CHAPTER 3
GREEN BUILDING
SECTION 301 GENERAL

301.1 SCOPE. Buildings shall be designed to include the green building measures specified as mandatory in the application checklists contained in this code. Voluntary green building measures are also included in the application checklists and may be included in the design and construction of structures covered by this code, but are not required unless adopted by a city, county, or city and county as specified in Section 101.7.

301.3 NONRESIDENTIAL ADDITIONS AND ALTERATIONS. [BSC-CG] The provisions of individual sections of Chapter 5 apply to newly constructed buildings, building additions of 1,000 square feet or greater, and/or building alterations with a permit valuation of $200,000 or above (for occupancies within the authority of California Building Standards Commission). Code sections relevant to additions and alterations shall only apply to the portions of the building being added or altered within the scope of the permitted work.

A code section will be designated by a banner to indicate where the code section only applies to newly constructed buildings [N] or to additions and/or alterations [A]. When the code section applies to both, no banner will be used.

301.3.1 Nonresidential additions and alterations that cause updates to plumbing fixtures only:

Note: On and after January 1, 2014, certain commercial real property, as defined in Civil Code Section 1101.3, shall have its noncompliant plumbing fixtures replaced with appropriate water-conserving plumbing fixtures under specific circumstances. See Civil Code Section 1101.1 *et seq.* for definitions, types of commercial real property affected, effective dates, circumstances necessitating replacement of noncompliant plumbing fixtures, and duties and responsibilities for ensuring compliance.

CHAPTER 5
NONRESIDENTIAL MANDATORY MEASURES

DIVISION 5.1 PLANNING AND DESIGN
SECTION 5.101 GENERAL

5.101.1 SCOPE
The provisions of this chapter outline planning, design and development methods that include environmentally responsible site selection, building design, building siting and development to protect, restore and enhance the environmental quality of the site and respect the integrity of adjacent properties.

SECTION 5.102 DEFINITIONS

5.102.1 DEFINITIONS
The following terms are defined in Chapter 2 *(and are included here for reference)*

CUTOFF LUMINAIRES. Luminaires whose light distribution is such that the candela per 1000 lamp lumens does not numerically exceed 25 (2.5 percent) at an angle of 90 degrees above nadir, and 100 (10 percent) at a vertical angle of 80 degrees above nadir. This applies to all lateral angles around the luminaire.

ELECTRIC VEHICLE (EV). [BSC-CG, HCD] An automotive-type vehicle for on-road use, such as passenger automobiles, buses, trucks, vans, neighborhood electric vehicles, electric motorcycles and the like, primarily powered by an electric motor that draws current from a rechargeable storage battery, fuel cell, photovoltaic array or other source of electric current. Plug-in hybrid electric vehicles (PHEV) are considered electric vehicles. For purposes of the California Electrical Code, off-road, self-propelled electric vehicles, such as industrial trucks, hoists, lifts, transports, golf carts, airline ground support equipment, tractors, boats and the like, are not included.

ELECTRIC VEHICLE (EV) CAPABLE SPACE. [BSC-CG, DSA-SS and HCD] A vehicle space with electrical panel space and load capacity to support a branch circuit and necessary raceways, both underground and/or surface mounted, to support EV charging.

ELECTRIC VEHICLE (EV) CHARGER. [BSC-CG, HCD] Off-board charging equipment used to charge an electric vehicle.

ELECTRIC VEHICLE CHARGING SPACE (EV SPACE). [HCD] A space intended for future installation of EV charging equipment and charging of electric vehicles.

ELECTRIC VEHICLE CHARGING STATION (EVCS). [BSC-CG, DSA-SS, HCD] One or more electric vehicle charging spaces served by EVSE or receptacle(s).

ELECTRIC VEHICLE (EV) READY SPACE. [HCD] A vehicle space which is provided with a branch circuit; any necessary raceways, both underground and/or surface mounted; to accommodate EV charging, terminating in a receptacle or a charger.

ELECTRIC VEHICLE SUPPLY EQUIPMENT (EVSE).[BSC-CG, DSA-SS and HCD] The conductors, including the ungrounded, grounded and equipment grounding conductors and the electric vehicle connectors, attachment plugs, personnel protection system, and all other fittings, devices, power outlets or apparatus installed specifically for the purpose of transferring energy between the premises wiring and the electric vehicle.

