Do not begin installation until all unsatisfactory conditions are resolved. Beginning work constitutes acceptance of site conditions and responsibility for defective installation caused by prior observable conditions.

B. General:
   1. In addition to framing operations normal to the fabrication and erection indicated on the drawings, install wood blocking and backing required for the work of other trades.
   2. Set horizontal and sloped members with crown up.

3. Do not notch, cut, or bore members for pipes, ducts, or conduits, or for other reasons except as shown on the drawings or as specifically approved in advance by the Engineer of Record.
4. The contact surfaces of any member coming in contact with an exterior concrete regardless of height above ground shall be treated wood or shall be painted with two coats of an approved preservative.
5. Wood Products with Chemical Treatment: Material shall be separated from contact with other materials by continuous layer of the specified isolation membrane applied to all contact surfaces.

3.2 INSTALLATION

A. Conform to APA Design/Construction Guides, California Building Code 51-50 Chapter 4, and the Structural Drawings.
1. Sill Gaskets: Provide two contiguous lines of specified product at sills of exterior walls and seal against air infiltration and water penetration.
2. Chemically Treated Wood Products: Material not certified by the manufacturer as compatible with contact surfaces and substrates shall be separated from contact with other materials by contiguous layer of the specified isolation membrane applied to all contact surfaces.

B. Cants, Curbs, and Nailers: Pressure treated; dimensions as indicated or required.

C. Fire Blocking: Construct nominal 2-inch-thick solid lumber at ceiling line. Construct at mid-height between studs, where partition height exceeds 8 feet. Do not exceed 10 feet on center vertical spacing.

D. Dressed Wood Grounds: Set for securing wood trim, base, and millwork. Install to be secure rigid, straight, true, and aligned.

E. Shims: Do not use shims for leveling on wood or metal bearings; cut and fit members accurately.

F. Wood Backing: Provide for secure installation and support of work of other Sections, including but not limited to casework, hardware, plumbing, heating, ventilating, and electrical work. Accepted for installation at metal stud partitions as well as for wood framing, except where not permitted by Code.

G. Structural nailing shall follow IBC Table 2304.9.1 unless more stringent requirements are indicated on the Structural Drawings.

3.3 WALL SHEATHING

A. Stagger panel ends per the Structural Drawings.

B. Nail to framing at exterior wall sheathing at 6 inches on center at panel edges maximum and 12 inches on center at panel field. Include additional fasteners as necessary to set securely in place.

C. Refer to the Structural Drawings for more stringent nailing requirements.

3.4 PANEL BOARDS

A. A. Provide panel boards and backings for support of Mechanical and Electrical work.
1. Use fire-retardant plywood for Electrical panel boards.
2. Oversize panel boards 12 inches beyond mounting requirements.

3.5 BLOCKING, NAILERS, AND CURBS

A. Provide blocking, nailers, and curbs for sheathing, roof construction, metal flashing, and other construction as indicated, and as necessary for firm support. Unless otherwise indicated, solid wood backing shall be a minimum 2-inch nominal thickness, installed flat.

B. Blocking: Install wood blocking to receive mechanical fasteners for support of plumbing and electrical fixtures and equipment, cabinets, door stop plates, wood base, wainscots, coat hooks, toilet and bath accessories, kitchen equipment, and all other wall- and ceiling-mounted components.

3.6 FASTENERS

A. Provide nails, spikes, screws, and bolts as necessary for secure and rigid permanent connections. Conform to CBC Table 2304.9.1-Fastening Schedule, APA recommendations, and provisions of the Contract Documents.

B. Provide stainless steel or coated components specifically intended for use in corrosive environments and the specific type of preservative treatment incorporated into the wood.

C. Anchors: Anchor plates, caps, and wood framing to other construction with anchors spaced 48 inches on center and with each item anchored with at least two anchors.

D. Drive nails perpendicular to grain of wood in lieu of toe nailing, where feasible.

E. Bolting: Drill holes 1/16 inch larger in diameter than bolts being used. Drill straight and true from one side only. Do not bear bolt threads on wood.

F. Screws: For lag screws and wood screws, pre-bore holes the same diameter as the root of threads, enlarging holes to shank diameter for length of shank.

G. Nailing:
1. Use only common wire nails or spikes of the dimension shown on the Nailing Schedule, except where otherwise specifically noted on the drawings. Sinker nails are not allowed.
2. For conditions not covered in the Nailing Schedule, provide penetration into the piece receiving the point of not less than 1/2 the length of the nail or spike, provided, however, that 16d nails may be used to connect two pieces of 2-inch (nominal) thickness.
3. Nail without splitting wood.
4. Prebore as required.
5. Remove split members and replace with members complying with the specified requirements.

END OF SECTION

SECTION 06 16 00 – sheathing

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Wall sheathing.
2. Roof sheathing.
3. Parapet sheathing.
4. Composite nail base insulated roof sheathing.
5. Subflooring.
6. Underlayment.
7. Sheathing joint-and-penetration treatment.

B. Related Requirements:

1. Section [06 10 00 **"Rough Carpentry"**] [**061053 "Miscellaneous Rough Carpentry"**] for plywood backing panels.
2. Section 07 25 00 "Weather Barriers" for water-resistive barrier applied over wall sheathing.

1.2 ACTION SUBMITTALS

A. Product Data: For each type of process and factory-fabricated product. Indicate component materials and dimensions and include construction and application details.

1. Include data for wood-preservative treatment from chemical treatment manufacturer and certification by treating plant that treated plywood complies with requirements. Indicate type of preservative used and net amount of preservative retained.
2. Include data for fire-retardant treatment from chemical treatment manufacturer and certification by treating plant that treated plywood complies with requirements. Include physical properties of treated materials.
3. For fire-retardant treatments include physical properties of treated plywood both before and after exposure to elevated temperatures, based on testing by a qualified independent testing agency according to ASTM D5516.
4. For products receiving a waterborne treatment, include statement that moisture content of treated materials was reduced to levels specified before shipment to Project site.

1.3 INFORMATIONAL SUBMITTALS

A. Evaluation Reports: For the following, from ICC-ES:

1. Wood-preservative-treated plywood.
2. Fire-retardant-treated plywood.

1.4 QUALITY ASSURANCE

A. Testing Agency Qualifications: For testing agency providing classification marking for fire-retardant-treated material, an inspection agency acceptable to authorities having jurisdiction that periodically performs inspections to verify that the material bearing the classification marking is representative of the material tested.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Stack panels flat with spacers beneath and between each bundle to provide air circulation. Protect sheathing from weather by covering with waterproof sheeting, securely anchored. Provide for air circulation around stacks and under coverings.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Fire-Resistance Ratings: As tested according to ASTM E119; testing by a qualified testing agency. Identify products with appropriate marking of applicable testing agency.

1. Fire-Resistance Ratings: Indicated by design designations from UL's "Fire Resistance Directory" or from the listings of another qualified testing agency.

2.2 WOOD PANEL PRODUCTS

A. Certified Wood: For the following wood products, provide material produced from wood obtained from forests certified by and FSC-accredited certification body to comply with FSC STD-01-001, "FSC Principles and Criteria for Forest Stewardship."

1. Plywood.
2. Oriented strand board.
3. Particleboard underlayment.

B. Thickness: As needed to comply with requirements specified, but not less than thickness indicated.

C. Factory mark panels to indicate compliance with applicable standard.

2.3 PRESERVATIVE-TREATED PLYWOOD

A. Preservative Treatment by Pressure Process: AWPA U1; Use Category UC2 for interior construction not in contact with ground, Use Category UC3b for exterior construction not in contact with ground, and Use Category UC4a for items in contact with ground.

1. Preservative Chemicals: Acceptable to authorities having jurisdiction and containing no arsenic or chromium.

B. Mark plywood with appropriate classification marking of an inspection agency acceptable to authorities having jurisdiction.

C. Application: Treat items indicated on Drawings and plywood in contact with masonry or concrete or used with roofing, flashing, vapor barriers, and waterproofing.

2.4 FIRE-RETARDANT-TREATED PLYWOOD

A. General: Where fire-retardant-treated materials are indicated, use materials complying with requirements in this article that are acceptable to authorities having jurisdiction and with fire-test-response characteristics specified as determined by testing identical products per test method indicated by a qualified testing agency.

B. Fire-Retardant-Treated Plywood by Pressure Process: Products with a flame-spread index of 25 or less when tested according to ASTM E84, and with no evidence of significant progressive combustion when the test is extended an additional 20 minutes, and with the flame front not extending more than 10.5 feet (3.2 m) beyond the centerline of the burners at any time during the test.

1. Use treatment that does not promote corrosion of metal fasteners.
2. Exterior Type: Treated materials shall comply with requirements specified above for fire-retardant-treated plywood by pressure process after being subjected to accelerated weathering according to ASTM D2898. Use for exterior locations and where indicated.
3. Interior Type A: Treated materials shall have a moisture content of 28 percent or less when tested according to ASTM D3201/D3201M at 92 percent relative humidity. Use where exterior type is not indicated.
4. Design Value Adjustment Factors: Treated lumber plywood shall be tested according to ASTM D5516 and design value adjustment factors shall be calculated according to ASTM D6305. Span ratings after treatment shall be not less than span ratings specified.

C. Kiln-dry material after treatment to a maximum moisture content of 15 percent. Do not use material that is warped or does not comply with requirements for untreated material.

D. Identify fire-retardant-treated plywood with appropriate classification marking of qualified testing agency

E. Application: Treat plywood indicated on Drawings, and the following:

1. Roof and wall sheathing within 48 inches (1220 mm) of fire and party walls.
2. Roof sheathing.
3. Subflooring and underlayment for raised platforms.

2.5 WALL SHEATHING

A. Plywood Wall Sheathing: Either DOC PS 1 or DOC PS 2, Exposure 1, Structural I sheathing.

1. Span Rating: Not less than 32/16.
2. Nominal Thickness: Not less than 1/2 inch (13 mm).

B. Oriented-Strand-Board Wall Sheathing: DOC PS 2, Exposure1, Structural I sheathing.

1. Span Rating: Not less than 32/16.
2. Nominal Thickness: Not less than 1/2 inch (13 mm).

C. Glass-Mat Gypsum Sheathing: ASTM C1177/C1177M.

1. Type and Thickness: Type X, 5/8 inch (15.9 mm) thick.
2. Size: 48 by 96 inches (1219 by 2438 mm) or 48 by 120 inches (1219 by 3048 mm) for vertical installation.

2.6 ROOF SHEATHING

A. Plywood Sheathing: Either DOC PS 1 or DOC PS 2, Exposure 1, Structural I sheathing.

1. Span Rating: Not less than 48/24.
2. Nominal Thickness: Not less than 1/2 inch (13 mm).

B. Oriented-Strand-Board Sheathing: DOC PS 2, Exposure1, Structural I sheathing.

1. Span Rating: Not less than 48/24.
2. Nominal Thickness: Not less than 1/2 inch (13 mm).

2.7 PARAPET SHEATHING

A. Plywood Wall Sheathing: Either DOC PS 1 or DOC PS 2, Exposure 1, Structural I sheathing.

1. Span Rating: Not less than 32/16.
2. Nominal Thickness: Not less than 1/2 inch (13 mm).

B. Oriented-Strand-Board Wall Sheathing: DOC PS 2, Exposure1, Structural I sheathing.

1. Span Rating: Not less than 32/16.
2. Nominal Thickness: Not less than 1/2 inch (13 mm).

C. Glass-Mat Gypsum Sheathing: ASTM C1177/C1177M.

1. Type and Thickness: Type X, 5/8 inch (15.9 mm) thick.
2. Size: 48 by 96 inches (1219 by 2438 mm) or 48 by 120 inches (1219 by 3048 mm) for vertical installation.

2.8 SUBFLOORING AND UNDERLAYMENT

A. Plywood Combination Subfloor-Underlayment: DOC PS 1, Exposure 1, Structural I, Underlayment single-floor panels.

1. Span Rating: Not less than 24.
2. Nominal Thickness: Not less than 23/32 inch (18.3 mm).
3. Edge Detail: Tongue and groove.
4. Surface Finish: Fully sanded face.

B. Underlayment: Provide underlayment in nominal thicknesses indicated or, if not indicated, not less than 1/4 inch (6.4 mm) over smooth subfloors and not less than 3/8 inch (9.5 mm) over board or uneven subfloors.

1. Plywood Underlayment for Resilient Flooring: DOC PS 1, Exterior B-C Exposure 1 Underlayment with fully sanded face.
2. Plywood Underlayment for Ceramic Tile: DOC PS 1, Exterior, C-C Plugged, not less than 5/8-inch (15.9-mm) nominal thickness.
3. Plywood Underlayment for Carpet: DOC PS 1, Exposure 1, Underlayment.
4. Particleboard Underlayment: ANSI A208.1, Grade M-2, made without urea formaldehyde.

2.9 FASTENERS

A. General: Provide fasteners of size and type indicated that comply with requirements specified in this article for material and manufacture.

1. For roof, parapet, and wall sheathing, provide fasteners with hot-dip zinc coating complying with ASTM A153/A153M.

B. Nails, Brads, and Staples: ASTM F1667.

C. Power-Driven Fasteners: Fastener systems with and evaluation report acceptable to authorities having jurisdiction, based on ICC-ES AC70.

D. Screws for Fastening Sheathing to Wood Framing: ASTM C1002

E. Screws for Fastening Wood Structural Panels to Cold-Formed Metal Framing: ASTM C954, except with wafer heads and reamer wings, length as recommended by screw manufacturer for material being fastened.

F. Screws for Fastening Gypsum Sheathing to Cold-Formed Metal Framing: Steel drill screws, in length recommended by sheathing manufacturer for thickness of sheathing to be attached.

1. For steel framing less than 0.0329 inch (0.835 mm)(20 ga.) thick, use screws that comply with ASTM C1002.
2. For steel framing from 0.033 to 0.112 inch (0.84 to 2.84 mm)(20 ga. to 10 ga) thick, use screws that comply with ASTM C954.

2.10 SHEATHING JOINT-AND-PENETRATION TREATMENT MATERIALS

A. Sealant for Glass-Mat Gypsum Sheathing: Silicone emulsion sealant complying with ASTM C834, compatible with sheathing tape and sheathing and recommended by tape and sheathing manufacturers for use with glass-fiber sheathing tape and for covering exposed fasteners.

1. Sheathing Tape: Self-adhering glass-fiber tape, minimum 2 inches (50 mm) wide, 10 by 10 or 10 by 20 threads/inch (390 by 390 or 390 by 780 threads/m), of type recommended by sheathing and tape manufacturers for use with silicone emulsion sealant in sealing joints in glass-mat gypsum sheathing and with a history of successful in-service use.

2.11 MISCELLANEOUS MATERIALS

A. Adhesives for Field Gluing Panels to Wood Framing: Formulation complying with APA AFG-01 or ASTM D3498 that is approved for use with type of construction panel indicated by manufacturers of both adhesives and panels.

1. Adhesives shall be compliant with California Department of Health Public Health (CDPH) Standard Method for the Testing and Evaluation of Volatile Organic Chemical Emissions from Indoor Sources Using Environmental Chambers, Version 1.1 (2010) or Version 1.2 (2017) (also known as Specification 01350).
2. Adhesives shall also meet the following VOC limits:
    a. Drywall and Panel Adhesive: 50 g/L.
    b. Multi-purpose Construction Adhesive: 70 g/L.
    c. Subfloor Adhesive: 50 g/L.
    d. Wood Substrate Adhesive: 30 g/L.
3. Follow more stringent local, regional, state and federal requirements where applicable.

PART 3 - EXECUTION

3.1 INSTALLATION, GENERAL

A. Do not use materials with defects that impair quality of sheathing or pieces that are too small to use with minimum number of joints or optimum joint arrangement. Arrange joints so that pieces do not span between fewer than three support members.

B. Cut panels at penetrations, edges, and other obstructions of work; fit tightly against abutting construction, unless otherwise indicated.

C. Securely attach to substrate by fastening as indicated, complying with the following:

1. Table 2304.9.1, "Fastening Schedule," in the ICC's International Building Code.
2. ICC-ES evaluation report for fastener.

D. Use common wire nails unless otherwise indicated. Select fasteners of size that will not fully penetrate members where opposite side will be exposed to view or will receive finish materials. Make tight connections. Install fasteners without splitting wood.

E. Coordinate wall, parapet, and roof sheathing installation with flashing and joint-sealant installation so these materials are installed in sequence and manner that prevent exterior moisture from passing through completed assembly.

F. Do not bridge building expansion joints; cut and space edges of panels to match spacing of structural support elements.

G. Coordinate sheathing installation with installation of materials installed over sheathing so sheathing is not exposed to precipitation or left exposed at end of the workday when rain is forecast.

3.2 WOOD STRUCTURAL PANEL INSTALLATION

A. General: Comply with applicable recommendations in APA Form No. E30, "Engineered Wood Construction Guide," for types of structural-use panels and applications indicated.

B. Fastening Methods: Fasten panels as indicated below:

1. Combination Subfloor-Underlayment:
    a. Glue and nail to wood framing.
    b. Screw to cold-formed metal framing.
    c. Space panels 1/8 inch (3 mm) apart at edges and ends.
2. Subflooring:
    a. Glue and nail to wood framing.
    b. Screw to cold-formed metal framing.
    c. Space panels 1/8 inch (3 mm) apart at edges and ends.
3. Wall and Roof Sheathing:
    a. Nail to wood framing. Apply a continuous bead of glue to framing members at edges of wall sheathing panels.
    b. Screw to cold-formed metal framing.
    c. Space panels 1/8 inch (3 mm) apart at edges and ends.

4. Underlayment:

   a. Nail to subflooring.
   b. Space panels 1/32 inch (0.8 mm) apart at edges and ends.
   c. Fill and sand edge joints of underlayment receiving resilient flooring immediately before installing flooring.

3.3 GYPSUM SHEATHING INSTALLATION

A. Comply with GA-253 and with manufacturer's written instructions.

1. Fasten gypsum sheathing to wood framing with screws.
2. Fasten gypsum sheathing to cold-formed metal framing with screws.
3. Install panels with a 3/8 inch (9.5-mm) gap where non-load-bearing construction abuts structural elements.
4. Install panels with a 1/4 inch (6.4-mm) gap where they abut masonry or similar materials that might retain moisture, to prevent wicking.

B. Apply fasteners so heads bear tightly against face of sheathing but do not cut into facing.

C. Horizontal Installation: Install sheathing with V-grooved edge down and tongue edge up. Interlock tongue with groove to bring long edges in contact with edges of adjacent panels without forcing. Abut ends over centers of studs, and stagger end joints of adjacent panels not less than one stud spacing. Attach panels at perimeter and within field of panel to each stud.

1. Space fasteners approximately 8 inches (200 mm) o.c. and set back a minimum of 3/8 inch (9.5 mm) from edges and ends of panels.
2. For sheathing under stucco cladding, panels may be initially tacked in place with screws if overlying self-furring metal lath is screw-attached through sheathing to studs immediately after sheathing is installed.

D. Vertical Installation: Install vertical edges centered over studs. Abut ends and edges with those of adjacent panels. Attach panels at perimeter and within field of panel to each stud.

1. Space fasteners approximately 8 inches (200 mm) o.c. and set back a minimum of 3/8 inch (9.5 mm) from edges and ends of panels.
2. For sheathing under stucco cladding, panels may be initially tacked in place with screws if overlying self-furring metal lath is screw-attached through sheathing to studs immediately after sheathing is installed.

E. Seal sheathing joints according to sheathing manufacturer's written instructions.

1. Apply glass-fiber sheathing tape to glass-mat gypsum sheathing joints and apply and trowel sealant to embed entire face of tape in sealant. Apply sealant to exposed fasteners with a trowel so fasteners are completely covered. Seal other penetrations and openings.

3.4 CEMENTITIOUS BACKER UNIT INSTALLATION

A. Install panels and treat joints according to ANSI A108.11 and manufacturer's written instructions for type of application indicated.

3.5 PARTICLEBOARD UNDERLAYMENT INSTALLATION

A. Comply with CPA's recommendations for type of subfloor indicated. Fill and sand gouges, gaps, and chipped edges. Sand uneven joints flush.

1. Fastening Method: Glue and nail underlayment to subflooring.

END OF SECTION 06 16 00

SECTION 06 16 43 – GYPSUM AND CEMENTITIOUS SHEATHING

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes requirements for gypsum sheathing in exterior cavity wall assemblies and **cement board at select roof and canopy assemblies.**

B. Definitions: ASTM C 11.

1.2 ADMINISTRATIVE REQUIREMENTS

A. Pre-Installation Conference: Verify compatibility, application rate and all other installation requirements for air barrier assembly work of Section 07 25 13 for the specific gypsum sheathing panels being provided for the work.

1.3 SUBMITTALS

A. Product Data: Submit manufacturer's product data for cementitious materials, lath, metal support components, and accessories.

1.4 QUALITY ASSURANCE

A. Fire-Resistance Assemblies: Tested per ASTM E 119 and UL listed, or other acceptable agency, for rating required.

B. Delivery, Storage and Handling: GA-216, GA-800 for gypsum sheathing.

C. Coordinate with air barrier assembly work of Section 07 25 13; sheathing panels provided as work of this Section may affect the quantity of material necessary for acceptable application of the required air barrier assembly or its components. Material quantities that exceed the air barrier manufacturer's typical coverage and thickness expectations due to sheathing characteristics shall be the responsibility of the Contractor and will be accepted neither as a basis for claim nor adjustment to Contract Sum or time.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Exterior Gypsum Sheathing: ASTM C 1177, Type X silicone treated core with glass fiber facings and manufacturer's standard edges 0.5 inch thick.
1. Walls and Exterior Soffits: G-P Dens Glass Gold Exterior Guard, USG Securock Ultralight Glass-mat Sheathing, CertainTeed or approved.
2. Gypsum sheathing boards in roof assembly are work of section 07 51 00.
3. Parapet Walls: ASTM C 1177 glass-mat sheathing Type X approved by the panel manufacturer and acceptable by the manufacturer of the membrane roofing as a substrate to receive the assembly required.

B. Structural Sheathing: ICC-ES listed water-resistant gypsum core reinforced with 22 gage galvanized sheet steel; Sure-board Series 200 Structural Panels. http://www.sureboard.com

C. Cement Board: ASTM C 1325, endorsed by the manufacturer for exterior applications as required for the Work; UISG Durock Cement Board, National Gypsum Permabase Cement Board, 0.5-inch thickness square or tapered joints as recommended by manufacturer is the basis of design.
   1. Flexural Strength: ASTM C 947, 750 psi.
   2. Fastener Holding: ASTM D 1307 90 pounds, 0.4-inch diameter fastener head.
   3. Joint Reinforcing: PermaBase polymer coated alkali resistant mesh, 4 inches wide.
   4. Bonding Material: ANSI A118.1 or 118.4 Portland cement-based mortar or as otherwise recommended by manufacturer for Project applications required.

D. Metal Framing Systems: Comply with requirements of Section 05 40 00 Cold Formed Metal Framing; size ceiling supports to comply with ASTM C 754 except as otherwise required.

2.2 ACCESSORIES

A. Accessories: ASTM C 1047; Standard types as required; galvanized steel unless otherwise indicated, with either knurled and perforated or expanded flanges for nailing or stapling, and beaded for concealment of flanges in joint compound, and one-piece control joint beads.

B. Anchors for Exterior Sheathing: Provide bugle-head, self-tapping/driving fastener types, size, length and thread configuration necessary for each Project application and complying with ICC-ES Report for fastener performance characteristics and as necessary for each Project-specific application and compliance with performance requirements.
   1. Fasteners Covered by Water-Resistant Air Barrier: Organic polymer coating shall have a salt-spray resistance to red rust of more than 800 hours per ASTM B 117. ITW Buildex; Teks Maxiseal with Climaseal finish Textron Inc., Textron Fastening Systems; Elco Dril-Flex with Stalgard finish or approved.
   2. Fasteners Not Covered by WRAB: Shall have salt spray resistance of 2,000 hours; Stalgard AS Class 4 or approved.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Metal Framing: Comply with requirements of Section 05 40 00.

B. Gypsum Sheathing: ASTM C 1280, GA201; Face side out, joints tightly butted, plumb, level and square; shim as necessary to maintain required tolerances. Do not use damaged boards.
   1. Joints: Minimum number possible; stagger not-less-than one foot in alternate courses. Install boards with long edge orientation per manufacturer's recommendation for each application required.
   2. Isolate sheathing at structural abutments; provide 0.25 to 0.5 inch space, trim edge with U or J-type semi-finishing edge trim, and seal joint with sealant.
   3. Seal panel joints as necessary to provide a secondary air infiltration barrier and coordinate with work of Section 07 25 00 for details compatible with air barrier installation.

C. Cement Board: Comply with manufacturer's recommendations for exterior applications indicated on A523, A531 and as otherwise required for the Work. Mechanically attach to supports to comply with performance requirements of Section 07 42 00
   1. Panel Edges: Square or tapered as best suited to application per manufacturer's recommendations.
   2. Joint Treatment: Tape joints with specified joint reinforcing bedded in bonding material unless otherwise acceptable.

D. Locate long edges over supports. Attach to framing and supplementary support at corners, openings, cutouts, and penetrations.

E. Provide control joints at locations recommended by the manufacturer for the installation conditions encountered in the Work.

3.2 TOLERANCES

A. Exposed joints, including control joints and sealant joints at openings: Straight, plum and regular. Limit variation in width to 1/8 inch total in 10 feet; variation from plumb 0.125 inch in 8 feet; variation from location indicated plus or minus 0.125 inch.

B. Variation of board surface from plum and level: Plus or minus 0.25 inch in any 4 foot by 8 foot panel or section.

END OF SECTION

SECTION 06 20 00 – FINISH CARPENTRY

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes materials, work and services necessary and required for nonstructural finish carpentry work which is exposed to view, is primarily site fabricated and assembled, and not specified as part of other sections.

B. Related Sections:
1. Section 06 10 00 Rough Carpentry.
2. Section 06 40 00 Architectural Woodwork.
3. Section 08 14 00 Wood Doors.

1.2 SUBMITTALS

A. Product Data: Submit as required for each manufactured product to be incorporated into the Work.

B. Shop Drawings: Plans, elevations and large-scale details; locate casework, paneling, and trim, attachment, hardware and accessories.

C. Samples:
1. Wood Products: Submit for each species, cut, profile, and finish required; demonstrate range of color and grain variation expected in Work. Two feet by board, molding, or panel width.
   a. Solid Stock, including Composite Decking: 3 samples of each, finish one side and one edge.
   b. Veneers, Panels, Plywood: 2 samples of each, one finished.
2. Hardware: One sample of each type and finish required for approval of function and appearance.

1.3 QUALITY ASSURANCE

A. Fabricator and Installer Qualifications: Five years successful experience with Work similar to that required for this Project, regularly and presently construct finish carpentry as a principal service and have proper equipment for Work as outlined in Standards.

B. Installer and Fabricator Certification: Five recent jobs similar this Project, include project and contact name, location, and date.

C. Pre-Installation Conference: Prior to delivery of materials meet with Architect, installers of finish carpentry and other trades whose Work may affect conditions required for installation of finish carpentry. Review coordination and environmental controls required for proper installation and ambient conditioning in areas to receive work. Proceed with Work only when everyone concerned agrees that required ambient conditions can be maintained.

1.4 PROJECT CONDITIONS

A. Temperature and Humidity for Installation: As required by fabricator to maintain moisture content of installed Work within 1.0 percent of optimum moisture content, maintain conditions until final acceptance.
   1. Store materials only in areas meeting requirements specified for installation areas.

1.5 SEQUENCING AND SCHEDULING

A. Complete work in installation areas which could damage finish carpentry and establish controlled environmental conditions prior to delivery of materials.

B. Conditioning Period: Store wood products for four days (96 hours) at Project prior to installation.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Solid Stock: Kiln-dried, S4S; softwood complying with American Softwood Lumber Standard PS 20 and referenced grading rules; hardwood complying with National Hardwood Lumber Association rules; glued-up lumber complying with American Softwood Lumber Standard PS 56. Nominal sizes are indicated, except as shown by detailed dimensions. Provide actual sizes as required by PS 20, unless otherwise indicated.
   1. Moisture Content: Limited to values required by referenced grading rules, and woodworking standard.
   2. Material for Transparent Finish: Solid lumber stock.
   3. Material for Painted Finish: Solid lumber or glued-up lumber.
   4. Glued-up Lumber for Exterior Use: PS 56, Wet Use.

B. Plywood: Softwood complying with American Softwood Lumber Standard PS 1-74, and hardwood complying with PS 51.

C. Preservative Treatment by Pressure Process: AWPA U1 for lumber, plywood, and Glue-Laminated Timbers. Treatment containing neither arsenic nor arsenate, non-toxic when cured and free of chemical compounds not acceptable in the Work. For exposed items indicated to receive a stained or natural finish, use chemical formulations that do not require incising, contain colorants, bleed through, and otherwise adversely affect finished appearance. Kiln-dry material after treatment to a maximum moisture content of 19 percent for lumber and 15 percent for plywood. Do not use material that is warped or does not comply with requirements for untreated material.
   1. Subject to compliance with Project requirements provide one of the following treatments.
      a. Ammoniacal, or amine, copper quat (ACQ).
      b. Copper bis (dimethyldithiocarbamate) (CDDC).
      c. Ammoniacal copper citrate (CC).
      d. Copper azole, Type A (CBA-A).
      e. Zinc or Sodium Borate (DOT).
   2. Mark each treated item with the treatment quality mark of an inspection agency approved by the American Lumber Standards Committee Board of Review.

a. For exposed lumber indicated to receive a stained or natural finish, mark end or non-exposed surface of each piece, or omit marking and provide certificates of treatment compliance issued by inspection agency.

D. Fire-Retardant Treated Wood (FRTW): Materials that comply with performance requirements in AWPA U1 for lumber and plywood. Identify fire-retardant-treated wood with appropriate classification marking of UL, U.S. Testing, Timber Products Inspection, or another testing and inspecting agency acceptable to authorities having jurisdiction.
1. Use treatment for which chemical manufacturer publishes physical properties of treated wood after exposure to elevated temperatures, when tested by a qualified independent testing agency according to ASTM D 5664, for lumber and ASTM D 5516, for plywood.
2. Use treatment that does not promote corrosion of metal fasteners and that is free of halogens, sulfates, chlorides, and ammonium phosphate.
3. Exterior Treatment: Exposed exterior wood and interior applications where conditions of service are similar to exterior exposure.
4. Interior: Type A High Temperature (HT), Reduced hygroscopic, non-blooming chemicals unless otherwise required. Chemical treatment shall neither bleed-through nor adversely affect finished appearance.
5. Fire Retardant: Provide for lumber and panels as indicated. Fire retardant treated finish wood shall comply with requirements of the Section where the work is specified.

E. Woodworking Standard: Architectural Woodwork Institute (AWI) Quality Standards.

F. Exterior [Composite] Decking: BOD decking products are as manufactured by Resysta USA or approved equal.
1. Size: 5/4 x 6-inch nominal by lengths indicated in Drawings. Where not shown, provide in longest length available and under no circumstances less than 10 feet in length.
2. Color: As selected by Architect from manufacturer’s standard and premium colors.
3. Grade and edge treatment: Manufacturer’s standard extruded profile; edge profile(s) as shown in Drawings. Where not shown, provide edge profile(s) directed by Architect.
4. Installation:
   a. Concealed Clip and 316 stainless steel small head screw to framing for gapped installation.
   b. Tongue and Groove Decking: Install per manufacturer’s guidelines for concealed tongue (field) and exposed face (starter and terminal) screwed boards, using stainless steel screws. Nailing and stapling are prohibited.
5. Texture: As selected by Architect from manufacturer’s standard finish options.
6. Slip-resistance: Wet Method Value of 55 or greater measured by Pendulum DCOF Slip Resistance Test Method (ASTM E303-22).

G. Exterior Hardwood Decking: Ipe, Brazilian Walnut (Handroanthus spp.):
1. Size: 4 x 4 and 4 x 6 (nominal) in length indicated; provide full width at elevated walkway decking.
2. Edge treatment: Provide eased edge at decking.

H. Interior Finish Carpentry:
1. Standing and Running Trim: AWI Custom grade for quality of materials and manufacture.
   a. Transparent Finish: NHLA First Grade Lumber [Plain Sawn] [Rift Sawn] [Quarter Sawn] Species TBD, Clear, no heart, free of mineral streaks.
   b. Painted Finish: Group 1 soft-wood species, WWPA C-Select.

2. Hardwood Plywood Stock Panels: ANSI/HPMA HP 1983, Premium Grade, Type II, Rotary cut Natural Birch faces, sound hardwood veneer core, number of plies required for thickness indicated.
   a. Face Pattern: Plain edge matched veneer.
   b. Panel-to-Panel Veneer Matching: No match.
   c. Face Veneer Matching (Panel-to-Panel): Sequence matched from one or similar flitches as required by quantity of panels.
   d. Finish: Polish sanded.
   e. Finish: Prefinished with manufacturer's standard clear factory finish.

I. Interior Finish Carpentry: Solid sawn lumber and composite components as required. Seal solid stock lumber at mill, all edges and faces.
   1. Standing and Running Trim: WIC Quality Standards Section 3, Plain sawn WWPA Prime Finish VG Douglas Fir unless otherwise required.
      a. Solid Stock Douglas Fir: Transparent finish, Premium Grade; provide at doors and exterior windows as scheduled.
      b. Medium Density Fiberboard: Formaldehyde free; Medite II or equal. Opaque painted finish, Custom Grade; typical except where solid stock material is required for transparent finish.

J. Miscellaneous Materials:
   1. Fasteners and Anchorages: Nails, screws and anchors of type, size, material and finish required for application indicated; ASTM A 153 galvanized where exposed to exterior and high relative humidity. Use concealed devices to greatest extent possible.
      a. Provide special fasteners, moldings, adhesives and accessories as necessary for each installation.
   2. Isolation Membrane: Self-adhering non-asphalt based, breathable, water-proof membrane; WR Grace Perm-A-Barrier VPS.

2.2 SOURCE QUALITY CONTROL

A. Lumber and Plywood: Factory-mark identify type, grade, mill and grading agency, submit mill certificate in-lieu-of marking surfaces to receive transparent finish.

B. Do not stamp or mark surfaces which will be exposed to view in completed structure.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Discard units of material which are unsound, warped, bowed twisted, improperly treated, not adequately seasoned or too small to fabricate work with minimum of joints or optimum jointing arrangements, or which are of defective manufacture with respect to surfaces, sizes or patterns.
   1. Wood Products with Chemical Treatment: Material not certified by the manufacturer as compatible with contact surfaces and substrates shall be separated from contact with other materials by contiguous layer of the specified isolation membrane applied to all contact surfaces.

B. Install the work plumb, level, true and straight. Provide concealed shims to achieve required alignments, accommodate variations in adjacent and supporting assemblies, and maintain

tolerances. Cope, miter, and scarf to produce tight fitting joints with full surface contact. Scribe and cut work to fit adjoining work including walls and floor and refinish cut surfaces or repair damaged finish at cuts.

1. Tolerance For Countertops: 1/8 inch in 8 feet for plumb and level, and 1/16-inch maximum offset in flush adjoining surfaces, and 1/8-inch maximum offset in revealed adjoining surfaces.

C. Secure finish carpentry work in place. Use concealed fasteners and blind nailing wherever possible.
   1. Exposed fasteners: Fine finishing nails countersunk, filled flush and finished to match adjacent surface unless otherwise indicated.

D. Solid Stock Exterior Work and Interior Work Subject to High Humidity and Wet Environment: Back prime, comply with Section 09 91 13 and 09 91 23 requirements and referenced woodworking standard.

E. See Section 09 91 13 and 09 91 23 for finishing requirements for installed finish carpentry.

F. Standing and Running Trim: Use minimum number of joints possible, using full-length pieces (from maximum length of lumber available). Stagger joints in adjacent and related members.
   1. Apply flat grain lumber with bark side exposed to weather.

G. Plywood Paneling: Select and arrange panels on each wall for best match of adjacent panels. Attach to supports as indicated.

H. Adjust joinery for uniform appearance. Repair damaged and defective Work. Replace Work that cannot be satisfactorily repaired.

I. Prevent damage and deterioration of installed Work; maintain environmental conditions as required and as recommended by installer.

END OF SECTION

SECTION 06 40 00 – ARCHITECTURAL WOODWORK

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes requirements for casework and architectural woodwork exposed to view in the finished building that is predominantly manufactured and finished off site.
   1. Provide wood framing and furring necessary for support of architectural woodwork assemblies as indicated.

B. Related Sections:
   1. Section 05 50 00 Metal Fabrications.
   2. Section 08 71 00 Door Hardware.

C. References: Architectural Woodwork Standards current edition as published by Architectural Woodwork Institute.

1.2 ADMINISTRATIVE REQUIREMENTS

A. Prior to fabrication and delivery of materials, Contractor shall meet with fabricator and installer of architectural woodwork, and work of other trades that may affect sequence, fabrication and installation requirements for architectural woodwork; proceed only when coordination tasks have been satisfactorily completed.
   1. Verify environmental controls for compliance with ambient conditions for staging and installation areas for first-in-place and subsequent work.
   2. Review requirements for First-In-Place samples.
   3. Integration of building services into casework and coordination with characteristics of building services; complete field measurement prior to fabrication and shop assembly as necessary or appropriate for the work.
   4. Provisions for attachment to building floor slabs, walls and other construction as necessary for stability of installed work; give particular attention to requirements and characteristics of supporting assemblies and compliance with Related Sections requirements for support fabrications.
   5. Coordinate with partition and finish trades ensure compliance with requirements for installation of the work and verify appropriate delegation for final service connections being performed as work of other Sections.
   6. Field verification of dimensions affecting shop fabrication and assembly of the work.

B. Work Sequence: Ensure compliance with Project Schedule for fabrication and installation of work; deliver work of this Section to the Project neither prior to establishment of required environmental conditions nor before the work is required for installation.
   1. Schedule work to limit potential for damage to installed casework due to subsequent activities of other trades and protection provisions for installed work.
   2. Conditioning Period: Store work at Project for 96 hours unless otherwise recommended by referenced woodworking Standard.

1.3 SUBMITTALS

A. Product Data: Submit as required for each manufactured product, material, accessory, and finish to be incorporated into the Work.
   1. Fire Retardant Treated Wood: Demonstrate compliance with System Description requirements for casework components and assemblies in select locations.
   2. FSC Certified Wood: For each firm supplying wood products and each firm performing fabrication work on these wood products provide firm's COC number, identify each FSC certified product on a line-item basis and identify the material cost and value-added fabrication cost.
      a. Vendor Chain-of-Custody
      b. Fabricator Chain-of-Custody
      c. Installer Chain-of-Custody provide when the installer is other than the fabricator.

B. Shop Drawings: Plans, elevations and large-scale details; locate casework, paneling, and trim; show attachment and support from building, hardware and accessories.
   1. Indicate extent and location of fabrication work deferred to the field; field application of finishes is not acceptable.
   2. Show each method of anchorage to be used, identify fasteners and hardware, locations where the anchorage is proposed and coordination with supporting structure.
   3. Coordination of utility lines serving casework, connection of utilities and controls.
   4. Wood Paneling: Indicate complete elevations of rooms to receive paneling.

C. Samples: Provide a minimum of five samples or sample sets where multiple pieces are required; 12 by 12 inches of panel materials and 12-inch length by typical width of linear material.
   1. Solid Surface Panels: Two pieces of each type and thickness required nominally one square foot finish four edges as required for the work.
   2. Plastic Laminate: One sample of each color, and surface type. Provide flat surface, and section of outside corner of work surface in configuration required.

D. First-In-Place Sample: Refer also to Section 01 33 00. Before fabricating and installing interior architectural woodwork, build First-In-Place Sample as indicated below:
   1. Prepare First-In-Place Sample of Bench Seating using materials proposed for the work.
   2. First-In-Place Sample will be maintained during construction as standard for acceptance of completed work,
   3. Obtain Architect's approval of final finish of First-In-Place Sample before starting remaining interior architectural woodwork fabrication. Approved sample may become part of the Work.

1.4 QUALITY ASSURANCE

A. Fabricator: Work of a single entity unless otherwise acceptable. Demonstrate minimum of five years successful experience with architectural woodwork and casework utilizing similar materials and of similar type, complexity and scope as required for the Work on projects of similar size and quality to that specified and shown.
   1. Comply with AWI Woodworking Standards for materials and fabrications required in addition to specific Project requirements.

B. Installer: Successful history of installation of Architectural Woodwork, including but not limited to logistical capability, installation sequence and proper handling of preassembled and partially assembled components for final fitting and installation in the field.

1. Firm shall be acceptable to the fabricator unless otherwise approved.

C. Fabricator and Installer: AWI member for the category of services they will provide or other acceptable credentials establishing expertise for the services to be provided.

1.5 PROJECT CONDITIONS

A. Temperature and Humidity for Installation: As required by referenced quality standards, and fabricator to maintain moisture content of installed Work within 1.0 percent of optimum moisture content, maintain conditions until final acceptance.
1. Store materials only in areas meeting requirements specified for installation areas.

B. Field Measurements: Taken prior to fabrication of woodwork to be fitted to other construction, verify dimensions on shop drawings.
1. Avoid delay of Project, allow for subsequent scribing and trimming of woodwork for accurate fit where field measurement is impractical.

1.6 PRODUCT HANDLING

A. Without limitation, protect architectural woodwork from damage and loss during fabrication, shipping, handling and installation to Substantial Completion due to shipping, handling, hoisting, exposure to environmental conditions outside of required parameters, work schedule, sequence, means and methods.
1. Maintain protection of architectural woodwork and casework from the shop to Project, during and following installation. Remove protection when directed to allow for observation of work by Architect.

PART 2 - PRODUCTS

2.1 SYSTEM DESCRIPTION

A. Design Requirements:
1. Provide concealed and semi-concealed attachment of finished components as required and as demonstrated in approved submittals.
2. Framing, Furring and Supports: Provide final determination of components sizes, spacing, connection types and fastening for architectural woodwork fully concealed from view in completed work and complying with Performance Requirements.
3. To the maximum extent practical for the work select material and component sizes and configurations and woodwork assemblies to minimize the number and frequency of visible joints in the installed work; indicated provide joint locations, types and spacing in shop drawings.
4. Barrier Free Access: Comply with requirements of ANSI A 117.1 and 2022 CBC for reach ranges and clearances.

B. Performance Requirements:
1. Provide fire retardant treated wood as necessary for compliance with CBC Section 410 requirements for platforms; Table 803.9 and Section 803.11 requirements for supports for panels and similar wall surfacing.
a. Treat wood components to achieve ATM E 84 Class flame spread of 25 or less and smoke development of 50 and as otherwise necessary for compliance with Code.

2. Support architectural woodwork and casework to comply with CBC Chapter 16 structural criteria and deflection limitations for assembly types required and to resist forces incidental to intended conditions of service.
   a. Provide for attachment of supports to building structure or other construction in an approved manner complying with CBC and requirements of Building Official.
   b. Resistance to Seismic Forces; Comply with requirements of CBC 1613.1 for resistance of non-structural components that are permanently attached to structure per seismic criteria in the General Structural Notes.
   c. Construct cabinets to support 200 pound dead load on countertop.
3. Shelves for Casework and Wall Mounting: Thickness not less than AWS Section 10 Assembly rules and as otherwise necessary to limit deflection to 0.25 inch or less for a uniform load of 40 pounds per lineal foot.
   a. Spans greater than 42 inches are not acceptable regardless of materials composition.
4. Composite Wood Products shall meet California Green Building Standards Code Title 24, Chapter 11 (CALGreen) compliance requirements: hardwood plywood, particleboard and medium density fiberboard composite wood products used on the interior or exterior of the building shall meet the requirements for formaldehyde as specified in ARB's Air Toxics Control Measure (ATCM) for Composite Wood.
   a. Materials not exempted under the ATCM must meet the specified emission limits, as shown in Table 5.504.4.5.
   b. Documentation: Section Compliance verification shall be provide as required by 5.504.4.5.3.

2.2 MATERIALS

A. Opaque Finish Wood Trim: Solid stock hardwood species complying referenced woodworking standard requirements for Custom Grade opaque finish material.