SECTION 5.105 DECONSTRUCTION AND REUSE OF EXISTING STRUCTURES

5.105.1 Scope. [BSC-CG] Effective July 1, 2024, alteration(s) to existing building(s) where the combined altered floor area is 100,000 square feet or greater shall comply with either Section 5.105.2, 5.409.2, or 5.409.3. Addition(s) to existing building(s) where the total floor area combined with the existing building(s) is 100,000 square feet or greater shall comply with either Section 5.105.2, Section 5.409.2, or Section 5.409.3. Effective January 1, 2026, the combined floor area shall be 50,000 square feet or greater.

[DSA-SS] Alteration(s) to existing building(s) where the combined altered floor area is 50,000 square feet or greater shall comply with either Section 5.105.2, 5.409.2, or 5.409.3. Addition(s) to existing building(s) where the total floor area combined with the existing building(s) is 50,000 square feet or greater shall comply with either Section 5.105.2, Section 5.409.2, or Section 5.409.3.

Exception [BSC-CG, DSA-SS]: Combined addition(s) to existing building(s) of two times the area or more of the existing building(s) is not eligible to meet compliance with Section 5.105.2.

5.105.2 Reuse of existing building. An alteration or addition to an existing building shall maintain at a minimum 45 percent combined of the existing building's primary structural elements (foundations; columns, beams, walls, and floors; and lateral elements) and existing building enclosure (roof framing, wall framing and exterior finishes). Window assemblies, insulation, portions of buildings deemed structurally unsound or hazardous, and hazardous materials that are remediated as part of the project shall not be included in the calculation.

5.105.2.1 Verification of compliance. Documentation shall be provided in the construction documents to demonstrate compliance with Section 5.105.2.

Note: Sample Worksheet WS-3 in Chapter 8 may be used to assist in documenting compliance with this section.

5.105.3 Deconstruction (Reserved).

SECTION 5.106 SITE DEVELOPMENT

5.106.1 STORM WATER POLLUTION PREVENTION FOR PROJECTS THAT DISTURB LESS THAN ONE ACRE OF LAND. Newly constructed projects and additions which disturb less than one acre of land, and are not part of a larger common plan of development or sale, shall prevent the pollution of storm water runoff from the construction activities through one or more of the following measures:

5.106.1.1 Local ordinance. Comply with a lawfully enacted storm water management and/or erosion control ordinance.

5.106.1.2 Best Management Practices (BMPs). Prevent the loss of soil through wind or water erosion by implementing an effective combination of erosion and sediment control and good housekeeping BMPs.

1. Soil loss BMPs that should be considered for implementation as appropriate for each project include, but are not limited to, the following:
   a. Scheduling construction activity during dry weather, when possible.
   b. Preservation of natural features, vegetation, soil, and buffers around surface waters.
   c. Drainage swales or lined ditches to control stormwater flow.
   d. Mulching or hydroseeding to stabilize disturbed soils.
   e. Erosion control to protect slopes.
   f. Protection of storm drain inlets (gravel bags or catch basin inserts).
   g. Perimeter sediment control (perimeter silt fence, fiber rolls).
   h. Sediment trap or sediment basin to retain sediment on site.
   i. Stabilized construction exits.
   j. Wind erosion control.
   k. Other soil loss BMPs acceptable to the enforcing agency.
2. Good housekeeping BMPs to manage construction equipment, materials, non-stormwater discharges and wastes that should be considered for implementation as appropriate for each project include, but are not limited to, the following:
   a. Dewatering activities.
   b. Material handling and waste management.
   c. Building materials stockpile management.
   d. Management of washout areas (concrete, paints, stucco, etc.).
   e. Control of vehicle/equipment fueling to contractor's staging area.
   f. Vehicle and equipment cleaning performed off site.
   g. Spill prevention and control.
   h. Other housekeeping BMPs acceptable to the enforcing agency.

5.106.2 STORMWATER POLLUTION PREVENTION FOR PROJECTS THAT DISTURB ONE OR MORE ACRES OF LAND. Comply with all lawfully enacted stormwater discharge regulations for projects that (1) disturb one acre or more of land, or (2) disturb less than one acre of land but are part of a larger common plan of development sale.

Note: Projects that (1) disturb one acre or more of land, or (2) disturb less than one acre of land but are part of the larger common plan of development or sale must comply with the post-construction requirements detailed in the applicable National Pollutant Discharge Elimination System (NPDES) General permit for Stormwater Discharges Associated with Construction and Land Disturbance Activities issued by the State Water Resources Control Board or the Lahontan Regional Water Quality Control Board (for projects in the Lake Tahoe Hydrologic Unit).

The NPDES permits require postconstruction runoff (post-project hydrology) to match the preconstruction runoff (pre-project hydrology) with the installation of postconstruction stormwater management measures. The NPDES permits emphasize runoff reduction through on-site stormwater use, interception, evapotranspiration, and infiltration through nonstructural controls, such as Low Impact Development (LID) practices, and conversation design measures. Stormwater volume that cannot be addressed using nonstructural practices is required to be captured in structural practices and be approved by the enforcing agency.

Refer to the current applicable permits on the State Water Resources Control Board website at: www.waterboards.ca.gov/constructionstormwater. Consideration to the stormwater runoff management measures should be given during the initial design process for appropriate integration into site development.

5.106.4 BICYCLE PARKING. For buildings within the authority of California Building Standards Commission as specified in Section 103, comply with Section 5.106.4.1. For buildings within the authority of the Division of the State Architect pursuant to Section 105, comply with Section 5.106.4.2

5.106.4.1 Bicycle parking. [BSC-CG] Comply with Sections 5.106.4.1.1 and 5.106.4.1.2; or meet the applicable local ordinance, whichever is stricter.

5.106.4.1.1 Short-term bicycle parking. If the new project or an addition or alteration is anticipated to generate visitor traffic, provide permanently anchored bicycle racks within 200 feet of the visitors' entrance, readily visible to passers-by, for 5% of new visitor motorized vehicle parking spaces being added, with a minimum of one two-bike capacity rack.
Exception: Additions or alterations which add nine or less visitor vehicular parking spaces.

1.02 The ceiling grid system must be rated heavy duty as defined by ASTM C635.

1.03 Ceiling systems. The following ceiling system(s) is/are part of the scope of this project:

Manufacturer's Name:	Armstrong Prelude XL	or	USG Donn DX/DXL
Product Evaluation Report Type & Number:	ICC ESR-1508	or	ICC ESR-1222
Manufacturer's Model Number - main runner:	XL7301	or	DX-26
Manufacturer's Model Number - cross runner (4ft):	XL7341	or	DX-424
Manufacturer's Model Number - cross runner (2ft):	XL7328	or	DX-216

1.04 Seismic Wall Clip: Not Used

1.05 Ceiling panel shall not support any light fixtures, air terminals or devices.

1.06 For framing installations utilizing acoustical tile panels of mineral or glass fiber, it is not mandatory to provide 3/4" clearance between the acoustical tile panels & the wall on the sides of the ceiling which are free to slip.For all other ceiling panels types, provide 3/4" clearance between the ceiling grid runners/members & walls shall comply with the details on these drawings regardless of ceiling tile material.

2. MATERIALS:

2.01 Ceiling wire shall be Class 1 zinc coated (glavanized) carbon steel conforming to ASTM A641. Wire shall be #12 gage (0.106" diameter) with soft temper & minimum tensile strength = 70 ksi.

2.02 Galvanized sheet steel (including that used for metal stud & track compression struts/posts) shall conform to ASTM 653, or other equilvalent sheet steel listed in Section A3.1 of the North American Specification for the Design of Cold-Formed Steel Structural Members (AISI S100). Material 43 mil (18 guage) & light shall have minimum yield strength of 33 ksi. Material 54 (16 gauge) & heavier shall have a minimum yield strength of 50 ksi.

2.03 Electrical metallic tube (EMT) shall be ANSI C80.3/UL 797 carbon steel with G90 galvanizing. EMT shall have minimum yield strength of 30ksi & minimum ultimate strength of 48 ksi.