B. Medium Density Overlay MDO Panels: 0.75 inch thick, minimum seven ply APA Group I B-B solid veneer layers free of splits and all other voids. Both faces finished with resin-treated, cellulose-fiber sheet complying with PS-1 specifications, and permanently fused to plywood under heat and pressure. Non added urea-formaldehyde.

C. High Pressure Plastic Laminate: Comply with National Electrical Manufacturer's Association (NEMA) publication LD 3. Provide General Purpose, Vertical and other material Grades as required for the Work.
   1. PL1: Nevamar Miesian, Wood Essence.
   2. PL2: Nevamar Miesian, Textured Suede.
   3. PL3: Wilsonart Morelia Mango, Timbergrain.
   4. PL4: Nevamar Aqua Mini Raffia, Textured Suede.
   5. PL5: Laminart Classic Brushed Champagne, Brushed.
   6. PL-6: Nevamar Gunmetal, Textured Suede.
   7. Bonding Adhesive: Urea-formaldehyde free, water resistant and suitable for the type of laminate and substrate being bonded.

D. Resin - Mineral Composite Panel Indicated as SS1: Homogenous composite of minerals and resins fabricated using heat and pressure to produce proprietary panel products; provide sheet sizes to minimize waste and field joints. Wilsonart Quartz is the Basis of Design.
   1. Slab Thickness: Reference Drawings for requirements.
   2. Edges: Finish profile indicated.
   3. Color: Graphite.

E. Solid-Surfacing Material indicated as SS2: Homogeneous solid sheets of filled plastic resin complying with material and performance requirements in ANSI Z124.3, for Type 5 or Type 6. Corian Solid Surface is Basis of Design.
   1. Slab thickness: Reference Drawings for requirements.
   2. Edges: As indicated.
   3. Finish:
   4. Color: Bone.

F. Resin Composite Panel indicated at SS3: Homogenous composite of cellulose or other non-mineral fibers and resins fabricated under heat and pressure to produce a dense hard panel; provide sheet sizes to minimize waste and eliminate field joints. Trespa Toplab is the Basis of Design manufacturer.
   1. Slab Thickness: Reference Drawings for requirements.
   2. Edges: As indicated.
   3. Finish:
   4. Color: Slate Gray.

G. Cabinet Hardware: Comply with ANSI/BHMA A156.9, Grade 1, Heavy Duty. Provide cabinet hardware and accessories as required.
   1. Exposed Hardware Finishes: Provide finish compliant with ANSI/BHMA A156.18 for BHMA finish number indicated.
      a. Satin Chromium Plated: BHMA 626 for brass or bronze; BHMA 652 for steel base.
      b. Satin Stainless Steel: BHMA 630.
   2. Concealed Hardware Finishes: Provide manufacturer's standard finish compliant with ANSI/BHMA A156.9 product class requirements.
   3. Door and Drawer Pulls:
      a. Wire Type: Back-mounted, stainless steel, solid metal, finish as selected: Doug Mockett DP57 Series or equivalent from Hafele.
         1) 6-inch on drawers and upper and base cabinet doors.
         2) 12-inch on full height cabinet doors.
   4. Shelf Pins: Plated steel, ANSI/BHMA A156.9, meet or exceed Grade 1 B04013; Plated Steel 0.5mm hole diameter with seismic (earthquake) pin and pre-drilled hole for seismic fasteners to shelf; 50 ponds per clip working load capacity. Plastic clips are not acceptable and will be rejected.
      a. Hettich Sekura #1, US Futaba 72511 52 068, or equal.
   5. Concealed Hinges: Eurostyle Hinge, Blum Soft-Close 110-degree BLUMotion hinges required for face-framed or frameless cabinet door as indicated in Drawings, nickel finish.
   6. Continuous Hinges: Medium gauge piano style made of 0.040-gauge steel with 0.10-inch diameter pin, satin nickel finish.
   7. Casework Door Catches: Magnetic type; Ives 325, 12 lb. pull.
   8. Drawer Slides: Meet or exceed ANSI/BHMA 156.9 Grade 1, Heavy Duty.
      a. Acceptable manufacturer: Accuride International Inc., Sata Fe Springs, CA.
      b. Drawer capacity up to 200 lb and up to 24 inches wide: Accuride #3640A.
      c. Drawer capacity up to 350 lb and up to 42 inches wide: Accuride #7957.
      d. Drawer capacity up to 600 lb and up to 60 inches wide: Accuride #9301E.
   9. Door and Drawer Silencers: ANSI/BHMA A156.16, L0311.
   10. Grommets: Aluminum or laminate as required to line and close penetrations in countertops and cases.
      a. Laminate Cap Grommets: Provide at laminate countertops.
         1) 3-inch OD molded plastic grommets and matching plastic caps with slot for wire passage except as noted otherwise. Laminate to match adjacent countertop laminate.

2) Manufacturer: LG3 Laminate Cap by Doug Mockett & Co.

b. Satin Aluminum Cap Grommets: Provide at non-laminate countertops.
   1) 3.5-inch OD, satin aluminum grommets and matching satin aluminum caps with oval cord slot lined with radiused brush for wire passage except as noted otherwise.
   2) Manufacturer: ABG3-94 by Doug Mockett & Co.

c. Drawer and Cabinet Locks: ANSI/BHMA 156.11, E07041.
   1) Acceptable Manufacturer: Olympus Lock, Inc., Lynwood, WA. 800.525.0954; www.olympus-lock.com.
   2) Product: 700SC deadbolt lock for cabinet doors; 800SC deadbolt lock for cabinet drawers.
   3) Pro ide locs at drawers, single doors and on active leaf of paired doors as indicated on Drawings.
   4) Provide 2 keys for each lock.
   5) Provide lock for active leaf of pairs of doors with elbow catch for inactive leaf.

H. Mounting Hardware for Panels: Concealed clips for demountable installation; 2.5-inch pairs of interlocking metal Zee clips.

I. Anchors, Screws and Nails: Material, type, size and finish required for each use. Comply with applicable requirements of ASTM A 307 for screws and ASTM F 1667 for nails.
   1. Exterior Woodwork: Any non-corrosive metal nail, except use stainless steel for work with transparent finish.
   2. Provide toothed steel or lead expansion bolt devices for drilled-in-place anchors. Furnish inserts and anchors, to be set into concrete or masonry work for anchorage of woodwork.

2.3 FABRICATION

A. Fabricate woodwork to dimensions, profiles, and details indicated with openings and mortises precut, where possible, to receive hardware and other items and work.
   1. Assemble woodwork and casework in shop, disassemble for shipment and reassemble with concealed fasteners in the field.
   2. Include all preparations fixtures and services for plumbing, mechanical, electrical, telecom and signal work.
   3. Fire Retardant Chemical Treatment of Wood Products: Compatible with adhesives, and specified finishes, non-pressure process, non-aqueous solution, no adverse impact on appearance of treated wood. Treatment is in addition to other applied finish requirement.

B. Ease edges to 0.0625-inch radius, for corners of cabinets and edges of solid wood (lumber) members less than 1 inch in nominal thickness, 0.125-inch radius for edges of rails and similar members over 1 inch in nominal thickness.

C. Complete fabrication, assembly, finishing, hardware application, and other work before shipment to project site to maximum extent possible. Disassemble components only as necessary for shipment and installation. Where necessary for fitting at site, provide ample allowance for scribing, trimming, and fitting.
   1. Shelves for Casework and Wall Mounting: Approved panel product in thickness indicated and as necessary to comply with Performance Requirements.
   2. Dado Case for recessed installation of shelf standards where adjustable shelves are required inside cabinet.

D. Pre-Cut Openings: Provide as necessary for hardware, appliances, equipment, service connections and other components. Locate and size openings accurately. Use templates or roughing-in diagrams for accurate sizing and configuration. Ease cut edges and seal cutouts with a water-resistant coating. Finish exposed exterior and interior edges to comply with Section 10 Material Rules, finish semi-exposed edges as required for exposed edges.
   1. Provide grommets in configuration necessary to line and close countertop and case penetrations.

E. Standing and Running Trim and Rails Standing and Running Trim and Rails: AWS Quality Standards Sections 6 and 7, Premium Grade:

F. Casework Cabinets: Comply with AWS Section 10, flush overlay construction, Custom grade except as required for door backs and edges and as specified for wood cabinets.
   1. Laminate Cladding: HGS laminate on horizontal surfaces, VGS laminate on vertical surfaces, and VGL laminate on semi-exposed surface.
      a. Edges: Match face.
      b. Orient pattern of wood grain laminate vertically, unless otherwise indicated on Drawings.
   2. Balance Backing:
      a. Wood Backing: Straight-grained hardwood of the same thickness and grain orientation as the face veneer; thickness and species characteristics well suited to use as a backing veneer with the face veneer required.
      b. Plastic Laminate Backing: 0.020 phenolic backer is required for all panels and components regardless of reference woodwork standard requirements for the grade of workmanship specified.
   3. Doors and drawer fronts and fixed panels thickness indicated and as required for flush overlay construction.
   4. Cabinet hardware as indicated.
   5. Separation between adjacent cabinet doors shall be uniform dimension not exceeding 0.125 inch. Coordinate door and case fabrication, hinge prep and installation to ensure compliance with this requirement. Uneven work and work with excessive gaps will be rejected.
   6. Cabinet Bases: Solid stock wood with laminate cladding as required for door and drawer front including balance backing.

G. Open Storage Compartments: AWI Section 10 Custom Grade and per Project requirements for Frameless box construction with concealed joinery for fixed divider shelves, Stop Dadoed to case body members - dowel and dowel-screw joinery are not acceptable. Provide box and divider shelf dimensions and configuration as indicated.
   1. Storage Below Fixed Bench:

H. Cabinet Tops: AWS Section 11, Custom Grade fabrication.
   1. Substrate Product: Required panel product; provide waterproof substrate 2 feet each-side of sink openings, and areas exposed to water.
   2. Solid Surface: Provide in configuration shown fabricated per manufacturer’s recommendations. Provide under-counter mount sink complying with barrier free access reach range; coordinate with fixtures and plumbing work of Division 22 Sections.

I. Worksurfaces: As required for Cabinet Tops and as follows.
   1. Support Brackets: Provide a minimum of one pair of supports for each worksurface up to 48 inches in length and one additional support for every 2 lineal feet of worksurface, or increment thereof, exceeding 48 inches and as otherwise necessary for support of worksurface configuration required and as necessary for loads and service conditions.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install woodwork plumb, level, true and straight with no distortions. Scribe and cut woodwork to fit adjoining work including variations in finish floors, and refinish cut surfaces or repair damaged finish at cuts. Coordinate woodwork with electrical and plumbing work.
   1. Shims: Concealed, provide as necessary due to conditions encountered and as otherwise necessary for compliance with Project requirements.

B. Secure Work to supporting construction reinforced as required for imposed loads, as necessary for compliance with Project requirements and per approved submittals. Use concealed means of attachment unless otherwise required. Countersink, fill flush and finish exposed fasteners to match adjacent surface, unless otherwise indicated.
   1. Coordinate with work of Section 05 54 000 and this Section; Reference Drawings for countertop support brackets, backing plates and reinforcing locations and requirements in framed walls.

C. Architectural Woodwork: Comply with reference woodworking standard for fabrication Grade specified and Project requirements.
   1. Standing and Running Trim: Gaps behind members shall be filled and finished to match the backing surface.
   2. Cabinets and Casework: Division B, Custom grade.
      a. Cabinet Base: Scribe to fit variations in finish floor and set in sealant.
      b. Backsplash: Fill gaps to wall exceeding 0.125 inch with an approved filler material.
   3. Paneling: Division C, Premium grade.
   4. Wood Bench: Coordinate with work of Section 05 50 00 to ensure configuration of wood fabrications and attachment to metal supports as required.

D. Field Joints: Acceptable only as shown on approved submittals. Install work with the minimum number of joints possible. Cope and miter joints; stagger joints in adjacent and related members. Comply with AWI Quality Standards referenced for shop fabrication.

E. Tolerances: 0.125 inch in 8 feet for plumb and level (including tops); and with no variations in flushness of adjoining surfaces, except where referenced standard is tighter.

3.2 ADJUSTMENT, CLEANING, FINISHING, AND PROTECTION

A. Repair damaged and defective woodwork where possible to eliminate defects functionally and visually; where not possible to repair replace Work. Adjust joinery for uniform appearance.

B. Clean, lubricate and adjust hardware.

C. Clean woodwork on exposed and semi-exposed surfaces. Touch-up shop-applied finishes to restore damaged or soiled areas.

D. Provide final protection and maintain conditions, in a manner acceptable to Fabricator and Installer, which ensures architectural woodwork being without damage or deterioration at time of substantial completion.

END OF SECTION

SECTION 07 01 50.19 - PREPARATION FOR REROOFING

PART 1 - GENERAL

1.1 SUMMARY

A. The Work of This Section Includes:
   1. Full roof tear-off.
   2. Partial roof tear-off.
   3. Temporary roofing.
   4. Roof re-cover preparation.
   5. Base flashing removal.
   6. Removal of existing skylight and equipment curbs and screens as indicated.
   7. Fastener pull-out testing.
   8. Disposal.

B. Related Requirements:
   1. Section 01 10 00 "Summary" for use of premises and for phasing requirements.
   2. Section 01 50 00 "Temporary Facilities and Controls" for temporary construction and environmental-protection measures for reroofing preparation.

1.2 REFERENCES

A. California Code of Regulations, Title 24, Part 11 California Green Building Standards Code,”"CALGreen.”

B. California Code of Regulations, Title 24 Part 2, California Building Code (CBC), International Building Code with California Amendments.

1.3 ALLOWANCES

A. Allowance for removal of existing wet insulation, and replacement with new insulation, is specified under Section 01 21 00 "Allowances."

B. Allowance for removal of existing deteriorated metal roof deck, and replacement with new metal roof deck, is specified under Section 01 21 00 "Allowances."

C. Allowance for removal of existing deteriorated wood roof deck, and replacement with new wood deck, is specified under Section 01 21 00 "Allowances."

D. Allowance for removal of existing deteriorated wood nailers and curbs, and replacement with new wood, is specified under Section 01 21 00 "Allowances."

E. Allowance for removal of existing deteriorated parapet wall sheathing, and replacement with new sheathing, is specified under Section 01 21 00 "Allowances."

1.4 UNIT PRICES

A. Work of this Section is affected by [insulation removal and replacement unit price] [metal deck removal and replacement unit price] [roof sheathing removal and replacement unit price] [and] [parapet wall sheathing removal and replacement unit price] <Insert name of unit price>.

1.5 DEFINITIONS

A. EPS: Molded (expanded) polystyrene.

B. Full Roof Tear-off: Removal of existing roofing system down to existing roof deck.

C. OSB: Oriented strand board.

D. Partial Roof Tear-off: Removal of selected components and accessories from existing roofing system.

E. Roofing Terminology: Definitions in ASTM D1079 and glossary of NRCA's "The NRCA Roofing Manual: Membrane Roof Systems" apply to work of this Section.

F. Roof Re-Cover Preparation: Existing roofing system is to remain and be prepared for new roof installed over it.

1.6 PREINSTALLATION MEETINGS

A. Preliminary Roofing Conference: Before starting removal Work, conduct conference at Project site.
   1. Meet with Owner, Architect, Owner's insurer if applicable, testing and inspecting agency representative, roofing Installer, and installers whose work interfaces with or affects roofing, including installers of roof accessories and roof- mounted equipment.
   2. Review methods and procedures related to roofing tear-off, including, but not limited to, the following:
      a. Reroofing preparation, including roofing system manufacturer's written instructions.
      b. Temporary protection requirements for existing roofing system components that are to remain.
      c. Existing roof drains and roof drainage during each stage of reroofing, and roof-drain plugging and plug removal.
      d. Construction schedule and availability of materials, Installer's personnel, equipment, and facilities needed to avoid delays.
      e. Existing roof deck conditions requiring Architect notification.
      f. Existing roof deck removal procedures and Owner notifications.
      g. Condition and acceptance of existing roof deck and base flashing substrate for reuse.
      h. Structural loading limitations of roof deck during reroofing.
      i. Base flashings, special roofing details, drainage, penetrations, equipment curbs, and condition of other construction that affect reroofing.
      j. HVAC shutdown and sealing of air intakes.
      k. Shutdown of fire-suppression, -protection, and -alarm and -detection systems.
      l. Asbestos removal and discovery of asbestos-containing materials.

m. Governing regulations and requirements for insurance and certificates if applicable.
n. Existing conditions that may require Architect notification before proceeding.

1.7 ACTION SUBMITTALS

A. Product Data: For each type of product.

B. Temporary Roofing Submittal: Product data and description of temporary roofing system.
1. If temporary roof remains in place, include surface preparation requirements needed to receive permanent roof, and submit a letter from roofing manufacturer stating acceptance of the temporary roof and that its inclusion does not adversely affect the new roofing system's resistance to fire and wind or specified special warranty.

1.8 INFORMATIONAL SUBMITTALS

A. Field Test Reports: Fastener pull-out test report.

B. Photographs or Video: Show existing conditions of adjoining construction and site improvements, including exterior and interior finish surfaces, that might be misconstrued as having been damaged by reroofing operations.
1. Submit before Work begins.

C. Landfill Records: Indicate receipt and acceptance of demolished roofing materials and hazardous wastes, such as asbestos-containing materials, by a landfill facility licensed to accept them.

1.9 QUALITY ASSURANCE

A. Regulatory Requirements:
1. Comply with governing EPA notification regulations before beginning roofing removal.
2. Comply with hauling and disposal regulations of authorities having jurisdiction.

1.10 FIELD CONDITIONS

A. Existing Roofing System: [Built-up asphalt] [Built-up coal-tar] [APP-modified bituminous] [SBS-modified bituminous] [EPDM] [CSPE] [KEE] [PVC] [TPO] [APP-modified bituminous protected membrane] [SBS-modified bituminous protected membrane] [Fluid-applied protected membrane] [Coated foamed] <Insert roof type> roofing.

B. Owner [**will**] [**will not**] occupy portions of building immediately below reroofing area.
1. Conduct reroofing so Owner's operations are not disrupted.
2. Provide Owner with not less than [**72**] <**Insert number**> hours' written notice of activities that may affect Owner's operations.
3. Coordinate work activities daily with Owner so Owner has adequate advance notice to place protective dust and water-leakage covers over sensitive equipment and furnishings, shut down HVAC and fire-alarm or -detection equipment if needed, and evacuate occupants from below work area.
4. Before working over structurally impaired areas of deck, notify Owner to evacuate occupants from below affected area.

a. Verify that occupants below work area have been evacuated before proceeding with work over impaired deck area.

C. Protect building to be reroofed, adjacent buildings, walkways, site improvements, exterior plantings, and landscaping from damage or soiling from reroofing operations.

D. Maintain access to existing walkways, corridors, and other adjacent occupied or used facilities. Retain first paragraph below and revise to suit Project.

E. Conditions existing at time of inspection for bidding will be maintained by Owner as far as practical.
1. A roof moisture survey of existing roofing system is available for Contractor's reference.
2. The results of an analysis of test cores from existing roofing system are available for Contractor's reference.
3. Construction Drawings[and Project Manual] for existing roofing system are provided for Contractor's convenience and information, but they are not a warranty of existing conditions. They are intended to supplement rather than serve in lieu of Contractor's own investigations. Contractor is responsible for conclusions derived from existing documents.

F. Limit construction loads on existing roof areas to remain, and existing roof areas scheduled to be reroofed to <**Insert load**> for rooftop equipment wheel loads and <**Insert load**> for uniformly distributed loads.

G. Weather Limitations: Proceed with reroofing preparation only when existing and forecasted weather conditions permit Work to proceed without water entering existing roofing system or building.
1. Remove only as much roofing in one day as can be made watertight in the same day.

H. Hazardous Materials:
1. It is not expected that hazardous materials, such as asbestos-containing materials, will be encountered in the Work.
a. Hazardous materials will be removed by Owner before start of the Work.
b. Existing roof will be left no less watertight than before removal.
2. If materials suspected of containing hazardous materials are encountered, do not disturb; immediately notify Architect and Owner.
a. Hazardous materials will be removed by Owner under a separate contract.
3. A report on the presence of hazardous materials is on file for review and use. Examine report to become aware of locations where hazardous materials are present.
a. Hazardous material remediation is specified elsewhere in the Contract Documents.
b. Do not disturb hazardous materials or items suspected of containing hazardous materials except according to procedures specified elsewhere in the Contract Documents.
c. Coordinate reroofing preparation with hazardous material remediation to prevent water from entering existing roofing system or building.

1.11 WARRANTY

A. Existing Warranties: Remove, replace, patch, and repair materials and surfaces cut or damaged during reroofing, by methods and with materials so as not to void existing roofing

system warranty issued by <**Insert name of manufacturer for existing warranted roof system**>.

1. Notify warrantor before proceeding with the Work.
2. Notify warrantor of existing roofing system on completion of reroofing and obtain documentation verifying that existing roofing system has been inspected and warranty remains in effect.
   a. Submit documentation at Project closeout.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. VOC limits for adhesives, sealants, fillers, primers, and coatings. Comply with limits specified

2.2 TEMPORARY PROTECTION MATERIALS

A. Design and selection of materials for temporary roofing are Contractor’s responsibility.

2.3 TEMPORARY ROOFING MATERIALS

A. Design and selection of materials for temporary roofing are the Contractor’s responsibilities.

2.4 INFILL AND REPLACEMENT MATERIALS

A. Use infill materials matching existing roofing system materials unless otherwise indicated.
   1. Infill materials are specified in [Section 07 51 13 "Built-up Asphalt Roofing"] [Section 07 51 16 "Built-up Coal Tar Roofing"] [Section 07 52 13 "Atactic-Polypropylene (APP) Modified Bituminous Membrane Roofing"] [Section 07 52 16 "Styrene-Butadiene-Styrene (SBS) Modified Bituminous Membrane Roofing"] [Section 07 53 16 "Chlorosulfonate-Polyethylene (CSPE) Roofing"] [Section 07 53 23 "Ethylene-Propylene-Diene-Monomer (EPDM) Roofing"] [Section 07 54 16 "Keytone Ethylene Ester (KEE) Roofing"] [Section 07 54 19 "Polyvinyl-Chloride (PVC) Roofing"] [Section 07 54 23 "Thermoplastic-Polyolefin (TPO) Roofing"] unless otherwise indicated.

B. Wood blocking, curbs, and nailers are specified in Section 06 10 00 "Rough Carpentry."

C. Parapet Sheathing: Match existing, adjacent, undamaged materials.
   1. Plywood roof sheathing is specified in Section 06 16 00 "Sheathing."

D. Fasteners: Factory-coated steel fasteners with metal or plastic plates listed in FM Approvals' RoofNav, and acceptable to new roofing system manufacturer.

2.5 AUXILIARY REROOFING MATERIALS

A. General: Use auxiliary reroofing preparation materials recommended by roofing system manufacturer for intended use and compatible with components of [**existing and**]new roofing system.

PART 3 - EXECUTION

3.1 PREPARATION

A. Protection of In-Place Conditions:
   1. Protect existing roofing system that is not to be reroofed.
   2. Limit traffic and material storage to areas of existing roofing that have been protected.
   3. Maintain temporary protection and leave in place until replacement roofing has been completed. Remove temporary protection on completion of reroofing.
   4. Comply with requirements of existing roof system manufacturer's warranty requirements.

B. Seal or isolate windows that may be exposed to airborne substances created in removal of existing materials.

C. Shut off rooftop utilities and service piping before beginning the Work.

D. Test existing roof drains to verify that they are not blocked or restricted.
   1. Immediately notify Architect of any blockages or restrictions.

E. Coordinate with Owner to shut down air-intake equipment in the vicinity of the Work.
   1. Cover air-intake louvers before proceeding with reroofing work that could affect indoor air quality or activate smoke detectors in the ductwork.

F. During removal operations, have sufficient and suitable materials on-site to facilitate rapid installation of temporary protection in the event of unexpected rain.

G. Maintain roof drains in functioning condition to ensure roof drainage at end of each workday.
   1. Prevent debris from entering or blocking roof drains and conductors.
      a. Use roof-drain plugs specifically designed for this purpose.
      b. Remove roof-drain plugs at end of each workday, when no work is taking place, or when rain is forecast.
   2. If roof drains are temporarily blocked or unserviceable due to roofing system removal or partial installation of new roofing system, provide alternative drainage method to remove water and eliminate ponding.
      a. Do not permit water to enter into or under existing roofing system components that are to remain.

3.2 ROOF TEAR-OFF

A. Lower removed roofing materials to ground and onto lower roof levels, using dust-tight chutes or other acceptable means of removing materials from roof areas.

B. Full Roof Tear-off: Where indicated on Drawings, remove existing roofing and other roofing system components down to the existing roof deck.
   1. Remove [substrate board] [vapor retarder] [roof insulation] [and] [cover board].
   2. Remove base flashings and counter flashings.
   3. Remove perimeter edge flashing and gravel stops.
   4. Remove copings.
   5. Remove expansion-joint covers.

6. Remove flashings at pipes, curbs, mechanical equipment, and other penetrations.
7. Remove roof drains indicated on Drawings to be removed.
8. Remove wood blocking, curbs, and nailers.
9. Remove fasteners from deck[or cut fasteners off slightly above deck surface].

C. Partial Roof Tear-off: [**Where indicated on Drawings, remove**] [**Remove**] existing roofing down to [**existing cover board**] [**existing insulation**] <**Insert substrate**> and immediately check for presence of moisture.
1. [**Engage**] [**Owner will engage**] a qualified testing agency to perform the following test:
   a. Coordinate with Owner's testing agency to schedule times for tests and inspections immediately after removal.
2. Survey exposed substrate that is to remain using infrared color thermography according to ASTM C1153.
   a. Prepare survey report of initial scan indicating locations of entrapped moisture, if any, and area calculations of locations of entrapped moisture.
3. Survey exposed substrate that is to remain using electrical capacitance/impedance testing according to ASTM D7954/D7954M.
   a. Prepare survey report indicating locations of entrapped moisture, if any, and area calculations of locations of entrapped moisture.
4. Survey exposed substrate that is to remain using nuclear hydrogen detection testing according to SPRI/RCI NT-1.
   a. Prepare survey report indicating locations of entrapped moisture, if any, and area calculations of locations of entrapped moisture.
5. Remove wet or damp materials below existing roofing and above deck as directed by Architect.
   a. [Removal is paid for by adjusting the Contract Sum according to unit prices included in the Contract Documents.]
6. Inspect wood blocking, curbs, and nailers for deterioration and damage.
   a. If wood blocking, curbs, or nailers have deteriorated, immediately notify Architect.
   b. [Removal is paid for by adjusting the Contract Sum according to unit prices included in the Contract Documents.]
7. Bitumen and felts that are firmly bonded to concrete decks are permitted to remain if felts are dry.
   a. Remove unadhered bitumen, unadhered felts, and wet felts.
8. Remove excess asphalt from steel deck that is exposed by removal of wet or damp materials.
   a. A maximum of 15 lb/100 sq. ft. (0.72 kg/sq. m) of asphalt is permitted to remain on steel decks.
9. Remove fasteners from deck[**or cut fasteners off slightly above deck surface**].

3.3 DECK PREPARATION

A. Inspect deck after tear-off of roofing system.

B. If broken or loose fasteners that secure deck panels to one another or to structure are observed, or if deck appears or feels inadequately attached, immediately notify Architect.
1. Do not proceed with installation until directed by Architect.

C. If deck surface is unsuitable for receiving new roofing or if structural integrity of deck is suspect, immediately notify Architect.

D. Do not proceed with installation until directed by Architect. Replace plywood roof sheathing as indicated on Drawings.

E. Replace plywood roof sheathing as directed by Architect.
1. Roof sheathing replacement will be paid for by adjusting the Contract Sum according to unit prices included in the Contract Documents.

3.4 INFILL MATERIALS INSTALLATION

A. Immediately after roof tear-off, and inspection and repair, if needed, of deck, fill in tear-off areas to match existing roofing system construction.
1.

3.5 TEMPORARY ROOFING Retain this article if required.

A. Install approved temporary roofing over area to be reroofed.

3.6 ROOF RE-COVER PREPARATION

A. Remove blisters, ridges, buckles,[mechanically attached roofing fastener buttons projecting above roofing,] and other substrate irregularities from existing roofing that inhibit new recover boards from conforming to substrate.
1. Remove loose aggregate from aggregate-surfaced, built-up bituminous roofing with a power broom.
2. Scarify surface of sprayed polyurethane foam as necessary to achieve a sufficiently uniform plane to receive new recover boards.
3. Broom clean existing substrate.
4. Coordinate with Owner's inspector to schedule times for tests and inspections.
5. Verify that existing substrate is dry.
a. Spot check substrates with an electrical capacitance moisture-detection meter.
6. Remove materials that are wet or damp.
a. Removal will be paid for by adjusting the Contract Sum according to unit prices included in the Contract Documents.

B. Remove blisters, ridges, buckles,[mechanically attached roofing fastener buttons projecting above roofing,] and other substrate irregularities from existing roofing that inhibit new [recover boards] [roofing] from conforming to substrate.
1. Remove loose aggregate from aggregate-surfaced, built-up bituminous roofing with a power broom.
2. Shave surface of sprayed polyurethane foam as necessary to achieve a sufficiently uniform plane to receive new [**recover boards**] [**roofing**].
3. Broom clean existing substrate.
4. Coordinate with Owner's inspector to schedule times for tests and inspections.
5. Verify that existing substrate is dry before proceeding with installation.
a. Spot check substrates with an electrical capacitance moisture-detection meter.
6. Remove materials that are wet and damp.
a. Removal will be paid for by adjusting the Contract Sum according to unit prices included in the Contract Documents.

C. Remove blisters and areas of roofing not fully adhered.

D. Remove[**mechanically attached roofing fastener buttons projecting above roofing and other**] substrate irregularities that inhibit new recover boards from conforming to substrate.
   1. Remove loose aggregate from aggregate-surfaced, built-up bituminous roofing with a power broom.
   2. Clean substrate of contaminants, such as dirt, debris, oil, and grease, that can affect adhesion of coated foamed roofing.
   3. Power vacuum the existing roof surface.
      a. If recommended by foam manufacturer, prime dried surface at recommended rate with recommended primer.
   4. Scarify surface of coated polyurethane roofing as necessary to achieve a suitable substrate for new roofing.
   5. Provide additional uplift securement for existing roofing system with new screws and plates applied to each roof zone at the following densities:
      a. Field of roof, one fastener for each <**Insert area**>.
      b. Corners of roof, one fastener for each <**Insert area**>.
      c. Perimeters of roof, one fastener for each <**Insert area**>. Width of perimeter zone of roof is <**Insert dimension**>.
   6. Verify that surface is dry by pressing litmus paper to surface areas most likely to retain moisture, such as shaded areas and low spots.
      a. If paper changes color, surface is too wet to apply foam.
   7. Build up isolated low spots on existing roofing with sprayed foam specified in Section 07 57 00 "Coated Foamed Roofing" to prevent ponding.

3.7 BASE FLASHING REMOVAL

A. Remove existing base flashings.
   1. Clean substrates of contaminants, such as asphalt, sheet materials, dirt, and debris.

B. Do not damage metal counterflashings that are to remain.
   1. Replace metal counterflashings damaged during removal with counterflashings specified in Section 07 62 00 "Sheet Metal Flashing and Trim."

C. Inspect parapet sheathing, wood blocking, curbs, and nailers for deterioration and damage.
   1. If parapet sheathing, wood blocking, curbs, or nailers have deteriorated, immediately notify Architect.

D. Remove existing parapet sheathing and replace with new parapet sheathing to comply with Section 06 16 00 "Sheathing."
   1. If parapet framing, wood blocking, curbs, or nailers have deteriorated, immediately notify Architect.

3.8 FASTENER PULL-OUT TESTING

A. [**Perform**] [**Retain independent testing and inspecting agency to conduct**] fastener pull-out tests according to SPRI FX-1 and submit test report to [**Architect**] [**and**] [**roofing manufacturer**] before installing new roofing system.
   1. Obtain [**Architect's**] [**roofing manufacturer's**] approval to proceed with specified fastening pattern.
      a. [**Architect**] [**Roofing manufacturer**] may furnish revised fastening pattern commensurate with pull-out test results.

3.9 DISPOSAL

A. Collect demolished materials and place in containers.
   1. Promptly dispose of demolished materials.
   2. Do not allow demolished materials to accumulate on-site.
   3. Storage or sale of demolished items or materials on-site is not permitted.

B. Transport and legally dispose of demolished materials off Owner's property.

C. Debris, waste, and removed materials, other than items to be salvages, are Contractor’s property for legal disposal off the site, as required by applicable Federal and State regulations. Do not allow removed materials to accumulate.

3.10 PROTECTION AND CLEANING

A. Clean roof and surrounding surfaces.

B. In areas where finished surfaces are soiled by bitumen or other materials, clean surfaces with manufacturer’s recommended products and procedures.

C. Repair of replace defaced or damages finishes caused by the work of this Section.

D. Protect installed work throughout construction.

END OF SECTION

SECTION 07 11 15 – BITUMINOUS DAMPPROOFING

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes requirements for subgrade, positive side, bituminous damp proofing system.

B. Related Sections:
   1. Section 07 13 26 Adhesive Sheet Waterproofing.

1.2 ADMINISTRATIVE REQUIREMENTS

A. Sequencing and Scheduling: Apply damp proofing prior to installation of sheet membrane waterproofing where the materials lap or otherwise come into contact, unless otherwise recommended by sheet membrane manufacturer.

1.3 SUBMITTALS

A. Product Data: Required for each waterproofing product to be incorporated into the Work.
   1. Material Samples: Provide upon request.

B. Products for each product to be incorporated into the Work.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Subject to compliance with requirements, manufacturers offering products which may be incorporated into the Work include but are not limited to the following.
   1. Karnak Corporation.
   2. Sonneborn.
   3. Tremco.
   4. W.R. Meadows, Inc.

2.2 MATERIALS

A. Cold-Applied Asphalt Water Emulsion: Asbestos-free; compatible with sheet membrane waterproofing.
   1. Emulsified Asphalt Mastic: ASTM D 1227, Type III.

B. Accessories: Compatible with damp proofing, and acceptable to manufacturer of primary materials.
   1. Asphalt Glass Felt: ASTM 2178 Type III.
   2. Bituminous Grout: ASTM D 147.
   3. Plastic Cement: ASTM D 491, asphalt base, unless otherwise recommended by damp proofing manufacturer.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Damp proofing: Unless otherwise indicated, apply to concrete walls below grade enclosing unoccupied space, including landscape retaining walls, and walls below grade not required to receive membrane waterproofing. Refer to Section 07 13 00 for waterproofing of other subterranean walls, ensure compatibility between waterproofing, and damp proofing.
   1. Extend from finished grade over top of footing, and six inches down outside face of footing. Lap twelve inches at intersecting walls, and footings.

B. Comply with manufacturer's instructions for installation and details, unless more stringent requirements shown.
   1. Prevent accumulation of fumes, ventilate enclosed spaces until coatings are completely cured.
   2. Prevent spillage and migration of materials onto other surfaces and prevent materials from entering drains and conductors.

C. Fill voids, seal joints, and apply bond breakers as recommended by prime materials manufacturer.

D. Flash joints and reinforce corners prior to application of dampproofing. Comply with details indicated, and manufacturer's recommendations.
   1. Provide two-inch cant of bituminous grout at intersection of vertical and horizontal surfaces.

E. Install asphalt glass felt reinforcing in damp proofing at inside and outside corners, and locations indicated to be reinforced; lap joints 3 inches in direction of water flow. Apply a second coating of bitumen over reinforcing.

F. Coverage: Five gallons per one hundred square feet, and dry film thickness of 30 mils; apply multiple coats as necessary to achieve film thickness.

END OF SECTION

SECTION 07 13 26 – ADHESIVE SHEET WATERPROOFING

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes requirements for waterproofing systems for sub-grade concrete walls and for concrete pits and sumps.

B. Related Sections:
   1. Section 03 30 00 Cast-In-Place Concrete.

1.2 ADMINISTRATIVE REQUIREMENTS

A. Pre-Installation Conference: Comply with requirements for Project meetings.
   1. Review of waterproofing installation requirements including but not limited to environmental conditions, mitigation measures planned for non-compliant installation conditions.
   2. Project Schedule and planned installation sequence and timing for waterproofing.
   3. Details for Project specific installation including without limitation, penetrations, transitions, compatibility with abutting assemblies and protective coverings.

B. Scheduling and Sequencing: Sequence Work to avoid cutting installed membrane for penetrations and cutting and patching for work not properly sequenced; minimize period of exposure of installed membrane.
   1. Work of this Section requires close coordination with work of Division 3 Concrete, Mechanical, Plumbing and Electrical work, and other trades whose work may penetrate waterproofing assemblies or may otherwise affect the integrity of the waterproofing. Coordinate the Work to minimize conflicts, limit the number of penetrations needed, and to ensure a permanently water-tight installation.

1.3 SUBMITTALS

A. Product Data: Required for each waterproofing product to be incorporated into the Work.
   1. Material Samples: Provide upon request.

B. Shop Drawings: Provide layout drawing for each area where waterproofing is required. Indicate type of material to be provided and locations to be reinforced or flashed. Provide Project specific details for installation at drain bodies and other penetrations, transitions, movement joints, and terminations.

C. Certifications: Provide for the following.
   1. Manufacturer Certification: Installer qualifications for waterproofing assemblies required. Certification of compatibility of waterproofing and site conditions as demonstrated by manufacturer’s test results.
   2. Manufacturer and Installer Warranty Certificate.

D. Coordination documentation and Pre-Installation Conference report.

1.4 QUALITY ASSURANCE

A. Qualifications: Installer approved by manufacturer of primary waterproofing materials, a minimum three years' successful experience with installation of waterproofing similar to that required for the Project and approved by membrane manufacturer.

B. Manufacturer's Field Quality Control Agent: Possess expert knowledge of the products being used including preparation, installation and warranty requirements. This agent shall have authority to certify compliance of the Work with Project Warranty provisions.

C. Provide inspector acceptable to waterproofing manufacturer who shall be on site and perform all inspections of the Work necessary for the waterproofing manufacturer to provide the specified warranty.

1.5 FIELD CONDITIONS

A. Provide temporary measures necessary due to Project Schedule, seasonal variations and prevailing weather to establish conditions required for successful application of the specified air barrier assembly including but not necessarily limited to temporary sheltering of work from precipitation, mitigation of temperature extremes and all other controls needed for conditions prevailing at the time of installation at no additional cost to the Owner.

1.6 SPECIAL WARRANTY

A. Project Warranty: Endorsed by manufacturer and installer for assemblies installed as work of this Section regardless of whether all products are from a single manufacturer. Warranty shall provide for correction or replacement of work that fails to remain waterproof or otherwise not remain in compliance with Contract requirements for a term of not less than one year following the date of Substantial Completion. Warranty work shall include removal, and reinstallation of assemblies concealing membrane waterproofing at no additional cost to the Owner.

PART 2 - PRODUCTS

2.1 MANUFACTURED MATERIALS

A. Single Source of Supply and Responsibility: Work of this Section shall use products of one manufacturer only (the primary manufacturer) to the maximum extent possible. Accessory components not by the primary manufacturer shall be approved by them and shall be covered by the Special Warranty as required for the Work.

B. Sheet Waterproofing: Self-adhering rubberized asphalt membrane integrally bonded to polyethylene film, not less than 56 mils thick; subject to compliance with Project requirements provide GCP Applied Technologies Bituthene System 3000, Henry, or approved.
1. Sheet Thickness: ASTM D 3767 Method A, 60 mils mm total; 56 mils rubberized membrane / 4 mils high density polyethylene film.
2. Tensile Strength : Membrane ASTM D 412 @ 2 inches per minute; 325 psi minimum. Film ASTM D 882 5,000 psi.
3. Ultimate Elongation : ASTM D 412, 300 percent minimum.
4. Lap Adhesion: ASTM D 1876, 5 psi..
5. Hydrostatic Head Resistance: ASTM D 5385, 230 feet min.

6. Water Absorption: ASTM D 570, Not more than 0.1 percent weight gain for 48 hours of immersion at 70 degrees F (21 degrees C).
7. Permeance: ASTM E 96 Section12 water method; 0.1 perms maximum.

C. Accessories for Sheet Waterproofing: Approved by manufacturer of primary materials, and recommended for substrates, and applications required.
1. Sealants, Adhesives and Tapes: Demonstrate compatibility with bonding surfaces and adjacent materials and components and capacity for reliable and permanent adhesive bonding. Provide as necessary for protection board, drainage composite, sheet-good seams, flashings, penetrations and other installation conditions.
2. Primers: As necessary and recommended by manufacturer for application required.
3. Membrane Flashing: Recommended by primary manufacturer for details and conditions encountered, unless otherwise indicated.
4. Termination Bar: 300 Series Stainless steel for water-tight termination of waterproofing and mechanical attachment to supporting construction, provide complete with anchors adhesive, sealants and similar.
5. Metal Flashing: 22 gage Stainless Steel; ASTM A 480, Type 304, annealed, No. 2D, unless harder temper required for forming or performance.
6. Protection: Reinforced asphaltic board, 0.125 inch thick; GCP Applied Technologies Asphaltic Hardboard.

D. Blindside Waterproofing: Multiple layer membrane of high-density polyethylene film with pressure sensitive adhesive specifically intended for use as positive pressure waterproofing; subject to compliance with Project requirements basis of design is GCP Applied Technologies Preprufe 275 or approved; provide manufacturer's recommend accessories for Project specific applications required for both vertical formed and shotcrete applications and under grade-supported concrete slab.
1. Sheet Thickness: ASTM D 3767 250 0.8 mm; 275 0.95 mm.
2. Tensile Strength: ASTM D 412, 250 & 275 4,000 psi, film.
3. Ultimate Elongation : ASTM D 412, 250 & 275 300 percent.
4. Lap Adhesion: ASTM D 1876, 250 4 pounds per inch of width; 275 7 pounds per inch of width
5. Hydrostatic Head Resistance: ASTM D 5385, 250 & 275, 180 feet min.
6. Puncture Resistance: ASTM E 154, 250 & 275, 135 pounds.
7. Permeance: ASTM E 96 Method B, 250 & 275, 0.01 perms maximum.
8. Ancillary Components: Approved by manufacturer of primary materials, and recommended for substrates, and applications required.

E. Drainage Composite: High impact polystyrene core having a 0.375-inch profile for positive flow, with a nonwoven polypropylene geotextile facing and high-density polyethylene backing film. W.R, Grace Hydroduct 220 for vertical assembly [and Hydroduct 600 for horizontal assemblies].
1. Drainage Core Compressive Strength: ASTM D 1621; 15,000 psi (vertical grade material) 18,000 psi (horizontal grade).
2. Geotextile Tensile Strength: ASTM D 4632; 100 pounds (vertical grade material), 200 pounds (horizontal grade).
3. Geotextile Burst Strength: ASTM D 3786 270 psi (vertical grade), 525 psi (horizontal grade).
4. Geotextile Permittivity: ASTM D 4491 130 gallons per minute or greater.

F. Protection Board: Reinforced asphaltic board, 0.125 inch thick; W.R. Grace Asphaltic Hardboard.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verification of Conditions: Excavations are sufficient to provide access to below grade Work; Substrate is dry, fully cured, smooth, free of debris, projections, depressions, and imperfections that might impair performance of installed membrane; Work has been sequenced for installation of membrane as required. Beginning of installation will be interpreted as installer's acceptance of substrate.

3.2 PREPARATION

A. Comply with manufacturer's recommended installation procedures and details, and Project requirements; provide a complete installation of waterproofing that will optimize service life of installed membrane. Provide all accessory components recommended by the waterproofing membrane manufacturer for best practices in Project specific applications regardless of whether they are specified or indicated at no additional cost to the Owner.
   1. Prime surfaces as recommended by prime manufacturer; reprime areas not covered by membrane within 12 hours of primer application.

B. Examine profile of bonding surfaces for conformity to waterproofing manufacturer's recommendations. Remove projections and fill depressions; mitigate texture of bond surfaces and other conditions as necessary to establish acceptable surface for installation.
   1. Penetrations: Pack solid with grout to ensure the penetrant remains stable in the completed assembly. Unrestrained components may compromise waterproof assembly integrity and are not acceptable.