3. ATTACHMENT OF HANGERS & BRACING WIRES:

3.01 Separate all ceiling hanger & bracing wires at least 6 inches from all unbraced ducts, pipes, conduit, etc.

3.02 Hanger & bracing wires shall not attach to or bend around obstructions including, but not limited to, piping,ductwork, conduit, & equipment.

3.03 Electrical metallic tube (EMT) shall be ANSI C80.3/UL 797 carbon steel with G90 galvanizing. EMT shall have minimum yield strength of 30ksi & minimum ultimate strength of 48 ksi.

3.04 Hanger wires that are more than one (horizontal) in six (vertical) out of plumb shall have counter-sloping wires.

3.05 Slack safety wires shall be considered hanger wires for installation & testing requirements.

3.06 Hanger & bracing wire anchorage to the structure shall be installed in such a manner that the direction of the anchorage aligns closely with the direction of the wire (e.g. bracing wire ceiling clips must be bent as shown in the details & rotated as required to align closely with the direction of the wire, screw eyes in woodmust be installed so they align closely with the direction of the wire, etc.)

4. FASTENERS & WELDING:

4.01 Sheet metal screws shall comply with ASTM C1513, ASME B18.6.3. Penetration of screws through joined material shall not be less than three exposed threads.

4.02 Expansion Anchors: Not Used.

4.03 Power-Actuated Fasteners: Not Used.

4.04 If not otherwise specified in the evaluation report, power-actuated fasteners installed in steel shall be installed so the entire pointed end of the fastener is driven through the steel member.

4.05 Power-actuated fasteners in concrete or masonry are not permitted for bracing wires.

4.06 Concrete reinforcement and prestressing tendons shall be located by non-destructive means prior to installing post - installed anchor.

4.07 Welding shall be in accordance with AWS D1.3 using E60XX series electrodes.

5. TESTING:

5.01 All field testing must be performed in the presence of the project inspector.

5.02 Post-installed anchors in concrete used to support hanger wires shall be tested at a frequency of 10%. Power actuated fasteners in concrete shall be field tested for 200 pounds in tension. All other post-installed anchors in concrete shall be tested in accordance with CBC Section 1910A.5.

7.02 Ceiling-mounted air terminals or other services weighing less than or equal to 20 pounds shall have one #12 gauge slack safety wire attached from the terminal or service to the structure above.

7.03 Flexible sprinkler hose fittings, ceiling-mounted air terminals or other services weighing more than 20 pounds but less than or equal to 56 pounds shall have two #12 gauge slack safety wires (at diagonal corners) connected from the terminal or service to the structure above.

7.04 Flexible sprinkler hose fittings, ceiling-mounted air terminals or other services weighing more than 56 pounds shall be supported directly from the structure above by not less than four taut #12 gauge hanger wires attached from the structure above or other approved hangers.

8. OTHER DEVICES WITHIN THE CEILING:

8.01 All lightweight miscellaneous devices, such as strobe lights, occupancy sensors, speakers, exit signs, etc., shall be attached to the ceiling grid. In addition, devices weighing more than 10 pounds shall have a #12 gauge slack safety wire anchored to the structure above. Devices weighing more than 20 pounds shall be supported independently from the structure above.

9. LATERAL FORCE BRACE ASSEMBLY SPACING: Lateral force bracing assemblies shall be spaced perTable 1 for all values of the component importance factor (I_p) of the ceiling.

$1.15 \leq S_{DS} \leq 1.73$	12' x 12'	8' x 12'
$S_{DS} \leq 1.73$	8' x 12'	8' x 8'

a. Where, as defined in ASCE 7, Section 13.3.1:
z = height in structure of point of attachment of ceiling with respect to the base
h = average roof height of the structure with respect to the base

b. It shall be permitted to use the brace assembly spacing for z/h > 0.5 for the full building height.

9.01 Brace Assembly Spacing: 8' x 8' max (S_{DS} = 1.795; SDS > 1.73; z/h > 0.5)

9.02 There shall be a brace assembly a distance of not more than one-half (1/2) of the spacing listed in Table 1 above from each surrounding wall, expansion joint, & edge of any ceiling vertical offset.

3. All Work done under this contract is to comply with the 2022 edition of the California Building Code.
4. Design and install all temporary bracing and shoring to ensure the safety of the Work until it is in its completed form. When required by law, employ a Civil Engineer to design shoring, bracing, and installation plans for structural items.
5. Verify all dimensions prior to starting Work. The Architect and Structural Engineer are to be notified of any discrepancies or inconsistencies. Check and coordinate all dimensions. See architectural Drawings for dimensions and non-structural items not shown on these Plans. Do not scale the Drawings to obtain dimensions.
6. All scaffoldings and shoring is to comply with the rules and regulations of the Industrial Safety Commission of the State of California.
7. The Structural Engineer will provide only periodic observation of the Work.
8. Fees or costs associated with the redesign or modification of these Plans by the Architect or Structural Engineer as a result of deviation by the Contractor from the Plans and Specifications, or due to errors, faulty materials or faulty workmanship, is to be paid to the Structural Engineer by the Contractor.
9. The Contractor is required to assume sole and complete responsibility for job site conditions during the course of construction of the project, including safety of all persons and property. This requirement applies continuously and is not limited to normal working hours. The Contractor further agrees to defend, indemnify and hold harmless the Structural Engineer from any and all liability, real or alleged, in connection with the performance of Work of this project, excepting liability arising from the sole negligence of the Structural Engineer.
10. Neither the professional activities nor the presence of the Structural Engineer at the construction site relieves the Contractor of his obligation, duties and responsibilities for construction means, methods, sequences, techniques and procedures necessary for the Contractor to complete the Work in accordance with the Plans and Specifications in a manner to ensure the health and safety of persons who enter the construction site.
11. Any differences between the existing construction as observed in the field and as shown on the Drawings is to be reported to the Structural Engineer before proceeding with Work.
12. Bidders must visit the building site and familiarize themselves with the existing conditions. Discrepancies or deletions must be brought to the attention of the Architect and Structural Engineer before bid date for correction.
13. All work has been done in a manner as required for new structures. No attempt has been made to bring the entire structure into compliance with current building codes. However, the new design substantially conforms to the following standards:
    A. The capacity of existing structural elements required to resist forces has not been reduced.
    B. The lateral loading to existing structural elements has not been increased beyond their capacity.
    C. New structural elements are detailed and connected to the existing structural elements as required by current code.

    B. Welding electrodes shall comply with AWS standards and as indicated on General Structural Notes.
5. Erection: Install components in accordance with Manufacturer's instructions. Secure in place with fasteners or welding at maximum 24". Place studs at 16" on center; not more than 2" from abutting walls and at each side of openings. Connect studs to track using fastener method unless noted otherwise. Construct corners using minimum three studs. Fasten metal studs by welding or screw-fastening as indicated. Do not fasten framing members by wire tying. Provide deflection allowance in stud track, directly below horizontal building framing for non-load bearing framing. Attach cross studs of furring channels to studs for attachment of fixtures anchored to walls. Install framing between studs for attachment of mechanical and electrical items, and to prevent stud rotation. Touch-up field welds and damaged galvanized surfaces with primer.

DESIGN PARAMETERS

1. Seismic Force Resisting System - A Tier 1 Screening and Tier 2 Deficiency-Based Evaluation and Retrofit of the existing two-story concrete shear wall building have been performed per the requirements of ASCE 41-17, Section 3.4.3. Airflow Performance Data