3.3 WATERPROOFING FOR SUB-GRADE CONCRETE

A. Sheet Waterproofing: Self-adhesive membrane together with the necessary accessories to provide a complete waterproof membrane on all subgrade concrete work. Seal projections through membrane, seams, and flashings. Extend waterproofing across entire subgrade surface; provide termination proximate to finish grade as required complete with all necessary accessory components. In addition to the components specified for each assembly provide appurtenances and incidentals necessary for a complete waterproof installation complying with Contract and Project Warranty requirements.
   1. Prior to placement of concrete, protect installed waterproofing from damage due to construction activities and exposure to precipitation and other weather conditions that could impair its performance.
   2. Waterproofing at Pits and Sumps: Provide water-tight transition between vertical waterproofing and horizontal vapor barrier reinforce transitions and terminations as necessary for conditions encountered; seal at drain bodies, penetrations, and seams.

B. Waterproofing Penetrations: Following application of sheet layer of waterproofing, thread a single piece of sheet membrane over the penetrant and place a one-inch-tall fillet of mastic around the penetrant and extending 2 inches onto the sheet; cut-and-lapped sheets are not acceptable. Size the sheet to allow a minimum 10 inches over-lap onto the penetrated surface.
   1. Coordinate waterproofing at reinforcing bar and dowel penetrants with bond requirements for concrete work to be placed on reinforcing or dowel; ensure positive bond between concrete and reinforcing or dowel.

2. Following placement of concrete per Contract requirements, inspect penetrations that remain visible for stability and complete bonding with concrete. Correct poorly bonded items as necessary to ensure integrity of waterproofing.
3. Provide stainless steel fabrications, termination bar and similar fabrications as necessary for waterproofing and protection of penetrations, waterproofing transitions and terminations as required for the Work.
4. Protection Board: Provide over sun grade and exposed waterproofing indicated to have neither rigid insulation covering nor drainage composite.

C. Intersection and Termination of Waterproofing with Under-slab Vapor Barrier: Integrate waterproofing with work of Section 07 26 00. Provide accessory components as necessary for work of this Section to make a water-tight transition to bonded vapor barrier work of section 07 26 00.
1. Footing, grade Supported Slab Edge and Similar: Cover vertical faces, exposed edges and subgrade portions of the foundation to prevent contact with moisture in soils and on grade.
2. For termination near finish grade provide specified mechanically anchored membrane termination bar bedded in mastic. Provide stainless steel counterflashing where indicated.
3. Provide complete accessory components to seal and reinforce inside and outside corners, vertical-to-horizontal change-of-plane and similar transitions in the work as recommended by the waterproofing manufacturer whether shown on the drawings or not.
4. Coordinate work of this Section with Section 07 25 13 to ensure integrity of building envelope at transition between waterproofing and air barrier for air-tight and water-proof performance.

3.4 WATERPROOING FOR PITS AND SUMPS

A. Waterproofing: Provide for pits and sump using the manufacturer's recommended product for the application required. Comply with manufacturer's recommended procedures and apply continuously throughout horizontal and vertical surfaces of pits and sumps with membrane firmly supported on prepared subgrade. Ensure required overlap at seams. Roll seams and otherwise ensure formation of a permanent water-tight bond resistant to hydrostatic pressure.
1. Ancillary Components: Provide as necessary for specific conditions and details encountered in the course of the work; comply with manufacturer's recommended details and practices as recommended by the waterproofing manufacturer whether shown on the drawings or not.
2. Provide complete accessory components to seal and reinforce inside and outside corners, vertical-to-horizontal change-of-plane and similar transitions in the work
3. Penetrations: Following application of initial layer of waterproofing, recoat waterproofing with liquid membrane, and thread a single piece of sheet membrane over the penetrant and embed it in the liquid membrane; cut-and-lapped sheets are not acceptable. Size the sheet to allow a minimum 10 inches over-lap onto the penetrated surface. Over-coat the sheet with an additional application of liquid membrane lapped 3 inches onto the penetrant.
   a. Following placement of concrete per Contract requirements, inspect penetrations that remain visible for stability and complete bonding with concrete. Correct poorly bonded items as necessary to ensure integrity of waterproofing.
4. Protection Board: Provide over waterproofing not indicated to have drainage composite.

3.5 DRAINAGE COMPOSITE

A. Drainage Composite: Apply over insulation at vertical plane of subgrade walls, pits and sumps or other substrate where indicated; secure in-place to prevent movement and dislocation due to conditions of service and ensure continuity of protective cover and water flow with drainage continuity vertically and horizontally across adjacent sheets as necessary for effective collection and conduct of water to disposal point. Provide tubing, pipe, fittings and all accessory components necessary for conveyance of water collected within composite drainage assembly and conduct it to required discharge point.
   1. Coordinate with formwork and concrete work for penetration details necessary to complete drainage system as required.
   2. Provide protection board for any waterproofing not otherwise covered with an approved protective covering as recommended by the manufacturer.

B. Provide rigid insulation over waterproofing in locations required; coordinate with Section 07 21 00.

3.6 FIELD QUALITY CONTROL

A. The Contractor shall be responsible for ensuring that the waterproofing materials manufacturer's Field Quality Control Agent is present at the Project for the following milestones as a minimum.
   1. Required Site Visits: Pre-Installation Conference, review of installation conditions, start of waterproofing work and at completion of work. Manufacturer's agent shall also visit the site not less than 3 times while waterproofing work is actively in progress without prior notice to the Contractor and at such intervals that they have observed and inspected execution of typical terminations and penetrations and critical details (if any).
   2. At completion of the work Contractor shall provide manufacturer's certification that the work of this Section complies with all of the manufacturer's warranty requirements and has been installed in accordance with manufacturer's accepted practices. Contractor shall notify the Architect of any exclusions and exceptions in this certification and provide corrective work to eliminate each exclusion and exception at no additional cost to the Owner.

B. The Owner may have an independent waterproofing consultant on site during the course of the work of this Section. Contractor shall assist the Owner's consultant in observing the work and cooperate fully with this effort including but not limited to providing advance notice of work schedules, material information and samples as the Consultant may determine to be necessary to verify compliance of the work with the Contract requirements.

END OF SECTION

SECTION 07 19 00 – WATER REPELLENTS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes requirements for vapor permeable treatments to protect cementitious and masonry substrates from weather exposure, soiling and other agents.

B. RELATED REQUIREMENTS
1. Sections specifying Volatile Organic Compound (VOC) Content restrictions and limitations.
2. Section 01 81 13 .71 Sustainable Design Requirements.

1.2 REFERENCES

A. California Code of Regulations, Title 24, Part 11 California Green Building Standards Code,""CALGreen."

B. California Code of Regulations, Title 24 Part 2, California Building Code (CBC), International Building Code with California Amendments.ASTM International:
1. ASTM C 140, Standard Test Methods for Sampling and Testing Concrete Masonry Units and Related Units.
2. ASTM D 1653, Standard Test Methods for Water Vapor Transmission of Organic Coating Films.
3. ASTM D 6490, Standard Test Methods for Water Vapor Transmission of Nonfilm Forming Treatments Used on Cementitious Panels.
4. ASTM D 6578, Standard Practice for Determination of Graffiti Resistance.
5. ASTM E 514, Standard Testm Metod for Water Penetration and Leakage through Masonry.

1.3 ADMINISTRATIVE REQUIREMENTS

A. Sequencing: Comply with sequence and schedule requirements of Section 04 22 00 for application of water repellent and graffiti control treatment.
1. Unless otherwise acceptable, apply water repellent and graffiti control treatment subsequent to completion of sealant installation.
2. Coordinate application schedule and installation of materials that may be adversely affected or damaged in the course of applying the required treatments to eliminate that potential or otherwise protect the work to prevent any damage.

1.4 SUBMITTALS

A. Product Data: Required for each type of water repellent to be incorporated into the Work; include manufacturer's installation instructions.

B. Supporting lab test data confirming material performance and characteristics as specified herein. ASTM E 514 results must be from a qualified, independent lab.CALGreen Submittals:

1. Product Data, VOC Limits: For adhesives, sealants, fillers and primers, documentation including printed statement of VOC contents; comply with specified limits.
2. Low/No VOC Paints and Coatings: Provide certification that all primers and coatings meet VOC emission limits. List manufacturer, brand, application, type (flat or non-flat), and the VOC emissions per gallon in grams/liter. Include MSDS and product data sheet indicating VOC limits for each product provided.

C. Shop Drawings: Annotate building elevations to indicate proposed location for break between graffiti treatment and water repellant.

D. Samples: Two 12 by 12 inches of each substrate to receive repellent treatment; treat half of each sample.

E. Product Certificates, for each water repellant type, from manufacturer.

F. Quality Assurance Submittals: Demonstrate specified Installer qualifications, manufacturer certificates and mock-up.

G. Field Quality Control Reports: Provide manufacturer's representative's written inspection report.

1.5 QUALITY ASSURANCE

A. Installer Qualifications: Five years successful experience with products and applications similar to those required for this Project and approved by water repellent manufacturer.

B. Certification: Signed by waterproofing manufacturer that required products are suitable for assemblies, and applications indicated.

C. Mock-Up: As a prerequisite to acceptance of materials for use on Project, treat the integrated exterior mock-up and on additional areas when directed, with graffiti control and water repellent treatments to demonstrate visual and physical effect of treatment; minimum area of 100 square feet; include with mock-up a demonstration of any protective coatings and covers proposed for use in the final work.

1.6 FIELD CONDITIONS

A. Environmental Requirements: 24 Hours prior to and following application; ambient and substrate temperature above 50 degrees F, and within the limits recommended by water repellent manufacturer.

1.7 EXTRA STOCK

A. Furnish extra materials that match products installed. Package coating materials in unopened, factory-sealed containers for storage and identify with labels describing contents.
1. Quantity: Five (5) percent, but not less than 1 gallon of each material installed.
2. Provide two (2) copies of manufacturer's mixing instructions in addition to those included on the product labels.

1.8 WARRANTY

A. Special Warranty: Signed by Manufacturer and Applicator; Installation shall remain water repellent and not deteriorate in excess of manufacturer's written representations:
   1. Water Repellent (general):
      a. Vertical Applications: Ten (10) years minimum.
      b. Horizontal Applications: Five (5) years minimum.
   2. Evonik Protectosil Chem-TRETE PB 350: Twenty (20) years.
   3. Graffiti Resistant Coating: Five (5) years minimum.
   4. Provide all necessary products and labor for reapplication of failed repellent at no cost to Owner.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. VOC limits for adhesives, sealants, fillers, primers and coatings.

B. Acceptable materials are penetrating reactive silane formulation only. Siloxane, silicon silicone, acrylic and silane-siloxane emulsions are not acceptable.

C. Performance Testing of Water Repellents: Water repellent products must meet or exceed listed performance criteria:
   1. Water Leakage of CMU: Minimum 99 percent reduction over the control wall per ASM E 514.
      a. Control wall to have a leakage rate of at least 6.0 liters per hour before coating application.
   2. Water Absorption of CMU: Minimum 89 percent reduction water absorption per ASTM C 140, 24-hour submersion test.
   3. Water Absorption of Concrete:
   4. Moisture Vapor Permeability: Minimum 95 percent breathability of coating per ASM C 1653 Requirement applies to water repellents and anti-graffiti coatings on all min substates.
   5. Note ASTM E 96 testing is not an acceptable substitution for ASTM D 1653 test.

D. Performance Testing of Anti-Graffiti Coatings: Anti-Graffiti Coating products must meet or exceed listed performance criteria:
   1. Graffiti Resistance: Cleanability Level 3 after 25 cycles per ASTM D6578.
   2. Breathability: Greater than 90 percent breathable per ASTM D 6490.

2.2 MANUFACTURERS

A. Basis of Design Products, as manufactured by Evonik Industries, www.protectosil.com:
   1. Clear Penetrating Water Repellent: Concentrated alkytrialkoxy silane for dilution with water before application. Do not dilute concentrate above a maximum VOC concentration of 50 grams per liter, 19:1 for the listed product.
      a. Subject to compliance with Project requirements provide Evonik Aqua-Trete Concentrate, Chem-Trete PB 100or approved. Provide product of a single manufacturer for water repellent and graffiti control treatment.

2. Graffiti Control Treatment: Breathable, penetrating aqueous silane specifically formulated by the manufacturer as a graffiti control treatment; Evonik Industries Protectosil Anti-Graffiti.
3. Effective Control: As determined using ASTM D 6578 all media types shall be removed without exceeding Level 3 cleaning procedure.

B. Acceptable Alternate:
1. Graffiti Master Products manufactured by This Stuff Works, In. TSW), Sacramento, CA distributed through Kelly-Moore Paints.

C. Subject to compliance with requirements, provide named products or equivalent products formulated for the specified substrates.
1. Substitutions: Per Division 01 25 00 requirements.

2.3 MATERIALS

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify that substrate is clean, free of contaminants, and surface treatments that could impair water repellant performance. Provide remedial Work necessary to eliminate unacceptable conditions. Test substrate moisture content and verify compliance with repellent manufacturer's recommended limits for products whose performance may be reduced by moisture contained in the substrate at time of application.

3.2 PREPARATION

A. General: Remove plates, plaques, and similar façade elements in place and not to receive coating; install surface protection where element size, weight or attachment render removal impractical.
1. Re-install elements after coating is complete.

B. Cleaning: Remove substances that could impair coatings efficacy, including oil, grease and surface contaminants prior to applying coatings.
1. Schedule cleaning and coating application so dust and other contaminants from cleaning processes will not fall on wet, newly coated surfaces.
2. Remove dirt and surface contaminants, excess mortar, efflorescence, form release agents, curing compounds, silicone and polymer coatings that may inhibit the coating’s required penetration.
3. Employ surface cleaning including abrasive cleaning methods as approved by coating manufacturer and as accepted by Architect during mock-up process; use of muriatic acids is prohibited.

C. Substrate Repair: Properly repair all mortar joints voids and bee holes, repair cracks as field directed with suitable cementitious mortar or polyurethane joint sealant.

D. Coating Preparation: Prepare coatings according to manufacturer’s written instructions.
1. Maintain containers and coatings in a clean, contaminant-free condition.

E. Adjoining Work Protection: Protect aluminum, glass and sealant bond surfaces from anti-water repellent and graffiti spillage or blow-over; protect landscaping from product exposure.

F. Sealant Coordination: Verify all patching and joint sealants have been placed and fully cured prior to applying water repellent / anti-graffiti coating; all re-pointing must be completed cured a minimum of three days prior to water repellent / anti-graffiti coating application.

G. Inspection: Applicator, Project Inspector, and Manufacturer's Representative shall inspect surfaces prior to coating application; Manufacturer's Rep shall submit a pre-application letter to the Applicator to be presented to the General Contractor detailing the inspection and any identifying conditions that may adversely effect water repellent / anti-graffiti coating's application.

3.3 Cure Time: Allow minimum 28-day cure for CMU, plaster and concrete substates; do not coat surfaces if substate moisture content exceeds that permitted in manufacturer's written instruction.APPLICATION

A. Apply a heavy saturation spray coating of water repellent on above grade masonry and cast-in-place concrete surfaces using high-volume, low-pressure spray equipment. Comply with manufacturer's instructions and recommendations, using airless spraying procedure unless otherwise indicated.

B. Precast Concrete: Initial application of water repellent shall be completed prior to installation of units. Mask sealant-bond surfaces to prevent migration of water repellent onto joint surfaces.

C. Apply a second saturation spray coating, repeating first application. Comply with manufacturer's instructions for limitations on drying time between coats and after rainstorm wetting of surfaces between coats. Consult manufacturer's technical representative if printed recommendations are not applicable to project conditions.

D. Anti-Graffiti treatment: Apply to all exposed concrete, precast concrete and masonry surfaces from finish grade to an approximate height of ten feet above finish grade. Terminate treatment at a natural break in the work as indicated in approved submittal. Coordinate application of water repellent and anti-graffiti treatment, ensure compatibility between the two and the final application of each does not alter the appearance of the building.

E. Cover adjoining and nearby surfaces and materials where there is possibility of damage or alteration in appearance due to water repellent being deposited on surfaces. Cover live plant materials with drop cloths. Clean water repellent from adjoining surfaces immediately after spillage. Comply with manufacturer's recommendations for cleaning.

F. Where other work cannot be sequenced to eliminate potential for damage due to work of this Section provide effective protection of materials, and adjoining work, including sealant bond surfaces, from spillage or blow-over of water repellent. Cover adjoining and nearby surfaces and materials where there is possibility of damage or alteration in appearance due to water repellent being deposited on surfaces. Cover live plant materials with drop cloths. Clean water repellent from adjoining surfaces immediately after spillage. Comply with manufacturer's recommendations for cleaning.

G. Handle and apply materials in accordance with manufacturer's recommendations on ventilation, disposal, building occupant protection, pedestrian and adjacent material safety measures.

1. Follow manufacturer’s coverage rate guidelines for each product.

H. Do not apply coatings to a hot (exposed to direct sunlight) wall or where darkening may occur.

3.4 FIELD QUALITY CONTROL

A. Manufacturer’s Representative shall perform Rilem Uptake Tube test after water repellent application to confirm water repellent’s performance.
1. Schedule testing in advance for Owner and Architect attendance and observation.
2. Allow cure time as recommended by manufacturer for substrate and application conditions; conduct tests per manufacturer’s performance and warranty requirements.

B. Spray-apply coated surfaces with clear water to reveal any areas having no or deficient product application; when surface is thoroughly dry, re-apply product to any area having exhibited moisture absorption.

END OF SECTION

SECTION 07 21 00 – THERMAL INSULATION

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes providing building insulation at grade-support concrete slabs, exterior walls and soffits throughout the building, including:

1. Extruded polystyrene foam-plastic board insulation.
2. Glass-fiber blanket insulation.
3. Glass-fiber board insulation.
4. Mineral-wool blanket insulation.
5. Mineral-wool board insulation.

B. Insulation at Roof Assemblies: As specified in Section 07 54 23 for roof assembly types required.

C. Definitions:
1. Thermal Resistance: R-Value; rate of heat flow through one square foot of homogenous material one inch thick.

1.2 ADMINISTRATIVE REQUIREMENTS

A. Preinstallation Conference: Coordinate work of this Section with all other aspects of exterior envelope construction including but not limited to proactive coordination of work sequence, provisions to prevent delay due to seasonal weather conditions that may impact work, and requirements for alternative insulation materials to maintain envelope thermal performance.

1.3 SUBMITTALS

A. Product Data: Required for each material, manufactured product, and accessory to be incorporated into the Work.

B. Shop Drawings: Indicate insulation types scheduled for each assembly at locations required, Including locations where spray-applied plastic foam insulation will be provided for compliance with requirements to maintain the continuity and integrity of the building thermal and air barrier envelopes.

1.4 FIELD CONDITIONS

A. Environmental Requirements: Perform Work only when existing and forecasted weather conditions comply with manufacturers' recommendations and warranty requirements.

B. Provide temporary measures necessary due to Project Schedule, seasonal variations and prevailing weather to establish conditions required for successful application of the insulation products required for the Work including but not necessarily limited to temporary sheltering of work from precipitation, mitigation of temperature extremes and all other controls needed for conditions prevailing at the time of installation at no additional cost to the Owner.

PART 2 - PRODUCTS

2.1 SYSTEM DESCRIPTION

A. Building Envelope Thermal Performance: Conduct work of this Section to ensure compliance with California Energy Code for R-Value continuity. Provide each type of insulation necessary and revise type required and installation method or sequence proposed so as to ensure compliance.

B. Building Envelope Air Barrier Performance: Provide spray-applied foam plastic insulation at vertical and horizontal assemblies as necessary to ensure air barrier continuity and integrity complying with Performance Requirements in Section 07 25 13.

2.2 MATERIALS

A. Insulation: Thermal Insulation shall comply with California Green Building Standards Code Title 24, Chapter 11 Section 5.504.4.7.
   1. All insulation shall meet the requirements of the California Department of Public Health, “Standard Method for the Testing and Evaluation of Volatile Organic Chemical Emissions from Indoor Sources Using Environmental Chambers” Version 1.2, January 2017.
      a. Provide verification of compliance as required by 5.504.4.7.1.
   2. Certified by manufacturer and independent laboratory as free of asbestos fibers and having no added urea-formaldehyde.
   3. Surface Burning Characteristics: ASTM E 84.
   4. Fire Resistance Ratings: ASTM E 119.
   5. Combustion Characteristics: ASTM E 136.
   6. Provide insulation in thickness indicated. Thermal resistance values shall be derivative from the material thickness required.

B. Glass Fiber Insulations: Formaldehyde free and contain a minimum 25 percent of recycled material, flame spread 25, and smoke development 50 rating, and comply with individual product specifications.
   1. Unfaced Glass Fiber or Mineral Wool Batt or Blanket: ASTM C 665, Type I, formaldehyde free, R-value not less than 10 for 3.5-inch thickness; provide insulation in actual thickness indicated and as necessary to comply with total R-value required. Contractor option to provide glass fiber or miner wool
   2. Fire Safing: ASTM C 612, passes ASTM E 13, Class 4 semi-rigid batts.
   3. Spray-In Glass Fiber Insulation: ASTM C 764, Johns Manville JM Spider Custom Insulation.
   4. Unfaced Glass Fiber Board Insulation: ASTM C 612, Category 1, and Category 2, boards as required, and as necessary for conditions of installation, R-value 4.13 at 75 degrees F.

C. Mineral Wool: Provide products in thickness required of a single manufacturer for all mineral wool insulations required, basis of design is products of Rockwool unless specified otherwise.
   1. Blanket: ASTM 665 Type 1, (blankets without membrane facing); consisting of fibers; passing ASTM E136 for combustion characteristics; 2 PCF density, Comfortbatt thermal batt insulation, having wood stud thermal performance as follows:
      a. R-15 3.5-inch thickness.
      b. R-23, 5.5-inch thickness.
      c. R-30 at 7.25-inch thickness.

2. Semi-rigid Board Insulation: ASTM C 612 Type IV B; CavityRock DD, dual density 6.2 outer and 4.1 inner pounds per cubic foot having ASTM C 518 per inch R-value of 4.3, at select locations as required provide monolithic density 11 pounds per cubic foot ComfortBoard 110 having an R-value of 4.0.
3. Fire Safing: ASTM C 612 Type IV, A pass ASTM E 13, semi-rigid batts Roxul SAFE.
4. Curtain Wall Spandrel: ASTM C 612 Type IV; 8 PCF density, ASTM E 96 perm rating of 32, per inch R-value 4.2 – provide thickness necessary for required R value Roxul Curtainrock, Thermafiber or approved.

D. Insulation for Miscellaneous Voids:
1. Spray Foam Insulation: Permanently flexible, closed-cell expanding foam stable and inert upon cure, HeatLOK HFO Pro by Huntsman Building Solutions may be acceptable.
a. CFC Content: Blowing agents and similar compounds used to produce and install insulation shall cause no adverse effect on the atmosphere.
b. Asbestos Content: Certified by manufacturer and independent laboratory to be asbestos free.
c. Free of PBDE; Green Guard certified for use in schools.
d. Permeance: 0.79 Perms evaluated per ASTM E 96 at 1.5-inch thickness.
e. Surface Burning and Smoke Development: ASTM E 84 Class 1.

E. Insulation Tape: Aluminum face construction tape recommended by the manufacturer for bonding and sealing joints between abutting rigid and semi-rigid board insulation units and similar applications.

F. Adhesive for Insulation: Recommended by insulation manufacturer and comply, compatible with weather resistant air barrier materials and with fire performance characteristics, and having demonstrated capability to bond insulation securely to substrates without damaging insulation and substrates.

G. Mechanical Attachment, Insulation Anchors, Spindles and Standoffs: Provide approved fastener type and head configuration recommended by the insulation manufacturer for substrate type and conditions of service required for each insulated assembly.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates and conditions under which insulation work is to be performed. Do not proceed with installation until unsatisfactory conditions have been corrected.

B. Clean substrates of substances harmful to insulation, remove projections that could damage insulation or adversely affect its performance.

3.2 INSTALLATION

A. For thermal insulation provided as work of this Section to fulfill the requirements of the Contract Documents, and perform acceptably, transmission of heat through assemblies to be insulated must be controlled and reduced to the extent represented by the thermal resistance value intended for the overall assembly. To achieve this objective the Contractor shall

exercise special care in the installation of thermal insulation including but not limited to the following components.

1. Thermal bridges can occur where components extend unbroken through an insulated assembly and at similar locations. Identify potential thermal bridges in the Work and propose modifications to eliminate this potential.
2. Ensure that insulation installed in the Work is continuous throughout the area required and placed so as to achieve the optimum resistance to heat flow through the insulated assembly.

B. Comply with manufacturer's instructions for installation. If printed instructions are not available or do not apply to project conditions, consult manufacturer's technical representative for specific recommendations before proceeding with work.

C. Extend insulation in thickness indicated, and as necessary for total R-value required over entire area to be insulated. Remove projections that interfere with placement. Cut and fit tightly around obstructions, and fill voids with insulation. Provide tight-fitting joints between abutting insulation units and to adjacent construction.

D. Mineral Wool Insulation: Provide for positive restraint of insulation by mechanical attachment or other acceptable means, friction fitting is not acceptable.
1. Provide where insulation is required in exterior wall cavity indicated as fire resistive assembly.
2. Provide at areas where insulation is indicated at exterior soffits.
3. Batts and Fire Safing: Provide for positive restraint of insulation by mechanical attachment or other acceptable means, friction fitting is not acceptable. Provide tight-fitting joints between abutting insulation units and to adjacent construction.

E. Batt Insulation at Framed Exterior Walls, Curbs and Other Assemblies as Indicated: Specified unfaced glass fiber or mineral wool batts in the thickness indicated in exterior wall types,
1. Coordinate with Section 07 26 00 for application of vapor barrier on warm-in-winter side where exterior framed walls are indicated to have batt insulation with no outside rigid insulation.
2. Batts and Fire Safing: Provide for positive restraint of insulation by mechanical attachment or other acceptable means, friction fitting is not acceptable. Provide tight-fitting joints between abutting insulation units and to adjacent construction.

F. Fire Safing: Provide as necessary to ensure non-combustible closure between horizontal structure and vertical assemblies.

G. Curtain Wall Spandrel Panel Insulation: Mineral wool semi-rigid board as indicated on A504 and A521 and elsewhere in the drawings in thickness necessary to achieve R13.

H. Protect installed insulation from harmful weather exposures and from possible physical abuses, where possible by non-delayed installation of concealing work or, where that is not possible, by temporary covering or enclosure.

PART 4 - INSULATION SCHEDULE

4.1 Thermal Insulation: Values specified here are minimums. Thicker insulation or higher R-Values as noted in Title 24 report shall govern over these values. Provide insulation at all locations required for complete insulation of conditioned spaces.

A. Faced glass fiber batt insulation at all exterior walls, (R-19) minimum.

B. Unfaced glass fiber batt insulation (R-19) between conditioned and non-conditioned interior spaces.

C. Unfaced glass fiber batt insulation (R-19) in cavity walls.

D. Mineral Wool insulation (R-30) in exterior soffits and (R-23) behind glulam and solid sawn wood beams.

E. Interior walls and partitions, refer to Section 09 81 00 “Acoustical Insulation”.

F. Fire Safing at rated walls.

END OF SECTION

SECTION 07 24 23 – EXTERIOR PLASTER REPAIR

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes requirement for pressure washing repair of existing exterior plaster as indicated and textured elastomeric finish.

B. Unit Prices: Required for work of this Section.. Contractor shall anticipate a variety of assembly conditions will be encountered and provide a single unit price for repairs without regard for deviations in assembly components and as necessary to match adjacent work. Unit Price shall include removal of existing plasterwork as necessary to affect required repairs.
   1. Price per square foot for infill and corrective inclusive for work categories A and B.
   2. Price per lineal foot for crack repair inclusive for work categories C, D and E.
   3. Price per square foot for deep repair as required at eastern pilaster capital.

1.2 DEFINITIONS

A. Water Spray Pressures: For use in describing Work of this Section; measured at the nozzle.
   1. Medium Pressure: 500 to 800 psi; 3 to 6 gallons per minute

1.3 SYSTEM DESCRIPTION

A. Design Requirements: The Contract Documents indicate the general location for the various categories of work required. Details of conditions are not shown; final resolution of details shall be work of this Section such that the completed installation is durable and permanently weathertight and achieves a satisfactory uniformity in appearance for the overall building. Where necessary due to variable assembly conditions details shall be revised without significant alteration to appearance as approved by the Architect. Such work shall be considered within the scope required by the Contract and shall not be used as a basis for Claims or other modification to the Contract.
   1. Work Category A Infill of Holes and Voids: Prepare lacunae and fill with the specified Repair Mortar or Void Filler as necessary for each condition.
   2. Work Category B Remedial and Corrective Work: Where substrate profile and texture does not match similar adjacent surface remove material to a depth sufficient to correct the profile and texture to match adjacent using the specified repair mortar. Where substrate is friable or poorly bonded, remove the material to sound substrate and as necessary for infill with specified repair mortar.
   3. Crack Repair Work Categories:
      a. Category C Small Cracks: Less than 0.0625 inch in width; fill with specified knife grade mastic as a pretreatment prior to general coating application.
      b. Category D Medium Cracks: Greater than 0.0625 inch and up to 0.125 inch in width; grind crack to 0.25-inch width and fill with specified filling compound.
      c. Category E Large Cracks: Over 0.125 inch in width; prepare as necessary for conditions encountered and to establish required joint profile and fill with the specified polyurethane sealant.
   4. Deep Repair: Provide as required for eastern most pilaster capital on North elevation.

5. Elastomeric Finish: Prepare surfaces and apply a non-textured base coat and textured finish coat of the specified permeable elastomeric coating to achieve a uniform appearance for entire building façade with textured finish per the approved mock-up.

B. Performance Requirements: Integrate remedial work with existing stucco to remain to provide a durable contiguous weather-tight envelope. Provide uniform texture and appearance in finished work as established with the approved mock-up.

1.4 SUBMITTALS

A. Product Data: Required for all components and accessories.

B. Finish Samples: Nominal 8 by 10-inch samples demonstrating the range of textures and colors achievable with the elastomeric finish for initial selection. Provide not fewer than four sample sets for initial selection purposes.
1. Submit sufficient number of samples to demonstrate color and finish deviations to be expected in the Work but not less than two.

C. Work Plan: Demonstrate method for complying with requirements for each Work Category and process adapted to specific Project conditions encountered include a narrative for the work processes to be performed and the products to be incorporated for each Work Category.
1. Document experience and skill for proper use of grinders and similar power tools.

1.5 QUALITY ASSURANCE

A. Installer Qualifications: Demonstrate successful experience with products and processes proposed to be provided as work of this Section compliance with qualification requirements and the following.
1. Installer: Certified by the manufacturer of products to be utilized in work of this Section. Local applicators identified by the manufacturer as having experience with their products include but are not necessarily limited to Pioneer Waterproofing and D & R Masonry.
2. Installation Forman: Five jobs completed by installer not less than three years prior to bid date for the Project, list products installed, General Contractor, Owner, Architect, and Warranty history.
3. Nozzle Operator for Power Washing: SSPC C-7 Certified abrasive blast nozzle operator or other acceptable credentials.

B. Manufacturer: Provide a single source of supply for products used for crack repair, filling of voids and correction of surface conditions and elastomeric finish system.

C. Pre-Installation Meeting: As required in Section 01200; Manufacturer's field representative shall attend, sequence as necessary for proper coordination with the Work.

D. Mock-Up: Following initial selection of color and texture demonstrate finish texture and color on prepared substrate. Mock-up shall include stucco needing only surface preparation without remedial work and surfaces requiring Category B remedial or corrective work. Approved mock-up shall establish the standard to be used in evaluating the final work.

E. Regulatory Requirements: Cleaning operations and disposal of cleaning solution and rinse water in compliance with requirements of agencies having jurisdiction:

1.6 PROJECT CONDITIONS

A. Locations of the Work Categories indicated are diagrammatic and not intended to document exact size and configuration of any given area to receive a given type of work. Work areas are distributed over wide portions of the building facades, suitable access shall be provided as work of this Section including reasonable opportunity for observation of the work by the Owner and the Architect as directed.

1.7 WARRANTY

A. Special Warranty: Signed by manufacturer, and installer, work of this Section will remain free from defects in materials and workmanship, not deteriorate in excess of normal weathering and remain in compliance with Project requirements for a period of 5 years and provide for correction of defective work and material at no additional cost to the Owner.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Basis of Design Manufacturer: Mastic, repair mortar, filler, sealant, primer, finish coating and accessory components of Edison Coatings, Inc.

B. Crack Repair: The following products of Edison Coatings, Inc. are the basis of design for the Work Categories required and as recommended by the manufacturer for specific Project conditions encountered.
1. Knife Grade Mastic: Cracks less than 0.0625 inch in width; Elasto-Mastic 352.
2. Filling Compound: Cracks 0.0625 to 0.125 inch in width; Elasto-Fill 354.
3. Polyurethane Sealant: Cracks greater than 0.125 inch in width; Hydrospan ES-400 GG.

C. Repair Mortar: Edison Coatings Custom System 45 Type ST and incorporating Restoration Latex RL-1 acrylic modifier.
1. Deep Repair Mortar: Custom System 45 Type TC or BR as necessary for compatibility of physical characteristics of substrate materials and in-fill repair.

D. Elastomeric Finish: Provide smooth base coat and textured finish coat and primer where necessary due to substrate conditions encountered; color and texture shall match approved mock-up.
1. Primer: Edison Coatings, Inc. 342 acrylic primer/Sealer/Consolidant.
2. Elastomeric Finish: Edison Coatings Elastowall 351 provide media as recommended by coating manufacturer to achieve finish texture required.

E. Accessories: 316 series stainless steel as necessary for conditions encountered in the Work. for internal reinforcement of remedial work and to secure new work to stable back-up masonry.
1. Reinforcing: Diamond mesh lath in shape required and recommended by manufacturer, allow full plaster encasement.
2. Dowels: Threaded to enhance mechanical mortar bond.
3. Masonry Pins: Helifix anchor, Weston, Ontario, Canada. Use dry without epoxy.

F. Cleaning Solution: Water or dilute solution of water and chemical cleaner where necessary to establish substrate conditions acceptable for subsequent remedial and finish work.

2.2 EQUIPMENT

A. Spray Equipment: Controlled application of water at specified rates and pressures measured at nozzle.

B. Brushes: Natural fiber bristle.

C. Grinders: Power operated hand saws and grinders based on installer's successful prior experience and demonstrated ability of operators to use tools without damage to masonry.

PART 3 - EXECUTION

3.1 PREPARATION

A. Comply with applicable requirements of ASTM D 5703 and requirements of this Section for pressure washing of stucco work. Where water washing and surface scrubbing cannot establish required substrate condition a dilute detergent solution shall be provided.

3.2 PLASTER REPAIR

A. Perform each Category of Work to comply with System Description requirements, recommendations of the manufacturer of remedial, corrective and finish products to be applied as work of this Section and as necessary for specific conditions encountered.
   1. Provide surface examination of areas where there is evidence of possible bond failure by surface sounding and other appropriate means. Provide remedial and corrective work of the type required for the conditions encountered. Work in excess of base bid quantities will be conducted on a Unit Price basis as provided for modifications to the Contract.

B. Prevent damage to building and work to remain cover exposed terminations and provide other temporary protection to prevent water infiltration behind the system.

END OF SECTION

SECTION 07 25 13 – WEATHER RESISTIVE AIR BARRIER ASSEMBLY

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes requirements for component products and completed system within the building enclosure assembly as a barrier to air infiltration and exfiltration and complying with the System Description of this Section.
   1. Interior vapor barrier is work of Section 07 26 00; provide products of a single manufacturer throughout the Project for all assembly types.

B. Definitions:
   1. For component indicated as WRB weather resistive barrier, Air Barrier and similar terms, Transition: Interpreted to mean anticipated locations where barrier assembly and all accessory components necessary to accommodate a change in substrate material, profile, substrate character accommodate movement and any other conditions are required. Provide consistent accommodation at all similar transitions in the Work whether indicated or not at no additional cost to the Owner.
   2. Transition. Air Barrier Transition and Similar Terms: Interpreted to mean anticipated locations where air barrier assembly and all accessory components necessary to accommodate a change in substrate material, profile, substrate character and any other conditions are required. Provide consistent accommodation at all similar transitions in the Work whether indicated or not at no additional cost to the Owner.

1.2 ADMINISTRATIVE REQUIREMENTS

A. Preinstallation Conference: Coordinate work of this Section with all other aspects of exterior envelope construction including but not limited to proactive coordination of work sequence, provisions to prevent delay due to seasonal weather conditions that may impact work, and requirements for alternative insulation materials to maintain envelope thermal performance and resistance to air infiltration and exfiltration.
   1. Pre-Installation Field Samples: Evaluated with Architect and technical representative of air barrier manufacturer present, prior to final approval of product for use on Project. Demonstrate substrate preparation, barrier application and evaluation of in-service performance. Locate and evaluate samples as directed.
   2. Temporary measures for mitigation of and protection from environment conditions outside of manufacturer's recommendations for material installation.

B. Sequence Work to minimize potential for damage to installed air barrier due to subsequent construction activities and exposure to weather. Anticipate environmental conditions necessary for successful application of air barrier system; provide temporary facilities necessary to mitigate adverse environmental conditions.
   1. Field Testing of Pre-construction Work: Performed prior to installation of cladding and other material covering barrier but with all types of penetrations in place.
   2. Pre-application of Air Barrier: Air barrier application to sheathing in advance of installation and all similar prefabrication processes, requires prior approval; submit complete, detailed narrative for proposed process and sequence and evidence of previous successful implementation of means and methods proposed for the Work.

1.3 SUBMITTALS

A. Product Data: Demonstrate the manufacturer of the components provided as work of this Section for the air barrier produces a comprehensive range of components and accessories for complete assemblies for the conditions and details that will be encountered during installation of the Work. Document each material and accessory component of air barrier assembly to be incorporated into the Work.

B. Barrier Manufacturer's Certification: Proposed products comply with specification requirements, are compatible with substrates, suitable for barrier assembly type and performance required, and appropriate for the anticipated service environment.
   1. Test Reports: Current product formulation, demonstrate compliance with requirements for each application proposed, and compatibility with substrate and adjacent components.
      a. Identify movement capacity of barrier components subject to movement in-service in the completed work.
   2. Quality Assurance Agent's review and approval of Shop Drawings.

C. Shop Drawings: Prepared by the installer with review and approval by the manufacturer's Quality Assurance Agent. Limn the actual products and assemblies utilized in the Work. Identify barrier assembly, component products and the products and materials to which the barrier products are applied to or integrated with.
   1. Specific Project Details: Transitions, termination, and through-penetrations (including but not limited to fastener and anchor penetrations) of air barrier assembly not adequately documented by manufacturer's standard assembly details.
   2. Typical Conditions:
      a. Openings for fenestration coordinated with work of Section 08 32 13, Section 08 41 00, Section 08 42 29, and Section 08 44 00.
      b. Secondary supports and attachments for unit masonry work of Section 04 22 00 and cladding assemblies of Section 09 24 00.
      c. Accommodation for movement due to structure deflection and dynamic joints.
      d. Roof edge terminations and through-penetrations coordinated with work of Section 07 54 19; give particular attention to transition details for asphalt bearing materials and other non-compatible components.
      e. Areas having limited access complicating normal installation means, sequence or materials selection.
   3. Means and Methods: Submit as required for pre-application means and methods.

D. QUALITY ASSURANCE
   1. Installer Qualifications.
   2. Manufacturer Field Quality Control Agent qualifications and authorization.
   3. Pre-Installation field tests.
   4. Special Warranty.

1.4 QUALITY ASSURANCE

A. Manufacturer: Produce a comprehensive range of component products and accessories for complete weather-resistive air barrier assembly suitable for the conditions and details that will be encountered during installation of the Work and complying with Project requirements.
   1. Five years successful presence in this construction market area as a manufacturer of products specifically intended for use as weather-resistive air barrier in assembly types and applications comparable to those required for the Work.

2. Produce barrier products having the required performance characteristics when installed as required for the Work. Provide complete accessory products for assembly transitions, flashing, reinforcing and all specialized conditions and configurations encountered in performance of the Work.
3. Must provide the specified product warranty.

B. Manufacturer's Field Quality Control Agent: Possess expert knowledge of the products being used, air barrier assembly to be installed and details of application including without limitation preparation, installation and warranty requirements. Shall have authority to certify the completed installation qualifies with the manufacturer's requirements for the Project Warranty specified.

C. Installer: Certified by the Air Barrier Association of America (ABBA) and approved by the manufacturer of the air barrier products being applied. Five years successful experience with the installation of the products and complete system of the type required for the Work.
1. Document at least 3 installations of comparable size and complexity to this Project utilizing similar components and assemblies that have been in-service for not less than 2 years. Provide complete service history and contact information.
2. Must provide the specified labor warranty.

D. Pre-Installation Field Samples: Tested with Architect and technical representative of manufacturer present, prior to final approval of barrier products and components for use in the Work. Evaluate installed performance, preparation of substrate conditions, installation methods for compliance with Project requirements, accommodation of movement and dynamic stresses.
1. Adhesion: Evaluate per ASTM D 4541.
2. Air infiltration: Evaluate per ASTM E 1186
3. Water Penetration: Evaluate per ASTM E 1105.

1.5 FIELD CONDITIONS

A. Environmental Requirements: Perform Work only when existing and forecasted weather conditions comply with manufacturers' recommendations and warranty requirements.

B. Provide temporary measures necessary due to Project Schedule, seasonal variations, and prevailing weather to establish conditions required for successful application of the air barrier assembly including but not necessarily limited to temporary sheltering of work from precipitation, mitigation of temperature extremes and all other controls needed for conditions prevailing at the time of installation at no additional cost to the Owner.

C. Coordination with exterior gypsum sheathing work of Section 06 16 43; confirm actual application rate of air barrier on Project specific substrates. Provide quantity necessary to achieve manufacturer's recommended cured thickness regardless of substrate effect on typical spreading rate and product coverage at no additional cost to the Owner.

1.6 WARRANTY

A. Special Warranty: Provide five-year term that materials are free from defects and will perform in accordance with the manufacturer published data. Provide for replacement of defective and non-compliant materials at no additional cost to the Owner.

B. Installer Warranty: Provide two-year labor warranty to remove and reinstall defective materials including concealing assemblies and work that fails to comply with required performance values at no additional cost to the Owner.

PART 2 - PRODUCTS

2.1 SYSTEM DESCRIPTION

A. Weather-Resistive Air Barrier: Continuous assembly incorporate with other building enclosure components, including but not limited to, building cladding, fenestration, roofing and components that penetrate or contact the air-barrier, complying with Project requirements including but not limited to this System Description and the terms specified for the Special and Installer Warranties.

1. Products produced by a single manufacturer or certified by the principal manufacturer as compatible with their products, and appropriate for the application required. The installed products complete with all specialized accessory components shall provide a continuous, integrated, weather-resistive, air barrier envelope having the properties and performance characteristics required when evaluated by an acceptable third-party agent per the referenced test methods.
2. Coordinate air barrier components and integrate them with the other components required for the Work to ensure the integrity of the weather-resistive air barrier envelope.
3. Work of this Section includes responsibility for selecting standard and specialized components for the applications required and as recommended by the manufacturer. Due to the variety of product types produced by different manufacturers certain components or products necessary or recommended by the manufacturer to complete the weather-resistive air barrier system may not be identified in the Contract Documents; such components shall be provided at no additional cost to the Owner as needed to complete the work in accordance with the System Description requirements.
4. Anticipate movement in air barrier assembly where there is no solid support, where supports may be subject to movement, where displacement may occur due to dynamic forces and to accommodate differing characteristics of the various components and materials required for the Work.
5. Subject to approval and compliance with Performance Requirements including restriction on combustible materials and limitations for fire propagation potential; spray-applied foam materials may be acceptable as a supplemental component in the air barrier assembly where restricted access, work sequence or other consideration of merit necessitate.

B. Performance Requirements: Weather-resistive, air barrier assembly shall form a continuous envelope that prevents water penetration and air infiltration into the building having the following characteristics.