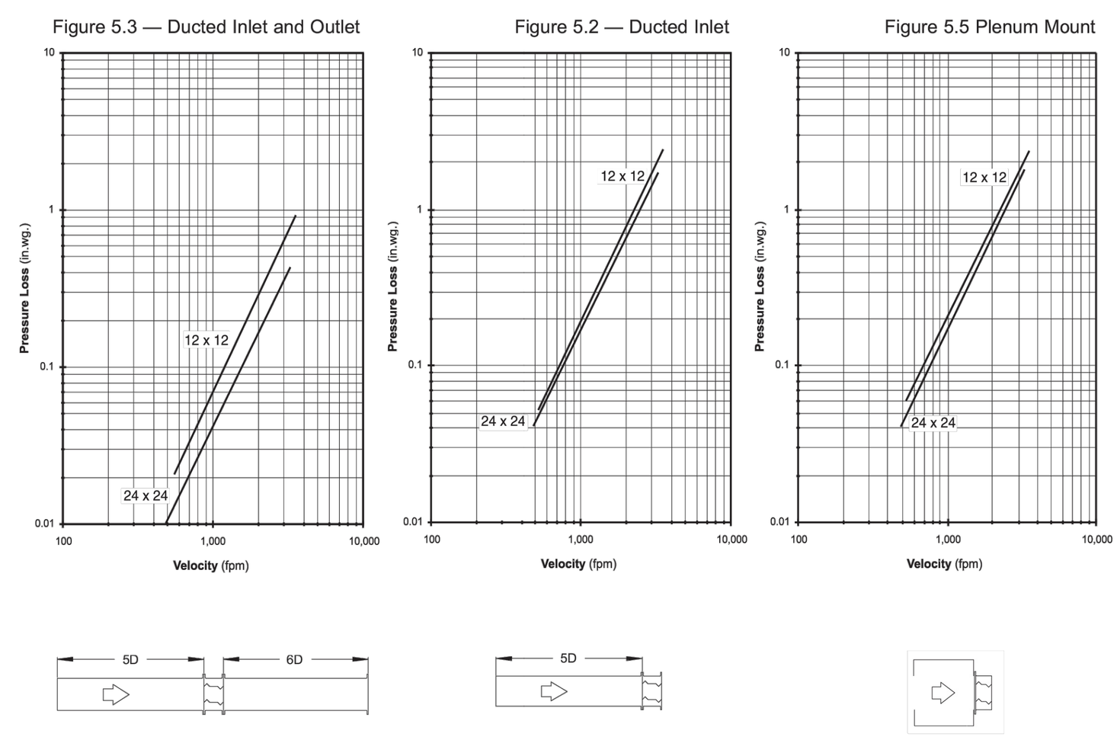
Pressure Loss vs. Velocity



Pressure drop testing was performed in accordance with AMCA Standard 500-D using the three configurations shown. All data has been corrected to represent air at density of 0.075 lb/ft. Actual pressure drop in any ducted HVAC system is a combination of many elements. This information, along with analysis of other system influences, should be used to estimate actual pressure losses for a damper installed in a given HVAC system.

Ducted Inlet and Outlet

AMCA Figure 5.3 Illustrates a fully ducted damper. This configuration represents the lowest pressure drop of the three test configurations because entrance and exit losses are minimized by straight duct runs upstream and downstream of the damper.

Ducted Inlet

AMCA Figure 5.2 Illustrates a ducted damper exhausting air into an open area. This configuration has a lower pressure drop than Figure 5.5 because entrance losses are minimized by a straight duct run upstream of the damper.

Plenum Mount

AMCA Figure 5.5 Illustrates a plenum mounted damper. This configuration has the highest pressure drop because of extremely high entrance and exit losses due to the sudden changes of area in the system.

1½ hour — combination fire smoke dampers horizontal installation instructions

The following installation details apply to models **CFS-171, CFS-172, FSD-141, FSD-142, FSD-143, FSD-151, FSD-152, FSD-171** and **FSD-172**

CLASSIFIED SEE DETAILS ON UL CLASSIFICATION MARKING ON ENCLOSED PRODUCT CLASSIFIED

Illustration depicts damper installed from the top down with the actuator above the floor line. Damper may also be installed from the bottom up with the actuator below the floor line. Illustrations show triple-V bladed (140/170 type), steel airfoil blade (150 type) similar.

A. Concrete or masonry fire partition shown. The opening shall be a minimum of ¼" (6) with a maximum of ¾" (19) larger than the overall damper and sleeve assembly size. When openings are larger than ¾" (19), but less than or equal to 6" (152) the mounting angles must be a minimum of 16 gauge (1.5) and must be wide enough to overlap the opening by a minimum of 1" (25). The damper must be installed with leading edge of closed blade within the partition.

B. For rigid type duct connections, the sleeve shall be a minimum of 16 gauge (1.5) for dampers up to 36" wide by 24" high (914 × 610) and a minimum of 14 gauge (1.9) for larger units. When lighter gauge sleeves are used, one or more of commonly used breakaway style connections are required. Refer to Sleeve Termination Supplemental Installation Instructions for further details. In no case will the sleeve gauge be less than the duct gauge to which it is connected. The damper sleeve shall not extend more than 16" (406) beyond the rated partition on the actuator side. The opposite side extension shall be a maximum of 6" (152) unless an access door is installed in the sleeve which then permits the extension to be a maximum of 16" (406).

C. Mounting angles shall be a minimum 1-½" × 1-½" × 16 gauge (38 × 38 × 1.5). Mounting angles are only required on the top side of the opening and must be attached to the sleeve at 6" (152) o.c. maximum, to the partition at 24" (610) o.c. maximum. There must be a minimum of two fasteners per side to both the sleeve and partition on all four sides. Alternately, mounting angles may be installed on both sides of the partition and must be attached only to the sleeve at 12" (305) o.c. maximum, with a minimum of two connections per side on all four sides. Attachment to the sleeve shall be with a minimum of #10 (M5) screws or bolts, 3/16" (4.8) diameter steel rivets, Quick-Lock joints, or welds.Attachment to the partition shall be with a minimum of #10 (M5) steel fasteners: anchors, bolts, or self-tapping masonry screws. A minimum ¾" × 20 gauge (19 × 1) flange termination may be used in lieu of mounting angles. Ensure that the attachment device does not interfere with the operation of the damper and the free movement of the damper blades.

Note: If optional sealing between the mounting angle (or flange) leg and the surface of the partition, or floor and/or between the mounting angle leg and the surface of the damper sleeve is required, any of the following sealants may be used: Dow Corning 700 or 732 or DOWSIL 700 or 732 or GE RTV 108 or SCS 1201 RTV These sealants must be applied such that they do not intrude into the annular space between the outside surface of the damper sleeve and the opening of the partition, or floor into which the damper/sleeve is installed. The annular space between damper sleeve and opening must not be filled with firestop materials such as fill, void, or cavity materials.

D. When joining multiple sections or fastening the damper to the sleeve, the damper shall be fastened with minimum 3/16" (4.8) diameter steel rivets, Quick-Lock Joints, welds or #10 (M5) bolts or sheet metal screws at 8" (203) o.c. maximum. There must be a minimum of two connections per side, top and bottom. For FSD-151 and 152 installations more than one damper high and three dampers wide, a minimum 14 gauge × 5" (1.9 × 127) supplemental steel mullion is required. The mullion should be the same length as the opening/duct height and must be installed between the damper frames running parallel to the opening/duct height, at the center of the assembly. Support mullions should be attached to the damper frames using the same fasteners indicated previously in this section.

E. A continuous bead of Dow Corning 700 or 732 or DOWSIL 700 or 732 or GE RTV 108 or SCS 1201 RTV silicone rubber sealant shall be applied between the damper and the sleeve and between sections of a multiple damper assembly. Sealant is only required on one side of the damper.

F. Fire/Leakage rated dampers and qualified operators are tested together by Underwriters Laboratories and are factory installed to qualify for standard damper/operator warranties. Damper operator/actuator must be tested prior to system start-up to ensure proper operation. Before applying power to the operator/actuator, the power must be verified.

SEQUENCE OF OPERATION

AC-1 TO AC-7:

UNIT SHALL BE SUPPLIED WITH FACTORY PROVIDED CONTROLS . THE SPACE TEMPERATURE SENSORS (REFER PLAN) WILL DETERMINE WHETHER THE UNIT IS IN COOLING /HEATING MODE OR NOT.

RUN CONDITIONS - SCHEDULED: THE UNIT SHALL BE PLACED IN COOLING/HEATING MODE BASED ON USER DEFINABLE BUILDING SCHEDULE VIA BMS.

A. OCCUPIED MODE: THE UNIT SHALL MAINTAIN
- 72 DEG F (ADJ) COOLING SETPOINT.
- 70 DEG F (ADJ) HEATING SETPOINT

B. UNOCCUPIED MODE: THE UNIT SHALL MAINTAIN
- 85 DEG F (ADJ) COOLING SETPOINT.
- 55 DEG F (ADJ) HEATING SETPOINT

COOLING MODE:
THE COMPRESSOR STAGES MODULATES TO MAINTAIN SPACE SETPOINT, WHILE COOLING IS CONTROLLED TO MAINTAIN THE SUPPLY AIR SETPOINT.