1. Air Leakage Limit for Installed Air Barrier Assembly: 0.004 cfm/ft2 under dynamic pressure differential not less than 0.3-inch water column (1.57 psf.) when evaluated in the field per ASTM E 2357 test methods for complete assembly and accessories.
   a. Air Permeance: 0.004 CFM per Square Foot at 1.56 PSF pressure differential per ASTM E 2178.
   b. Assembly Performance: ASTM E 2357 pass.
   c. Adhesion in Peel: ASTM C 836 6.5 pli, cohesive failure.
   d. Autonomic Seal: ASTM D 1970 pass Section 7.9.
2. Components demonstrated to be non-flammable when evaluated per ASTM E 119 or components passing ASTM E 84, Class A evaluation for Flame Spread and Smoke

Development and otherwise passing NFPA 285 in the same aggregate assembly complete with all cladding components as required for the Work.

3. Capable of withstanding dynamic forces including but not limited to structural deflection, building settlement, temperature differential, wind and seismic forces and transfer the imposed force to the building structure free of damage and degradation in performance and service life.
   a. Assembly shall not displace adjacent materials under full load.
   b. Permanently flexible components to accommodate the full range of movement due to dynamic forces and where movement in-service is anticipated.
4. Long-term, permanent resistance to exposure to ultraviolet radiation and visible spectrum sun light.

2.2 MANUFACTURED COMPONENTS – BONDED, NON-ASPHALTIC SHEET MEMBRANE

A. Weather Resistive Air Barrier: Non-asphaltic, stable and inert materials; Siga Majvest, and all additional components and accessories necessary for transitions between profiles, materials and orientation, flashing, penetrations, terminations, and all other Project conditions without limitation for the manufacturer's complete barrier assembly complying with requirements of this Section and as otherwise necessary for compliance with System Description. Product systems and assemblies of other manufacturers are acceptable as provided for substitutions in the work.

1. Accessories and Other Components: Approved by manufacturer of the primary air barrier material and recommended for substrates for specific Project applications and conditions encountered in the Work as proposed by the Contractor or their designated agent for work of this Section.
   a. SAM Transitions: Provide approved, non-bituminous, pressure sensitive, self-adhesive membrane component for locations indicated and where recommended by the air/weather barrier manufacturer. Material shall be compatible with sealants, contact surfaces and other adjacent and near-by components and suitable for conditions of service for each application. Provide minimum width to allow 3-inch overlap onto membrane barrier and bonding surface, across each plane at transitions and similar conditions. Siga Wigluv is the basis of design product.
   b. Flashing at Fenestration: Siga Fentrim series tapes are the basis of design.
   c. Tape or other approved adhesive attachment for bonding of membrane to supporting construction; provide types, primer and accessories as necessary for application to varying substrate materials and conditions as required.

2.3 MANUFACTURED COMPONENTS – FLUID-APPLIED BONDED MEMBRANE

A. The following manufacturers may offer products and systems equal to the basis of design cited in this Section, the listing herein establishes approval of neither a particular manufacturer nor their products. Subject to compliance with Project requirements fluid-applied, non-asphalt containing air barrier and accessory products of one of the following manufacturers may be acceptable

1. Tremco Inc., 3M, Carlisle and ProSoCo.

B. Air Barrier: Provide a fluid-applied elastomeric barrier and components necessary for transitions, flashing, penetrations, terminations, primers, preparatory materials and all other Project conditions without limitation for the manufacturer's complete air barrier assembly complying with requirements of this Section. Basis of design is ProSoCo R-guard CAT-5 which shall establish the minimum quality and material characteristics required and as otherwise necessary for compliance with System Description.

1. Membrane Chemistry: Free of asphalt, modified asphalt and bituminous compounds; materials shall have permanent elastomeric performance not dependent on membrane covering. Cured components shall be inert and compatible with multiple sealants, and adhesives as may be necessary for installation and performance of complete envelope assemblies
2. Accessories and Other Components: Approved by manufacturer of the primary air barrier materials, and recommended for substrates, Project details and applications required. The complete range of accessory components necessary for the range of details and installation conditions encountered in the Work shall be provided regardless of whether specifically enumerated in the Contract Documents at no additional cost to the Owner
    a. Transition: Generic notation requiring compatible components and materials recommended by the air barrier manufacturer for transition of any type whether between materials, across movement planes or planar-geometric changes without limitation to be provided as required for work of this Section.

C. Spray Foam Insulation: Reference Section 07 21 29.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verification of Conditions: Substrate is fully cured, free of debris, projections, depressions, and all surface conditions that might impair performance of installed membrane; Provide Work sequence appropriate for installation of the air barrier assembly proposed by the Contractor. Beginning of installation will be interpreted as installer's acceptance of substrate.
1. Provide moisture testing of bonding substrate and demonstrate moisture content is within manufacturer’s prescribed limits.

B. Access to certain areas may be limited due construction sequence, assembly configuration or other causes incidental to performance of the Work. Work of this Section includes adjustment to accessory components and air barrier materials, installation sequence, installation method and other adaptations in the work as necessary to ensure envelope integrity and comply with performance requirements at no additional cost to the Owner.
1. Where construction sequence or space limitations restrict access for installation of manufacturer's typical air barrier components provide approved spray-foam insulation in lieu of other material subject to compatibility with Project conditions.
2. Coordinate with work of Section 07 21 00; ensure compliance of the Work with requirements for thermal performance, weather-resistance and resistance to air infiltration/exfiltration.

3.2 INSTALLATION

A. Weather-resistive Air Barrier Assembly: Complete system installed to comply with System Description and Project requirements. Membrane shall be bonded to supporting substrates and construction free of surface defects including but not limited to wrinkles, sags, punctures, gaps and defects that may reduce in service performance membrane.
1. Joints, Seams and Transitions: Locate over solid support, overlap 4 inches and shingle horizontal joints to shed water. Treat membrane joints, edges, punctures, and penetrations using components per approved submittals and as necessary to ensure compliance with Performance Requirements.

a. Reinforce transitions and ensure continuity of air barrier assembly; seal terminations and penetrations to comply with Performance Requirements.

2. Coordinate with penetrations, anchors, flashing, miscellaneous metal support and similar components that penetrate the air barrier. Reinforce penetrations with air barrier components approved for the purpose and as recommended by the manufacturer as best practice for each condition and penetration encountered. Accommodate anchors necessary for connection of cladding components without adverse effect to required performance of air barrier assembly.
3. Coordinate with insulation work of Section 07 21 00; provide air barrier assembly and related accessories as necessary to form a continuous barrier to air infiltration and exfiltration with all components of exterior cladding assemblies.
4. Coordinate with Section 07 62 00; provide membrane flashing and related accessories as necessary to ensure air barrier and flashing function in an effective and complimentary manner.

3.3 FIELD QUALITY CONTROL

A. Inspection of Air Barrier Installation: Manufacturer's Field Quality Control Agent shall be present at the Project for the following milestones as a minimum.
1. Required Site Visits: Pre-Installation Conference, review of installation conditions, start of air barrier work and at completion. Manufacturer's agent shall also visit the site while work is actively in progress without prior notice to the Contractor and at such intervals that they will have observed and inspected execution of typical terminations and penetrations and seen the work in progress but not fewer than five times.
2. At completion of the work contractor shall provide manufacturer's certification that the work of this Section complies with all of the manufacturer's warranty requirements and has been installed in accordance with manufacturer's accepted practices. Contractor shall notify the Architect of any exclusion and exceptions in this certification and provide corrective work to eliminate each exclusion and exception at no additional cost to the Owner.

B. Installer’s Field Quality Assurance Program: Comply with ABAA protocol unless otherwise acceptable.

C. Field Testing: In addition to whole-building compliance testing the installed air barrier may be evaluated by the Owner’s Quality Control agent for compliance with envelope integrity requirements prior to covering with other work. Non-compliant work shall be subject to corrective measures as necessary to achieve compliance with air leakage rate limits.
1. Testing Methodology: ASTM E 2357, ASTM E 283 and ASTM E 2128 may be used individually or together and with selected modifications as necessary to accommodate Project conditions in the field conditions; additional testing may include the following.
a. Air infiltration: Evaluate per ASTM E 1186
b. Water Penetration: Evaluate per ASTM E 1105.

END OF SECTION

SECTION 07 26 00 – VAPOR CONTROL

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes requirements for materials to provide a continuous barrier to the transmission of water vapor through grade-supported concrete slabs, and a continuous vapor control membrane for select locations required at building wall assemblies.

1.2 ADMINISTRATIVE REQUIREMENTS

A. Preinstallation Conference: Schedule to permit coordination with the following.
   1. Concrete Flatwork: Work results for grade support concrete slab including but not necessarily limited to earthwork, below grade building systems, concrete formwork, reinforcing, cast-in-place concrete work and related work.
      a. Coordination with Contractor’s Vapor Emission Control plan and work of Division 9 Sections for applied finish floor covering.
   2. Wall Assemblies: Framing of assemblies indicated to receive a vapor control membrane and related building systems the penetrate or may otherwise influence work of this Section and performance of the installed membrane.

1.3 SUBMITTALS

A. Product data for barrier and control membranes and accessories.

B. Coordinate products utilized in work of this Section with Contractor's Moisture Emission Control Plan.

1.4 SEQUENCE AND SCHEDULING

A. Sequence Work to minimize potential for damage to installed membrane due to subsequent construction activities and exposure to weather.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Bonded Vapor Barrier: ASTM E 1745 Class A; Multi-ply polyolefin sheet with special facing to bond the membrane to the structure on contact with freshly place concrete; Sika SikaProof A-08 or GCP Applied Technologies Florprufe 120.

B. Accessories: Approved by manufacturer of primary materials, and recommended for substrates, and applications required.
   1. Adhesives and Tapes: For sealing of membrane seams, flashings, penetrations, and adjoining surfaces.
   2. Provide staples, mechanical fastenings and related accessories per manufacture's recommendations for the applications required.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verification of Conditions: Substrate is dry, fully cured, smooth, free of debris, projections, depressions, and imperfections that might impair performance of installed membrane; Work has been sequenced for installation of membrane as required. Beginning of installation will be interpreted as installer's acceptance of substrate.

B. Vapor Barrier: For below grade concrete work, coordinate with installation waterproofing and related work; give particular attention to components that must penetrate the vapor barrier and work of each of the following Sections.
   1. Cast-in-Place Concrete, Section 03 30 00.

3.2 INSTALLATION

A. Extend vapor barrier and vapor control membranes throughout each area to be protected from transmission of air or water vapor; install membrane for optimum effectiveness and service life as a barrier to water and air transmission. Secure barrier with adhesive, and mechanical fasteners as indicated and recommended by manufacturer.
   1. Installed Membranes: Free of wrinkles, sags, punctures and defects that may reduce in service performance.

B. Under Grade-Supported Concrete Slab: Provide vapor barrier membrane complying with ASTM E 1643 and project requirements. Un-roll membrane and install contiguously with long edge parallel to direction in which the pour will be made. Overlap and tape seams and penetrations as required. Repair damaged membrane with an additional layer of adhesively applied membrane. Restrain membrane to prevent movement and damage due to placement of reinforcing, concrete accessories and placement of the concrete mix.
   1. Provide aggregate capillary break below the barrier in conformance with the Geotechnical Report and Structural General Notes.

END OF SECTION

SECTION 07 54 19 – POLYVINYL CHLORIDE (PVC) ROOFING

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes requirements for weather-resistant, watertight, single ply polyvinyl chloride (PVC) roofing assembly insulated where required using fully adhered installation and the following:
   1. Accessory roofing materials.
   2. Substrate board.
   3. Roof insulation.
   4. Insulation accessories and cover board.
   5. Asphalt materials.
   6. Walkways.

1.2 ADMINISTRATIVE REQUIREMENTS

A. Pre-Installation Conference: Coordinate with schedule for work of roof-top mechanical equipment and mechanical screens. Manufacturer's Field Quality Control Agent shall attend in addition to other required parties.
   1. Include representatives of all trades performing work prior to and subsequent to membrane roofing installation whose work may affect roof installation or otherwise pose potential for wear or damage to installed work.
   2. Identify access requirements, nature of work being performed, protection required and procedures to be followed to prevent wear and damage to work of this Section. Include procedures for moving objects weighing more than 50 pounds.
   3. Coordinate with field quality assurance requirements for building envelope resistance to air infiltration; ensure compliance testing can be performed in sequence appropriate to the status of the work and allow for correction of non-compliant without delay to Project Schedule.

B. Sequence and Schedule Work to prevent exposure of installed membrane to construction traffic and minimize exposure to ultra-violet radiation. Complete installation in each area without interruption, including allowances for weather.
   1. Identify temporary facilities and controls to be provided to establish and maintain acceptable substrate conditions for roofing installation and weather protection during the work.

1.3 SUBMITTALS

A. Contractor shall provide certification from the roof manufacturer that submittal information and Project installation details have been reviewed and approved by the roof membrane manufacturer, and the proposed materials and roof system qualifies for the required warranty which will be provided by the manufacturer per requirements of this Section.

B. Product Data: Required for each product to be incorporated into the Work. Provide complete information for the assembly type required.
   1. Manufacturer's complete installation procedures and recommendations for the roof assembly required.

2. Roof membrane Manufacturer's certification of acceptability of insulation and accessory products.
3. Energy Performance: Licensed product of the Cool Roof Rating Council Product Rating Program and a listed EPA Energy Star rated roof.
4. Wind Performance: Test results demonstrating compliance with SPRI Wind Load Design Guide for the required installation and compliance with wind uplift due to open structure configuration.
5. Sample of Warranty complying with Project requirements.
6. Provide data for both means of installation mechanically attached and fully adhered.

C. Shop Drawings: Roof configuration, sheet layout and seaming; detail perimeter, flashing, penetrations, layout of Traffic Path, and special conditions.
1. Demonstrate coordination of roof insulation for required slopes including crickets; annotate insulation plan with thickness and actual slope in fractional inches per foot.
2. Provide annotated roof plans. Where necessary for approval of Regulatory Officials provide the Seal and signature of California Registered PE for roofing assembly resistance to Project wind loads.
   a. Design wind pressure for the specified ANSI/SPRI performance requirements at field and perimeter of roof.
   b. Adhered Installation: Adhesive application pattern and spreading rate recommended by the Manufacturer for attachment of insulation, cover board and membrane.
   c. Membrane seams and seaming methods (machine or hand welding).
3. Coordination drawing verifying compliance with height requirements for membrane terminations and penetrations.

D. Construction staging and installation drawings documenting protection of roof assembly components from damage by construction traffic subsequent to installation.

E. Closeout Submittals: In addition to Record Documents for work of this Section provide complete maintenance guidelines from the roof membrane manufacturer; include all procedures and inspections necessary to maintain the specified warranty and any rider enforce and any best practices that may ensure the Owner of optimal performance from the roof assembly.

F. Quality Assurance Submittals:
1. Installer Qualifications, project history and manufacturer’s certification.
2. Field Reports of membrane manufacturer's representative; compliance with wind resistance performance capacities, field pull test results for fasteners,

1.4 QUALITY ASSURANCE

A. The membrane roof to be incorporated in the Work shall be produced directly by the roof manufacturer named in this specification. Manufacture of the membrane by a licensee or any party other than the named manufacturer is not acceptable. Accessories and ancillary components used in the Work shall be produced or approved by the roof membrane manufacturer and included in the terms of the specified warranty.

B. Manufacturer's Field Quality Control Agent: Possess expert knowledge of the products being used including preparation, installation and warranty requirements. Shall have authority to certify to the Contractor that roofing installation qualifies with the manufacturer's requirements for the Project Warranty specified.

C. Installer: National Roofing Contractors Association NRCA member firm, having not less than ten years successful experience with installation of roofing system similar to that required for the Project and certified as a Sarnafil Elite, Carlisle ESP (Excellence in Single-Ply), Firestone Master Contractor, Johns Manville Pinnacle contractor.
   1. Previous Project Experience: Document three installations completed more than 2 years prior to issuance of the Contract Documents utilizing components of the proposed manufacturer that are comparable to those required for the Work, and similar in scope and complexity. Provide complete contact information, warranty and maintenance history for the installation and demonstrate in-service performance complies with original requirements for the work.
   2. Superintendent for work of this Section: Have minimum of five years' experience with thermoplastic roofing systems, the past three with this firm and possessing expert knowledge of the roofing system required for this Project. The Superintendent shall have direct responsibility for compliance of the work with Project requirements and be on-site at all times the work is in progress.

D. Related Work, including (but not limited to) vapor control membrane, insulation, flashing and counter-flashing, expansion joints, and joint sealers: Assigned to Installer of membrane roofing for single point of responsibility and warranty.

1.5 FIELD CONDITIONS

A. Prevailing and forecast weather conditions within Manufacturer's recommended extremes, and warranty requirements.

B. Where Contractor's Schedule and sequence for the Work result in roof installation occurring when seasonal weather conditions may not comply with the roofing manufacturer's recommendations for the specified assembly provide temporary measures necessary to establish compliant conditions and alternative materials suited to the prevailing conditions at no additional cost to the Project.

C. Delivery of Materials: Original packing with manufacturer's identifying label and demonstrating compliance with inspection and labeling requirements of Regulatory Agencies having jurisdiction over the Work.

1.6 WARRANTY

A. Total Roof Assembly Warranty: For all components of the insulated roof membrane assembly above the structural roof deck. Provide written warranty acceptable to the University and signed by the roof membrane manufacturer, installer and the Contractor. No dollar limit, providing for repair and replacement of roofing assembly and components that fail to remain weather-tight, comply with Contract requirements, deteriorates in excess of manufacturer's representations, or is otherwise determined to be defective, for a period of 20 years.
   1. Wind Rider: Attached to the Roof Warranty providing supplemental coverage for roofing failure due to wind up to and including wind speed of 72 miles per hour.

B. Installer Warranty: For all components of the insulated roof membrane assembly above the structural roof deck. In addition to the Total Roof Assembly Warranty provide a warranty against defective workmanship and providing for correction of work that fails to remain watertight and comply with requirements of this Section for three years.

PART 2 - PRODUCTS

2.1 SYSTEM DESCRIPTION

A. Design Requirements: Products complying with Project requirements and produced or approved by manufacturer of primary roofing materials as a sole source. Materials and systems requirements establish minimums only; provide design enhancements and accessories as necessary for the Work to qualify for the warranty required by this specification regardless of whether they are otherwise identified in the Contract Documents and without additional cost to the Project.
   1. All components attached to the structural composite deck shall comply with the Performance Requirements specified in this Section. Provide factory fabricated accessory components for corners, penetrations and all similar conditions in the work.
   2. Membrane Roof: Install assembly to comply with requirements for building envelope resistance to air infiltration; contractor shall have the option of providing a separate air barrier complying with this requirement in lieu of membrane roof compliance.
      a. Comply with roof manufacturer’s minimum height requirements for membrane at terminations and penetrations. Provide coordination submittals to verify compliance with roof manufacturer’s minimum height requirements for membrane terminations and penetrations.
   3. Membrane Roof on Open Structure: May be subject to uplift wind pressure, provide sealed insulation layer and other measures to prevent stress and damage to installed membrane and roof assembly due to open structure.
   4. Revise specific product types and accessory components as necessary for compliance with Section requirements and manufacturer's recommendations for conditions prevailing at the time of installation at no additional cost to the Project.

B. Performance Requirements: Provide a water-tight fully weather-resistant insulated single-ply membrane roof assembly complying with Factory Mutual FM Standard 4474 and the following.
   1. Wind Speed: Criteria indicated in General Structural Notes with an importance factor of 1.15. Roof assembly shall be certified by independent testing agency to resist uplift pressure calculated according to ASCE 7 for the required wind speed and importance factor.
   2. Design Wind Pressure: Positive and negative pressure at field and perimeter locations generated at the design wind speed for roof heights and configuration indicated; ensure assembly resistance to wind uplift due to open structure configuration.
   3. Fastener Pull-out Resistance: Adequate to resist required wind pressure loads with a safety factor of three.

2.2 MANUFACTURERS

A. Roofing System: Basis of Design PVC Roof membrane is Sarnafil G 410 Fully Adhered Roof System, 80 mil. Subject to compliance with Project requirements, equal products by the following manufactures may be acceptable:
   1. Carlisle Sure-Flex PVC.
   2. Firestone.
   3. Johns-Manville.

2.3 MATERIALS

A. Roof Membrane: Product of one manufacturer.

1. Accessories and Other Materials Incorporated in the Complete Roof Assembly: Compatible with membrane, and acceptable to membrane manufacturer.

B. PVC Roof Membrane: ASTM D 4434, Type II, Grade I. Thermoplastic roof PVC membrane, glass fiber or polyester reinforced and complying with the specified performance characteristics.
1. Wind Resistance: Compliance with SPRI Wind Resistance Design Guide.
2. Breaking Strength, ASTM D 751: 110 lbf.; not less than 200 percent elongation.
3. Tear Resistance: ASTM D 1004; 22 lbf.
4. Accelerated Weather Resistance: Pass ASTM G 154.
5. Brittleness Test, ASTM D 2136: Pass @ -40 C.
6. Ozone Resistance, ASTM D 1149: No cracks; seven days at 100 degrees F.
7. Heat Aging, ASTM D 571: Pass Tensile and Elongation.
8. Puncture Resistance: ASTM D 5602 Pass.
9. Membrane Seaming: Lapped per manufacturer specifications and continuously heat welded.
10. Membrane Thickness: 80 mil membrane at all roof locations**.**
11. Membrane Color: EnergySmart White:
    a. Initial solar reflectance of 0.85,
    b. Emittance of 0.86.
    c. Solar reflective index (SRI) of 107.

C. Polyisocyanurate Board: ASTM C1289 Type II, Class 2, Grade 2 including LTTR testing, flame spread 20, and smoke developed 95 (one-inch-thick board).
1. Total Thickness: As indicated and as otherwise necessary to maintain positive slope for drainage.
2. Provide tapered units where necessary for required slope.
3. Board Facing: Fiber reinforced felt facer, Saratherm ISO or coated, polymer-bonded, glass fiber mat, Sarnafil ISO CG as recommended by roof membrane manufacturer for the required installation.

D. Underlayment and Insulation Cover Board: Complies with FM 4470 and ASTM C 1177; 0.625-inch-thick rigid boards with water resistant gypsum core and resin coated fiberglass mat facings acceptable to the roofing manufacturer for the installation required and eligible for the specified Project warranty.

E. Accessories: Products of or recommended by membrane manufacturer.
1. Planar Transition, Flashing and Accessories: As indicated, and recommended by manufacturer for installation required; includes adhesives, tapes and other seals.
2. Membrane Flashing: Field membrane sheet or accessory product as necessary for warranty requirements and per membrane manufacturer's recommended best practices.
    a. Membrane Flashing Accessories: Provide prefabricated components for roof penetrations, inside and outside corners, penetration boots and similar details, field fabricated work is not acceptable where the manufacturer offers prefabricated components.
    b. Provide metal components with factory-applied thermoplastic membrane for welded joining with other membrane components.
3. Membrane Adhesive: Product recommended for prevailing conditions at the time of installation for bonding substrates indicated and complying with performance requirements.
4. Mechanical Fasteners: Metal plates, caps, battens, fasteners, and accessories, for substrates indicated, complying with performance requirements, and recommended by membrane manufacturer.

5. Traffic Path: Manufacturer's flexible pads, same color as roof membrane with similar thermal movement characteristics.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Installer shall verify that coordination, and required sequencing of the Work have been provided, and that conditions comply with requirements, and are acceptable for installation of membrane roof system including insulation, flashing and related accessories. Provide written statement of unacceptable conditions to Contractor for correction.
   1. Comply with requirements of this Section and Section 07 62 00 for sheet metal flashing.

B. Do not proceed with installation until the Work has been properly coordinated, and noncompliant, and unacceptable conditions have been corrected. Start of work by installer will be interpreted as Installer acceptance of conditions.

3.2 PREPARATION

A. Substrate For Roof Membrane: Sound, uniform surface, sloped where indicated, free of projections, depressions, and contaminants that could impair optimum service of installed roof assembly. Comply with membrane manufacturer's recommendations for substrate preparation, including priming.
   1. Contractor shall review installation areas with Manufacturer's Field Quality Control Agent, installer and Design Builder and comply with Quality Control Agent's directives for corrections to installation areas.
   2. For roof installations installed directly on metal roof deck provide continuous underlayment mechanically attached to the metal deck at intervals to comply with specified performance requirements.
   3. Provide continuous layer of Protection Board over foam insulation throughout membrane roof assembly.

B. Complete installation of cant strips, components to receive mechanical anchors, flashings, and accessory items as shown, and as recommended by manufacturer even though not shown.
   1. Inspect blocking, keyways and all other anchorage components not installed as work of this Section and confirm they have been secured to the structure with corrosion resistant fasteners and to withstand the required wind loads and pressures.

3.3 INSTALLATION

A. An aesthetically pleasing overall appearance of the finished roof application is required. Adopt means and methods and work processes to ensure uniformity in appearance of the completed work. Dress seams and other areas and prevent telegraphing of fastener plates through membrane.

B. Roof Insulation: Coordinate with installation of roof membrane. Do not install more insulation each day than can be covered with membrane before end of day, and prior to inclement weather. Run long joints of insulation in continuous straight line, perpendicular to roof slope, off-set all joints in successive layers of insulation. Ensure that insulation installed in the Work is continuous throughout the area required and placed so as to achieve the optimum

resistance to heat flow through the insulated assembly. Provide average R-Value specified for roof area.

1. Provide a minimum of two layers of insulation exclusive of tapered units. Stagger end joints between rows and off-set joints between boards and layers as required. Seal joints between boards in the initial layer and provide air-tight flexible seals at penetrations and termination of insulation.
2. Trim insulation at roof drains so surface is flush with drain ring, cut and fit tightly at obstructions.
3. Tapered Insulation: Minimum two percent (0.25 inch per foot) slope normal to slope.
4. Secure to roof deck; mechanically attach, and adhere as necessary for system required, and comply with performance requirements.
5. Insulation Protection Board: Secure to insulation and roof deck per manufacturer’s recommendations and to comply with Performance Requirements and Roof Assembly Warranty specified for this Section.

C. Membrane: Commence installation in presence of manufacturer's technical representative; comply with requirements, and membrane manufacturer's recommendations. Provide flashings and counterflashings indicated, and as recommended by membrane manufacturer.
   1. Membrane Seaming System: Manufacturer's standard for lapped joints, and exposed spliced edges.
   2. Accessory Components: Provide factory fabricated components for corners, penetration boots and similar details; field fabricated components are not acceptable where the manufacturer offers a prefabricated component.
   3. Where recommended by manufacturer and otherwise necessary for the Work provide bonding adhesives, tapes, flashing cements, seals and all necessary preparatory materials to complete the installation required.

D. Fully Adhered Installation: provide a fully adhered, insulated membrane roofing assembly identical to that successfully tested by a qualified testing and inspecting agency to resist the factored design uplift pressures calculated per Project criteria stated and referenced herein. Apply adhesive to bond surfaces, roll membrane into place when adhesive has properly cured. Lap sheets, weld seams, and seal exposed sheet edges. Provide mechanical fasteners as recommended by the roof membrane manufacturer and per approved submittals.

E. Traffic Path: Flexible rolled, heat-welded wthermoplastic walkway at locations indicated, and as necessary for access to roof areas and roof mounted equipment, Sarnatred-V, walkway with chevron-textured surface pattern or approved equal.
   1. Install pads to resist movement due to wind and other dynamic forces. Accommodate expansion and contraction due to temperature differential. Weep pads to allow for escape of water. Traffic path free of wrinkles, abrupt surface changes and similar defects.

F. Remove scrap materials debris and supplies during the course of the work. Give particular attention to debris and materials (such as anchors and plates) that could damage the roof membrane. Maintain roof drains free of debris throughout the roof installation and verify their condition when the work is complete.

G. Limit construction traffic to those routes documented on approved Construction staging and installation drawing. Protect membrane components and installed assembly from damage due to construction traffic and activities until time of final acceptance.

3.4 FIELD QUALITY CONTROL

A. The Contractor shall be responsible for ensuring that the roofing materials manufacturer's Field Quality Control Agent is present at the Project for the following milestones as a minimum.
   1. Required Site Visits: Pre-Installation Conference, Rh tests and review of installation conditions, Rh testing, start of roofing work and at completion of roofing work. Manufacturer's agent shall also visit the site not less than 3 times while roofing work is actively in progress without prior notice to the Contractor and at such intervals that they have observed and inspected execution of typical terminations at low and high parapet walls and penetrations.
      a. Perform seam tests of areas selected by the Architect during each progress visit.
   2. At completion of the work contractor shall provide manufacturer's certification that the work of this Section complies with all of the manufacturer's warranty requirements and has been installed in accordance with manufacturer's accepted practices. Contractor shall notify the Architect of any exclusion and exceptions in this certification and provide corrective work to eliminate each exclusion and exception at no additional cost to the Project.

END OF SECTION

SECTION 07 62 00 –SHEET METAL FLASHING

PART 1 - GENERAL

1.1 SUMMARY

A. References: Sheet Metal and Air Conditioning Contractors National Association (SMACNA) Architectural Sheet Metal Manual; comply with recommended material weights and details except where Project requirements are more stringent.

B. Related Sections:
1. Section 04 22 00 Concrete Unit Masonry.
2. Section 07 54 19 Polyvinyl Chloride (PVC) Roofing.
3. Section 07 72 00 Roof Accessories.
4. Section 07 92 00 Joint Sealers.
5. Section 08 32 13 Glazed Sliding Stacking Doors.
6. Section 08 41 00 Aluminum Entrances and Storefront.

1.2 ADMINISTRATIVE REQUIREMENTS

A. Preinstallation Meeting:

B. Sequencing: Coordinate work of this Section with work of assemblies where flashing is required as necessary to achieve an integrated installation complying with performance requirements for the Work.

1.3 SUBMITTALS

A. Product Data: Required for each material, manufactured product, and accessory to be incorporated into the Work.

B. Samples:
1. Sheet Stock: Three pieces, one square foot of each material and gage to be incorporated into the Work.
2. Seamed Samples: Two pieces joined as required for flat seam roof and incorporating one cleat as required for anchorage to supports.
3. Formed Sample: Full size sample 10 inches in length of two-piece cornice coping in profile required for the final work.

C. Shop Drawings: Pan layout for all work, details of typical joints, seams, and anchorage. Provide large scale details for each profile required and showing sheathing, blocking, and support for completed assemblies as installed.

D. Mock-Up: As directed and as necessary to demonstrate each type of joinery, seam, and anchorage to be used in the Work.

1.4 WARRANTY

A. Sheet Metal Flashing: Written format acceptable to Owner, signed by Fabricator- Installer. Replace, and repair flashing, as acceptable to the Owner, that fails to remain weather tight, comply with Contract requirements, deteriorates in excess of manufacturer's representations, and is otherwise determined to be defective, for a period of 2 years after date of substantial completion.

B. Finish on Prefinished Coated Steel Sheet: 10 years warranty against fading, chalking, crazing, and other degradation in appearance and performance.

PART 2 - PRODUCTS

2.1 SYSTEM DESCRIPTION

A. Design Requirements: The Contract Documents indicate the general configuration and appearance required for the completed work. Details of all conditions are not necessarily shown; final resolution of details where complete information is not shown shall be the responsibility of the Contractor such that the completed installation is durable and permanently weathertight. Where necessary to conform to Performance and Warranty requirements assembly details shall be revised without significant alteration to appearance as determined by the Architect. Such work shall be considered within the scope required by the Contract and shall not be used as a basis for Claims or other modification to the Contract. Work shall comply with recommended practices of NRCA Roofing and Waterproofing Manual and SMACNA Architectural Sheetmetal Manual; give particular attention to portions cited below.
   1. Gutters: SMACNA Architectural Sheetmetal Manual figure 1-21.
   2. Fascias, Accents and Accessory Components: Single and Double Flat Lock seams as indicated and as necessary to comply with Performance Requirements.
   3. Roof Edge Securement: Comply with California Building Code Chapter 1504.5.
   4. Cornice Coping: Provide continuous support by sheathing, blocking, shims and similar components regardless of whether shown on the drawings.
   5. Soffits at roof overhangs, eaves and similar conditions.

B. Performance Requirements: Provide metal fabrications, anchors and ancillary supports necessary to ensure the structural integrity of sheet metal work such that it remains free from damage, deformation and deflection exceeding allowable tolerances when subject to specified load criteria.
   1. Structural Performance: Accommodate the loads and stresses per criteria in the General Structural Notes with neither permanent deformation nor a reduction in weatherproof performance.
      a. Temperature Range: Accommodate thermal movement and stress for temperature differential of 20 degrees to 160 degrees.
   2. Limit movement and deflection within flashing assembly when subject to required load conditions and temperature range to 0.0057 of span. Prevent adverse impact to flashing appearance alteration due to movement and deflection of components.

2.2 MATERIALS

A. Prefinished Coated Sheet Steel: Licensed member manufacturer of the Galvalume® Sheet Producers of North America and conforming to ASTM Specification A792. 24 gage sheet

steel, with 55 percent Aluminum-Zinc Alloy-Coated by the Hot-Dip Process; AZ55 (0.55 oz/sq. ft.) coating weight.

B. Steel Sheet: ASTM A 568 with zinc coating complying with ASTM A 653 designation G90, or aluminum-zinc alloy coated per ASTM A792 A55; 24 gage, lock-forming not oiled, phosphatized where necessary for painting, limited spangle.
   1. Coated Steel Pre-painted by Coil-coating Process: ASTM A 755

C. Steel Sheet: ASTM A 792, 22 gage AZ55 Zinc-aluminum coating

D. Stainless Steel: 24 gage; ASTM A 480, Type 304, annealed, No. 2D or 2B cold rolled bright finish, unless harder temper required for forming or performance.

E. Aluminum: Provide alloy and temper as indicated,and recommended by producer or fabricator for finish specified.
   1. Extrusions: ASTM B 221; performance characteristics: 6063-T5.
   2. Plate: ASTM B 209; performance characteristics: 5005-H15; thickness of 0.080 inch unless otherwise required.
   3. Sheet: ASTM B 209; performance characteristics: 5005-H15; thickness of 0.025 inch unless otherwise required

F. Copper: 20-ounce, ASTM B 370, H00 temper.
   1. Lead Coating: 0.06 lbs. per sq. ft. on exposed surfaces.

G. Flexible Flashing: For work not included in Section 07 25 13 provide ANSI/RMA IPR-1 non-reinforced black EPDM rubber sheet.

2.3 ACCESSORIES

A. Cleats: Fabricated of coated sheet steel; metal gage and configuration shall comply with SMACNA or NRCA standards for the assembly types required.

B. Fasteners, anchors, and accessories: Galvanically compatible with metal fastened; provide stainless steel for stainless steel flashing. Provide anchor size and type necessary for installation required.

C. Provide clips, anchors, and accessories in sizes necessary and as required for installation of Work; compatible with material installed.
   1. Provide snap-lock reglets and interlocking flashing components as required for terminations at membrane and metal roof assemblies.

D. Solder: ASTM B 32, tin-lead, 50 - 50 rosin flux, except 60 - 40 acid-chloride flux for non-tinned stainless steel.

E. Joint Sealers: Compatible with the rubberized asphalt underlayment; provide silicone-based polymers unless otherwise recommended by metal fabricator for the Work.

F. Elastomeric Transition Gasket: Pre-cured silicone extrusion per Section 08 44 00 requirements or similar approved fabrications.

2.4 FABRICATION

A. Shop-fabricate Work to greatest extent possible; form to lines, levels, profiles and substrates indicated. Comply with details shown, SMACNA Architectural Sheet Metal Manual, and material manufacturer's recommendations. Prevent oil-canning, buckling, and tool marks; fold exposed edges back to form hems.
   1. Differential Movement, Expansion, and Contraction: Accommodated to provide optimal performance; provide weatherproof and water-tight joints of design acceptable to Architect; provide for proper installation of elastomeric sealant.
   2. Non-moving Seams: Flat-lock, tin edges to be seamed, form, and solder.
   3. Isolate galvanically active metals, and corrosive substrates; prevent galvanic action. Coat concealed contact surfaces with bituminous coating or other acceptable separation.
   4. Lap transverse flashing joints 4 inches and bed in sealant, and hem ends and edges to form a pan.

B. Sheet Metal Flashing in Curtain Wall and Storefront: Fabricated from stainless steel.

C. Factory Applied Finish: Comply with AAMA 2605 performance criteria; utilizing 70 percent PVDF Fluoropolymer or aliphatic polyurethane polymers and qualifying for the specified Warranty. Provide uniform appearance in color, gloss, and thickness. Apply to stock prior to fabrication unless otherwise acceptable.
   1. Color and Gloss: Where not Scheduled or otherwise indicated in Drawings, provide in color and gloss as directed by Architect.

D. Gutters: Provide double wall Box type gutters in the configuration indicated. Provide single piece fabrication to the maximum extent and complying with SMACNA recommendations. Provide watertight joints and accommodate movement within required temperature range at intervals recommended by SMACNA.
   1. Coordinate gutter assembly and conductor head with rain chain in lieu of sheet metal down spout where indicated for leak-free performance.
   2. Conductor-Head Guards: 20-gage bronze or nonmagnetic stainless-steel mesh, with selvaged edges.
   3. Conductors: Plain, round 3 inches diameter.
   4. Hangers: Number 10 and 30 Gem Circle hangers by Superior Roof Drainage Products 800.523.8852.

E. Rain Chain: Provide in lengths required and in finish as directed by Architect; install taut, secured at gutter conductor and anchored below grade as shown; coordinate tie-in to storm drain system. Basis of design is products of Nutshell Stores, Cup or Link Style as indicated in Drawings, in [Brushed Type 304 Stainless Steel] [Mill Finish Aluminum].
   a. Lengths: As Field Verified by Contractor, to 16’-0” maximum.
   b. Accessories: Manufacturer’s standard installation kit; match base metal to rain chain; field paint to match gutter color using compatible prime coat.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Integrate flashing into each of the assemblies in which it is required so as to provide effective control of moisture entering or otherwise occurring in the assembly. Collect the moisture and conduct it to the exterior for drainage without adverse effect on the performance and durability

of the assembly. Ensure continuity among flashing within different assemblies and provide a fully integrated system for the exterior of the building.

1. Provide effective drainage and venting of concealed cavities.

B. Install work true to established lines and levels; anchor in place; permanently watertight and weatherproof. Use concealed fasteners and provide for thermal movement. Comply with SMACNA Architectural Sheet Metal Manual, and manufacturer's recommendations.

1. Provide cleats and other anchors for sheet metal at intervals recommended by referenced Standards and as necessary to comply with performance requirements; moving seams shall have sufficient overlap to prevent water intrusion, but not less than three inches.
2. Provide continuous support for sheetmetal fabrications of this Section; Coordinate with supporting structure. Ensure effective anchorage of cleats and other attachments.

C. Isolate galvanically active metals, and corrosive substrates. Use slip sheet, underlayment, and bituminous coating where indicated, and as necessary to provide effective separation.

1. Provide effective drainage of concealed cavities.
2. Provide Underlayment for metal flashing components in locations required.
3. isolation membrane for metal flashing components in locations required.

D. Flashing in Concrete Masonry Unit Assemblies: Coordinate with masonry work of Section 04 22 00 and related components including but not limited to through-wall penetrations and weather barrier. Provide contiguous effective collection, control and drainage of moisture entering or otherwise occurring in cladding assemblies. Collect the moisture and conduct it to the exterior for drainage without adverse effect on the performance, durability and appearance of the assembly. Ensure continuity among water control features within the storefront and adjacent assemblies and provide a fully integrated system for the building envelope. Provide stainless steel sheet metal flashing except where flexible flashing is indicated.

1. Exposed work shall have a neat uniform appearance. Terminated edges to form a drip and locate to minimize visual impact on work.

E. Clean exposed metal surfaces, removing substances which might cause corrosion of metal or deterioration of finishes.

F. Protection: Provide to ensure that sheet metal work is free of marks such as hand and footprints, stains and other damage or deterioration at time of substantial completion.

END OF SECTION

SECTION 07 81 00 – APPLIED FIREPROOFING

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes requirements for cementitious, sprayed-on fireproofing.

1.2 ADMINISTRATIVE REQUIREMENTS

A. Preinstallation Conference: Perform field bond test prior to or in conjunction with Conference. Include all testing agents, manufacturer's field representative, applicator and others as directed.

B. Apply fire-resistive material prior to concealing members with enclosing construction. Do not conceal work until inspection and required tests are complete and the work has been accepted. Sequence work to minimize the need for cutting and patching of fire-resistive material for installation of other work.
   1. Install clips, sleeves, hangars, and items that will penetrate fire-resistive material prior to application of fireproofing.
   2. Coordinate installation of ducts, piping, and other items that would interfere with applying fire-resistive material with application of fire protection.

C. Apply fire protection on composite metal deck following placement of concrete.

D. Sequence installation to allow for field testing as Work progresses. Do not proceed with fireproofing of next area until test results for previously completed work evidence compliance with requirements.

1.3 SUBMITTALS

A. Product Data and manufacturer's recommended application procedures.
   1. Fire-resistive material manufacturer's certification of product compatibility with project substrates including necessary surface preparation, primers and coatings based on independent testing and prior application experience.

B. Shop Drawings: Structural framing plans indicating the locations and types of surface preparations required before applying sprayed fire-resistive material. Extent and thickness of sprayed fire-resistive material for each construction and fire-resistance rating, including UL assembly designation.
   1. Identify finish treatment required for sprayed fire-resistive material after application.

C. Quality Control Submittals: Test reports, and certification of compliance with referenced standards and fire protection rating.
   1. Results of Contractor's field tests of product bond to Project substrates.

D. Demonstrate coordination with Contractor's Vapor Emission Control Plan. Ensure that work of this Section neither contributes to elevated moisture content in concrete and masonry substrates nor complicates subsequent application of finishes to these substrates.

1.4 QUALITY ASSURANCE

A. Installer Qualifications: NFCA Member firm UL certified as a Qualified SFRM Contractor and approved by fire-resistive material manufacturer as an installer of the required products to achieve the fire-resistive performance required.

1.5 FIELD CONDITIONS

A. Environmental Requirements: Minimum ambient and substrate temperatures of 40 degrees F for 24 hours prior to and following application of fireproofing. Ventilate Work as recommended and as necessary to promote drying.

B. Existing Conditions: Where fireproofing has been removed in the course of hazardous materials abatement, selective demolition and other work the Contractor shall apply new fireproofing as required for work of this Section. Coordinate fireproofing work with Owner's abatement contractor. Scope of work for repair of abated areas shall be as necessary to maintain required fire resistance ratings of structure and decking.

PART 2 - PRODUCTS

2.1 SYSTEM DESCRIPTION

A. Sprayed-On Fireproofing: Materials and installation conforming to assemblies listed in UL "Fire Resistance Directory" and tested in accordance with ASTM E 119. Products of a single manufacturer for each type of fireproofing required.
   1. Certified by manufacturer and independent laboratory to be asbestos free.

B. Portland Cement Fireproofing Medium Density:
   1. Concealed within the completed structure, having only incidental gypsum content for shrinkage control, products having a dominate gypsum content are not acceptable; GCP Applied Technologies Monokote Z106HY, Cafco 400 or approved.
   2. Exposed to view within the completed structure, Manufacturer's standard products for areas exposed to impact and abrasion as required: GCP Applied Technologies MonoKote Z106-HY, or approved.
      a. Bond Strength: Minimum 2000-lbf/sq. ft. (94.5-kPa) cohesive and adhesive strength based on field testing according to ASTM E 736.
      b. Density: Not less than 22 pcf density as tested in accordance with ASTM E 605.
      c. Thickness: As required for fire-resistance design indicated, measured according to requirements of fire-resistance design or ASTM E 605, whichever is thicker, but not less than 0.375 inch (9 mm).
      d. Surface-Burning Characteristics: Comply with ASTM E 84; testing by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.
         1) a. Flame-Spread Index: 10 or less.
         2) b. Smoke-Developed Index: 10 or less.
      e. Compressive Strength: Minimum 100 lbf/sq. in. (680 kPa) according to ASTM E 761.
      f. Corrosion Resistance: No evidence of corrosion according to ASTM E 937.
      g. Deflection: No cracking, spalling, or delamination according to ASTM E 759.
      h. Effect of Impact on Bonding: No cracking, spalling, or delamination according to ASTM E 760.