HEATING MODE:
THE COMPRESSOR STAGES MODULATES TO MAINTAIN SPACE SETPOINT WHILE HEATING STAGE IS MODULATED TO MAINTAIN THE SUPPLY AIR SETPOINT.

ECONOMIZER MODE:
ECONOMIZER MINIMUM POSITION IS SET DURING OCCUPIED MODE, WHEN OSA IS NOT SUITABLE FOR 'FREE COOLING'.
FOR SINGLE ENTHALPY OPERATION, THE OSA IS SUITABLE FOR FREE COOLING, IF THE OSA ENTHALPY IS ATLEAST 1 BTU/LB BELOW THE ECONOMIZER OSA ENTHALPY SETPOINT AND OSA TEMPERATURE IS NO GREATER THAN THE RAT + 9°F.
FOR DUAL ENTHALPY OPERATION, THE OSA IS SUITABLE FOR FREE COOLING,, IF THE OSA ENTHALPY IS LOWER THAN THE RA ENTHALPY BY 1 BTU/LB AND OSA TEMPERATURE IS NO GREATER THAN RAT + 9°F.
IF OSA IS SUITABLE FOR FREE COOLING, FIRST STAGE OF COOLING WILL BE FREE COOLING AND THE DAMPERS MODULATE TO CONTROL THE SUPPLY AIR TEMPERATURE TO ECONOMIZER SETPOINT +/- 1°F (55°F).
DURING ECONOMIZER OPERATION, THE ECONOMIZER WILL MODULATE BETWEEN THE MINIMUM POSITION AND 100%.
IF THE SUPPLY AIR TEMPERATURE CANNOT BE MAINTAINED WITHIN 5°F OF THE ECONOMIZER SETPOINT, MECHANICAL COOLING IS THEN ALLOWED TO STAGE UP.

POWER EXHAUST:
ENERGIZES EXHAUST FAN, WHEN THE ECONOMIZER OUTPUT IS ABOVE THE ECONOMIZER DAMPER POSITION FOR EXHAUST FAN ON.
DE-ENERGIZES THE EXHAUST FAN, WHEN THE ECONOMIZER OUTPUT IS BELOW THE ECONOMIZER DAMPER POSITION FOR EXHAUST FAN OFF.

INDOOR AIR QUALITY:
WHEN THE SIGNAL FROM SENSOR IS BELOW SETPOINT, ACTUATOR MODULATES AS PER ENTHALPY AND MIXED AIR SENSOR INPUTS.
WHEN SIGNAL EXCEEDS SETPOINT AND NO CALL FOR FREE COOLING, ACTUATOR IS MODULATED PROPORTIONALLY TO THE SIGNAL.
WHEN THE SIGNAL EXCEEDS ITS DEMAND CONTROL VENTILATION SETPOINT AND THERE IS CALL FOR FREE COOLING, THE ACTUATOR MODULATES FROM MINIMUM POSITION TO FULLY OPEN BASED ON HIGHEST CALL FROM EITHER MIXED IR OR ENTHALPY INPUTS.

(VENTILATION CONTROL) FOR DCV:
A CO_2 SENSOR INSTALLED IN THE RETURN AIR DUCT, SHALL BE USED IN THE VENTILATION CONTROL SEQUENCE AS FOLLOWS:
- THE CO_2 CONCENTRATIONS USED FOR VENTILATION CONTROL OF PACKAGE UNIT SHALL BE MEASURED BY THE CO_2 SENSOR INSTALLED IN THE RETURN AIR DUCT OF THE EQUIPMENT.
- THE LARGEST CO_2 CONCENTRATION LEVEL MEASURED BY ALL OF THE SENSORS SHALL BE USED IN THE VENTILATION CONTROL SEQUENCE.

THE OUTDOOR AIR SET POINT WILL BE BASED ON THE FOLLOWING LINEAR RESET SCHEDULE:

MODE	SPACE OR RETURN AIR CO2 CONCENTRATION	OUTDOOR AIRFLOW RATE
MINIMUM DCV MODE	≤ 500 PPM	DCV MOA
MODULATING DCV MODE	500 PPM < AND < 1000 PPM	MODULATING BETWEEN DCV MOA AND MOA
MOA MODE	1000 PPM ≥	MOA