3. Sealer: Transparent-drying, water-dispersible, tinted protective coating recommended in writing by fireproofing manufacturer for each fire-resistance design; Cafco Bond-Seal or approved.
4. Fireproofing Repair: Subject to field verification of compatibility with existing material, provide GCP Applied Technologies Retro-Gard Type-RG or approved compatible substitute.

C. Auxiliary Fireproofing Materials: Compatible with sprayed-on fireproofing products and substrates and approved by fireproofing manufacturer for uses and fire-resistance rated designs indicated. Provide primer, adhesive, reinforcing fabric, sealer and other accessories as necessary and as recommended by fireproofing manufacturer for assemblies required.

2.2 MIXES

A. Cementitious Fireproofing: Factory-mixed dry formulation of inorganic binders and lightweight mineral aggregates mixed with water at project site to form a slurry for pumping and dispersal by compressed air introduced at spray nozzle.

B. Proportion mix as specified by fireproofing manufacturer for application method used, and as required for substrates, and specified fire resistance ratings.

C. Asbestos Content: Certified by manufacturer and independent laboratory as containing no detectable asbestos as determined per 40 CFR 763, Subpart E, Appendix E, Section 1, Polarized Light Microscopy.

D. Water: Potable and free of contaminants deleterious to fireproofing performance.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verification of Conditions: Work has been properly sequenced; substrates are accessible, not concealed by ducts, piping, equipment and construction, and free of contaminants which could impair fireproofing performance.
1. Perform fireproofing bond tests as directed and as necessary to confirm that substrate is acceptable.

3.2 PREPARATION

A. Protection: Prevent damage to other Work due fireproofing including overspray and fall-out of fireproofing materials.

B. Substrate Preparation: Comply with manufacturer's recommendations, remove coatings, loose mill scale, and contaminants that could impair fireproofing performance.

C. Prime substrate as recommended by fireproofing manufacturer and as necessary to ensure required fire protection.

3.3 APPLICATION

A. Apply fireproofing as scheduled and as necessary for required fire resistance ratings. Comply with manufacturer's recommendations for application procedures and equipment.

B. Exposed Fireproofing: Uniform spray texture finish unless otherwise required.
1. Finish: Roll flat surfaces with a damp paint roller, and apply topcoat where required.

C. Cure installed material in accordance with manufacturer's recommendations.

3.4 FIELD QUALITY CONTROL

A. Compatibility and Adhesion Testing: Contractor shall test representative sample of installed work per ASTM E 736 and requirements in UL's "Fire Resistance Directory" for coating materials and demonstrate compliance with Contract requirements.

B. Replace fireproofing within areas where test results indicate fireproofing does not comply with requirements.

3.5 CLEANING AND PROTECTION

A. Remove over-spray and fall-out, clean exposed surfaces, and remove evidence of soiling.

B. Protect fireproofing as recommended by manufacturer and installer from damage during subsequent construction operations until substantial completion. Repair and replace damaged fireproofing.

END OF SECTION

SECTION 07 81 22 - THIN-FILM INTUMESCENT FIREPROOFING

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes requirements for thin-film, intumescent fireproof coating on structural steel shapes utilizing paint products of a single manufacturer at bronze marquise structural steel.

1.2 REFERENCE STANDARDS

A. ASTM D2240 – Standard Test Method for Rubber Property – Durometer Hardness.

B. ASTM E84 – Standard Test Method for Surface Burning Characteristics of Building Materials.

C. ASTM E119 – Standard Test Methods for Fire Tests of Building Construction and Materials.

D. SSPC-PA 2 – Procedure for Determining Conformance to Dry Coating Thickness Requirements

1.3 ADMINISTRATIVE REQUIREMENTS

A. Preinstallation Conference: Provide field samples for review immediately following or in conjunction with Conference. Include all testing agents, manufacturer’s field representative, applicator and others as directed.

B. Sequence installation to allow for field testing as Work progresses. Do not proceed with fireproofing of next area until test results for previously completed work evidence compliance with requirements.
   1. Do not conceal fireproofing with field applied top coating or other work until inspection and required tests are complete and Work is accepted.
   2. Install clips, sleeves, hangars and items that will penetrate fireproofing prior to fireproofing installation.
   3. Minimize the need for alterations to applied fireproofing for installation of other Work.

1.4 SUBMITTALS

A. Product Data and manufacturer's recommended application procedures.
   1. Certification that fireproofing components provided as work of this Section comply with limitations on VOC content and chemical compounds.

B. Samples: Prior To Ordering Paint: Two samples on 12 in. by 12 in. hardboard for Architect's review of color, sheen and texture. Submit new samples until acceptable appearance achieved.
   1. Confirm color of paint mixed for job matches previous samples, submit a second set of draw-downs, revise paint color as directed by Architect until satisfactory match achieved.

2. Field Samples: Apply complete system including all coatings required for the Work in thickness necessary for the required fire resistance rating. Provide field samples on components that will be concealed in the complete work in the locations directed.
   a. Demonstrate finish texture, transition between different systems and overall appearance to be acceptable in the completed Project.

C. Quality Control Submittals: Test reports, applicator qualifications and certification of compliance with referenced standards and fire protection rating.

1.5 QUALITY ASSURANCE

A. Applicator Qualifications: Certified by the manufacturer of the intumescent fireproofing to be applied as a qualified to apply the products and accessories necessary to comply with System Description and Project requirements.
   1. Applicator shall have 5 years successful experience with the materials being used and shall be a knowledgeable expert in all aspects of proper application and cure for the required systems.
   2. Provide documentation of three previous projects using the materials proposed for Project applications required.

1.6 FIELD CONDITIONS

A. Environmental Requirements: Provide controlled conditions for application of intumescent fire proofing; ambient temperatures of 50 to 70 degrees F and relative Humidity between 50 and 70 percent for 48 hours prior to and following application of fireproofing.
   1. Ventilation: By mechanical means, provide a minimum of 3 air changes per hour in enclosed areas.
   2. Provide temporary enclosure of work area or other acceptable means of controlling working conditions including contamination of paint surfaces with dust and other airborne particulates.
   3. Provide a record of temperature and humidity from a recording hygrothermograph demonstrating compliance with environment requirements.

PART 2 - PRODUCTS

2.1 SYSTEM DESCRIPTION

A. Fireproofing: Provide intumescent thin-film fire protection systems tested by an independent testing agency in accordance with ASTM E199 for spray application in the field. Dry Film Thickness shall provide a UL listing of 2 hours for the steel columns and 1.5 hours for steel roof structure be protected. The specified product shall set the standard for DFT, products having a thicker DFT for the specified fire resistance are not acceptable.
   1. Final determination of products and work necessary for work of this Section shall be the contractor's. Provide all products and application methods and sequence necessary to comply with finish appearance requirements regardless of whether they specifically enumerated in the Contract Documents at no additional cost to the Owner.
   2. Finish on Concealed Work: As necessary to achieve required fire resistance rating for the work.
   3. Final determination of products necessary for work of this Section shall be the Contractor's responsibility. Provide all products, application methods and sequence

necessary to comply with performance requirements regardless of whether enumerated in the Contract Documents at no additional cost to the Owner.

B. Performance Requirements: Materials and installation conforming to assemblies listed in UL "Fire Resistance Directory" and tested in accordance with ASTM E 119.
   1. Provide 2-hour fire resistance rating on the marquise concealed steel columns, and 1.5-hour fire resistance rating on the marquise concealed horizontal steel structure as indicated and specified herein.

2.2 MANUFACTURED COMPONENTS

A. Thin-Film Intumescent Fireproofing: Products of a single manufacturer for each type of fireproofing required. Subject to compliance with specified requirements, provide the following manufacturers' products, or an approved substitution.
   1. Steel Having Only Interior Exposure: Products of Viking Corp., Tyco Fire Products or Reliable; provide a compatible primer recommended by the manufacturer.
      a. Surface Burning Characteristics: Class A, flame spread/smoked developed 25/450 maximum when tested in accordance with ASTM E84.
      b. Durometer Hardness, Type D: 60 minimum in accordance with ASTM D2240.
   2. Primer Coating and Protective Top Coating: Products manufactured and approved by the Fireproofing manufacturer for use together with thin film fireproofing as a complete system.
   3. Accessories: Products to be applied on site shall comply with VOC and chemical compound limitations for the Work.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates to determine if they are in satisfactory condition to receive intumescent fire protection; verify that substrates are clean and free of oil, grease, incompatible primers, or other foreign substances capable of impairing bond to fireproofing system.

B. Do not being installation until substrates have been properly prepared.

C. If substate preparation is responsibility of another installer, notify Architect of unsatisfactory preparation before proceeding.

3.2 PREPARATION

A. Thoroughly clean surfaces to receive fireproofing.

B. Repair substrates to remove surface imperfections that could affect uniformity of texture and thickness of fireproofing system, and remove minor projections and fill voids that could telegraph through finished work.

C. Cover or otherwise protect other work that might be damaged by fallout or overspray of fireproofing system, and provide temporary enclosures as necessary to confine operations and maintain required ambient field conditions.

3.3 APPLICATION

A. Comply with manufacturer's instructions for each particular intumescent fire protection system installation application as indicated.

B. Apply manufacturer's recommend primer to required coating thickness.

C. Apply fireproofing to full thickness over entire area of each substate to be protected.

D. Apply coats at manufacturer's recommended rate to achieve dry film thickness (DFT) as required for fire resistance ratings designated for each condition.

E. Apply intumescent fire protection by spraying to maximum extent possible, and as necessary complete coverage by roller application or other method acceptable to manufacturer.

F. Achieve uniform finished appearance.

3.4 FIELD QUALITY CONTROL

A. Tests: Comply with requirements for Special Inspections of OSSC Chapter 17 and the following.
   1. Applicator Testing: Provide written documentation of continuous wet film testing of the work during application to ensure the required DFT is achieved and to maintain compliance with manufacturer's recommended application procedures.
   2. Special Inspection: Owner's independent testing laboratory will inspect the work per ASTM D 3276 and determine the DFT and adhesion of the intumescent fireproofing as appropriate to the status of the work. Test areas will be selected by the laboratory in the frequency required by Regulatory Authorities to demonstrate compliance with Code requirements, but not less than one test for every 250 square feet of material covered.
      a. Dry Film Thickness: Determined in accordance with SSPC PA2.
      b. Adhesion: ASTM D 4541.

B. Repair fireproofing as necessary due to field tests. Correct work where test results indicate fireproofing does not comply with Contract requirements.

C. Tests:
   1. Contractor Testing: Provide written documentation of continuous wet film testing of the work during application to ensure the required DFT is achieved and to maintain compliance with manufacturer's recommended application procedures.
   2. Owner Testing: Owner's independent testing laboratory will inspect the work per ASTM D 3276 and determine the DFT and adhesion of the intumescent fireproofing as appropriate to the status of the work. Test areas will be selected by the laboratory in the frequency required by Regulatory Authorities to demonstrate compliance with Code requirements, but not less than one test for every 250 square feet of material covered.
      a. Dry Film Thickness: Determined in accordance with SSPC PA2.
      b. Adhesion: ASTM D 4541.

D. Repair fireproofing as necessary due to field tests. Correct work where test results indicate fireproofing does not comply with Contract requirements.

3.5 CLEANING

A. Immediately after installation of fireproofing in each area, remove overspray and fallout from other surfaces and clean soiled areas.

3.6 PROTECTION

A. Protect installed intumescent fire protection from damage due to subsequent construction activities so fireproofing is without damage or deterioration before Date of Substantial Completion.

B. Touch-up, repair or replace damaged products before Date of Substantial Completion.

END OF SECTION

SECTION 07 84 00 – FIRESTOPPING

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes requirements for firestopping products to maintain continuity of fire rated construction throughout the Project, at joints, openings and penetrations indicated, and as required for compliance with Code, and requirements of building and fire authorities.
   1. Fire Rated Sealants: Work of this Section, comply with applicable requirements of Section 07 92 00.
   2. Applications for firestop systems may include but are not necessarily limited to the following:
      a. Joints between horizontal and vertical construction assemblies; Perimeter fire containment between floor slabs and curtain walls and between floor slabs and exterior wall assembly.
      b. Head-of-wall joint with movement capability.
      c. Through- and membrane-penetration of walls by conduits, cables, and by insulated and uninsulated pipes and ducts
      d. Through-penetrations of floor slabs by conduits, cables, and by insulated and uninsulated pipes
      e. Wall opening protective materials for metallic outlet boxes.
   3. Applications for smoke seals may include but are not necessarily limited to the following.
      a. Acoustic seals in horizontal and vertical construction assemblies.
      b. Wall opening protective materials at junction boxes and similar components.
      c. Smoke gasketing of door jambs and heads is work of Section 08 71 00 Finish Hardware.

1.2 DEFINITIONS

A. F Rating: Time period that a firestop assembly can withstand fire and hose stream test as determined by ASTM E 814.

B. T Rating: As required for F Rating and to limit temperature rise above the initial temperature to 325 degrees F on protected side as determined by ASTM E 814.

C. L Rating: Resistance of firestop assembly to air leakage as determined by UL 1479.

D. Through-penetrant: Duct, pipe, conduit, cable tray or other component that continues directly through both sides of a vertical or horizontal assembly.

E. Membrane-penetrant: Switch box, service outlet or other component that penetrate one side of an assembly without continuing through the total assembly.

F. Perimeter Fire Barrier System: Specific assembly used to close the void between a fire resistance rated floor and abutting wall assembly whether rated or not.

G. Opening: Shall include any void, lacunae, and aperture, whether formed by a frame or incomplete construction, of any kind without limitation and may occur in both new and existing construction and is not otherwise recognized as a door or window.

1.3 ADMINISTRATIVE REQUIREMENTS

A. Preinstallation Conference: Provide as required for coordination among multiple Trades performing work requiring penetration of fire rated assemblies and similar conditions where work of this Section is required to maintain the continuity of a required fire resistance rating.
   1. Coordinate work sequence for installation of firestop products with work for each type of penetrant and each assembly required for the Work to ensure proper application of materials and compliance with the fire resistive performance required.

1.4 SUBMITTALS

A. Product Data: Required for each material, manufactured product, and accessory to be incorporated into the Work. Provide UL listing number for specific assembly used at each penetration.

B. Fire Stopping Matrix: Provided for each firestopping assembly to be incorporated into the Work. Identify UL assembly number and rating and every constituent component. Matrix shall cross reference the assembly to each application it is proposed to be used in and indicate penetrant type, size, and material.
   1. Clearly identify assemblies incorporating fire stop components not produced by the same manufacturer and note why it is necessary to introduce products of more than a single manufacturer.

C. Certificates: Certify firestopping installer qualifications compliance.
   1. Where modification of a particular tested and listed fire stop assembly is necessary due to Project specific conditions submit the manufacturer’s Engineering Judgment, developed in accordance with International Firestop Council Guidelines, and acceptable to the authority having jurisdiction.

1.5 QUALITY ASSURANCE

A. Installer Qualifications: Firestop Contractors’ International Association member or Factory Mutual Class 4991 approved installer.

B. Field Inspection Agency Qualifications: Compliance with ASTM E 699 criteria and International Accreditation Services Inspection Agency Accreditation Criteria AC 291 and comply with IBC Section 1703. Familiarity with the firestop materials and assembly types required for the Work. Have a minimum 3 years documented record of successful performance of field inspections of firestopping work as a primary service offered by this firm.
   1. Personnel Qualifications: Passed Factory Mutual FM 4991 or UL Firestop Exam.

C. Deliver materials in unopened containers bearing manufacturer's name and product description. Store under cover and protected from damage. Remove damaged material from job site.

PART 2 - PRODUCTS

2.1 SYSTEM DESCRIPTION

A. Design Requirements: Demonstrate firestopping products have a comprehensive library of specific UL Listed assemblies that will address conditions and assemblies likely to be encountered on the Project.
   1. Provide fire stop assemblies listed by UL or other acceptable third-party agent having the required fire resistance for the specific type and configuration of penetration incorporating materials and components proposed or the Work.
   2. Limit each assembly to the products of a single manufacturer as represented by the UL listing for the assembly.

B. Performance Requirements: Fire block assembly for penetrations and configuration indicated able to withstand standard fire and hose stream test (F Rating) and limit temperature rise (T Rating) of penetrant on protected side as required by regulatory authorities.
   1. Surface Burning Characteristics: ASTM E 84.
   2. Fire Resistance: ASTM E 119.
   3. Fire Test of Through-Penetration Fire Stop: ASTM E 814.
   4. Smoke Seals: Comply with ICC Sections 709 and 710 and Section 909 and leakage tested in accordance with UL 1479 for compliance with required limits.
   5. Fire-Resistive Joints: Provide joint systems with fire-resistance ratings indicated, as determined per UL 2079 or (ASTM E 1399 and E 1966), but not less than the fire-resistance rating of the construction in which the joint occurs.
   6. Perimeter Fire Resistance, Movement Cycling and integrity Tests: ASTM E 2307.

2.2 MANUFACTURERS

A. Subject to compliance with requirements, provide products of Metacaulk, United States Gypsum, 3M Fire Protection Products, or Specified Technologies, Inc.

2.3 MATERIALS

A. Materials: Products of a single manufacturer for each type of firestop assembly required for the Work. Provide all components necessary for the complete assembly to comply with Project requirements regardless of whether a particular component or product is identified in the Contract Documents or not.

B. Firestopping: Asbestos-free, intumesce when exposed to temperatures of 250 degrees F as necessary for the required performance, and maintain an effective barrier against flame, smoke and gasses, under actual fire conditions in the assemblies indicated without requiring removal of pipe insulation.

C. Firestop Assembly Rating: Not less than the fire-resistance rating of the assembly in which it will be installed and possessing all additional performance attributes necessary for compliance with all applicable regulatory requirements.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine openings, voids and joints where firestop systems are to be installed and verify conditions are in compliance with product requirements for firestopping materials and assemblies required. Correct non-compliant conditions before proceeding with installation.

B. Examine surfaces where smoke seal material is to be applied and verify conditions are in compliance with product requirements for smoke seal materials and assemblies required. Correct non-compliant conditions before proceeding with installation.

C. Inspect existing construction and identify openings and penetrations of any type in assemblies required to have a fire resistance or smoke barrier rating and provide firestopping as necessary to fill and seal the opening or penetration and maintain or establish the integrity of each assembly.

3.2 PREPARATION

A. Clean surfaces to receive firestopping and smoke seal materials to remove materials and substances that may adversely affect installation and performance and establish optimum conditions for installation of fire stopping materials.

B. Provide masking and drop cloths to prevent materials from contaminating any adjacent surfaces. Remove masking materials promptly following application of product.

3.3 INSTALLATION

A. Fire Stopping for the Work: Required at each penetration through a fire rated assembly without regard for the trade that performed the work to install or create the penetration, location of the penetration and the materials involved. Firestopping shall also be provided at work that is recessed within or may otherwise affect the integrity of a fire rated assembly, and shall effectively restore or maintain the required fire resistive performance. Firestop each penetration to maintain the integrity of the fire rated assembly affected and to conform to the UL listing of the firestop.

B. Fire Stopping for mechanical and plumbing work shall include but is not necessarily limited to smoke proof and fire resistive seals at pipe, duct, conduit and other penetrations. Firestop devices, and equipment mounted in fire rated assemblies.

C. Fire Stopping for electrical work, including signal and data systems shall include but is not necessarily limited to smoke proof and fire resistive seals at cable tray, wiring, conduit and other penetrations. Firestop electrical devices, panelboards and light fixtures recessed in fire rated assemblies.

D. Install materials in accordance with manufacturer's instructions. Provide firestopping at each joint and penetration in fire-resistive construction assemblies forming floors, shaft enclosures, exit enclosures, occupancy separations and corridors. Seal all holes or voids to provide an effective barrier against flame, smoke and gasses.
   1. Provide smoke seals at wall and floor intersections and at membrane-penetrants not required to have firestopping. Smoke seal installation shall conform to ASTM C919 methodology for acoustic sealing to achieve an STC of 50 or better.

2. Firestopping Installed in Openings Larger Than Four Inches: Capable of withstanding design loads required for original assembly.

E. Examine firestopped areas to ensure proper installation prior to closing, and covering, and keep accessible until inspection by applicable authority where required.

3.4 IDENTIFICATION

A. Identify penetration firestopping with preprinted permanent labels. Attach labels permanently to surfaces adjacent to and within 6 inches of firestopping edge so labels will be visible to anyone seeking to remove penetrating items or firestopping. Use mechanical fasteners or self-adhering-type labels with adhesives capable of permanently bonding labels to surfaces on which labels are placed. Include the following information on labels:
1. Warning - Penetration Firestopping - Do Not Disturb. Notify Building Management of Any Damage.
2. Date of installation, Contractor and Installer's name, address, and phone number.
3. Assembly listing number and manufacturer of firestop components.

3.5 FIELD QUALITY CONTROL

A. Identify on the Record Drawings the location and system used for firestopping and smoke sealing.

B. Obtain documentation of inspection, acceptance and approval of firestopping and smoke sealing by appropriate parties prior to covering.

C. Special Inspection reports shall identify unacceptable installations, which shall be corrected by the responsible contractor and reinspected.

D. Special Inspection reports to be filed with the authority having jurisdiction shall indicate verification of inspection and acceptance.

E. When work is sufficiently complete to allow pressurization testing, each smoke zone shall be pressurized to a positive pressure of 0.05 inches water gage relative to adjacent zones and the air quantity required shall be recorded. Where the calculated leakage rate in the smoke zone is less than or equal to that allowed by CCR Title 24, Part 2, Section 714.4, the work shall be deemed acceptable. In unacceptable works, leaks shall be identified by cold smoke testing or other appropriate means and shall be repaired until it complies with Section 714.4.

END OF SECTION

SECTION 07 92 00 – JOINT SEALANTS

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes joint sealants, fillers, compressible seals, and accessories necessary, and required for sealing joints, and reveals as indicated, and required, and not specified in work of other Sections.
   1. Smoke Barriers and Fire Rated Seals: Work of Section 07 84 00, coordinate with requirements of this Section.

B. Definitions for terms used in this Section: ASTM C 717.
   1. Compatible: Materials, and surfaces that are not detrimental to performance of sealed joint; non-staining to substrate and sealer as determined by ASTM D 2203.
   2. Modulus of Elasticity: ASTM D 412 Tensile strength in pounds per square inch at 100 percent elongation tested at 77 degrees F, and 50 percent relative humidity after 14 days cure.
   3. Hardness: ASTM D 2240 Shore A.

1.2 ADMINISTRATIVE REQUIREMENTS

A. Preinstallation Conference: Coordinate work of this Section with all other aspects of exterior envelope construction including but not limited to proactive coordination of work sequence, provisions to prevent delay due to seasonal weather conditions that may impact work, and requirements to optimize joint geometry. Have results of the following available for review.
   1. Preconstruction Compatibility and Adhesion Testing: Submit to joint-sealant manufacturers.
   2. Preconstruction Field-Adhesion Testing: Before installing sealants, field test their adhesion to Project joint substrates. Test joint sealants according to Method A, Field-Applied Sealant Joint Hand Pull Tab, in Appendix X1 in ASTM C 1193 or Method A, Tail Procedure, in ASTM C 1521.

B. Sequence sealant installation to prevent conflict with other construction operations that could alter joint substrates and reduce performance characteristics of installed sealant.

1.3 SUBMITTALS

A. Product Data: Required for each material, manufactured product, and accessory incorporated into the Work; manufacturer's recommendations for sealant installation for materials and configuration indicated.
   1. Each sealant product data submittal shall identify each joint assembly the sealant will be used in with a reference to the specification Section where the constituent products or materials are specified.

B. Samples: Each type and color of joint sealer required, in 0.5-inch-wide joints formed between two six-inch strips of material matching the appearance of exposed surfaces adjacent to joint sealers in the work.

C. Test Reports: Certified, current product formulation, demonstrate compliance with requirements for proposed installation, movement capacity, and compatibility with substrate and adjacent components.

1.4 QUALITY ASSURANCE

A. Installer: Three years successful experience with sealers, and assembly types required for this project. Assign mechanics from these earlier applications to this project, one of whom shall serve as lead mechanic, and be on site at all times work is in progress.
1. Provide certification of installer's status in the Sealant Waterproofing and Restoration Institute's Contractor Validation program or documentation for five similar projects in-service for two to five years and representative of similar work scope to the required.

B. Manufacturer's Field Quality Control Agent: Possess expert knowledge of the products being installed including preparation, application and field-testing requirements. Shall have authority to certify compliance of the Work with Project Warranty provisions. Shall be responsible for knowing the specifics of this installation and available to perform the required field testing and inspections.

C. Pre-Installation Conference: Comply with requirements for Project meetings.
1. Pre-Installation Field Samples: Evaluated with Architect and technical representative of waterproofing manufacturer present, prior to final approval of product for use on Project. Evaluate cured performance, and installation quality. Locate samples as directed.

1.5 FIELD CONDITIONS

A. Environmental Requirements: For installation of joint sealers; ambient and substrate temperature above 40 degrees F, and within the limits recommended by joint sealer manufacturer; dry substrate free of contaminants that could impair sealer performance.

B. Due to the potential variety of combinations between construction materials, sealant types, and sealant formulations, the final selection of which may be made by the Contractor; responsibility for ensuring sealant compatibility with Project conditions, not limited to bond surfaces, shall be the Contractor's.

1.6 WARRANTY

A. Special Installer’s Warranty: Signed by installer, joint sealers are free from defects in materials and workmanship, will not deteriorate in excess of normal weathering and remain in compliance with Project requirements for a period of 3 years, and agreeing upon receipt of written notice from the Owner to promptly repair, and replace any portion of the Work that does not; to the Owner's complete satisfaction, and at no cost to the Owner, nor change in contract amount.

B. Special Manufacturer’s Warranty: Manufacturer to furnish elastomeric joint sealants to repair or replace general exterior weather seals and other sealants in exterior assemblies that do not comply with performance and other requirements specified in this Section for a period of 5 years.

C. Special Warranties specified in this article exclude deterioration or failure of joint sealants from the following:

1. Movement of the structure caused by stresses on the sealant exceeding sealant manufacturer's written specifications for sealant elongation and compression.
2. Disintegration of joint substrates from causes exceeding design specifications,
3. Mechanical damage caused by individuals, tools or other outside agents.
4. Changes in sealant appearance caused by accumulation of dirt or other atmospheric contaminants.

PART 2 - PRODUCTS

2.1 SYSTEM DESCRIPTION

A. Design Requirements: ASTM C 1193 and ASTM C 1472; joint configuration recommended by manufacturer for optimum sealant performance for required application.
   1. Sealant Joints to be Painted: Comply with manufacturer's recommendations, coordinate with Section 09 91 13, 09 91 23 and 09 96 00 and ensure compatibility of paint and sealant.
   2. Sealant Backing: Closed cell material at all sealants having weather exposure; open cell for seals without weather exposure where necessary for proper sealant cure.

B. Performance Requirements: Sealer joints that are a continuous barrier to intrusion by water, air, sound, and foreign matter able to accommodate extension and contraction at moving joints, as required such that the integrity of each sealer joint is maintained under all in-service conditions.
   1. Exposed Sealants: Resistant to deterioration due to weathering, and exposure to ultraviolet radiation; resistant to abrasion where traffic may occur.
   2. Joint seals in the exterior building envelope shall comply with performance requirements for envelope integrity and as required for work of this Section.
   3. Provide sealant products and accessories for successful application to Project substrates in the configurations required and the installation conditions encountered in the Work. Products shall be compatible with bonding substrates and adjacent materials and suitable for the service conditions encountered.

C. VOC Content: Sealants and sealant primers shall comply with CALGreen VOC limitations:
   1. Architectural sealants shall have VOC content of 250 g/L or less.
   2. Sealants and sealant primers for nonporous surfaces shall have a VOC content of 250 g/L or less.
   3. Sealants and sealant primers for porous surfaces shall a a VOC content of 775 g/L or less.
   4. Sealant shall comply with the testing and product requirements of the California Department of Public Health's "Standard Method for the Testing and Evaluation of Volatile Organic Chemical Emissions from Indoor Sources Using Environmental Chambers.: The building concentration of formaldehyde shall not exceed half the indoor recommended exposure limit, or 33 mcg/cu,m, and that of acetaldehyde shall not exceed 9 mcg.cu.m.

2.2 MANUFACTURERS

A. Joint Sealers: Products complying with Project requirements; produced by a single manufacturer for each type required, and by one of the following approved manufacturers for the sealer types listed.
   1. Urethane: Bostik, Pecora, Tremco, and Sika.
   2. Silicone: Dow, Pecora, and Tremco.

3. Polysulfide: Bostik, Pecora, and Thiokol.

2.3 MATERIALS

A. Products, and Accessories: Compatible with one another, and with joint substrates under conditions of application, and service indicated, as demonstrated by field testing, and experience. Not all Sealant types described are used; See Drawings for additional direction.
   1. Sealer Color: Exposed; selected by Architect from manufacturer's complete range of standard colors, concealed; natural color having optimal performance characteristics for product.

B. Elastomeric Sealant: ASTM C 920, chemically curing, of base polymer indicated.
   1. Grade and Hardness: Recommended by manufacturer for optimal performance in application indicated; self-leveling for joints in traffic surfaces, otherwise nonsag.
      a. Self-Leveling: Hardness 55; modulus not greater than 150 psi.
      b. Non-sag: Hardness 20 to 30; modulus not greater than 75 psi.
   2. Modulus of Elasticity: Unless otherwise required, lowest available consistent with joint configuration, and conditions of service, including movement.
   3. Type: Single component products; Type S, multicomponent products; Type M.

C. Polyurethane: Multi-component; Class 25; Uses T, and NT, M, G, A and, as applicable to joint substrates indicated, O. Provide as sealant for exterior joints and joints exposed to UV radiation except as otherwise required.

D. Silicone Sealant: Non-Acid-Cure; Class 25; Uses NT, G, A and, as applicable to joint substrates indicated, O. Provide for glazing and as follows.
   1. One-Part with Fungicide: For interior joints with nonporous substrates, ceramic tile, showers, sinks and plumbing fixtures.
   2. Two-Part: For Use T, M, and, as applicable to joint substrates indicated, O.

E. Polysulfide: Multicomponent; Class 12-1/2; Uses NT, M, G, A and, as applicable to joint substrates indicated, O.
   1. Pourable: Uses T, M, G, A and, as applicable to joint substrates indicated, O.
   2. Water Immersion: Uses T, M, G, A, and, as applicable to joint substrates indicated, O; history of successful performance in sealing joints immersed intermittently or continuously in water.

F. Polysulfide: Single component; Class 12-1/2; Uses T, M, G, A and, as applicable to joint substrates indicated, O.

G. Solvent-release-curing Sealants: ASTM C 1311 Single component, Uses NT, M. G, A and, as applicable to joint substrates indicated, O.
   1. Butyl: 75 percent solids; Tremco Butyl Sealant.
   2. Small Joint Sealant: Synthetic rubber sealant formulated for sealing joints 3/16-inch width or smaller; Tremco Seam Sealer.

H. Acrylic-Emulsion Sealant: ASTM C 834, Single component; Class 12-1/2, mildew resistant, paintable, for exposed interior applications; Tremco Acrylic Latex Caulk.

I. Acoustical Sealant for Concealed Joints: Synthetic rubber sealant for interior concealed joints to reduce transmission of airborne sound; Tremco Acoustical Sealant.

J. Polyurea Joint Filler: 100 percent solids, rapid-setting, Shore A hardness of 90 and suitable for joints 0.125 inch to 0.25 inches in width; Metzger McGuire EdgePro 90.

K. Butyl-Polyisobutylene Sealant: AAMA 809.1, Solvent-release-curing, for concealed joints; PTI 404, Protective Treatments, Inc.

L. Butyl-Polyisobutylene Tape Sealant: AAMA 804.1; Solvent-free, 100 percent solids, and paintable; Tremco 440 Tape.

M. Joint Fillers for Concrete Flatwork: ASTM D 1752 Type 1 cross-linked cellular polyethylene demonstrating 98 percent recovery to original thickness when compressed to 50 percent of original thickness, less than 0.05 percent water absorption by volume. Provide thickness necessary for joint widths and applications required. Fosroc Hydrocell XL or approved equal.

N. Bituminous Joint Filler for Concrete Paving: ASTM D 1751: See Civil Drawings for additional direction.

2.4 ACCESSORIES

A. Sealant Backing: Comply with ASTM C 1330, Type B requirements, non-gassing, preformed, resilient, plastic foam joint-filler strips, SOF Rod® by NOMACO Inc. Shall control sealant depth, aid in establishing optimum joint configuration, and provide isolation from components that may adversely affect sealant performance.

B. Joint Filler: Comply with ASTM D 8139 requirements for closed-cell, non-gassing, preformed, non-asphaltic, resilient, plastic foam joint-filler strips, Nomaflex by NOMACO Inc. Shall control sealant depth, aid in establishing optimum joint configuration, and provide isolation from components that may adversely affect sealant performance. Suitable for hot and cold applied sealants and not require a bond break.

C. Bond-Breaker Tape: Polyethylene or other plastic recommended by sealant manufacturer for preventing bond between sealant, joint filler, and other materials; self-adhesive tape where necessary.

D. Elastomeric Tubing Joint-Fillers: ASTM D 1056; Neoprene, butyl or EPDM non-absorbent to water and gas, resilient down to -26 degrees F, with low compression set; size and shape to provide a secondary seal, to control sealant depth and otherwise contribute to optimum sealant performance.

E. Primer: Recommended by joint sealer manufacturer for optimum sealant performance, and as determined from preconstruction tests.

F. Cleaners for Nonporous Surfaces: Compatible with joint materials and substrates, and acceptable to manufacturer of sealer, and accessories.

G. Masking Tape: Provide non-staining, non-absorbent type compatible with joint sealants and to surfaces adjacent to joints.

2.5 SOURCE QUALITY CONTROL

A. Elastomeric Sealant Tests: Aged performance under cyclic movement, for hardness, stain resistance, adhesion and cohesion low-temperature flexibility, modulus of elasticity at 100

percent strain, effects of heat aging, and accelerated weathering; Conducted within 24 months of date of submission to Architect.

1. Submit to manufacturer of joint sealer products substrate materials of actual joint surfaces to be sealed for laboratory testing of sealants for adhesion to primed and unprimed substrates and for compatibility with secondary seals.
2. Use test methods standard with manufacturer to determine if priming and other specific joint preparation techniques are required to obtain rapid, optimum adhesion of joint sealers to joint substrates under environmental conditions that will exist during actual installation.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify conditions under which work is to be performed for compliance with requirements. Provide written report listing conditions that may be detrimental to performance of installed work. Proceed with work only when unsatisfactory conditions have been corrected.

1. Confirm required joint configuration, including backing, bond break and isolation from incompatible materials (where necessary) can be accommodated within the actual joint configurations encountered.
2. Preformed Seals: Field verify actual joint profile conforms to manufacturer’s requirements for the seal products specified and that work sequence has been coordinated for proper installation of preformed seals adhered to abutting bonding substrates.

3.2 PREPARATION

A. Surface Cleaning of Joints: Immediately before installation of joint sealer; remove contaminants that could impair sealer performance, including paints, except for permanent, protective coatings tested and approved for sealant adhesion and compatibility by sealant manufacturer. Use mechanical and chemical methods as recommended by sealer manufacturer, and as necessary to meet requirements.

B. Prime joint substrates where necessary, and where recommended by sealer manufacturer based on preconstruction tests, and prior experience; comply with sealer manufacturer's recommendations. Confine primers to areas of joint sealer bond, do not allow spillage or migration onto adjoining surfaces.

C. Protection: Prevent deterioration of adjacent materials due to sealer installation work, cover surfaces with tape or other approved means of protection recommended by sealer manufacturer. Remove protection immediately after tooling, do not disturb joint seal.

D. Coordinate with work of other Sections affecting joint substrate conditions, geometry and all other conditions of installation for work of this Section to ensure compliance with System Description requirements; without limitation give particular attention to the following conditions.

1. Joints In and Abutting: Precast concrete specialties and curtain wall assemblies.

3.3 INSTALLATION

A. Comply with sealer manufacturers' printed installation instructions applicable to products and applications indicated, except where more stringent requirements apply.

B. Installation Standard: ASTM C 1193 as applicable to materials, sealant type and joint conditions required.

C. Sealant Backing: As indicated, and necessary to support sealers, and produce configurations which allow optimum sealant performance; continuous installation with no gaps, punctures nor deviation in profile; remove absorbent joint-fillers which have become wet prior to sealant application and replace with dry material.
1. Bond Breaker: Install to prevent third-side adhesion of sealant at back of joint.
2. Sealant backings: Closed-cell, nonabsorbent at primary and secondary weather seals.
3. Compressible seals serving as sealant backings: Comply with requirements for joint fillers.

D. Sealants: Provide direct contact and full wetting of substrates, properly fill joint recesses, provide uniform, cross-section, and depth relative to width and optimum sealant movement capability.
1. Moving, Non-Traffic Elastomeric Sealant Joints: Depth 50 percent of joint width; not more than 0.5 inch, nor less than 0.25 inch deep.

E. Tooling of Non-sag Sealants: Approved by sealant manufacturer; form smooth, uniform bead of configuration indicated, prior to skinning cure, eliminate air pockets, ensure contact, and proper sealant adhesion. Remove excess sealant. Do not discolor sealants, nor adjacent surfaces.
1. Tooled Joint Configurations: Profile indicated and conforming to ASTM C 1193, Figure 8; where no profile is indicated provide concave profile.

F. Preformed Seals: Provide fully adhered installation to opposing surfaces at joint per manufacturer's requirements and to ensure water and airtight seal throughout the length of the joint. Mechanical restraint of preformed seal by friction and compression into joint profile is not acceptable. Bonded application shall accept movement throughout the total range of seal per manufacturer's specifications.

G. Preformed Hollow Neoprene Gaskets: Provide continuous lengths, minimize end joints, use adhesive splices at joints; Recess gasket as indicated, but not less than 0.125 inch.
1. Joint Recesses: Clean crisp arris, sides straight and parallel.

H. Joint Filler at Concrete Flatwork: Polyurea joint filler; fully adhered installation to opposing surfaces at joint per manufacturer's requirements and to ensure a durable water-tight seal throughout the length of the joint. Secure the joint filler in place per manufacturer’s recommended procedure to prevent displacement due to subsequent work and in-service conditions. Provide at perimeter of grade support concrete flatwork abutting exterior paving and similar locations as indicated.

I. Acoustic Seals: Conform to ASTM C 919 methodology for acoustic sealing to achieve an STC of 50 or better. For smoke seal applications comply with Section 07 84 00 Firestopping requirements.
1. Provide a 0.5-inch-wide annular gap and continuous seal between gypsum panels and penetrations, including but not limited to plumbing penetrations, ductwork and other mechanical penetrations, electrical conduit and boxes.
2. Provide paintable sealant for joints that will remain exposed to view in completed work.

J. Curing: Comply with manufacturer's recommendations to obtain high early adhesive and cohesive strength, surface durability, and optimum sealer performance.

3.4 PROTECTION AND CLEANING

A. Protect joint sealers during and after curing period so that they are without deterioration or damage at time of substantial completion, other than normal weathering. Cut out and replace damaged and deteriorated joint sealers to produce joint sealer installations with repaired areas indistinguishable from original work.

B. Remove excess sealant, and spills as work progresses; use methods and materials approved by manufacturers of joint sealers, and acceptable to Architect.

3.5 FIELD QUALITY CONTROL

A. Test Method ASTM C 1193 Appendix X1.1 Method A, Method B may be acceptable at conditions where performing Method A test is impractical.
1. Dissimilar Bond Surface: Cut joint to isolate each substrate and test independently.
2. Retest failed applications until test results prove sealants comply with requirements.

B. Visual Inspection: Inspect joints for complete fill, for absence of voids, and for joint configuration complying with specified requirements.

C. Record results in Field Test and Inspection Log: Test and Inspection locations, sealant fill, configuration, and dimensions. Type of failure (cohesive or adhesive), whether results are indicative of specific defect in the work, pull-test extension in inches or other acceptable units and as a percentage of joint.

PART 4 - JOINT SEALANT SCHEDULE

4.1 COLOR SELECTIONS:

A. Architect will provide color selections and locations for each sealant type and for Contractor’s use. Not all locations will have the same color. Custom colors will be required.

B. General: Joints in construction between interior and exterior spaces and other designated or required locations to provide effective barrier against passage of elements
1. Single-Component, Nonsag, Neutral-Curing Silicone Joint Sealant: ASTM C 920, Type S, Grade NS, Class 50, for Use NT.

C. Specialty perimeters where required for appearance or weather tightness:
1. Single-Component, Nonsag, Neutral-Curing Silicone Joint Sealant: ASTM C 920, Type S, Grade NS, Class 100 / 50, for Use NT.

D. Exterior Locations:
1. Joints Bordered by Glass: Single-component, nonsag, neutral-curing silicone joint sealant, ASTM C 920, Type S, Grade NS, Class 50, for Use NT.
2. Joints Bordered by Plastic: Single-component, nonsag, neutral-curing silicone joint sealant, ASTM C 920, Type S, Grade NS, Class 100 / 50, for Use NT.

3. Horizontal Joints in Exterior Walks Abutting Building Walls, Interior Concrete Floors: Multicomponent urethane sealant, self-leveling; ASTM C 920, Grade P, Class 25, Uses T, M and A.
4. Where walks abut structural slabs or stoops.
5. Where walks abut exterior wall of buildings.
6. Where exposed interior concrete slabs abut vertical surfaces.
7. Where sealant is shown on the Drawings for concrete slabs.
8. Membrane Roofing Sealants: Types recommended by roofing manufacturer and complying with requirements of this Section.
9. Sheet Metal and Roof Accessory Sealants: Types recommended by roofing manufacturer and complying with requirements of this Section.
10. Exterior Sheet Metal Lap Joints: Types recommended by manufacturer and complying with requirements of this Section.
11. Joints Between Concrete Panels, and Between Concrete Panels and Other Work: Single-component, nonsag, neutral-curing silicone joint sealant, ASTM C 920, Type S, Grade NS, Class 100 / 50, for Use NT.
12. Restoration of Panel Joints in Façade Cladding: Preformed Foam Sealants in sizes required to fit existing panel joints.
13. Exterior Metal Panel Butt Joints and Trim: Types recommended by manufacturer and complying with requirements of this Section.
14. All Other Exterior Joints:
    a. Single-component, nonsag, neutral-curing silicone joint sealant, ASTM C 920, Type S, Grade NS, Class 100 / 50, for Use NT.
    b. Single-component, nonsag, neutral-curing silicone joint sealant, ASTM C 920, Type S, Grade NS, Class 50, for Use NT.
15. Around perimeters of frames where door, window and louver frames abut concrete, masonry or other building materials.
16. Expansion and control joints in masonry.
17. Masonry at dissimilar material or at dissimilar masonry.
18. Sills and thresholds.
19. At miscellaneous locations where sealant is shown on Drawings.

E. Interior Locations:
1. Expansion and Control Joints:
    a. Multicomponent, Nonsag, Urethane Joint Sealant: ASTM C 920, Type M, Grade NS, Class 25, for Use NT, M, A and O.
    b. Single-Component, Nonsag, Urethane Joint Sealant: ASTM C 920, Type S, Grade NS, Class 35, for Use NT.
    c. Around perimeters of frames where door, window and louver frames abut concrete, masonry or other building materials.
    d. Expansion and control joints in masonry walls.
    e. Masonry at dissimilar material or at dissimilar masonry.
    f. Sills and thresholds.
2. Interior Concrete Slabs on Grade: Urethane, self-leveling; ASTM C 920, Grade P, Class 25, Uses T, M and A; single component.
3. Interior Wet Areas, Around Plumbing Fixtures, Countertops Abutting Walls, Food Service Applications: Mildew-resistant, single-component, acid-curing silicone joint sealant, ASTM C 920, Type S, Grade NS, Class 25, for Use NT, A and O.
4. Interior Static Dry Joints as Required to Dress Appearance: Acrylic latex or siliconized acrylic latex joint sealant, ASTM C 834, Type OP, Grade NF
5. Sound Control Applications: Acoustical Sealant, ASTM C 834.
    a. Where Required for Sound Control with Limited Flame Spread: Acoustical sealant, ASTM C 834, fire-rated type.

END OF SECTION

SECTION 08 11 00 – METAL DOORS AND FRAMES

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes requirements for steel doors and hollow metal frames for doors and other openings as scheduled and indicated.

B. Related Sections:
1. Section 08 71 00 Door Hardware.
2. Section 08 81 00 Glass and Glazing.

1.2 ADMINISTRATIVE PROCEDURES

A. Pre-Installation Meeting: Coordinate with work of section 08 71 00 for door hardware and other trades as necessary to effectively coordinate work of this Section.

1.3 SUBMITTALS

A. Product Data: Required for each product used in work of this Section.

B. Shop Drawings: Fabrication and installation of door and frame, details of types, construction, location and installation of reinforcement, anchors, finish hardware, and accessories; elevations of door types.
1. Schedules: Use reference numbers shown on contract documents, coordinate glazing frames and stops, and glazing requirements. Coordinate with work of Section 08 14 00, 08 71 00 and 08 81 00.
2. Indicate deviations from referenced Standards for hollow metal door and frame installation proposed for the Work and Project specific details not addressed by the Standards.

C. Samples: Two, 6 inches square of each metal, color, and finish system required for Project.

D. Certification:
1. Engineering Judgment: For assemblies deviating from tested and labeled assembly to certify performance equivalent to the tested assembly.

1.4 DELIVERY, STORAGE AND HANDLING

A. Protect doors and frames from damage during shipping and storage; ship and store in carton or crate, protect factory applied finishes, keep dry, and prevent corrosion. Inspect work for damage upon delivery, replace, or repair damaged material as acceptable to Architect.

PART 2 - PRODUCTS

2.1 SYSTEM DESCRIPTION

A. Design Requirements: Hollow metal door and frame assemblies, frames for glazed assemblies and other openings of the size and configuration required and incorporating components complying with Steel Door Institute or Hollow Metal Manufacturer's Association standards and performance requirements.

2.2 MANUFACTURERS

A. Manufacturer: Member of Steel Door Institute or National Association of Architectural Metal Manufacturers and have five years successful experience with products required for the Project: Steelcraft or approved.

2.3 MATERIALS

A. Hot-Rolled Steel Sheet and Strip: ASTM A 1011 Commercial Steel Type

B. Cold-Rolled Steel Sheet: ASTM A 1008 Commercial Steel Type B.

C. Galvannealed Steel Sheet: ASTM A 653, Commercial Steel Type B A40 coating.

D. Electrolytic Zinc-Coated Steel Sheet: ASTM A 879 Commercial Steel Class B, mill phosphatized.

E. Stainless Steel: AISI Type 302/304, unless otherwise indicated.
1. Plate and Sheet: ASTM A 480, Type 304, annealed, No. 2D, unless harder temper required for forming or performance.
2. Fasteners: IFI-104 and ASTM F 738 and F 836.

F. Aluminum: Sheet, ASTM B 209, Alloy 3003; Extrusions, ASTM B 221, Alloy 6063-T52; minimum performance characteristics of alloy and temper listed, provide actual temper and alloy required for fabrication, and finishing.

G. Hardware, and Fasteners: Manufacturer's standard units.
1. Items Built into Exterior Walls: ASTM A 153, Class C and D.
2. Supports and Anchors: 18 gage galvanized sheet steel.
3. Exposed Fasteners: Countersunk, flat, Phillips head unless otherwise indicated.

H. Galvanic Isolation: Corrosion resistant, rapid-cure, two-component amido amine epoxy mastic that is self-priming on steel substrate; provide two coats for total dry film thickness not less than 6 mils; Benjamin Moore Low Cure Epoxy Mastic Coating M45L/M46; or other approved means of galvanic isolation of concealed contact and wash-down surfaces.
1. Prior to application on fire rated assemblies, confirm use will void neither UL Label nor listing.

2.4 FABRICATION

A. Doors and Frames: Types, and sizes required; rigid, neat in appearance, free from defects, warp, and buckle; fit and assemble units in manufacturer's plant to fullest extent possible,

identify work that cannot be permanently factory assembled before shipment, for proper assembly at Project. Comply with SDI-100 and the following.

1. Interior Steel Doors: Level 4, Model 2, 14 gage end closures with vertical steel stiffeners.
2. Exterior Steel Doors: Level 4, Model 2 Physical Performance Level A.
3. Stile and Rail Doors: Level 3, Model 3.
4. Exposed Door Panels, Stiles and Rails: Cold-rolled steel; other components may be cold or hot-rolled at manufacturer's option.
5. Close door top and bottom with intermittently welded channels; grind and dress welds smooth and continuously fill joint and finish flush for seamless appearance.
6. Provide square door edge unless otherwise indicated.

B. Insulated Assemblies: ASTM C 1363, and SDI 113; exterior openings, and other locations as Scheduled; total assembly door and frame not to exceed U-value of 0.37.

C. Complete preparation of doors and frames in shop for mortised and concealed hardware, reinforce as necessary for each type of hardware required; comply with ANSI A250.6, door and hardware schedules, templates, approved shop drawings, and DHI Recommended Locations for Builder's Hardware.

D. Drilling and tapping for surface-applied finish hardware may be done at Project.

E. Glaze doors and frames in shop or field, comply with requirements of Section 08 81 00; provide glass types as scheduled and required by Code.

1. Glazing Stops and Beads: 18 Gage steel, 45-degree beveled top; projected fascia returned to door face unless otherwise indicated; miter corners.
   a. Stops: Welded to door on security side.
   b. Beads: Secure with exposed fasteners, snap-on not acceptable.

2.5 SHOP FINISHES

A. Galvanize doors, and frames to be installed to be installed in masonry or concrete openings and all exterior assemblies. Provide ASTM A 924 hot-dipped, G90 galvanized coated or ASTM A 653 A60 galvannealed zinc-iron alloy coating for material type and size required.

B. Paint System: Uniform gloss, texture, and thickness; clean, treat, and prime doors and frames, including door bottoms and tops, and frame surfaces. Coordinate with Section 09 96 00 requirements to ensure compatibility among shop and field finish coatings.

1. Epoxy Coating: Self-priming, rapid-cure, two-component amido amine epoxy; Benjamin Moore Low Cure Epoxy Mastic Coating M45L/M46.
2. Shop Painting: Uniform gloss, texture, and thickness of 2.5 mils.; clean, treat, prime, and finish doors and frames, including door bottoms and tops, and surfaces exposed to view when door is open. Shop prime doors and frames unless otherwise required.

2.6 SOURCE QUALITY CONTROL

A. Fire-Rated Door and Frame Assemblies: Tested and labeled by acceptable laboratory for compliance with the hourly rating required, and positive pressure and temperature rise limits where required.

1. Fire-rated Assemblies: Configuration required including hardware, and glazing (if any), tested for compliance with UL 10B and 10C (GSZN), ASTM E 2074 and NFPA 252.

a. Temperature Rise Rating: 450 degrees F maximum in 30 minutes of fire exposure for doors into exit enclosures, and other locations where required by Code.
b. Smoke-Control Door Assemblies: NFPA 105, UL 10C and UL 1784.

2. Frames for Glazed Openings: Tested per NFPA 257 and UL 9. Glazing performance and labeling shall comply with Section 08 81 00 requirements.
3. Engineering Judgment: Provided by UL authorized source for required assemblies not identical to a tested assembly due to size, configuration or other factor as acceptable to regulatory authorities certifying performance equivalent to that of the tested assembly.

PART 3 - EXECUTION

3.1 PREPARATION

A. Coordinate and sequence the Work for proper installation of anchorages for standard steel frames. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete embeds, anchor bolts, and items with integral anchors.

3.2 INSTALLATION

A. Doors, Frames, and Accessories: Except for deviations documented by approved submittals install work to comply with the following standards and the manufacturer's recommendations for specific Project applications.
1. ANSI/DHI A115.IG, Installation Guide for Doors and Hardware.
2. ANSI A250.11, Recommended Erection Instructions for Steel Frames
3. SDI I22 Installation and Troubleshooting Guide for Standard Steel Doors and Frames.
4. HMMA 840, Installation and Storage of Hollow Metal Doors and Frames.
5. NFPA 80.

B. Frames: Place prior to construction of adjoining walls, except at concrete, and masonry construction; set accurately in position, plumbed, aligned, and brace until permanent anchors are set. Provide three jamb anchors per jamb locate at hinge and strike levels, floor anchors may be powder-actuated, masonry anchors, or machine screws as indicated and as appropriate for the given assembly.
1. Fire-rated: NFPA Standard No. 80.
2. Secure to concrete and masonry with machine screws, and masonry anchors, unless otherwise required.
3. Secure to closed steel studs; attach studs to wall anchors with tapping screws.
4. Exposed fasteners shall be countersunk, filled and finish flush to the frame face.

C. Door Installation: Fit accurately in frames, within clearances specified in SDI-100, and NFPA Standard No. 80 except as otherwise necessary for required acoustic performance.

D. Finish Hardware: Comply with requirements of Section 08 71 00 and referenced Standards.

E. Field Priming and Finishing: Where galvannealed steel is provided field priming may be acceptable in lieu of shop priming. Field applied prime and finish paint shall comply with Section 09 90 00 requirements.

3.3 ADJUST AND CLEAN

A. Repair of Shop Applied Coating: Immediately after erection, sand smooth damaged, and deteriorated coatings and repair to restore original performance without evidence of repair work in the finished components, coatings that cannot be acceptably repaired in the field shall be returned to the shop, repaired and reinstalled.

B. Repair and Replacement of Damaged Doors and Frames: Where the Architect determines that a door or frame has been too severely damaged to represent new goods and materials as required by the Contract it shall be replaced by new undamaged work; regardless of whether this damage adversely effects door operation. Remedial work such as filling of dents and grinding to correct excessive damage is not acceptable in lieu of replacement.

C. Final Adjustments: Check and readjust operating finish hardware items, leaving steel doors and frames undamaged and in complete and proper operating condition.

END OF SECTION

SECTION 08 14 00 – WOOD DOORS

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes requirements for flush panel and stile and rail wood doors. Standing and running trim are work of Section 06 40 00.

B. Related Sections:
1. Section 06 40 00 Architectural Woodwork.
2. Section 08 11 00 Metal Doors and Frames.
3. Section 08 71 00 Finish Hardware.

1.2 ADMINISTRATIVE REQUIREMENTS

A. Pre-Installation Meeting: Coordinate with work of Section 08 11 00 for metal frames, Section 08 71 00 for finish hardware, Section 06 40 00 for woodwork and other trades as necessary for execution of the work required of this Section.

1.3 SUBMITTALS

A. Product Data: Required for each product to be incorporated into the Work, including details of core and edge construction, trim for openings and louvers, and factory finish specifications.
1. FSC Certified Wood: For each firm supplying wood products and each firm performing fabrication work on these wood products provide firm's COC number, identify each FSC certified product on a line-item basis and identify the material cost and value-added fabrication cost.
   a. Vendor Chain-of-Custody
   b. Fabricator Chain-of-Custody
   c. Installer Chain-of-Custody provide when the installer is other than the fabricator.

B. Shop Drawings: Fabrication and installation of doors, details of types, construction and veneer matching; location and installation of reinforcement, anchors, finish hardware, and accessories; elevations of door types.
1. Schedule: Use reference numbers shown on contract documents, coordinate glazing frames and stops, and glazing requirements.

C. Samples: Provide for each exposed species, cut, and finish, in sufficient number to demonstrate complete range of color and grain variation expected in Work but not less than three.
1. Solid Stock Samples: 1 foot length of member configured as required for the work including molding profiles.
2. Veneer and Panel Samples: Sufficient size to demonstrate required veneer sequence and typical flitch dimension but not less than 1 square foot.
3. Glazing Stops and Similar appurtenances: Two of each in the configuration proposed to be used in the work.

1.4 QUALITY ASSURANCE

A. Certification:
1. Provide AWI Quality Certification Labels or an AWI letter of licensing for Project indicating that doors comply with requirements of grades specified.
2. Provide WIC-Certified Compliance Certificate indicating that doors comply with requirements of grades specified.
3. Fire-Rated Wood Doors: UL Tested, Listed and Labeled; or other acceptable independent agent.
4. Sustainably Produced Wood Products: Chain of Custody certification that wood products originate from Certified Well-Managed Forests as determined by standards endorsed by the Forest Stewardship Council (FSC).
a. Acceptable FSC Certified Programs: Green Cross certification Program administered by Scientific Certification Systems (SCS); SmartWood Certification Program administered by Rainforest Alliance; and Silva Forest Foundation.
b. For information and sources for certified forest products, contact the Certified Forest Products Council at (503) 590-6600 or www.certifiedwood.org .

B. Environmental Requirements: Comply with Section 06 40 00 requirements for prevailing conditions for installation of woodwork.

C. Field Measurements: Hardware mortises in metal frames to verify dimensions and alignment prior to pre-machining door. Field verified dimensions for fit to hollow metal frames provided as work of Section 08 11 00.

1.5 WARRANTY

A. Warranty: Written agreement signed by Manufacturer, Installer and Contractor, providing for repair and replacement, to the Owner's satisfaction, of defective work, and work that does not conform to Project requirements; Warranty shall cover all work included in the original Contract; finishing, hardware preparation, and installation at no additional cost to Owner.
1. Warranty Period: From date of final acceptance.
a. Solid Core Flush Interior Doors: Life of installation.
b. Stile and Rail Doors: Five years.

PART 2 - PRODUCTS

2.1 SYSTEM DESCRIPTION

A. Design Requirements:
1. Flush Doors: WDMA Industry Standard IS-1-A Architectural Wood Flush Doors, AWS Section 9.
2. Stile and Rail Doors: WDMA Industry Standard I.S.6-A Architectural Stile and Rail Doors, AWS Section 9.
3. Metal Frames: Comply with Section 08 11 00 requirements for assemblies required.

B. Performance Requirements: Fire-rated door and frame assemblies UL listed and labeled for compliance with NFPA 80 in size and configuration required with specified hardware, and glazing.

1. Door and Frame Assemblies: Tested per NFPA 252, or UL10B & 10C as necessary for required assembly performance. Coordinate with Section 08 11 00 for wood doors and hollow metal frame assemblies.
   a. Temperature Rise Rating: 450 degrees F maximum in 30 minutes of fire exposure for doors into exit enclosures, and other locations where required by Code.
   b. Smoke-Control Door Assemblies: NFPA 105, UL 10C and 1784.
2. Frames for Glazed Openings: Tested per NFPA 257 or UL 9. Glazing performance and labeling shall comply with Section 08 81 00 requirements.
3. Engineering Judgment: Provided by UL authorized source for required assemblies not identical to a tested assembly due to size, configuration or other factor as acceptable to regulatory authorities certifying performance equivalent to that of the tested assembly.

2.2 MANUFACTURERS

A. Subject to compliance with requirements, provide wood doors from one of the following manufacturers unless otherwise indicated.
   1. Masonite, VT Industries, or approved.

B. Producer of Certified Sustainably Produced stave lumber cores: Algoma Hardwoods.

2.3 MATERIALS

A. Solid Stock: Certified Sustainably produced. Exposed members shall match grade, cut and species of exposed face veneer; concealed as required by reference standards.

B. Select veneer and lumber for uniform appearance of grain and color and arrange for optimum match between adjacent pieces and throughout the work as a whole. Coordinate with appearance of wood fabrications provided as work of Section 06 40 00 to provide a close visual match with work of this Section.

C. Faces and Edges of Wood Doors Scheduled to have opaque painted finish shall be an approved paint-grade species complying with referenced Standard.

D. Adhesive: Shall contain no added urea-formaldehyde resins, comply with ASTM D 5572 for finger joints and ASTM D 5751 for laminate joints; waterproof for doors in wet use locations and exterior.

E. Provide [Structural Composite Lumber] [Solid particle board] core containing no added urea-formaldehyde, with bonded stiles and rails comply with WDMA Extra Heavy Duty performance level as demonstrated by independently certified test data.
   1. When necessary for compliance with fire-resistance performance criteria a mineral core, reinforced for mounting of required hardware components shall be provided in lieu of other core material.

2.4 MANUFACTURED UNITS

A. Flush Panel Architectural Doors: Comply with AWS Section 9 requirements for Premium Grade work. Provide specified solid core construction.

1. Cross Banding: Provide 0,125-inch-thick engineered hardwood composite board, OSB and particle board are not acceptable. Wood veneer shall be a minimum of 0.125 thick and not telegraph through finish veneers.
2. Provide solid stock edges matching face veneers.

B. Openings: Cut and trim as indicated and required, use solid wood except where metal trim is required for fire rating; veneer wrap metal trim unless otherwise acceptable.

C. Fire Doors: Fire core as necessary for assembly configuration and performance required.
1. Stile Edge Screw Withdrawal: ASTM D 1037, 750 pounds.
2. Stile Edge Split Resistance: ASTM D 143, 1200 pounds.
3. Through-Bolt Pull-out: 1200 pounds.
4. Pairs: Formed steel edges and astragals, veneer wrapped on B and C label doors, except as otherwise required.
5. Intumescent Seals for Positive Pressure Doors: Concealed with veneer matching exposed door face.

D. Door Frames: AWS Premium Grade and as otherwise required for the Work; provide ploughed-in stop and dadoed joinery between head and jambs of frame. Factory fit wood doors and frames to required opening size, and to comply with installation tolerances, clearances and bevels. Preassemble finished frames for final installation in the field.

E. Glaze doors in field or shop; comply with requirements of Section 08 81 00; provide glass types as scheduled and required by Code.
1. Glazing: Comply with ANSI Z97.1 and testing requirements of 16 CFR Part 1201 for category II materials, and permanently labeled as Safety Glazing. Provide assembly type and configuration indicated and other characteristics such as color, fire rating and custom features as required.
   Glazing Stops and Beads: Shape and profile indicated, where not indicated provide 45 degree beveled top and projected fascia returned to door face, miter corners; solid wood except veneer wrapped 18 gage steel where necessary for assembly rating.
   a. Stops: Anchor on security side with concealed fasteners.
   b. Beads: Secured by exposed fasteners, snap-on not acceptable.
2. Shop finish stops and beads as required for doors.

F. Prefit and pre-machine doors for hardware to comply with Contract requirements and referenced woodworking standard. Comply with final hardware schedules, shop drawings, and hardware templates, see Section 08 71 00 for hardware requirements.

G. Factory fit wood doors and frames to required opening size, and to comply with installation tolerances, clearances, and bevels.

H. Coordinate wood doors with hollow metal frames of Section 08 11 00; fit to required opening size, and comply with installation tolerances, clearances, and bevels.
1. Fire Rated Assemblies: Comply with NFPA 80.
2. Lock and hinge Bevel: 0.125 inch in t2 inches unless otherwise required for fire resistant performance.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify frame type, size, location, and swing complies with requirements and that door can be installed within required tolerances without field modification. Do not proceed with installation until unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Condition doors to average prevailing humidity in installation area for at least twenty-four hours prior to hanging.

B. Hardware: Comply with requirements of Section 08 71 00.

C. Install doors to comply with manufacturer's instructions referenced WDMA standards and as otherwise required for the Work. Comply with Section 08 11 00 requirements for wood doors installed in hollow metal frames.

D. Where field fitting of doors is necessary and acceptable to Architect, machine and fit with uniform clearances and bevels required; do not trim stiles and rails in excess of NFPA standards and manufacturer's limits. Finish cut edges as required for shop work.

E. Tolerances: NFPA Standards 80 and 105 for assembly performance required.
1. 0.125 inch at jambs and heads.
2. 0.0625 inch per leaf at meeting stiles for pairs of doors.
3. 0.25 inch over finish floor covering, and as indicated.
4. 0.1875 inch at thresholds and saddles.
5. Bevel: 0.125 inch in 2 inches at lock and hinge edges.
6. Warp, bow, cup, or twist not exceeding 0.25 inch in a 42 by 84-inch section.
7. No telegraphing of core construction in face veneers.

F. Where the Architect determines that a door or frame has been too severely damaged to represent new goods and materials as required by the Contract it shall be replaced by new undamaged work; regardless of whether this damage adversely effects door function. Remedial work such as filling and sanding to correct excessive damage is not acceptable in lieu of replacement.
1. Restore damaged finishes, site cut, and machined surfaces and edges before installation, return to shop doors that cannot be acceptably refinished on site, replace work that cannot be acceptably repaired.

G. Operation: Replace and rehang doors that do not swing or operate freely, when directed by Architect.

H. Protect installed work as recommended by manufacturer and as required to assure that doors are without damage, nor deterioration at time of substantial completion.

END OF SECTION

SECTION 08 31 00 – ACCESS DOORS

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes products, equipment, labor and services to provide access doors as necessary and required.

1.2 SUBMITTALS

A. Product Data: Required for each material, manufactured product, and accessory to be incorporated into the Work.
   1. Provide complete information on removable core lock and keying.

B. Shop Drawings: Fabrication and installation of custom units; modifications to standard units, project specific installations. Indicate locking units.
   1. Coordination with Ceramic Tile: Indicate locations of access panels occurring in areas to receive ceramic tile and integrate panels with tile pattern.

C. Samples:
   1. Metal Finish: Two 3 x 5-inch pieces of panel face material and finished as required.
   2. Provide one complete access panel as a demonstration of appearance and assembly quality proposed for the Work; include cam lock as required.

D. Coordination Drawings: Penetrations, ceiling-mounted components, concealed framing, suspension systems, mechanical, plumbing and electrical systems, and other construction.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Subject to compliance with requirements, provide access doors by one of the following: J.L. Industries, Karp Associates, Inc., Milcor (DuraVent), Nystrom, Inc. or Acudor Inc.

2.2 MANUFACTURED COMPONENTS

A. Access Door Assembly: Complete, and ready for installation; continuous welded steel construction unless otherwise indicated. Grind exposed welds smooth and flush with adjacent surfaces. Provide anchors and attachments necessary for installation indicated.
   1. Frames: 16 gage steel; provide flange type necessary for the installation required.
   2. Stainless Steel Frames and Flush Panel Doors: 14 gage stainless steel, No. 4. satin finish; concealed spring hinges or concealed piano hinge set to open 175 degrees.
   3. Flush Doors: 14-gage sheet steel, with concealed spring hinges or concealed continuous piano hinge set to open 175 degrees.
   4. Lock: Southco CM-6, removable core cam lock and PK core compatible with Schlage 1347 keyway.

5. Ceiling Doors: Recessed door panel depth necessary to finish ceiling insert and install flush to adjacent finish ceiling. Reinforced 18 gage sheet steel face. Provide access sleeves for locking devices.
   a. Size: As necessary for efficient access, but not less than 24 by 24 inches. Obtain Architect's acceptance of manufacturer's standard size units which vary from sizes indicated.
6. Plumbing Valve Doors: Recessed access door for tiled wall. Provide concealed pivoting bar hinge and frameless appearance.

B. Fire-Rated Units: Comply with NFPA 80, provide UL listed and labeled units having performance level required with insulated flush panel door, continuous piano hinge and self-closing mechanism for rated assemblies in sizes and configuration required.
1. Vertical Doors: NFPA 252 or UL 10B.
2. Horizontal Doors: ASTM E 119 or UL 263.

C. Securing of Units: Provide the specified lock for all panels where any portion is installed at a height 8 feet or less above finish floor; key locks and provide master keying as directed by Owner’s Representative. Secure units located more than 8 feet AFF with flush, screwdriver-operated cam locks, number required to hold door flush when closed.

D. Shop Applied Coating: Corrosion resistant prime paint compatible with field applied finish specified in Section 09 91 23.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Total number of doors required for access to mechanical equipment is not necessarily shown on drawings. Consult with Architect for direction on placement of required doors not shown on drawings.
1. Comply with Section 22 05 00 requirements for access doors for plumbing work and provide as work of this Section.
2. Comply with Section 23 05 00 requirements for access doors for HVAC work and provide as work of this Section.
3. Comply with Section 26 05 00 requirements for access doors for electrical work and provide as work of this Section.
4. Coordinate access door placement with ceramic wall tile layout, consistent with approved Shop Drawings to minimize cut tile and center vertically and horizontally within tile module.

B. Comply with manufacturer's instructions for installation of access doors. Provide all necessary support and supplemental framing for assembly where the access doors is required. Set accurately in position, plumb, level, and flush to adjacent finish surfaces; and secure to support.
1. Provide 60-minute, fire rated doors for units required in fire rated assemblies.
2. Provide stainless steel units in restrooms, wet areas and sterile areas.

C. Adjust hardware and panels for proper operation. Remove and replace damaged work and work that does not operate freely.

END OF SECTION

SECTION 08 32 13 – GLAZED SLIDING STACKING DOORS (METAL)

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes requirements for bi-parting and multi-leaf sliding and stacking aluminum framed glazed doors in the configurations required.

B. Related Sections:
1. Section 08 41 00 Aluminum Entrances and Storefront.
2. Section 08 71 00 Door Hardware.
3. Section 08 81 00 Glass and Glazing.

1.2 PROCEDURAL REQUIREMENTS

A. Preinstallation Conference: Comply with Project Meeting requirements. Review methods and procedures related to installation of curtain-wall assemblies specified as work of this Section and coordination with other components and assemblies of the building cladding,
1. Review and confirm Contractor's Project Schedule and work sequence and required tests and inspections.
2. Coordination of fabrications for head-track supports work of Section 05 50 00 and work of this Section for track and frame assemblies and hanging rod connections.

1.3 SUBMITTALS

A. Product Data: Submit as required for each material, manufactured product, accessory, and finish to be incorporated into the Work.

B. Shop Drawings: Prepared by the original component manufacturer; preparation by the site fabricator or installer is not acceptable. Elevations at 0.25-inch equals one foot scale, details at 3-inch equals one foot scale, full size sections of composite members and isometric drawings of joinery intersections and internal sealant applications. Provide details of all conditions for every member, reinforcing, support system, anchorage details, glazing and interface with adjacent work. Indicate all component locations and intersection details; method of isolating dissimilar materials; provisions for expansion and contraction. Indicate shop-assembled units and pick-points for field erection.
1. The Contractor shall provide professional engineering services for work of this Section to comply with System Description requirements. Engineer shall stamp and sign drawings and calculations prepared for this Project.
   a. Engineer Certification: Maximum deflections are within required limits, and probable glass breakage will not exceed frequency specified in Section 08 81 00 using manufacturers' data.
2. Show locations and details for sliding door support structures and connections to building structure and loads imposed on building structure; coordinate with work of Section 05 50 00 and tolerances for supporting structure and sliding glass doors. Document fastener type proposed for each application and note why proposed fastener is superior.
3. Indicate extent of work that is shop fabricated and assembled and work that is fabricated and assembled in the field.

4. Detail fabrication, attachments and installation for sills, track and custom fabrications if required.
5. Installation Details: Perimeter closure across transition between fenestration frame and rough opening with elastomeric closure in configuration and attachment for each assembly and system required.

C. Samples: Demonstrate fabrication, workmanship, and design of curtain wall. Provide a minimum of four samples of each type as required. Include an example of intersecting components either corner sections or intermediate mullion demonstrating representative appearance of component joinery to be provided in the Work.
1. Custom Fabrications: Provide samples of sills and closures in profiles and configurations required.
2. Finish: Apply to 12-inch sections of curtain wall members; use same extrusion and alloy to be used in final Work. Demonstrate acceptable appearance match specified for the Work.

D. Maintenance Manual: Document recommended frequency and cycle for inspections, and maintenance work for conditions of service representative of this facility such that in-service performance will comply with Project requirements. Identify means, methods and materials for inspection and assessment of operating components, cleaning and periodic maintenance necessary for reliable function and optimal service life. Provide complete listing of consumables and components reasonably anticipated to require replacement incidental to normal maintenance, and procedures for reglazing.

E. Quality Assurance Submittals: Demonstrate compliance with requirements.
1. Certificate of Production: For finish system and application.
2. Test Results: For curtain wall assembly as specified.

1.4 PROJECT CONDITIONS

A. Verification of Dimensions: Actual dimensions of in-place construction work for location, tolerance compliance, operating clearances and all other criteria that may impact work of this Section in advance of component fabrication. Coordinate fabrication to avoid delay of work. Correct Work as necessary to remediate dimensional conflicts and provide assemblies with acceptable capacity for installation with required fit and operating clearances.
1. Coordinate with work of section 05 50 00 for metal fabrications required to support operable fenestration assemblies provided by this Section.

1.5 WARRANTY

A. Special Warranty: Signed by authorized representative of the manufacturer, agreeing upon receipt of written notice of defective work, and work not in compliance with Project requirements to correct or replace the work to the satisfaction of the Owner, and at no cost to the Owner for the time periods required.
1. Project Installation: 10 years
2. Finish Durability: 20 years against loss of required match in appearance, fade, chalk and deterioration in excess of normal weathering when evaluated per AAMA 2605.

B. Installer Warranty: Signed by authorized representative of the General Contractor and fabricator-installer for work of this Section agreeing upon receipt of written notice of defective work, and work not in compliance with Project requirements to provide all labor necessary to correct or replace the work to the satisfaction of the Owner, at no cost to the Owner for the time periods required.

1. Project Installation: 3 years.

PART 2 - PRODUCTS

2.1 SYSTEM DESCRIPTION

A. Design Requirements: Components with sections and profiles indicated. Design is based on specific type and model aluminum systems by a single manufacturer. .
   1. Assembly framing concealed from view at head and sill; only vertical stiles may be visible.
   2. Provide an integrated gutter assembly to collect, control and dispose of water occurring in the assembly.
   3. Coordinate assembly to receive locks as required by Section 08 71 00, and prepare frames for locks.

B. Performance Requirements: Comply with criteria of the General Structural Notes on S series drawings.
   1. Air Infiltration: 0.37 cubic feet per minute per lineal foot of joint at inward pressure of 6.24-pound force per square foot.
   2. Water Penetration: None at inward pressure of 15-pound force per square foot.
   3. Structural Performance: Support and anchor units to limit deflection to 0.0057 of span and comply with Performance Requirements of Section 08 81 00 for service conditions required.

2.2 MANUFACTURERS

A. Basis of design is CR Laurence Palisades S100 Sliding Door.

B. Substitution Request: Comply with procurement requirements; requests received after bid opening will be rejected.

2.3 MATERIALS

A. Aluminum: Alloy and temper recommended by manufacturer for strength, corrosion resistance, and application of required finish; ASTM B 221 for extrusions, ASTM B 209 for sheet and plate.

B. Fasteners: Noncorrosive, compatible with metals fastened; Phillips flat-head machine screws for exposed fasteners.

C. Concealed Flashing: 26 gage dead-soft stainless steel, or 0.062 inch extruded aluminum, 0.062.

D. Brackets and Reinforcements: Non-magnetic stainless steel or hot-dip galvanized steel complying with ASTM A 386.

E. Concrete/Masonry Insert: Cast-iron, malleable iron, or hot-dip galvanized steel complying with ASTM A 386.

F. Compression Weatherstripping: Molded neoprene gaskets complying with ASTM D 2000 or molded PVC gaskets complying with ASTM D 2287.

G. Sliding Weatherstripping: Replaceable stripping of wool, nylon woven pile, or polypropylene, with nylon fabric or aluminum strip backing, complying with AAMA 701.2.

H. Glass and Glazing: Comply with requirements of Section 08 81 00, provide Safety Glazing as required for the Work.

I. Hardware: Provide manufacturer's heavy duty top panel guide, bottom panel caster and miscellaneous components. Provide lockset and cylinder as required in Section 08710.
   1. Plates and Handles: Aluminum, of style indicated.
   2. Thresholds: Comply with barrier free access regulations for aluminum flor track, threshold and similar fabrications cross line of travel. Extruded aluminum, mill finish, with anchors and clips, coordinated with pivots and floor-concealed closers.

2.4 FABRICATION

A. Provide sizes, configurations, and profiles indicated, and scheduled with accurate relation of planes and angles, and hairline tight joints. Shop fabricate and assemble work to greatest extent possible using manufacturer's standard methods; disassemble only as necessary to ship and install; protect finishes from damage and deterioration.
   1. Coordinate with work of Section 08 71 00; prepare units for hardware and install in shop wherever possible, except drill and tap for surface-mounted hardware at Project site.
   2. Reinforce work as necessary for hardware mounting, and performance requirements.

B. Welding: Comply with AWS recommendations to avoid discoloration; grind exposed welds smooth and flush and restore finish.

C. Isolate dissimilar metals and incompatible materials, prevent galvanic action and corrosion.

D. Fasteners: Concealed, unless otherwise acceptable, except use exposed fasteners for surface mounted hardware.
   1. Exposed Fasteners: Countersunk, filled, ground flush and finished to match surface where later removal is not necessary; finish removable fasteners to match adjacent finish as directed.

E. Weatherstripping: Exterior openings and locations required; unless otherwise required, sliding type mortised into adjustable strip centered in door edge at stile and head rail, compression type at fixed stops. Provide silencers where weatherstripping is not required.
   1. Bottom Rail: Adjustable EPDM/vinyl blade gasket.
   2. Jamb of Center Pivot Door: Finger guards of collapsible neoprene or PVC anchored to frame.

F. Glazing System: Type indicated, design for reglazing from interior without disassembly
   1. Stops: Extruded aluminum with beveled top and projected fascia returned to door face unless otherwise indicated; nonremovable exterior stops, and snap-on interior stops.

2.5 FINISHES

A. High Performance Pigmented Organic Coating: AAMA 2605; 70 percent PVDF resin contents; non-metallic black as selected and to provide visual match to similarly finished work of Section 08 41 00.

B. Hardware Finishes: Comply with requirements of Section 08 71 00.

2.6 SOURCE QUALITY CONTROL

A. Test and certify storefront and entrance assembly compliance with Project performance requirements.
1. Wind Load: ASTM E 330.
2. Air Infiltration: ASTM E 283
3. Water Penetration: ASTM E 331
4. Thermal Transmission: U-value Btu/(hr x sf x degree F) AAMA 1503.1.
5. Condensation Resistance Factor: AAMA 1502.7.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Comply with manufacturer's instructions and recommendations for installation of aluminum entrances and storefronts.

B. Set units plumb, level, and true to line, without warp or rack of framing members, doors, or panels. Anchor securely in place, isolate incompatible metals and substrates, prevent corrosion and electrolysis.

C. Set sills and other members in sealant bed and provide joint fillers and gaskets as indicated to provide weathertight construction.

D. Drill and tap frames and doors and apply surface-mounted hardware items, complying with hardware manufacturer's instructions and template requirements. Use concealed fasteners wherever possible.

E. Field test installed work for compliance with performance requirements for air and water penetration using referenced standards as a guide.

3.2 ADJUST AND CLEAN

A. Adjust operating hardware to function properly, without binding, and to provide tight fit at contact points and weatherstripping.

B. Clean completed system, inside and out, promptly after erection and installation of glass and sealants. Remove excess glazing and joint sealants, dirt, and other substances from aluminum surfaces.

C. Protect work so that it is without damage or deterioration, other than normal weathering, at time of acceptance.

END OF SECTION

SECTION 08 34 00 – SPECIAL FUNCTION DOORS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes Interior Aluminum-Framed Top-Hung Sliding Doors.

B. Related Sections:
   1. Section 08 14 00 Wood Doors

1.3 REFERENCES

A. ANSI – American National Standards Institute
   1. ANSI 156.18 Materials and Finishes
   2. ANSI A117.1 Specifications for making buildings and facilities usable by physically handicapped people.

B. BHMA – Builders Hardware Manufacturers Association

C. DHI – Door and Hardware Institute

D. NFPA – National Fire Protection Association
   1. NFPA 80 – Fire Doors and Windows

1.4 SUBMITTALS

A. Product Data: Submit manufacturer’s product data, including installation instructions.

B. Shop Drawings: Submit manufacturer’s shop drawings, including plans, elevations, sections, and details, indicating dimensions, tolerances, materials, components, hardware, finish, options, and accessories. Shop Drawings to show required blocking by others.

C. Samples: Submit manufacturer’s samples of the following sliding door components:
   1. Door veneer or laminate sample.
   2. Aluminum Frame finish sample.

D. Manufacturer’s Certification: Submit manufacturer’s certification that materials comply with specified requirements and are suitable for intended application.

E. Warranty Documentation: Submit manufacturer’s standard warranty.

F. Test Reports: Submit acoustical reports or UL1784 as applicable.

1.5 QUALITY ASSURANCE

A. Product Options: Drawings indicate size, profiles, and dimensional requirements of interior aluminum frames and doors.

B. Source: Obtain sliding aluminum framed doors and hardware from single source.

C. Manufacturer's Qualifications: Manufacturer regularly engaged for past 5 years in manufacture of sliding doors similar to that specified.

1.6 PERFORMANCE

A. Aluminum perimeter frames with integral acoustic seals at all door/frame interfaces
   1. Architect to verify frame thickness suitable for required application.

B. Soft-closing mechanism at both sides of door integrated with top track. Soft Closers tested to a minimum of 150,000 cycles.

C. Concealed door guide.

D. Manufacturer to 3rd party acoustical performance test data.

E. Manufacturer to submit 3rd party test data on air infiltration and/or smoke ratings as applicable.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Delivery and Acceptance Requirements: Deliver materials to site in manufacturer’s original, unopened containers and packaging, with labels clearly identifying product name and manufacturer.

B. Notify manufacturer immediately of any shipping damage.

C. Storage and Handling Requirements:
   1. Store and handle materials in accordance with manufacturer’s instructions.
   2. Keep materials in manufacturer’s original, unopened containers and packaging until installation.
   3. Store materials in clean, dry area indoors.
   4. Protect materials and finish during storage, handling, and installation to prevent damage.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. AD Systems (Assa Abloy), RACO Interiors, Tubelight, or approved.

2.2 INTERIOR SLIDING ALUMINUM-FRAMED DOORS AND PARTITIONS

A. Manufacturer: Basis of Design is OfficeSlide™ High Performance Barn (Sliding) Door System by AD Systems.

B. Specified Wall Thickness: As indicated in Drawings and required by wall assembly.

C. Frame Profiles: Extruded aluminum frame “wrap” frame with integral vertical jamb (stile pocket).

D. Finish: Painted Hardcoat (Kynar) Finish. Meets AAMA 2604 Standard Colors: As selected by Architect.

E. Frame Profiles: Extruded aluminum
1. Standard: frame “wrap” frame with integral vertical jamb (stile pocket).
2. Profile Dimensions: As indicated in Drawings.

F. Door Leaves: all Doors to be factory machined for hardware including pilot and function holes.
1. Wood Doors: Reference Section 08 14 00 for Wood Doors.
2. Aluminum Stile & Rail Door: Manufacturer’s standard 1-3/4 inch thick glazed doors with extruded-aluminum tubular stile and rail members. Welded and bolted corner connections.
   a. 3-1/2 inch vertical stiles plus 1/2 inch stop.
   b. 3-1/2 inch Horizontal stiles plus 1/2 inch stop; provide 10-inch bottom rail where indicated or Scheduled in Drawings.
   c. Glazing: Glazing Type as Scheduled. . Reference Drawings and Section 08 81 00.

G. Door Components:
1. Single Top Track: Extruded aluminum track for both single and bi-parting doors, as indicated in Drawings and Schedule.
2. Valances: Extruded aluminum with integral end caps.
3. Top Rollers: Tandem nylon roller sized to match door weight.
4. Concealed Floor Guide: Integral Jamb floor guide by manufacturer.
5. Soft-Closers: Soft-closing dampener mechanism at both sides of door leaf.
6. Pull Handles: As Scheduled in Door Hardware. Where Pull is not indicated, provide as selected by Architect from manufacturer’s standards.
   a. Flush Pull and custom pull handle by request.

H. Door Locks and Finish Hardware: As Scheduled.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine wall openings to receive sliding doors for plumb, level, and square. Note: Finish door operation will be affected by out of tolerance framing.

B. Verify dimensions of wall openings.

C. Examine surfaces to receive top and bottom guide.

D. Notify Architect of conditions that would adversely affect installation or subsequent use of sliding doors.

E. Do not begin installation until unacceptable conditions are corrected.

F. Base of door side to be flush or minimal. Rubber Base acceptable.

3.2 INSTALLATION

A. Install sliding doors plumb, level, square, in proper alignment and in accordance with manufacturer's instructions.

B. Install sliding doors to open and close smoothly, with no visible gap between door and wall in closed position.

C. Anchor sliding doors securely in place to supports. Required: Fire treated 2 x 6 blocking required full length of track.

3.3 ADJUSTING

A. Adjust sliding doors to operate smoothly without binding and in accordance with manufacturer's instructions.

B. Repair minor damages to finish in accordance with manufacturer's instructions and as approved by Architect.

3.4 CLEANING AND PROTECTION

A. Clean sliding doors promptly after installation in accordance with manufacturer's instructions.

B. Do not use harsh cleaning materials or methods that could damage materials or finish.

C. Protect installed sliding doors from damage during construction.

END OF SECTION

SECTION 08 41 00 – ALUMINUM ENTRANCES AND STOREFRONT

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes requirements for a weatherproof installation of aluminum entrances and storefronts.

B. Related Sections:
1. Section 08 71 00 Finish Hardware.
2. Section 08 81 00 Glass and Glazing.

1.2 SUBMITTALS

A. Shop Drawings: Prepared by the original manufacturer of the storefront components. Preparation by the site fabricator or installer is not acceptable. Elevations at 0.25-inch equals one foot scale, details at 3-inch equals one foot scale, full size sections of composite members; detail anchors, hardware, reinforcement, movement provisions, accessories, and glazing assembly.
1. The Contractor shall provide professional engineering services for work of this Section to comply with Design and Performance Requirements. Engineer shall be registered in the State of the Project and shall stamp and sign drawings and calculations prepared for this Project.

B. Samples: Demonstrate fabrication, design, operation and finish; provide two samples of each type as required.
1. Finishes: Apply to 12-inch sections of members required, use extrusion and alloy type required for final Work.
2. Assemblies: Typical joinery, and corner of custom units.

C. Quality Control Submittals: Demonstrate compliance with requirements.
1. Certificates: For performance of manufacturer's standard window units.
2. Test Results: For performance of window units as specified.

1.3 PROJECT CONDITIONS

A. Field Measurements: Verify actual dimensions of construction work by accurate field measurement before fabrication. Coordinate fabrication to avoid delay of work; when so directed fabricate units without field measurement, and coordinate installation tolerances for proper fit.

1.4 WARRANTY

A. Warranty: Signed by authorized representative of GC, the storefront manufacturer, and the installer agreeing upon receipt of written notice of defective work, and work not in compliance with the Contract Documents to correct or replace the work to the satisfaction of the Owner, and at no cost to the Owner for the time periods required.
1. Weatherproof Installation: 5 years.

2. Finish Durability: 10 years against loss of required match in appearance, fade, chalk and deterioration in excess of normal weathering when evaluated per AAMA 2605.

PART 2 - PRODUCTS

2.1 SYSTEM DESCRIPTION

A. Design Requirements: Final design of this assembly for resistance of imposed loads, and attachment to building structure is the responsibility of the Contractor. Components shall have the sections and profiles indicated. Design is based on aluminum systems of one manufacturer but may include modifications to standard components and custom fabrications as necessary for compliance with Project requirements. As determined by the Architect, aluminum systems of other manufacturers may be acceptable where deviations neither affect the Architect's design, nor detract from performance.
1. The Contractor shall provide final design, and engineering of internal reinforcing, external supports, and anchors for storefront and entrance assemblies to resist imposed loads and attach to the building structure at the locations indicated as work of this Section. Reinforcing, supports and anchors shall comply with requirements of this Section and Section 05 50 00.
2. As necessary to conform to the Architect's design, standard components and assemblies shall be modified and custom components provided at no additional cost to the Owner.

B. Performance Requirements: Accommodate dimensional tolerances for adjacent and supporting construction, thermal movement over temperature range of 120 degrees F; inward and outward wind load, and structural criteria as indicated in the General Notes on the Structural Drawings.
1. Fixed Frame: Air infiltration at 6.24 psf of 0.10 CFM/square foot; No uncontrolled water penetration at inward pressure of 12 psf.; condensation resistance factor (CRF) of 51, and a U-value of 0.65.
2. Assembly U-value equal to or better than U=0.38 and SHGC=0.40 and otherwise complying with California Energy Code (Title 24 Part 6) and applicable voluntary energy efficiency provisions in CALGreen (Title 24 Part aa) for unit sizes and configurations required with insulating glazing specified in Section 08 81 00 when evaluated per AAMA 507 as certified by NFRC.
   a. .Entrances: Assembly U-value equal to or better than U= 0.60
3. Operable Frame: Air infiltration of 0.10 CFM/linear foot of perimeter at air pressure differential of 6.24 psf; No uncontrolled water penetration at inward pressure of 12 psf; CRF not less than 51, and U-value of 0.65.
4. Structural Performance: Maximum deflection 0.0057 of span under design wind load and exposure condition for building configuration and elevations indicated. Neither glass breakage nor permanent set in excess of 0.2 percent of span at 35 psf live load.

2.2 MATERIALS

A. Aluminum: Alloy and temper recommended by manufacturer for strength, corrosion resistance, and application of required finish; ASTM B 221 for extrusions, ASTM B 209 for sheet and plate.

B. Fasteners: Noncorrosive, compatible with metals fastened; Phillips flat-head machine screws for exposed fasteners.

C. Concealed Flashing: 0.062-inch extruded aluminum, or 26 gage stainless steel.

D. Reinforcement, Supports and Anchorage: Galvanically compatible with aluminum components.
   1. Steel Reinforcement:
      a. Structural Shapes, Plates and Bars: ASTM A36/A36M.
      b. Cold-Rolled Sheet and Strip: ASTM A1008/A1008M.
      c. Hot-rolled Sheet and Strip: ASTM 1011/A1011M.
   2. Steel Reinforcement Primer: Manufacturer's standard zinc-rich, corrosion-resistant primer complying with SSPC-PS Grade No. 12.00; applied immediately after surface preparation and pretreatment. Select surface preparation methods in accordance with recommendations in SSPC-SP COM, and prepare surfaces in accordance with applicable SSPC standard.

E. Concrete/Masonry Insert: Cast-iron, malleable iron, or hot-dip galvanized steel complying with ASTM A 386.

F. Galvanic Isolation: Provide permanent isolation of contact and wash surfaces of non-compatible metal components to prevent galvanic action between dissimilar metals using manufacturer's approved system.

G. Compression Weatherstripping: Molded neoprene gaskets complying with ASTM D 2000 or molded PVC gaskets complying with ASTM D 2287.

2.3 MANUFACTURED COMPONENTS

A. Provide sizes, configurations, and profiles indicated, and scheduled with accurate relation of planes and angles, and hairline tight joints. Shop fabricate and assemble work to greatest extent possible using manufacturer's standard methods; disassemble only as necessary to ship and install; protect finishes from damage and deterioration.
   1. Storefront Systems: Subject to compliance with Project requirements, provide basis of design storefronts as manufactured by Oldcastle Building Envelope (OBE) or approved equal in locations indicated in Drawings:
      a. Series 6000 Center Set System (2 X 6-inch), having the following performance (combined framing plus glazing):
         1) Winter U-Factor: 0.373.
         2) Solar Heat Gain Coefficient (SHGC): 0.26.
         3) Visible Light Transmittance (VT): 0.59.
         4) Condensation Resistance: 53.
      b. Series 3000 Center Set System (2 X 4.5-inch) having the following performance (combined framing plus glazing):
         1) Winter U-Factor: 0.363.
         2) Solar Heat Gain Coefficient (SHGC): 0.25.
         3) Visible Light Transmittance (VT): 0.57.
         4) Condensation Resistance: 47.
      c. Series 3000 Storefront with U-Channel (2 X 4.5-inch).
   2. Reinforcing, Supports and Anchorage: Sized and configured for internal reinforcing of aluminum extrusions and for external support and anchorage as necessary for the Work. Coordinate work with aluminum frame assemblies and building structure for each configuration required. Comply with Performance Requirements for all loading conditions.
   3. Aluminum Entrance Frame and Stile and Rail Doors: Reference Section 08 42 24 Automatic Sliding Entrances and Section 08 71 00 for Finish Hardware.

B. Welding: Comply with AWS recommendations to avoid discoloration; grind exposed welds smooth and flush and restore finish.

C. Isolate dissimilar metals and incompatible materials, prevent galvanic action and corrosion.

D. Fasteners: Concealed, unless otherwise acceptable, except use exposed fasteners for surface mounted hardware.
   1. Exposed Fasteners: Countersunk, filled, ground flush and finished to match surface where later removal is not necessary; finish removable fasteners to match adjacent finish as directed.

E. Glazing System: Type indicated, design for reglazing from interior without disassembly.
   1. Stops: Extruded aluminum with beveled top and projected fascia returned to door face unless otherwise indicated; nonremovable exterior stops, and snap-on interior stops.

2.4 FINISHES

A. Provide Aluminum Finishes as indicated in Drawings:
   1. High Performance Pigmented Organic Coating: Eligible for the specified Project Warranty. AAMA 2605; apply to aluminum extrusions; match appearance as demonstrated by approved samples, and coordinate with related components specified in Section 07 62 00 and Section 08 42 29.
      a. Two coat, 70 percent fluorocarbon (PVDF) resin system with mica flakes; OBE/Valspar Standard, Premier or Custom Color as selected by Architect, where storefronts are indicated to match existing system finish
   2. Color Anodic Finish: AAMA 611, AA-M12C22A42/A44, Class 1, 0.018 mm or thicker.
      a. Color: Dark bronze to match Architect's sample.

2.5 SOURCE QUALITY CONTROL

A. Test and certify storefront and entrance assembly compliance with Project performance requirements.
   1. Wind Load: ASTM E 330.
   2. Air Infiltration: ASTM E 283
   3. Water Penetration: ASTM E 331
   4. Thermal Transmission: U-value: (Btu/hr x sf x degree F) AAMA 1503.1.
   5. Condensation Resistance Factor: AAMA 1502.7.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install aluminum frame storefront assemblies within the overall building envelope in which they occur so as to provide contiguous effective collection, control and drainage of moisture entering or otherwise occurring in cladding assemblies. Collect the moisture and conduct it to the exterior for drainage without adverse effect on the performance, durability and appearance of the assembly. Ensure continuity among water control features within the storefront and adjacent assemblies and provide a fully integrated system for the building envelope.
   1. Provide flashings and similar ancillary components for storefront installation as necessary to maintain continuity of water control features, and to provide effective

venting and drainage of concealed cavities. Flashing shall comply with Section 07 62 00 requirements.

B. Set units plumb, level, and true to line, without warp or rack of framing members, doors, or panels. Anchor securely in place, isolate incompatible metals and substrates, prevent corrosion and electrolysis.
   1. Coordinate installation of aluminum frame components with internal and external reinforcing, supports and anchors to ensure completed assembly can resist all imposed loads and complies with Performance Requirements.

C. Drill and tap frames and doors and apply surface-mounted hardware items, complying with hardware manufacturer's instructions and template requirements. Use concealed fasteners wherever possible.

D. The Owner reserves the right to test storefront work for compliance with performance requirements for resistance to air infiltration and water penetration in accordance with AAMA 503. Work failing to meet performance requirements will be determined to be defective.
   1. Repair, or replace defective Work as acceptable to the Owner.

3.2 ADJUST AND CLEAN

A. Adjust operating hardware to function properly, without binding, and to provide tight fit at contact points and weatherstripping.

B. Clean completed system, inside and out, promptly after erection and installation of glass and sealants. Remove excess glazing and joint sealants, dirt, and other substances from aluminum surfaces.

C. Protect work so that it is without damage or deterioration, other than normal weathering, at time of acceptance.

END OF SECTION

SECTION 08 42 29 – AUTOMATIC SLIDING ENTRANCES

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes requirements for fully automatic sliding entrances with operator, motion and presence sensors and controls. Coordinate electrical requirements of door control and operating hardware with Section 08 71 00 requirements for card key operation and security requirements. Work includes electrical service and connections necessary for normal operation of hardware.
   1. Low Energy Operators: Work of Section [08 71 10, 08 71 00].

1.2 ADMINISTRATIVE REQUIREMENTS

A. Preinstallation Conference: Provide coordination with work of the following Sections:
   1. Section 08 81 00 Glass and Glazing.
   2. Division 26 Electrical Sections.

1.3 SUBMITTALS

A. Product Data: Submit as required for each product to be incorporated into the Work, include information on electrical characteristics.
   1. Wiring Diagrams: For coordination with Division 26.

B. Samples: Finish samples to demonstrate required appearance match.

C. Templates: Furnish to fabricator of Work factory-prepared for hardware. Coordinate mounting heights and installation requirements for hardware.

D. Operation and Maintenance Manuals: Document routine maintenance and inspection procedures and frequency for each assembly type provided in the Work. Provide trouble shooting guidelines for diagnostic service. Provide for normal operation and highlight specific Project adaptations and features necessary for integration with building electronic safety and security systems. Provide for emergency operation and reset of breakaway panic leaves. Provide name, address, and contact information of the manufacturer providing the hardware and their nearest service representatives and the installing contractor.
   1. Tools: A complete set of specialized tools and instructions as necessary.

1.4 QUALITY ASSURANCE

A. Installer: Certified by the American Association of Automatic Door Manufacturers and approved by the manufacturer of the assemblies to be installed as an installer of their products and having five years successful experience with installation of high frequency, automatic sliding doors in the configurations required.

1.5 WARRANTY

A. Special Warranty: Signed by authorized representatives of the Manufacturer, Supplier and Installer of hardware providing for the prompt replacement of defective and non-compliant work, including actuators, sensors, electromechanical operators and other system components.
   1. Door Operators: Five years written warranty.
      a. Gear Boxes: Guaranteed for complete cost of replacement including installation.
   2. Glazing Installation: As required by Section 08 81 00.

PART 2 - PRODUCTS

2.1 SYSTEM DESCRIPTION

A. Design Requirements: Safety sensor, operator, header and track, jambs, sliding doors for single, bi-parting and telescoping configurations with fixed sidelights, in size and function required.
   1. Main entrance: Fixed sidelights and bi-parting sliding door leaves with breakout panic.
   2. Stile and Rail Doors: 4.5-inch stiles and head rail, 10-inch bottom rail; configure glazing channel for glazing Type required.
   3. Provide complete assemblies with all operating components, controls, hardware, weather seals and accessories.
   4. Digital Cycle Counter: Resettable, 8-digit capacity to track door operation cycles.

B. Performance Requirements: High energy, automatic operating door assemblies suitable for high frequency function and heavy traffic in apublic building having a minimum of 50,000 operating cycles per year.
   1. Comply with ANSI/BHMA A156.10 Standard for Power Operated Pedestrian Doors.
   2. Breakout Panic: Provide magnetic catch and hydraulic closer to return breakout leaf to normal position.

2.2 MANUFACTURED COMPONENTS

A. Subject to compliance with system Description requirements the basis of design is Stanley DuraGlide 2000 Series Bi-Parting Door assembly for Door Types as required, Horton Automatics, Assa Abloy Besam or approved.

B. Operating Mechanism: Drive operator concealed within the header, not larger than 4 inches by 6 inches tall with removable fascia.
   1. Microprocessor Control functions required by ANSI A156.10. Control shall provide for integration with building electronic safety and security systems as required for work of Section 28 13 10.
   2. Finger Safety: When unit slides open, strike rail of sliding panel will stop short of adjacent sidelite; resulting opening is net slide.

C. Security and Safety Power Fail Options: Monitored with battery back-up for user determined power failure response; doors may slide open or slide function will lock when door is closed at the user’s election.

D. Track: Aluminum, nylon covered, and replaceable. Rollers will be steel, high quality ball bearing wheels 1.25-inch diameter with continuous anti-derailing guide full length of panel travel.

E. Hardware: Coordinate with requirements of Section 08 71 00 and building electronic safety and security systems.
   1. Flush Panic Exit Device: Recessed in muntin bar.
   2. Threshold: Aluminum configured to comply with barrier free access requirements and as indicated.

F. Finish: Comply with requirements of Section 08 44 00 and match finished appearance of work of that Section.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Mounting Heights: Comply with governing regulations, and Door and Hardware Institute, "Recommended Locations for Builders Hardware for Standard Steel Doors and Frames" unless otherwise required.

B. Install hardware level, plumb, and true to line and location, comply with the manufacturer's instructions and recommendations. Prevent conflicts between mounting heights for each component of hardware. Provide electrical service as necessary for hardware function.

C. Adjust and reinforce substrate as necessary for installation and operation, provide backing as wall mounted door stops and other surface mounted hardware; cut and fit as required for installation of hardware, and remove hardware prior to application of final finish; reinstall hardware once finishing is complete.
   1. Where Work cannot be reinforced for fasteners use sleeved through-bolt, or sex screw fastener.

D. Drill and countersink units not factory-prepared for fasteners. Space fasteners in accordance with industry standards.

E. Cut and fit floor covers to profile of door frames with mitered corners and hair-line joints. Join units with concealed welds or concealed mechanical joints. Permanently anchor thresholds to substrate with No. 10 or larger stainless-steel screws. Cut smooth openings for spindles, bolts and similar items as required.

3.2 ADJUST AND CLEAN

A. Adjust and check each operating item of hardware and each door, to ensure proper operation or function of every unit. Replace units which cannot be adjusted to operate freely and smoothly as intended for the application made.

B. Clean adjacent surfaces soiled by hardware installation.

C. Final Adjustment: Inspect and adjust hardware one week prior to scheduled inspection for final acceptance and instruct Owner's personnel in adjustment and maintenance of hardware.

1. Clean operating items as necessary to restore proper function and finish of hardware and doors.
2. Adjust door control devices to compensate for final operation of heating and ventilating equipment.

END OF SECTION

SECTION 08 63 00 – METAL FRAMED SKYLIGHTS

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes requirements for monumental, metal framed skylights.

B. Related Sections:
1. Section 07 62 00 Flashing and Sheet Metal.
2. Section 07 92 00 Joint Sealers.
3. Section 08 81 00 Glass and Glazing.

1.2 ADMINISTRATIVE REQUIREMENTS

A. Pre-Installation Conference: Participate in Preinstallation conference required for work of Section 07 54 19.

1.3 SUBMITTALS

A. Samples: Finished as required for Project; two frame sections 12 inches long, and one glazed corner section 12 by 12 inches incorporating curb anchors and other necessary fasteners, corner section will be returned.

B. Certificates: Demonstrate compliance with requirements.

C. Shop Drawings: Plans, sections, and details of joints, anchors, and flashing; analysis of stress points due to live loads, and thermal stress. Annotate modifications of manufacturer's standard systems necessary to comply with requirements; document field measurements and tolerances.
1. The Contractor shall provide professional engineering services for work of this Section to comply with System Description requirements. Engineer shall stamp and sign drawings and calculations prepared for this Project.
   a. Engineer Certification: Compliance with CBC Title 24 maximum deflections are within required limits and probable glass breakage will not exceed frequency specified in Section 08 81 00.
2. Show locations and details for skylight connections to building structure and loads imposed on building structure. Indicate coordination of tolerances for supporting structure and curtain wall supports. Document fastener type to be used. Highlight locations where self –drilling screws are proposed and note why other fastener type cannot be used.
3. Coordinate Glazing Schedule specified in Section 08 81 00.

1.4 QUALITY ASSURANCE

A. Manufacturer and Installer: One firm acting as a single source of supply for work of this Section. Firm shall have ten years successful experience as a manufacturer, and installer of skylights similar in scope and type to Work of the Project as demonstrated by the required certification.

B. Certificates:
1. Certified test results of standard unit similar to that proposed for used in the Project complying with performance requirements.
2. Five projects in place for two to five years, include date. location, and names of Foreman, Owner, and Architect.

1.5 PROJECT CONDITIONS

A. Field Measurements: Frame openings to receive skylights; prior to fabrication. Avoid delay of Project, where measurements cannot be made in required sequence provide erection tolerance corresponding with tolerances for work adjoining skylights. Give written notice to Contractor of unsatisfactory tolerances, and tolerances that exceed requirements.

1.6 WARRANTY

A. Special Warranty: Notarized, signed by manufacturer, and installer; skylight system, including flashings, and glazing will remain water-tight, free from defects in materials and workmanship, and not deteriorate in excess of normal weathering for a period of ten years from date of final acceptance, and agreeing upon receipt of written notice from the Owner to promptly repair, and replace any portion of the Work which does not perform as required; to the Owner's complete satisfaction, and at no cost to the Owner, nor change in contract amount.

PART 2 - PRODUCTS

2.1 SYSTEM DESCRIPTION

A. Design Requirements: Design of skylight structure, anchors, inserts, flashings, and accessories; spacing and profile of members as indicated. Minor deviations acceptable to the Architect may be permitted where they allow the use of manufacturer's standard products.
1. Horizontal loads shall not be translated to the curb by the skylight frame.
2. Weep closed sections and provide controlled drainage of free water to exterior at elevation above apron flashing using a cascading internal gutter system.
a. Water Control System: Designed for cold climate installation prevent ice dam blockage of drains and size gutters for elevated amounts of condensation that may be associated with the assembly occupancy of the space.
3. Comply with recommendation of AAMA Glass Design for Sloped Glazing.
4. Provide assemblies incorporating thermally broken aluminum components except as necessary to comply with structural requirements.

B. Performance Requirements: CBC Title 24 Chapter 16 and Section 2405; AAMA 501.2 Quality Assurance and Diagnostic Field Check of Sloped Glazing Systems, and source quality assurance tests on manufacturer's units to be incorporated into the Work.
1. Air Infiltration: 0.06 cfm/ft of sash joint at inward pressure of 6.24-pound force per square foot (lbf/sf).
2. Water Penetration: None at inward pressure of 8.00 lbf/sf.
3. Wind, Snow and Seismic Loading: Comply with criteria in General Structural Notes.
4. Deflection: Less than 1/175 of span for frame and glazing without failure nor permanent set under the required load conditions.
5. Impact: Comply with CBC Title 24 Part 2 Section2404.2 and CAL OSHA 1910.23 without the use of metal guards.

6. Thermal Performance: NFRC listed for overall U-Value of 0.43 when evaluated with insulating glazing units having a U-value of 0.29 or better. SHGC less than 0.6 per NFRC 200.

2.2 MANUFACTURERS

A. Subject to compliance with Project requirements manufacturers whose products may be incorporated into the Project: VELUX, DEAMOR Skylights and Supersky.

2.3 MATERIALS

A. Aluminum: Alloy and temper recommended by manufacturer for required performance, strength, durability, and finish.
1. Extrusions: ASTM B 221; tensile strength 22,000 psi., and 0.125 inch thick for primary frame and sash members.
2. Sheet: ASTM B 209, minimum performance properties of Alloy 5052, and not less than 0.040 inch thick.

B. Steel Plates, Bars, and Shapes: Manufacturer's standard formed, and fabricated units, comply with material requirements of Section 05 50 00.
1. Galvanizing: ASTM A 123, Grade 85; applied after fabrication to all steel components.

C. Fasteners: Compatible with metals fastened, type, grade, and class necessary, and as required; cadmium plated steel, or other non-corrosive metal except non-magnetic stainless steel where exposed to moisture.

D. Sealant: Comply with requirements of Section 07 92 00; not permitted along rafter line.
1. Sealant Within Fabricated Units: Permanently elastic, non-shrinking, non-migrating, and recommended by manufacturer for optimal performance in necessary joint size and movement.

2.4 COMPONENTS

A. Concealed Flashing: 26 gage dead-soft stainless-steel compatible with contact metals.

B. Exposed Flashing Gutters: Aluminum sheet, and extrusions finished to match frame.

C. Glazing: Outside glazed, dry system; reglazing shall not require interior access; comply with requirements of Section 08 81 00.
1. Gaskets: 50-Durometer extruded neoprene mechanically interlocked into the skylight rafter bar and cap extrusions; setting surface and waterproof seal against both surfaces of the glass.

D. Provide accessory components necessary and required for complete, weathertight installation complying with specified requirements regardless of whether indicated or not, including but not limited to the following.

E. Electrochromic Glass: Product of Sage Electrochromics as necessary to comply with performance requirements for insulating sloped daylighting glazing.

F. Laminated Light: Provided as required for Electrochromic Insulating Slope Daylighting Glazing consisting of 0.125 inch thick clear fully tempered glass with two 0.015-inch thick

Vanceva interlayers 'Smoke Gray' and 'Cool White' and 0.030-inch thick clear polyvinyl butyral interlayer and as otherwise necessary for compliance with performance requirements for IGU.

2.5 FABRICATION

A. Skylight Frames: Match existing skylight scheduled for demolition in form, panelization and general character; provide aluminum extrusions of sizes, profiles and configuration indicated, where not indicated, provide manufacturer's standard; shop assemble, and glaze work to the greatest degree possible, disassemble only as necessary for shipment and installation; minimize field cutting, splicing, sealing and finishing.

B. Maintain continuity of line and accurate relation of planes and angles. Remove arrises from cut edges, radius edges and corners 0.01565 inch.

C. Prevent corrosion of skylight assembly and adjoining Work; isolate galvanically active metals, and incompatible materials.

D. Welds: Comply with AWS recommendations. Use method and material which will prevent discoloration of exposed work, grind exposed welds smooth and flush, and restore finish.

E. Joints: Securely attached and supported; hairline fit between contacting members of mechanical joints. Ensure free movement between surfaces where thermal, and deflection movement is intended, prevent freeze-up of joint.

F. Fasteners: Concealed unless otherwise acceptable to Architect; where exposed fasteners are acceptable use countersunk Phillips screws, finished to match item fastened.

G. Reinforce work at joints, attachments for other work, and points of support as necessary to comply with performance requirements.
   1. Aluminum members less than 0.125 inch thick: reinforced for fastener, and anchor attachments.

H. Finish: Shop applied to exposed components after fabrication of metal work, sequence to minimize differences between members; uniform overall appearance, variation of paint color and texture will not be accepted.
   1. High Performance Fluorocarbon Coating: AAMA 2605, 70 percent resin content and complying with requirements of Section 08 44 00 for matching appearance to finish work of that Section.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify curbs and assemblies supporting skylights have been coordinate correctly and are ready for skylight installation. Verify coordination with roof assembly, flashing and other weatherproofing components.

3.2 INSTALLATION

A. Install work weathertight, level, plumb, and true, uniform in appearance, with tight joints, sealant reveals, and features indicated; permanently anchor to structure with galvanically compatible, noncorrosive components to comply with performance requirements, and permit necessary movements.
   1. Prevent damage to skylight during installation. Use erection equipment and sequence that will not damage skylight, nor compromise performance, of installed work including glazing and finishes.
   2. Provide protection to prevent damage to roof structure, and other Work during skylight installation.

B. Do not install irregular, damaged, nor defective material, glazing exhibiting edge damage, and material with damaged finishes; do not damage appearance, nor performance of component parts, and skylight assembly due to field fabrication and installation.
   1. Repair of Component Parts: Performed in shop, replace components that cannot be returned to shop and repaired.

C. Provide concealed gaskets, sealants, fillers, pads and sleeves for permanently weathertight assembly, unrestrained at joints intended to accommodate thermal and deflection movements.
   1. Prevent corrosion between galvanically active components, and incompatible materials.
   2. Comply with requirements of Section 07 92 00 for sealers.
   3. Coordinate installation with flashing provided as work of Section 07 62 00 to ensure continuity of components as required for control, collection and drainage to exterior of water entering and occurring within skylight assembly.

D. Keep weeps, gutters, and cavities clean, and free of debris; remove debris as work progresses, use temporary closures to prevent accumulation.
   1. Clean skylight including glazing, remove excess glazing and sealing compound, dirt, and other substances.

3.3 TOLERANCES

A. Maximum Variation from Plumb, Level and Angle: 0.25 inch in 40 feet, and 0.125 inch in 10 feet, except 0.125 inch in 20 for horizontal runs.

B. Maximum Variation in Location: 0.375 inch any member, any location, and 0.125 inch in any 10-foot run.

C. Offsets in Edge-to-Edge, and End-to-End Alignments: 0.125 inch, except 0.0625 inch for members designed to be out-of-flush 0.5 inch and less, and members separated by 2 inches or less.

D. Measurement: Taken from established lines and levels.

E. Provide field testing on five percent of installed area in locations directed complying with AAMA 502 for evaluation of sloped glazing system compliance with System Description requirements. Depending upon initial test results, Architect reserves the right to require testing of more than five percent of installed area without change in contract amount.

F. Protect installed skylights from damage and deterioration other than normal weathering throughout contract time, until final acceptance of work.

END OF SECTION

SECTION 08 71 00 – DOOR HARDWARE

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes items known commercially as door or finish hardware that are required for swing, sliding, and folding doors, except special types of unique hardware specified in the same sections as the doors and door frames on which they are installed.

B. This Section includes the following, but is not necessarily limited to:
1. Door hardware, including electric hardware.
2. Storefront and Entrance door hardware.
3. Low-energy automatic operators and actuators.
4. Gate hardware.
5. Card reader access control devices.
6. Power supplies for electric hardware.
7. Thresholds, gasketing and weather-stripping.

C. Related Sections: The following sections are noted as containing requirements that relate to this Section, but may not be limited to this listing.
1. Division 08: Section - Hollow Metal Doors and Frames.
2. Division 08: Section - Wood Doors.
3. Division 08: Section - Aluminum-Framed Storefronts.
4. Division 08: Section - Automatic Sliding Doors.
5. Division 28: Section - Electronic Access Control.

G. SDI - Steel Door Institute

1.4 SUBMITTALS & SUBSTITUTIONS

A. General: Submit in accordance with Conditions of the Contract and Division 01 Specification sections.

B. Submit product data (catalog cuts) including manufacturers' technical product information for each item of door hardware, installation instructions, maintenance of operating parts and finish, and other information necessary to show compliance with requirements.

C. Submit electronic PDF copies of schedule organized vertically into “Hardware Sets” with index of doors and headings, indicating complete designations of every item required for each door or opening. Include following information:
1. Include a Cover Sheet with:
   a. Job Name, location, telephone number.
   b. Architects name, location and telephone number.
   c. Contractors name, location, telephone number and job number.
   d. Suppliers name, location, telephone number and job number.
   e. Hardware consultant's name, location and telephone number.
2. Job Index information included:
   a. Numerical door number index including; door number, hardware heading number and page number.
   b. Complete keying information (referred to DHI hand-book "Keying Systems and Nomenclature"). Provision should be made in the schedule to provide keying information when available; if it is not available at the time the preliminary schedule is submitted.
   c. Manufacturers' names and abbreviations for all materials.
   d. Explanation of abbreviations, symbols, and codes used in the schedule.
   e. Mounting locations for hardware.
   f. Clarification statements or questions.
   g. Catalog cuts and manufacturer’s technical data and instructions.
3. Vertical schedule format sample:

Heading Number 1 (Hardware group or set number - HW Group #1)				
(a) 1 Single - Door #101 - Corridor 101 to Exterior			(b) 90°	(c) RH
(d) 3'-0" x 7'-0" x 1-3/4" - Wood Door x Hollow Metal Frame - 20 Minute				
(e) 1.	(f) 3 ea	(g) Hinges - (h) 5BB1 4.5 x 4.5 NRP (i) 1/2 TMS	(j) 630	(k) IVE
2.	1 ea	Lockset - ND80P6D x RHO x RH x 10-025 x JTMS	626	SCH
3.	1 ea	Closer - 4040XP x EDA x TBSRT	689	LCN

a) Single or pair of doors with opening number and location.
b) Degree of opening.
c) Hand of door(s).
d) Door/frame dimensions and material; Label requirements, if any.
e) Hardware item line # (Optional).
f) Quantity.
g) Product description.
h) Product part number.

i) Fastenings and other pertinent information.
j) Hardware finish codes per ANSI/BHMA A156.18.
k) Manufacturer abbreviation.

D. Make substitution requests in accordance with Division 01. Substitution requests must be made prior to bid date. Include product data and indicate benefit to the project. Furnish samples of any proposed substitution.

E. Wiring Diagrams: Provide product data and wiring and riser diagrams for all electrical products listed in the Hardware Schedule portion of this section.

F. Keying Schedule: Submit separate detailed schedule indicating clearly how the Owner's final instructions on keying of locks has been fulfilled.

G. Templates for doors, frames, and other work specified to be factory prepared for the installation of door hardware. Check shop drawings of other work to confirm that adequate provisions are made for locating and installing door hardware to comply with indicated requirements.

H. Furnish as-built/as-installed schedule with close-out documents, including keying schedule and transcript, wiring/riser diagrams, manufacturers' installation and adjustment and maintenance information.

I. Fire Door Assembly Testing: Submit a written record of each fire door assembly to the Owner to be made available to the Authority Having Jurisdiction (AHJ) for future building inspections.

J. LEED Certification Points: Submit information and certifications necessary to achieve maximum points for LEED certification; coordinate and cooperate with Owner and Architect in providing information necessary for required LEED rating.

1.5 QUALITY ASSURANCE

A. Obtain each type of hardware (latch and lock sets, hinges, closers, exit devices, etc.) from a single manufacturer.

B. Supplier Qualifications: A recognized architectural door hardware supplier, with warehousing facilities in the project's vicinity, that has a record of successful in-service performance for supplying door hardware similar in quantity, type, and quality to that indicated for this project and that employs an experienced architectural hardware consultant (AHC) who is available to Owner, Architect, and Contractor, at reasonable times during the course of the Work, for consultation.
1. Responsible for detailing, scheduling and ordering of finish hardware.
2. Meet with Owner to finalize keying requirements and to obtain final instructions in writing.
3. Stock parts for products supplied and are capable of repairing and replacing hardware items found defective within warranty periods.

C. Hardware Installer: Company specializing in the installation of commercial door hardware with five years documented experience.

D. Fire-Rated Openings: Provide door hardware for fire-rated openings that complies with NFPA 80 and requirements of authorities having jurisdiction. Provide only items of door hardware that are listed and tested by UL or Warnock Hersey for given type/size opening and degree

of label. Provide proper latching hardware, door closers, approved-bearing hinges and seals whether listed in the Hardware Schedule or not.

1. Where emergency exit devices are required on fire-rated doors, (with supplementary marking on doors' UL labels indicating "Fire Door to be Equipped with Fire Exit Hardware") provide UL label on exit devices indicating "Fire Exit Hardware".

E. Exit Doors: Operable from inside with single motion without the use of a key or special knowledge or effort.

F. Product packaging to be labelled in compliance with CA Prop 65, Safe Drinking Water and Toxic Enforcement Act of 1986.

1.6 DELIVERY, STORAGE AND HANDLING

A. Coordinate delivery of packaged hardware items to the appropriate locations (shop or field) for installation.

B. Hardware items shall be individually packaged in manufacturers' original containers, complete with proper fasteners. Clearly mark packages on outside to indicate contents and locations in hardware schedule and in work.

C. Provide locked storage area for hardware, protect from moisture, sunlight, paint, chemicals, etc.

D. Contractor to inventory door hardware jointly with representatives of hardware supplier and hardware installer until each all are satisfied that count is correct.

1.7 WARRANTY

A. Provide warranties of respective manufacturers' regular terms of sale from day of final acceptance as follows:

1. Locksets: Ten (10) years.
2. Exit devices: Ten (10) years.
3. Closers: Thirty (30) years.
4. Automatic Operators: Two (2) years.
5. Electronic: Three (3) years.
6. All other hardware: Two (2) years.

1.8 MAINTENANCE

A. Maintenance Tools and Instructions: Furnish a complete set of specialized tools and maintenance instructions as needed for Owner's continued adjustment, maintenance, and removal and replacement of door hardware.

1.9 PRE-INSTALLATION CONFERENCE

A. Convene a pre-installation conference at least one week prior to beginning work of this section.

B. Attendance: Architect, Construction Manager, Contractor, Security Contractor, Hardware Supplier, Installer, Key Owner's Personnel, and Project Inspector.

C. Agenda: Review hardware schedule, products, installation procedures and coordination required with related work. Review Owner's keying standards.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

Item	Manufacturer	Acceptable Substitutes
Hinges	Ives	Hager, Stanley, McKinney
Locks, Latches & Cylinders	Schlage	Or Approved Equal
Exit Devices	Von Duprin	Or Approved Equal
Closers	LCN	Or Approved Equal
Flush Bolts & Coordinators	Ives	Trimco
Push, Pulls & Protection Plates	Ives	Trimco
Door Stops	Ives	Trimco
Overhead Stops	Glynn-Johnson	Or Approved Equal
Seals, Bottoms & Thresholds	Zero	Pemko, NGP

2.2 MATERIALS

A. Hinges:
1. Provide hinges conforming to ANSI/BHMA A156.1.
2. Hinges shall be sized in accordance with the following:
   a. Height:
      1) Doors up to 42" wide: 4-1/2 inches.
      2) Doors 43" to 48" wide: 5 inches.
   b. Width: Sufficient to clear frame and trim when door swings 180 degrees.
   c. Number of Hinges: Provide 3 hinges per leaf to 7'-5" in height. Add one for each additional 2 feet in height.
3. Exterior out-swinging hinges shall be non-ferrous material and shall have stainless steel hinge pins. All doors to have non-rising pins.
4. Furnish non-removable pins (NRP) at all exterior out-swing doors and interior key lock doors with reverse bevels.
5. Provide hinges with electrified options as scheduled in the hardware sets. Provide with sufficient number and wire gage to accommodate electric function of specified hardware. Locate electric hinge at second hinge from bottom or nearest to electrified locking component.

B. Continuous Hinges:
1. Provide aluminum geared continuous hinges fabricated from 6063-T6 aluminum conforming to ANSI/BHMA A156.26, Grade 1.
2. Provide split nylon bearings at each hinge knuckle for quiet, smooth, self-lubricating operation.
3. Provide continuous hinges capable of supporting door weights up to 450 pounds, and successfully tested for 1,500,000 cycles.
4. Provide continuous hinges 1” shorter in length than nominal height of door, unless otherwise noted, with symmetrical hole pattern.
5. Install continuous hinges with fasteners supplied by manufacturer.

C. Heavy Duty Cylindrical Locks and Latches: Schlage "ND" Series as scheduled with "Rhodes" lever design.
   1. Provide cylindrical locks conforming to ANSI/BHMA A156.2 Series 4000, Grade 1, and UL Listed for 3 hour fire doors.
   2. Provide cylindrical locksets exceeding the ANSI/BHMA A156.2 Grade 1 performance standards for strength, security, and durability in the categories below:
      a. Abusive locked lever torque – minimum 3,100 inch-pounds without gaining access.
      b. Offset lever pull – minimum 1,600 foot pounds without gaining access.
      c. Vertical lever impact – minimum 100 impacts without gaining access.
      d. Cycle Test – tested to minimum 16 million cycles with no visible lever sag; without the use of performance aids such as set screws or spacers.
   3. Cylinders: Refer to “KEYING” article, herein.
   4. Provide locks with standard 2-3/4” backset, unless noted otherwise, with 1/2” latch throw. Provide proper latch throw for UL listing at pairs.
   5. Provide locksets with separate solid steel anti-rotation thru-bolts, and no exposed screws.
   6. Provide independently operating levers with two external return spring cassettes mounted under roses to prevent lever sag.
   7. Provide standard ASA strikes unless extended lip strikes are necessary to protect trim.
   8. Lever Trim: Solid cast levers without plastic inserts and wrought roses on both sides.
   9. Provide levers with vandal resistant technology as scheduled for use at abusive applications.
   10. Provide wired electrified options as scheduled in the hardware sets.
      a. 12 or 24 volt DC auto-detecting operating capability.
      b. Selectable EL (fail safe) or EU (fail secure) operating mode via switch on chassis.
      c. 0.23A (230mA) maximum current draw.
      d. 0.01A (10mA) holding current.
      e. Modular request to exit (RX) switch.

D. Exit devices: Von Duprin as scheduled.
   1. Provide exit devices tested to ANSI/BHMA A156.3 Grade 1 and UL listed for Panic Exit or Fire Exit Hardware.
   2. Provide certificate by independent testing laboratory that device has completed over 1,000,000 cycles and can still meet ANSI/BHMA A156.3 standards.
   3. Provide touchpad type exit devices, fabricated of brass, bronze, stainless steel, or aluminum, plated to standard architectural finishes to match balance of door hardware.
   4. Provide exit devices cut to door width and height. Touchpad must extend a minimum of one half of door width. No plastic inserts are allowed in touchpads.
   5. Mount mechanism case flush on face of doors, or provide spacers to fill gaps behind devices. Where glass trim or molding projects off face of door, provide glass bead kits.
   6. Provide flush end caps for exit devices.
   7. Exit devices shall comply with CBC Section 11B-404.2.7 and shall be mounted between 34" and 44" above the finished floor surface.
   8. Provide exit devices UL certified to meet 5 lbs. maximum unlatching force requirements according to the CBC Section 11B-309.4.
   9. Cylinders: Refer to “KEYING” article, herein.
   10. Provide cylinder or hex-key dogging as specified at non fire-rated openings.
   11. Provide exit devices with deadlatching feature for security and for future addition of alarm kits and/or other electrified requirements.
   12. Provide exit devices with optional trim designs to match other lever and pull designs used on the project.

13. Provide factory drilled weep holes for exit devices used in full exterior application, highly corrosive areas, and where noted in hardware sets.
14. Provide exit devices with manufacturer's approved strikes.
15. Provide electrified options as scheduled.

E. Closers: LCN as scheduled.
1. Provide door closers conforming to ANSI/BHMA A156.4 Grade 1 requirements by BHMA certified independent testing laboratory. ISO 9000 certify closers. Stamp units with date of manufacture code.
2. Provide door closers with fully hydraulic, full rack and pinion action with high strength cast iron cylinder, and full complement bearings at shaft.
3. Provide certificate by independent testing laboratory that door closers have completed over 10,000,000 cycles and can still meet ANSI/BHMA A156.4 standards.
4. Cylinder Body: 1-1/2" diameter with 3/4" diameter double heat-treated pinion journal.
5. Hydraulic Fluid: Fireproof, passing requirements of UL10C, and requiring no seasonal closer adjustment for temperatures ranging from 120° F to -30° F.
6. Spring Power: Continuously adjustable over full range of closer sizes, and providing reduced opening force as required by accessibility codes and standards.
7. Hydraulic Regulation: By tamper-proof, non-critical valves, with separate adjustment for latch speed, general speed, and backcheck.
8. Provide closers with solid forged steel main arms and factory assembled heavy-duty forged forearms for parallel arm closers.
9. Pressure Relief Valve (PRV) Technology: Not permitted.
10. Provide door closers powder coated to match balance of door hardware. Powder coating finish shall be certified to exceed 100 hours salt spray testing as described in ANSI/BHMA A156.4 and ASTM B117.
11. Provide special templates, drop plates, mounting brackets, or adapters for arms as required for details, overhead stops, and other door hardware items interfering with closer mounting.

F. Electro Mechanical Automatic Operators: LCN Senior Swing as scheduled.
1. Provide low energy automatic operator units that are electro-mechanical design complying with ANSI/BHMA A156.19.
2. Opening: Powered by DC motor working through reduction gears.
3. Closing: Spring force.
4. Manual, hydraulic, or chain drive closers: Not permitted.
5. Operation: Motor is off when door is in closing mode. Door can be manually operated with power on or off without damage to operator. Provide variable adjustments, including opening and closing speed adjustment.
6. Cover: Aluminum.
7. Provide units with manual off/auto/hold-open switch, push and go function to activate power operator, vestibule interface delay, electric lock delay, hold-open delay adjustable from 2 to 30 seconds, and logic terminal to interface with accessories, mats, and sensors.
8. Provide drop plates, brackets, or adapters for arms as required to suit details.
9. Provide hard-wired actuator switches for operation as specified. Provide weather-resistant actuators at exterior applications.
10. Provide complete assemblies of controls, switches, power supplies, relays, and parts/material recommended and approved by manufacturer of automatic operator for each individual leaf. Actuators control both doors simultaneously at pairs. Sequence operation of exterior and vestibule doors with automatic operators to allow ingress or egress through both sets of openings as directed by Architect. Locate actuators, key switches, and other controls as directed by Architect.
11. Provide caution signs as described in ANSI/BHMA A156.19.

G. Flush Bolts & Dust Proof Strikes:
1. Automatic flush bolts shall be of the low operating force design.
2. Provide top bolt only model for interior doors where applicable and as permitted by testing procedures.
3. Provide dust proof strikes at openings using bottom bolts.
4. Manual flush bolts shall only be permitted on storage or mechanical openings, as scheduled.

H. Door Stops:
1. Unless otherwise noted in hardware sets, provide floor or wall type with appropriate fasteners. Where neither floor or wall type can be used, provide overhead type.
2. Do not install floor stops more than four (4) inches from the face of the wall or partition (CBC Section 11B-307).
3. Provide backing plate at wall framing behind wall type.
4. Overhead stops shall be made of stainless steel and non-plastic mechanisms and finished metal end caps. Field-changeable hold-open, friction and stop-only functions. Stop-only function shall be provided at fire-rated openings.

I. Protection Plates:
1. Provide kick, mop, and/or armor plates minimum of 0.050” thick, with four beveled edges. Furnish with sheet metal or wood screws, finished to match plates.
2. Kick plates shall be sized 10" high and 2" less door width (LDW) at single doors and 10” high and 1” LDW at pairs or doors.

J. Thresholds: As scheduled and per details.
1. Thresholds shall not exceed 1/2" in height, with a beveled surface of 1:2 maximum slope. Thresholds shall comply with CBC Section 11B-404.2.5.
2. Set thresholds in a full bed of butyl-rubber or polyisobutylene mastic sealant complying with requirements in Division 07 “Thermal and Moisture Protection”.
3. Use 1/4” fasteners, red-head flat-head sleeve anchors (SS/FHSL).

K. Seals: Provide silicone gasket at all rated and exterior doors.
1. Smoke & Draft Control Doors: Provide UL10C Classified gasketing that complies with NFPA 80 & NFPA 252 for use on “S” labeled Positive Pressure door assemblies.

2.3 KEYING

A. Furnish a Proprietary Schlage masterkey system as directed by the Owner or architect. Key system to be designated and combinated by the Schlage Master Key Department even if pinned by the Authorized Key Center, Authorized Security Center or a local authorized commercial dealer.

B. A detailed keying schedule is to be prepared by the Owner and/or architect in consultation with a representative of Allegion or an Authorized Key Center or Authorized Security Center. Each keyed cylinder on every keyed lock is to be listed separately showing the door #, key group (in BHMA terminology), cylinder type, finish and location on the door.

C. Furnish all cylinders in the Schlage Full Size Interchangeable Core (FSIC) style. Pack change keys independently (PKI).

D. Furnish construction keying for doors requiring locking during construction.

E. Furnish all keys with visual key control.

1. Stamp key “Do Not Duplicate”.
2. Stamp (BHMA) key symbol on key.
3. Stamp unique owner identifier from the key bow.

F. Furnish mechanical keys as follows:
1. Furnish 2 cut change keys for each different change key code.
2. Furnish 1 uncut key blank for each change key code.
3. Furnish 6 cut masterkeys for each different masterkey set.
4. Furnish 3 uncut key blanks for each masterkey set.
5. Furnish 2 cut control keys cut to the top masterkey for permanent I/C cylinders.
6. Furnish 1 cut control key cut to each SKD combination.

G. Furnish Schlage Padlocks and the cylinders to tie them into the masterkey system for gates, storage boxes, utility valve security, roof hatches and roll-up doors keyed as directed in the keying schedule.
1. Furnish KS43F3200 padlock for use with FSIC Schlage cylinders. Furnish 23-030 (FSIC core) with padlock above.

H. Furnish one Schlage cabinet lock for each cabinet door or drawer so designated on the drawings or keying schedule to match the masterkey system.
1. Furnish CL777R for use with FSIC Schlage cylinders.

2.4 FINISHES

A. Generally to be satin chrome US26D (626 on bronze and 652 on steel) unless otherwise noted.

B. Furnish push plates, pull plates and kick or armor plates in satin stainless steel US32D (630) unless otherwise noted.

C. Door closers shall be powder-coated to match other hardware, unless otherwise noted.

D. Aluminum items to be finished anodized aluminum except thresholds which can be furnished as standard mill finish.

2.5 FASTENERS

A. Screws for strikes, face plates and similar items shall be flat head, countersunk type, provide machine screws for metal and standard wood screws for wood.

B. Screws for butt hinges shall be flathead, countersunk, full-thread type.

C. Fastening of closer bases or closer shoes to doors shall be by means of sex bolts and spray painted to match closer finish.

D. Provide expansion anchors for attaching hardware items to concrete or masonry.

E. All exposed fasteners shall have a phillips head.

F. Finish of exposed screws to match surface finish of hardware or other adjacent work.

G. All Exit Devices and Lock Protectors shall be fastened to the door by the means of sex bolts or through bolts.

PART 3 - EXECUTION

3.1 INSPECTION

A. Verify that doors and frames are square and plumb and ready to receive work and dimensions are as instructed by the manufacturer.

B. Beginning of installation means acceptance of existing conditions.

C. Fire-Rated Door Assembly Inspection: Upon completion of the installation, all fire door assemblies shall be inspected to confirm proper operation of the closing device and latching device and that only the manufacturer's furnished fasteners are used for installation and that it meets all criteria of a fire door assembly per NFPA 80 (Standard for Fire Doors and Other Opening Protectives). A written record shall be maintained and transmitted to the Owner to be made available to the Authority Having Jurisdiction (AHJ). The inspection of the swinging fire doors shall be performed by a certified FDAI (Fire Door Assembly Inspector) with knowledge and understanding of the operating components of the type of door being subjected to the inspection. The record shall list each fire door assembly throughout the project and include each door number, an itemized list of hardware set components at each door opening, and each door location in the facility.

3.2 INSTALLATION

A. Install hardware in accordance with manufacturer's instructions and requirements of DHI.

B. Use the templates provided by hardware item manufacturer.

C. Mounting heights for hardware shall be as recommended by DHI. Operating hardware shall be located between 34" and 44" above finish floor to comply with CBC Section 11B-404.2.7.

D. Door Closers:
1. Place door closers inside building, stairs, rooms, etc. Closers shall be installed to permit doors to swing 180 degrees or maximum allowable by conditions.
2. Maximum effort to operate closers shall not exceed 5 lbs., such pull or push effort being applied at right angles to hinged doors.
3. When fire doors are required, the maximum effort to operate the closer may be increased but shall not exceed 15 lbs. when specifically approved by fire marshal.
4. All closers shall be adjusted to operate with the minimum amount of opening force and still close and latch the door. These forces do not apply to the force required to retract latch bolts or disengage other devices that hold the door in a closed position.
5. Compensating devices or automatic door operators may be utilized to meet the above standards.
6. Per CBC Section 11B-404.2.8.1, doors shall take minimum of 5 seconds to move from an open position of 90 degrees to 12 degrees to the latch jamb.

E. Set units level, plumb and true to line and location. Adjust and reinforce the attachment substrate as necessary for proper installation and operation.

F. Drill and countersink units that are not factory-prepared for anchorage fasteners. Space fasteners and anchors in accordance with industry standards.

G. Set thresholds for exterior doors in full bed of butyl-rubber sealant.

H. If hand of door is changed during construction, make necessary changes in hardware at no additional cost.

I. Electronic Hardware:
1. Hardware Installer shall coordinate with security contractor to route cable to connect electrified locks, panic hardware and fire exit hardware to power transfers or electric hinges at the time these items are installed so as to avoid disassembly and reinstallation of hardware.
2. Hardware Installer shall also be present with the security contractor when the power is turned on for the testing of the electronic hardware applications. Installer shall make adjustments to solenoids, latches, vertical rods and closers to insure proper and secure operation.
3. All wiring for electro-mechanical hardware mounted on the door shall be connected through the power transfer and terminated in the interface junction box specified for in the Electrical Section.
4. Conductors shall be minimum 18 gage stranded, multicolored. A minimum 12 in. loop of conductors shall be coiled in the interface junction box. Each conductor shall be permanently marked with its function.
5. If a power supply is specified in the hardware sets, all conductors shall be terminated in the power supply. Make all connections required for proper operation between the power supply and the electro-mechanical hardware. Provide the proper size conductors as specified in the manufacturer’s technical documentation.

3.3 ADJUST AND CLEAN

A. Adjust and check each operating item of hardware and each door, to ensure proper operation or function of every unit. Replace units which cannot be adjusted to operate freely and smoothly as intended for the application made.

B. Clean adjacent surface soiled by hardware installation.

C. Final Adjustment: Wherever hardware installation is made more than one month prior to acceptance or occupancy, return to that work area and make final check and adjustment of all hardware items in such space or area. Clean operating items as necessary to restore proper function and finish of hardware and doors. Adjust door control devices to compensate for final operation of heating and ventilating equipment.

D. Instruct Owner's Personnel in proper adjustment and maintenance of hardware finishes, during the final adjustment of hardware.

E. Continued Maintenance Service: Approximately six months after the completion of the project, the Contractor accompanied by the Architectural Hardware Consultant, shall return to the project and re-adjust every item of hardware to restore proper functions of doors and hardware. Consult with and instruct Owner's personnel in recommended additions to the maintenance procedures. Replace hardware items which have deteriorated or failed due to faulty design, materials or installation of hardware units. Prepare a written report of current and predictable problems (of substantial nature) in the performance of the hardware.

3.4 HARDWARE LOCATIONS

A. Conform to CCR, Title 24, Part 2; ADA Standards; and the drawings for access-compliant positioning requirements for the disabled.

3.5 Field quality control

A. Contractor is responsible for providing the services of an Architectural Hardware Consultant (AHC) or a proprietary product technician to inspect installation and certify that hardware and its installation have been furnished and installed in accordance with manufacturers' instructions and as specified herein.

3.6 HARDWARE SCHEDULE

A. The items listed in the following schedule shall conform to the requirements of the foregoing specifications.

B. While the hardware schedule is intended to cover all doors, and other movable parts of the building, and establish type and standard of quality, the contractor is responsible for examining the Plans and Specifications and furnishing proper hardware for all openings whether listed or not. If there are any omissions in hardware groups in regard to regular doors they shall be called to the attention of the Architect prior to bid opening for instruction; otherwise, list will be considered Complete. No extras will be allowed for omissions.

C. The Door Schedule on the Drawings indicates which hardware set is used with each door.

MANUFACTURERS ABBREVIATIONS

GLY	=	Glynn-Johnson	Overhead Stops
IVE	=	Ives	Hinges, Door Pulls, Flush Bolts, Coordinators, Door Stops, Kick Plates & Silencers
LCN	=	LCN	Door Closers & Automatic Operators
LOC	=	Locinox	Gate Closers
SAT	=	Stanley Access	Automatic Sliding Doors

- END OF SECTION -

SECTION 08 81 00 – GLASS AND GLAZING

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes requirements for shop and field glazing of frames, doors and openings throughout the Project.
   1. Install glazing gaskets furnished by other Sections.

B. Related Sections:
   1. Section 08 14 00 Wood Doors.
   2. Section 08 32 13 Glazed Sliding Stacking Doors.
   3. Section 08 34 00 Special Function Doors.
   4. Section 08 41 00 Interior Aluminum Entrances and Storefront.
   5. Section 08 42 29 Automatic Sliding Entrances.
   6. Section 08 63 00 Metal-Framed Skylights.
   7. Section 10 23 10 Glazed Interior Wall Systems.

C. Definitions:
   1. Hazardous Locations: California Building Code Title 24 Part 2 Section 2406.4.1 through 2406.4.7.

1.2 ADMINISTRATIVE REQUIREMENTS

A. Preinstallation Conference: Coordinate with requirements of Section 08 41 00 for glazing of aluminum fenestration assemblies, Section 08 63 00 for glazing of skylights and coordination with other components and assemblies of the building cladding,
   1. Review and confirm Contractor's Project Schedule and work sequence.
   2. Integration of glazing provided as work of this Section with casework assemblies including but not necessarily limited to those indicated on A###, A### and A###.
   3. Coordinate fittings, glass preparation and installation requirements with work of steel fabrications for glazing at interior glass wall partitions.

1.3 SUBMITTALS

A. Product Data: Required for each product to be incorporated into the Work.

B. Shop Drawings: Provide for each glazing assembly required.
   1. Calculations: Provide for Exterior and Interior glazing assemblies to demonstrate compliance with Performance Requirements.
   2. Glazing Assembly Schedule: Coordinated with submittals required in Section 08 41 00 and Related Sections referenced above; indicate glazing assembly to be provided for each frame and location on the building.

C. Samples: Two samples nominal 12 inches by 12 inches for each glazing assembly required for the Work.
   1. Provide individual samples of glass products being incorporated into glazing assembly as directed and as otherwise necessary to demonstrate material compliance with Source Quality Control color and distortion testing requirements.

2. Glazing Film First in Place Sample: In location directed provide sample for review and acceptance of installation and appearance prior to start of final work.

D. Certificates: Document that glazing materials furnished comply with Project requirements.

1.4 QUALITY ASSURANCE

A. Contractor responsibility to provide Work complying with contract requirements shall not be altered by statements made in referenced standards and documents.
1. Flat Glass Marketing Association Glazing Manual.
2. Safety Glazing Standard: Comply with ANSI Z97.1 and testing requirements of 16 CFR Part 1201 for category II materials.

B. Fabricator and Installer Qualifications: Ten years successful experience with fabrication and installation of glazing work similar in material, design, and extent to that required for this Project. When directed provide records of representative work including warranty and in-service performance of previous work.
1. Glaziers for this Project: Certified under the National Glass Association, Glazier Certification Program as Level 2 (Senior Glaziers) or Level 3 (Master Glaziers).
2. Applicator of field applied glazing film, certified by the manufacturer as qualified to perform the installation required.

1.5 DELIVERY STORAGE AND HANDLING

A. Store and handle products in accordance with written recommendations of manufacturer, and fabricator, and to prevent damage to glass, including edges.

1.6 WARRANTY

A. Special Warranty for Glazing: Signed by the Fabricator, and agree to furnish replacements for defective glazing at no cost to the Owner for the glazing assembly types and time periods below. Defective glazing includes, but is not limited to, failure due to weakening edge characteristics shown identified in FGMA Glazing Manual, and as determined by the Architect.
1. Laminated Glazing: Five years.

B. Special Warranty for Installation: Signed by glazier and installer of work of related Section to receive the glazing assembly agreeing upon receipt of written notice of defective work and work not in compliance with Project requirements to provide all labor necessary to install replacement glazing furnished by the fabricator at no cost to the Owner for the warranty term.
1. Warranty Term: Three years.

PART 2 - PRODUCTS

2.1 SYSTEM DESCRIPTION

A. Design Requirements: Glazing when installed in the required assembly capable of withstanding the stresses imparted in accordance with the Performance Requirements, IBC Chapter 24 Glass and Glazing requirements, and service conditions reasonably anticipated for the Work without deterioration, damage or failure.

1. Contractor shall analyze Project loads, glazing assembly sizes and configurations and in-service conditions and provide glass of the thickness and type required for each assembly as necessary to comply with Code requirements and ASTM E 1300 for required criteria. In no case shall glass be less than 0.25 inch thick. Provide heavier glazing, heat treated glass and laminated units as necessary to resist stresses and forces incidental to the required conditions of service.
2. Glazing in Hazardous Location as defined in this Section shall comply with Performance Requirements for Safety Glazing.
3. Sealant: Provide clear silicone sealant complying with Section 07 92 00 requirements; provide structural grade sealant where required for joint type or configuration indicated. Exposed edges of glazing shall be polished and finished smooth, edge of laminated glazing not captured by framing shall be fully covered by sealant.

B. Performance Requirements: For loads conforming to the criteria in the General Structural Notes and as follows.
1. Deflection Limit: Comply with CBC Section 2403.3 for Exterior assemblies and Section 2403.4 for Interior assemblies.
2. Probability of Breakage for Vertical Glazing: 8 lights per 1000 for lights set not more than 15 degrees off vertical and under wind action with 60 second load duration.
3. Probability of Breakage for Sloped Glazing: 1 light per 1000 for lights set more than 15 degrees off vertical and under wind load with 60 second duration, except 5 days for snow load.
4. Safety Glazing: ANSI Z97.1 and testing requirements of 16 CFR Part 1201 for category II materials. Field applied films are not acceptable for compliance with this requirement.
5. Sound Transmission Loss of Acoustic Glazing: Glazing assembly having ASTM E90 STC value necessary for the glazed assembly to comply with required performance values when evaluated per ASTM E966.

2.2 MATERIALS

A. Glazing Assemblies: Product of one fabricator for each type required. Fabricate glass to sizes necessary for glazing of openings as required, with edge clearances and tolerances complying with recommendations of glass manufacturer and requirements of this Section.

B. Primary Glass Products: Product of one manufacturer for each variety; comply with ASTM C 1036.
1. Clear Float Glass: Type I, Class 1, Quality q3.

C. Heat-Treated Primary Glass Products: ASTM C 1048, by horizontal method with roller wave distortion parallel to bottom edge of glass. Provide fully tempered glass for glazing in hazardous locations except where laminated safety glazing is required. Heat treat glass where necessary to resist thermal stresses induced by differential shading of individual glass lights and for all lights 35 square feet and larger. Fabricate to size and configuration required with penetration and edge work completed prior to heat treating.
1. Tempered Safety Glazing: Comply with Performance requirements.

D. Coated Glass: Provide for clear float glass and other substrates as necessary for the performance and appearance required; coating on number 2 surface except as required for pyrolytic Low-E coating.
1. Low-E 1: Neutral color, Vitro Solarban 70, or approved.
2. One-inch, Low-E Insulating Glass Unit to meet the following (minimum) performance standards:

a. Winter Nighttime NFRC / U-Value: 0.28.
b. Solar Heat Gain Coefficient (SHGC): 0.27.
c. Light to Solar Gain (LSG) ratio of 2.33.
d. Visible Light Transmission: 64 %.
e. Visible Light Reflectance (Outside): 12%.
f. Visible Light Reflectance (Inside): 13%.
g. Total Solar Transmittance: 25%.
h. Total Solar Reflectance: 52%.
i. UV Transmittance: 6%.

3. Ceramic Frit: Opaque or transparent coating applied by roll or silkscreen process as necessary for required appearance; apply to heat treated substrate as recommended for the coating type and glazing assembly required.
4. Silicone Coated Spandrel Glass: Heat Strengthened or Fully Tempered per the coating manufacturer's recommendation for light size, configuration and assembly type required.

E. Laminated Architectural Flat Glass: Heat and pressure process to fuse glass to interlayer conforming to ASTM C 1172. Provide a minimum interlayer thickness of 0.060 inch; clear polyvinyl butyral (PVB) interlayer or clear ionic cross-linked thermoplastic ionomer as necessary for applications required.
1. Acoustic Glazing: As necessary for compliance with performance requirements for glazed acoustical assembly. At a minimum provide two lights for each glazing unit; one light having two layers of 0.1875 glass laminated together, and a second light having two layers of 0.125-inch-thick glass laminated together and assembled per IGU requirements.
2. Sloped Glazing: Two laminated panes each 0.25-inch clear tempered float.
3. UV Control Glazing: Filter out 99 percent of UV radiation below 380 nanometers (nm). Two panes each 0.25-inch clear float laminated to 0.030 thick clear UV absorbing interlayer (Monsanto Saflex).
4. Privacy Glass: Two sheets 7/32-inch Laminate high purity float glass with vision obscuring interlayer, Northwestern Industries, Inc. Sandwhite 0.030 LAM.
5. Translucent Glazing: Balanced assembly of two sheets of high purity float glass with vision obscuring interlayer, Northwestern Industries, Inc. White Diffuse 030 LAM, nominal 0.25 inch thick overall.
6. Laminated Safety Glazing: Comply with Performance Requirements.
7. Privacy Glass: Two sheets 0.25 inch thick, high-purity float, laminated with 0.060 white diffuse polyvinyl interlayer, Vanceva Arctic Snow, color code 0009. Comply with definition for safety glass in locations required.
8. Specialty Glass, Type GL-XX: Two panes of tempered clear float with custom graphics interlayer, overall thickness 0.5-inch-thick minimum.

F. Applied Privacy Glazing Film: Visible Light Transmittance 69 percent, shading Coefficient .82; CP Films, Llumar NRM PS2 Frosted.

G. Mirrors: Fabricate to sizes and configurations required to ASTM C1503 standard manufactured using copper-free, low-lead mirror coating process.
1. Annealed Monolithic Glass Mirrors: Mirror Select Quality, low-iron float glass with a minimum 91 percent visible light transmission.
2. Mirror M-1, Frameless type.
a. Size: As indicated in Drawings and shown in approved Shop Submittal, with radiused corners.
b. Nominal Thickness: 6.4 mm or unless otherwise indicated.
c. Edge: Beveled, unless indicated otherwise in Drawings

3. Mounting Hardware: J-Shaped Mirror Bar mounting channel: provide in single piece, continuous along bottom [bottom and top] of flat, polished-edge frameless mirror in [stainless steel] [polished chrome] [satin nickel] finish.

2.3 ACCESSORIES

A. Gaskets: Provide as necessary for glazed opening; black unless otherwise indicated
   1. Dense Compression Seal: ASTM C 864, neoprene, EPDM, or thermoplastic polyolefin rubber.
   2. Cellular Elastomeric Preformed: ASTM C 509, Type II, extruded or molded neoprene.

B. Glazing Tape: ASTM C 1281; preformed, closed cell, tape sealant recommended by manufacturers of tape and glass for each Project specific installation required.
   1. Fire Rated Glazing: Provide as necessary for compliance with Performance Requirements and UL assembly listing.

C. Cleaners, Primers and Sealers: Type recommended by manufacturer of gaskets, and tape.

D. Blocks and Spacers: Neoprene, EPDM or silicone as necessary for compatibility with glazing sealants.
   1. Hardness: 90 Shore A for setting blocks, and as recommended by glass and sealant manufacturers.

E. Filler Rods: Closed-cell synthetic rubber, or plastic foam, 25 percent compression at five to ten psi.

F. Sealants: Comply with Section 07 92 00 requirements for joint types required.
   1. Fire Rated Glazing: Provide type recommended by manufacturer and as necessary for compliance with UL assembly listing.

2.4 SOURCE QUALITY CONTROL

A. Glass Color Testing: Measure monolithic coated glass and coated insulting glass units.
   1. Color Target: Established per approved samples conforming to specified tolerance.
   2. Color Measurement: Calibrated, off-line spectrophotometer (Minolta 2500d / 2600d or equal); measure uncoated side of glass in the central area. Measure the first 15 panes/ units to establish the color target, then measure a minimum of 1 pane / unit every four (4) hours and each product change.
   3. Tolerances for color variation shall be less than 4.5 DE.
   4. Document and record result of each color measurement performed. Tag each pane / unit of glass that falls outside of the maximum color variation limits and certify that non-conforming glass will not be fabricated and or supplied to the Project.
   5. Perform on-line continuous color measurements.
   6. Perform quality control checks using off-line measurement instrumentation every 4 hours or product change.

B. Distortion Testing: Measure each pane of monolithic uncoated and coated heat-treated glass used in the Project.
   1. Measurement Device: LiteSentry measurement system, or equal.
   2. Horizontal Roll Wave: Millidopeter Criteria: (90% surface) Maximum + or – 120 A overall, or the highest overall measurement from the approved visual mock-up that is less than + or – 120 A overall, whichever is less.

3. Bow/Warp Tolerance: Tolerance as described herein.
4. Measure every hour on a vertical plane with an aluminum or other type of straight edge.
5. Documentation: Document and record results for each pane
   a. Tag each pane of glass that falls outside of the maximum distortion limits and certify that these non-conforming glass panes will not be fabricated and supplied to the Project.
   b. Provide written documentation of the Roll Wave and Millidopeter measurements of the glass used in visual mock-ups before the mock-ups are reviewed by the Owner and Architect for approval.
   c. Provide additional written documentation upon request by the Owner or Architect.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Inspect glass prior to and during installation; discard pieces with edge characteristics that could affect glass performance.

B. Examine frames to receive glazing for compliance with recommended tolerances, face and edge clearances, and general proper installation. Notify Contractor in writing of unacceptable conditions, and do not proceed with glazing where conditions have not been corrected.

3.2 INSTALLATION

A. Comply with FGMA Glazing Manual, and instructions of manufacturers of glass, and gaskets, to achieve air, and watertight performance.
   1. Provide safety glazing in individual lights, laminated and insulated glazing units per System Description requirements.

B. Prevent damage to glass edges during installation. Use rolling blocks, suction cups, wedges and other devices for proper handling of glass.

C. Set units of glass in each series with uniformity of pattern, draw, bow and similar characteristics.

D. Setting Blocks: Properly sized for glazing unit; locate at quarter points of unit width.

E. Cleaning: As recommended by glass fabricator and manufacturer. Wash both faces within four days of scheduled inspection intended to establish date of substantial completion.

F. Protect glass from contact with deleterious contaminants; immediately remove contaminants using method approved by glass manufacturer, and fabricator.

G. Glazing Film: Apply with continuous, permanent bond to glazing substrate; film shall be free of visual and surface imperfections and have a uniform appearance throughout the entire installation.

H. Installation Conditions: Some conditions of installation may represent a departure from conventional applications of certain glazing materials. Review each application and provide glass products and assemblies which are suited to the required use. Such applications may

include heat treatment of glazing to enhance strength, supplemental back-coating of spandrel glazing to ensure uniform opacity (eliminate pin holes and variations in coating density) and similar fabrication measures.

3.3 SCHEDULE OF GLAZING ASSEMBLY TYPES

A. Locations, Dimensions, and Quantities: As indicated for each type incorporating glass products specified.
   1. Type GL-1: One-inch Insulating Glass Unit:
      a. Exterior lite: 0.25-inch Vitro Clear glass with Vitro Solarban 70 on S#2, tempered where required.
      b. Air gap: 0.50-inch.
      c. Interior Lite: 0.25-inch Vitro Clear glass.
   2. Type GL-2: As GL-1 above, with ceramic frit on number three surface, tempered where required.
      a. Frit Pattern: As indicated on Drawings.
      b. Color 1: TBD.
      c. Provide blank margins where recommended for location of the coated surface in the glazing assembly Type.
   3. Type GL-3: Single glazed tempered in thickness required, not less than 0.5-inch.
   4. Type GL-4: Single glazed spandrel in thickness required, not less than 0.5-inch Opacifier or Glass pattern as indicated on Drawings.
   5. Type E: Sloped Glazing.
      a. Outboard Light: Tempered coated tinted float.
      b. Inboard Light: Laminated sloped glazing.
   6. Type M - Mirror (M1): Frameless. Reference 2.2.G. above.

END OF SECTION

SECTION 09 05 00 – MOISTURE CONTROL SYSTEM

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes requirements for applied system to mitigate moisture levels and prevent adverse effect of elevated pH on applied finish floor covering for both new and existing Portland cement concrete slabs whether elevated or grade supported.

1.2 ADMINISTRATIVE REQUIREMENTS

A. Preinstallation Conference: Review installation requirements for finish floor coverings and applied floor coatings; with the installers, identify criteria specific to each product and system for substrate acceptance relative to vapor emission and pH. Identify proposed mitigation measures will ensure acceptable conditions and moisture system compatibility with adhesives and coatings required for the Work.
   1. Provide coordination of Project conditions, work sequence and schedule and requirements for subsequent applied coatings and finishes.

1.3 SUBMITTALS

A. Provide complete data and application narrative for proprietary components.

B. Moisture Control System Narrative: Identify each component to be applied as work of this Section and basic function for each in mitigating conditions that may otherwise delay or prevent installation of subsequent work as required. Identify optional and accessory components to adapt a standard system to conditions anticipated to be encountered in the Work.

C. Quality Assurance Submittals: Demonstrate compliance with Preinstallation Conference requirements for verification of substrate conditions and materials compatibility.
   1. Manufacturer and Installer Certification that products provided as work of this Section are compatible with applied finish floor covering work of Division 9 Sections.

1.4 QUALITY ASSURANCE

A. Installer Qualifications: Specialist in application of moisture control systems similar to those required for the Work with specific experience with the manufacturer of the products to be used as work of this Section and as necessary to qualify for the required extended warranty.
   1. Written approved or similar documentation of applicator’s qualifications from the manufacturer of the moisture control system proposed for us as work of this Section.

B. Manufacturer's Field Quality Control Agent: Possess expert knowledge of the products being used including preparation, installation and warranty requirements. Shall have authority to certify that underlayment installation qualifies with the manufacturer's requirements for the application required.

C. Preparatory Testing of flooring Substrates: Technician current certification by International Concrete Repair Institute as a Concrete Slab Moisture Testing Technician and otherwise be familiar with testing methods and procedures for the work and fully capable of producing consistent and accurate test data with including but not limited to expertise in the following.
   1. ASTM F 1896 MVER moisture vapor emission rate.
   2. ASTM F 2170 rH of concrete substrates.
   3. ASTM F 2659 electronic moisture meter measurements.
   4. ASTM F 710 pH assessment of concrete substrate.
   5. ASTM F 2170 testing methodology and protocols.

1.5 SPECIAL WARRANTY

A. Manufacturer’s extended system warranty: guarantee moisture control system provided as work of this Section shall remain in compliance with Project requirements that finish floor coverings remain free of failure and defects due to vapor content, pH and related performance factors for a period of not less than five years following substantial completion.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Moisture Control System: Subject to coordination and verification of compatibility with applied finish flooring work products of Ardex are the basis of design and shall establish minimum acceptable performance properties. Provide additional characteristics as necessary to conform to the Project schedule and accommodate Project specific conditions encountered in the course of the Work.

B. Basis of Design: ARDEX MC Ultra Moisture Control System.
   1. Primer: Ardex MC Ultra Primer with sand aggregate.
   2. Seal Coat: Ardex MC Ultra Sealer with sand aggregate.

C. ? Compatible with the finish floor covering and installation materials required. Subject to Contractor's determination of methods to be utilized and compatibility with flooring, acceptable vapor emission control coatings utilizing two-component 100 percent solids epoxy technology or other chemistry complying with STM F 3010 may include products of Ardex, Koster, Sinak, Floor Seal Technology or approved.

PART 3 - EXECUTION

3.1 PREPARATION

A. Verify substrate conditions; correct unacceptable conditions per the manufacturer's published procedures and field recommendations of manufacturer's field quality control agent and ensure compliance of completed work with extended warranty requirements of this Section.
   1. Substrate Joints and Cracks: Correct each category of joint and crack per manufacturer’s recommendations including but not limited to stable and active conditions, control joints, work stoppage joints and similar conditions that may adversely affect performance or durability of the Work.

B. Preparation and Testing of Floors: Remove incompatible coatings and surface irregularities. Patch and level substrate as necessary. Establish final surface that will ensure optimum and durable mechanical and adhesive bonds for flooring.
   1. Perform pH, bond and moisture tests per ASTM F 710 and ASTM F 2170 with a sampling not less than one for every 800 to 1,000 square feet of installation area and determine compliance of substrate conditions with the floor manufacturer's requirements.
   2. Concrete surfaces shall be primed and otherwise treated in accordance with the finish flooring manufacturer's recommendations for the installation required by the Contract Documents.

C. Substrate Moisture Content and pH Level: Contractor responsibility to ensure that moisture content and pH level of bonding substrate at the time the flooring installation is scheduled to occur complies with the manufacturer's acceptable moisture emission limits and pH for floor covering and adhesive required when evaluated per ASTM F 710 and ASTM F 2170 or limits. In no case shall a pH level greater than 9.0 be acceptable.

D. Vapor Emission Control and pH Control: Contractor shall determine most effective method or combination of methods to achieve the required installation conditions. Contractor shall be responsible to provide means and methods to effectively establish the moisture and pH levels required for the finish flooring in compliance with the Construction schedule and per the approved Vapor Emission Control Plan at no additional cost to the Owner.

3.2 INSTALLATION

A. Place moisture control system using the manufacturer’s recommended sequence and procedures; apply primer with broadcast application of sand aggregate followed by seal coat and additional broadcast sand aggregate. Comply with coverage rate recommended by the manufacturer and confirmed by the field quality control agent immediately prior to and during installation.
   1. Establish environmental conditions prior to installation and maintain during and following installation until material is sufficiently cured to be unaffected by conditions deviating from recommended limits. In no case shall conditions deviate from range of manufacturer’s intended normal service environment

B. Coordinate work of this Section with finish work products of Division 9 Sections for finish flooring and provide substrate conditions acceptable to finish flooring installer for each type of applied finish flooring required.

C. Work of this Section includes responsibility for ensuring that the moisture control system manufacturer's Field Quality Control Agent is present at the Project for the following milestones as a minimum.
   1. Required Site Visits: Pre-Installation Conference, review of field conditions, and as required by the manufacturer for extended warranty coverage.
   2. Manufacturer's agent shall also visit the site to review each stage of installation of the moisture control system.
   3. Visits shall be scheduled to afford comprehensive observation of the work while the work is actively in progress without prior notice to the installer.
   4. Site visit to inspect the completed work and certify the installation qualifies for the specified warranty.

END OF SECTION

SECTION 09 21 00 – GYPSUM BOARD

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes requirements for gypsum boards and accessories for drywall and other finish systems.

B. Related Sections:
1. Section 01 81 13.17 Sustainable Design Requirements - CALGreen
2. Section 09 21 16 Shaft Wall Assemblies.
3. Section 09 22 16 Non-Structural Metal Framing.
4. Section 09 51 00 Acoustical Ceilings.

C. Definitions: ASTM C 11.

1.2 REFERENCES

A. California Code of Regulations, Title 24, Part 11 California Gren Building Standards Code, “CALGreen.”

B. CALIFORNA CODE OF REGULATIONS, TITLE 24, Part 2, California Building Coe (CBC), International Building Code with California Amendments.

C. Gypsum Association:
1. GA-214- Recommended Levels of Gypsum Board Finish.
2. GA-600- Gypsum Fire Resistance Design Manual.

D. Underwriters Laboratories, Inc (UL):
1. UL Fire-Resistance Directory.

E. ASTM International standards and testing procedures as listed in this Section.

1.3 SUBMITTALS

A. Product Data: Submit manufacturer's product data for cementitious materials, lath, metal support components, and accessories.

B. CALGreen Submittals: Product Data-VOC limits for adhesives, sealants, fillers and primers, documentation including printed statement of VOC contents; comply with limits specified.

C. Shop Drawings: Indicate movement joints in drywall assemblies, coordination with framing assemblies for vertical and horizontal assemblies and transitions between existing work to remain and new assemblies.

D. Samples: When directed provide one by one foot square incorporating one panel joint demonstrating finish texture required.

E. Closeout Submittals: Submit under provisions of Section 01 77 00.

1.4 QUALITY ASSURANCE

A. Fire-Resistance Assemblies: Tested per ASTM E 119 and UL listed, or other acceptable agency, for rating required.

B. Acoustic Performance: Assemblies tested per ASTM E 90 and classified per ASTM E 413.

C. Delivery, Storage and Handling: GA-216, GA-800.

D. Environmental Requirements: ASTM C 840; minimum ambient temperature between 55- and 85-degrees F., and as recommended by manufacturer.

E. Applicator Qualifications: Acceptable to manufacturer with documented experience on at least 5 projects of similar nature in the past 5 years.

F. Single Source Responsibility for Panel Products: Obtain each type of gypsum board and other panel products from a single manufacturer.

G. Single Source Responsibility for Finishing Materials: Obtain finishing materials from either the same manufacturer that supplies gypsum board and other panel products or from a manufacturer acceptable to the gypsum board manufacturer.

H. Mock-ups: Before beginning gypsum board installation, install mock-ups of at least 100 square feet in surface area to demonstrate aesthetic effects and set quality standards fo materials and execution.
   1. Install mock-ups for each level of gypsum board finish indicated for use in exposed locations.
   2. Apply final decoration indicated, including painting and wall coverings on exposed surfaces for review.
   3. Simulate finished lighting conditions for mock-up review.
   4. Subject to compliance with requirements, approved mock-ups may become part of the complete Work, if undisturbed at time of Substantial Completion.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENT–

A. VOC Limits for adhesives, sealants, fillers, primers, and coatings. Comply with limits specified in Section 01 81 13.17.

B. Fire-Resistance Rated Assemblies: For fire-resistive rated assemblies, provide materials and construction identical to those tested in assembly indicated according to ASTM E 119 by an independent testing laboratory.
   1. Fire-Resistive Ratings: Indicated by design designations from UL Fire-Resistance Directory or GA-600 Gypsum Fire Resistance Design Manual.

C. STC-Rated Assemblies: For STC-rated Assemblies, provide materials and construction identical to those tested in assembly indicated according to ASTM E 90 and classified according to ASTM E 413 by an independent testing agency.

2.2 MATERIALS

A. Gypsum Board: ASTM C 1396, products of a single manufacturer unless approved otherwise; products of different manufacturers shall be acceptable to the manufacturer of the gypsum board. Provide maximum lengths available to minimize end-to-end joints, 0.625-inch thickness is typical, provide other thickness where required.
   1. Provide the specific board Types for each application and as necessary for resistance to fire, moisture, impact and other conditions of service.
   2. Edges: Tapered, unless otherwise indicated, or acceptable.

B. Interior Gypsum Board: Mold-Resistant Type X and approved for vertical or horizontal application as required; USG, Georgia Pacific, CertainTeed or Temple-Inland except as otherwise specified for select locations. Provide additional types as necessary for specific performance requirements.
   1. Moisture Resistant Gypsum Board: ASTM D3273 mold growth resistance of 10 or better; moisture resistant non-cellulose facings having no special finish requirements and non-combustible, moisture and mold resistant gypsum core with tapered edges; GP DensArmour Plus Fireguard Interior Panel, CertainTeed ProRoc or USG Sheetrock Mold Tough Firecode X,
   2. Fire Rated Assemblies: Comply with UL Listed materials and tested assembly requirements for each assembly type required. At ceilings provide ASTM C 1396 Type X (special fire-resistant) panels as necessary for assembly compliance.
   3. Abuse Resistant Gypsum Board: Provide abuse resistant face and core at all corridors, stair walls, and public toilet rooms.

C. Interior Glass Fiber Mat Faced and Reinforced Gypsum Panels: ASTM C 1658, 0.625-inch-thick Type X panels, tapered edges; Georgia Pacific DensArmor Plus Fireguard, USG Sheetrock Glass-Mat Mold Tough Firecode X or approved.

D. Metal Framing Systems: Comply with requirements of Section 09 22 16 as necessary for framing assemblies required; size ceiling supports to comply with ASTM C 754 except as otherwise required.
   1. Non-perforated Gypsum Board Ceilings: Subject to compliance with Project requirements use of ASTM C 635 direct hung suspension system rated for heavy duty and drywall attachment clips complying with Section 09 51 00 requirements is acceptable.

E. Tile Wall Backing: ASTM C 1178 Inorganic matt reinforced gypsum panel with water-resistant treated core and factory applied heat cured acrylic face coating 0.5 inch and 0.625 thick as required; USG Durock Glass Mat Tile Backer, GP Gypsum DensShield Tile Guard, CertainTeed or approved.
   1. Fire Rated Assembly: Provide UL listed product in thickness necessary for assembly rating required.
   2. Fiber Cement Board: comply with Section 09 30 00.

F. Plywood Panels in Wall Assemblies: Reference Section 06 10 00.

2.3 ACCESSORIES

A. Accessories: ASTM C 1047; Standard types as required; galvanized steel unless otherwise indicated, with either knurled and perforated or expanded flanges for nailing or stapling, and beaded for concealment of flanges in joint compound, and one-piece control joint beads.

B. Joint Tape, and Compound: ASTM C 475; type recommended by the manufacturer for the application indicated unless otherwise required.
   1. Joint Compound: Ready-mixed vinyl-type for interior use; chemical hardening type for exterior; water resistant type for water resistant backer board and panel in wet-use areas.

C. Anchors and Adhesive:
   1. Adhesive: Recommended by gypsum board manufacturer and complying with VOC limitations. Adhesive for Wood: ASTM C 557.
   2. Nails for Wood: ASTM C 514.
   3. Screws for Metal Framing: 20 Gage and lighter ASTM C 1002, minimum 1.25 inch long, Phillips-head, Type S;18 Gage and heavier ASTM C 954

D. Provide auxiliary materials of the type and grade recommended by the manufacturer of the gypsum board.
   1. Acoustical Sealant: Per Section 07 92 00.
   2. Thermal and Acoustic Insulation: As required in Section 09 81 00.
   3. Ceramic Tile Backing Panels: Provide tape, joint compound, and other accessories as recommended by the panel manufacturer for the Project specific assembly required.
   4. Epoxy Painted Panels: Waterproof skim coat.
   5. Acoustic Sleeve: Size and configure for each penetration from 22 gage galvanized steel, fabricate flange to extend a minimum of 1.5 inch onto face of gypsum board.

E. Edge Trim Reveals: Extruded aluminum with clear anodized finish; products of Fry Reglet, provide standard U and L type trim for finishing panels edges and as otherwise required. Plastic and vinyl trim, edge and corner bead products are not allowed.
   1. Edge Trim Type A 0.625 inch by 0.5 Z shape.
   2. Edge Trim Type B 0.625 inch by 0.25-inch Z shape.

F. Sound Barrier Mullion Trim Cap: Provide pre-finished 0.125-inch extruded aluminum trim cap in profile indicated and in lengths required; provide concealed attachment to partition framing and compressible gasket at existing glazing system as required to satisfy performance requirements. Subject to performance requirements, provide products by Mull-it-Over Products, Mullion trim Cap, or Gordon Architectural, Mullion Mate.
   1. Profile: As selected by Architect to allow solid attachment and fastening to the partition wall framing.
   2. Color and Finish: As selected by Architect, standard anodized or custom color options.
   3. Acoustical performance: STC 55, minimum.
   4. Provide and install accessory products to manufacturer’s requirements, including fasteners, ASTM E 84 Class 1, microbial growth-resistant, sound absorbing foam and sealants.

G. Acoustic Accessories: Provide the following as necessary for isolation and support of acoustic assemblies; include fasteners, pads and gaskets as necessary for required performance.
   1. Sway Braces: Interlocking steel clips with neoprene isolation pad, nominal dimensions 3.75 inches tall by 1.5 inches wide and as required for differing assembly types; WIC-2 by Mason Industries.
   2. Mineral Fiber Panels: Reference Section 09 81 00.
   3. Fiber Glass Batt: Reference Section 09 81 00.
   4. Acoustic Gasket: 0.3125 inch thick, 40 Durometer, neoprene waffle; Mason Type W, Kinetic NP/NG or approved.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Metal Framing: Comply with requirements of Section 09 22 16.
   1. Steel Fire Door Frames: Comply with Project requirements, and GA-219.
   2. Coordinate with Section 07 21 00 and Section 09 81 00 requirements for insulated assemblies.
   3. Backing and Reinforcing: Verify assemblies have been reinforced for mounting of wall and ceiling supported components per Section 05 40 00 or 09 21 00 requirements.
   4. Ceilings: Coordinate with Section 09 51 00 for work supported by suspended acoustical ceiling grid assemblies.

B. Gypsum Board: ASTM C 840, GA201 and GA 216; Face side out, joints tightly butted, plumb, level and square; shim as necessary to maintain required tolerances. Do not use damaged boards. Cover both faces of partition frame including concealed spaces, except in reinforced chase walls. In concealed areas scraps 8 square feet and larger may be used, unless otherwise necessary for performance requirements.
   1. Fire Rated Assemblies: Comply with requirements of UL Listed and tested assembly types indicated; provide materials and installation as required for the approved Listed assembly. Coordinate with Section 07 84 00 requirements for perimeter and penetration seals.
   2. Mold Resistant Panels: Provide throughout for interior applications, ceilings and walls including accessory components.

C. End Joints: Minimum number possible, locate exposed joints away from center of walls and ceilings; stagger not-less-than one foot in alternate courses. Install wall and partition boards with long edges vertical; stairwells, and high walls with long edge horizontal, and end joints staggered over supports, unless otherwise acceptable.

D. Locate edge or end joint over supports; stagger vertical joints over different studs on opposite faces of partitions. Attach gypsum board to supplementary framing and blocking; provide supplementary support at corners, openings, cutouts, and penetrations. Reinforcing may be omitted where control joints are required.
   1. Abut like edges; tapered edges against tapered edges and cut ends against cut ends. Do not place tapered edges against cut edges or ends.

E. Control and Expansion Joints: As minimum comply with ASTM C 840 and GA 216 recommendations for control joints, obtain Architect approval of location of joints not shown on drawings; form with space between edges of boards prepared to receive trim accessories.
   1. At door jambs where rough opening is framed with 0.5-inch gap between jack and bearing stud and where partial height door frame falls at a location where a control joint is required by refenced standard; extend joint to top of partition from both corners.
   2. Ceiling area 2,500 square feet and greater, joint spacing not great than 30 feet with no perimeter relief and 50 feet with perimeter relief.

F. Isolate perimeter of non-load-bearing drywall partitions at structural abutments; provide 0.25-to-0.5-inch space, trim edge with U-type edge trim, and seal joint with acoustical sealant.

G. Insulation: As indicated; install full height of partition, tight to framing and penetrations unless otherwise required.
   1. Acoustic: Install prior to gypsum board unless readily installed after board has been installed; provide at sound-rated assemblies, and location indicated.

2. Thermal: Install vertically; hold in place with z-furring placed 24 inches on center, use 18 gage staples through slots in furring web to hold in place until board is install; provide at locations indicated.

H. Single-Layer Application: Screw to metal supports; screw or nail, and glue to wood.
1. Ceilings: Apply board prior to application to wall and partition to the greatest extent possible.
2. Long edges horizontal on partitions and walls 8 feet one inch and less in height; use maximum length sheets to minimize end joints.
3. Z-Furring: Long edges vertical, supported by furring; no end joints.

I. Double-Layer Application: Gypsum backing board base, and gypsum wallboard face layer; stagger joints between layers at least ten inches. Fasten base layer with screws and face layer with adhesive and screws.
1. Ceilings: Apply base prior to application of wall and partition base; apply face layers in same sequence. Apply base layers at right angles to supports unless otherwise indicated.
2. Z-Furring: Base layer, long edges vertical, locate on furring member; face layer long edges vertical or horizontal; offset vertical joints at least one furring member.

J. Trim and Accessories: Provide edge trim, and corner beads on exposed edges of gypsum base; types indicated, and as required. Fasten to substrate as recommended by manufacturer; where feasible, use same fasteners required for gypsum board, otherwise, nail or staple.
1. Embed face flange in joint compound; L-type trim where work is tightly abutted to other work; kerf-type where work is kerfed to receive long leg of L-type trim; U-type where edge is exposed, revealed, gasketed, or sealant-filled.

3.2 SPECIAL INSTALLATIONS

A. Acoustically Insulated Work: Double-layer work on resilient furring, unless otherwise indicated; seal perimeter, joints, openings, and penetrations with a continuous bead of acoustical sealant on both faces of partition.
1. Comply with ASTM C 919 and manufacturer's recommendations for location of beads.
2. Close off sound-flanking paths around or through the work, including sealing of partitions above acoustical ceilings.
3. Multi-layer Assemblies: Tape and finish joints in each layer.
4. Penetrations: Oversize to allow a minimum annular gap of 0.75 inch for entire perimeter. Isolate penetrant from wall assembly. Provide sheet metal sleeve bedded in sealant and fill annular gap with acoustic insulation (regardless of whether penetrant is insulated). Comply with Section 07 92 00 requirements for seals.
5. Fill voids at junction boxes and similar components in assembly cavity with acoustic insulation.

B. Direct-Bonding Substrate: Concrete or masonry as indicated, comply with manufacturer's recommendations, brace board until adhesive has set.

C. Gypsum Board Scheduled to Receive Epoxy Paint: Moisture resistant gypsum board at walls; ceilings shall comply with requirements for tile wall backing. Seal ends, cut edges and penetrations with water-resistant adhesive or, water-resistant joint compound as recommended by backing board manufacturer.

D. Tile Wall Backing: Coordinate panel thickness with abutting assemblies to ensure smooth and flush transition at finish walls.
   1. Provide acceptable substrate ready for required tile installation. Coordinate installation with Section 09 30 00 requirements and comply with TCA Handbook method W245.
   2. Tape and finish joints to prevent absorption and penetration of water through the assembly and comply with recommendations of gypsum backing board manufacturer for additional joint treatment.

E. Gypsum Board Shaft walls: See Section 09 21 16 for additional requirements.

3.3 FINISHING
